Servant leadership is about focus on the leaders for behaviors or attitudes of their followers and the organization (Patterson, 2003). The theory of Greenleaf can be describes to the primary passion, motivation to serve and meet employees' needs and wants. The servant leadership will be attained goals in the long term only in the organization to enhance the growth, development and general well-being of their individuals (Stone & Russell & Patterson, 2004). Moreover, it is also focus on the organization and organization objectives in the servant leadership. Servant leadership able to deliver a leadership approach that can deal with challenges of the modern workplace while still delivering on their needs of belonging. This might be why organizations that implement servant leadership practices. Furthermore, a lot of manager in the organization always make their action based on the priority for themselves.

Thus, a lot of people think that the relation between employee and leader are negative sides and just give advantages to one side of leaders only. Besides, servant leaders will build and stimulate the organization level of achievement. These approached will stimulate in term of performance in the organization through people development to become healthy (Wheeler, 2011). One of the important type in servant leadership will able to change other people because their attitude and charisma. Other than that, listening concept is one of the important aspects in order to listen to the employees' problem. The leaders also need to know the skills and limitations for every employee in the organization.

Characteristics of servant leadership

For servant leadership there is a right perspective for achievement and talent for their abilities. Servant leaders actively seek the help of others, humility shows which the leaders prioritize the

⁷² Olson, Ashley. (2020). Advising Clients in Times of Crisis: How Servant Leadership Can Deepen Client Relationships and Add Value During the Pandemic and Beyond (May 10, 2020)

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

interest of others, facilitate their performance, and give support of the importance (Patterson, 2003). Authenticity is closely related to expressing the true self, expressing oneself in ways that are consistent with inner thoughts and feelings. For the authenticity of servant leaders can be divided in various aspects in terms of what promises must be done, honestly in all environment, and visibility in the organization (Russell & Stone, 2002).

Servant leadership depends on the ability to color and feel others and from where the right person and also the ability to let go of perceived mistakes, not hold a grudge against other problems.⁷³ For servant leaders, it is important to create an atmosphere of trust, where people feel accepted, are free to make mistakes, and know that they will not be rejected (McCullough et al, 2000). Providing direction ensures that people know what are expected of them which are beneficial for both employees and the organization. Providing direction will able to provide the right degree of accountability high quality interpersonal relations (Ferris et al, 2009). The willingness to take responsibility for greater information and to go for security service, content and self-interest is essential for a harmonious interpersonal relationship.

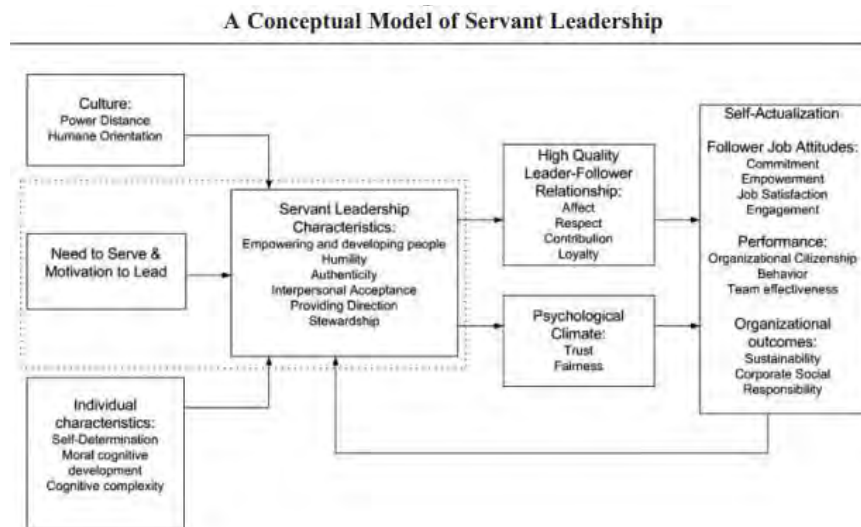

Figure 2.2.1 conceptual model servant leadership

Another characteristic is a persuasion in making decision in the organization. Most of the time servant leader seek to convince the employees rather than coerce compliance and also effective at building consensus within groups. Conceptualization is also important characteristic that really require in discipline and practice to achieve short-term and long-term operational goals. Effective leaders need to develop both perspectives within themselves. Otherwise, trustees probably need to develop both perspectives within themselves. Foresight is similar with the conceptualization that able to see outcome of hard situation. Learn from the past and able to improve making decision to be better rather than before this for in the future surely to be more carefully.

3 Research Methodology

Research methodology is the direction by which researchers are expected to perform study. It shows the path by which these researchers formulate their problem and objective and present their results from the data obtained during the period of study. Methodology refers to ways in which data is collected, structured and analysis. Decisions related to methods depend on the complexity of the research question. This study is concerned about the importance of servant leadership during Covid-19 pandemic. Research methods and techniques are selective and decisive for users in future processes. The data that been use in qualitative. The research will be used in qualitative method selection for respondents. The respondent for the research are school principals of primary school in Kelantan. The total of the respondent is 4 school principals are potential to be interviewed for this research. The research also focuses on the attribute of servant leaders to the school principals. In this study, the researcher wants to know about the importance of servant leadership during Covid-19 pandemic.

Because nowadays, the school was closed because of Covid-19 so the government has publicly announced the student, teachers and staff started working from home and will be monitored with the school principals. Furthermore, this is interesting for the researcher to study because even the school is closed but the school principal needs to go work as usual to settle their jobs. The researcher chooses school principals because of the servant leadership's different background of family and surrounding. The researcher prepared written questions to be asked to the interviewees, the semi- structured interview were used in this research. In this context, semi-structured interview aims to searching the data and information through questioning the respondent using conversation method. This method offers the chance to the respondents to share their own opinion with utilizing their own words. This process encouraged the participants to respond to the questions as accurate and calm as possible.

4 Findings and Discussion

The procedure in the interview session needs to be planned wisely and efficiently to find the answer for the interview questions. This study conducted by using semi-structured interviews to searching the data and information through questioning the respondent using the conversation method. The most important thing the researcher should list down all of the questions that need to be answer by the informants. In this study, the researcher conducted the interviews session through face to face, call and Whatsapp. During the meeting, an interviewer asked the questions clearly and easily to be understood by the respondents in a proper manner. In addition, the researcher used the audio recorder and notebook to collect the data during the interviews session. All informants during the interview are very nice and easy to communicate each other.

Research Question 1: Why it is important the servant leadership for the leaders and employees during Covid-19 pandemic?

Research objective 1: To understand the importance of servant leadership for leaders and employees during Covid-19 pandemic

In this study to answer the Research Question 1 (RQ1), there are some of the sub-themes have been identified in order to justify the Research Objective 1 (RO1). In the sub-themes there are have which is to understand the leadership, goals achievement, monitoring the staffs and ways of convinces. Justifications can be seen as below:

Table 4.1: Sub-theme 1 (Understand about leadership)

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

Informant	Interview's quote	
	Transcript	Translation
IF 1	“keupayaan seorang pemimpin untuk memimpin organisasi untuk menguruskan kakitangan menguruskan hal ehwal pentadbiran”	the ability of a leader to lead an organization to manage staff managing administrative welfare
IF 2	“Pemimpin yang tanggungjawab ialah seorang pentadbir atau pengurus sekolah lebih kepada mengurus sekolah lah.....menguruskan guru, menguruskan murid-murid, menguruskan pembersihan”	The leader who is the responsibility of an administrator or school manager is to manage the school.....managing teachers, managing students, managing cleaning
IF 3	“pemimpin di sekolah menguruskan pentadbiran di sekolah dalam segala aspek”	The leaders at school manage administration of school in all aspects
IF 4	“satu proses kita sebagai seorang pentadbir yang dapat membimbing, menyokong dan boleh bekerjasama dengan orang bawahan kita”	a process we as an administrator who can guide, support and can work with our subordinates

Table 4.1 shows all the informants know on the ability to understand about leadership in term of servant leadership. Thus, the researcher did not clearly asking about servant leadership because the researcher not surely that informants will not understand when the researcher asked about that question. So, the researcher was asked for the basic question about leadership. The participants know a leadership is very important being as a good leader in the organization. The participants also have same opinion about as administrator will responsible to manage all aspects in the organization including during pandemic covid-19.

Table 4.2 Sub-theme 3 (Achieve the goals)

Informant	Interview's quote	
	Transcript	Translation
IF 1	“mestilah mempunyai wawasan untuk membawa organisasi kearah yang lebih baik lagi daripada apa yang tercapai semasa. Jadi sifat-sifat kepimpinan ini adalah sangat penting untuk membawa organisasi kearah yang lebih baik”	We must have the vision to lead the organization towards something even better than what is currently being achieved. So these leadership qualities are very important to lead the organization for the better
IF 2	“di landasan yang betul maka perjalanan sekolah akan terus betul ikut apa yang kita hasratkan, kan kita ada misi visi, kita ada wawasan sekolah kita jadi memang itu perlu diwar-warkan nak selalu diberitahu”	On the right track then the school journey will continue to follow exactly what we want, we have a vision mission, we have the vision of our school so indeed that needs to be announced to always need to be told
IF 3	“Sebagai pemimpin jangan tanya pasal kerja kita sahaja, kerja dia sahaja tapi kita boleh tanya hal selain kerja kita takut menyebabkan	As a leader do not ask about our work only, their work only but we can ask things other than our work because we afraid to cause something wrong for him so we can help

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

	dia ada sesuatu kita boleh membantu dia supaya dia dapat bekerja dengan baik”	him so that he can work well
IF 4	“menentukan hala tuju sesebuah organisasi kemana arah kita nak bawa pertamanya apakah matlamat kita untuk organisasi kita , apa yang kita nak bawa sebab itu sebelum kita nak buat perlu check apa keperluan dan kehendak dan matlamat untuk organisasi”	Determine the direction of an organization which direction we want to bring firstly what is our goal for our organization, what we want to bring the because before we want to do anything we need to check first what the needs and wants and goals for the organization

Table 4.2 shows the informants will give the best decision to be a good leader to achieve the goals in the organization. The participants also have make the another plan to be success because the management will be change during pandemic covid-19. Based on the opinion from the participants said are leadership is important in the organization and also give more impact to the achievement of organization goals. For example the informant four (4) is clearly mentions that we have to know needs, wants and goals of the organization.

Table 4.3: Sub-theme 6 (Monitor the staff)

Informant	Interviewer’s quote	
	Transcript	Translation
IF 1	“melalui group whatsapp dimana setiap guru kelas akan mencipta group kelas masing-masing dimana guru-guru yang mengajar berada dalam group itu saya pun berada dalam group itu jadi saya tahu saya dapat pantau apa kerja yang cikgu bagi kepada murid”	through whatsapp group where each class teacher will create their own class group where the teachers who teach in that group I am also in that group so I know I can monitor what works the teacher gives to students
IF 2	“pastikan setiap guru istiharkan dari mana contohnya seperti urusan di bank, makan gulai kahwin perlu beritahu jangan sembunyikan punca dengan kata lain kita yakin bahawa cikgu kita selamat”	make sure the teachers declare from where there are for example such as business in the bank, attend the wedding need to tell first do not hide the causes in other words we are sure that our teacher is safe
IF 3	“semua guru akan berada dirumah walaupun ada diantara mereka yang terkandas diluar negeri jadi saya menanyakan kepada guru tersebut untuk memaklumkan kepada saya dan akhirnya Berjaya pulang...”	all the teachers will be at home even though some of them are stranded abroad so I asked the teacher to inform me and finally safely arrived at home
IF 4	“masa pandemic ini kita tengok kerja dia sebab sekarang ni cikgu saya online dengan pelajar-pelajar biasanya akan dihantar ke saya contoh-contoh yang dibuat mereka tunjuk dekat saya apa online	This pandemic we look at his work because now my teacher is online with students usually sent to me the examples they made and show me what they do in the online teaching and manual teaching

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

	pengajaran dan juga manual pun mereka ada buat”	
--	---	--

Table 4.3 shows the participants have to monitor the employees and students through using medium online for example (whatsApp and telegram) during pandemic covid-19 because the employees will work from home. This can be related to the importance of the researcher’s objective. Besides, the participants satisfied with the teachers because they will put effort to help the student using online teaching and for the student not afford to get using online media the teachers will give manual teaching to be fair for everyone. Using medium online is an important support connection between the school principals with the teachers, students and other staff.

Table 4.4: Sub-theme 13 (Ways of convinces)

Informant	Interviewer’s quote	
	Transcript	Translation
IF 1	“memberi kata-kata motivasi sudah tentu guru-guru atau kakitangan dibawah kita akan berasa yakin untuk membuatnya jadi kata-kata rangsangan daripada pemimpin sangat penting dengan memberi kepercayaan 100%”	Giving words of motivation for sure the teachers or staff will feel confident to make it so those words of encouragement from leaders are very important by giving 100% trust
IF 2	“Kita nyatakan hasrat kita apa yang nak dicapai macam visi misi dalam jangka masa terdekat dan jangka yang panjang jadi nak yakin sebagai contoh kejayaan yang telah dicapai oleh sekolah lain”	we express our desire for what we want to achieve like a mission vision in the near future and long term so we want to be more confident to be success that has been achieved by other schools
IF 3	“kita suruh dia terima dulu kemudian kita bincang bagaimana nak laksanakan dengan cara itu dia boleh terima dan perlu kepada sokongan yang lain sebab kadang-kadang kita bagi kerja tidak jelas suruh buat tapi dia tak tahu apa pun jadi kita kena tanya progress”	We ask him to accept first and then we discuss how to implement in that way he can accept and need other support because sometimes we give some work that is not clearly to settle but he does not know anything so we have to ask for progress
IF 4	“saya serahkan pada guru-guru dan saya yakin mereka boleh buat mula-mulanya tak berapa yakin tapi insyaallah kita buat bersama-sama, cikgu yang lain bersungguh-sungguh tunjuk progress kepada saya”	I give it to the teachers and I am sure they can do it at first time not so confident but insyaallah we do it together, the other teachers are serious about showed the progress to me

Table 4.4 shows the importance for a good leader in convincing their employees to do a new task or an assessment. All the participants agree that the importance of servant leadership among school principals when giving words of motivation will encourage the teachers more confidence to finish the work. Based on informant one (1) it was said that giving motivation and 100% trust will make the teachers or staff more confident to do that work. The leaders must be opened minded to the employees for better progression and development in the organization.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Research Question 2: What is the characteristic of servant leadership for a good leader during Covid-19 pandemic?

Research objective 2: To determine the characteristics of servant leadership for a good leader during Covid-19 pandemic

To answer the Research Questions 2 (RQ2), some of the sub-themes had been identified in order to justify the Research Objectives 2 (RO2). There are good characteristics, lead the organization, ways of communication, good values and benefit of listening. Justification can be seen as below:

Table 4.5: Sub-theme 2 (Good characteristics)

Informant	Interview's quote	
	Transcript	Translation
<i>IF 1</i>	“mempunyai integriti yang tinggi dimana pemimpin itu sendiri sebagai ketua jabatan mestilah menunjukkan contoh teladan yang baik mestilah amanah, mestilah menepati masa, mestilah menunjukkan sikap yang baik”	have high integrity where the leader as the head of the department must set a good example such as must be trustworthy, must be punctual, must show good attitude
<i>IF 2</i>	“kita perlu ada hala tuju lah... hala tuju yang jelas kepada guru anak buah kita”	we need to have a clear way direction... a clear ways direction to our teachers and subordinates
<i>IF 3</i>	“mestilah prihatin kepada sekolah janganlah bersikap dua hala kita jangan suka mengarah saja maksudnya kita kena timbal balik supaya tidak menjadi tekanan kepada orang bawahan kita”	must be concerned with the school do not be biased we do not like to just direct it means we have to reciprocate so as not to be a pressure on our subordinates
<i>IF 4</i>	“lebih suka membimbing dan berkerjasama dengan guru-guru maknanya kita buat kita bimbing dan kita kerjasama bukan kita lepas terus... apa-apa yang kita buat, kita suruh cikgu buat, kita arah mereka buat kemudian kita pantau kalau ada yang tidak berpuas hati kita akan bimbing bukan menekan”	prefer to guide and cooperate with teachers it means we make us guide and we cooperate not we let go... anything we do, we tell the teacher to do, we direct them to do then we monitor if anyone is dissatisfied we will guide instead of pressing

Table 4.5 shows the participants must have good characteristics as a leader, administrator or any kind of person that is able to show high integrity in the organization. In servant leadership also mention about the behavior to be successful leaders. The characteristics also need to enhance during a pandemic because they will work hard to manage the organization. The researcher highlighted to the informant 4 that we have to guide and cooperate with the teachers, subordinates not to let it pass without briefing. Other than that, the leaders do not press the staff to finish the work.

Table 4.6: Sub-theme 4 (lead the organization)

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

Informant	Interview's quote	
	Transcript	Translation
IF 1	“kita terikat juga dengan garis panduan yang dikeluarkan oleh Kementerian Pendidikan. Jadi buat masa sekarang perkara yang paling penting ialah pemimpin atau saya sendiri mematuhi segala garis panduan yang telah ditetapkan”	We are also tied by the guidelines issued by the Ministry of Education. So for now the most important thing is for the leader or myself to abide by all the guidelines that have been set
IF 2	“ apa jua saya tidak akan kongsi kepada mana-mana guru selagi tidak dapat hitam putih daripada PPD maklumat ini walaupun disampaikan dalam bentuk text dan sebagainya saya akan kongsi kepada group sekolah, jadi prosedurnya mestilah menepati dengan apa yang telah digariskan”	I will not share anything with any teacher as long as I cannot get black and white letter from PPD this information even if presented in text and so on I will share with the school group, so the procedure must comply with what has been outlined
IF 3	“wajib hadir kesekolah dan masa itu kakitangan sokongan kita bertugas seperti biasa... saya terpaksa mengumpulkan semua guru mengikut SOP yang ditetapkan dan memberi taklimat guru dibenarkan berada dirumah dan tunggu info yang terkini dan saya sebagai pentadbir terpaksa hadir kesekolah untuk menguruskan kakitangan dan pekerja sebab kita tidak bercuti”	We must attend school and at that time our support staff is on duty as usual... I had to gather all teachers according to the SOP set and briefed teachers are allowed to be at home and wait for the latest info and I as an administrator had to attend school to manage staff and employees because we are not on holiday
IF 4	“saya berurusan dengan guru dan pekerja melalui media yang paling banyak saya guna ialah whatsapp group dengan whatsapp individu dan juga media-media yang lain tapi banyaknya whatsapp lah yang penting maklumat itu sampai”	deal with teachers and employees through the media that I use the most apps is whatsapp group and personal and also other media but a lot of whatsapp is important information to arrives

Table 4.6 shows how the participants lead the organization during Covid-19 pandemic. All informants have the same condition in handling their teachers, subordinates because they work from home and the leader must get the response as soon as possible. As we know, the administrator among school principals must go as usual at school to settle the work. The informant also ties by the guidelines from the PPD and Ministry of education before announcing the right information to others. Moreover, during a pandemic they will have to follow SOPs to do something related with the teachers or students.

Table 4.7: Sub-theme 7 (Ways of communication)

Informant	Interviewer's quote	
	Transcript	Translation
IF 1	<i>“lebih memahami melalui lisan dan apabila kita bertentang mata bersemuka kita dapat memahami apa</i>	It better understand through words and when we face each other we can understand what is going on happened in

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

	<i>sebenarnya yang berlaku.... Penulisan tidak sama dengan lisan apa dia tulis kalau kita baca dengan nada yang berlainan dia membawa maksud yang berlainan”</i>	real Writing is not the same as oral what he writes if we read in different tones it carries different meanings
IF 2	<i>“Semasa pandemic covid-19 kita berbincang secara bersemuka dengan penjarakkan dengan mana- mana guru yang berkaitan..... lain- lain yang perlukan tindakan segera maka dibincang didalam talian contohnya telegram dan whatsapp itu saja jadi maklumat itu akan sampai lah dengan segera.... Jadi kedua-dua kaedah ini sesuai untuk semua”</i>	During the pandemic covid-19 we discuss face to face with any teacher with the distance..... Other things who need immediate action then discussed online such as telegram and whatsapp only so the information will arrive immediately.... So both of these methods are suitable for all
IF 3	<i>“musim PKP kita memang menggunakan secara whatsapp tapi kita galakkan juga guru untuk hadir ke sekolah mengikut waktu yang ditetapkan dan kalau nak ikutkan guru memang nak hadir ke sekolah”</i>	During PKP we do use whatsapp but we also encourage teachers to attend school according to the set time and usually the teacher always want to attend school
IF 4	<i>“tengok situasi kalau benda itu sulit saya akan bertulis dulu baru hantar kalau tidak sayakan panggil secara peribadi tapi banyaknya lisan lah lagi senang kalau jumpa saya tanya direct atau panggil dalam bilik saya tanya apa masalah yang berkaitan”</i>	look at the situation if the thing is difficult I will write first then send if not I can call that person but the usually more comfortable if I meet them I will ask directly or call in my room ask what is the problem related

Table 4.7 shows ways of communication are important characteristics in servant leadership. The researcher was asked by the participants which is prefers to communicate to the employees and almost all informants agree that verbal communication is the best way to deliver the information. The researcher also considers the element of communication will help the employees to be more successful in the organization. The informant two (2) mentioned that during pandemic, the leader will have to communicate and discussion with the staff within distancing.

Table 4.8: Sub-theme 11 (Good values)

Informant	Interviewer’s quote	
	Transcript	Translation
IF 1	<i>“mengamalkan integriti yang tinggi dimana pemimpin haruslah menepati masa, pemimpin tunjukkan pemimpin boleh menyiapkan kerja yang</i>	<i>have high integrity such as the leader must be on time, the leader shows the leader can complete the work given by the department within the allotted time</i>

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

	diberikan oleh jabatan dalam masa yang ditetapkan”	
IF 2	“perlu berterus terang kemudian kita...hmmm. Ambil tahu tentang anak buah kita kemudian banyak mengucapkan terima kasih segala yang dilakukan”	<i>We need to be honest then we... hmmm. Take noted about subordinates and then always say thank you for everything that they did</i>
IF 3	“kena baik hati dengan pekerja dan kita tahu cara kerja mereka tapi kadang-kadang kita boleh ajak pergi makan, kita boleh bantu orang lain”	<i>Be kind to our employees and know how they work but sometimes we can treat them to eat, we can help others</i>
IF 4	“suka menerima pandangan daripada guru-guru dan orang bawahan berkenaan dengan kerja saya sebab mereka kata saya adalah guru yang terbaik untuk sekolah ini dan GK saya cakap bila saya mari sekolah ini terus berubah 360 darjah”	<i>I like to accept opinions from teachers and subordinates regarding my work because they say I am the best teacher for this school and also my assistant said when I let this school it totally changed into 360 degrees</i>

Table 4.8 shows the response from the participants about good values in leadership. Based on the study the researcher also considers that element is a main point in servant leadership. Based on the question all participants clearly give the strong statement that personality values absolutely influenced the employees and organization. This study shows that good values of personality are important characteristics among school principals in servant leadership. The researcher highlighted based on informant one (1) which is the good leader must have high integrity to conduct the employees and organization.

Table 4.9: Sub-theme 12 (Benefit of listening)

Informant	Interviewer’s quote	
	Transcript	Translation
IF 1	“mesti ada kemahiran mendengar sebab orang-orang dibawah pimpinan kita dia ada macam-macam mungkin ada yang masalah mungkin yang tidak ada masalah, ada masalah yang besar ada masalah yang kecil jadi bagi kakitangan kita yang bermasalah tempat yang mereka nak rujuk adalah pemimpin”	there must have listening skills because the people under our leadership he has all sorts of things maybe there are problems maybe there are no problems, there are big problems there are small problems so for our staff who have problems the place they want to refer to is the leader
IF 2	“mereka akan datang mengadu masalah yang mereka hadapi jadi kita sebagai good listener dan sebaik mungkin pandai menyimpan rahsia ataupun masalah-masalah tadi supaya tidak dikongsi dengan orang lain”	They will coming to complain about their problems that have to face so we as good listener and as best as possible are good at keeping secrets or problems so as not to be shared with others
IF 3	“saya lebih suka kalau kita bermesyuarat kita tidak fokus hanya sehala tapi dua hala dalam mesyuarat saya bagi peluang kepada guru apa masalah berkaitan”	I prefer to in the meeting we cannot focused on one way but two-way in the meeting for the opportunity to teachers tell what problems are related

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

IF 4	“kita kena dengar dulu masaada baik buruk kita kena dengar baru boleh buat penilaian sebab kalau tak dengar kita tak tahu”	We have to hear first the good and bad conditions we have to hear before we can make an judgment because if we do not hear we do not know
------	--	---

Table 4.7 shows the informants agree that listening is a good skill in leadership. In addition, one characteristic of servant leadership also mentions that listening is an important element needed by the leaders. In other words, the leader must be able to be a good listener to the employees when they want to share problems or tell the truth. Furthermore, three informants mentioned the same answer that listening is an important skill needed by the administrators. The leaders have to face a variety of problems in the organization because the employees will find the leaders to be a good listener.

Research Question 3: What are the challenges of servant leadership as a leader towards the organization during Covid-19 pandemic?

Research objective 3: To determine the challenges of servant leadership as a leader towards the organization during Covid-19 pandemic

To answer the Research Questions 3 (RQ3), some of the sub-themes had been identified in order to justify the Research Objectives 3 (RO3). They are divided into differences of opinion, challenges of leaders, barrier of leaders and decisions of leaders. Justification can be seen as below:

Table 4.10: Sub-theme 5 (Differences of opinion)

Informant	Interviewer’s quote	
	Transcript	Translation
IF 1	“kita mestilah mendengar setiap pendapat itu dan sama ada kita nak menerima atau tidak pendapat tersebut saya biasanya akan membuat keputusan didalam mesyuarat”	we must listen to each opinion and whether we want to accept it or not I will usually make a decision in the meeting
IF 2	“sekiranya pentadbir faham akan punca kuasa dan guru-guru itu faham dan maklum mengenai punca kuasa itu....maka tidak wujud jika ada sebarang perbezaan pendapat berkenaan dengan ideal yang boleh memajukan sekolah maka itu kita bincangkan bersama...”	If the administrator understands the source of power and the teachers understand and be concern of the source of power... and then there does not exist if there is got any differences of opinion regarding the ideal that can develop the school then we discuss it together
IF 3	“cuma apabila ada bertentangan kita kena rujuk kepada kebenaran yang sebenar kita tidak boleh.....(ada orang kol)..... sebab dalam keadaan sekarang ini kita banyak ketinggalan dari segi pembelajaran disebabkan oleh pelbagai dugaan”	When only there in a conflict we have to refer to the real truth we cannot... (someone is calling)..... because in the current situation we miss a lot of term learning due to various allegations
IF 4	“saya lebih suka kalau dalam mesyuarat cikgu bagi pandangan mana yang terbaik kita akan ambil	I prefer if the teacher discuss in meeting to give the opinions we will take the best opinions because I do not like to press it

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

	sebab saya tidak suka menekan”	
--	--------------------------------	--

Table 4.10 shows differences of opinion from the school principal are quite difficult to manage because the leaders must be responsible for all of the employees. Almost all participants prefer to listen first on what the employees want to share about the information and discuss together. The informant one (1) was mentioned that as a leader must have to be professional to listen about that opinions, at the end the discussion will be present in the meeting and the leader need to decide the best decision to improve better in the future.

Table 4.11: Sub-theme 8 (Challenges of leader)

Informant	Interviewer’s quote	
	Transcript	Translation
IF 1	“Kita tidak dapat memantau 100% apa yang guru-guru buat kita hanya menilai kerja guru melalui laporan-laporan guru”	We cannot monitor 100% of what teachers do we only evaluate teacher work through their reports
IF 2	“saya tidak boleh bernyawa berada disekolah setiap hari sepanjang covid sebab kalau setakat cikgu kita boleh control tapi ibubapa tidak boleh kawal”	I cannot breath easily in the school every day throughout of Covid because if as far as we can control the teachers but we cannot control
IF 3	“kita nak menghadapi PDPC dari rumah dan tak tercapai info kepada murid.....hampir separuh juga yang boleh terima dan tidak boleh terima jadi kita harapkan agar ibubapa mainkan peranan mereka dirumah”	we have to face PDPC from home and do not have access the information to studentsalmost half are also acceptable and not acceptable so we hope that parents play their role at home
IF 4	“line yang agak teruk dalam kawasan Machang yang paling susah nak dapat internet tapi bila ada benda yang perlu buat on the spot cikgu kita akan rela keluar dari sekolah nak buat benda tu sebab kalau line slow nak buat tak boleh”	The line is quite bad in the Machang area which is the most difficult to get internet but when there is something that needs to be done on the spot our teacher will be willing to leave school to do that thing because if the line is slow they cannot do it

Table 4.11 shows challenges of leadership are difficult for servant leader towards in the organization during Covid-19 pandemic. The challenges of the leaders during a pandemic are more challenging to handle because they have specific procedures to follow. The leaders should monitor the employees’ are work from home but just can evaluate the performances through the reports. Other than that, the leaders also take the responsibilities for the student that is learning online from home. The researcher highlighted that three (3) informants were disappointed during the pandemic because they cannot get clear information from the teachers, students and other subordinates in the organization.

Table 4.12: Sub-theme 9 (Difficulty of leaders)

Informant	Interviewer’s quote	
	Transcript	Translation
IF 1	“maklumat kita perlukan segera jadi dalam keadaan guru-guru bekerja dari rumah ia agak memakan masa untuk	we need the information immediately so in a situation where teachers work from home it is takes time to gather that

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

	kumpul maklumat itu contohnya laporan tentang PDPR ataupun perlu hantar laporan”	information for example a report on PDPR or need to send a report
IF2	“sebab kalau diikutkan proses untuk membuat keputusan itu sebenarnya yang paling sukar yang melibatkan sesuatu perkara yang penting yang utama”	because if you follow the process to make the decision actually the most difficult that involves something that more important
IF 3	“kadang-kadang dalam karenah cikgu ni bermacam ada yang boleh kerjasama, ada yang payah sikit tapi kita atasinya”	Sometimes because of the teachers, there are many behaviors that who can be cooperate, some who work a little hard but we can overcome
IF 4	“paling sukar sekali penatlah sebab dalam sebuah organisasi kita terpaksa kawal dan kena ambil tahu semua keseluruhan mengenai sekolah dari A to Z, dari kecil sampai besar benda”	the most difficult is being tired because in an organization we have to control and have to know everything about the school from A to Z, from small to large things

Table 4.12 shows the informants have the difficulty of the leaders that influence to manage the employees in the organization. This study shows that two (2) informants have limited information and make decisions to get immediate information or need to send the reports. The informant four (4) was mentioned as a leader needs to know everything about the school from the small to large things in the organization. Based on servant leadership can be considered an important element that is challenging during a pandemic. Besides, the leaders also should be fair and cannot bias the employees.

Table 4.13: Sub-theme 10 (Decisions of leaders)

	ketinggalan sedangkan dah diberitahu beberapa hari jadi benda begini kena tengok selalu walaupun rasa remeh-temeh tapi boleh kita kongsi bersama”	while they have been told for a few days so this kind of thing should always be seen, even if it can be shared
IF 4	“apabila saya bersama dengan cikgu okay tidak ada masalah cuma dengan pentadbir yang lain GK saya ada seorang dua yang dia ada sorang itu dia memang daripada dulu lagi saya tanya dengan orang lain dia memang tak boleh masuk”	When I am with the teacher okay there is no problem only with other administrators GK that I have some problems started indeed from long ago I asked other people that he really cannot together with others

Table 4.13 shows how the informants are really hard to make decisions during Covid-19 pandemic. The decisions of leaders will give more impact to servant leadership for a leader towards in the organization. The school principals need to carefully think and make the best decision for the organization during a pandemic because there are procedures and SOPs. The informant one (1) is taking the risk to have the meeting even if things are totally wrong during a pandemic but the responsibility of the leader needs to brief the teachers and other staff clearly. All the leaders agree that making a decision is a very difficult matter to the organization especially during Covid-19 pandemic.

4 Conclusion and Limitations

Nowadays, an effective leader must understand the motivations, strengths and weaknesses to create a more engaged and productive workforce to the positive environment. During Covid-19 Pandemic communication is very important to give a work or some information clearly. The leaders should be relentless in communicating to the employees with true information. Furthermore, the leaders will struggle with the new normal of a pandemic because all the things to do should be followed with the procedures and SOPs. According to the result, it shows that the findings are parallel with the interviews where it is able to answer all the research questions and research objectives of the study. The study focused mainly on the servant leadership among school principals as a leader during Covid-19 Pandemic. This is because while doing the research there is in current crisis of Covid-19 Pandemic. The findings of this study have to be seen in light of some limitations. This is because the time given to finish this study is limited to one semester of fourth year. Whereby, this study used a qualitative method in order to collect the data of study. From the analysis of the research findings, the manner in which this study have collected the data or the way in which researchers have collected analysis has limited researcher’s ability to conduct thorough to the result.

Universiti Malaysia Kelantan,
Malaysia

Email: puvaneswaritamilaran@gmail.com; mardhiah.k@umk.edu.my

Abstract:

This paper aimed to study the effect between food quality, service quality, price fairness, and physical environment on customer satisfaction in fast food restaurant at Ayer Keroh, Melaka. This study reviewed the literature of past researchers on factors that influence customer satisfaction in a fast food restaurant from different areas. Four main factors that was used in this study to analyse customer satisfaction were food quality, service quality, price fairness, and physical environment. The data were collected from 384 respondents from the Ayer Keroh residents through google form via online. These collected data were analysed using SPSS and the result gathered through Pearson correlation coefficient and multiple regression analysis. The findings indicated that food quality, service quality, price fairness, and physical environment had positive significant effect on customer satisfaction in fast food restaurant at Ayer Keroh, Melaka. The result shows that price fairness influences customer satisfaction the most compared to food quality, service quality, and physical environment. These findings provide beneficial suggestion for well-established fast food restaurant in Ayer Keroh to focus on price fairness as it gives important impact on customer satisfaction. Besides that, upcoming fast food restaurant who wants to open new branches at Kota Bharu can focus on these factors as well.

Keywords: Fast food restaurant, customer satisfaction, food quality, service quality, price fairness, physical environment

1 Introduction

Fast-food industry is being adapted by Malaysian as a food requirements and is a growing phenomenon in Malaysia (Habib, Abu Dardak, & Zakaria, 2011) It is necessary to understand needs and wants as well as understand their preferences, which will lead to customer satisfaction and revisit intention towards fast food restaurants (Chow, Ong, Tham, & Wong, 2013). Customer satisfaction traditionally regarded as a fundamental determinant of long-term customer behaviour (Ranaweera & Prabhu, 2003). When the customer is satisfied, their revisit intention will be high. Customer satisfaction is also viewed as customer's fulfilment response (Taylor & Baker, 1994).

In fact, sustaining customer satisfaction remains as biggest issue for majority of fast food restaurant in Malaysia. Therefore, the challenge now is to identify the determinants of customer satisfaction that actually affect customer satisfaction in fast food restaurant because it is important for fast food restaurant to implement service standards and customer requirements to meet customer satisfaction so that they can retain customers.

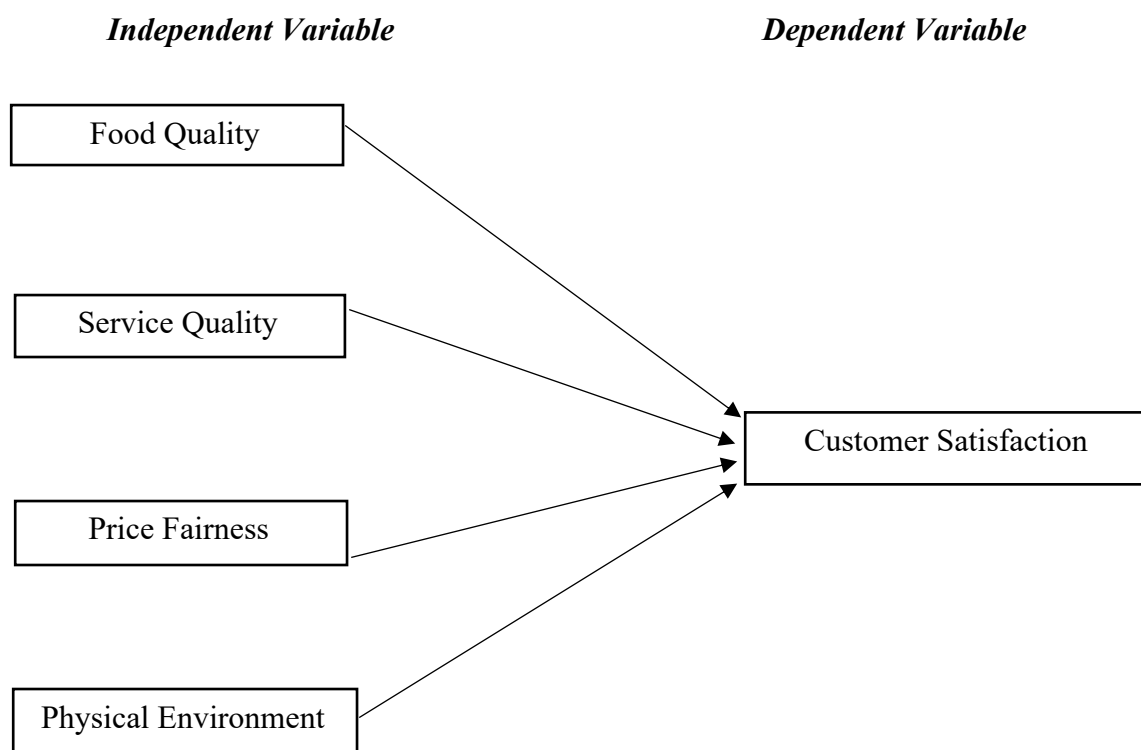

For example, four main factors that could influence customer satisfaction are price fairness, food quality,

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

service quality, and physical environment (Hanaysha, 2016). Namkung and Jang (2007) have stated in his study that food quality is one of the factors that influence customer satisfaction. According to Naspetti and Zanolli (2009), Consumers evaluate the quality of food through four universal dimensions in quality perception, which is taste, appearance, health, process and convenience. Ryu, Lee, and Gon Kim (2012) stress in their studies that quality of physical environment will affect customer satisfaction. The factors of physical environment features such as colour, store layout, lighting, music and ambient factors (Aubertgamet, 1997). Quality of service is also seen as an attribute dependent on the consumer's view of the customer's perceived service during the service delivery process (Zeithaml et al., 1990). Service quality specifically means meeting with consumer standards (Angelova and Zekiri, 2011). Price fairness has a positive impact on customer satisfaction, which affect brand association (Beristain & Zorrilla, 2011). Bolton, Warlop, and Alba (2003) state that price comparison used base on past prices, competitor prices, and vendor costs. Hence, for these reason this study measures the relationship of four components such as food quality, service quality, price fairness, and physical environment on customer satisfaction in fast food restaurant.

2 Literature Review

Conceptual Framework

2.1 Food Quality

Food quality is a primary marketing tool that employed to satisfy and retain customer. This was supported by the study done by Al-tit (2016) as he emphasized food quality is important to measure customer satisfaction in the restaurant industry. The review of past literature indicates common characteristics of food quality emphasize several elements such as, the presentation of food, taste, freshness and temperature (Shaharudin, Mansor, and Elias, 2011). As mentioned by Chamhuri and Peter (2015), consumers possibly able to evaluate the attributes such as appearance, color, shape, size and structure, but, on the other hand, they can only judge the experience attributes such as taste, tenderness, crunchiness and juiciness after the product being consumed.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

The past researcher stated that food quality is one of the factor that can affect the customer satisfaction Hanaysha (2016). This is supported by Rozekhi, Hussin, Siddiqie, Rashid, and Salmi (2016), they mentioned that food quality is the important factor that give customers to satisfy their needs and expectations towards the restaurant they choose.

2.2 Service Quality

In a restaurant, clients not only enjoy the taste of food, but also observe service meetings during their meal. Pugh (2001) believed that consumers' positive feelings have beneficial effects on their expectations of the quality of service. For example, waiters should also be able to pay promptly and conveniently. If there are issues due to inaccurate billing, long waiting period to pay and server indifference, even if the meal itself was deemed perfect by patrons, the whole dining experience could be destroyed (Pugh, 2001). Researchers have meanwhile noted that the proper honouring of customer reservations is a prerequisite for employers to perceive good quality of service (Lee and Hing, 1995). Cronin & Taylor (1992) subsequently suggested that quality of service is one of the precedents of customer satisfaction, but quality of service had a less impact on procurement intentions than satisfaction of customers. The process of benchmarking starts by setting up service specifications by defining service characteristics consisting of service standards.

2.3 Price Fairness

Price is an important factor that affects the level of customer satisfaction. According to Anderson and Sullivan (1993), the judgments of price fairness involve a comparison of a price with a related standard which is the difference between a selling price and the comparative price is really justifiable, can be acceptable, or reasonable. Price fairness become concern of many companies and they try treat consumers in fair condition to avoid customer perceptions of unfair prices will lead to decreased profitability (Blinder, 1991). The relationship between price fairness and customer satisfaction was reported by certain research Srikanjanarak et. al. (2009) and Nazari et al. (2014) who found that price fairness had positive relationship with customer satisfaction. Customers will evaluate a price through comparing it with: a price paid by them in another buying occasion, the costs estimated by them for the product or with a price set by another store (Cătoiu et al., 2010). The selling price also has essential influence in the assessment of whether the price or price increase is acceptable or fair (Bolton et. Al. 2003).

2.4 Physical Environment

Physical environment seen as an important factor including the ambient conditions and layout of the restaurant are measurement for atmospherics to make their customers satisfied with the environment on fast food restaurant. Ambient conditions can be discuss through the nature of surroundings such as temperature, lighting, music and smell (Jalil, Fikry, & Zainuddin, 2016). Similar as Clemes, Mohi, Li, and Hu (2018) said that physical environment is a crucial part to make a perfect surrounding physical environment such as ambient conditions, interior and other important tangibles contribute to customer satisfaction or dissatisfaction Clemes et al., (2018). The impact of physical environment is significant for both consumer's behaviour and their feelings of ambient factors itself (Aubert-gamet, 1997). Additionally, private dining setting is important to make a perfect surrounding physical environment such as ambient factor Jalilvand et al., (2017) followed by Garcia et al., (2014) the important of physical environment influences experience with dining associated with pleasure sensations that can be something new to customers and make a customers will be remembered about the restaurant.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

2.5 Customer Satisfaction

Customer satisfaction is a measure of how the organisation's total product performs in the relation to the set of customer requirement (Hill & Brierley, 2017). They also added that understanding the concept of customer satisfaction is easy if we stand in customers' place. In the context of services industry, the customer satisfaction is the outcome of the customer's perception of the value received in a transaction or relationships (Valarie A. Zeithaml, 1990). Based on Krüger (2016), a customer's level of satisfaction with a service or product is determined by the difference between the customer's expectation and customer's perception of the actual performance. In a more simple way to understand the definition of customer satisfaction, it is a result of customer perceiving that the organization has or exceed their expectation regarding overall conduct and key performance criteria (Vavra, 2002). Few studies have come out with positive and negative impact of customer satisfaction, which is referred as the antecedent of customer satisfaction. Looking in the positive side of customer satisfaction, it could increase repurchase intention and positive word of mouth (WOM) (Oh, 1999). Based on Szymanski and Henard (2001) consequences of low customer satisfaction in a fast food restaurant are complaining behaviour and negative word of mouth. Blodgett, Wakefield, and Barnes (1995) in his study of complaining behaviour process, he stated that dissatisfied customer would choose either to complain to the seller or to spread negative word of mouth of their experience.

3 Methodology

This study designed to test the effects of food quality, service quality, price fairness, and physical environment on customer satisfaction toward fast food restaurant in Ayer Keroh, Melaka. In relation to that, quantitative research approach was utilized for collecting the relevant data. Specifically, a survey instrument was utilized for obtaining the responses from customers of fast food restaurants in Ayer Keroh, Melaka. A total of 384 questionnaires were distributed via google form to the respondents using convenience sampling technique. Krejcie and Morgan (1970) stated that the perfect sample size for any research is 384 respondents. As for this research, the researchers targeted customer around Kota Bharu with estimated population of 37, 716 people.

In constructing the questionnaire, measurement scales of variable were adapted and adopted from previous study to measure customer satisfaction taken from Hanaysha (2016). This were also further explain by Bland and Altman (1997) saying that acceptable values of alpha, ranging from 0.70 to 0.95. The items were also measured using a five-point Likert scale that ranges between 1 = "strongly disagree" and 5 = "strongly agree".

The statistical tools and techniques used in this study such as Pearson correlation analysis and multiple regression analysis are performed with the help of IBM SPSS latest versions. The data and results are presented in charts and tables. Pearson correlation are used to measure how strong relationship is between two variables. It has a value between -1.00 to +1.00, with zero means that the two variables are not related at all. +1.00 indicates the strongest positive correlation possible and -1.00 is the strongest negative correlation possible. Thus, the larger the correlation coefficient, the stronger the linkage or level of association. The null hypothesis states there is no relationship between independent variable and dependent variable and that the correlation coefficient is zero.

Multiple regression analysis is a method to predict the value of a variable based on the value of two or more variables. Multiple regression analysis is a powerful statistical test that researchers used in finding the relationship between dependent variable and a set of independent variables.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Multiple regressions allow explanation of variation in a continuous dependent variable, which is customer satisfaction on fast food restaurant in Ayer Keroh, Kelantan. Multiple regressions may help to segregate the effect of one variable on the continuous dependent variable while talking into consideration that other variable can be affecting each other.

$$Y = a + b_1x_1 + b_2x_2 + b_3x_3 + b_4x_4$$

Customer Satisfaction = $\beta_0 + \beta_1$ Food Quality +
 β_2 Service Quality + β_3 Price Fairness + β_4 Physical Environment

The equation above shown that **Y** is referring to dependent variable, which is customer satisfaction. The value of unstandardized coefficients beta (β) has been applied in the equation above to show the value mention to the three independent variables whether the value are statistically significant and the direction of the relationship between independent variable and dependent variable.

4 Analysis and Discussion

Examining the reliability of constructs is very important in order to proceed with data analysis. However, this study relied on Cronbach's alpha procedure, which done using SPSS 24 to calculate the reliability of constructs. The findings confirmed that all constructs achieved above the suggested value of Cronbach's alpha is 0.7.

Table 1 Pilot Test

Variable	No of Items	Cronbach's Alpha
All Variables	26	0.969
Food Quality (IV 1)	6	0.876
Service Quality (IV 2)	6	0.909
Price Fairness (IV 3)	4	0.886
Physical Environment (IV 4)	5	0.877
Customer Satisfaction (DV)	5	0.944

Out of 384 set of questionnaires distributed via google form to the respondents and all the respondents answered the questionnaires. Below shows the descriptive analysis of the respondents.

Demographics	Total	Percentage
<i>Gender</i>		
Male	190	49.48
Female	194	50.52

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

<i>Race</i>		
Malay	90	23.44
Chinese	98	25.52
Indian	111	28.91
Others	85	22.14
<i>Age (years)</i>		
20-29	148	38.54
30-39	87	22.66
40-49	71	18.49
>50	78	20.31
<i>Marital status</i>		
Single	191	49.74
Married	193	50.26
<i>Occupation</i>		
Businessman	77	20.10
Private sector employee	74	19.32
Government sector employee	67	17.49
Student	110	28.72

<i>Frequent visit to fast food restaurant</i>		
Once a week	96	25.00
Twice a week	94	24.48
Once in two week	94	24.48
Once a month	100	26.04

Interpretation, Tabulation, and Conclusion

There is a significant effect of food quality, service quality, price fairness, and physical environment towards customer satisfaction ($p < 0.05$). In every unit rise of food quality, customer satisfaction will be increase by 0.13 (b). Then, every unit growth of service quality, customer satisfaction will be increase by 0.04 (b). In every unit upturn of price fairness, customer satisfaction will increase by 0.61 (b) and also unit of physical environment surge, customer satisfaction will be increase by 0.10 (b).

Table 4.7 Interpretation, Tabulation, and Conclusion

Variable	Simple Linear Regression			Multiple Linear Regression		
	Beta	t-start (95% confidence interval)	p - value	Beta	t-start (95% confidence interval)	p - value
Food Quality	0.70	20.46 (0.60, 0.72)	<0.001	0.13	3.02 (0.05, 0.22)	0.003
Service Quality	0.54	17.45 (0.48, 0.61)	<0.001	0.04	0.92 (0.04, 0.12)	0.358
Price Fairness	0.78	34.53 (0.74, 0.83)	<0.001	0.61	21.26 (0.55, 0.66)	<0.001

Hypothesis Testing

Table 4.8 Hypothesis Testing

Hypothesis	Objective	Result
H1	There is a significant relationship between the food quality and customer satisfaction in a fast food restaurant.	Accepted
H2	There is a significant relationship between service quality and customer satisfaction in a fast food restaurant.	Accepted
H3	There is a significant relationship between the price fairness and customer satisfaction in a fast food restaurant.	Accepted
H4	There is a significant relationship between the physical environment and customer satisfaction in a fast food restaurant.	Accepted

5 Conclusion

This research was carried out to better understand the quality of food, quality of service, price fairness, and a physical atmosphere for clients towards a fast food restaurant. This research project has achieved its goals of identifying a consumer satisfaction relationship between the four variables.

The result showed that all the four separate variables including food quality, quality of service, price fairness, and the physical environment, which were measured in the Pearson correlation analysis, and the reliability analysis test, have a positive and important relationship with customer satisfaction. The results showed that Next, Linear Regression Analysis found that consumer satisfaction was also positive. In addition, this chapter also makes valuable enhancement to fast-food restaurants.

In conclusion, the findings of the research show that the key factor affecting customer satisfaction is price fairness, while the lowest factor is service quality. Furthermore, this study has posed some limits and suggestions for potential researchers. Many interested in investigating further into the factors influencing customer loyalty in a fast food restaurant may thus find out in this report.

FACTORS INFLUENCING UNEMPLOYMENT AMONG FRESH GRADUATES

Sing Yu Feng and Mardhiah Binti Kamaruddin

Faculty of Entrepreneurship and Business,
University Malaysia Kelantan
Malaysia

Email: singyu@gmail.com; mardhiah.k@umk.edu.my

Abstract:

One of the current problems being discussed by higher education researchers is the graduate unemployment rate. In order to obtain educational benefits, college and university students frequently experience unemployment after investing their precious time and resources. As these students have invested a lot of their money while getting the higher education, it makes them more vulnerable to unfavourable economic conditions. Package for the Social Sciences (SPSS) was used to test the relationship between these four factors with unemployment. This paper examines the reasons and factors why fresh graduates are facing unemployment in the competitive market in Johor, Malaysia. 384 data of fresh graduate was collected and analyzed by SPSS20. There are several factors that explain their unemployment status, and this paper identifies each component at an individual level. With specific analysis of the unemployment phenomena, this paper provides direction for further research. The study establishes that the fresh graduates need to change their demanding attitude and at the same time, they must adopt more employability skills in order to get a job placement.

Keywords: *Unemployment, fresh graduates, factors, job, Johor.*

1 INTRODUCTION

Unemployment is an unwelcome issue that may occur in many developing countries. As long as the person is involved in the labour market, he or she can one day be unemployed (Hossain et al., 2018). If an unemployment issue is not resolved, the contribution to the problem of the unemployed graduates, the government, society and even the country will definitely increase. Moreover, if the nation's unemployment continues to be severed, protests and rebellion will take place across the country, and the country's trade will be uncertain. Due to this dangerous issue, a major loss to the country would occur. (Hanapi and Nordin, 2013)

The country with high unemployment means that the country's human resource is not fully exploited. In theory, a country that does not make effective use its resources do not reach its optimum performance. Full employment need to be consider as a macro-economic priority if a country means to increase its output. The unemployment rate in Malaysia declined over the year, although the number of unemployed graduated in Malaysia. Unemployment among fresh graduated is not a new hot problem.

We study this issue because of the unemployment among fresh graduated in Johor is quiet serious. College or university students often facing unemployment after investing precious time and money to obtain educational benefit. It makes them more vulnerable to adverse economic conditions as these students have invested a lot their money on higher education. So, this paper

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

examines the cause and factor why fresh graduated facing unemployment in the competitive market in Johor.

This research has four objectives:

1. To identify the educational knowledge influence unemployment among fresh graduates in Johor.
2. To determine the graduates' attributes influence unemployment among fresh graduates in Johor.
3. To investigate the employability skills influence unemployment among fresh graduates in Johor.
4. To examine the job mismatch influence unemployment among fresh graduates in Johor.

Significant of Study

The purpose of this study was to identify the significant factors that influence unemployment among graduates in Malaysia. The area where the problem has more effect in view of the problems caused by the unemployment in Johor despite the government's deliberate attempts to create employment opportunities in the country. The interest in this issue is to determine through facts and figure the level of, and develop the problem of unemployment in the country with a view to making a sustainable strategy.

Besides from that, this research is to know what are the factors that cause unemployment and the ways to reduce the unemployment rate. Example for government to reduce the unemployment rate is providing better institutions to command market confidence for private sector development, so that individuals or firms can invest and there have more choice and opportunities for the fresh graduates. Researchers have confidence in the research as they can help in reduce the unemployment rate by showing the factors influencing unemployment for the fresh graduates. So the fresh graduates can improve themselves by enhance the skills and knowledge. For the academicians is to improve the educational system especially English because knowing English as well can increase the chances of getting a job in a multinational company within home country or seeking jobs abroad.

2 Literature Review

Educational Level

Educational achievement is also used as an indicator of the capabilities available to the public and to the workforce. The economies of the advance countries depend upon a sufficient supply of high-skilled workers. Due to technical developments that have changed the demands of the global job market, workers with higher or more specialised expertise are in high demand. Employment rate have decreased for people of all levels of education and have decreased on average by around two percentage points between 2000 and 2013. Acquiring higher education has two main effects in our life. First is get a better kind of job or salary and the second is more bargaining power in the job market.

Graduated Attributes

The Graduate Tracer Study is maintained by the Ministry of Education. It maintains track of students in higher education institutions six months after graduation to assess if they are working or continuing to learn or still searching for a job. Remarks are taken from public and private colleges and other institutions. Graduate attribute are the quality, talents and understanding that the university community accepts that its students can acquire during their time with the institutions(Zou, 2008). These standardised graduate attributes describe the skills that will be developed by students. This refers to all disciplines of study. These characteristics are meant to prepare learners to be global citizens and successful representatives of society who can serve as agents of 'social good' (Barrie, 2004).

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Employability Skills

The lack of excellence is one of the factors leading to a problem of unemployment among Malaysian graduates (Human ology, 2020). A large number of Malaysian employers have a negative view of graduates and have mention that graduates lack the necessary skills and qualifications needed by the industry. Besides, the graduates fail to demonstrate a good working performance and they are weak as regards employability capabilities.

Job Mismatch

Job mismatch is a popular theme of unemployment among graduates. Role mismatch can also be characterised as Qualification mismatch where it occurs where the standard of formal education a worker possesses deviates from that needed for a job, ability mismatch occurs when a worker has a higher or lower degree of skills than is required to perform a job (Kihong Park, 2020). According to research conducted by (Shujaat Farooq, 2020), the phenomenon of job mismatch can be categorised into three groups which is job mismatch compare to graduate's educational level, job mismatch compare in the graduate's qualification, and job mismatch compare to the graduate's field of study.

Unemployment

The main reason of unemployment is mismatches of skills between fresh graduated and employer's demand. Soft skills are crisis factor in the acquisition of entry-level learners, and there seems to be a shortage of students from Malaysian universities in these fields. Even at the early stages of recruiting, business and educational institutions do not necessarily match the prospect of entry-level graduates. The internship programme is to help the fresh graduates to gain more knowledge and employability skills before they start a new job. In order to satisfy social demands and internal conditions, the economy requires different sizes of labour force. Graduates who have different majors who try to get a career at the same time, their job searching will have different results based on industry demands. Acquiring a job depends not only on their academic performance, but also on their personal background.

Research Hypotheses

In this study, there were four hypotheses:

H1: There is a little relationship between educational knowledge and unemployment among fresh graduates in Johor.

H2: There is a little relationship between graduated attributes and unemployment among fresh graduates in Johor.

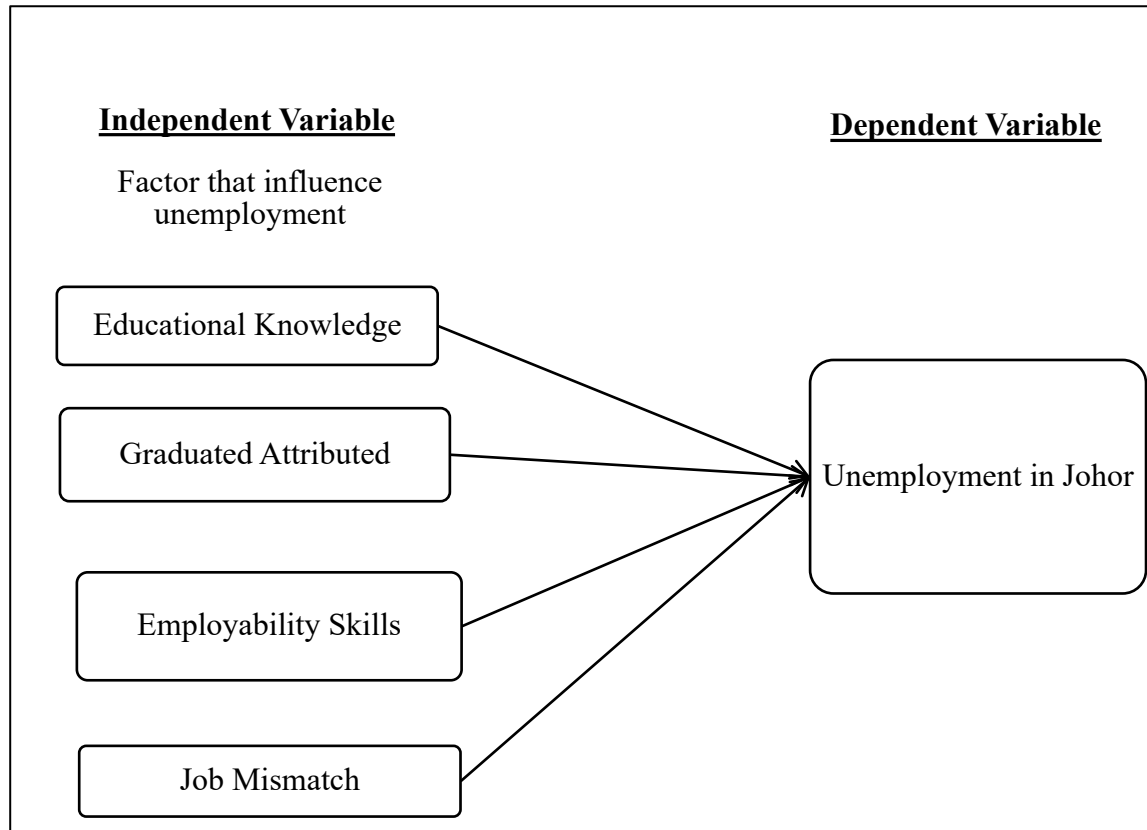

H3: There is a little relationship between employability skills and unemployment among fresh graduates in Johor.

H4: There is a little relationship between job mismatch and unemployment among fresh graduates in Johor.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Research Framework

A research framework has been conducted to investigate the connection between the independent variable and dependent variable.

3 Methodology

Research Design

This study used the quantitative method to examine the factors that influence use of social media in visit intention. This research was carried out using the method of descriptive research as a way of obtaining all the information. This study used survey research to obtain the related data.

Data Collection

In the first stage, a set of questionnaires were developed as to collect the data for this research. The questionnaires contain three sections which is section A, B, and C with total of 32 items will be collected through Google form. Before the survey was conduct, the interviewers were briefed in detail to ensure that they understand the objectives of the study and the questions. In addition, the interviewers were required to identify the target respondents to ensure that the survey does not violate research ethics and avoid bias from the questionnaire responded. Apart from that, identifying the right respondent is important before conducting the survey to avoid invalid information.

The second stage of data collection was a fieldwork. A set of questionnaires was distributed to the population to collect the data. All the online questionnaires was distribute through social media such as WhatsApp because WhatsApp is the fastest to deliver information and reached to people in every state in Malaysia. According to the research by Izyani binti Mistar and Mohamed Amin Embi (2016) stated that Whatsapp is more popular compared to other application since there were 97% Malaysians are using WhatsApp, only a small 3% of those surveyed said they

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

used it less than once a month. However, we also distributed to other social media like Facebook, Instagram and Twitter.

Sampling

The sampling method used in this study was the non-probability sampling method which is purposive Sampling Procedure. This is because this research is purposive sampling procedure that we choose the sample based on population in Malaysia graduated that used social media. This objective also to investigate the factors that influencing unemployment among fresh graduates in Johor.

In achieving reliable and valid sample of this study, the researchers used the equation from Krejcie & Morgan (1970) to determine the sample size. The formula will be shown as below:

$$S = \frac{x^2 N p (1 - p)}{e^2 (N - 1) + X^2 p (1 - p)}$$

n = sample size

N = population size

e = the degree of accuracy expressed as proportion (0.05)

x^2 = chi-square of degree of freedom 1 and confidence 95% (3.841)

p = proportion of population (if unknown, 0.5)

Data Analysis

There were three data types of data analysis used in this study, that were descriptive analysis, reliability analysis and Pearson correlation analysis. The data obtained was analysed by using Statistical Package for the Social Science (SPSS) version 25. Descriptive statistics analysis was performed to map the demographic profiles of the tourists. The technique of data analysis for this study was descriptive analysis and correlation analysis.

4 Findings

Descriptive Analysis (Demographic Respondents)

Table 1: Demographic profile of respondents

	Frequency (N)	Percent (%)
Gender		
Female	156	59.4
Male	228	40.6
Age		
20-22 years old	142	37
23-25 years old	186	48.4
26-28 years old	49	12.8
29-31 years old	6	1.6
31 years old and above	1	0.3
Higher Qualification		
Diploma	124	23.3
Bachelor's Degree	221	57.6
Master	6	1.6
Doctorate/PhD	1	0.3
Other	32	8.3
Employment Status		
Working under government	71	18.5
Working under private sector	45	11.7
Self employed	49	12.8

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

Unemployed	196	51.0
Other	23	6.0
Duration of Unemployment		
Below 2 months	143	37.2
2-4 months	54	14.1
4-6 months	61	15.9
6-8 months	37	9.6
8 months – 1 year	31	8.1
1 year and above	58	15.1
Total	384	100
Type of Institution		
Public University or College	198	51.6
Private University or College	85	22.1
Other	101	26.3
Field of Study		
ICT	17	4.4
Medical	48	12.5
Business	183	47.7
Hospitality	49	12.8
Science	26	6.8
Art	19	4.9
Other	42	10.9
Total	384	100

Table 1 shows the demographic profile of respondents. There was a total of 104 respondents. In this study, male (59.38%) respondents were higher with respondents as compared to female (40.63%). Next, the highest number of respondents was from group 23-25 years (48.4%), 20-22 years (37%), 26-28 years (12.8%), 29-31 years (1.6%) and 31 years and above (0.3%). For the higher qualification, Bachelor's Degree was the highest (57.6%), followed by diploma (32.3%), master (1.6%), other (8.3%), and Doctorate/PhD (0.3%). Moreover, respondents who was unemployed status was (51.0%), working under government was (18.5%), self-employed was (12.8%), working under private sector was (11.7%) and other was (6.0%). Most of the duration unemployment is below 2 months (37.2%), followed by 4-6 months (15.9%), 1 year and above (15.1%), 2-4 months (14.1%), 6-8 months (9.6%), and 8 months – 1 year (8.1%). The respondents who came from public University or College is 51.6%, followed by other (26.3%) and private University and College (22.1%) Last, respondents who study business were the highest (47.7%), followed by hospitality (12.8%), medical (14.5%), other (10.9%), science (6.8%), art (4.9%) and ICT (4.4%).

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Table 2: Result of Pearson Correlation Analysis

Variable	Mean (SD)	Educational Knowledge	Graduates Attributes	Employability Skills	Job Mismatch	Unemployment
Educational Knowledge	3.58(1.00)	1	0.568	0.546	0.630	0.103
Graduates Attributes	3.80(1.02)	0.568	1	0.817	0.705	0.094
Employability Skills	3.71(1.09)	0.546	0.817	1	0.734	0.079
Job Mismatch	3.71(1.00)	0.630	0.705	0.734	1	0.117
Unemployment	3.25(0.58)	0.103	0.094	0.079	0.117	1

According to the Pearson Correlation analysis on Table 2. Pearson's correlation value (r value) which is 0.103 had shown that there is little correlation relationship between first independent variable (educational knowledge) and dependent variable (unemployment) among fresh graduated in Johor.

Next, table 2 shows that Pearson's correlation value (r value) which is 0.094 had shown that there is little correlation relationship between second independent variable (graduates attributes) and dependent variable (unemployment) among fresh graduated in Johor.

Moreover, table 2 shows that Pearson's correlation value (r value) which is 0.079 had shown that there is little correlation relationship between third independent variable (employability skills) and dependent variable (unemployment) among fresh graduated in Johor.

Furthermore, table 2 shows that Pearson's correlation value (r value) which is 0.117 had shown that there is little correlation relationship between fourth independent variable (job mismatch) and dependent variable (unemployment) among fresh graduated in Johor.

5 Discussion & Recommendation

Limitation of The Study

This study focused on four independent variables which is educational knowledge, attributes graduates, employability skills, and job mismatch. These variables were adapted from different past researcher and had limited establishment on its theory.

The primary data of this study was collected by distributing questionnaires through google form. It also did not get satisfactory results in terms of respondent response through online platform such as WhatsApp, and Facebook. The researcher had to extend the time of collecting the questionnaire to get a response from respondents and post more often on social media like WhatsApp. By using this method, researcher cannot identify the true thinking from respondents while answering these questionnaires. This is due to different respondents in reading the questions on different ways and most of them are responded based own their understanding for each question. For example, the word 'neutral' to some respondents maybe 'disagree' and 'agree'. Some respondents probably just choose any of the answer without reading. Moreover, the result from this study was focused on the fresh graduated which not able to reflect the factors that influencing unemployment among fresh graduates in Johor.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

6 Recommendations

For controlling the foreign worker recommendation, it is recommended for future researcher should carry out the admission of foreign workers must be seen as one of the threats to local labour, particularly to the youth community. One the way to overcome the entry of foreign workers to the local labour market is to vigorously condemn the ASEAN nation memoranda on the mass recruiting of foreign workers to the local market. The job vacancies should be given to Malaysian university students, school leavers, unemployed and poverty community

For increase job opportunities recommendation, the researcher suggests focused on economic development plans and directions for the development of more job openings, especially in rural areas.(Shirotzuki, M., Otsuki, S., & Sonoda, 2010) stated that resource allocation was one of the main concerns of the residents; more precisely, they were concerned about financial allocation. The positioning of sectors in rural areas should therefore be focused on the capacity of existing capital which may help to revive economic growth in that region. Provide more employment prospects for those living in rural areas, as most of them do not work outside their living areas.

For training recommendation, it is highly recommended for the future researcher to empowered before they can be sold and considered to be one of the benefits that future employers need. New skills can be train and practised if the ability to learn is greater than that of filling the job. Nowadays, the urban labour market trend is very dynamic.

7 Conclusion

Unemployment may cause a lot of issues in society in terms of economic, social and physical aspect of a country. In the research, factors that influencing unemployment among fresh graduates were tested. According to the results, all independent variables such as educational knowledge, graduates attributes, employability skills, and job mismatch caused influence to the dependent variable unemployment among fresh graduates in Johor. This research also suggests adoption of another research framework, enlarging the sampling frame and to apply the same quantitative method for data collection for future research.

FACTOR INFLUENCE CUSTOMER SATISFACTION TOWARD MOBILE CELLULAR NETWORK SERVICE: USER IN AREA MUAR

Siti Norhidayah binti Ruslan and Mardhiah Binti Kamaruddin

Faculty of Entrepreneurship and Business,
Universiti Malaysia Kelantan,
Malaysia

Email: hidayah.a17a0682@siswa.umk.edu.my; mardhiah.k@umk.edu.my

Abstract:

In every year, issues about mobile telecom are raised. The issues that always trending are about service of quality and customer satisfaction. Have a lot of studies are have been done to find what the factor that influence that problem area. With many of targeting service quality issues is from services providers' perspective. Telecommunication party, are trying to solve this problem with many of solution such as, MCMC (Malaysian Communications and Multimedia) sue the TELCOM company with a lot of an amount, gives warning letter to TELCOM and to switch to fiber broadband to improve themselves to improve their service quality. All the solution still did not lead to achieve satisfaction of the customer. This research is to know what factors that influence customer satisfaction toward mobile cellular network service in Muar area. This research uses the quantitative method to get the information and data from the customer. The key informants are from primary data such as students from previous study and by questionnaire. A total of 306 respondents are answering a questionnaire in this research. The quantitative data were analyzed using the descriptive statistics function SPSS. In SPSS the method that used it is descriptive analysis, reliability analysis, Pearson correlations and multiple regressions also used. All of this analysis method are to changes the original data into a new form that eases to understanding include manipulate the process and to arrange the data to generate descriptive information. Besides that, to check if the data that collected can trust or not this research, to find relationship between dependent variables and independent variables, and to testing the value of variables. The conclusion of this research is, TELCOM need to improve their service quality by upgrading their technology and networking more widely so that the use of mobile phones in each district in Malaysia would be exchanged as usage pattern expand to capture any data with the emergence of smart phones. To a customer, there should dare to voice dissatisfaction to MCMC as a customer, we have the right to speak out, so that they are more sensitive to the voice of the user.

Keywords: *Customer satisfaction, billing and price, network connectivity, perceived value, mobile cellular network.*

1 Introduction

With the passage of the time, technology is constantly evolving and being updated with the latest and most advanced. Especially wireless communication technology has grown in global including Malaysia. Now have a lot of provider of telephone in the market such as iPhone, Samsung, Vivo and Oppo including several types of mobile network service such as Digi, Celcom, Maxis and

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Umobile. With this latest existence, telecommunications companies will race to develop aggressive and challenging marketing strategies to increase their *service* quality, network connectivity, price, and product offerings to achieve loyalty customer in *the same time* to attract a new customer. Thus, this research aims to analyze factors influence customer satisfaction toward mobile cellular network services. Furthermore, an analyze of the relationships between customer satisfaction and factors influence customer satisfaction toward mobile cellular network; billing and price, network connectivity and perceived value to the customer will be analyzed. This research is done for residential at Muar district.

Objectives

1. To investigate factors influence customer satisfaction toward mobile cellular network services.
2. To identify the relationship between independent variables (billing and price, network connectivity, perceived value) with dependent variables (customer satisfaction).
3. To determine the dominant between factor (billing and price, network connectivity, perceived value) that influencing customer satisfaction on mobile cellular network services.

Significance of the Study

According to the latest time distribution consumption of technology are thrive in parallel with decade of global. When consumption of technology continues growth, the use of mobile cellular network is a necessity of life for nowadays. Everything can do and finish only use finger to access on smart mobile phone with mobile cellular network. Everything is simple and easy with is need a right and speed data network on our mobile smart phone. This research also can will be guideline for each TELCO to improve the quality of service with is give the best of services until achieve the standard which has been set. To identify the main problem on mobile cellular network that influence customer satisfaction. Through improvement of quality on mobile cellular network services, can solve network problem on each TELCO in Malaysia, also can satisfy of customer at maximum level. This is also will make TELCO to understand the impact of being more competitive in this industry. There must always follow the current trend of customer demand and get more competitive advantage.

2 Literature Review

Quality services are the mean topic for the researchers to get customer loyalty. Satisfaction of customer how far their desires are verified by the experiences of using mobile cellular network with on any TELCO that they are choice (Cronin & Taylor, 1992), Although it is stated that other factors such as price and product quality can affect customer satisfaction, perceived service quality is a component of customer satisfaction (Zeithaml et al. 2006: 106-107), according to (Arokiasamy & Abdullah, 2013). Based on Customer perceptions of quality and customer satisfaction by Wilson. Have relationship between customer satisfaction and service quality. Customer satisfaction more affected by service quality, product quality and price, also personal factors and situational factor(Arokiasamy & Abdullah, 2013).If the consumer is pleased with the company's product or service, the customer may make frequent purchases and recommend products or services to potential customers.(Khadka & Maharjan, 2017).

Billing and Price

The payment that the customer should do it for each purchasing. According to what type of TELCO that they are choice. There are not only for call, also for internet data using need to pay. Almost all users are shock went see the billing and price during usage. In 2013 April, has

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

agreement by cellular service provider to notice the customer their allowance of included minutes so the customer will know total of their billing and will know the marginal prices increases to the overage rate, by CTIA (The Wireless Association 2011). To have both of the items the user need to spend a lot of money to get satisfied from that thing. But when they are able to have that thing it by own, the quality of services are bad not comparable to the price they invest to purchase.

Network Connectivity

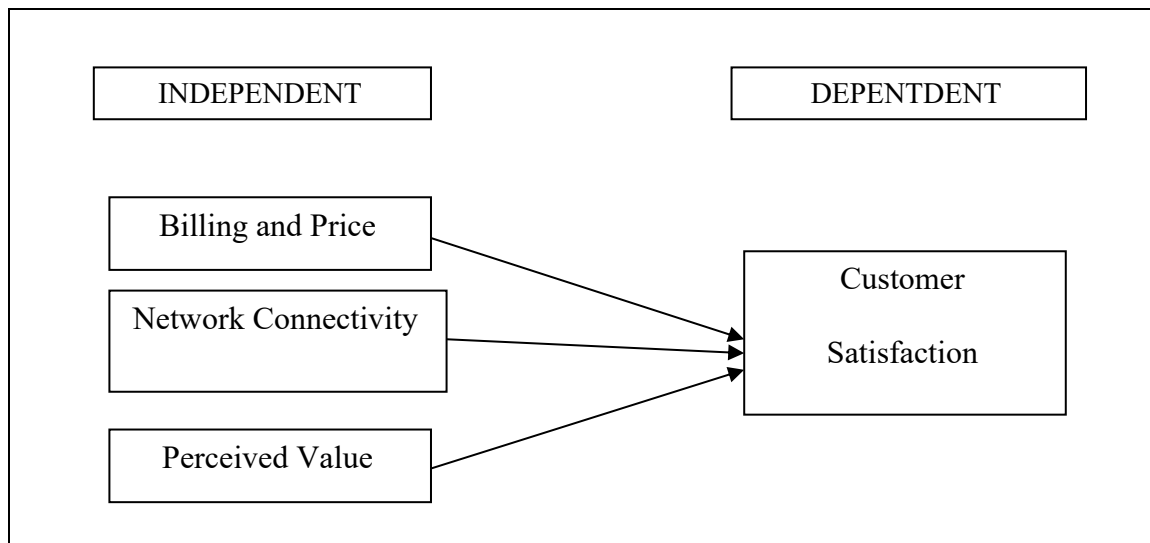

Process of connecting was described in various part of a network to one another (Munyanti & Masrom, 2018). Connectivity refers to quality and strength of the network signal on mobile cellular. It is about the quality of mobile network in any area, and connectivity especially during downloading and uploading daily activity in social media or to do work or research did not any network interruption or no limit during the process.

Perceived Value

The customer is investing in huge amount, but still there are, mismatches in the actual and perceived value of the customer. Committed that companies have the opportunity to increase customer satisfaction through creating customer value by many ways, such as by providing to the customers the comparative net value, effectiveness, efficiency, and differentiation of services, which can be delivered via logistics. (Munyanti & Masrom, 2018)

Conceptual Framework

Conceptual Framework of Factors Influencing Customer Satisfaction toward Mobile Cellular Network Services.

Adapted from (Nurysh et al., 2019), and (Arokiasamy & Abdullah, 2013)

Based on figure above there have theory related with satisfaction customer on quality of mobile cellular network. The researcher was used this theory on this study to identify and found out whether user of mobile TELCO network in Muar area have an idea about service quality gaps/determinants as presented in the Gaps Model. If this are working, how the users do access to the performance of the Mobile TELCO in Malaysia based on their knowledge with the gaps or determinants. For a specific section in on the customer, the researcher already provide questionnaire for all of this.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

3 Methodology

This research used a quantitative approach to collect the data and in this study an experimental research based on the questionnaire survey methods that are applied. Research is about factor that influencing customer satisfaction toward mobile cellular network services. It is because a cross-sectional study involves looking at data from a population at one specific point in time. All the measurements on each person are made at one point in time. Cross sectional studies are also used to infer causation (Mann, 2003)Simpler size is from users of mobile cellular network in Muar districts. This research was choosing cross sectional study design.

Descriptive Research, because in this research will looked the relationship factors (billing and price, network connectivity, and perceived value) influencing customer satisfaction toward mobile cellular network services. The population of the study would can be respondent from a group of people that are related to this study. Population is the entire group of people that a researcher would like to investigate. This is usually the group of people, events, or anything that the researcher wishes to understand more about. (Kamarudin, 2013).

The population the researcher choose based on factors (billing and price, network connectivity, and perceived value) influencing customer satisfaction toward mobile cellular network TELCO services at area Muar. Altogether, target populations for this study are residents of Muar district. Size of sample are very important to decide before would like to do observation, because if the amount of sample too large it will take a lot of times and the research will be complicated. While sample that are too small, the data are collect will not accurate. The researcher decides to refer (MORGAN, 1970)table and formula to making a right decision and to do calculation on the sample size for this research. The sample size for collect the pilot test data, the researcher only take 30 respondent, but for the truly for this research the researcher need 306 respondent based on the total amount of population in Muar area and after refer Morgan table.

In this research would like to use easier sampling technique. Convenient sampling is obtaining by group of people who are mostly and easily accessible(Ullah, Ajmal, & Aslam, 2016). Non-Probability is the convenient sampling to apply for this study because the target of population meets certain practical criteria.

There have three part (Section A, Section B and Section C) on the questionnaire that will distribute to the respondent. Section A include demographic of respondent, this part only using nominal scale for type of measurement. For Section B and Section C are used Likert Scale to measure the level of agree or disagree the respondent, with the questions by using a five-point Likert Scale ranging from 1= “Strongly Disagree”, 2= “Disagree”, 3= “Neutral”, 4= “Agree”, 5= “Strongly Agree”. Five-point Likert Scale used because can make a compromise between the conflicting goals and strength of opinion and making things manageable for respondent. In addition, this method also has recommended from the researcher of previous studies.

4 RESULTS

This part will present the result obtained from the statistical analysis including reliability, correlation regression and descriptive analysis.

Respondents Demographic

The result of questionnaire, for demographic side of age, education, income, occupation, type of services, type of connection, and type of mobile network. The majority of participants in this research were 18 to 27 years old, with a total of 161 (53%) respondents out of 306 respondents.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

The age group with the lowest number of participants is 58 years old and above. Out of 306 respondents, the majority of participants in education are from degree level, with a total of 125 (41%) respondents out of 306 respondents. While the lowest of participated in this research is the education group in master level, with a total of 11 (4%) respondents out of 306 respondents.

The highest income group involved in this research is from the group of no fixed income, with a total of 116 (38%) respondents out of 306 respondents. It is because the majority have participated in this research are a student and housewife, there are not have permanent work and income. While the lowest is from group RM5000 and above, with a total of 16 (5%) responded, they consist of self-employed, business and private employees. In terms of occupation, students are the highest amount that is participating, with a total of 104 (34%) respondent out of 306 respondents. While the lowest amount with a total 27 (9%) respondent from business and self-employed. Both types of occupation got the same number of entries.

For type of services have two categories it is postpaid and prepaid. From both the items, prepaid are the highest the amounts that respondent use. With a total of 176 (58%) responses out of 306 respondents, and the rest is from postpaid with a total of 130 (42%). The next is the type of connection, there have three types it is fixed line broadband, broadband and mobile data broadband. Three of that types, mobile data broadband are the highest that amount of respondent choose and use, with a total of 242 (80%) out of 306 respondents. Almost half of respondents that use mobile data broadband than the others type of connection. For fixed line broadband and broadband are 45 (15%) respondent and 16 (5%) respondent for both of two types. There have more than five types of mobile network on this research; it is maxis, Digi, Celcom, Umobile, OneXOX, Weber TM, and others. The highest that customer uses in Muar districts are maxis, with a total of 69 (23%) respondent out of 306 respondents. The lowest is a web team with a total of 6 (2%) responded.

Descriptive Analysis

For mean value, a scale in the range 4 to 5 represent as high, 3 was regarded as moderate and 1 to 2 was considered a low. Thus, based on table 1, the mean value for dependents variable which is customer satisfaction is 4.4268, but between independent variables which is billing and price (4.3680) is slightly lower than network connectivity (4.4744) and followed by perceived value (4.3529). In conclusion, all the variables were at high level. The range of standard deviation for this study was 0.4 - 1.0. Standard deviation indicated how far the individual responded to a question that deviates from the mean. Therefore, the dispersion shown for this study is between 0.4 - 1.0 which is the dependent variable customer satisfaction (0.62089) and for independent variable billing and price (0.60913), network connectivity (0.59167), and perceived value (0.62924).

Reliability Analysis

This research is conducted reliability analysis to compute the dependability of the questionnaire. This test is crucial to prevent any failures that might occur during this research. Through this analysis, the Cronbach's Alpha has applied to test each of variables. The test was analyzed based on range of coefficient value. The result which were more (>0.5) show that the question are reliable and can be used as the measuring tool to measure the concept intended to be measured.(Kiang, L.H Jauhar, J &Haron, H, 2014).

In this study, there were 306 respondents involved in the actual survey by online. The participants are among the residents of Muar district. The researcher randomly distribute questionnaire to user that have using telephone in Muar district with any type of services and any type of mobile

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

network. Based on this table, that shows the Cronbach Alpha values for the variables used in measurement instrument.

This purpose of using Cronbach Alpha is to measure the reliability of the test. The acceptable value for Cronbach Alpha ranges from 0.7 - 0.95.

Table 1
Respondents Demographic (N = 306)

	Demographic	N
Age	Below than 18 years	26 (8.5%)
	18 to 27	161 (52.6%)
	28 to 37	47 (15.4%)
	38 to 47	36 (11.8%)
	48 to 57	26 (8.5%)
	58 years and above	10 (3.3%)
Education	Primary	33 (10.8%)
	Secondary	74 (24.2%)
	Diploma	63 (20.6%)
	Degree	125 (40.8%)
	Master	11 (3.6%)
Income	No Fixed Income	116 (37.9%)
	Less than RM1000	46 (15%)
	RM1001 – RM3000	105 (34.3%)
	RM3001 – RM5000	23 (7.5%)
	More than RM5000	16 (5.2%)
Occupation	Student	104 (34%)
	Self-employed	27 (8.8%)
	Government Worker	51 (16.7%)
	Private Sector	65 (21.2%)
	Businessman/women	27 (8.8%)
	Others	32 (10.5%)
Type of Service	Postpaid	130 (42.5%)
	Prepaid	176 (57.5%)
Type of Connection	Fixed line broadband	45 (14.7%)
	Broadband	16 (5.2%)
	Mobile data broadband	242 (79.1)
Type of Mobile Network	Maxis	69 (22.5%)
	Digi	64 (20.9%)
	Celcom	61 (19.9%)
	Umobile	65 (21.2%)
	Webe ^(TM)	6 (2.0%)
	Others	12 (3.9%)

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

Table 2
Descriptive Statistics

Variables	Mean	Standard Deviation
Customer Satisfaction	4.4268	0.62089
Billing and Price	4.3680	0.60913
Network Connectivity	4.4744	0.59167
Perceived Value	4.3529	0.62924

Table 3
Reliability statistics

Variable	Cronbach's Alpha	Number of Items	Strength of Association
<u>Independent Variable</u>			
Billing and Price	.809	5	Acceptable
Network Connectivity	.913	6	Acceptable
Perceived Value	.893	5	Acceptable
<u>Dependent Variable</u>			
Customer Satisfaction towards mobile cellular network	.868	5	Acceptable

For this research, the first independent variables is billing and price, the value shows 0.809. The second independent variable is network connectivity. The value shows is 0.913. Follow with the third independent variable is perceived value and the value shows is 0.893. Dependent variable is customer satisfaction toward mobile cellular network. The value for dependent variables shows is 0.868. Basically, all the variables meet reliability test requirement because the Cronbach Alpha is more than 0.60. It concludes that the variable to be tested is reliable.

Correlation Analysis

The Correlation coefficient refers as r, ranges from 1.0 to -0.01. If the value r is 1.0 means there is a perfect positive relationship but if the value of r is -0.01 means there is a perfect negative relationship. Then when the value of r is 0, it is means indicated that there is no relationship

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

between both of variables. In this study, to identify the relationship between dependent variables (customer satisfaction) and with independent variables which is billing and price, network connectivity, and perceived value, the researcher using the method of Pearson Correlation Analysis. The result of the correlation between the independent variables and dependent variable are presented in Table 4.

Table 4: Correlation among the variables

Variable	Means (SD)	Customer Satisfaction	Billing and Price	Network Connectivity	Perceived Value
Customer Satisfaction	4.43 (0.62)	1	0.797	0.769	0.702
Billing and Price	4.37 (0.60)	0.797*	1	0.823	0.767
Network Connectivity	4.47 (0.59)	0.769*	0.823	1	0.749
Perceived Value	4.35 (0.63)	0.702*	0.767	0.749	1

P- value < 0.05, Pearson correlation analysis applied

There is a positive perfect significant relationship between billing and price with customer satisfaction ($p < 0.05$, $r=0.797$). There is a positive perfect significant relationship between network connectivity and customer satisfaction ($p < 0.05$, $r = 0.769$). There is a positive significant relationship between perceived value and customer satisfaction ($p < 0.05$, $r = 0.702$).

Multiple Linear Regression

This study examined the influence of the three independent variables (billing and prices, network connectivity and perceived value) of the packaging on the independent variable (customer satisfaction toward mobile cellular network) using multiple linear regression. R^2 was used for the coefficient of determination and can be called as multiple correlation coefficient which published in classical regression analysis. It showed that the rate of variance explained by the regression model made it beneficial as a measure of success of predicting the dependents variable from the independent variable. Before doing multiple linear regression approach, the researcher using simple linear regression to evaluate of each independent variable.

Based on the Table 4, this was part of the variance to describe how dependent variable which was customer satisfaction among residents Muar district describe by the independent variable which were billing and price, network connectivity and perceived value. Trust R^2 was used to measure the accuracy of the models. According to the table 5, the coefficient of multiple determinations for customer satisfaction toward mobile cellular network (R^2) was 0.681 or 68.1%. This indicated that 68.1% of customer satisfaction toward mobile cellular network can be explained by the three independent variables (billing and price, network connectivity and perceived value). Thus, the remaining 31.9% of the dependent variable was explained by unidentified.

Based on the regression result, billing and price (standardized beta = 0.319, $p < 0.001$) and network connectivity (standardized beta = 0.453, $p < 0.001$) was the most significant determinant for customer satisfaction toward mobile cellular network compared to another one independent variables. Whereas perceived value (standardized beta = 0.132, $p = 0.001$) has no significant

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

determinant for customer satisfaction. In sum, the result indicated that two identified independent variables (billing and price and network connectivity) were statistically significantly influence the dependent variable (customer satisfaction) at significant level, $p \leq 0.001$.

The perceived value variables resulting no significant and excluded determinant in this research probably due to the assumption and perceived value placed by the respondents toward mobile cellular network did not related with factor that influence customer satisfaction toward mobile cellular network. In the past studies, the mostly reason to get a highest in purchase and to get customer loyalty it is quality of product and services. Making the customer feeling satisfied and always trusts with that product and service there are provide.

There is a significant effect of billing and price, network connectivity and perceived value toward satisfaction. In every unit increase of billing and price, and satisfaction will increase by 0.81(b). In every unit increase of network connectivity and satisfaction will increase by 0.80(b). In every unit increase of perceived value and satisfaction will increase by 0.69(b).

Table 4: Summary of the Simple Linear Regression and Multiple Linear Regression Analysis

Variable	Simple Linear Regression			Multiple Linear Regression		
	Beta	T-Stat (95%CI)	P- Value	Beta	T-Stat (95%CI)	P – Value
BP	0.81	22.98 (0.74, 0.88)	< 0.001	0.45	7.12 (0.32, 0.57)	< 0.001
NC	0.80	21.00 (0.73, 0.88)	< 0.001	0.31	5.02 (0.19, 0.44)	< 0.001
PV	0.69	17.17 (0.61, 0.77)	< 0.001	0.13	2.49 (0.28, 0.36)	0.013

*Normality assumption was met

The table 4 above, it show the statistical significant of each independent variables toward the dependent variables. The researcher was refer the multiple linear regression model which is:

$$Y = \beta_0 + \beta_1x_1 + \beta_2x_2 + \beta_3x_3 + e$$

β = for every 1 unit increase of X, Y will increase by the value of β

Checking the normality assumptions for multiple linear regression

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Figure 4.11: Regression Standardized Residual

Based on figure 4.11 shows that there is a normal bell shaped distribution on the histogram graph. It is a regression standardized residual of the factors (billing and price, network connectivity and perceived value) toward mobile cellular network among user on Muar districts.

5 Conclusions

Nowadays, having a lot of new company are in progress to grow successfully, especially in the mobile market. There have a lot of competition among of, the market has become very extremely competitive and the service provider which moving more aggressively in providing a good product and offering attractive promotion to attracting the customer. Therefore, the service provider should put triple action to produce the best product and services. The action will give the inside effect, that will make the customers more satisfied to choose their product and services. Other than that, there also will retain the existing customers and will attract new customers into their company. The finding in this research, for mobile network operator, Malaysia Communication and Multimedia (MCMC) and to the others services provider company this research has a lot of information that can they use to refer to relate with any issues. Which indicates that the quality of services, billing and price, network connectivity and perceived value have a high impact to the customer satisfaction. The services provider company should look out their company is internal and external factors, that their services, whether are matched or not with the prices, service quality and also the attitude of their employee to handling customer, especially in the customer services. Their attitude to handling the customer must with smooth, speak kindly and politely. To each word that the employee says need to be convincing to the customer until they become buyers.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

ACKNOWLEDGEMENT

I would like to thank my special of gratitude toward my supervisor Madam Mardhiah binti Kamaruddin who had given the valueable guidance to me for this final year project which was like a golden opportunity for me to do a wonderful work on this project. Without her guidance and persistent help in this research, it would not have been possible to finish in successfully. Plus, in this opportunity I want to most thankful toward to the panel, Madam Norfazlirda binti Hairani for her advice and her valuable comments.

I would like to thank to my family and friend that always support and help me to continue motivated to finish this project. They always give me some ideas and comment about my research, by that I able to improve my research in many different ways. Do not forget also to the respondents willing to spend time by answering my questionnaire.

THE FACTOR THAT INFLUENCE CONSUMER PURCHASING BEHAVIOR OF SKINCARE PRODUCT AMONG UMK STUDENTS

Syaza Izzaty binti Shohaimi and Tahirah binti Abdullah

Faculty of Entrepreneurship and Business,
Universiti Malaysia Kelantan,
Malaysia

Email: izzaty.a17a0720@siswa.umk.edu.my ; tahirah@umk.edu.my

Abstract:

The purpose of the study is the factor that influences consumer purchasing behavior of skincare products among UMK students. Through this paper an attempt was conducted to identify the different factors that influence consumer purchasing behavior of skincare products. This study reveals that various factors which is packaging, quality and prices that influences consumer purchasing behavior. This research paper helps to contribute an extra idea and knowledge for skincare products companies and get know more about the consumer purchasing behavior. The data collection is conducted by distributing survey questionnaires and total respondents is 380 among UMK students. The data is obtained through a questionnaire then proceed with Statistical Packages for Social Sciences SPSS as Idevices for analyzing and interpreting the data. The results in this study prove that the packaging and quality significantly influence the consumer purchasing behavior while the prices do not significantly influence the consumer purchasing behavior.

Keywords: *Consumer Purchasing Behavior, Packaging, Quality, Prices.*

1 Introduction

Understanding consumer purchasing behaviour is a key to the success of business organizations. Skin serves as a protective barrier between our insides and the rest of the world, helps regulate body temperature and acts as a filter. Skin exists in a constant state of growth, with old cells dying as new cells are forming. It's affected by every aspect of our life, from what we eat to where we live. Healthy skin is better able to fight signs of aging, heals much faster and staves off potential disease better than unhealthy skin. With the right selection of facial skincare products, this kind of problem can be solved and healthy skin can be obtained.

The beauty and wellness industry is growing fast in Malaysia. Since recent years, the rate of consumer spending on cosmetics has increased by 40 percent, i.e. from MYR 1.4 billion in 1995 to MYR 1.9 billion in 2007, with a sales volume expected to exceed USD 1.1 billion by 2010. According to Malaysia's Department of Statistics, gross spending on cosmetics in 2013 was roughly USD 407 million. Malaysian consumers tend to obtain beauty products from top name brands that are marketed especially those that enhance youthful appearance. (Hassali, Al-Tamimi, Dawood, Verma, & Saleem, 2015).

Adequate research on consumer purchasing selection behavior among skincare-related student's products is still lacking. The purpose of this study is to examine the factors that influence skincare

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

products among students and focus on their considerations when choosing and purchasing their skincare products.

1.1 Research Objectives

The research objectives to understand about the factors that influence consumer purchasing behavior of skin care products among UMK students. This is objectives of the current research:

1. To determine the relationship between packaging and consumer purchasing behavior of skin care products among UMK students.
2. To identify the relationship between qualities and consumer purchasing behavior of skin care products among UMK students.
3. To evaluate the relationship between prices and consumer purchasing behavior of skin care products among UMK students.

1.2 Significance of study

1.2.1 Skincare Product Companies

This research will help the skin care product business to make a survey on the consumer purchasing behavior of skin care products. The ideas presented of the product can be used as reference to find information that is useful to them. This research will prove how the youth is influenced by the consumer behavior factors which are packaging, quality and price.

1.2.2 Future Research Agenda

This research will be useful to other researchers for reference. This research can help anyone who would make any related study regarding the factor that influences consumer purchasing behavior of skincare products among UMK students. A researcher who is interested to continue their research in the same field with a wide scope. They can refer to the data and the suggestion is given as well.

2 Literature Review

2.1 Underpinning Theory

This research uses the Theory of Planned Behavior (TPB) as the main theory of behavioural research. Attitude, subjective standard, and perceived behavioural regulation are related to the principle of TPB. The aspect of the country of origin is a type of attitude toward the image of the product's country of origin. The principle of TPB is very appropriate to describe different types of behaviours and attitudes possessed by prospective consumers of a product in forming a customer purchasing intention. TPB may be associated with the intention of purchasing, which means that the purchasing interest of the consumer is determined by the perceptions of the consumer about the product, packaging of the product, quality of the product and the price of the product that the consumer is familiar with.

2.2 Dependent Variable

2.2.1 Consumer Purchasing Behavior

Consumer buying behavior is both a decision-making process and the behavior of the consumers involved in the purchase and use of products. Consumers make purchasing choices for the buying of small and large products. Consumers begin looking for goods or services that suit their needs

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

after identifying a need or a wish. Consumer purchase decisions have now become a complex process and are related to consumers' attitudes, perceptions and behaviour. Consumer purchasing behaviour is perceived to be a key point in accessing and comparing goods and services.

Ghosh (1990) he states that it is an efficient method to predict purchasing behaviour with customer buying intentions. There is a probability of adjusting the purpose of purchasing due to the influence of packaging, quality and price. (Kotler & Armstrong, 2010) & (Kawa, 2013) they talk about the six steps discussed: information, understanding, preference, interest, encouragement and purchasing suggested by researchers before preparing or deciding to purchase the product. Gogoi (2013) he states, since the standard and value of these goods is not consistent, consumers have an awareness that products that are little known, low priced, and easy packaging have a high risk potential.

2.3 Independent Variables

2.3.1 Packaging

The packaging is important part for each product and not serves only in a practical function, but also serves as a way of communicating product details and the character of the brand. Packaging must be functional; the goods must be secured in good packaging, in shipping and sometimes in service. In addition, it also has the aim of helping customers with ease of access and use for convenience. After looking at Kolter's packaging theory, in order to help us solve the first research issue, it will turn to various theories relevant to packaging design and its significant elements. (Lu, 2008).

2.3.2 Quality

The quality, which brings a certain specific feeling of affection, is what we call the “quality of affection”. It is necessary to clarify the physical attributes which make up this quality. It is because of the quality of the skin care product that women customers become brand loyal. High-quality skincare products will help to build and maintain the confidence of targeted consumers and its also inspire them to buy the products. Until deciding to buy products, clients are worried about the consistency of cosmetic products. To keep competition among the cosmetic companies of the competitor should increase and focus more on improving the quality of products. (Priyangal & Krishnaveni, 2016).

2.3.3 Price

Customers make a comparison and pricing comparison of alternative products before making real purchases, so customers have a great confidence or belief in the value or profit they receive from their quality product. The best approach to create customer loyalty is to compare price with value and perceived cost. It is known that if the perceived values are greater than the product expense, customers are willing to purchase a product. The long life of consumers with a company makes them more accepting of prices and they have shown few interest in comparing prices with the alternatives. (Keller, 2013).

2.3 Research Hypothesis

The purpose for this study is to test the relationship of both variables which are dependent variables and independent variables. Based on the literature review and the research question that has been discussed, the hypothesis of this study can be summarized:

H₁: There is significant relationship between packaging and consumer purchasing behavior of

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

skincare product.

H₂: There is significant relationship between quality and consumer purchasing behavior of skincare product.

H₃: There is significant relationship between price and consumer purchasing behavior of skincare product.

2.4 Theoretical Framework

Figure 1 shows the theoretical framework above clearly showed how independent variables were related to the dependent variable. Based on the theoretical framework, the independent variables of this study consisted of three factors, which is packaging, quality and price. These factors were related with consumer behavior which was the dependent variable of this study. Through the theoretical framework, a clear concept of this study could be defined, then generated and tested hypotheses.

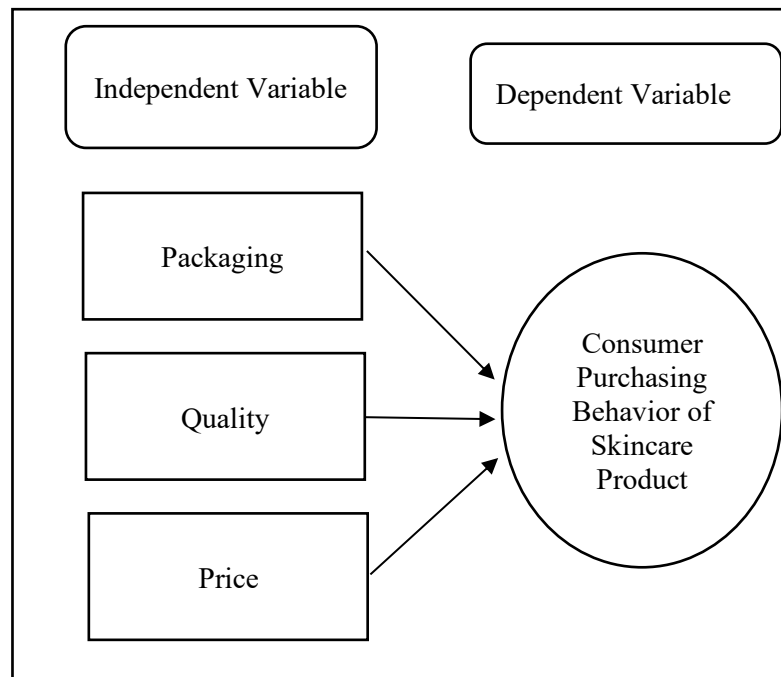

Figure 1: The theoretical framework on packaging, quality and price that influence consumer purchasing behavior of skin care products among UMK students.

3 Methodology

3.1 Research Design

In this research, researchers chose the quantitative research approach. Quantitative research includes the collection of primary data which can ensure the validity of the study. This research is to identify the factors that influence consumer purchasing behavior of skin care products among UMK students.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

3.2 Population

From this research, the researchers were targeting UMK students. The population for this study is students who study at Universiti Malaysia Kelantan and is 384 students.

3.3 Sample Size

The number of apprehensions selecting from the whole population for the research purpose can be definite as a sample size. The sample size is the subset of the population therefore 361 students who study at Universiti Malaysia Kelantan.

3.4 Data Collection

These research will use a quantitative research of data collection likes survey method that brings together the data obtained from the respondents. Data was collected via a questionnaire for this research. To create a self-administered questionnaire, the author used Google forms. The self-administered questionnaire is selected because the time is limited, that there need for minimum students, respondents can remain confidential while responding and respondents can complete the form on their own. In order to form an appropriate sample size, a convenience sampling procedure was chosen.

3.5 Sampling

The sampling techniques that have been utilized by the researchers to use for this research was non-probability. Individuals will be chosen entirely by chance and each member of the population has an equal chance, or convenient probability of being selected as a sample. Sampling is an alternative used by the researcher to know and get the conclusion of the factor that influences consumer purchasing behavior of skin care products among UMK students.

3.6 Research Instrument

The questionnaire is self-administered. The research will divide the questionnaire into three sections which is section A, B, C and D. In section A, the survey questionnaire provides general information about respondent which is a student who studies in Universiti Malaysia Kelantan such as qualification level, age, and marital status. The questions will expound more on the independent and dependent variables, for the Section B, C and which include in the factor that influence consumer purchasing behaviour of skincare products which are (i) Packaging (ii) Quality and (iii) Price that will be investigated in the survey.

3.7 Data Analysis Techniques

The results of the questionnaire were evaluated using SPSS Statistics, a statistical application. The software offers an incentive to evaluate the findings in a numerical form and to view them. By a statistical method, this numerical knowledge can be distilled and developed into a structure that facilitates conclusion-making. In order to find a correlations between the variables and relationship between problems, statistical measurements support. (Kothari, 2004).

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

4 Data Analysis and Findings

4.1 Preliminary Analysis

Preliminary analysis is known as pilot test. In social science studies, the term pilot study is used in two different ways. It can refer to that so feasibility tests carried out in preparation for the main study, which are small-scale versions or trial tests (Polit, 2001). Before continuing with larger respondents, conducting a pilot test provides the researcher with the ability to develop and strengthen the skills required. Researchers can distribute the questionnaire by survey questionnaire method based on previous research before the pilot test is conducted. It will determine the consistency and reliability of the questionnaire. The number of respondents for this pilot test is 30 respondents among UMK students.

Table 1: Summary of Pilot Test

Variables	Number of item	Cronbach Alpha
Consumer Purchasing Behavior	3	0.861
Packaging	5	0.765
Quality	5	0.762
Prices	4	0.716

4.2 Demographic Profile

The basic analysis of this study was including frequency analysis. The researcher discussed in particular the respondent's profile. The data attained part A that included questionnaires among various demographic variables of the respondents such as gender, age, race, course and allowance from parents or scholarship.

The table 2 presents that the percentage of females is higher compared to male, which is 51.1 percentage with 186 female respondents while the percent of male is 48.9 percent with 194 male respondents. In terms of age majority the respondents of UMK students between 23-25 years old which 52.9 percent with 201 respondents. Furthermore, the participative respondents were between 20-22 years old which 29.5 percent with 112 respondents. In contrast, between 26-28 years old was 16.8 percent with 64 respondents followed by between 29 years old and above was 0.8 percent with 3 respondents.

Next, the majority respondents of UMK students from Malay which 61.6 percent with 234 respondents. Furthermore, the participative respondents were from Chinese which 20.0 percent with 76 respondents. In contrast, from Indian was 18.2 percent with 69 respondents followed by from others was 0.3 percent with 1 respondents respectively.

Furthermore, majority the respondents of UMK students from SAR which is 16.3 percent with 234 respondents. Furthermore, the participative respondents were from SAK which 15.8 percent with 60 respondents, SAL which 13.9 percentage with 53 respondents, SAB and SAE which 12.1 percent with 46 respondents. In contrast, from SAW was 11.8 percent with 45 respondents followed by SAH which 9.2 percent with 35 respondents and SAP which 8.7 percentage with 33 respondents.

Lastly, the majority of UMK students are between RM301-RM500 which 39.7 percent with 151 respondents. Furthermore, the participative respondents were between RM100-RM300 which

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

34.7 percent with 132 respondents. In contrast, between RM501-RM1000 was 20.3 percent with 77 respondents followed by between RM1000 and above was 5.3 percent with 20 respondents.

Table 2: Summary of demographic profile

		Frequency	Percent
Gender	Male	186	48.9%
	Female	194	51.1%
Age	20-22 years old	112	29.5%
	23-25 years old	201	52.9%
	26-28 years old	64	16.8%
	29 years old >	3	0.8%
Race	Malay	234	61.6%
	Chinese	76	20.0%
	Indian	69	18.2%
	Others	1	0.3%
Course	SAR	62	16.3%
	SAK	60	15.8%
	SAL	53	13.9%
	SAB	46	12.1%
	SAE	46	12.1%
	SAW	45	11.8%
	SAP	33	8.7%
	SAH	35	9.2%
Allowance from parents or scholarship	RM100-RM300	132	34.7%
	RM301-RM500	151	39.7%
	RM500-RM1000	77	20.3%
	RM 1000>	20	5.3%

4.3 Normality Test

Data normality tested and analyzed in the SPSS system. Skewness and Kurtosis statistics were used to determine the normality distribution data. There are two varieties of distribution data which are abnormal and normal distribution. In hypothesis parametric correlation can be analysed if the data was normal and non-parametric correlation for abnormal data. In this study, the researcher used parametric correlation for hypothesis testing. Based on (Chua, 2011) the propensity value of normal data is 0, but the value range +/-2 still indicates normally distributed data. As for test results using Skewness and Kurtosis, it is necessary to make sure that value both is located between the value of + -1 for Skewness and + - 1.96 = -3 for Kurtosis. Then, this data has a normal distribution because Skewness value and Kurtosis value are in the range of + -1.96 as shown in the table.

Table 3: Summary of Skewness and Kurtosis value

Variables	Skewness	Kurtosis
-----------	----------	----------

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Consumer Purchasing Behavior	-0.447	-0.930
Packaging	-0.291	-0.818
Quality	-0.195	-0.969
Prices	-0.240	-0.955

4.4 Descriptive analysis

The descriptive analysis tested 17 items according to their variable and listed out the summary of the mean and standard deviation computed in Table 2. Table 2 presents the number of respondents, mean and standard deviation between independent variables and dependent variables. The mean of dependent variables for consumer purchasing behavior is 4.58. Meanwhile, for independent variables, the highest mean is packaging and quality which is 4.57, followed by prices which is 4.55. Next, the standard deviation of dependent variable for consumer purchasing behaviour is 0.350. Meanwhile the highest independent variable for standard deviation is prices which is 0.332, followed by quality which is 0.324 and packaging which is 0.318.

Table 4: Descriptive Statistic of Dependent Variable and Independent Variable

Variables	N	Mean	Std. Deviation
DV: Consumer Purchasing Behavior	380	4.58	0.350
IV1: Packaging	380	4.57	0.318
IV2: Quality	380	4.57	0.324
IV3: Prices	380	4.55	0.332

4.5 Pearson Correlation

Pearson's correlation coefficient is a statistic that measures the statistical relationship between two variables. In this study, researchers had used correlation analysis to identify the relationship between dependent variable and independent variables. Thus, the dependent variable in this study is the consumer purchasing behavior. However, the independent variables are packaging, quality and prices.

Table 5 presents the p-value is 0.000, which is less than the significant level of 0.01. This study is rejected null hypothesis for hypothesis of packaging and quality while for hypothesis of price the study is accepted null hypothesis. The correlation coefficient for packaging and consumers purchasing behaviour is 0.866 while the correlation coefficient for quality and consumers purchasing behaviour and quality students is 0.523. Based on the result of the correlation value $r > 0.05$ show that packaging is related with the factor that influences consumer purchasing behavior of skincare products among UMK students.

Table 5: Summary of Pearson Correlation

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

Independent Variables	N	Sig. (2-tailed)	Consumer Purchasing Behavior
Packaging	380	0.00	0.868**
Quality	380	0.00	0.523**
Price	380	0.00	0.480**

4.6 Summary

Table 4: Summary of the Hypothesis Results

Number of hypothesis	Statement of hypothesis	Results	Significant value
H ₁	There is significant relationship between packaging and consumer purchasing behavior of skincare products	Rejected Null	0.00
H ₂	There is significant relationship between quality and consumer purchasing behavior of skincare products	Rejected Null	0.00
H ₃	There is no significant relationship between prices and consumer purchasing behaviour of skincare products.	Accepted Null	0.00

5 Conclusion and Future Research

In terms of packaging, more respondents agree that the attractive packaging of skincare products encourage them to buy. This is because packaging, colour and style can have a striking influence on consumer purchasing behaviour and it will cause impulse the consumers to purchase when they see it. The attractive packaging encourages the consumer and supports the purchasing of skincare products. Believe the reviews from other customers who used it assist them to believe in the quality of the products and believe that if the skincare products are used by many customers it shows that the products are high quality. This is because nowadays on social media a lot of people are doing videos to give some review about the skincare products that they used. From that, the consumers will be attracted to buy the skincare products.

Based on this study, all the researchers state the following recommendations. Firstly, the type of the respondents need to be changed to a smaller population from UMK students to Faculty of Entrepreneurship students in UMK or other smaller populations such as students by semester. Secondly, spreading the questionnaires through Google form is quite inconvenient since there are not a lot of senior students answering the questionnaires although the research is not specific for seniors only. If this research is carried through face to face or physical, the researchers can make sure there are junior students also involved more in answering the questionnaires.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

6 Acknowledgment

First, I would like to thank to my supervisor Dr. Tahirah binti Abdullah for the continuous support of my study and research, for her patience, motivation, enthusiasm and immense knowledge. Her guidance helped me while doing my study and writing of this research. Besides my supervisor, I would like to thank the rest of my research panel Dr. Siti Afiqah binti Zainuddin for her encouragement and insightful comments.

Next, I would like to also thank my fellow friends for the stimulating discussions, for the sleepless nights we were working together before deadlines and for all the fun we have had in the last four years. I am grateful to have them in my journey to complete my research and for enlightening me the glance of these research.

Last but not least, my sincere thanks to my family which is my parents and my younger brother. I am blessed to my mother Puan Merrina binti Minhat for giving birth to me in the first place and my younger brother Syafiq Syahmi bin Shohaimi supporting me spiritually throughout my life.

THE IMPACT OF SOCIAL MEDIA ADVERTISING ON SUCCESS OF FAMILY MART IN SEREMBAN

Tarsiny Ramalingam and Nurul Izyan Mat Daud

Faculty of Entrepreneurship and Business,
Universiti Malaysia Kelantan,
Malaysia

Email: tarsiny97@gmail.com, izyan.md@umk.edu.my

Abstract:

Social media and internet advertising is a benchmark for a business success. When the advertising give effectiveness and is able to benefit the business, the business is able to reap the benefits that result from the good advertising shown by the good marketing strategies. A proper advertising will give a good impact to the business growth and performance. As a result, we have agreed to do the research on the effect of social media advertising on the success of Family Mart with the issue is problems that how effective the advertising to the business performance. Achieving good performance by increasing the awareness of the new product, create brand awareness, product purchasing, and increase the number of customers to a business, this study will provide recommendations for the management of the business or organization to increase its marketing strategy, especially on social media. The data collection will be conducted in Seremban, Negeri Sembilan area to youngsters. The research would be done through the utilization of questionnaire to the youngsters as a survey and reference. By the strategies of researchers will be able to know the effect and the effectiveness to the Family Mart. Based on the hypothesis result, all the H0 have been rejected while H1, H2, H3 and H4 have been accepted in this study. Based on the result of the Pearson Correlation, this research is accepting hypothesis because of significant value $p < 0.05$, it means that there is a significant relationship exist between independent variable and dependent variable.

Keywords: *Social Media, Advertising, Brand Awareness, Awareness of New Product, Product Purchasing, Number of Customers, Success.*

1 Introduction

The topic of this research is the impact of social media advertising on the success of Family Mart. Family Mart is Japan's second largest convenience store chain, behind 7-Eleven. There are now 24,574 stores worldwide in Japan, Taiwan, China, Philippines, Thailand, Vietnam, Indonesia, and Malaysia. Malaysia has 70 Family Mart Store and we had chosen the Family Mart that located Seremban, Negeri Sembilan. Family Mart is a convenience store where selling wide variety of product. There are four independent variable in this research which are brand awareness, new product awareness, increasing product purchasing and increases in the number of customer. Brand awareness will help to gaining the brand recognition where it is the most important marketing goals. Creating new possibilities and opportunities with the aim of increasing consumer brand awareness (1). There are many effect that can bring success to a business but social media and internet advertising is one of the most important that can create awareness about product and can increase the growth of a business. Brand awareness will help to gaining the brand recognition where it is the most important marketing goals. Creating new possibilities and opportunities with

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

the aim of increasing consumer brand awareness⁽²⁾. Product purchasing is a process for purchasing product and service to fulfil their wants and needs. Based on (3) discovered that customers' decision to buy a product which called as purchasing intention on depended largely on the product's value and recommendations that other consumers have shared, for example on social media. The four factors are known as independent variables of this research are brand awareness, new product awareness, product purchasing, and number of customers.

In this research, the researcher will be distributing the questionnaires and collecting the data from the Family Mart's customers at Seremban. Based on the data collection, the researcher will be analysing on the impact of social media advertising to success of Family Mart. This will give the best result where it comes up with suitable objectives for the research project. There are four objectives for this research which are determine whether there is significant relationship between the new product awareness and success of Family Mart To determine whether there is significant relationship between the product purchasing and the success of Family Mart. To determine whether there is significant relationship between the brand awareness and the success of Family Mart. Besides, determine whether there is significant relationship between the increases number of customer and the success of Family Mart and finally, find out the most effective impact to the success of Family Mart. Focus on what are the success of business and how become more successful in the market by invest in advertising. The impact of advertising can be either good or bad to a business. This research describes the effect of advertising whether they can affect their business performance or vice versa.

2 LITERATURE REVIEW

There are four independent variable that will determine by definition under this research which are brand awareness, awareness of new product, product purchasing and increase the number of customer.

2.1 CREATE BRAND AWARENESS

Brand awareness is a marketing term that describes the degree of consumer recognition of a product by its name. Creating brand awareness is a key step in promoting a new product or reviving an older brand. Ideally, awareness of the brand may include the qualities that distinguish the product from its competition. According to Dr. Neha Shukla (2017) the Facebook advertising and creating product page for a brand is most effective way to creating the brand awareness and it also will increase the sale directly.

H₀: The increase of brand awareness had no significant relation with success of Family Mart.

H₁: The increase of brand awareness had significant relation with success of Family Mart

2.2 AWARENESS OF NEW PRODUCT

Based on Hansel Bagus Tritama (2016) brand awareness is the capacity of a possible purchaser to perceive and review a brand as a component of a specific item class. Brand that a specific brand has been known previously, so the buyer accepts that the item is the main brand in a specific crowd. Brand and product awareness can be separated into four level, namely brand unaware, brand recognition, brand recall and top of mind.

H₀: The awareness of new product had no significant relation with success of Family Mart.

H₂: The awareness of new product had significant relation with success of family Mart.

2.3 PRODUCT PURCHASING

Purchasing is the process a business or organization uses to acquire goods or services to accomplish its goals. Although there are several organizations that attempt to set standards in the

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

purchasing process, processes can vary greatly between organizations. If the customers need your product or service to function the way they need in order to solve their problem or desire. Every customer will have different type of budget for product purchase. According to Bruno Schivinski and Dariusz Dabrowski (2016) consumers are more easily and frequently to social media such as Facebook, Instagram, and etc to find the information about product that they plan to purchase. Based on (Kim and Ko 2011), brand equity is the main influence for the customer while purchasing a brand products.

H₀: The product purchasing had no significant relation with success of Family Mart.

H₃: The increase of product purchasing had significant relation with success of Family Mart

2.4 INCREASE THE NUMBER OF CUSTOMER

The customer base is the group of customers who repeatedly purchase the goods or services of a business. These customers are a main source of revenue for a company. Companies with a customer base consisting mainly of large companies may increase their customer base by pursuing small and mid-size companies. A brand gave to consumer loyalty that sets aside the effort to form individual messages will innately be seen in a positive light, regardless of whether reacting to a client objection. (Dr. Neha Shukla., 2016).

H₀: Increasing customer had no significant relation with success of Family Mart.

H₄: Increasing customer had significant relation with success of Family Mart.

2.5 THE SUCCESS OF FAMILY MART (DV)

Successful businesses use resources effectively and efficiently to execute business strategies. Create a culture of rigor and standards for financial stability. Require process around fiscal management, oversight and decision-making. Execute strategies in an operationally efficient manner. Many factors contribute to being successful in business. Having a sound strategy, having a marketable product or service, and having efficient processes are all important. Advertising on social media and internet will create strongest relationship with brand success and effective of advertising can be considered as the main factor influencing promoting viability. The second and the third most significant components influencing publicizing achievement were discovered to promote information and customer relationship (Azarnoush Ansari1, 2016). But it falls to the people within the organization to actually execute on the strategies, plans, and processes to make a business successful. Marketing is major element of a business to achieve their goal and success and it also help to maintain the relationship with their customer on the grounds that it permits organizations to keep up dependable and ever-present associations with their client. Brand picture likewise can consider as achievement of a brand. Brand image as "observations about a brand as reflected by the brand affiliations held in purchaser memory, according to Keller (1993).

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

2.6 CONCEPTUAL FRAMEWORK

INDEPENDENT VARIABLE

Figure 1: Conceptual framework of the research study

In Figure 1 shows the framework of the relationship between social media advertising toward Family Mart success. The impact of social media advertising are the dependent variables in this study, which involved of increasing product awareness, increasing product purchasing, increasing brand awareness and increasing customer are the independent variable. This are the positive impact that can bring success to the Family Mart brand and product.

3 METHODOLOGY

3.1 RESEARCH DESIGN

Research design is the set of methods and procedures used in collecting and analysing measures of the variables specified in the problem research. It provides insights about “how” to conduct research using a particular methodology. Quantitative analysis research was used in this study to conduct a subtitled study. Leedy (1993) explains that quantitative research is based on the belief that the most meaningful data is from first-hand experience. This research is intended to study the impact of social media advertising on success of Family Mart. The data is collected based on the relationship between the independent variable and the dependent variable. Section B and section C is about questions regarding perceptions of respondent on factors that how the impact social media and internet advertising will effected the success on Family Mart and the customer purchasing decision. We have prepared 5 questions for each independent variable and 5 questions about the success of Family Mart. These sections have used Likert Scale where respondents have to choose a suitable answer

3.2 DATA COLLECTION METHOD

3.2.1 PRIMARY DATA

Primary tools provide first-hand data, which indicates that the reading of the author’s own account of a particular subject or occurrence in which individuals have participated (Library, 2020) . Primary sources were gathered through the questionnaires for this analysis of the 384 young age respondents in Seremban, Negeri Sembilan. The questionnaire was used to gather data from respondents as the key method. This is the most appropriate approach since the least cost has been incurred as it is transmitted via google forms, saves time and does not require the high capacity

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

to perform and turn into research. In English and Malay, the questionnaire was built.

3.2.2 SECONDARY DATA

Secondary data is a kind of data that has quite recently been conveyed in books, day by day papers, magazines, journals, online doors and government reports. The secondary data from various resources that relevant about the social media advertising to a brand.. These criteria consolidate, anyway not confined to date of circulation, capability of the maker, constancy of the source, idea of discoursed, significance of examinations and the level of duty of the substance to the headway of the investigation zone (Dudovskiy, 2011).

3.3 SAMPLE SIZE

The ever-increasing demand for research has created a need for an effective method of deciding the sample size required to represent a given population. The population of this research is Family Mart store young customers who using social media and internet frequently. We choose about 384 respondents based of Morgan table which are our sample size and they are youngster who using social media frequently. We have distributed the questionnaire to the young customer of Family Mart Store to obtain information about how social media advertising affected their purchasing and how it influence the active youngster in social media at Malaysia. The sample size is 384 and the data is collected from the questionnaire which is answered by the respondent to obtain information about our research.

Sampling methods refer to the process of selecting a group of people or in other words selecting an appropriate number of elements from a population. Two types of sampling methods, which are probability sampling and non-probability sampling techniques, can be used in the sampling process. Convenience sampling is a basic type of sampling where the members of the target population that meet such as easy accessibility, availability at a given time, or the willingness to participate are included for the purpose of the study. It is also referred to the researching subjects of the population that are easily accessible to the researcher doing to collect data collection (Etikan, Musa, & Alkassim, 2016). Convenience sampling also can help the researchers collect the data and information for the study from Family Mart customers. The researchers used non probability sampling techniques where the number of 21 questions were distributed to 384 respondents and the response rate was 100%. The target population was the young customer of Family Mart that located in Ampangan Seremban, Negeri Sembilan. Convenience sampling will be used to selected male and female young customer of the store and who are active in social media.

3.4 PROCEDURE FOR DATA ANALYSIS

SPSS means “Statistical Package for the Social Sciences” and was first launched in. Since SPSS was acquired by IBM in 2009, it is officially known as IBM SPSS Statistics but most users still just refer to it as “SPSS”. SPSS is software for editing and analysis all sorts of data. These data may come from basically any source: scientific research, a customer database, Google Analytics or even the server log files of a website.

3.4.1 Multiple Regression Analysis

An extension of simple linear regression is multiple regressions. It is used when the researcher wants the value of a variable to be predicted based on the value of two or more other variables (Kumar et al., 2013) . This analysis can be used to evaluate empirical hypotheses as to what and to what degree those independent variables describe variance in a variable of interest that depends

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

on it as well to identify the most affected variables towards the research studies. In this research, this analysis uses more than one independent variable to describe one dependent variable. There will be linear and nonlinear multiple regressions. For example, in this research it will conduct a study on the relationship between the effect of social media on success of Family Mart.

3.4.2 Pearson's Correlation Coefficient Analysis

According to Mukesh et al., (2013), the Pearson Correlation is to measure the degree to which there is a linear association between two variables (measured in either interval and/ or ratio). The purpose of this analysis is to determine if there is a relationship between independent and dependent variable and to identify which hypothesis should accept and reject. The most regularly utilized strategy to decide the quality of the connection of the coefficient is between -1 and 1. The coefficient will be 1 if there is positive relationship between variable while the coefficient is -1 if there is a negative relationship

3.4.3 Descriptive Analysis

Descriptive analysis is the topic of quantitatively describing the key elements of information collection (Best & Kahn, 2003). Descriptive statistics are used in this study to disclosing the ordinary pattern of response, summarize and describe the characteristics of the respondents. By doing descriptive analysis, researcher was able to identify and illustrate the information of demographic respondents in the research study such as gender, age, race, and occupation.

3.4.4 Reliability Test

By collecting data from 30 target respondents as the recommendation, the researchers conduct the reliability test (Schoonenboom & Johnson, 2017). Reliability test is performed by researchers to test data stability and reliability of the variables. According to J. McLeod (2013), the term reliability in psychological testing refers to the consistency of an interpretation or appraisal test with two types of internal and external reliability. For this study, Cronbach's alpha is used to test the reliability of the question that set to collect the data from target population.

4 FINDINGS

4.1 DATA ANALYSIS AND FINDINGS

In this study, there are six questions were asked under respondents' demographic section such as gender, age, occupation, and salary per month of Family Mart customers

Table 1: Summary of Demographic Profile of Respondents

Item	Frequency n=384	Percentage %
Gender		
Male	188	48.96
Female	196	50.04
Age		
20 -25 years old	160	40.67
25-30 years old	139	36.20
30-35 years old	85	22.14
Occupation		

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

Government sector	71	18.46
Private sector	114	29.69
Self-employed	76	19.01
Student	126	32.18
Salary Per-month		
Below RM1200	121	31.51
RM 1200-RM2000	150	39.06
Above RM2000	113	29.43
Total	384	100

From the table 1 Summary of Demographic Profile of Respondents the majority of the respondents are females which consist of 51.04% or 196 respondents, while the minority respondents are males which consist of 48.96 % or 188 respondents and the total number of respondent are 384. Besides, there are three age categories provided in the questionnaire. The age range between 20 to 25 years old eventually become the highest proportion among 384 respondents, consists about 41.67% or 160 respondents. This followed by respondents who aged between 25 to 30 years old with approximately 36.20% or 139 respondents. Finally, respondents who aged from 30 to 35 years old are consist of 22.14% or 85 respondents. the results revealed that 18.49% or 71 of the respondent are from government sector, followed by the respondents who are private sector employees with 29.69 or 114. Then, 19.01% or 73 respondents are self-employed .Is this part, students are the majority respondents which are consists of 32.81% or 126. Moreover, there are three categories in salary status which are below RM1200, RM 1200-RM2000 and above RM2000. The majority of the respondents select RM 1200-RM200 which consists of 39.06% or 150, while the minority respondents are above RM 2000 which consist of 29.43% or 113 respondents and finally 31.51% or 121 are from below RM1200 salary per-month.

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

4.2 RELIABILITY ANALYSIS

Table 2: Pilot Test

CONSTRUCT	Number of Items	Cronbach's Alpha	RELATIONSHIP
All Variables	25	0.917	Good
Brand Awareness (IV 1)	5	0.658	Good
Awareness of New Product (IV 2)	5	0.758	Good
Product Purchasing (IV 3)	5	0.822	Good
Increase Number of Customer (IV 4)	5	0.845	Good
Success of Family Mart (DV)	5	0.830	Good

Based on Table 4.1, Cronbach's alpha coefficient tests were conducted on all five variables. Usually the closer Cronbach's alpha to 1.0, the greater the internal consistency of the items in the scale and reliability coefficient normally ranges between 0 and 1. The table above shows result of Cronbach's alpha for brand awareness is (0.658), awareness of new product (0.758), product purchasing (0.822), increase number of customers (0.845), and success of Family Mart is (0.830). The overall Cronbach's alpha on this study is (0.917) it means that brand awareness, awareness of new product, product purchasing, number of customer and success of Family Mart has good reliability and acceptable (Lund, 2012). The overall scale is highly internally consistent.

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

4.3 PEARSON CORRELATION ANALYSIS

Table 3: Pearson Correlation Analysis

HYPOTHESIS	RESULT	FINDING OF DATA ANALYSIS
(Brand Awareness) H1: The brand awareness had significant relation with success of family Mart.	$r = 0.502^*$ $p = 0.000$ moderately positive correlation	H ₁ : Accepted
(Awareness of New Product) H2: The awareness of new product had significant relation with success of family Mart.	$r = 0.502^*$ $p = 0.000$ moderately positive correlation	H ₂ : Accepted
(Product Purchasing) H3: The increase of product purchasing had significant relation with success of Family Mart.	$r = 0.627^*$ $p = 0.000$ moderately high positive correlation	H ₃ : Accepted
(Increase the Number of Customers) H4: Increasing customer had significant relation with success of Family Mart.	$r = 0.755^*$ $p = 0.000$ high positive correlation	H ₄ : Accepted

* p -value <0.05 , pearson correlation analysis applied

Based on the Table 4.8, the correlation of each independent variable (brand awareness, awareness of new product, product purchasing, increase the number of customer) is significant at 0.01 levels, two- tailed toward success of Family Mart. In addition, the result also shows that there are the positive perfect significant relationship between all independent variables and the impact of social media advertising on success of Family Mart.

The value between brand awareness and the success of Family Mart 0.502, awareness of new product is 0.502, while product purchasing is 0.627, and increase the number of customer is 0.755. As a result, number of customers shown a strongest positive relationship with success of Family Mart ($r = 0.755$), followed by the product purchasing ($r = 0.627$), then brand awareness ($r = 0.502$), and awareness of new product ($r = 0.502$). Besides that, the correlation between mediator (number of customers) and dependent variable (success of Family Mart) is positively related with $r = 0.755$ at 0.01 levels.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

4.4 MULTIPLE LINEAR REGRESSION ANALYSIS

In this research, the researcher had implemented Multiple Linear Regression Analysis in statistics to find the relationship between the impact of social media advertising on success of family Mart as the dependent variable and Brand Awareness, Awareness of New Product, Product Purchasing, and Number of Customer as the independent variables. Besides that, this analysis will help the researcher to identify the most dominant impact that help improve the success of Family Mart in Seremban, Negeri Sembilan.

Table 4: Multiple Linear Regression

Variable	Simple Regression		
	b	t-stat(95%CI)	p-value
Brand Awareness	0.58	13.31(0.5,0.67)	<0.001
Awareness of New Product	0.45	11.35(0.37,0.53)	<0.001
Product Purchasing	0.5	15.71(0.5,0.64)	<0.001
Increase the Number of Customer	0.7	2.49(0.64,0.76)	<0.001

*Normality assumption was fulfilled / met

After data exploration and cleaning, Uni-variable Analysis was done using the Simple Linear Regression Analysis (SLR), thus from that analysis, the results show in table 4.9 shown there is a significant effect of brand awareness, awareness of new product, product purchasing, increases the number of customer towards success of Family Mart ($p < 0.05$). In every unit increase of brand awareness, success of Family Mart will be increase by 0.15 (b). Then, unit increase of awareness of new product, success of Family mart will be increase by 0.01 (b). In every unit increase of product purchasing, success of Family Mart will increase by 0.13 (b) and also unit of the number of customers, success of Family Mart will be increase by 0.52(b).

5 DISCUSSION

5.1 Hypothesis 1

H1: The brand awareness had significant relation with success of family Mart.

Besides that, researchers have identified that there is significant relationship between the brand awareness and the success of Family Mart from the impact of social media advertising. According to the result the index of Pearson Correlation Coefficient, this research accepting significant relationship between the brand awareness and the success of Family Mart among the youngster because the result 0.548 with significant value $p < 0.05$, it means it mean that there is a significant relationship exist between brand awareness and success of Family Mart at Seremban among youngsters. Therefore, the null hypothesis (H_0) was rejected because the p-value is 0.00 which is less than 0.05 and that mean there is no significant relationship that exist between both independent and dependent variable. Brand awareness is one of the important factor that can impact the customer's purchasing decision and can increase the sales of the business. Besides, brand awareness also a solid trust of customers about the product of Family Mart and brand can help to achieve the objective and goals of Family Mart. The social media advertising can help to

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

change the customer's perception toward Family Mart and bring success to the brand of Family Mart. Creating new possibilities and opportunities with the aim of increasing consumer brand awareness (Comscore Media, 2009). In order to attract consumers' attention and address customization of their needs, advertising specialists have started using social networking website appeals in their ads (Milad Dehghani , ustafa Tumer 2015).

5.2 Hypothesis 2

H2: The awareness of new product had significant relation with success of family Mart. Besides that, researchers have identified that there is significant relationship between the awareness of new product and the success of Family Mart from the social media advertising among youngster. According to the result the index of Pearson Correlation Coefficient, this research accepting significant relationship between awareness of new product and the success of Family Mart in Seremban because the result 0.482 with significant value $p,0.05$, it means it mean that there is a significant relationship exist between awareness of new product and the success of Family Mart. Therefore, the null hypothesis (H_0) was rejected because the p -value is 0.00 which is less than 0.05 and that mean there is no significant relationship that exist between both independent and dependent variable. The social media advertising of Family Mart can help to launching their new product and create awareness of new product among youngster in social media such as Facebook, Instagram and etc. Brand and product awareness can be separated into four level, namely brand unaware, brand recognition, brand recall and top of mind. The bottom level of brand awareness is the brand recognition and it can be called as level of supported recall. The next level is brand recall where in level the customer will not need anything to remember the brand. New product exceptional review where the customer will ready to buy the products by the product attraction and swiftness of new product awareness (Hansel Bagus 2016).

5.3 Hypothesis 3

H3: The increase of product purchasing had significant relation with success of Family Mart.

Moreover, researcher has identified that there is significant relationship between product purchasing and the success of Family Mart from the social media advertising among youngster at Seremban. Based on the result of the Pearson Correlation Table 4.21 this research is accepting H3 because 0.616 with significant value $p;0.05$, it means that there is a significant relationship exist between product purchasing and success of Family at Seremban. Therefore, the null hypothesis (H_0) was rejected because the p -value is 0.00 which is less than 0.05 and that mean that there no significant relationship between both independent variable and dependent variable. The understanding of customer decision making to purchase a product is very important for Family Mart. From this research the Family Mart could know the important of product purchasing. It also help Family Mart to study about their customer buying behaviour and their decision making process, from this point the Family Mart can easily achieve their goals and objective. Every customer will have different type of budget for product purchase. According to Bruno Schivinski and Dariusz Dabrowski (2016) consumers are more easily and frequently to social media such as Facebook, Instagram, and etc to find the information about product that they plan to purchase.

5.4 Hypothesis 4

H4: Increasing customer had significant relation with success of Family Mart. Furthermore, researcher has identified that there is significant relationship between the number of customer and the success of Family Mart from the social media advertising. Based on the result of the Pearson Correlation Table 4.22 this research is accepting H4 because 0.713 with significant

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

value $p < 0.05$, it means that there is a significant relationship exist between increases the number of the customers and the success of Family Mart at Seremban, Negeri Sembilan among youngsters. Therefore, the null hypothesis (H_0) was rejected because the p-value is 0.00 which is less than 0.05 and that mean that there no significant relationship between both independent variable and dependent variable. Based on the Pearson Correlation's analysis on table 4.19, the result shown that independent variable 1 (increase the number of Family Mart) which is key impact that had a high positive influence on the success of Family Mart through the social media advertising. Moreover, the social media advertising helps to increasing the number of customer to Family Mart, where the customer attracted by the advertising and doing purchasing at Family Mart. Without customer there is no sale for a business, the Family Mart marketing strategies will help to increase the number of customers. A brand gave to consumer loyalty that sets aside the effort to form individual messages will innately be seen in a positive light, regardless of whether reacting to a client objection. (Dr. Neha Shukla., 2016).

5.5 HYPOTHESES TESTING

Based on the Spearman Correlation Analysis, it can be concluded that the Brand Awareness, Awareness of New Product, Product Purchasing, and increase the Number of Customer has a significant relationship towards the Success of Family Mart in Seremban, Negeri Sembilan. While from the Multiple Linear Regression Analysis, the most dominant impact that effect the success of the Family Mart will be the increases the number of the customers.

Table 5: Hypotheses Testing

Hypothesis	Objective	Result
H ₁	There is a significant relationship between the Brand Awareness and the Social Media Advertising towards success of Family Mart	Accepted
H ₂	There is a significant relationship between the Awareness of New Product and the Social Media Advertising towards success of Family Mart	Accepted
H ₃	There is a significant relationship between the Product Purchasing and the Social Media Advertising towards success of Family Mart.	Accepted
H ₄	There is a significant relationship between the Dominant factor which is the number of Customer and the Social Media Advertising towards success of Family Mart	Accepted (increase the number of customers)

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

6 RECOMMENDATIONS/ SUGGESTION FOR FUTURE RESEARCH

The future researcher can manage to conduct the research in different area of Malaysia to enrich the local context. Different state of Malaysia will have different culture of buying behavior and different convenience store with different variety product. Future researcher can find out more information about the impact of social media advertising on success of Family Mart. Future researcher can know how importance of the social media advertising for a business and how it help to achieve their goals and objective. It is recommended that future researchers perform similar research in different district, states or even in Malaysia as it will lead to a different outcome. In addition, in order to improve the quality of the data obtained, the number of respondents can be expanded for future studies. To get an accurate result from larger amount of responses, future researchers must take a longer duration for data collection and analysis. Furthermore, future researcher should consider to use quantitative method for research. Future researcher may gain deeper understanding about the relationship of the impact of social media advertising on success of a business.

Beside, Interview with the respondents enables researcher to know how the respondents think of social media advertising about a store, brand and also a product. Therefore, using quantitative method may get different perspectives of the relationship between the social media advertising and the success of a business.

7 CONCLUSION OF THE STUDY

This study focuses on the impact of social media advertising on success of Family Mart at Seremban, Negeri Sembilan. Organizations can use the outcome of this study to determine the most effectiveness and impact of social media advertising on success of Family Mart among youngster. This is because it will help to build a brand awareness, create awareness of product, product purchasing and increase the number of customer. Malaysian companies from either government or private sectors can also use the data to determine the impact of social media advertising and success of a business on the future development of the country. The minimum requirement for reliability analysis has been met from the study of the overall variable since the value of the Cronbach's Alpha coefficients is above 0.6. The independent variables identified as the a brand awareness, create awareness of product, product purchasing and increase the number of customer the significant relationship to the dependent variable known as the success of Family Mart.. Based on the hypothesis result, all the H₀ have been rejected while H₁, H₂, H₃ and H₄ have been accepted in this study. Most notably, this study has established that university students and entrepreneur are nowadays learn the important of advertising to a business. They are also really concerned about the specifications in marketing to improve the sales of a business.

ACKNOWLEDGEMENTS

First, we wanted to express our gratitude towards our GOD Almighty that we were able to finish our research. We would also like to express our appreciation to our supervisor Dr. Nurul Izyan Binti Mat Daud for his helps by giving feedback and comment that are invaluable value to us, his support towards us, patience and understanding to guide us in process to complete our research. Besides that, we were highly indebted to Universiti Malaysia Kelantan for providing great facilities and platform to search for related sources to complete our research and we would like to thank Faculty of Entrepreneurship and Business by provided latest format and information regarding this research. Other than that, we would like to express sincere gratitude to our parents

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

and family members supporting us throughout our studies at Universiti Malaysia Kelantan, they had encouraged and help us in completion of this research. Invaluable thank to our course mate because they always support us by giving feedback and share their information to let us complete our research within the time. We gain knowledge through this research and we gain the spirit of co-operations among the group members. Finally, we would like to express deep appreciation to all respondents in Universiti Malaysia Kelantan. They sacrificed their precious time to helping us to complete our research by fill up questionnaire. Useful information gain from respondents had helps us a lot in our research.

THE FACTORS THAT AFFECT THE CONSUMERS TO PURCHASE PRODUCTS FROM VIRTUAL SHOPPING IN TAMPIN, NEGERI SEMBILAN

Teebashini A/P Gunasekaran and Nurul Izyan Mat Daud

Faculty of Entrepreneurship and Business,
Universiti Malaysia Kelantan,
Malaysia

Email: teebashini.a17a0735@siswa.umk.edu.my, izyan.md@umk.edu.my

Abstract:

In the era of globalization, virtual shopping become the first alternatives that consider by publics especially the young generations when making the purchase decision. Compared to the off-line shopping, virtual shopping are more favorite by consumers today since it more convenient than off-line shopping way which usually cause the parking space, limited time, crowded and traffic jam problem. The primary aim of this research is to identify the factors that affect the consumers to purchase products from virtual shopping in Tampin, Negeri Sembilan. This study to investigate the relationship between the independent variable namely website quality, convenience and security and propensity to trust that influence the dependent variable, consumer attitude towards virtual shopping. This research used the quantitative method through the structured questionnaire. Non-probability sampling where the convenience sampling is used to collect the data through an online survey questionnaires with 379 respondents from young adults in Tampin, Negeri Sembilan who have experience about virtual shopping. This study used Statistical Package for Social Science (SPSS) version 26.0, to analysed the data and derived the descriptive analysis, reliability analysis, and Pearson's correlation analysis to test the research objectives and hypotheses. Pearson's Correlation was used in this research to test the hypotheses and to determine the significance of the relationship between independent variables and dependent variable. The result indicates that website quality, convenience, security and propensity to trust had significant results on consumer attitude. The finding has contributes to the literature and make a number of theoretical contributions to the upcoming researches. It has brought some practical implication to the entrepreneurship fields, especially to the e-commerce industry in Malaysia.

Keywords: *Consumer Attitude Towards Virtual Shopping, Convenience, Propensity To Trust, Security, Website Quality*

1 INTRODUCTION

Virtual shopping is a type of electronic commerce (e-commerce) which consumer can search the products and service directly and make the purchase decision from the seller through the Internet (Saad Akbar, 2017). Compared to offline shopping, online shopping is more preferred by consumers today since it is more convenient than offline shopping way which usually causes the parking space, limited time, crowded and traffic jam problem. The number of online shoppers in the worldwide also significant increase because the consumers feel that virtual shopping is more easy and convenient compared to off line shopping (Kubanychbekova Aidai, 2020). With using the virtual shopping, consumer can search the products and services that interested by viewing the pictures or images, details of the product specifications, characteristics, and price and then

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

make the purchase decision directly. Rehman, Abdul and Dost (2015) have confirmed that the younger generation such as young adults are more interested in browsing via online and they are used the internet in their regular activities and are totally reliant on it. Hence, this research is conducted to study the factors that affect the consumers to purchase products from virtual shopping in Tampin, Negeri Sembilan. There are four factors contributed to this research, which are website quality, convenience, security and propensity to trust.

This study will be investigating the factors that affecting consumer attitude towards virtual shopping among young adults. Specifically, the objectives of this study are to identify the relationship between the website quality that influences consumers attitude towards virtual shopping among young adults in Tampin, Negeri Sembilan, to investigate the relationship between the convenience that influences consumers attitude towards virtual shopping among young adults in Tampin, Negeri Sembilan. Next will be to determine the relationship between the security that influences consumers attitude towards virtual shopping among young adults in Tampin, Negeri Sembilan and to examine the relationship between propensity to trust that influences consumers attitude towards virtual shopping among young adults in Tampin, Negeri Sembilan. Lastly, to find out the relationship between most effective factor to purchase products from virtual shopping among young adults in Tampin, Negeri Sembilan.

E-commerce has become the new way of trading model which can provides the faster and convenient buying channel that provides greater superior experience consumption for customers. Compared with the traditional shopping mode, e-commerce has the advantages of time savings, speedy deliveries, lower prices, convenience, and information richness (Robert, Patrick & James, 2015).). It became more acceptable and favorite by people today because they can buy the products via online without leaving their home. Nowadays, customers are becoming more mindful of virtual shopping, browsing the internet on a regular basis and purchasing goods worldwide (Sharma, 2019).

2 LITERATURE REVIEW

2.1.1 Website Quality

Website quality is described as the degree to which a website promotes efficient and effective shopping, achievement and transmission (Ye, 2015). According to Akram (2018), explored the website quality affects online impulse buying and showed that website quality is a very strong determinant in the development of virtual buying behaviour. The website is an online store and the quality of the website is very significant because it affects the quality of online services (Tran Phi Hoang, 2019). As indicted by Sheng (2020), a well-developed website can improve the rate of return by increasing the purpose and satisfaction of virtual shopping by customers.

H1: Website quality is significant affect the consumer attitude towards virtual shopping.

2.1.2 Convenience

Convenient is a processes, goods and services are those aimed at making accessibility simpler, saving resources such as time, effort and energy and reducing dissatisfaction which stated by Mohammad Ali (2020). The most critical core elements for virtual shopping are convenience, quick delivery and time saving, and the other side of branding is not an important factor for virtual shopping (Kloppers, 2014). Consumers can also avoid from crowds especially when a discount

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

sale or clearance stock is offered by the virtual store. The virtual store provides a much wider range of colours or even a size as compare if finding the products locally. Convenient access to product details will make it easier and help purchasers make decisions in virtual purchases (Saad Akbar, 2017).

H2: Convenience is significant affect the consumer attitude towards virtual shopping

2.1.3 Security

The degree of protection of customer information and network security against fraud or hackers refers to privacy or security. Consumers often expect their personal data and records to be stored secretly and securely by the online website owner. In an effort to encourage consumers and provide them with a sense of security in using the site, some online service providers publish stories, customer testimonials, and policies about their security or privacy practises (Shu-Hao Chang, 2015). Owner of virtual website should be aware of and improve the online transaction security of their website and provide customers with a privacy policy, thus enhancing the confidentiality, satisfaction and buying intent of the customer (L.Antheunis, 2016).

H3: Security is significant affect the consumer attitude towards virtual shopping.

2.1.4 Propensity To Trust

The trustworthiness of the buyer is likely to assess the final purchasing decision between a buyer and a dealer. Retailers that are capable of delivering what they promise and avoiding any errors that disappoint consumers will create greater consumer trust. The trust between the consumer and the seller would give both parties a positive impact and good vibes (Majid Mohammad Shafiee, 2017). Trust is observed as the attitude towards the use of social media that involves privacy and security issues (Bilal Eneizan, 2020). According to Rina (2020), in interactions and transaction processes, trust is established between parties that do not know each other.

H4: Propensity to trust is significant affect the consumer attitude towards virtual shopping.

2.1.5 Consumer Attitude towards Virtual Shopping

Attitude is one of the key factors in online marketing that drives customers to make an online purchase (May, 2005). Consumer's attitude towards virtual shopping refers to their psychological state in terms of making purchases over the Internet (Saad Akbar, 2017). Attitude is a multi-dimensional construct with cognitive, affective and behavioral components (Yet Mee Lim, 2019). Virtual allows customers to use search characteristics to discover the same or exact products, models, identification or products they want whether they know the exact name of the product (Datta, 2018).

Al Khasawneh and Irshidat (2017), mentioned that the attitude of the consumer greatly affects his or her buying intention and decisions as well. Attitude impacts decision-making directly and is often central to the purchasing behavior of a consumer. Virtual shopping is an evolving challenge for accommodate to market trends and meeting consumer preferences (Mohammad Ali, 2020). The explosive of virtual shopping available in lower price and the import variety is more than traditional shopping, the consumers will choose to capture online.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

2.2 CONCEPTUAL FRAMEWORK

A conceptual framework defined as an analytical tool with many variations and circumstances. It is used to provide organize ideas for conceptual distinctions. Conceptual framework leads the researcher to find out the result and statistical relationship that will be examines between the dependent variable and independent variables (Saad Akbar, 2017).

Figure 1: The factors that affect the consumers to purchase products from virtual shopping. As indicated in Figure 1, the factors that affect the consumers to purchase products from virtual shopping including website quality, convenience, security and propensity to trust are used to examine the consumer attitude towards virtual shopping.

3.0 RESEARCH METHODOLOGY

3.1 *Research Design*

The target respondents for this research are young adults who are active in virtual shopping in Tampin, Negeri Sembilan. Researcher uses an independent variables and dependent variable by construct the questions. This study use descriptive research analysis to further explore about the consumer attitude towards virtual shopping among young adults in Tampin, Negeri Sembilan. Descriptive research will be used in this study to explain the respondent's preferences and opinion about the factors that affect the consumer attitude towards virtual shopping environment. The unit analysis in this research is individuals who are the young adults in Tampin, Negeri Sembilan. The quantitative approach is use where the online survey method also will be used to gather information from the young adults by using the questionnaire. . The population of this study is the number of young consumers in the area Tampin, Negeri Sembilan which is 24,120 residents (Department of Statistic Malaysia, 2016). The number of respondents chosen in this study is 379 consumers.

3.2 *Data Collection Method*

The researcher distributes the questionnaire to the respondents to collect the data. The questionnaire is all about the factors that affect the consumers to purchase products from virtual shopping. This method will be more accurate to collect the data from the respondents because respondents will get more time to read and to answer sincerely. The secondary data is from various resources such as past journals, internet and articles that related with the factors that affect the consumers to purchase products from virtual shopping in Tampin, Negeri Sembilan.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

3.3 *Sampling*

The researcher uses the non-probability sampling which is called as convenience sampling. Convenience sampling refers to the collection of information from the target population who are conveniently available to provide it. A 5-point Likert Scale was used to measure target respondents response based on the factors that affect the consumers to purchase products from virtual shopping in Tampin, Negeri Sembilan. The scale ranged are from 1 until 5 which is (1=Strongly Disagree, 2=Disagree, 3=Neutral, 4=Agree, 5= Strongly Agree). The questionnaire was divided into three sections which are Section A represents the demographic questions, Section B represents the independent variables while Section C is about the dependent variables.

3.4 *Data Analysis*

Researcher used closed-ended questionnaire, which contain Section A, B, and C. After the information had gathered from respondents, the researcher started to collect and analyze the questionnaires. The respond of respondents were changed into numerical values before enter the data in the spreadsheet. Statistics Package for the Social Science (SPSS) was choose and applied to collect and analysed the gathered information.

4 RESEARCH FINDINGS

4.1 *FREQUENCY ANALYSIS*

The data analysis will focus on analysing factors affecting consumer attitude towards virtual shopping in terms of website quality, convenience, security and propensity to trust. This study were able to get 379 questionnaires which fully completed and hence, eligible for data analysis.

Table 1: Summary of Demographic Profile of Respondents

Items	Frequency (n= 379)	Percentage %
Gender		
Male	180	47.5
Female	199	52.5
Age		
21-25 years old	127	33.5
26-30 years old	105	27.7
31-35 years old	101	26.6
36-40 years old	46	12.1

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

Race		
Malay	128	33.8
Chinese	120	31.7
Indian	131	34.6
Others	0	0
Occupation		
Student	70	18.5
Self-employment	61	16.1
Government Sector	59	15.6
Private Sector	189	49.9
TOTAL	379	100

Table 1 show that the summary of the demographic profile. It indicates that 199 (52.5%) female respondents and 180 (47.5%) male respondents were involved in this research study. The total number of respondents is 379. There are five age categories provided in the questionnaire. The age range between 21 to 25 years old eventually become the highest proportion among 379 respondents, consists about 33.5% or 127 respondents. This followed by respondents who aged between 26 to 30 years old with approximately 27.7% or 105 respondents. Next, respondents who aged from 31 to 35 years old consist of 26.6% or 101 respondents and the last one is years old with 1.21% or 46 respondents.

Next is race category. It has been stated that the highest number of respondents are from the race group of Indian which is about 34.6% (n=131). While the second-highest race group are from Malay with 33.8% (n=128). This is followed by the lowest number of respondent race group is from Chinese which is about 31.7% (n=120). It has been stated that the highest number of respondents of occupation is from private sector which consists of 49.9 % of 189 respondents. This statistics is followed by the occupation of student which consist of 18.5% of 70 respondents, then followed by self-employment which consist of 16.1 % of 61 respondents. From this study, the least number of respondents are from the group of government sector which consists of 15.6% of 59 respondents only.

4.2 RELIABILITY ANALYSIS

Table 2: Pilot Test

Construct	Number of Items	Cronbach's Alpha Coefficient	Relationship
All Variables	25	0.925	Excellent
Website Quality (IV 1)	5	0.845	Good

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

Convenience (IV 2)	5	0.809	Good
Security (IV 3)	5	0.708	Good
Propensity to Trust (IV 4)	5	0.815	Good
Consumer Attitude Towards Virtual Shopping (DV)	5	0.884	Good

Based on Table 2, Cronbach's alpha coefficient tests were conducted on all five variables. Usually the closer Cronbach's alpha to 1.0, the greater the internal consistency of the items in the scale and reliability coefficient normally ranges between 0 and 1. The table above shows result of Cronbach's alpha for website quality is (0.845), convenience (0.809), security (0.708), propensity to trust (0.815), and consumer attitude towards virtual shopping (0.884). The overall Cronbach's alpha on this study is (0.925) it means that website quality, convenience, security, propensity to trust and consumer attitude towards virtual shopping has excellent reliability (Lund, 2012).

4.3 PEARSON CORRELATION ANALYSIS

Table 3: Summary Result of Pearson Correlation

Hypothesis	Result	Findings of Data Analysis
H1: There is a significant relationship between the website quality and the consumer attitude towards virtual shopping.	$r= 0.511^{**}$ $p=0.000$ Moderate Positive(negative)	H1:Accepted
H2: There is a significant relationship between the convenience and the consumer attitude towards virtual shopping.	$r= 0.529^{**}$ $p=0.000$ High Positive (negative)	H2: Accepted

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

H3: There is a significant relationship between the security and the consumer attitude towards virtual shopping.	r=0.364** p=0.000 Moderate Positive (negative)	H3: Accepted
H4: There is a significant relationship between the propensity to trust and the consumer attitude towards virtual shopping.	r=0.587** p=0.000 High Positive (negative)	H4: Accepted

*p-value<0.05, pearson correlation analysis applied

Table 3 shows the Pearson's Correlation coefficients. The correlation of each independent variable (website quality, convenience, security, and propensity to trust) is significant at 0.01 levels, two- tailed toward consumer attitude towards virtual shopping. In addition, the result also shows that there are the positive significant relationship between all independent variables and consumer attitude towards virtual shopping.

The correlation coefficients for website quality and consumer attitude towards virtual shopping is 0.511 and it shows that the strength of correlation between website quality and consumer attitude towards virtual shopping is moderate positive correlation. Besides that, the P value was 0.000 indicates the significant value for the analysis where it is lower than the alpha root which is 0.01. Therefore, there is significant moderate positive correlation relationship between website quality and consumer's attitude towards virtual shopping.

Moreover, the correlation coefficients for convenience and consumer attitude towards virtual shopping is 0.529 and it shows that the strength of correlation between convenience and consumer attitude towards virtual shopping is high positive correlation. Besides that, the P value was 0.000 indicates the significant value for the analysis where it is lower than the alpha root which is 0.01. Therefore, there is significant high positive correlation relationship between convenience and consumer attitude towards virtual shopping.

In addition, the correlation coefficients for security and consumer attitude towards virtual shopping is 0.364 and it shows that the strength of correlation between security and consumer attitude towards virtual shopping is moderate positive correlation. Besides that, the P value was 0.000 indicates the significant value for the analysis where it is lower than the alpha root which is 0.01. Therefore, there is significant moderate positive correlation relationship between security and consumer attitude towards virtual shopping.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Lastly, the correlation coefficients for propensity to trust and consumer attitude towards virtual shopping is 0.587 and it shows that the strength of correlation between propensity to trust and consumer attitude towards virtual shopping is high positive correlation. Besides that, the P value which was 0.000 indicates the significant value for the analysis where it is lower than the alpha root which is 0.01. Therefore, there is significant high positive correlation relationship between propensity to trust and consumer attitude towards virtual shopping.

4.4 MULTIPLE REGRESSION ANALYSIS

Table 4: Coefficient Analysis

Model	Unstandardized Coefficients		Standardized Coefficients	t	Sig.
	B	Std. Error	Beta		
1 (Constant)	1.076	.207		5.203	.000
Website Quality	.185	.037	.230	5.030	.000
Convenience	.153	.041	.181	3.751	.000
Security	.126	.042	.122	2.987	.003
Propensity to Trust	.342	.041	.369	8.273	.000

In this research, the researcher implemented Multiple Linear Regression to identify the relationship between the consumer attitude towards virtual shopping as dependent variable and website quality, convenience, security and propensity to trust as independent variables. Furthermore, this analysis helps the researcher to find out the most dominant factor that affect the consumer attitude towards virtual shopping. The independent variables were significant since the p-values were less than 0.05. The equation of regression can be written as follows;

$$\gamma = \alpha + \beta_1 x_1 + \beta_2 x_2 + \beta_3 x_3 + \beta_4 x_4$$

where

γ = Consumer Attitude towards Virtual Shopping

x_1 = Propensity to trust

x_2 = Website Quality

x_3 = Convenience

x_4 = Security

Hence, the equation becomes

$$\gamma = 1.076 + 0.342 x_1 + 0.185 x_2 + 0.153 x_3 + 0.126 x_4$$

Unstandardized coefficients beta represents the strength of the effects of every single of the independent variables to the dependent variable. The higher the value of the beta coefficient, the stronger the effect of independent variable towards dependent variable. According to the Table 4, the most influence independent variables in measuring the consumer attitude towards virtual

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

shopping was the propensity to trust variable ($\beta_1 = 0.342$). The website quality ranked at second rank ($\beta_2 = 0.185$) and followed by the convenience ranked at third rank ($\beta_{13} = 0.153$). The lowest influence consumer attitude towards virtual shopping was the security ($\beta_4 = 0.126$).

5.0 DISCUSSION

With reference to the findings by previous researches on factors that affect the consumer attitude towards virtual shopping, this study has further investigated the factors that affect the consumers to purchase products from virtual shopping in Tampin, Negeri Sembilan.

5.1 *Website Quality*

The researcher have identified that there is significant relationship between the website quality and consumer attitude towards virtual shopping among young adults. According to the result the index of Pearson Correlation Coefficient, this research accepting significant relationship between website quality and the consumer attitude towards virtual shopping in Tampin, Negeri Sembilan which is the result is 0.511 with significant value $p < 0.05$. It shows that there is a significant relationship between website quality and the consumer attitude towards virtual shopping in Tampin, Negeri Sembilan. According to Akram (2018), explored how website quality affects online impulse buying and showed that website quality is a very strong determinant in the development of virtual buying behaviour.

5.2 *Convenience*

The researcher have identified that there is significant relationship between the convenience and consumer attitude towards virtual shopping among young adults. According to the result the index of Pearson Correlation Coefficient, this research accepting significant relationship between convenience and the consumer attitude towards virtual shopping in Tampin, Negeri Sembilan which is the result is 0.529 with significant value $p < 0.05$. It shows that there is a significant relationship between convenience and the consumer attitude towards virtual shopping in Tampin, Negeri Sembilan. The ability to search for goods and services at a time that is convenient for customers is the most common determinant of virtual shopping (Kloppers, 2014).

5.3 *Security*

The researcher have identified that there is significant relationship between the security and consumer attitude towards virtual shopping among young adults. According to the result the index of Pearson Correlation Coefficient, this research accepting significant relationship between security and the consumer attitude towards virtual shopping in Tampin, Negeri Sembilan which is the result is 0.364 with significant value $p < 0.05$. It shows that there is a significant relationship between security and the consumer attitude towards virtual shopping in Tampin, Negeri Sembilan. A study from Loonan and Loughlin (2018) indicated that security particularly in the online banking industry, it played an important role because customers presumed that all website providers had a safe website as standard virtual shopping requirements.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

5.4 *Propensity to Trust*

The researcher have identified that there is significant relationship between the propensity to trust and consumer attitude towards virtual shopping among young adults. According to the result the index of Pearson Correlation Coefficient, this research accepting significant relationship between propensity to trust and the consumer attitude towards virtual shopping in Tampin, Negeri Sembilan which is the result is 0.587 with significant value $p < 0.05$. It shows that there is a significant relationship between propensity to trust and the consumer attitude towards virtual shopping in Tampin, Negeri Sembilan. The view of the party who trusts in the trustworthy party that has the characteristics that will help customers is trusting confidence (Fakhri, 2019).

6.0 RECOMMENDATION

From this research, it able to provide more understanding about the customer attitude towards virtual shopping in measure the independent variable which are website quality, convenience, security and propensity to trust. The researcher suggests to selects more sample that can represent the whole population in Malaysia that able to provide the view of the virtual shopping behaviour. This is because, the larger population will increase the number of the sample size that can help to know more detail especially the factors that affect the consumers to purchase products from virtual shopping. Besides that, future research also might be considered to develop more factors that will influence the consumer attitude towards virtual shopping.

In addition, researcher also recommend for the future research in term of the variable. In this study, the researcher used 4 independent variables to see the relationship between the dependent variable that provided. Then, for the next research, I recommended to increase the number of variables that can make the research are strong enough.

In this research all the researcher especially student must review the result of this research and take concern about it. This is because, the finding of this study may contribute many advantages to them to enhance about the factor that affect the consumer attitude towards virtual shopping from the different aspects especially all the factors that used in this research.

7.0 CONCLUSION

This study was conducted to provide in-depth investigation on factors that affect the consumers to purchase products from virtual shopping among young adults in Tampin, Negeri Sembilan. Through the analytical results, it indicated that all the independent variables which are website quality, convenience, security and propensity to trust that used in this study had significant effect of consumer attitude towards virtual shopping among young adults in Tampin, Negeri Sembilan. Meanwhile, findings of this study also indicated that website quality, convenience, security and propensity to trust had positive relationship toward consumer attitude towards virtual shopping. As conclusion, the propensity to trust had the strongest impact on consumer attitude towards virtual shopping which the marketer should evaluate their website elements seriously and functionality in order to capture the demands of the online customers. In interactions and transaction processes, trust is established between parties that do not know each other. Although propensity to trust has the strongest impact on consumer attitude towards virtual shopping, others factors such as website quality, convenience and security should not be underestimated.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

ACKNOWLEDGEMENT

First, I wanted to express my gratitude towards God that I am able to finish my research proposal. I would also like to express my appreciation to my supervisor Dr Nurul Izyan Binti Mat Daud for her helps by giving feedback and comment that are invaluable value to me, her support towards me, patience and understanding to guide me in process to complete my research proposal. Appreciate for giving such opportunities to do this project, and I have gained more knowledge about research, giving advices and also doing correction to out of mistake. Besides that, I am highly indebted to University of Malaysia Kelantan for providing great facilities and platform to search for related sources to complete my research and I would like to thank Faculty of Entrepreneurship and Business by provided latest format and information regarding this research.

FACTOR AFFECTING THE ONLINE IMPULSE BUYING AMONG STUDENTS IN UNIVERSITY MALAYSIA KELANTAN (UMK), CITY CAMPUS

Wong Pei Ling and Siti Afiqah Binti Zainuddin

Faculty of Entrepreneurship and Business,
Universiti Malaysia Kelantan,
Malaysia

Email: wpling.a17a0780@siswa.umk.edu.my; sitiafiqah@umk.edu.my

Abstract:

Online shopping is a trend in Malaysia. Malaysians have long adopted and practiced it. Advances in Internet technology have enabled Malaysian consumers to purchase goods or services online. The research is to probe into the factor that affecting the online impulse buying among students in University Malaysia Kelantan (UMK), City Campus. This research will probe into the relationship between the relationship between the variety of selection, price attributes and website ease of use with the mediator as shopping enjoyment that will affect the online impulse buying among the students in University Malaysia Kelantan (UMK), City Campus. In order to achieve this goal, some variables or factors are determined. In this analysis, quantitative research analysis and sampling techniques are used to ensure the archiving of research objectives. This is a quantitative study, in which 357 respondents who have enrolled in 5,631 for students in University Malaysia Kelantan (UMK), City Campus. 357 respondents were of different gender, age, and race. SPSS was used to analyze the data collected from the respondents. After this research, researcher acknowledged that factors such as variety of selection, price attributes, website ease of use and shopping enjoyment were significant towards online impulse buying among the students in University Malaysia Kelantan (UMK), City Campus. Through reliability analysis, descriptive analysis, Pearson's correlation analysis and multiple regression analysis, researcher studied each variable and verified the result.

Keywords: *Online Impulse Buying, Price Attributes, Shopping Enjoyment, Variety of Selection, Website Ease of Use*

1. Introduction

With the rapid development of the era and the advancement of science and technology, it can be found that more and more people use the Internet. Now it is an era where everyone can operate the Internet. Whether you are at home or out, people are online with WIFI everywhere, just like everyone has a mobile phone today, and the mobile phone is connected to the mobile network 24 hours a day. For example, before going to a shopping mall for a long time, you might not be able to buy a suitable piece of clothing. Now you only need to sit in front of a computer or hold your mobile phone or tablet and move your fingers. A large number of clothing styles will appear in front of you and you can choose. The price is clear at a glance, and it will be delivered to your door, so you can buy your favorite clothes without leaving home. People enjoy convenience through the Internet.

Online store is a common authoritative type of e-retail business, which is a shopping center set up on the Internet. Online stores are places where clients can shop through the Internet whenever, anyplace; sellers can sell items and services, and can reduce the cost of maintaining real store management and sales. Simply enter the address of a web page in the browser to log in the online store. Online stores are the least difficult Internet business model. These days, web based shopping has become a typical method of shopping in this period. From huge internet shopping centers to little online stores, with the development of the style and assortment of online stores, the web based shopping industry has gotten denser and clients have more options. For this situation, the "Double Eleven" web based shopping celebration is a cunning blend of

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

occasion shopper brain research and customer value advancement advertising (Akram et al., 2017)

As indicated by the review report by the (MCMC, 2018), the online business market in Malaysia is demonstrating positive patterns. As per the study, the extent of web based business shoppers in Malaysia is 51.2%. In 2018, there were around 16.6 million internet business customers. Among them, 93.3% of the respondents professed to be just online customers, while 6.1% professed to be online customers and merchants, and the excess 0.5% professed to be just sellers (MCMC, 2018)

With the rapid development of e-commerce, consumers increasingly prefer to buy goods online, which leads to impulse purchases in some situations or occasions. Consumers can order products with one click, can easily access products and browse product information and time saving are factors that motivate consumers to buy impulse online. Approximately 40% of all online consumers spending can be attributed to online impulse buying (Akram et al., 2017; Liu et al., 2013; Verhagen & van Dolen, 2011).

In 2020, physical stores were closed due to the COVID-19 pandemic and social distancing measures, leading consumers to gradually shift from offline purchases to online purchases, thereby accelerating Malaysia's e-commerce market growth. Consumers are more dependent on online shopping in order to maintain social distance and reduce time outdoors.

According to the report, among 51.2% of online consumers, 9.2% are full-time students. Among them, 82.8% are currently studying at a university or college (MCMC, 2018). According to past research reports, Malaysia's university students invest a great deal of energy on the web (Anuar et al., 2013; Haque et al., 2016; Zainudin et al., 2013). Moreover, youngsters, including understudies, have an uplifting mentality towards internet shopping since they feel that web based shopping is advantageous, low-evaluated products and efficient (Jadhav & Khanna, 2016). At the end of the day, greater college understudies are moving towards web based shopping as their shopping stage (Jin et al., 2015).

This study is aim to investigate the factors that affecting the online impulse buying among students in University Malaysia Kelantan (UMK), City Campus. Below are the specific objectives that were used to answer the research questions:

To determine if there is a significant relationship between variety of selection and online impulse buying among students in University Malaysia Kelantan (UMK), City Campus.

To determine if there is a significant relationship between price attributes and online impulse buying among students in University Malaysia Kelantan (UMK), City Campus.

To determine if there is a significant relationship between website ease of use and online impulse buying among students in University Malaysia Kelantan (UMK), City Campus.

To determine if there is a significant relationship between shopping enjoyment and online impulse buying among students in University Malaysia Kelantan (UMK), City Campus.

The aftereffects of this exploration will additionally help online business administrator or advertisers give all the more promoting methods and correspondence techniques in web based business. It causes them convey all the more successfully, in this manner expanding the requirement for future business sectors and giving counsel from the data accumulated. It utilizes measurements, scientific strategies, and methods to acquire knowledge into the dynamic cycle. Along these lines, through exploration, it could give online business administrator or advertisers a superior comprehension of the variables that influencing college understudies' online motivation purchasing and to give better client care and exact market data.

From a buyer's point of view, this exploration can assist them with pulling in customers regarding site upgrades, showcasing boosts and situational improvements, subsequently upgrading purchasers' fun in the web based shopping measure and drawing in the consideration of various web based business markets. These bits of knowledge gave to the web based business stage can additionally improve its ascribes, including variety of selection, price attribute and website ease of use, to give a charming air and cause purchasers to feel energized and intrigued by the e-shopping measure.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Overall, the purpose of this research is to fill gaps for academicians and future researchers and to contribute to literature interested in conducting research in this area. The research could help future researchers interested in conducting research in the field, especially university students to buy online impulses. Researcher and academicians who intend to run or direct such study later on can utilize this exploration as a source of perspective for help and information consistency. Also, while exploring comparative factors, researcher can allude to the strategies utilized in this examination as a kind of perspective for their future exploration. Throughout the research, the expansion of future research has helped to provide audiences with clearer images of the factors that contribute to online shopping impulse buying.

2 Literature Review

2.1.1 Online Impulse Buying

(Beatty & Ferrell, 1998) provided a simpler classification that separates impulse purchases from unplanned purchases. Impulsive buys are "unexpected and prompt buys, with no pre-request proposed to buy a specific item classification or to finish a particular buy task", and a spontaneous update buy might be an "unavailable" update buy. As a result, impulse buying is a whimsy purchase that is almost unthinking. For example, shoppers see some sweets and decide to buy suddenly, while unplanned cautionary purchases are purchases because shoppers forget to list a piece of goods. For example, shoppers see sugar in the store and remember she bought them when they don't (Bellini et al., 2017). Past investigations have demonstrated that purchasers are impacted by others when they purchase items, which might be higher online than offline (Riegner, 2007). (Kollat & Willett, 1969), indicated to that when an individual attempts to purchase little things, for example, food, drinks, and different things, and winds up getting them with buying huge things like jewelry, watches, cell phones, and so forth, they are no plans. It indicates that the person made an impulsive or unannimity purchase during the purchase process.

2.1.2 Variety of Selection

Variety of selection is an important reason for shoppers to shop online (Szymanski & Hise, 2000). A study by (Chang, 2011), shown that when things were arranged into more subcategories in the decision menu, clients comprehended that the page offered more kinds of things and experienced furthermore shopping euphoria, improving them toward online stores. (Mallapragada et al., 2016) also uncovered that online retailers with multiple product categories will in general carry more advantages to online buyers. There are numerous reasons why online customers esteem item classes. To start with, superior products can expand the odds of addressing their requirements, especially when it is highly unlikely that traditional retail channels will offer them. Second, a wide variety of search engines allow consumers to buy higher-quality goods (Bakos, 1997).

2.1.3 Price Attributes

Price attribute is an important variable in the process of consumer's purchase decision-making, which can easily affect consumer's purchasing behavior. According to a study by (Biswas & Blair, 1991), revealed price discounts can affect consumers' price perceptions and ultimately their willingness to shop. (Brynjolfsson & Smith, 2000), argue that online products and services cost 9 to 16 per cent less than similar products in traditional retail stores, contingent upon whether duties, delivery cost and shopping costs are included for the cost. (Reibstein, 2002), points out to that online shopper frequently look for price information from various retailers of a similar item to settle on the most ideal economic choices. Now and again, not exclusively do costs are brought down, yet exceptional proposals from online suppliers make web based business a productive alternative for customers. These unique offers may incorporate a "get one, get one", free pass for an event, discount coupons for future purchases, free gifts for 1st customers, holiday exchanges, etc. (Arora & Aggarwal, 2018).

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

2.1.4 Website Ease of Use

The website ease of use of a website is a view of the extent to which the site can be easily browsed. In an internet shopping climate, convenience is the client's inclination that it is nothing difficult to use the site for web based shopping (Awad & Ragowsky, 2008; Cho & Sagynov, 2015; Vijayasarathy, 2004). (Liu et al., 2013) define ease of use as "how easy it is to navigate through online shopping sites". In addition, ease of use is that clients can without much of a stretch peruse efficient sites, peruse and comprehend the data showed on sites (Loiacono et al., 2002). Ease of use additionally includes intuitiveness and traversability on a site, a quick and confided in inquiry framework, a deliberate showcase of refreshed and complete data on the site, and simple installment (Akram et al., 2017; Bilgihan & Bujisic, 2015; Verhagen & van Dolen, 2011). Many scholars point out that factors influence impulse buying: online users are more likely to participate when they are positively affected. In addition, online shoppers' positive feelings about emotions increase impulse buying and overspending (Akram et al., 2017).

2.1.5 Shopping Enjoyment

Shopping enjoyment, whereby individuals consider shopping a sort of amusement, don't cling to a buying list, and subsequently, generally speaking, they will make many impulse purchases (Beatty & Ferrell, 1998). Online entertainment shoppers like to socialize while shopping. Shopping for them is a pleasant experience. The intermediary shopping enjoyment in this research is the pleasure and experience enjoyed in the shopping process rather than the satisfaction obtained from the purchased goods or services. Shopping enjoyment is the result of enjoying a fun experience during the shopping process, not the completion of the purchase. It might have been gotten from looking for merchandise or services, discovering deals and limits, finding out about new patterns and trends, interfacing with others, for example, loved ones, and delivering pressure when shopping on the web (Ozen & Engizek, 2014).

2.2 Hypothesis Development

The hypothesis is a proposition to test or a tentative statement that two variables are causally related. In short, it is a clear statement of what is supposed to be investigated. It is a must to investigate the relationship which researchers already analyse with reasonable reasons because the results that researchers found will give suggestions for the problem solving. It also can be used as formal procedures by statisticians or researchers to accept or reject a statistical hypothesis. In this research, researchers have identified four hypotheses as stated below.

H1: There is a significant relationship between the variety of selection and online impulse buying among students in University Malaysia Kelantan (UMK), City Campus.

H2: There is a significant relationship between the price attributes and online impulse buying among students in University Malaysia Kelantan (UMK), City Campus.

H3: There is a significant relationship between the website ease of use and online impulse buying among students in University Malaysia Kelantan (UMK), City Campus.

H4: There is a significant relationship between the shopping enjoyment and online impulse buying among students in University Malaysia Kelantan (UMK), City Campus.

2.3 Research Framework

In order to better explain the factors that affecting the online impulse buying, among students in University Malaysia Kelantan (UMK), City Campus, this study proposes external stimulus, including variety of selection, price attributes and website ease of use as independent variables that affect the online impulse buying among students in University Malaysia Kelantan (UMK), City Campus. Variety of selection, price attributes and website ease of use, as situational stimulus, market stimulus, and the website stimulus represents each of external stimulus. Shopping enjoyment as an organism is considered to be the mediator variable between external stimulus as independent variables and online impulse buying as dependent variables. According to (Mehrabian & Russell, 1974), they emphasize that stimulation affects a person's

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

emotional state. In addition, (Childers et al., 2001), a similar concept has been adopted, suggesting that the pleasure of an interactive web environment can affect consumers' attitudes towards Internet shopping.

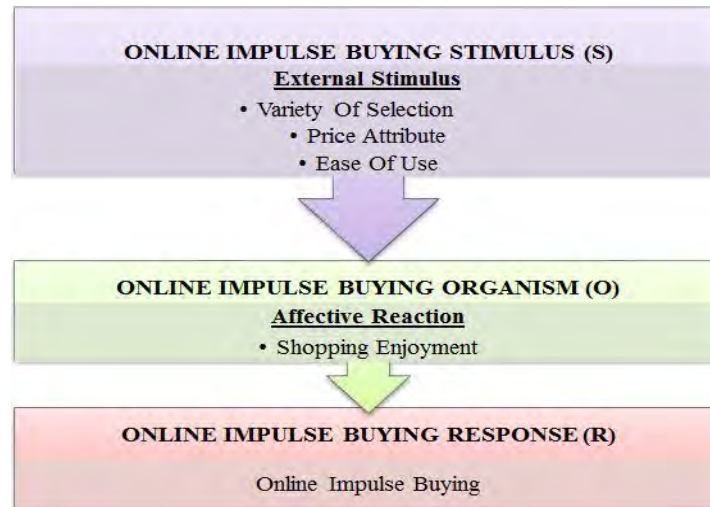

Figure 1: Suggested S-O-R framework

Source: The state of online impulse-buying research: A literature analysis (Chan, T. K., Cheung, C. M., & Lee, Z. W., 2017).

3 Methodology

3.1 Research Design

A research design is the plan of research followed to fulfill the research objectives or test the hypotheses of a research. Research design creates solutions to the research problem that researchers discussed earlier. Research design includes qualitative method and quantitative method. Quantitative method is more preferable as researchers are using surveys to conduct the research. A survey and experiment type of research is most likely to use quantitative research because qualitative research is more on interview and observation. Questionnaires will be distributed in this study. Likert scale is one of the common techniques that will be used in quantitative research which enable the opinion of the respondent translated into numerical data. Descriptive research is a sort of basic task research, which alludes to the examination and exploration of various components and various parts of the circumstance, the assortment and recording of information, zeroing in on the static depiction of target realities. Cross-sectional design is also known as cross-sectional survey, because the descriptive information obtained is collected at a certain point in time or within a short time interval, so easy to implement.

3.2 Data Collection

Data collection is the process of collecting and gathering information about identified variables. All researchers collect data to understand and explore the answers to their questions. Key data will be collected in this research and will be further explained. Primary data and secondary data were utilized in this research as data collection method. The primary data of researcher use to collect the data is questionnaire and the source of secondary data that researchers use to collect data is the including books, journal, web, article and electronic library data set.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

3.3 Sampling

Probability sampling is the sample techniques method that will be chosen in this research. In probability sampling, a random selection is used to select the sample so that each element in the population has a known chance of being selected. Simple random sampling is the most basic form of probability sampling. In a simple random sample, each member of the population has an equal known opportunity to become the body of the sample. This approach is used because researchers are required to collect data over exercise periods and there is no funding for the study. As a result, researchers will distribute online questionnaires through Google forms and publish them to certain groups or pages. This allows the person to fill out comments in their free time based on their volunteer attitude. By using this approach, consumers can easily provide their personal information and making the data collection process more efficient.

3.4 Population

Population refers to the whole population, events, and things of interest that researchers want to investigate. Every individual from the populace is known as a component. The complete number of components in the populace is known as populace size and it is signified by 'N'. Target population which is otherwise called the respondents that satisfy a portion of the particular benchmark set by the researchers. According to the University Malaysia Kelantan Enrollment Of Active Students Of Bachelor's Degree Session 2020/2021 showed that students in University Malaysia Kelantan (UMK), City Campus have around 5,631 enrolments.

3.5 Sample Size

The sample is a subset of the population. The total number of objects in the sample is called the sample number and is expressed as "n". The sample size is a subset of the researchers in the selected target population. The sample size between 30 and 500 is considered the ideal size for the study (Hill, 1998). The sample size is based on the sample table standard (Krejcie & Morgan, 1970). As gotten from the proposals, the sample size from Krejcie and Morgan's table, the quantity of 357 respondents will be recommended as adequate cases for this study.

3.6 Research Instrument

The questionnaire planned in the study was bilingual, for example English and Malay. This is on the grounds that English is a worldwide language and can speak with respondents from everywhere the world, while Malaysia is the Malaysian language of the nation. Furthermore, the inquiries in this study questionnaire have been adapted and adjusted, and this entire source is recorded in Table 1.

Table 1: Sources of Questionnaire

Section	Description	Sources	No. of item
Section A	Demographic	(Jin et al., 2015)	6
Section B	Variety of Selection	(Park et al., 2012)	4
	Price Attributes	(Cham et al., 2018; Park et al., 2012)	5
	Website Ease of Use	(Lee et al., 2018; Liu et al., 2013)	4
	Shopping Enjoyment	(Beatty & Ferrell, 1998; Brosdahl & Carpenter, 2011; Lee et al., 2018; Mohan et al., 2013)	5
Section C	Online Impulse Buying	(Lee et al., 2018; Verhagen & van	4

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

		Dolen, 2011; Zou, 2018)	
--	--	-------------------------	--

3.7 Data Analysis

Data analysis (the application of statistical and logical techniques in the system) can be used to describe and analyze the compression, generalization, and evaluation of data. The data for this research will be analysed using statistical software known as IBM. The Social Science Statistics Package (SPSS) software was used to analyze data collected from questionnaires. IBM was picked in light of its similarity with most other programming bundles and its ease of use utilized for information examination. SPSS is used to explain Descriptive Analysis, Pearson Correlation Analysis, and Multiple Regression analysis. By using this software will eliminate errors. Research can be carried out quickly and efficiently.

4 Data Analysis and Findings

The purpose of the study was to find out whether the different factors considered affected respondents' online impulse buying. In addition, the study highlights the relationships between the different variables that influence online impulse buying. A total 319 questionnaire were returned out of 357.

4.1 Demographic profiles of respondents

Table 2: Demographic profiles of respondents

Demographic Profiles	Number	Percentages
Gender		
Male	68	21.3
Female	251	78.7
Age		
20-22	78	24.5
23-25	214	67.1
26-28	19	6.0
29 and above	8	2.5
Races		
Malay	186	58.3
Chinese	108	33.9
Indian	23	7.2
Others	2	.6
Number of times respondents made online purchases (during the past months)		
Never	11	3.4
1-5 times	239	74.9
6-10 times	53	16.6
>10 times	16	5.0
How often respondents have been shop online?		
Weekly	41	12.9
Monthly	175	54.9
Semi Annually	82	25.7

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Annually	19	6.0
None	2	0.6
Payment Method for Micro transaction*		
Credit Card Channel	42	7.7%
Online Banking	270	49.8%
E-wallet	183	33.8%
Online Payment Systems	47	8.7%

Note: *Multiple choice questions

Table 2 summarizes demographic information of the 319 respondents. As per their gender, number of respondents is 21.3% male and 78.7% female. Equal numbers of respondents in the category of each age group of 20-22, 23-25, 26-28 and 29 and above are taken into consideration. The distribution of respondents as per their races showed 58.3% are Malay, 33.9% are Chinese, 7.2% are Indian and 0.6% is other races. Of the total respondents, 3.4% are never made online purchases during the past month, 74.9% are made 1-5 times online purchases during the past month, 16.6% made 6-10 times online purchases during the past month and 5.0% are made more than 10 times online purchases during the past month. Among all respondents, 12.9% of respondents have been shop online weekly, 54.9% of respondents shop online monthly, 25.7% of respondents shop online semi-annually, 6.0% of respondents have been shop online annually and 0.6% of respondents don't have shop online. As per their payment method for micro transaction, 7.7% using credit card channel as payment method, 49.8% using online banking as payment method, 33.8% using E-wallet as their payment method and 8.7% using online payment systems as payment method.

4.2 Descriptive Statistics

Table 3: Mean and Standard Deviation of IVs, MVs and DVs

Variable	Mean	Std. Deviation
Variety of Selection (IV ₁)	4.4937	0.46068
Price Attributes (IV ₂)	4.3129	0.52515
Website Ease of Use (IV ₃)	4.4240	0.48392
Shopping Enjoyment (MV)	4.2790	0.63446
Online Impulse Buying (DV)	3.9600	0.92451

The Table 3 illustrates the descriptive statistics for the factors that affecting the online impulse buying among students in University Malaysia Kelantan (UMK), City Campus. Table 3 showed all the independent variable consist of variety of selection, price attributes and website ease of use mediator by shopping enjoyment that affecting the online impulse buying among students in University Malaysia Kelantan (UMK), City Campus. Based on the result, variety of selection obtains the highest mean whereas online impulse buying has the lowest mean.

4.3 Reliability Analysis

The general rule of thumb is that the Cronbach's Alpha which is >0.9 (excellent), >0.8 (good), >0.7 (acceptable), >0.6 (questionable), >0.5 (poor) and <0.5 (unacceptable). Table 4 shows the Cronbach's Alpha values of the questionnaire were above the acceptance level with the value range above than 0.70.

Table 4: Reliability Statistics

Variable	No. of Items	Cronbach's Alpha	Results
Variety of Selection (IV ₁)	4	0.822	Good
Price Attributes (IV ₂)	5	0.790	Acceptable

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Website Ease of Use (IV ₃)	4	0.860	Good
Shopping Enjoyment (MV)	5	0.919	Excellent
Online Impulse Buying (DV)	4	0.919	Excellent

Based on the result from Table 4, the dependent variable that is Online Impulse Buying discovered to be excellent reliable (4 things; $\alpha = 0.919$). The independent variable is Variety of Selection indicated a good reliable (4 things; $\alpha = 0.822$). The second factor that is Price Attributes indicated a acceptable reliable (5 things; $\alpha = 0.790$) and the last independent variable that is Website Ease of Use discovered to be additionally a good reliable (4 things; $\alpha = 0.860$). The mediator variable which is Shopping Enjoyment demonstrated an excellent reliable (5 things; $\alpha = 0.919$). The overall variable is discovered to be an excellent reliable (22 things; $\alpha = 0.939$). Along these lines, the information was viewed as reasonable for additional examination.

4.4 Pearson Correlation

Pearson correlation analysis is utilized to decide the connection between at least two quantitative elements. This sort of assessment is an essential level, depending on the doubt of the direct connection between quantitative elements. The aftereffect of relationship investigation is a connection coefficient whose worth reaches from - 1 to +1. The connection coefficient +1 shows that two factors have great relationship in a positive direct way; a relationship coefficient of - 1 demonstrates that the two factors have a huge connection in a negative straight way, and a relationship coefficient of 0 shows that there is no direct connection between the two factors (Gogtay & Thatte, 2017).

1 Table 5: Pearson Correlation of IVs, MVs and DVs

Correlations						
		Variety of Selection	Price Attributes	Website Ease of Use	Shopping Enjoyment	Online Impulse Buying
Variety of Selection	Pearson Correlation	1				
	Sig. (2-tailed)					
	N	319				
Price Attributes	Pearson Correlation	.660**	1			
	Sig. (2-tailed)	.000				
	N	319	319			
Website Ease of Use	Pearson Correlation	.774**	.724**	1		
	Sig. (2-tailed)	.000	.000			
	N	319	319	319		
Shopping Enjoyment	Pearson Correlation	.532**	.670**	.665**	1	
	Sig. (2-tailed)	.000	.000	.000		
	N	319	319	319	319	
Online Impulse Buying	Pearson Correlation	.269**	.599**	.370**	.577**	1
	Sig. (2-tailed)	.000	.000	.000	.000	
	N	319	319	319	319	319
**. Correlation is significant at the 0.01 level (2-tailed).						

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Based on the Table 5, it can be seen that all of the independent variable which are variety of selection, price attributes, and website ease of use mediator by shopping enjoyment are significantly correlated to dependent variable which is online impulse buying among students in University Malaysia Kelantan (UMK), City Campus at 0.01 levels (2-tailed). The relationship between variables, 0.70 is strong, within range of 0.30 to 0.60 is moderate and below of 0.30 is weak. The table showed that relationship between variable variety of selection is stated as 0.269, while price attribute stated as 0.599, website ease of use stated as 0.370 and shopping enjoyment stated as 0.577. Thus, all of the independent variable with mediator has a weak and moderate relationship with dependent variables of this study.

4.5 Multiple Regression Analysis

Multiple regression analysis is a statistical technique used to compute the estimation of a needy variable dependent on the estimations of at least two independent factors. It is utilized to decide the coefficients of at least two independent factors and to gauge the measure of dependent factors. It utilizes the un-square technique to decide the coefficients of independent factors. In addition, SPSS will be used for multiple regression analysis in this study.

Table 6: Coefficients Analysis

Coefficients ^a						
Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	.236	.390		.605	.546
	Variety of Selection	-.408	.134	-.203	-3.033	.003
	Price Attributes	1.017	.116	.578	8.747	.000
	Website Ease of Use	-.306	.147	-.160	-2.081	.038
	Shopping Enjoyment	.590	.087	.405	6.811	.000

a. Dependent Variable: Online Impulse Buying

Two significant predictors are positively related to the criterion in the regression, as shown in Table 6 which is price attributes 1.017 and shopping enjoyment 0.590. Variety of selection has the lowest regression coefficient at -0.408 and website ease of use at -0.306.

4.6 Summary

Table 7: Hypothesis Statement

No. of Hypothesis	Hypothesis Statement	P-value	Remarks
H1	There is a significant relationship between the variety of selection and online impulse buying among students in University Malaysia Kelantan (UMK), City Campus.	0.003	Supported
H2	There is a significant relationship between the price attributes and online impulse buying among students in University Malaysia Kelantan (UMK), City Campus.	0.000	Supported
H3	There is a significant relationship between the website ease of use and online impulse buying among students in	0.038	Supported

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

	University Malaysia Kelantan (UMK), City Campus.		
H4	There is a significant relationship between the shopping enjoyment and online impulse buying among students in University Malaysia Kelantan (UMK), City Campus.	0.000	Supported

The significant value of Hypothesis 1, Hypothesis 2, Hypothesis 3 and Hypothesis 4 which mentioned in Chapter 3 are supported. These four hypotheses stated that there is a relationship between the variety of selection and online impulse buying, between the price attributes and online impulse buying, between the website ease of use and online impulse buying and also between the shopping enjoyment and online impulse buying. The result shows that hypothesis 1 is correct as the p-value for variety of selection is less than 0.05 which is 0.003. Hypothesis 2 is supported as the result show that there is significant relationship between the price attributes and online impulse buying among students in University Malaysia Kelantan (UMK), City Campus. The p-value for price attributes is less than 0.05 which is 0.000. Next, Hypothesis 3 is also supported as the result show that there is a significant relationship between the website ease of use and online impulse buying among students in University Malaysia Kelantan (UMK), City Campus. The p-value for website ease of use is 0.037 which less than 0.05. Hypothesis 4 is supported as the p-value is 0.000 which is lower than 0.05. Thus, shopping enjoyment has significant relationship with online impulse buying among students in University Malaysia Kelantan (UMK), City Campus.

4.7 Discussion and Recommendation

The finding of this research had enhanced our knowledge to make us understand the factor that affecting the online impulse buying among students in University Malaysia Kelantan (UMK), City Campus. This research has extended the understanding of the online impulse buying among students in University Malaysia Kelantan (UMK), City Campus by analysing the predictive variables which included variety of selection, price attributes, website ease of use and shopping enjoyment. This study can serve as a basic guideline if future researchers want to conduct similar studies on factor that affecting the online impulse buying among university students in Malaysia.

This study is trying to achieve four objectives. The first objective is to determine if there is a significant relationship between variety of selection and online impulse buying among students in University Malaysia Kelantan (UMK), City Campus. The second objective is to determine if there is a significant relationship between price attributes and online impulse buying among students in University Malaysia Kelantan (UMK), City Campus. The third objective is to determine if there is a significant relationship between website ease of use and online impulse buying among students in University Malaysia Kelantan (UMK), City Campus. Lastly, the fourth objective is to determine if there is a significant relationship between shopping enjoyment and online impulse buying among students in University Malaysia Kelantan (UMK), City Campus.

Based on the results and findings, this study has come out with several recommendations. The research recommendations bring together the expected perspectives on this research and what future research can do to better research the current research. Research recommendations are used to avoid repeated mistakes in future research in order to distribute better future research results.

Based on the above explanation, the first suggestion is to conduct an offline survey of this research in the future. For example, face-to-face interviews are used to solve the problem of false data or information. Through face-to-face interview, more problems can be dealt with and explained immediately. They can obtain complete information, perception, experience and thinking from the interviewee to improve accuracy. Sometimes, they may get unexpected opinions from interviewees.

In addition, researchers can use a longer period of time to conduct research and collect data. Time

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

constraints may limit the possibility of potential respondents to reply. Extending the time to collect data allows respondents to choose any day of the week to answer the questionnaire based on their busy schedule. Therefore, the researcher can collect more possible answers from the respondents and increase the accuracy and accuracy of the research results. It can reduce bias in research. In general, these are suggestions that researchers can use to improve their findings in the future.

5 Conclusion

The study examines the factors affecting the online impulse buying among students in University Malaysia Kelantan (UMK), City Campus. The result of this study shows that the literature is supported and the data collect is reliable. This is proven by all the independent variable and mediator which include variety of selection, price attributes, website ease of use and shopping enjoyment are supporting dependent variables, online impulse buying among students in University Malaysia Kelantan (UMK), City Campus based on the Pearson's Correlation Analysis and Multiple Regression Analysis.

According to the result shown all variable which include variety of selection, price attributes, website ease of use and shopping enjoyment are positive and significant towards online impulse buying among students in University Malaysia Kelantan (UMK), City Campus. This is because their P-value is less than 0.05. Hence, the implication of this research shows that this research provides useful suggestions for online business operators to increase consumers' online impulse buying behaviour.

Regarding the limitations of the research, although the hypothesis results indicate that there is a relationship between the variables, the research has certain limitations for future research. This limitation is the questionnaire distributed and collected online, and the time limit for collecting data, and for this method, the researcher cannot identify the authenticity of the respondent when answering the questionnaire.

Last but not least, some recommendations have been made for researchers who might conduct similar studies in the future. Future research can conduct offline surveys, such as face-to-face interviews, to solve the problem of false data. Second, future research can use a longer period of time for research and data collection. Extending the data collection time allows respondents to choose any day of the week to answer the questionnaire based on a busy schedule.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Acknowledgement

This examination project was effectively finished with help and co-activity of different specialists. I might want to communicate my most profound gratefulness and appreciation to those individuals who guided, helped and upheld us in finishing this examination.

Most importantly, I might want to express gratitude toward University Malaysia Kelantan (UMK) for allowing me the chance to be engaged with the exploration. All through this examination, I acquire a great deal of involvement, information and openness to a circumstance which can't be found in the course book and absolutely going to profit me later on.

Besides, I would like to special thanks to my Final Year Project Supervisor, Madam Siti Afiqah binti Zainuddin for her valuable information, inspiration and taking patience in guiding me step-by-step throughout the entire research project. Her guidance and support was priceless to me. I would also like to thank her for giving me so much patience for all the mistakes that I had made.

Lastly, I want to communicate my definitive gratefulness to those respondents who are happy to help by investing their valuable energy to react to the survey of the examination project. Other than that, I might want to thank my relatives, companions, course mates and gathering mates for aiding and supporting me till the examination project finished.

THE EFFECTIVENESS OF SOCIAL MEDIA IMPLEMENTED BY 7-ELEVEN IN SUSTAINING THE CUSTOMER LOYALTY IN MALAYSIA

Yak Li Xin and Norfazlirda Binti Hairani

Faculty of Entrepreneurship and Business,
Universiti Malaysia Kelantan,
Malaysia.

Email: jennylixin1997@gmail.com ; fazlirda.h@umk.edu.my

Abstract:

Nowadays, with the growth of e-commerce in the market, online shopping has developed many benefits to the retail industry such as 7-eleven, 99 speedmart, Family mart and others. The aim of this study is to study the effectiveness of social media such as FB, Twitter and Instagram implemented by 7-eleven in sustaining customer loyalty in Malaysia. Customer loyalty is an essential element for a company to survive in the intense competition. Enhancing the customer loyalty is one of the most efficient strategies to sustain in the retail industry. As the number of loyal customers increases, more benefits will be gained by the organization, in terms of market share, market position, and profit. Thus, SPSS software version 26.0, used for the purpose of descriptive analysis, normality test, spearman correlation analysis and multiple linear regression analysis. Data collected through convenience sampling. The result showed the effectiveness of Instagram towards customer loyalty is high and tangible which had the highest mean score followed by Facebook and Twitter. Finally, researchers suggested several recommendations which are to implement the use of social media in the retail industry.

Keywords: *Customer loyalty, Twitter, Facebook, Instagram, 7-eleven.*

1 Introduction

Convenience stores continue to witness strong growth in terms of outlet numbers and value sales. Increasing income and busier lifestyles, especially among the consumers in Malaysia and other major urban areas, have translated into greater consumer demand for quick and convenient access to all types of groceries through social media (Latif, 2018). Global retail is growing since the last decade due to the turbulent economic conditions and varying consumption patterns (Kasemsap, 2016). The total retail sales have risen at least 6.7% every year from 2010 to 2016 leading to the highest increase of \$22.5 trillion over the last few years. The retail industry in Malaysia has a large and growing retail market, supplied by local and imported products. Customer loyalty is known as an important issue for the success of any retail organization because it is known that drawing new customers is more expensive than keeping existing ones Magatef (2015). Social media is media for social interaction a superset beyond social communication. The advantage of social media is the online sharing of knowledge and information among different groups of people. Citizens are able to find 7-Eleven stores all over the country, even in the rural areas (Latif, 2018). 7-eleven is one of the largest convenience stores in Malaysia as it has 2,250 stores nationwide, while serving over 900,00 customers daily.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Social media like Facebook, Instagram, Twitter and Blog have a number of users and continue growing daily (Greenhow, Chapman, Marich, & Askari, 2017). The problem and issues in this study is if there are benefits from social media there will also have the negative or impact of the effectiveness of social media. The first issues are lack of awareness and trustworthy issues which most individuals distribute without realizing that it is fake news. For instance, there is a lot of fake news in social media, according to new YouGov research commissioned by Grey London, consumers trust social media platforms less than they did two years ago, with people split on how that impacts their usage of the platforms. More than 500 million people are estimated to communicate through social media. In a poll of more than 2,000 people, 63% said they had lost trust in social media platforms. As a result, 22% said they use social media less, while 25% said they use it even more. Meanwhile, 61% of users said they were now more careful about the privacy of their posts.

The first research objective of this study was; to examine how does Twitter effective in sustaining the customer loyalty of 7-eleven in Malaysia. The next research objective is to determine how does Facebook effective in sustaining the customer loyalty of 7-eleven in Malaysia. Then, the third objective is to identify how does Instagram effective in sustaining the customer loyalty of 7-eleven in Malaysia. Last but not least, the final research objective is to identify the dominant effective of social media either Twitter, Facebook, or Instagram in sustaining customer loyalty in Malaysia

2 Literature Review

The literature review of this study is it will review the literature on determining the effectiveness of social media implemented by 7-eleven in sustaining customer loyalty in Malaysia. The researchers also explain about the variables involved, previous study, research hypothesis, conceptual framework for this study. The independent variables of this study are the effectiveness of social media and how these variables help in sustaining customer loyalty in 7-eleven convenience stores in Malaysia.

2.1 Social Media

Social media allows relationships to form between users from distinct backgrounds, resulting in a tenacious social structure. A prominent output of this structure is the generation of massive amounts of information, offering users exceptional service value propositions. However, a drawback of such information overload is sometimes evident in users' inability to find credible information of use to them at the time of need. Social media applications such as Facebook, WhatsApp, Twitter, YouTube, LinkedIn, Pinterest, and Instagram often come to mind. These applications are driven by user-generated content, and are highly influential in a myriad of settings, from purchasing or selling behaviours, entrepreneurship, political issues, to venture capitalism (Greenwood & Gopal, 2015). As of April 2017, Facebook enjoys the exalted position of being the market leader of the social media world, with 1.97 billion monthly users (Nagy, 2017). In addition to posts, social media sites are bombarded with photo and video uploads, and according to the recent numbers, about 400 million snaps a day have been recorded on Snapchat, with around 9000 photos being shared every second (Kapoor et al., 2018). However, 50 million businesses are active on Facebook business pages, two million businesses are using Facebook advertising. Apparently, 88% businesses use Twitter for marketing purposes (Kapoor et al., 2018).

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

2.2 Twitter

Based on previous study Edison Research in a report, “Twitter usage in America 2010” pulled data obtained from a survey of 2000 Americans carried out in February 2010. The results were combined with similar studies carried out in 2009 and 2008 to provide a comprehensive representation of Twitter related user statistics. One of the noticeable findings was that people are much more aware of Twitter's existence as a social network service than in the previous two years. Twitter has now roughly acquired the same awareness amongst the population as Facebook. This massive surge in the percentage of Americans that are aware Twitter has likely been driven by traditional media saturation, with many mainstream television, radio and print media outlets prominently highlighting their Twitter accounts throughout the course of their programming. By commercialising these interactions Twitter will gain revenue for opening the communication channel for businesses advertising to their customers and potential customer base (Curran et al., 2011). Word of mouth (WOM) is the process of conveying information from person to person and plays a major role in customer buying decisions (Zhao & Rosson, 2009).

2.3 Facebook

According to (Casteleyn, Mottart, & Rutten, 2009). Facebook data can be compared to a crystal ball to understand customers. The user actions on Facebook appear in the news-feed status, and every single friend is able to see them. Facebook communities where users are members are the most relevant for marketers (Casteleyn et al., 2009). Through these communities, marketers are able to identify consumer tastes and likes, which is essential in helping to create market segmentation and targeting and positioning strategies (Ramsaran-Fowdar & Fowdar, 2013). Marketers can gain valuable information on community members' profiles and from the news feed statements that users post on their walls and pages (Casteleyn et al., 2009). This information can then be used for direct marketing purposes. Facebook allows companies to connect with many more people and much more often than the companies would be able to approach through phone calls, emails, or meetings (Ramsaran-Fowdar & Fowdar, 2013). One of the main benefits of social networking for organizations is therefore lower marketing costs in terms of monetary and personnel. Thus, with the economic downturn, many companies are trying to find ways to cut spending, and social networking sites are the way for them to market their businesses and reduce their costs.

2.4 Instagram

According to (Ting et al., 2015), Instagram first started off with providing functions on editing and sharing photos and later on added in the functions of sharing videos and photo messaging directly to another user. Instagram allows users to snap a photo or video anywhere they are at any time and share it with their followers nationally and also internationally (Bergström & Bäckman, 2013). Users are able to take a 15 seconds long video and 13 artistic filters are available for users to edit their photos (Huey & Yazdanifard, 2014). Instagram started to develop when Kevin Systrom and Mike Krieger wanted to focus on the HTML5 check-in application named Burbn, which allows the function of location check in, earn points upon meeting friends and post photos (Huey & Yazdanifard, 2014). Instagram is said to be the third most popular social network among the college students in the Malaysia and United States. Following the press release from Instagram (2013) cited in (Huey & Yazdanifard, 2014) in the year 2013, Instagram has 100 million monthly active users, 40 million photos were uploaded per day, 8,500 likes and 1,000 comments gained per second.

2.5 Customer Loyalty

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

According to (Wu & Ai, 2016), Customer's loyalty has received a great marketing attention since its implications cannot be overstated for modern businesses. In fact, customer's loyalty is regarded as a long-term asset and a key business outcome. Having loyal customers is a required option for various companies based on its important role in creating sustainable competitive advantages. According to (Abu-Alhaija, Hussein, & Allan, 2019), Customer's loyalty is considered a significant intangible asset for numerous companies. Marketing scholars have provided different conceptualizations on customer's loyalty. Different definitions of customer's loyalty have been adapted by marketing researchers based on the research objectives and contexts. For instance, conceptualized customer loyalty as "one's feelings of devoted attachment to the loyalty object, rather than repeated commercial transactions". Attitudinal loyalty as a customers' intention to remain committed to specific providers in the marketplace by repeating their purchasing experiences. Marketing scholars have provided different conceptualizations on customer's loyalty. Different definitions of customer's loyalty have been adapted by marketing researchers based on the research objectives and contexts. For instance, conceptualized customer loyalty as "one's feelings of devoted attachment to the loyalty object, rather than repeated commercial transactions". Attitudinal loyalty as a customers' intention to remain committed to specific providers in the marketplace by repeating their purchasing experiences.

3. Hypothesis Statement

This research would suggest testing and analysing the relationship between all these variables. This study will examine the effectiveness of social media implemented by 7-eleven in sustaining customer loyalty in Malaysia. To this end, four hypotheses have been developed:

- H0: There is a significant relationship between the effectiveness of Twitter towards customer loyalty in 7-eleven in Malaysia.
- H2: There is a significant relationship between the effectiveness of Facebook towards customer loyalty in 7-eleven in Malaysia.
- H3: There is a significant relationship between the effectiveness of Instagram towards customer loyalty in 7-eleven in Malaysia.
- H4: There is a significant relationship between the effective dominant factors of social media either Twitter, Facebook or Instagram towards customer loyalty in 7-eleven in Malaysia.

4. Conceptual Framework

The theoretical framework provides a broad, systematic structure of ideas that the researcher can use from the outset to investigate a phenomenon or a message. The primary aim of this research is to study the effectiveness of social media that is implemented by 7-eleven in sustaining customer loyalty in Malaysia.

Figure 1: Conceptual Framework

Figure 1 has to reflect the relationship between the independent variables and dependent variable in this study. Based on the framework, researchers can make a few hypotheses about the relationship between the dependent variable and independent variables.

5. Methodology

This study has been used as quantitative research and finds out the relationship between social media towards customer loyalty. This study purpose is to examine the effectiveness of social media that is implemented by 7-eleven in sustaining customer loyalty in Malaysia. The researcher had chosen to use causal research for this study. The researchers use convenience sampling by considering the time factor for the survey and population. A set up of constructed questionnaires survey had been distributed to the respondents which seek to examine the effectiveness of social media in sustaining customer loyalty in Malaysia. The researchers had used a self-administered questionnaire as the method for the survey. The research instruments consist of three sections. Section A of the survey was designed to capture the demographic characteristics of the respondent, while section B consists of four variables: Twitter, Facebook, Instagram, dominant factor of social media, and last but not least section C which is customer loyalty. The questionnaires are arranged in close-ended questions and dual languages, English and Malay languages. The population of this study is the number of populations in Malaysia which is 31.53 million. The number of respondents is 384 based on Krejcie and Morgan (1970). The data collected had been analysed using the statistical package for social sciences (SPSS) version 26.0. The data collected from the questionnaire had been analysed by using descriptive analysis, reliability test, normality test, correlation analysis and multiple linear regression.

6. Findings

The data of demographic analysis obtained from Section A include questions among various demographic variables of the respondents such as gender, age, race, and more others. There are some other questions also that I want to know from respondents. Researchers have presented the

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

respondents demographic profiles in a form of table.

Table 1: Descriptive analysis for demographic profile

	Item	Frequency (n=384)	Percentage (%)
Age	15-25 years	85	21.9
	26-36 years	119	30.6

	Instagram	95	24.4
	Twitter	87	22.4

According to descriptive analysis, based on table 4.2, the demographic profile of the age for the respondents. It found that the highest number of respondents from the age of 26-36 years old which is about 28.0% (n=140). As for the lowest, it is respondents which are age 50 and above. There are only 32 respondents (6.4%). Next, for the gender of respondents, the highest number for gender of respondents is male which is about 47.8% (n=186). While there is about 47.8% (n=186) of female respondents. Then, there are five races of respondents that answer this survey which has been stated that the highest number for the race of the race group is Chinese which is about 28.0% (n=109). Next, the lowest number of respondent's race is Christian which is about 10.0% (n=39). Furthermore, as for marital status the highest number for the marital status group

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

of respondents is a single group which is about 40.1% (n=156). Then, the lowest number of the marital status are the others group which is about 20.1% (n=78). Next, followed by employment status, the highest number for the employment status are self-employed which is about 35.0 (n=136). Then, the lowest employment status group is students which is 31.1% (n=121). As well as time spent on Social Media Per Day, it has been stated that the highest number for time spent on social media per respondent is 30 minutes which is about 24.2% (n=94). Next, the lowest time spent on social media per day of respondents is 2-5 hours which is about 18.0% (n=70). Hence, it means that there are only a few respondents that spend 2-5 hours per day on social media. In addition, as for the notification about 7-eleven is that the highest number of social media platforms that respondents got notification about 7-eleven is Facebook which is about 48.3% (n=188). Then, the lowest number of social media platforms that respondents get notification about 7-eleven is Instagram which is about 27.5% (n=89). Last but not least, as for the frequency of active Social Media Platform, the highest number for the most active social media platform is Facebook which is about 50.6% (n=197). While, the lowest number for the most active social media platform is Instagram which is 11.6% (n=45). Finally, the last question in the demographic question is Frequency of Social Media Platform used in 7-eleven Advertisement, the highest number of advertisements about 7-eleven in social media is Facebook which is about 51.9% (n=202). However, the lowest number of advertisements about 7-eleven in social media is Twitter which is 22.4% (n=87). Thus, this shows that the lowest frequent advertisement about 7-eleven that is seen by the respondent is Twitter.

Table 2: Mean score

Shapiro-Wilk	N	Mean	SD
Mean of Customer Satisfaction	0.951	384	0.000
Customer Loyalty	384	4.1922	0.70894
Twitter	384	4.0677	0.74743
Facebook	384	4.1311	0.74187
Instagram	384	4.1740	0.69093
Valid N (list wise)	384		

Based on table 1, it can be summarized that for the dependent variables of this study which is the Customer Loyalty. It is stated that the majority respondents strongly agreed with all the questions of effective of social media in sustaining Customer Loyalty that implemented by 7-eleven in Malaysia, thus this variable has the highest number of mean which is 4.1922 compared with the independent variables as respondents believe that the Customer Loyalty is very important for 7-eleven in order to increase their sales profit.

Next, the second highest value of mean falls on the last independent variable of the study which is the effectiveness of Instagram in sustaining customer loyalty which is 4.1740. From the result, it is stated that majority respondents strongly agreed and partially agreed with all the questions of these variables. Thus, it has been stated that the respondents agreed with all the questions that Instagram can effectively sustain customer loyalty by promoting the sale of 7-eleven products.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Then, the third highest value of mean falls on the second independent variable of the study which is the social media of Facebook in sustaining customer loyalty which is 4.1311. Thus, from these outcomes, it can be stated clearly that there are some respondents who disagree with the item that is provided in this section of variables. Therefore, the respondents believe that when 7-eleven used Facebook as the tools for them to advertise their product it can effectively sustain the customer loyalty of the respondents.

Additionally, the lowest value of mean of the independent variables is Twitter which is 4.0677. From this result, it can be concluded that there are respondents who strongly disagree on the item provided in this section of questions. Consequently, the respondents believe that Twitter is effective in sustaining customer loyalty.

As a conclusion, in this research study, the range of mean for each variable are ($4.0 \leq \alpha \leq 5.0$). The outcome of the mean for each variable is classified as a good result.

Table 3: Summary of Shapiro-Wilk Test

Shapiro-Wilk	Statistic	df	Sig
Customer Loyalty	.859	384	.000
Twitter	.873	384	.000
Facebook	.851	384	.000
Instagram	.853	384	.000

Based on table 2, the Shapiro-Wilk meaning value reaches 0.05, the data shall be considered regular. Although the value of importance is less than 0.05, it is assumed not to be distributed normally. The data are not normally distributed based from Table 4.14. Shapiro-Wilk refers to the test which according to the correlation between data and the normal values. It is recommended by researchers as it has the ability to detect a sample whether it comes from a non-normal distribution. Shapiro-Wilk Test was used to detect departures from normality and the sample size applied up to 2000. Shapiro-Wilk was first conducted to determine the normality of the data and the correct method used to evaluate the correlation was also determined. All the significant value is ($p=.000$) which is less than 0.05, thus in both tests of this study all the independent variables and dependent are abnormal for the correlation analysis. So, Spearman Correlation Analysis should be implemented in order to identify the relationship of the two variables of this study.

Table 4: Table of hypothesis results

Hypothesis	Spearman Correlation	Results
H1: There is a significant relationship between the effectiveness of Twitter towards customer loyalty in 7-eleven convenience stores in Malaysia.	$r = 0.467, p\text{-value } 0.000 < 0.01$	Accepted

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

H2: There is a significant relationship between the effectiveness of Facebook towards customer loyalty in 7-eleven convenience stores in Malaysia. $r = 0.550, p\text{-value} 0.000 < 0.01$ **Accepted**

H3: There is a significant relationship between the effectiveness of Instagram towards customer loyalty in 7-eleven convenience stores in Malaysia. $r = 0.521, p\text{-value} 0.000 < 0.01$ **Accepted**

H4: There is a significant relationship between the effective dominant factors of social media (Twitter, Facebook, Instagram) towards customer loyalty in 7-eleven convenience stores in Malaysia. $\text{Beta} = 0.36$ **Accepted (Instagram)**

Based on table 3, it can be summarized that all the four independent variables which are Twitter, Facebook, Instagram, and the dominant factor of social media (Twitter, Facebook, Instagram) has a significant relationship that 7-eleven has implemented in social media in order to sustain customer loyalty in Malaysia. Hence, all the hypotheses are accepted as the p value is less than 0.05.

7. Discussion

7.1 Twitter

Based on the result, Twitter has a fair correlation with the value ($r = 0.467$) and statistically significant with the value ($p = 0.000$). Thus, the hypothesis is accepted. According to (López, Sicilia, & Moyeda-Carabaza, 2017; Senders, Govers, & Neuts, 2013), the authors has agreed with the statement that there must be a significant relationship between relationship between the effective of Twitter towards customer loyalty in 7-eleven convenience store in Malaysia. This can be seen when the author explained that Twitter is one of the effective social media for 7-eleven in order to sustain the customer loyalty so that customers will buy 7-eleven products frequently as a loyal customer. According to (Li, 2015; Stutzbach & Rejaie, 2006), the authors had stated that Twitter is used as an important channel for relationship maintenance in sustaining customer loyalty. Twitter is known as an important part of the convenience retail picture in attracting customers to become loyal customers. Thus, it can be concluded that, a recent study investigated the relationship between customer loyalty and social media engagement (Hoffman & Lowitt, 2008). This study surveyed consumers in used social media engagement to measure the degree of customer loyalty. The result showed that only consuming social media (passive engagement) is directly related to affective loyalty. Also, the study maintained that organizations have been able to bring back dissatisfied customers and stakeholder through social media channels. Nowadays, the carefully designed customer loyalty program through social media has become a critical part of the marketing plan (He, Tian, & Wang, 2019).

7.2 Facebook

Facebook has a positive correlation relationship with the ($r = 0.550$) and statistically significant with the value ($p = 0.000$). Thus, the hypothesis is accepted. Then, this statement has been supported by (Boateng & Okoe, 2015; Casteleyn, Mottart, & Rutten, 2009). Customer loyalty occurs when it relates to those consumers that keep coming back to the store. It's about having

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

lower prices than competitors or better discounts for specific products that consumers are looking for. Consumers who are loyal to a brand remain customers because they believe that 7-eleven convenience stores offer a better service and higher quality than anyone else. Finally, it may be concluded that this statement has been supported because according to (Baird & Parasnis, 2011), the authors have stated that the power of Facebook which is the social media does give a very high effect towards 7-eleven in order for them to sustain customer loyalty. On the other hand, by using Facebook to promote 7-eleven products, it is much easier because consumers could get recommendation, opinion and reviews from the comments that had been made by the other consumer. According to (Constantinides & Fountain, 2008), the effectiveness of social media is versatile which the retailer can make changes once published whereas traditional media, once published, is set in stone. Other than that, social media is immediate, while traditional can be delayed due to press times.

7.3 Instagram

Instagram has a moderate correlation with the value ($r = 0.521$) and statistically significant with the value ($p = 0.000$). These variables have the most significant relationship with customer loyalty. Hence, this hypothesis has been supported by (Huey & Yazdanifard, 2014; Silva, De Melo, Almeida, Salles, & Loureiro, 2013), an active and well put-together Instagram campaign can lead to a huge amount of engagement among the followers which give huge benefit for 7-eleven in sustaining the customer loyalty. Not only that, but it can also drive customers to make referrals and become brand evangelists, as well. To sum up, according to (Handarkho, 2020), Instagram is ever-evolving, adding new features that can leverage to increase the level of connectivity between 7-eleven and customers. Hence, keep on top of everything Instagram has to offer, and retailers will be able to reach their audience in an easy and safe way.

8 Recommendations

8.1 Theoretical Implication

According to the theoretical recommendations for the future research, it is stated that there are only four variables that are based on in this analysis. Hence, its constraints preclude researchers from investigating other influences that could have an effect on the effectiveness of social media that is implemented by 7-eleven in sustaining customer loyalty. On this basis, it is prudent to incorporate more variables for more study in combination with various types of social networking and social media sites to be experimental. On this basis, it is prudent to incorporate more variables for more study in combination with various types of social networking and social media sites to be experimental.

Hence, in this theoretical recommendation for the future research, researchers would like to recommend for the future researcher to implement the use of social media in the retail industry. According to (Yadav & Rahman, 2018), as the prime of the marketing program is to boost the sales of the business and to develop and sustain a strong relationship between the retailer and customer and the foundation of social media is also a relationship. This study assessed the effectiveness of social media in sustaining customer loyalty.

8.2 Practical Recommendation for Future Research

Despite the drawbacks of this style of procedure, these experiments have offered valuable observations and have undeniably added to the social media literature. According to (Ramsaran-Fowdar & Fowdar, 2013), the benefits for organizations of marketing by using social media were

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

because it has lower communication costs, personalized and directed advertising, immediate feedback from customers, word-of-mouth referrals and positive influence on buyer behaviour from the customer. On the other hand, social media users may simply ignore the marketing and be weary with flooding of their walls with advertisements such as privacy violations and abuse of information by third parties and sellers' domination of communities are possible.

However, any strategic decision by a retailer overseeing marketers to implement social media tools as a part of a company in this field should be followed by a deep understanding of the industry. In addition, detailed research on how social media are used by all clients need to be studied especially by users.

9 Conclusion

This study was conducted to provide in-depth investigation of the effective factor of social media that is implemented by 7-eleven in sustaining customer loyalty in Malaysia. Hence, through the analytical results, it indicated that all the independent variables which are Twitter, Facebook, Instagram and the dominant factor of social media (Twitter, Facebook, Instagram) that were used in this study significantly affected the customer loyalty in Malaysia. For the time being, findings of this study also indicated that Twitter, Facebook, and Instagram had a positive correlation relationship towards customer loyalty in Malaysia and the researcher had concluded that Instagram was the most dominant factor of this study.

Nevertheless, it can be concluded that retailers are interested in exchanging and spreading information, trading products or services, staying close to current and potential customers, acquiring a better understanding of their customers and other benefits generated by social media. According to (Lim & Yazdanifard, 2014), the increase of communication flow of information among customers together with the increased availability of assorted communication channels is creating a new level of complexity in the design and implementation of new marketing strategies. Social media does not replace the traditional marketing tools but can be used as a complement to existing traditional promotional tools.

As a conclusion, social media is known as a popular social networking site used as a mobile application. It helps in getting people interacting nationally and globally. Social media have gathered all the people around the world who are interested in photography, communication as it is an application focused on photographic and communication functions. Moreover, it has now become a new marketing tool in social network marketing. Online marketing is not something new to the business industry and social network marketing has been actively applied nowadays. Recently, there are many companies that use social networking sites to sell and advertise their products and services. Social media has created a different platform for marketers to interact with the customers. In addition, according to (Krallman et al., 2016) social media such as Twitter, Facebook and Instagram can be used free of charge. Social media provides a better visual based platform and has made it convenient for the people to interact with each other.

10 Acknowledgements

First of all, I would like to thank and express my gratitude towards our GOD Almighty and my supervisor which is my course coordinator which is Puan Norfazlirda Binti Hairani. I would like to express my gratitude towards madam who helped me a lot by sacrificing her time by giving comments and advice that are valuable for me and her support towards me, her patience and letting me understand in order for me to finish this research project successfully.

Secondly, I would like to thank my examiner, Puan Mardhiah Binti Kamaruddin for her support

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

throughout my presentation time, as a general who has made an exciting experience throughout this presentation. Besides that, I would like to say that I was highly indebted to my university which is University of Malaysia Kelantan for providing great facilities and platform for me to search for the related sources in order for me to complete my research report. Thus, I also would like to thank the Faculty of Entrepreneurship and Business by providing me the latest information and format regarding this research project.

Then, I would like to express my sincere gratitude to my lovely family members, relatives, and friends for giving me the guidance, encouragement, enthusiasm and also the valuable assistance for me to carry out in doing this research report and they have been very supporting me throughout my studies in University of Malaysia Kelantan. I gained a lot of knowledge throughout this research report and I know that without their support it is not easy for me to complete my research project.

Finally, I would like to express my deep appreciation to all the respondents which have been cooperative in answering my survey question. They have sacrificed their precious time in order to help me to complete my research report by filling up the questionnaire. There is much useful information that gained from the respondent which has helped me in this report.

Abstract:

The aims of this research is to study the effectiveness of Foodpanda service affecting customer loyalty in Sabah. Based on that, this research will investigate the effect Foodpanda in Sabah and qualitative methods will be used. A questionnaire based survey distributed to 384 respondents. The service quality was measured in terms SERVQUAL attributes and key dimension is responsiveness, trust and reliability. The data collected were analysed by using SPSS v 26.0 (Statistical Package Science Social) version 26.0. Findings show that responsiveness, trust and reliability have that positive on customer loyalty that using FoodPanda service delivery. Finally, researchers suggest and recommend improving the

Keywords: Customer loyalty, Responsiveness, Trust, Reliability, Foodpanda

1 INTRODUCTION

Retail industry is an economic sector consisting of individuals and companies engaged in the sale of finished products to end users. (Barbara Farfan, 2019). Retail is the process of selling services or goods through various distribution channels for profit. (Norm Feuti, 2016). In Malaysia, the food retail industry is rapidly developing. The emergence of the food retail industry has become globalization in sector food retail in Malaysia. The changes in the external environment surrounded the food retail industry that impacted the economy. Retail businesses handling food and daily necessities received business continuity demands from the government, but many types of food retail business had closed. The impact on the economy is so severe that some say it will take time. Next, According (Rohit Chadda, 2020) Foodpanda online food service delivery almost 9 years based in 50 countries since 2012 until now. As we know Foodpanda is a mobile food delivery marketplace owned by Berlin and based on company Delivery Hero SE. he service is available via mobile application and via website. The company of Foodpanda has partnered with over 115,000 restaurants in 246 cities and works with over 80,000 delivery riders. Foodpanda is the platform to easy for customer order just used are technology (Rohit Chadda,2020).

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

The online business owners have been facing challenges while operating as this practice is relatively new (Frambach, 1998). Besides, the prevalent online grocery or food delivery service businesses have been struggling to reach out to their customers due to logistical issues (Ring, 2001). Research has shown that the major challenges that these online businesses are facing are mainly concerned with late deliveries, less interaction with the customers, slow response, overload of orders, etc. (Scarborough, 2002). Other problems related to consumer adoption include the ease of use of the websites, security concerns and complicated methods of payment (Fowell, 2000). As a result, it has been observed that the online food delivery service industry has been the slowest in growth compared to the other service sectors in the market (Yusof, 2016).

The first objective of this research was, to examine the influence of responsiveness toward Foodpanda service in Sabah. Next objectives was to examine the influence of trust toward Foodpanda service and the last research objectives was to examine the influence of reliability toward Foodpanda service.

2 LITERATURE REVIEW

The literature review of this study researchers will research the effectiveness of Foodpanda service affect customer loyalty in Sabah. The researchers will explore theoretical background that affect Foodpanda, previous study, research hypothesis, conceptual framework from this study. The independt variables of this research was responsiveness, trust and reliability and how these variables affect to customer loyalty used Foodpanda service in Sabah.

2.1 Customer Loyalty

Customer loyalty can be defined as a customer's faithfulness and commitment to a business. The measure of loyalty is often based on consumer preferences, the degree of satisfaction, the frequency of purchase, fidelity, price sensitivity and brand advocacy. Most loyal customers have what is considered polygamous loyalty. As opposed to monogamous loyalty, consumers spend most of their time and money at one location and only that location. Polygamous customers shops at a few location offer similar products, but only those few locations. Although monogamous loyalty is ideal, polygamous loyalty is not bad for business in fact it is better. Customer loyalty is a predictor of business success, so learning to manage it is crucial for organizations to understand (Sallie Burnet, 2020).

2.2 Responsiveness

This is a willingness to help customers and provide prompt service. This dimension emphasizes attention and accuracy in dealing with customer questions, complaints, issues and requests. Responsiveness is communicated to customers by length of time they have to wait for answers,

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

assistance to attention or question to problems (Parasuraman, 1985). This characterization is based on the ability of the organisation to be responsive to customers needs, with an emphasis on a willingness to respond promptly. Keeping a customer waiting, especially when there is no clear, obvious reason, generates a negative perception (bizSkinny, 2019).

2.3 Trust

Customer trust in online food delivery service firms about the reputation of their website which represents authentic and reliable information (Shin, 2015). According to (Yousafzai, 2003), trust is a personal perspective on expectations in online transactions that expect companies or organizations that sell online not to misuse websites. Based on (Sativa, Rahayu, & Astuti, 2016) trust is a consumer's belief in the quality and reliability of the product or service provided. Meanwhile, according (Zhu, 2016) states that trust is the level of trust or certainty of the customer in conducting online transactions

2.4 Reliability

Reliability refers to the organization ability to perform the service accurately and dependably. There are 3 basic components to this dimension, the ability to complete the service, first is on time, second is consistently (routine tasks should be completed in a consistent manner) and third is error free, every time (bizSkinny, 2019). This is the ability to perform the services promised accurately. Reliability means that the company fulfills its promises regarding problem solving, delivery, service delivery, and pricing (Parasuraman, 1985).

3 HYPOTHESIS

This research will analyse and examine the effectiveness of Foodpanda service affect customer loyalty in Sabah. Three hypothesis have been developed:

H1: There is significant responsiveness in Foodpanda service in Sabah.

H2: There is significant trust in Foodpanda service in Sabah.

H3: There is significant reliabilty in Foodpanda service in Sabah.

4 CONCEPTUAL FRAMEWORK

The conceptual framework is an analytical tool with several and contexts. It can be applied in different categories of work where an overall picture is needed. It is used to make conceptual distinctions and organize ideas. The aims of this study is the effectiveness of Foodpanda service affect customer loyalty in Sabah.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Figure 1: Conceptual Framework

Figure 1, this research model is study of the significant effect of Foodpanda service that is based on the literature review. Based on the framework, research can make the relationship between independent variables and dependent variables.

5 METHODOLOGY

This study will use primary data which is quantitative of questionnaire method data collection to measure the respondent toward effectiveness of Foodpanda service affect customer loyalty in Sabah. A 5-point Likert Scale will be used on the questionnaire to gain the response from respondent which is (1) strongly disagree (2) disagree (3) neutral (4) agree (5) strongly agree. Three sections of questionnaire which is Section A is about demographic respondent while section B consists of independent variables which is responsiveness, trust and reliability, and s Section C is question based on dependent variables which is customer loyalty. The questionnaire will be arranged in the number of population in Sabah which is 3.91 million showing just a slight increase from 2019. ([R.Hirschmann](#), 2020). The number of respondents is 384 based on sample size Krejcie, Robert V.Morgan and Detyle W (1970). The data collected from questionnaire had been analysed by using SPSS v 26 (Statistical Package Science Social) version 26.0. Lastly but not least, the data will be analysed by using descriptive analysis, reliability analysis, normality test, correlation analysis, simple liner regression and multiple regression.

6 FINDINGS

Data of demographic respondents obtained from Section A such as age, gender, race and other more. There are some other questions also in demographics that I want to analysed from respondents and researcher will be shows the demographic respondent based on using the table

Table 1: Descriptive Analysis for Demographic Profile of Respondents

Demographic	Item	Frequency (n=384)	Percentage (%)
Age	18-25 years old	316	82.3%

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

	26-30 years old	54	14.1%
	31-40 years old	11	2.9%
	41 and above	3	0.8%
Gender	Male	175	45.6%
	Female	209	54.4%
Race	Malay	214	55.7%
	Chinese	102	26.6%
	Indians	62	16.1%
	Other	6	1.6%
Marital status	Single	345	89.9-
	Married	35	9.1%
	Divorced	4	1.0%
Education level	Secondary school	27	7.0%
	College	14	3.6%
	Diploma	43	11.2%
	University	287	74.7%
	Others	13	3.4%
Occupation sector	Housewife	7	1.8%
	Employed Self-employed	53	13.8%
	Student	7	1.8%
	Unemployed	309	80.0%
	Others	4	1.0%
		4	0.8%
How many times do you order through Foodpanda each week?	Less than 3 times per week	294	76.5%
	3-6 times per week	87	22.7%
	More than 6 times per week	3	0.8%
How much do you spend per week?	Less than RM50	234	60.9%
	RM50-RM100	147	38.3%
	More than RM100	3	0.8%

According to descriptive analysis, based on table 1, which is the demographic respondents of the age it has been stated that the the highest number from the age group of 18-25 years old which is about 82.3% and under is 316 respondents. This shows that respondents aged between 18-25 years answered this survey more compared to the other age group While the lowest age group was 41 and above which is 0.8% (n=3). Next, the gender respondents shows that the highest of female respondents is 209 with a percentage 54.4%. This shows that there are more female answer respondents that answer this survey compared the male with percentage of 45.6% and under is 175 respondents answered this survey. Then, the highest of race respondents which is malay respondents with percentage 55.7% (n=214). This shows that there

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

are more Malay race groups answered this survey and the lowest is other race group of respondents with 1.6% and under 6 respondents just answered the questions. Furthermore, as for marital status the highest is single respondents with percentage 89.9% (n=345). Then, the lowest of marital status divorced respondents with 1.0% (n=4) answered this survey. Next, followed by education level, the highest number of education group is are University with 74.7% (n=387). Then, the lowest for education level is the other group which is 3.4% (n=13). Next, the highest of occupation sector is student which is 80.0% (n=309) and followed by the lowest occupation is unemployed and other groups which 1.0% (n=4). Furthermore, as for order through Foodpanda each week the highest is less than 3 times per week which is 76.5% (n=294). Then, followed by the lowest is more than 6 times per week which is 0.8% (n=3). Other than, the highest spend foodpanda per week is less than RM50 which is 60.9% (n=234) and the lowest is more than RM100 spend per week which is 0.8% (n=3).

Table 2: Level of Mean

Variable	Mean	Interpretation
Responsiveness	3.7357	High
Trust	4.1595	High
Reliability	4.1738	High
Customer Loyalty	4.1842	High

Based on table 2, it can be summarized that the most highest it can be summarized that for the dependent variable of this study which is the customer loyalty. From the result, it is stated that majority respondents agree with all the respondents of the effective of Foodpanda service delivery in sustaining customer loyalty in Sabah. Thus, this variables has the highest number mean which is 4.1842 compared other independent variables as believe that customer loyalty is very important for Foodpanda in order to increase their service

Next, the second highest value of mean for independent variables of this study which is the effective of reliability in sustaining customer loyal which is 4.1738. From the result, it is stated that majority respondents is agree with all the questions of this variables. Thus, it has been stated that respondents agreed with all questions that reliability can effectively in sustain the customer loyalty by service of Foodpanda.

Then, trust is the third highest value of mean for the independent variable of this study which is delivery service of trust in sustaining customer loyalty which is 4.16 . Thus, frim these outcomes, it can be stated clearly that there are some respondents who agree with the item that provided in this section of variables. Therefore, the respondents believe that when Foodpanda make a trust to customer loyalty that can effectively sustaining the customer loyalty of the respondents.

In addition, it can be summarized that for the independent variables of the study which is effective of responsiveness is lowest in sustaining customer loyalty which is mean 3.7357. From the result, it is stated that the majority respondent agrees with all questions of this variable. Thus, it has been stated that the respondent agrees with all questions that

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

responsiveness can effectively sustain the customer loyalty by giving good responses to customers.

As conclusion, in this research study, the range of mean for each variable are (3.0 < > 5.0).

The outcome mean for each variable is classified as good result.

Normality test

Table 3: Normality for simple linear regression

Variables	Simple Linear Regression		
	b	t-stat(95%CI).	p-values
Responsiveness	0.08	4.62 (0.23,0.68)	<0.001
Trust	0.38	8.15 (0.43,0.38)	<0.001
Reliability	0.49	10.37(0.44,0.48):	<0.001

Based on table 3, it shows that there is a simple linear regression results show that there is a significant linear reliability of customer loyalty b=0.49 which is increase compared other variables.

Table 4: Normality for multiple linear regression

Variables	Multiple Linear Regression		
	b	t-stat(95%CI).	p-values
Reliability	0.49	10.37(0.44,0.48):	<0.001

*b Adjusted Regression Coefficient

*Stepwise Multiple Regression method are applied.

Based on table 4, it shows that there are multiple linear regression results that show that there is a significant linear of reliability on loyalty b=0.49; is increased in reliability, so that loyalty will rise by 0.49 (b). Also, there is a significant effect of reliability towards customer loyalty (<0.05). Thus, this means that there are good results for reliability that affect to customer loyalty.

Thus, for final model equations of regression could be formed by using this formula:

$$Y = B_0 + B_1X_1 + B_2X_2 + B_3X_3$$

$$Y = b_0 + b_1x_1$$

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Spearman's Correlation Analysis

Table 5: Results of Spearman's Correlation Analysis between Variables

Variables	Correlation coefficient	
Responsiveness	Pearson Correlation	1.000
	Sig. (2-tailed)	.
	N	384
Trust	Pearson Correlation	0.550**
	Sig. (2-tailed)	<.001
	N	384
Reliability	Pearson Correlation	0.454**
	Sig. (2-tailed)	<.001
	N	384
Customer Loyalty	Pearson Correlation	0.496**
	Sig. (2-tailed)	<.001
	N	384

**correlation is significant at the 0.01 level (2-tailed)

Table 5 presented the results of the Spearman's correlation analysis between variables on the effectiveness of Foodpanda service affect customer loyalty in Sabah. The value of the Spearman's correlation for responsiveness 1.000. It is shown that the responsiveness is moderate positive level. Followed by trust,, the value of the Spearman's correlation trust is 0.550. It is shown that the trust is at a high positive level. Next, the value of the Spearman's correlation reliability is 0.454 It is shown that the trust is at a positive level. Last but not least, the value of the Spearman's correlation customer loyalty is 0.496 It is shown that the trust is at a high positive level.

Hypothesis Testing

Table 6: Summary of Hypotheses Testing

Hypotheses	Statistical Analysis	Result
H1 There is a significant of responsiveness service FoodPanda delivery in Sabah.	1.000	Accepted
H2 There is a significant of trust service FoodPanda delivery in Sabah.	0.550	Accepted
H3 There is a significant of reliability service FoodPanda delivery in Sabah.	0.454	Accepted

Based on table 6, it can be concluded that all the three independent variables namely responsiveness has a high positive with statistical analysis is 1.000, while trust has a good positive with statistical analysis is 0.550 toward foodpanda service in Sabah. While, the reliability also have a good positive with statistical analysis is 0.454. In short, three hypotheses in this study were accepted after Spearman's correlation testing was conducted

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

7 DISCUSSION

Responsiveness

The first purpose of this research is to identify the affected the responsiveness of Foodpanda service in Sabah. The coefficient for responsiveness of Foodpanda service is $b=0.08$, and p-value is 0.000 which is (α root $p<0.001$) it shows that responsiveness has a significant relationship.

The organization's ability to adjust to market dynamics is one of its core capabilities, and means to achieve competitive advantage (Beenardes and Hanna, 2009 ; Lee et al. 2004). The key concepts in this respect are responsiveness and flexibility (Reichhart and Holweg, 2007). Responsiveness tends to be linked to the changes of behaviour requires by the system external environment. It also includes some time or effort dimensions, such as speed of response (Thatte et al, 2013). In this study responsiveness is defined as a system performance capability to timely change behaviour in response to external stimuli (Heidi C.Dreyer, Natalia Swahn, Kasper Kiil, Jan Ola Strandhagen and Anita Romsdal, 2015).

Trust

The second purpose of this research is to identify the affected trust of Foodpanda service in Sabah. The coefficient for trust of Foodpanda service is $b=0.38$, and p-value is 0.000 which is (α root $p<0.001$) it shows that trust has a significant relationship.

According (Yusof Ismail, A.K.M. Ahasannul Haque & Selim Ahmed, 2015), trust is earned based on previous experiences of the customer. In the e-commerce environment, if the customer has a positive experience from his or her previous use of a product or service, then he or she will choose the same website to place the order. Likewise, in the case of online food ordering, customers will revisit the website if they trust it. (Yoon, 2002) found that there are four factors that are crucial in the formation of trust such as transactional security, website properties, search functionality and personal variables. These four factors formulate trust and if they are fulfilled then the overall loyalty is increased (Yoon, 2002). Therefore, based on this discussion, it is expected that online food trust will have a significant effect on customer loyalty.

Reliability

The third research is to identify the affected reliability of Foodpanda service in Sabah. The coefficient for reliability service is $b=0.49$, and p-value is 0.000 which is (α root $p<0.001$) it shows that reliability has a significant relationship.

According (Kenneth.C. Adiele, Azunwo and A.Anyahie, 2018), relinquish is about the accuracy and timelines in the service provided. Quick service food firms are expected to be

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

accurate in their service delivery, be prompt at responding and attending to customers food order and delivery. Reliability is just as important good impressions, because every customer want to know of their service is reliable and fulfill the set requirements of loyalty (Delgado & Ballester, 2004). Service reliability is an important factor in restaurants success the world over. Most customers in the hospitality industry would prefer patronizing fast food firms that are considered reliable and dependable over a long period times (Kenneth.C. Adiele, Azunwo and A.Anyahie, 2018). Efficient service reliability increases customer trust, loyalty, retention and positive word-of-mouth for a company. An increase in positive word-of-mouth/referral could impact significantly on food delivery level (Kenneth.C. Adiele, Azunwo and A.Anyahie, 2018).

8 RECOMMENDATION

Implications

Based on implications research focused on three independent variables which are responsiveness, trust and reliability in service delivery. The result shows that responsiveness, trust and reliability was a factor for customer loyalty who are affected by customer loyalty. In addition, responsiveness , trust and reliability sensitivity were important for research as long as the service was a giving good. Also, the emphasis on service delivery is important in understanding the pandemic and impact to customer loyalty.

Finally, the researcher finds out that the responsiveness, trust and reliability is affected of FoodPanda service on customer loyalty during pandemic, means that this is the objective of customer loyalty giving there responsibility as a customer especially in pandemic.

Limitations

The limitations have limited several, first is lack of research in service quality during pandemic especially for online service and making researchers do research. As a result, the researcher aiming to study the effectiveness of FoodPanda service on customer loyalty in Sabah is the first research explorer during pandemic. Next, the responsiveness, trust and reliability on customer loyalty based FoodPanda service . Future researchers will compare the quality service online FoodPanda with others. Dependent variables as customer loyalty will provide a comparison based on their experience doing FoodPanda service during pandemic. Other than that, die to the face-to-face pandemic interview do not do where the researcher will make an interview online. Interview online which might have limited the research ability to gather more insight from the respondents, although the respondents used a google form questionnaire to answer the questions. And finally, the qualitative method is the only one the researcher used, although the qualitative method can help researchers to more understanding and explore wider.

Practical Recommendations for Future Research

From this study, researcher found that responsiveness, trust and reliability effected on customer loyalty of FoodPanda service in Sabah and this independent variable important. This study was made to find out what customer response and what factors they use FoodPanda service. Based

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

on multiple regression analysis shows these three independent variables effect on customer loyalty in performing FoodPanda service because during pandemic online platform makes it a convenience for customers to order food. Most customers do not have difficulty using FoodPanda applications as the result shown in chapter 4. There may be customers who prefer to use FoodPanda because it is convenient, not limited in terms of food place and cheap costs. The recommendation is that FoodPanda need to upgrade their service. Such an, FoodPanda needs improve services in terms of place for food delivery such villages areas. Such as are difficult to get out of since the pandemic and rely on online.

9 CONCLUSION

This research showed out that the factor that affected service FoodPanda on customer loyalty in Sabah during pandemic. The factor that affected is the responsiveness, trust and reliability as an independent variable. This research also will carry out what the data collection method used, sample size, sampling techniques, populations study, development of the research instrument, data analysis procedure and variable measurement. The data analysis of this research will be an online questionnaire which is google form by survey the questions from the respondents. Data analysis was collected by using reliability, descriptive analysis, multiple regression analysis and Spearman's correlation analysis. Other than that, the researcher determined the significance of the research hypothesis and results showed that there is significant between independent variables and dependent variables. Finally, the improvements for FoodPanda service and future research.

ACKNOWLEDGMENT

First of all, I would like to express my special thanks to gratitude supervisor Madam Norfazlirda Binti Hairani for giving me the opportunity to research and providing invaluable guidance through this research. Her dynamism, vision, sincerity and motivation have deeply inspired me. It was a great privilege and honor to work and study under her guidance. I am really thankful.

Secondly, I would like to thank my examiner, Puan Mardhiah Binti Kamaruddin for her support throughout presentation time, sincere guidance and inspiration in completing this project and I would like to thank the Faculty of Entrepreneurship and Business by providing me the information to complete this project and I really indebted to my University which is Universiti Malaysia Kelantan providing platform for me.

Secondly I would also like to thank my parents and friends who helped me a lot in completing this project. I am making this project not only for marks but to also increase my knowledge and finally I would like to express my deep appreciation to all the respondents which have been cooperative in answering my questionnaire. I really appreciate all your time and sacrifice by helping me to complete my project.

Abstract:

This study aims to determine the effect of price, service of quality and easiness towards decisions to purchase products through Shopee. In this study, primary data is selected which is the quantitative method of data collection will be used as the survey method to measure the respondent's behaviour toward purchasing buying decision through Shopee. There are 32.7 million population in Malaysia, so 384 respondents will be chosen in this research as the sample size. The sample size of the research is decided based on Krejcie and Morgan (1970). therefore, the selected population in this study is people that have experienced shopping in Shopee will be selected as respondents. The study begins by distributing the questionnaire to the respondents through via online method. Data analysis techniques used multiple linear regression models. The results of this study indicate that price, service of quality and easiness affect the product purchase decision through Shopee with each significant value of <0.001.

Keywords: price, service of quality, easiness, decision on purchasing product

1 INTRODUCTION

Online shopping is a form of electronic commerce which lets consumers to directly buy goods or services from a seller over the internet by using a web browser or a mobile app. According to Prof. Dr. Tatik Suryani, (2020) online shopping is common particularly when individuals feel comfortable and easy to shop at any time or anywhere. Online shopping has become a habit in society nowadays. Online is an alternative way of buying and selling products or services, which in terms of service, quality, protection and popularity has grown quite well (Laohapensang, 2009).

Malaysian e-commerce market is growing fast. Malaysians spend more on online purchases than many of their Southeast-Asian neighbours, but average ecommerce revenue per user (ARPU) in the country still barely a quarter of the global average. In 2017, according to the research conducted by MCMC, there are 24.5 million users which is 76.9% have an access to internet and the other 7.5 million do not have an access to the internet from 32 million people in Malaysia (Ahmad, 2018).

In addition, more than 32 million Malaysians have been affected by the Movement Control Order (PKP) in an effort to control the spread of the COVID-19 epidemic. In the retail sector where leading e-commerce platform which is Shopee has found new shopping habits among Malaysian consumers because the implementation has created new norms (Ambrose, 2020)

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Next, Shopee was first introduced in Singapore in 2015 and has grown rapidly so far since then. Shopee reach has spread to many nations such as Malaysia, Taiwan, Vietnam, Thailand, Indonesia and the Philippines. Moreover, Shopee was successful in Brazil in 2019 and became the first Shopee in South America and outside of Asia. Shopee is part of an online shopping site operating in Southeast Asia within a retail network. Based on the e-commerce map published by iprice.co, Shopee has successfully held its first spot in the second quarter of 2019 as the top e-commerce for ten consecutive quarters, as seen from the Play Store ranking.

Shopee is a marketplace that has potential in Malaysia. According to Ian Ho which is Shopee Regional Managing Director said, over the few months, shopping activities on Mondays and Tuesdays have increased showing that consumer love shopping at the beginning of the week. It showed, consumers spend about 20% more time on Shopee a week. The sellers must also provide the best quality of service, in order to encourage consumers to purchase the items offered. Then, Shopee expects the trend of selling and buying through live streaming to become more popular as in China. Furthermore, Shopee become list of the top ten e-commerce in Malaysia 2018 besides Lazada, Zalora, Lelong.my and Carousell. (AseanUp, 2019).

This study will give advantages to customers who prefers online shopping because they can find out whether the price offered at the Shoppe has affect their decision on purchase or not. Hence, this study can help customers to make wise decision.

This study can also assist retailers especially who conducts the online business in analyzing information in term of service quality where they can find out whether the service carried out can affect customers on online purchases. Besides that, it also helps traders detect the price offered at the online shopping whether it give affects the customer on purchasing decision.

Retailer also can find out the does the price, service quality and easiness influence towards customer decision to purchase products through online shopping. Furthermore, with the data collected through this study, it is able to provide information to retail industry and supplier in providing a good product and services to customers.

Finally, this study will give benefit to researchers to fill the data and information than can obtained from previous studies and also can used as a reference to do the research in the future.

2 LITERATURE REVIEW

2.1 Price

Price is the amount of money as a medium of exchange to acquire products or services. Kotler and Armstrong (2006). Next, Shanthi & Kannaiyah (2015) found that prices were the most influential factor in online purchasing decisions. In previous study, the researchers are concerned to take up price as a variable because of the goods that are in sell on the marketplace. Shopee able to compete with the marketplace. A kind of where the offer is very varied and there are even cheaper because the goods imported directly from abroad and thus formed a much cheaper price than the market price. Price is one factor that can affect a person for the purchase decision states that the price significantly influence the

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

purchase decision. (Goldianus Solangius Mbete & Rinabi Tanamal, 2020)

2.2 Service quality

Raje Arcana and Vandana (2012) mention that the three metrics of reliability, responsiveness and empathy can assess the quality of online services. Reliability is the first one. This applies to how companies offer their good and accurate services to customers, so that customers can trust and rely on them. It is very important to remember that it can give retailers the confidence of customers in making product buying decisions by providing a real service impression. On the other hand, service quality is the assessment of long-term provided by the consumer on the service provided based on the evaluation of cognitive. Companies that consistently provide the best service then it will get an edge over the competition, more freely and easily in fostering the loyalty of the consumer. In this case, the success of a company or business is based also from the factors of service quality. (Goldianus Solangius Mbete, Rinabi Tanamal, 2020).

2.3 Easiness

According to Goldianus Solangius Mbet, Rinabi Tanamal, (2020) one of the factors that attract the buying interest of consumers, namely the ease. Each marketplace or anyone selling online should consider the ease in accessing and obtaining the goods needed by the consumer. Because by increasing the ease of it will make consumer feel comfortable and feel easy in obtaining the good that, the goods or services needed or wanted. This will give benefit from the consumer in giving the decision to make a purchase or otherwise do not want to make a purchase. Based on the description above, the researcher decided to use the variable ease as one of the independent variables to determine the purchase decision. Other than that, consumers choose online market because the ease of transaction without going through the queue in the purchase. Besides that, there are many variations of the products supplied and accompanied by many choices of price are offered and ease to comparing prices before they buying. (Abdulrahman & Mohammed, 2017).

2.4 Purchase decision

Purchasing decision also one of the main components of consumer behaviour where the decision to buy can influences how the process of making the decision is made. Purchase decision is based on the user's behaviour in choosing the product to find a way out and decide whether to use the product (Rini Astuti & Anisa permata dewi 2017). According to Afroz (2013) a purchasing decision is an attitude of using and willing to buy a product whether in the form of goods or services that are felt to be able to satisfy their wants or needs and are willing to take risks against the decisions that have been taken. In Sanjiwani & Suasana (2019) argued interpretation of cognitive factors and consumer persona is very useful and has a strong influence on the attitude of purchasing a product or service from its products and companies (Goldianus Solangius Mbete and Rinabi Tanamal, 2020).

2.5 Research Hypothesis

Three hypotheses are developed in this study which are as following: -

H₁: There is a significant effect of price on decision making in buying goods through Shopee.

H₂: There is a significant effect of service quality on decision making in buying goods through Shopee.

H₃: There is a significant effect of easiness on decision making in buying goods through Shopee.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

2.6 Conceptual Framework

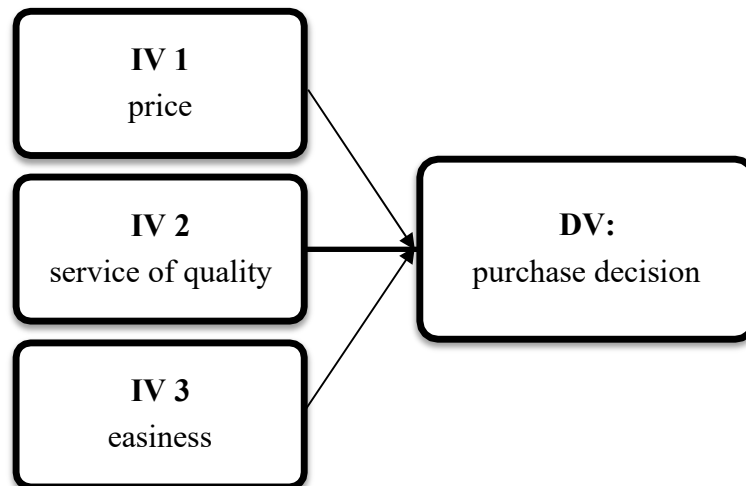

Figure 2.1: Conceptual Framework

Figure 2.1 shows the proposed conceptual model of the study price, quality of service and easiness are the independent variables (IVs) for this study and purchasing decision as the dependant variable (DV) to be tested for this particular study.

3 RESEARCH METHODOLOGY

3.1 Research Design

For this study, the research design use is quantitative method. Quantitative research refers to a structured way to collect and analyse the data collected from various sources. This study is focusing on customer that have experience using Shopee in Malaysia as respondents. Besides that, a set of questionnaires that consist of questions that related research variables will be answered by the respondent. In this study, primary data is selected which is the quantitative method of data collection will be use as the survey method to measure the respondent's behaviour toward purchasing buying decision through Shopee, a questionnaire method is chosen as a tool to collect data. The study begins by distributing the questionnaire to the respondents through via online method. The questionnaire was distributed via online as it can respond by anyone and anywhere (Debois, 2016). From that, questionnaire answered gathered among purchaser in Malaysia.

3.2 Measurement Development

To gather data, researchers developed an online questionnaire. The question in survey is designed according to the conceptual framework. Nominal scale used in Section A where this section is the first segment gathers data about biographical detail of respondent including gender, age, ethnicity, marital status, education, and income. For section B and C, researcher used 5-point Likert scale to determine the level of agreement customers are about the statement

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

given. Likert scale is used to measure people's attitudes, opinions, and perceptions about phenomena and social problems that arise in the midst of society. This study used 5-point Likert scales to evaluate the objects, going from "strongly disagree" to "strongly agree". There were two variants of the questionnaire, which were English and Bahasa Malaysia.

3.3 Sample Size

The total population in Malaysia is 32.7 million, so 384 respondents will be chosen in this research as the sample size. The sample size of the research is decided based on Krejcie and Morgan (1970) table that used a fix formula for an estimated population.

3.4 Data Collection

Data was obtained through the use of Google Form online. In this study, non-probability sampling method is chosen as a sampling design which is convenience sampling where researchers collected a large number of samples to easily and economically complete the questionnaire. Convenience sampling is defined as a sort of non-likelihood sampling technique where the sample is taken from a group of individuals easy to reach or to attain. This kind of sampling is otherwise called grab sampling or availability sampling. Besides that, participants are selected based on availability and willingness to take part. Researcher distribute the questionnaire by using networking applications such as WhatsApp's, Facebook and Telegram. In order to begin the survey, this questionnaire had a screening question where respondents needed to answer "Yes" on all questions. The respondents could not continue the survey if they replied "No"

3.5 Data Analysis

The data that collect through the questionnaires is analyses by using Statistically Package for Social Science (SPSS) version 26.0 computer software package. In analyzing the data, Data forms such as frequency analysis, descriptive analysis, reliability analysis, Spearman correlation analysis and multiple regression analysis were used for data analysis.

4 FINDINGS

4.1 Demographic Profile of Respondents

A set of personal characteristics which are gender, age, race, status, occupation and income level have been examined and presented in Table 1. The questionnaire was distributed through online by using communication application. 384 set of questionnaires were collected. The main objective for descriptive analysis is to understand the profile of respondents.

Table 1: Demographic profile of respondents

Demographic		Frequency	Percentage (%)
Have you ever had a shopping experience at Shopee?	Yes	384	100
	No	0	0
Gender	Male	164	42.7
	Female	220	57.3
Age	Below 18 years old	129	33.6
	19 to 30 years old	146	38.0
	31 to 40 years old	84	21.9
	41 years old	25	6.5

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

Race	Malay Chinese	239	62.2
		91	23.7
	Indian	53	13.8
	Others	1	0.3
Status	Single	224	58.3
	Married	140	36.5
	Divorced	20	5.2
Occupation	Student	190	49.5
	Employee	136	35.4
	Unemployed	17	4.4
	Self-employed	41	10.7
Income level	RM 0 – RM 1000	226	58.9
	RM 1001 – RM 3000	128	33.3
	RM 3001 and above	30	7.8

Table 1 shows demographic profile of respondents. There is a total of 384 respondents who participated in the survey. The results showed the total number for male respondents is 164 with 42.7%. Meanwhile, the total number of respondents for female is 220 with 57.3%. Therefore, relative to males, there are more female respondents responding to this survey.

Respondent's age group is categorized under four different groups. The first group is below 18 years old, which are 129 respondents or 33.6% of total respondents. The next category is between the age 19 to age 30, with a total of 146 numbers of respondents or 38% of total respondents. Meanwhile for age between 31 – 40 years old is 84 respondents or 21.9%. The last group of age range is 41 years old and above, which recorded a total of 25 respondents or 6.5% of total respondents. The age chosen according to the category as in the diagram above is due to the researcher wanting to see which age group that many buy in Shopee. Hence, the result shows that respondents age between 19 -30 years old answer this survey more compare to the others age group.

Table above shows that the highest race that answer this survey is Malay which is 239 respondents as the percentages is 62.2% and total for Chinese people is 91 respondents with 23.7%. Then for Indian people is the lowest with 53 respondents that involved in this study or 13.8% of total respondents. The researcher chose the three races as above is because those races are the three main races found in Malaysia but there are also other races. Besides that, the others race is only 1 respondent answer in this survey with 0.3% which is Bajau.

Based on table shows the status of respondent that involved in this study. For single the total of respondent that involved is 224 people with the higher percentage which 58.3% while for married is 140 respondents with 36.5% out of 384 total respondents and divorced is 20 respondents with percentages 5.2%.

The respondent's occupation that are categorized into four different occupation which is student, employee, unemployed and self-employed. Out of the total sample of 384, 190 respondents or 49.5% of the total respondents are students. While respondent who fall into the employee category is 35.4% of the total is 136 respondents. Next, the overall unemployed is 17 with the lowest percent, which is 4.4 percent, and 41 respondents for self-employed as many as 10.7 percent are involved in this study. This is due to the random distribution of questionnaire samplings.

Table 1 shows that the level of income starting from RM 0 – RM 1000 is 226 respondents or 58.9% of total respondents. Income for between RM 1001 – RM 3000 is equal to 128 respondents as much 33.3%, meanwhile for RM 3001 and above is 30 respondents with 7.8%.

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

Hence, the highest income is from RM 0 – RM 1000 due to the participation of many students in answering this survey.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

4.2 Spearman Correlation Analysis

Spearman Correlation Coefficient will be conducted is applied to analyze the relationship between independent variables and dependent variables. The aim of this test is to evaluate the statically relevant correlation coefficient and analyze which hypothesis should either be accepted or rejected. If the relationship is important, the analysis must determine which degree of intensity is important. Table 2 shows the result of the correlation analysis effect of price, service of quality and easiness towards decisions to purchase products through Shopee.

Table 2: Results of Spearman Correlation Analysis

Variables	Acceptance of QR Code	Supported or Rejected
Price	.361**	Supported
Service of quality	.530**	Supported
Easiness	.475**	Supported

**. Correlation is significant at the level 0.01 level (2-tailed).

Table 2 shows that There is a positive fair correlation significant relationship between price and purchase decision ($p < 0.0$, $b = 0.361$). Next, there is a positive moderate good significant relationship between service of quality and purchasing decision ($p < 0.05$, $b = 0.530$). Lastly, there is a positive fair significant relationship between easiness and purchasing decision ($p < 0.05$, $b = 0.475$).

As a conclusion, price, service of quality and easiness were significantly correlated with purchase decision.

4.3 Multiple Regression Analysis

This research assessed the influence of associated factors on acceptance of QR code by using multiple regression analysis. It determines how ease of use, social influence and security impact on acceptance of QR code payment system.

Table 3: Associated effect of price, service of quality and easiness towards decisions to purchase products through Shopee.

Variables	Simple Linear Regression		Multiple Linear Regression	
	b (95% CI)	p-value	b (95% CI)	p-value
Price	0.59 (0.51,0.67)	< 0.001	0.39 (0.31,0.47)	< 0.001
Service od quality	0.42 (0.35,0.49)	< 0.001	0.24 (0.18,0.30)	< 0.001
Easiness	0.62 (0.53,0.71)	< 0.001	0.27 (0.18,0.36)	< 0.001

Table 3 shown There is a significance effect of price, service of quality and easiness towards purchasing decisions ($p < 0.05$). In every unit increase of price, purchasing decision will increase by 0.39(b). In every unit increase of service, purchasing decision will increase by 0.24(b). In every unit increase of easiness, purchasing decision will increase by 0.27(b). Hence, price is the most influence on product purchasing decision through Shopee.

4.4 Hypothesis Testing

The hypothesis on significant effect between price, service of quality and easiness with purchase decision through Shopee were tested by using Multiple linear regression analysis. All hypotheses were accepted at 0.01 significant levels.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

5 DISCUSSION

Based on the result, price has a positive fair correlation significant relationship with purchase decision through Shopee ($r = 0.361$). thus, the hypothesis is accepted. This variable is the most significant factor that effect on purchase decision through Shopee. This is because price is the main factor in purchasing product. Based on the studies from Rizki, Hidayat, & Devita (2019) that price has a significant positive effect on consumer purchasing decisions on online Shopee purchases. Besides that, a value in Spearman correlation for service of quality is 0.530, the second lowest value among three independent variables. It indicated positive significant relationship thus the hypothesis is accepted. So, there is a significant effect of service quality on decision making in buying goods through shopee. The result un this study supported by Nursiam, Anastasia Auti merry Yanissa, Rina Kurnia Ariana (2020). The facilities provided by Shopee include the easiness to be learned, accessed, understood, and easy to get information on Shopee. This easiness expected to encourage consumers to make purchasing decision on the Shopee. According to the result shown, there is positive fair significant relationship between easiness and purchase decision with value of 0.475. The hypothesis H3 is accepted. This result supported by Goldianus Solangius Mbete & Rinabi tanamal, (2020). They had conducted a similar topic which showed easiness effect on decision making in buying goods through Shopee.

5.1 LIMITATION AND RECOMMENDATION

The limitation of this research involves the collection of data by the use of a questionnaire and only the use of internal variables so that the research outcomes have not been maximized. Therefore, it is proposed that data should be collected for future study not only using questionnaires but also through in-depth interviews or interviews with respondents, so that the information gathered can be more varied, further evaluating variables using external factors and the future should put more effort to increase the outcome of future study. Next, the researcher only used limited independent variables such as price, service of quality, and easiness which have moderate positive significant with dependent variables which is purchasing decision. Besides that, the questionnaire that used by researchers in this research only contain 5 number of items and only four questions for each variable were divided into two section which is section B and section C. So, for questionnaire part, the future research should do more than 5 number of items to get more consistency and stability result. The questionnaire needs to be more open-ended response question.

5.2 CONCLUSION

Generally, this study was conducted with a view to the factor that affected on product purchasing decisions through Shopee. On the other hand, from the survey, data analysis was gathered to perform a reliability test, descriptive analysis and multiple linear regressions. In the analysis, the researcher determined the relevance of the research hypothesis. As a consequence, it can infer from this chapter about the significance between the independent variable and the dependent variable. Based on the results of the study it is showed that the variables of price, service quality and easiness affect the product purchase decision through the Shopee. Last but not least, this study was carried out by researcher to all purchaser in Malaysia that have experience of buying goods at Shopee. This study also can give benefits for the customers to make a wise decision in buying product through Shopee and also can help the company aware about their weakness.

Abstract:

Grocery purchase decision is an important activity that to be take part in consumers lifestyle. The objective of this study is to determine the relationship between the impact of COVID-19 pandemic towards grocery purchase decision among consumers with purchasing method, method of payment and time period of purchasing. There are 379 consumers have been involved in the questionnaires conducted by researcher. The elements analysis of the survey result revealed between the impact of COVID-19 pandemic towards grocery purchase decision among consumers. This study provided numerical data about between the impact of COVID-19 pandemic towards grocery purchase decision among consumers. The findings of the data are essential to see the pattern of between the impact of COVID- 19 pandemic towards grocery purchase decision among consumers. There are significant relationship between the impact of COVID-19 pandemic towards grocery purchase decision among consumers with purchasing method, method of payment and time period of purchasing.

Keywords: COVID-19, Grocery, Method of Payment, Purchase Decision, Purchase Method, Time Period

1. INTRODUCTION

Malaysia is known as one of the most advanced of the developing nations and is rated as an upper middle income region. In a market where shifts in consumer lifestyles and tastes determine the form of retailers in the industry, small grocery stores are increasingly difficult to survive. (Nor Khalidah Abu, Rosmimah Mohd Roslin, 2008). While grocery shopping is an important task, not much is known about the COVID-19 pandemic's complex relationship to the actions of grocery shoppers.

According to a special survey conducted by the Department of Statistics Malaysia on the Impact of COVID-19 on the Economy and Individuals (Round 1) from March 23 to 31, 2020, there was a major shift in regular expenditure needs before and after the outbreak of COVID-19. The study revealed that the spending trend of raw materials for cooking on the market or supermarket or grocery indicates that the current purchase has changed to occasionally and rarely compared to before the COVID-19 outbreak (Sharon Kong, 2020).

The purchase decision process is the decision-making process used by customers before, during, and after the purchase of a product or service in relation to market transactions. In the case of several alternatives, this can be seen as a basic method of cost-benefit analysis (Herbert A. Simon, 1947, 1957). Consumers are affected by emotional and non-rational factors that make it only

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

marginally efficient to try and be rational. He called for substituting a conception of rationality suited to cognitively restricted agents for the ideal rationality assumptions of homo economics.

The studies adapted from Hutjens (2012) with modification to suit the Malaysian context are considered suitable for this analysis because of the similarities in the cases and associated risk factors. During a pandemic crisis such as COVID-19, this study would substantially close the research gap in understanding changes in Malaysian consumer purchase decision of important grocery products and the mediation impact of shopping experience and the Fear of Missing Out (FoMO).

There are three objectives for this study, which are:

To examine the relationship between purchasing methods and grocery purchase decision among consumers during pandemic in Sungai Gadut, Seremban.

To examine the relationship between methods of payment and grocery purchase decision among consumers during pandemic in Sungai Gadut, Seremban.

To examine the relationship between time period of purchase and grocery purchase decision among consumers during pandemic in Sungai Gadut, Seremban.

To avoid this pandemic goes more dangerous, lockdown was perceived as only way to stop spreading from a person to another. Malaysians replied in fear and confusion when the initial MCO announcement was made. People jammed public transit centers to fly back to their hometowns in addition potentially raising the risk of contamination to other areas of the world. Although this response to the MCO was not surprising, it raises concerns about the degree of understanding and attitudes among Malaysians towards COVID-19.

This Movement Control Order (MCO) in Malaysia has made the consumers to face many challenges in their purchase decision of their grocery goods such as bread, rice, oil, frozen foods and many more. Based on this, panic buying was happened rapidly in Malaysia which was not fair to consumers who cannot afford those grocery goods. According to New Straits Times, this purchase decision robs other persons of the ability to get what they need. Any manufacturers may not be able to manufacture enough to satisfy it because of the unexpected increase in demand (Andrew Kok Ken Sen, 2020). And this issue was made the consumers to have limited time for purchase their goods especially grocery goods.

2 LITERATURE REVIEW

2.1 Grocery Purchase Decision

Grocery purchase decision is an individual's measure of evaluating their purchasing activities of grocery as defined by Kassirjian (1981). According to Americus Reed (2011), process that leads a consumer to recognize their need, create options and selecting their specific grocery product or brand. Few attention has, however, been given to the relationship between the shopper and the action, particularly self-relevance or engagement with the operation of grocery purchasing (Mary F Smith, 1996).

2.2 COVID-19

According to Seema Mehta (2020), the COVID-19 pandemic is not a common crisis, and different steps have been taken to monitor the transmission of the outbreak, including absolute and then partial lockout. And this made the government of Malaysia to apply first phase of MCO which affects all

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

the consumers of grocery goods during this lockdown period. Even the Malaysian government has consistently addressed the country with reminders not to panic and with assurance that adequate grocery goods are available; posts on social media causing panic among Malaysia consumers (Ain Umaira Md Shah, 2020).

2.3 Purchase Method

According to the past research, consumers focusing on experiences in-store which stimulate them to engaging with the product or goods they want to purchase and have an emotional contact with the retail store (Smith and Wheeler, 2002). However, researchers had stated that whereas the focus on experience is common, knowledge about how to trigger the experience referred to is rare at most in theoretical practice. The literature that emphasizes the importance for retailers to focus on the inducement of consumers' experience often lacks both definitions of central concepts and empirical support (Ibrahim and Ng, 2002).

2.4 Method of Payment

E-cash is sometimes referred to as Electronic cash, electronic money, online cash and digital cash. Often, it is Often referred to as [Chou, Lee and Chong, 2004] cyber currency. E-cash is a modern money. EPS definition because it blends computerized comfort with protection and privacy that improves paper money [Sumanjeet, 2009]. The method of payment is transaction. It is possible to describe m-payment as the degree to which a person assumes that it will be effortless to traverse or participate in transactions via m-commerce (Cheong and Park, 2005; Choi, 2008; Kim et al, 2005).

2.5 Time Period of Payment

Scanner data is an ideal medium for examining time costs associated with media of exchange as well. These data represent actual market exchanges, are very accurate, and are available at a very high frequency (American Banker, March 15, 2004). The transport literature applies to statistics on time usage, although the respondents are asked to record only travel and travel-related events for most surveys, not their whole day. Bose (2006) discusses technical detail for using the ATUS for travel estimates.

2.6 Research Hypothesis

This study proposed to examine the impact of COVID-19 pandemic towards grocery purchase decision among consumers in Sungai Gadut, Seremban. Based on the literature discussed in this chapter and research questions, hypothesis of this study can be summarized in the following way.

H1: There is a relationship between the purchasing methods and grocery purchase decision among consumers during pandemic in Sungai Gadut, Seremban.

H2: There is a relationship between the methods of payment and grocery purchase decision among consumers during pandemic in Sungai Gadut, Seremban.

H3: There is a relationship between the time period of purchase and grocery purchase decision among consumers during pandemic in Sungai Gadut, Seremban.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

2.7 *Research Framework*

The aim of this study would be to examine the relationship between purchasing methods, methods of payment and time period of purchasing with the impact of COVID-19 pandemic towards grocery purchase decision. This section explained the proposed theoretical framework. The research frameworks that showed in Figure 2.1 had three key of component included purchasing methods, methods of payment and time period of purchasing which are serve as an independent variable. Impact of COVID-19 pandemic towards grocery purchase decision serves as a dependent variable.

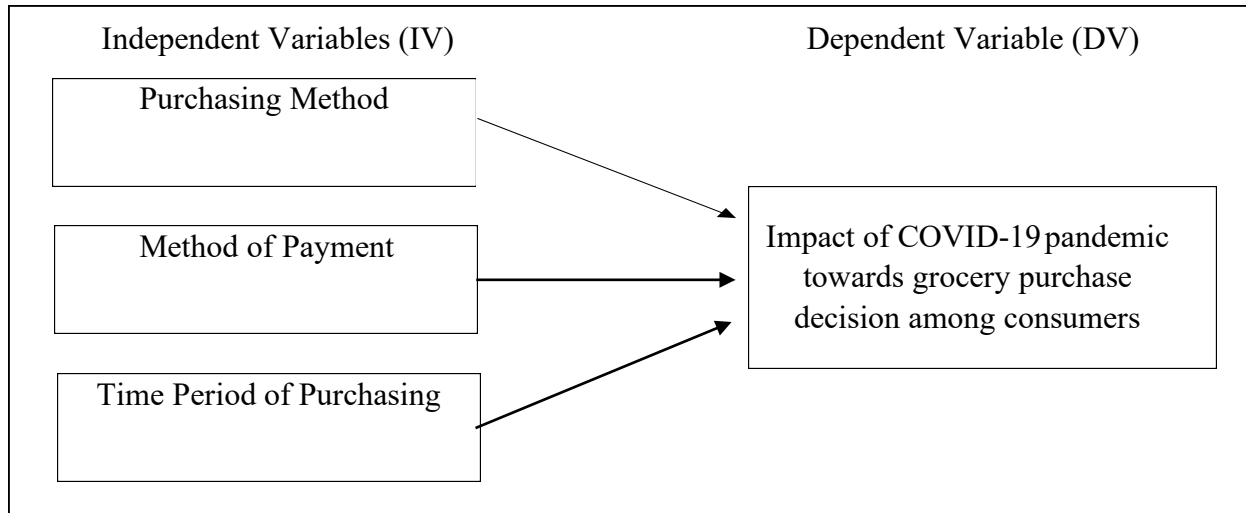

Figure 1: Conceptual Framework

3 RESEARCH METHODS

3.1 *Research Design*

A descriptive research methodology will be used for this study. According to Kerlinger & Lee, (2000), in descriptive research, researcher do not have direct power over free factors on the field that their indications have as of now happened or on the fields that they are spontaneous not manipulated. For this study, quantitative method will be used, so that can be referred to the raw and numerical data collection and then analyzed in terms of values and variables. These data will be collected from survey questionnaires. Respondents were collected by capturing those who involves in grocery purchase activity. Respondents will be screened and choose for those who had been involves in grocery purchasing activity frequently.

3.2 *Data Collection*

Mostly, primary data ensures the most up-to- date information and realistic view to answer the hypotheses and research questions (Saunders 2009). In the questionnaire, the researcher divided the questions to three type of section which is section A, section B and section C. In section A of the survey, there will asked about the demographics question about the respondents. In section B, the researcher will collects some information about the independent variable that impact the grocery purchase decision on or after COVID-19 pandemic. And in section C of the questionnaire, the researcher will get information based on dependent variables. The questionnaire will be distributed to the grocery shoppers in Sungai Gadut electronically at the online platform which is Google form.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

3.3 Population

Consumers are the appropriate medium to collect data on the purchasing decision of groceries since they are the respondent that frequently involved in grocery purchasing activity. The population of people in Sungai Gadut is 30,000 in the year of 2019 (Official Portal of Seremban City Council). Sungai Gadut was chosen as the research venue because there is more of grocery purchasing consumers who are facing problems on making decision of grocery purchasing during the pandemic.

3.4 Sampling

A sample is a group of people randomly drawn from the target market in order to participate in this research study. Number of respondents in this research depends on geographical area selected to obtain the level of accuracy in the data. According to Krejcie & Morgan, (1970) the sample size was 379 used to make an estimation for the population. This study was targeted on the consumers who involved in grocery purchasing decision during the COVID-19 pandemic season within Sungai Gadut area. Every questionnaire is sent out individually and respondents have to answer based on their first thoughts.

$$S = \frac{\chi^2 N p (1 - p)}{e^2 (N - 1) + \chi^2 p (1 - p)}$$

n = sample size (379)

N = population size (30,000)

e = the degree of accuracy expressed as proportion (0.05)

χ^2 = chi-square of degree of freedom 1 and confidence 95% (3.841) p

= proportion of population (if unknown, 0.5)

4 ANALYSIS AND DISCUSSION

There were three data types of data analysis used in study, that were descriptive analysis, reliability analysis and Pearson correlation coefficient. The data obtained was analysed by using Statistical Package for the Social Science (SPSS) version 25.0.

4.1 Descriptive Analysis

Table 1: Descriptive statistic for dependent and independent variables.

Descriptive Statistics			
Variables	N	Mean	Std Deviation
IMPACTOFCOVID-19PANDEMICTOWARDSGROCERYPURCHASE DECISION	379	3.9057	0.72531
PURCHASINGMETHOD	379	3.9208	0.77988
METHODOFPAYMENT	379	3.9450	0.80934
TIMEPERIODOFPURCHASING	379	3.9330	0.82568

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Table 1 indicates the mean and standard deviation of independent variable and dependent variable which include the impact of COVID-19 pandemic towards grocery purchase decision, purchasing method, method of payment and time period of purchasing. Based on the result above, the highest mean was recorded among the independent variables is method of payment with the value of mean 3.9450, followed by time period of purchasing with the value of mean 3.9330 and purchasing method with the value of mean 3.9208 . The mean for dependent variable which is the impact of COVID-19 pandemic towards grocery purchase decision among consumers is 3.9057.

4.2 Reliability Test

Table 2: Reliability analysis for 379 respondents.

Variables	Number of Items	Cronbach's Alpha	Strength of Association
Impact of COVID-19 pandemic towards grocery purchase decision among consumers in Sungai Gadut, Seremban	13	0.889	Good
Purchasing method	6	0.830	Good
Method of payment	6	0.845	Good
Period of purchasing	5	0.836	Good

Table 2 above shows the reliability analysis with the Cronbach's Alpha Coefficient value for this study. The intensity of the interaction of each independent and dependent variable is based on the table above. The Cronbach's Alpha value for first independent variable, method of payment stated 0.845 which is categorized as Good value meanwhile the Cronbach's Alpha value for another two independent variable which time period of purchasing with a Good value which is 0.836 followed by purchasing method is 0.830 which was also a Good value, as well as the dependent variable, impact of COVID-19 pandemic towards grocery purchase decision among consumers stated 0.889 respectively where this were also categorized as a Good value.

The overall result showed that the respondents understood the questions presented, which indicated that the questionnaires were accurate and could be accepted for this analysis.

4.3 Pearson Correlation Coefficient

Table 3: Pearson's Correlation Coefficient of two variables.

Variables		Impact of COVID-19 pandemic towards grocery purchase decision among consumers in Sungai Gadut, Seremban
-----------	--	---

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

Impact of COVID-19 pandemic towards grocery purchase decision among consumers in Sungai Gadut, Seremban	Pearson Correlation Sig. (2-tailed)	1
Purchasing method	Pearson Correlation Sig. (2-tailed)	.777** .000
Method of payment	Pearson Correlation Sig. (2-tailed)	.765** .000
Period of purchasing	Pearson Correlation Sig. (2-tailed)	.710** .000

Table 3 shows the result of Pearson correlation test. The Pearson's Correlation was used in this research is to identify the relationship between two variables in terms of strength of the relationship. The result demonstrate that there will be a significant relationship between the purchasing method and grocery purchase decision among consumers during pandemic in Sungai Gadut, Seremban. The positive value of correlation coefficient is 0.777** and it shows that the relationship is high according to the rule of thumb. After that, Table 3 there will be a significant relationship between the purchasing method and grocery purchase decision among consumers during pandemic in Sungai Gadut, Seremban. The positive value of correlation coefficient is 0.777** and it shows that the relationship is high according to the rule of thumb. Lastly, the finding in Table 3 show that there will be a significant relationship between the time period of purchasing and grocery purchase decision among consumers during pandemic in Sungai Gadut, Seremban. The positive value of correlation coefficient is 0.710** and it shows that the relationship is high according to the rule of thumb.

4.4 Discussion

According to correlation analysis in chapter 4, researcher have identified that there is a significant relationship between between purchasing methods with impact of COVID-19 pandemic towards grocery purchase decision among consumers in Sungai Gadut, Seremban. This can be seen through the result shown in the index of Pearson Correlation Coefficient, with significant value which means that there is a significant relationship exist between purchasing method, method of payment and time period of purchasing with impact of COVID-19 pandemic towards grocery purchase decision among consumers in Sungai Gadut, Seremban.

Based on the Pearson Correlation's analysis on table 4.13, the result shown that independent variable 1 which is purchasing method had a high positive influence on impact of COVID-19 pandemic towards grocery purchase decision among consumers. This refer to the Pearson's Correlation value (r value) which is 0.777 had shown high positive correlation relationship between independent

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

variable 1 and the dependent variable. Purchasing method plays a significant role among consumers' grocery purchase decision in a target performance area. This is because the retailers can develop the strategies to achieve their target to sell their groceries and encourage consumers to perform their work easily without difficulty in purchasing method in retail stores which consumers consume groceries.

According to the result the index of Pearson Correlation Coefficient, this research accepting the significant relationship between methods of payment with impact of COVID-19 pandemic towards grocery purchase decision among consumers in Sungai Gadut, Seremban. because the result 0.765 with significant value $p, 0.00$. Method of payment is important because the difficulty of payment method influence the consumers on a grocery purchase decisions. Payment methods choices for consumers are now quicker and safer than ever and consumers want to have a preference in this respect. Not providing consumers different payment options could lead to reduced revenue and harm a company's image.

Based on the result of the Pearson Correlation Table 4.13 this research is accepting H3 because 0.710 with significant value $p, 0.00$ it means that there is a significant relationship between time period of purchase with impact of COVID-19 pandemic towards grocery purchase decision among consumers in Sungai Gadut, Seremban. Time period of purchasing is important factor that impacts the consumers' grocery purchase decision during COVID-19 pandemic. Because consumers expects more time to spend on purchasing groceries in retail stores which gives a satisfaction on their purchases

5 CONCLUSION AND FUTURE RESEARCH

5.1 Recommendations

The future researcher might be managing to conduct the research in different area of Malaysia to enrich the local context. Future researcher may able to find out more information about the impact of COVID-19 pandemic towards grocery purchase decision among consumers. Future researcher can know how importance of the impact of COVID-19 pandemic towards grocery purchase decision among consumers to improve the purchasing method, method of payment and time period of purchasing.

Next, the future researcher is recommended to expand the sample size and the population in order to get more accurate and diverse outcome of the study. The study was conducted only among the residence of Sungai Gadut, Seremban. It is recommended that future researchers perform similar research in different states, retail stores or even in Malaysia as it will lead to a different outcome. In addition, in order to improve the quality of the data obtained, the number of respondents can be expanded for future studies. To get an accurate result from larger amount of responses, future researchers must take a longer duration for data collection and analysis.

Furthermore, future researcher should consider using qualitative method for research. This is due to the future researcher may gain deeper understanding about the relationship of the impact of COVID-19 pandemic towards grocery purchase decision among consumers with purchasing method, method of payment and time period of purchasing. Interview with the respondents enables researcher to know how the respondents think of the importance of grocery purchase decision. Therefore, using quantitative method may get different perspectives of the relationships which were included in the dependent and independent variables.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

5.2 Conclusion

This study focuses on the impact of COVID-19 pandemic towards grocery purchase decision among consumers in Sungai Gadut, Seremban. Grocery purchase decision to adopt the outcome of this study to determine the purchasing method, method of payment and time period of purchasing for the future retail industries. This is because it will help to build a great relationship between the consumers and the retail stores they visit to purchase groceries. Malaysian retail stores from either government or private sectors can also use the data to determine the impact of COVID-19 pandemic towards grocery purchase decision among consumers.

The independent variables identified as the purchasing method, method of payment and time period of purchasing indicate the significant relationship to the dependent variable known as the impact of COVID-19 pandemic towards grocery purchase decision among consumers. Based on the hypothesis result, all the hypothesis which was H1, H2 and H3 have been accepted in this study. Most notably, this study has established that consumers are nowadays really aware of their grocery purchase decision. They are also really concerned about the purchasing method they going to use according to their comfort. These users are really willing to accept the impact of COVID-19 pandemic towards the grocery purchase decision which is in purchasing method, method of payment and time period of purchasing.

THE EFFECT OF BRAND PERSONALITY ON CONSUMER- BASED BRAND EQUITY IN MALAYSIA SMEs CONTEXT

Edayana Binti Idris and Noor Hasmini Binti Hj Abd Ghani

Faculty of Entrepreneurship and Business,
Universiti Malaysia Kelantan,
Malaysia

Email: edayana.a17a0079@siswa.umk.edu.my; hasmini.ag@umk.edu.my

Abstract:

This study aims to investigate the effect of brand personality on customer brand equity in Malaysian SMEs context. In conducting this study, the researcher found that there are five independent variables which are sincerity, excitement, competence, sophistication and ruggedness that can be used with dependent variables. To collect data, 200 respondents used a structured questionnaire targeting consumers who buy SMEs product. The Reliability and Multiple Regression analysis to test hypotheses is used. From the results, the sincerity, sophistication and ruggedness had a positive significant effects on consumer-based brand equity in Malaysian SMEs context.

Keywords: *Customer-based brand equity, brand personality, SMEs*

1 Introduction

Marketing professionals and scholars also face two key questions in today's competitive market is what makes a brand successful and how entrepreneurs create strong brands. In order to provide a satisfactory solution to this issue, marketing researchers and practitioners prefer to refer to the Consumer-Based Brand Equity (CBBE) model, which incorporates management strategies and analytical developments in the understanding of consumer attitudes and behavior Pham (2019). Although a number of useful perspectives have been put forward regarding brand equity, the concept of the CBBE provides a unique perspective on what brand equity is and how it should be best built, measured and managed.

The fundamental premise of the concept of customer-based brand equity is that a brand's power lies in what customers have learned, felt, seen and heard about the brand as a result of their interactions over time. In other words, Pham (2019) the power of a lies in what resides in the minds and hearts of customers. The customer-related brand equity approaches are specifically divided into two categories (Atilgan, et al. 2005). The behavioral dimension that includes consumer behavior such as brand loyalty, and the perception dimension that involves consumer perceptions such as brand awareness, perceived quality and brand associations(Oliver 2014).

The importance of CBBE in SMEs they have three important concept are included in the definition of CBBE in differential effect, brand knowledge and consumer response in marketing (Keller 1993). In the distinct of a brand personality plays a vital role in a brand's growth. This

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

causes consumers to understand the identity of the brand and establish a deep brand link (Lin 2010). To be long-lasting and consistent, a brand figure should be formed. In addition, it should also vary from other products and satisfy the demands of customers (Balaji, et al. 2016). Therefore the buyers of these toys and video games are like the spokespersons of the brand and become the foundation for brand personality creation for manufacturers. Consumers with various personality characteristics will be drawn to the same brand personality and their brand loyalty will then be more established. Moreover, by its brand personality, an organization can maintain a strong relationship with consumers (Farhat and Khan 2011).

According acquired a five-factor structure, three dimensions of which apply to the big five dimensions (Mulyanegara, et al. 2009). Sincerity taps into the attributes of perception and consciousness. Excitement requires, just as extraversion does things like sociability, vitality and movement. In Conscientiousness and Extraversion, integrity captures attributes observed. The remaining two dimensions do not apply to either of the major five dimensions, Sophistication and Ruggedness. The brand personality structure is more or less repeated by (Aaker, et al. 2001). There were very distinct differences among many other researchers (Geuens, et al. 2009). This is obviously not too shocking as most of them began from the broad definition of brand personality. Only big five elements were used (Davies, et al. 2018) but a similarity to the big five measurements appeared only in the latter study.

The key to what makes a business strong and how entrepreneurs establish a strong brand in Malaysia's market place is based on CBBE. In many countries including Malaysia, SMEs play a profound role in economic development. However many SMEs are unable to complete and maintain the marketplace long enough due to an array of critical problems. This scenario is troubling because SMEs form an important economic dimension and are also seen as the driver of economic development. Building good brand image is therefore the top priority for many SMEs in terms of goods and services, but achieving this goal is not always a simple task since the products and services of many SMEs in Malaysia are similar and their methods of distribution are similar.

2. Literature Review

2.1 Consumer-Based Brand Equity

Based on Aaker (2009) on the other hand, includes customer-based brand equity dimensions, among other proprietary brand properties, brand loyalty, brand recognition, perceived efficiency, and brand associations. Since the proprietary brand assets are business or company-related, only the market-related components have been adopted through subsequent research (Malhotra, et al. 2013), resulting in a four-dimensional Consumer Based Brand Equity (CBBE). In the Brand awareness refers to "the ability of a potential buyer to recognize or remember that a brand refers to a category of a particular product" (Aaker, 1991). Associations can help customers to process or retrieve data, provide a basis for differentiation and extensions, provide a justification to purchase and generate positive feelings (Aaker 1991). Aaker (1992) clarified that perceived quality provides value by providing a justification to buy, defining the brand, attracting the interest of distribution channels, being the basis for line extensions, and supporting a higher price. Aaker (1992) assumes that it is also an efficient way of handling equity to rely on brand loyalty.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Table 2.1 Definition of Consumer-based Brand Equity

Definition	Authors
Brand equity has focused on the perspective of cognitive psychology known as consumer-based brand equity.	(Aaker 1991)
There are four dimensions of consumer-based brand equity: brand loyalty, brand awareness, perceived quality, and brand association. Brand loyalty is one of the most significant marketing components, and is a measure of a customer's attachment to a brand.	(Aaker and Biel 1993)
The number of repeated transactions also tests brand loyalty in a behavioural context. While a range of valuable viewpoints have been put forward on brand equity, the definition of the CBBE offers a new viewpoint on what brand equity is and how it can be better built, measured and managed.	(Keller, et al. 2011)
The customer-based approach to brand equity is the dominant view and most marketing research researchers and practitioners prefer that marketers, manufacturers or distributors ultimately have no meaning if a brand has no value or importance to the consumer.	(Cobb-Walgren, et al. 1995)

In the description of CBBE, three essential concepts are important included: differential impact, brand awareness and marketing response to customers. Firstly the differential effect is measured by contrasting the consumer's reaction to a brand's marketing with the response to the same marketing of a product or service fictitiously named or unnamed (Keller 1993). The differential effect is the empirical and subjective comparison of the same object, place, or individual with a related, but distinct, object, place, or person, based on perception. Second is brand knowledge is essential to this theory. In particular, in determining the differential response, the favourability, strength, and uniqueness of the brand associations play a critical role. If consumers assume that the brand is similar to the prototypical version of the product or service in the category, their reaction to the hypothetical product or service does not differ; if the brand has any distinctive, special associations, the reactions should vary (Keller 1993). (Escalas and Bettman 2005) Lastly consumer response to marketing is according to this definition a brand is said to have positive negative) customer-based brand equity if consumers respond more (less) favourably to the brand's product, price, advertisement, or delivery than they do to the same marketing mix factor when it is attributed to a fictitious world called or unnamed version of the product or service.

2.2 Brand Personality

Brand personality provides the consumer with self-expressive of symbolic advantages from the perspective of customer (Aaker 1999). Consumer often use brands to build and articulate to fulfil their needs, according to creating links between their self-concepts and brand images (called self-brand connections). These interactions play an important role in building brand awareness and establishing long-term relationships between customers and brand. (Escalas and

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Bettman 2005) have also proposed that consumers of associate the psychological advantages of associating with brands because in a number of social context, consumers may build and describe their self-concept and present themselves to others. A well-established brand personality is thought to increase emotional relations with the brand, increase preference and increase a sense of confidence and loyalty, as asserted by (Siguaw, et al. 1999).

Table 2.2 Definition of Brand Personality

Definition	Author
Brand personality is a part of brand association that defines a brand's symbolic consumption and emotional relations to connections with consumer.	(Aaker, et al. 2004)
Based on three sources, her scale was developed: personality scales from Psychology, marketers' trait measures and initial observational studies on personality qualities correlated with a variety of well-known products.	(Aaker 1997)
It implies that brand identity can be shaped in two ways: explicitly (through individuals) and indirectly. Indirectly, by product-related features, such as packaging, brand name, logo, symbol, or advertisement, personality characteristics may be attributed to a brand.	(Aaker 1997)
The author described the brand's personality "as a set of human characteristics related to the brand." The author has established five brand personality measures, which are sincerity, excitement, competence, sophistication, and ruggedness.	(Aaker 1997)
Brand personality is defined as how a consumer understands the brand in dimensions that usually capture the personality of an individual.	(Batra, et al. 1993)

In the per-suasion method, marketing researcher and practitioners have suggested the concept of the importance of brand personality; they consider brand personality as an effective way to differentiate a brand from its competitors at the symbolic level (Plummer 2000). In addition, previous literature assumes that customers also use brand to create, reinforce and communicate their personality (Belk 1988). A growing number of studies have been carried out to theoretically and practically test its application in the field, given the importance of the brand personality construct in marketing and consumer psychology research (Sung and Kim 2010). However several researchers have concentrated on the structure and measurement scales and, with the exception of a few recent studies, minimal research has explored the predictive functions of brand personality in empirical persuasion. (Aaker 1999; Ang and Lim 2006; Chang and Chieng 2006; Lau and Phau 2007).

The objective of the current study is to conceptualize and empirically examine the effect of brand personality on key dependent variables in consumer behavior. More specifically, this study conceptually links two research streams and examines the effect of five dimensions of brand personality (Sincerity, excitement, competence, sophistication, and ruggedness). This study follow and test (Chaudhuri and Holbrook 2001) brand impact/brand confidence brand loyalty model by adding five brand personality dimensions to (Aaker 1997). To this end, the current study proposes theoretical models for brand personality, brand loyalty and brand effect, including

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

five dimensions. This study builds on and contributes to previous research, building on and adding to previous brand personality and consumer psychology literature by investigating the determinant roles of brand personality in brand evaluation.

3 Methodology

3.1 Sampling and Data Collection

The sample size for this study was 200 respondents are from respondent are among the customers who also use the online platform to buy product SMEs and this study researcher are used questionnaire online survey to collect the data from the respondent. In addition, the respondents participating in the research are independent of gender, age, marital status and employment status. The sample size can be referred to as the term that the greater population of respondents would always be used by the researcher for survey and this sample is considered to be an important element for the researcher in obtaining the right results of the research.

3.2 Research Construct

A construct is the abstract concept, the underlying theme or subject matter that researchers want to measure using survey questions in the context of survey research.

Table 3.1 Review of selected research about variables, definitions and items.

Variables	Definition	Items
DV: Customer Based-Brand Equity (Biel and Aaker 2013)	There are four dimensions of consumer-based brand equity: brand loyalty, brand awareness, perceived quality, and brand association. Brand loyalty is one of the most significant marketing components,	6
	and is a measure of a customer's attachment to a brand.	
IV: Brand Personality (Aaker 1997) IV 1: Sincerity IV 2: Excitement IV 3: Competence IV 4: Sophistication IV 5: Ruggedness	The author described brand personality "as a set of brand-related human characteristics". The author created five brand personality measurements, which are sincerity, excitement, competence, sophistication, and ruggedness.	20

3.3 Data Analysis Methods

Using computer software, Statistical Programmers for Social Science (SPSS) version 26.0.0, the data obtained in the analysis will be analyzed. In addition, in the report, descriptive, reliability and multiple regression analysis was also carried out. Cronbach's Alpha makes it acceptable for all variables above 0.7 in the reliability study, as it ranges from 0.7 to 0.9, it is acceptable for an outstanding calculation. Cronbach (2016) also supports this because Cronbach's Alpha is higher, which means that the internal consistency of the scale item is higher. To accept the hypothesis,

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

for Multiple Regression, the p-value of the variable must be less than the value of 0.05.

4 DATA ANALYSIS AND ANALYSIS

4.1 Sample Characteristics

In this sample characteristics of respondents including gender, ethnicity, age, race, marital status, occupation and monthly income. This study provided the end result of the demographic of the respondent in different types of tables that shows the result from 200 respondent who answer the questionnaire. From the tables 4.1 show the summary of the respondent.

Table 4.1: Sample Characteristics

Sample Characteristics	Frequency (200)	Percentages (%)
Gender		
Male	77	38.5
Female	123	61.5
Race		
Malay	156	78.0
Indian	18	9.0
Chinese	20	10.0
Other	6	3.0
Age		
21 – 25	150	75.0
26 – 30	28	24.0
31 – 35	14	6.0
36 and above	8	4.0
Marital		
Single	158	79.0
Married	42	21.0

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

Occupation		
Unemployed	13	6.5
Employed	54	27.0
Student	133	66.5
Monthly Income		
RM 500 – RM 1000	137	68.7
RM 1001 – RM 3000	44	22.0
RM 3001 – RM 5000	15	7.5
More than RM 5001	4	2.0
Have you ever bought SMEs product?		
Yes	100	100.0
No	0	0

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

Type of buying		
Conventional store	114	57.0
Online purchase	32	16.0
Both above	54	27.0
Number of SMEs product bought per month		
1 – 3 times	146	73.0
4 – 6 times	30	15.0
7 – 9 times	16	8.0
More than 10 times	7	4.0

4.2 Hypothesis Testing

The result of Multiple Linear Regression of independent variables towards dependent variables. The results of five hypothesis is different based on result from multiple linear regression. There are three hypothesis that supported which is H1: Brand personality (sincerity) have significant relationship on CBBE, H2: Brand personality (sophistication) have significant relationship on CBBE and H5: Brand personality (ruggedness) have significant relationship with CBBE. In addition, there have two hypothesis not be supported with the result from multiple linear regression which is H2: Brand personality (excitement) have significant relationship on CBBE and H2: Brand personality (competence) have significant on CCBE. In conclusion, in this study there have only three hypothesis are significant and two hypothesis are not significant.

4.3 Reliability Analysis

Reliability analysis talk about to the point that a scale should accurately represent the construct it is measuring way in which the researcher may use reliability analysis is when the equivalent result is also obtained by two measurements under study that are equivalent to each other in terms of the construct being evaluated. In addition, Cronbach's Alpha is the usual technique for evaluating a scale internal consistency. It measure all the variables in the research is valid or not. The results in pilot test in 30 respondent shown in table 4.2. Cronbach's Alpha show $0.7 > \alpha \geq 0.6$ questionable, $0.8 > \alpha \geq 0.7$ is acceptable, $0.9 > \alpha \geq 0.8$ is good and more than above is excellent so that if more than 0.6 so it is valid.

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

Table 4.2 Reliability Analysis

Variables	No. of Items	Cronbach's Alpha	Strength
Customer-Based Brand Equity	6	0.910	Excellent
Sincerity	4	0.886	Good
Excitement	4	0.850	Good
Competence	4	0.882	Good
Sophistication	4	0.879	Good
Ruggedness	4	0.888	Good

Multiple Linear Regression

To define the data and to explain the relationship between one dependent variable and one or more independent variables, regression is used. This is because multiple regression is often used in all sections of the sincerity, competence, sincerity, sophistication and ruggedness to calculate the relationship with customer-based brand equity and brand personality of SMEs brand.

Table 4.3: Model Summary

Model	R	R Square	Adjusted Square	Std. Error Of The Estimate
1	0.716 ^a	0.613	0.500	0.44284

Predictors: (Constant), Ruggedness, Competence, Sincerity, Sophistication, Excitement

Dependent variable: Customer-Based Brand Equity

Based in Table 4.3 show the determination of R² (R Square) is 0.613. It means that 61.3% of all independent variables which are sincerity, excitement, competence, sophistication and ruggedness have explained to the variance of dependent variables (CBBE).

Table 4.25: Multiple Linear Regression

Variables	Multiple linear regression		
	b	t-stat(95% CI)	p-value
Sincerity	0.368	4.807(0.217,0.519)	<0.001
Sophistication	0.454	5.892(0.32,0.606)	<0.001

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

Ruggedness	0.198	2.765(0.57,0.338)	<0.001
------------	-------	-------------------	--------

The result shows that on multiple linear regression of the variable sophistication, sincerity, ruggedness are significant since the p-value is <0.05.

5 Recommendation and Conclusion

The researchers propose a variety of recommendations for future studies, according to the overall report. First, in order to achieve the exact outcome of gender, future researchers should balance the number of genders. In the formation of this report, different opinions or factors have arisen. Future research should take into account the selection of the number of genders to match the total number of respondents by age. In addition, larger population sizes are aimed at reducing errors and producing a better result, according to (Costello and Osborne 2005) Future researchers need to increase the sample size in order to obtain reliable results and can be established in the sense of Malaysia SMEs about the effects of brand personality on customer-based brand equity. The greater the sample of the respondents, the more detailed and accurate the outcome (Nuijten, et al. 2015) . Future researchers should to improve the accuracy and reliability of the analysis, increase the sample size. The researchers then propose that future researchers could use qualitative methods for conducting this research. The qualitative approach does not need to classify the respondents. They just need to locate the organization or person to be interviewed. Besides that, for future research may want to consider how to obtain information from respondents from various types of states in Malaysia so that the results of the findings of the study are more balanced. Obtain the number of respondents who can represent each state in Malaysia related to their field related to SMEs Products in Malaysia.

The results of this study show that Malaysian SMEs product do play an important role in developing the brand personality on customers-based brand equity. Five types of dimensions in brand personality are used as independent variables to the effect of brand personality on brand equity based on customers. The results of the study found that there were different significant differences between the variables used. As mentioned in chapter three, the respondents consisted of the population in Malaysia and the questionnaire using Google form was given randomly to 200 respondents with different personal backgrounds. Based on the result from this research there have three independent variables have a positive relationship with dependent variables. The independent variables which is sincerity, sophistication and ruggedness have a positive significant using multiple linear regression. Finally, the final chapter presents the conclusions of the final results based on the data analysis. In other words, this involves an overview of statistical evaluation with quantitative studies and research problems. In the end, there are only three hypotheses that are proved to have a positive relationship and there are two hypotheses that are rejected. Meanwhile, this also includes the limitations and recommendations of this research is important to provide various information on the advantages and disadvantages related to this topic for future research.

Acknowledgements

I would like to show our gratitude to our lovely supervisor for final year project Associates Prof. Madya Dr. Noor Hasmini Binti Hj Abd Ghani, for giving us a good guideline directly and indirectly for this final year project throughout numerous consultations. I also thank the University Malaysia Kelantan for the opportunity for let us study in this excellent university and provide us with a good experience in this university. I also want to thank again to this university for introducing this final year project to us because students can study their entrepreneurship in details. As the same time, I want to thank to my respondents for take their time to answer my questionnaire regarding my research. I am extremely grateful to my parents for their support, inspiration, motivate, love, prayers, caring and sacrifices for educating and preparing me for my future and help me to active my dreams.

THE IMPACT OF SOCIAL MEDIA MARKETING ON ONLINE PURCHASE INTENTION OF LUXURY BRAND AMONG CONSUMERS IN NORTHERN REGION OF PENINSULAR MALAYSIA

Farah Hanani binti Azizi and Wan Farha Binti Wan Zulkiffli

Faculty of Entrepreneurship and Business,
Universiti Malaysia Kelantan,
Malaysia

Email : farah.a17a0092@siswa.umk.edu.my; farha@umk.edu.my

Abstract:

The purpose of conducting this research is to study the impact of social media marketing on online purchase intention of luxury brand among consumers in Northern region of Peninsular Malaysia. The states involved were Perlis, Kedah, Penang and Perak. This research involved quantitative data analysis. Using non-probability sampling, which was convenience sampling, a total of 384 respondents was taken as the sample for this study. The data were analysed using SPSS software programming that involved reliability analysis and multiple regression analysis to test the hypotheses. The findings of this research have concluded that electronic word-of-mouth (eWOM), attitude and perceived behavioural control have significant impact on the online purchase intention. In contrast, subjective norm and trust are proven to have insignificant impact on the online purchase intention.

Keywords: luxury brand, social media marketing, online purchase intention

1 Introduction

Online purchasing refers to the act of purchasing in an electronic form which allows the buyers to buy goods or services directly from vendors on the internet via internet browser in which companies develop new technologies to encourage the growth of their businesses through online shopping websites that let them to advertise and adorn their products and services using the websites.¹ In comparison to the traditional luxury retails that tend to embrace an aesthetically oriented strategy, the websites made for the online luxury retailers can also be enhanced by creating websites that have darker colours for the background, a spacious and wide space to display their content as well as a horizontal navigation bar.²

A lot of luxury companies have emerged into the online market to reach a wider market base as consumers are believed to have more affinity to purchase products

¹ Wahab, F. Z. A., Mokhtar, N. F., & Set, K. (2019). Investigating the factors of trust and risk on career women in luxury brand purchasing intention through online in Malaysia. *Int J Account Finance Bus*, 4(19), 108-122.

² Yu, S., Hudders, L., & Cauberghe, V. (2018). Selling luxury products online: The effect of a quality label on risk perception, purchase intention and attitude toward the brand. *Journal of Electronic Commerce Research*, 19 (1), 16- 35.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

from online stores. In the context of luxury market, due to the increasing number of prosperous youngsters in purchasing online brands as well as the success of luxury retailers in the online platform, more marketers of the luxury brands have decided to sell their products online which results in a numerous luxury brand companies to start making their own e-stores on the online platforms such as website and social media. Creating a business strategy on electronic base can also encourage the expansion of brand awareness in the global market. In addition to this, seeing that the performance of the offline retail to slacken, these luxury brand retailers feel the urge to think about emerging the online market ([Yu, Hudders, & Cauberghe, 2018](#)).

In the opinion of most scholars, online businesses are believed to assist in the extension of luxury brands since the online medium as well as the luxury industry is getting more advance from time to time ([Yu et al., 2018](#)). The use of social media platforms among majority of consumers includes Facebook, Instagram, Twitter, LinkedIn, YouTube, Pinterest and Snapchat. Social media has caused the relationship among individuals, firms and societies to be changing dramatically.³ As the number of companies that recognize the significant role of social media increases, it becomes a means of communication and drives the creation of new business opportunities ([Farzin & Fattahi, 2018](#)). As a result, consumers and firms will be able to communicate and share various category of information, as well as comments, evaluations, images, photos and videos.⁴

Despite the uncertainty of luxury brands to emerge into the online platform, the negative consequence with regards to the digitalisation of luxury in the scenario of market today has started to modify as consumers are participating a new shopping experience in online mode that involves the availability of comprehensive information of products.⁵ Companies need reliable estimations of the growth of online shopping if they have the intention to grow in online retailing and need to comprehend all factors that may affect the customers' online shopping intention ([Ha & Nguyen, 2019](#)). Hence, this is one of the reasons for almost every luxury fashion brand to stretch the use of social media sites such as Facebook, LinkedIn, Youtube and Twitter in which these sites are being appraised as the brands' business take-off tools.⁶ The use of social media among the online consumers has opened the opportunity for these luxury brand retailers to reach the online community by implementing an effective marketing strategy. In this study, social media marketing is related to electronic word-of-mouth (eWOM), subjective norm, trust, attitude and perceived behavioural control. Hence, the research will be focusing on how social media marketing can influence the online purchase intention of luxury brand among the consumers.

⁶ Gautam, V., & Sharma, V. (2017). The mediating role of customer relationship on the social media marketing and purchase intention relationship with special reference to luxury fashion brands.

2 Literature Review

2.1 Social Media Marketing

By using social media platforms, salespeople will be able to correlate value-creating functions and convey outstanding value within their relationship and the customers. Making a connection by means of relationship building with the customers can be indicated through this marketing strategy that is essential for businesses ([Di Virgilio & Antonelli, 2018](#)). Social media is believed to be effective in capturing the attention of not only consumers but including the managers. It is proven in a past global survey of managers in which it has revealed that social media has played a big part in attracting the focus of consumers when they are involved in the buying process ([Di Virgilio & Antonelli, 2018](#)). Compared to the traditional approaches, the social media platforms can give a better contribution towards the improvement of consumers' decision making on purchase intention ([Di Virgilio & Antonelli, 2018](#)).

2.2 Electronic Word-of-mouth (eWOM)

eWOM is a new form of WOM that is believed to be more influential among the online consumers. ([Di Virgilio & Antonelli, 2018](#)) stated that supplementary and highly customized information can be provided by eWOM to the study of social media platform through the social digital media, online population and blogs. Hence, it will measure the concern and increasing of the online community towards particular brand and how it is popularised among them. In online platforms, consumers are exposed to the information on all products or services that can be found in which they are allowed to visualise images including product reviews which is among the most vital element of eWOM communication ([Farzin & Fattahi, 2018](#)), where they have the accessibility to review other consumers point of view in which can assist in making decision effectively ([Di Virgilio & Antonelli, 2018](#)). According to ([Farzin & Fattahi, 2018](#)), it is progressively usual for consumers to look for reviews of other consumers towards specific products or brands before deciding to make a purchase. In addition to this, it is also mentioned that the risk, uncertainty and ambiguity of online products or services can potentially be reduced with the presence of eWOM. This can be proven that eWOM has the power to attract the attention of consumers and has an impact on their behaviours ([Di Virgilio & Antonelli, 2018](#)).

2.3 Subjective Norm

According to a study by ([Di Virgilio & Antonelli, 2018](#)), subjective norm is also seen as a perceived pressure from social on an individual to act a particular behaviour. It is also mentioned that the intention of individual in making a certain decision willingly is through the social pressure from significant others in which these potential consumers truly depend on their referral groups that include friends, family members and social networks ([Di Virgilio & Antonelli, 2018](#)). Subjective norm is viewed as a normative belief where consumers can be pressured with judgement by the public and the assumptions from a particular group. The influence coming from a relation among individuals on social network is referred as tie strength. Tie strength can either be weak or strong. Strong tie strength can be found among a group of individuals that involve intimate relation

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

in which they are supporting each other emotionally such as friends, family members or relatives. Meanwhile, weak tie strength is referred to the group of individuals that involve less intimate relation, as for example, the colleagues or other recognized people ([Farzin & Fattahi, 2018](#)).

2.4 Trust

Trust is referred as the belief of an individual in which will result in a certain manner that align with the confidence of what is expected by the individual ([Di Virgilio & Antonelli, 2018](#)). In other words, trust can be described as how individuals feel motivated to pursue or act based off the advice, information, or knowledge that they have received from other individuals about a certain brands or products ([Farzin & Fattahi, 2018](#)). In addition to this ([Di Virgilio & Antonelli, 2018](#)) has also stated that in online context, trust is constructed from the belief of one's trustworthiness. Uncertainty is commonly higher in the context of social media platforms because of the high level of content that are created by users including the lack of interactions that are done face-to-face ([Di Virgilio & Antonelli, 2018](#)). Customers will be suspicious about the truthfulness when engaging with online vendors due to the lack of face-to-face interactions as customers has high probability to be exposed to online purchase risk ([Di Virgilio & Antonelli, 2018](#)). Therefore, trust is a vital element in the context of online purchase as it can trigger the individuals to share their information, judgement and point of views towards the products or brands with others ([Farzin & Fattahi, 2018](#)). ([Di Virgilio & Antonelli, 2018](#)) has also stated that the trust of consumers is found to be a dependant element for e-vendors to receive purchases in the past research.

2.5 Attitude

According to ([Wahab, Mokhtar, & Set, 2019](#)), attitude is such an imprudent measure when it comes to the thought about an item or brand even though there are a lot of different factors that can affect the choices of a buyer when making a purchase. One tends to influence other consumers if he or she has a positive attitude towards the act of purchasing via the internet, where the online purchase behaviour is also considered as an attitude in which it involves browsing on different websites, choosing and buying products or services that can satisfy the consumer's needs and wants ([Wahab et al., 2019](#)).

2.6 Perceived Behavioural Control

According to ([Sembada & Koay, 2019](#)), perceived behavioural control (PBC) of an individual can be affected by internal and external factors. As for example, consumers who consider themselves ethical may not have the intention to purchase ethical products if they are opposed by the contextual forces to do so. Therefore, the researchers testify that it is also the same for consumers who cannot find the satisfaction to purchase from social media stores at first will end up doing so when the alternate channels can satisfy their desire to purchase.⁷

⁷ Sembada, A. Y., & Koay, K. Y. (2019). How perceived behavioral control affects trust to purchase in social media stores. *Journal of Business Research*.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

According to ([Bulsara & Vaghela, 2020](#)), an individual should have the capability to handle and control information technology when making a purchase via the internet. Therefore, he or she will be able to conduct a well-organized action.⁸

2.7 Online Purchase Intention

Online purchase intention can be described as the desire of consumers to purchase products virtually or via the Internet. Purchase intention acts as a key measure in analysing the behaviour of buyer because it can measure the chance of purchasing ([Wahab et al., 2019](#)). Consumers' online purchase intention can be affected by two elements which are perceived usefulness and perceived ease of use.⁹ In the context of online shopping, it is explained that perceived usefulness is referred as the extent in which a consumer believe that the effectiveness of procurement can be increased. On the other hand, perceived ease of use is referred as the extent in which a consumer believe that online buying can be done effortlessly ([Ha & Nguyen, 2019](#)). Apart from that, consumers have more tendency to purchase from e-stores rather than the physical stores as they will be provided with facilitating tools that are much more satisfying where they will be able to view product or service catalogues, capable to search, trust in websites, compare prices, use buying carts as well as using the online transaction system ([Wahab et al., 2019](#)). The ease in the use of internet to explore and purchase products is time saving in which it also encourages the consumers to purchase again in the future ([Wahab et al., 2019](#)).

3 Methodology

3.1 Sample

Using the convenience sampling technique, this study aims to identify the impact of social media marketing on online purchase intention of luxury brand among consumers in Norther region of Peninsular Malaysia. Based on the minimum sampling requirements by Tabachnick and Fidell (2007), the given formula used provides a range of sample size of 90-109 respondents. In addition to this, the result of sample size required using G-power tool is 138 respondents. Based on these calculations, it is concluded that the sample size will be between 90 to 138 respondents or more. Therefore, researcher has chosen 384 respondents as the sample size for this study.

3.2 Data Collection

The primary data of this research are collected from the online survey assessed by the online community who experienced online purchases of luxury brand. The survey includes bilingual (both English and Malay) questions. Using Google form, the questionnaires were distributed on social media platforms among the online consumers in Perlis, Kedah, Penang and Perak.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

3.3 Data Analysis Method

Collected data are analysed using Statistical Programmers for Social Science (SPSS) version 26.0 where descriptive, reliability and multiple regression analysis are conducted in the study. The results of the analysis are used to identify the acceptance of variables as well as the hypotheses involved in the study.

4 Results and Analysis

4.1 Sample Profile

The data analysed are based on the responses from 384 respondents who experienced online purchases of luxury brand. Table 4.1 shows the profile of respondents which includes gender, age, ethnicity, states, marital status, employment status and monthly income as well as several screening questions.

Table 4.1: Profile of Respondents

No.	Category	Details	Frequency (384)	Percentage (%)
1.	Gender	Male	131	34.1
		Female	253	65.9
2.	Age	Below 18	10	2.6
		18-21	41	10.7
		22-25	127	33.1
		26-29	61	15.9
		30 and above	145	37.8
3.	Ethnicity	Malay Chinese	290	75.5

7. Monthly Income	Less than RM3000	166	43.2
	RM3001- RM6000	122	31.8
	RM6001- RM9000	75	19.5
	More RM9000	21	5.5
8. Time spent on social media every day?	Less than 1 hour	52	13.5
	1-2 hours	158	41.1
	2-3 hours	86	22.4
	3-4 hours	88	22.9
	More than 5 hours		
9. Social	Facebook	145	37.8
	Instagram	181	47.1
	Twitter	58	15.1
10. Have you ever made any online purchases of luxury brand?	I have	384	100
	I have not	0	0
	No, but I will	0	0
11. Does social media marketing influence your intention to purchase luxury brand online?	Yes	368	95.8
	No	16	4.2
12. What category of luxury product that you purchase online?	Clothing	153	39.8
	Accessories	70	18.2
	Handbags	87	22.7
	Electronic	74	19.3

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

13. How often do you make online purchases annually?	1-3 times	92	24
	4-6 times	96	25
	7-9 times	76	19.8
	10 times and above	120	31.3

4.2 Hypotheses Testing

This section will be discussing on the hypotheses of this study which are tested based on the results obtained from reliability analysis and multiple regression analysis involving both independent variables and dependent variable of this study.

4.3 Reliability Analysis

The research initially confirmed the internal consistency of Cronbach's Alpha. Table 4.2 represents the reliability of independent variables and dependent variable involved in this study. From the result, it can be seen that Cronbach's alpha for electronic word-of-mouth is 0.758, subjective norm is 0.796, trust is 0.886, attitude is 0.893 and perceived behavioural control is 0.785. On the other hand, the result of Cronbach's alpha for online purchase intention is 0.798. According to (Sharma, 2016), the results of all variables have good and acceptable consistency. Therefore, it can be concluded that this study has obtained a reliable coefficient.¹⁰

Table 4.2: Reliability Test

Variable		Number of Items	Cronbach's Alpha	Internal Consistency
Electronic (eWOM)	Word-of-mouth	4	0.758	Acceptable
Subjective Norm		4	0.796	Acceptable
Trust		5	0.886	Good
Attitude		3	0.893	Good
Perceived Control	Behavioural	3	0.785	Acceptable
Online Purchase Intention		5	0.798	Acceptable

¹⁰ Sharma, B. (2016). A focus on reliability in developmental research through Cronbach's Alpha among medical, dental and paramedical professionals. *Asian Pacific Journal of Health Sciences*, 3(4), 271-278.

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

4.4 Multiple Regression Analysis

Table 4.3: Multiple Regression Analysis

Paths	Unstandardized Coefficient		Standardized Coefficients β	t	Sig.
	β	Std. Error			
Electronic Word-of-mouth (eWOM)	.294	.049	.308	6.052	.000
Subjective Norm	.035	.039	.046	.883	.378
Trust	-.001	.040	-0.02	-0.31	.975
Attitude	.234	.043	.282	5.461	.000
Perceived Behavioural Control	.199	.046	.205	4.360	.000
R Square: 0.425 Adjust					
R square: 0.418					

From Table 4.3 above, it is shown that there is a significant value for three independent variables which are electronic word-of-mouth (0.000), attitude (0.000) and perceived behavioural control (0.000) as these values are less than 0.05 ($p < 0.05$). Therefore, it is concluded that electronic word-of-mouth, attitude and perceived behavioural control have a significant impact on the online purchase intention. In contrast, both subjective norm and trust do not have a significant impact on online purchase intention due to their value which is 0.378 and 0.975 respectively ($p\text{-value} > 0.05$).

In addition to this, the increase of every unit for electronic word-of-mouth (eWOM) with online purchase intention is 0.308(β). Meanwhile, $\beta = 0.046$ in every unit of subjective norm with online purchase intention. On the other hand, the increase of every unit for trust with online purchase intention is -0.02(β). For attitude with online purchase intention and perceived behavioural control with online purchase intention, the coefficient value in every unit increase is 0.282(β) and 0.205(β) respectively.

4.5 Hypotheses Results

Table 4.4: Result of Hypotheses Testing

Hypotheses	Path Coefficient (β)	p-value (<0.05)	Result (H_0)
H ₁ : Electronic word-of-mouth (eWOM) has a positive significant impact on online purchase intention of luxury brand.	0.308	0.000	Rejected
H ₂ : Subjective norm has no positive significant impact on online purchase intention of luxury brand.	0.046	0.378	Accepted
H ₃ : Trust has no positive significant impact on online purchase intention of luxury brand.	-0.02	0.975	Accepted
H ₄ : Attitude has a positive significant impact	0.282	0.000	Rejected

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

on online purchase intention of luxury brand.

H ₅ : Perceived behavioural control has a positive significant impact on online purchase intention of luxury brand.	0.205	0.000	Rejected
--	-------	-------	----------

5 Recommendation and Conclusion

The main objective of this study is to examine the impact of social media marketing on online purchase intention of luxury brand among consumers in Northern region of Peninsular Malaysia in which the states involved are Perlis, Kedah, Penang and Perak. The results of this study showed whether the online purchase intention among the consumers are influenced by five factors associated with social media marketing which are electronic word-of-mouth (eWOM), subjective norm, trust, attitude and perceived behavioural control. From the results obtained in this study, it is shown that only electronic word-of-mouth (eWOM), attitude and perceived behavioural control that have a positive significant impact on online purchase intention. On the other hand, subjective norm and attitude have insignificant impact on online purchase intention.

From the analysis, it is concluded that this study has achieved the minimum requirement of Cronbach's alpha coefficient where all variables involved have good and acceptable consistency which are greater than 0.6. The highest value of beta coefficient(β) which is 0.308 has shown that electronic word-of-mouth (eWOM) had a greater impact on the online purchase intention of luxury brand among the consumers compared to the other indicators.

Although this research has achieved its purpose to identify the impact of social media marketing on online purchase intention of luxury brand among consumers, there are several limitations found in this research. Firstly, due to the focus of this research on population in Northern region of Peninsular Malaysia, future researchers are suggested to broaden their target population by approaching the population in other regions of the country in order to improve the results of the study as the market base of luxury purchase is wide. Secondly, it is recommended for the future researchers to widen the scope of study instead of limiting the focus on experienced online luxury buyers only, yet to also take into consideration about the online buyers who may as well become potential luxury purchasers. The measurements used in collecting data has also limited the findings of this research. Hence, future researchers are advised specify the questions in the survey which can help in addressing the issue that can provide adequate information in relation to the factors of social media marketing that can influence the online purchase intention of luxury brand among the online communities.

Acknowledgements

First and foremost, researcher would like to express her highest gratitude to The Almighty, Allah S.W.T., for Him the Most Gracious and the Most Merciful, including the last messenger of His, Prophet Muhammad S.A.W. She is grateful for all the blessings and chances that are given to her to finish this proposal with great

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

commitment and patience. The efforts made to research and analyse the chosen topic is worth completing this proposal within the given period.

Furthermore, the researcher would love to thank her supervisor, Dr. Wan Farha binti Wan Zulkifli, as well as her examiner, Prof. Madya Dr. Mohammad bin Ismail, for the dedication and guidance in giving clear instructions for her to carry out this research smoothly. All advices and tips given are highly appreciated as they have helped her to have a better understanding and lead her through completing this proposal successfully.

Last but not least, a special thankfulness is also expressed to her beloved family and fellow friends for the continuous supports, prayers and meaningful advices that act as an inspiration and strength for her to always have the courage as well as being her ears during the difficult time throughout the journey. The researcher is also taking into account for the effort and time spent by the cooperative respondents in answering the distributed questionnaires and making this research possible.

Hopefully this proposal is accepted satisfactorily as all efforts are used in finding information including analysing and evaluating the data to study about the topic of this research. Therefore, the researcher hopes that the time and effort spent in finishing this proposal are totally worth it.

CONSUMER BUYING BEHAVIOUR TOWARDS HOMEGROWN COSMETIC PRODUCTS AMONG GENERATION Z

Fatin Azmalia binti Mohd Rodiand Raja Rosnah Binti Raja Daud

Faculty of Entrepreneurship and Business,
Universiti Malaysia Kelantan,
Malaysia

Email: azmalia.a17a0098@siswa.umk.edu.my; rosnah.d@umk.edu.my

Abstract:

Cosmetic is any substance used to clean and improve the skin, hair and others part of body. Cosmetic also are substances used on the outside of the body for the purposes of cleaning, changing the appearance, improving body odor, protecting, or maintaining in good condition. Many people use the products every day and its usage is increasing every year. The use of these products is regarded as a requirement for personal hygiene, better appeal, skin and hair protection from ultraviolet light and harmful contaminants and slowing down the aging process. This research is conducted to investigate the buying behaviour towards homegrown cosmetic products among generation Z. The development of a conceptual framework led to a hypothesis showing that there is a positive relationship between independent variable (brand awareness, attitude, consumer experience, price) and consumer buying behaviour. A quantitative method will be used in this research and the type of survey to collect the data is an online questionnaire due to the issue of Covid-19. Furthermore, a total sample size of approximately 137 respondents among generation Z will be distributed with the questionnaires and the data will be analysed using Statistical Package for Social Science (SPSS).

Keywords: *consumer buying behaviour, brand awareness, attitude, consumer experience, price.*

1 INTRODUCTION

Consumer behaviour emphasizes on the understanding the purchase decision that individual consumers and how they utilize the existing resources such as money, time and effort to get the product or services that they want (Jalal Rajeh Hanaysha, 2018). The consumer behaviour in making the purchase decision are always changes and never loyal to the same product or brands. Nowadays, the consumers are more to something that can fulfil their needs and wants. The marketers must be aware with any changes of consumer buying behaviour. The consumer decision-making process can be described as the phases that consumers can go through in making the final purchase decision before they buy the products. The task of the marketers is to focus to the whole purchase process instead of emphasizing solely on the decision-making process. It is because the consumers are

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

experience to find the different phases before do the conclusion (Basil, 2013).

1.1 Research Objectives

The objectives of the study are:

To examine the relationship between attitude and consumer buying behaviour among generation Z.

To examine the relationship between brand awareness and consumer buying behaviour among generation Z.

To examine the relationship between consumer experience and consumer buying behaviour among generation Z.

To examine the relationship between price and consumer buying behaviour among generation Z.

2 LITERATURE REVIEW

2.1 Attitude

Attitude means feeling, reaction or tendencies on something such as idea or object (Yuan Sim, 2012). Consumers' attitudes are developed from personal experiences, earning with reality, information from friends and salesperson (Ying San, 2012). Some consumers know and understand on every ingredient that used in cosmetic product because they aware of the long-term effect on their skin and also to avoid the risk on the skin and money also. But some consumers were not really care about the long-term effect on the skin. They were just wanting a beauty and light skin in a short period of time without care the on the long-term effect or in the future.

2.2 Brand awareness

Brand awareness is a super definition including brand acquaintance, potential of being remembered, information and the ideas about the product (Bilgili & Ozkul, 2015). Ekhveh and Darvishi (2015) points out brand awareness is associated with the information node in memory. The ability of customers to recognize a brand under a variety of conditions reflects their awareness of the brand. According to Jamil and Wong (2010) define brand awareness as the brand recall and brand recognition of a brand. Brand awareness creates a great association in memory about a particular brand (Malik, Ghafoor, Hafiz, Raiz, Hassan, Mustafa & Shahbaz, 2003). Brand awareness is one of the main factors affecting the knowledge level of consumers about the brand (Ekhveh & Darvishi, 2015).

2.3 Consumer experience

Customer perceptions of service quality, effectiveness of a product and quality of product will differ either they had online purchase or walk in. They experience decide them to make last decision before making any purchase and also choices are based on the other customer experience such as friends, buddies, relatives or even their neighbour picking method for selecting items being factor influence them to choose right cosmetic product (Mardhihah, 2018). There is an interaction effect between customer experience level and picking method for customer perceptions of service

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

quality (Hazriah, 2018). Service quality is correlated with increased customer behavioral intentions.

2.4 Price

Price is very important when consumer want to buy a product. If the product expensive, this will affect the consumer interested to buy the product. Price may be the most important consideration in ordinary users. However, the price of a product does not affect the consumer's intent to purchase a product as it does in brand loyalty (Rahim, 2018). Consumer satisfaction can also be constructed by comparing the prices with the costs that it considers and values. It is also one of the strongest indicators of customer loyalty (Singh & Pattanayak, 2014).

2.5 Consumer Buying Behaviour

Kotler and Keller (2011) state the consumer buying behaviour is the study of the ways of buying and disposing of goods, services, idea or experience by individuals, groups and organizations in order to satisfy their needs and wants. Consumer buying behaviour focuses on how individuals make decisions to spend their available resources (time, money, effort) on consumption-related items that includes what they buy, when they buy, why the buy, where they buy it, how often they use it, how often they buy it, how they evaluate it after the purchase and the impact of evaluation on future purchase and how they dispose it (Hawkins & Coney, 2001).

Consumer buying behavior is a decision process as well as an attitude of the people involved in purchasing and using products. Consumers make purchase decisions for buying small as well as large products. Consumers begin looking for products or services that suit their requirements after identifying a need or a desire. Their decision depends upon many criteria (SS Anjana, 2018). However, SS Anjana also states consumer purchases have happened much before their actual purchase.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

2.6 Research Framework

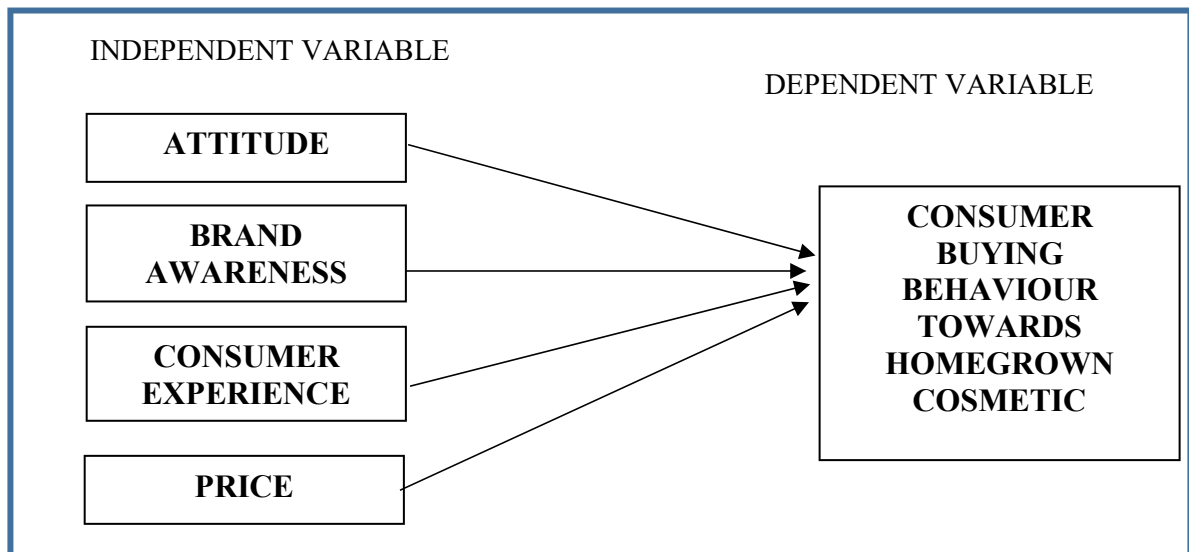

Figure 1: Research Framework

3 METHODOLOGY

This research aims to examine the consumer buying behaviour towards homegrown cosmetic products among generation Z. The choice of generation Z consumer as a target population of this research including the teenagers which from secondary students, Malaysian Higher School Certificate (STPM) students, diploma and degree student and all teenagers within the age. The unit of analysis will be individual those who are 15-24 years old.

3.1 Sampling Technique

There are two types of sampling techniques, which are non- probability and probability sampling technique (Sekaran & Bougie, 2010). Probability sampling methods is choosing sampling on random or chance selection from the target population. Non-probability method is the probability of each case being selected from the population is not known.

In this research, non-probability method is preferred because it is judgmental and sample could be chosen from many ways. Under non-probability sampling technique, one of the sampling method been used in the research is judgmental sampling. This research used judgmental sampling and it also called purposive sampling or authoritative sampling. Judgmental sampling is used where the researcher select units to be sample based on his own existing knowledge. Therefore, generation Z were chosen as one of the groups of respondents for the research due to the availability and familiarity to the researcher. Judgmental sampling method have been applied in this study because this method can save the time and cost for the researcher to collect the data (Smith, 2016). The respondent of the questionnaire can be the consumers which are generation Z who age 15-24.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

3.2 Research Instrument

Questionnaire developed on five-point Likert scale was used as a tool of data collection. The independent variables; attitude have 5 items, brand awareness have 5 items, consumer experience have 4 items and price have 5 items. The dependent variable, consumer buying behaviour has 5 items. The other section of questionnaire contained questions regarding demographic information of the respondents such as gender, age, race, status, education level, occupation and income level. For data analysis, SPSS software was used to test the hypotheses.

3.3 Data Collection

Data was collected by administrating a close ended questionnaire. For collecting data electronically “Google forms” were created and questionnaire distributed among respondents through social networking sites like WhatsApp and Facebook.

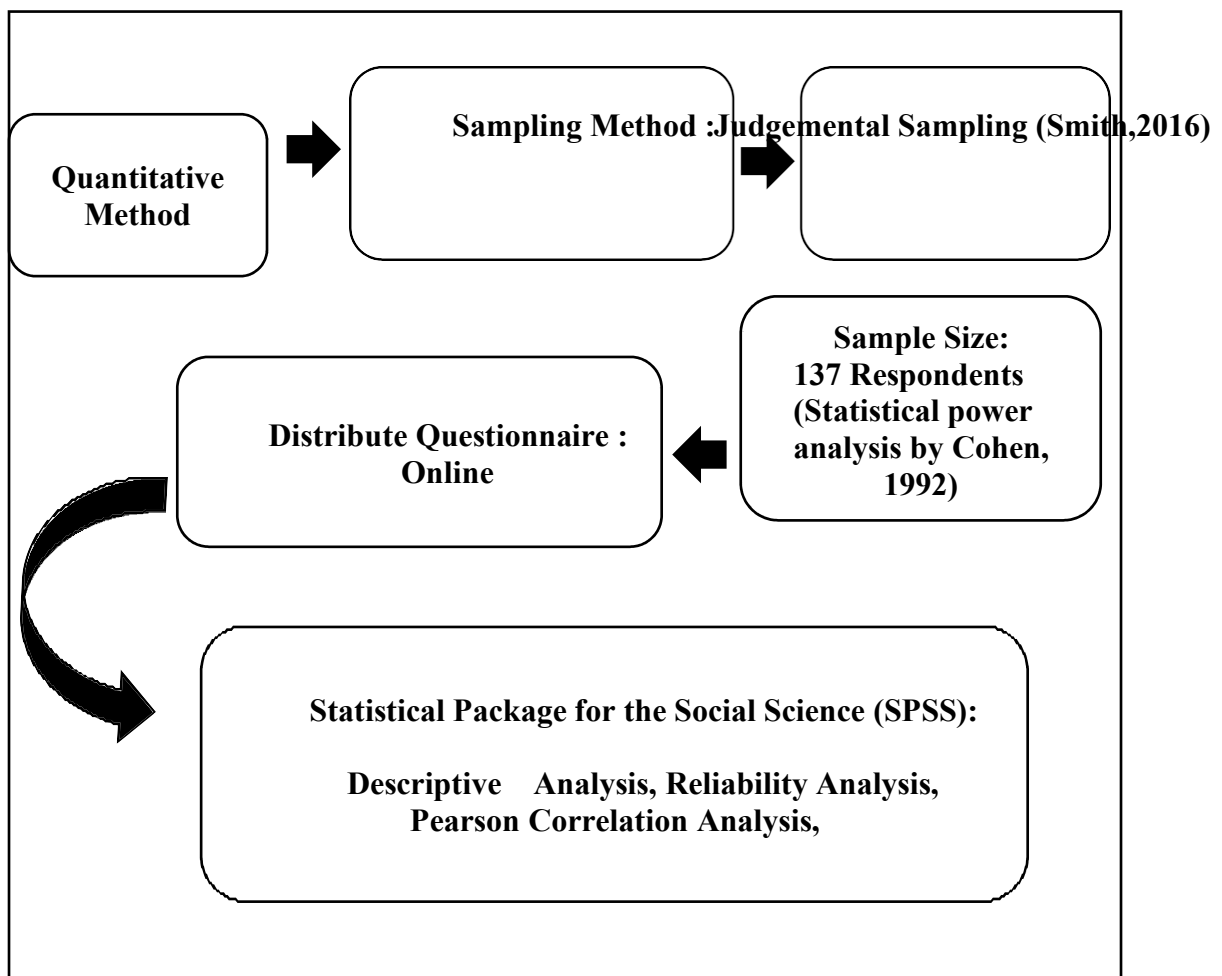

Figure 2: Research Methodology

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

4 RESULT AND ANALYSIS

4.1 Demographic Profile

137 set of questionnaires have been personally distributed to the respondent. Table below shows the data of the respondents.

Table 2: Data of the Respondent

Demographic	Frequency	Percentage
GENDER		
Male	20	14.6
Female	117	85.4
Total	137	100.0
AGE		
15-18 Years Old	7	5.1
19-21 Years Old	34	24.8
22-24 Years Old	87	63.5
25 And Above	9	6.6
Total	137	100.0
RACE		
Malay	126	92.0
Chinese	4	2.9
Indian	7	5.1
Total	137	100.0
STATUS		
Single	121	88.3
Married	12	8.8
Divorced	2	1.5
Widowed	2	1.5
Total	137	100.0
EDUCATION LEVEL		
SPM	15	10.9
Foundation/ STPM/ STAM	20	14.6
Diploma	25	18.2
Degree	75	54.7
Master	2	1.5
Total	137	100.0
OCCUPATION		
Student	80	58.4
Employee	36	25.5
Unemployed	6	4.4
Self-employed	16	11.7
Total	137	100.0

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

4.2 Reliability Analysis

Table 3 : Result of reliability analysis

Variable	Cronbach's Alpha	Number of items	Strength of association
Independent variable			
Attitude	0.721	5	Good
Brand awareness	0.862	5	Very good
Consumer experience	0.773	4	Good
Price	0.778	5	Good
Dependent variable			
Consumer buying behaviour	0.843	5	Very good

Based on the reliability analysis in Table 3, it can be concluded that the coefficient alpha for reliability of independent variable attitude is 0.721. This means the consistency and stability of 0.721 is good according the Rules of Thumb about Cronbach's Alpha Coefficient Size. According to the reliability analysis, it can conclude that the coefficient alpha for reliability of independent variable brand awareness is 0.862. This means the consistency and stability of 0.862 is very good refer to the Rules of Thumb about Cronbach's Alpha Coefficient Size (Hair Jr. et al., 2011). Based on the reliability, it can conclude that the coefficient alpha for reliability of independent variable consumer experience is 0.773. This means the consistency and stability of 0.773 is good referring to the Rules of Thumb about Cronbach's Alpha Coefficient Size. Lastly based on reliability analysis, it can conclude that coefficient alpha for reliability of price is 0.778 and this mean consistency and stability of 0.778 is good according the Rules of Thumb about Cronbach's Alpha Coefficient Size.

4.3 Pearson Correlation

Table 4: Pearson Correlation Analysis

Variable	Consumer buying behaviour	Attitude	Brand awareness	Consumer experience	Price
Consumer buying behaviour	1	0.555	0.327	0.648	0.581
Attitude	0.555**	1	0.360	0.427	0.500
Brand awareness	0.327**	0.360	1	0.400	0.371
Consumer experience	0.648**	0.427	0.400	1	0.519

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Price	0.581**	0.500	0.371	0.519	1
-------	---------	-------	-------	-------	---

The result of correlation analysis between attitude and consumer buying behaviour, it shows the Pearson correlation coefficient significant value and also number of respondents. The number of respondents represents 137 respondents for this study. The correlation coefficient for the attitude and consumer buying behaviour is 0.555, which is good positive relationship between these variables. Thus, this situation can prove the attitude can influence on consumer buying behaviour. Since the p value also equal to 0.000, so researcher should reject the null hypothesis.

The result of correlation coefficient for brand awareness and consumer buying behaviour shows the Pearson correlation coefficient significant value and also number of respondents. The number of respondents represents 137 respondents for this study. The correlation coefficient for the brand awareness and consumer buying behaviour is 0.327, which is a positive relationship between these variables. Thus, this situation can prove the brand awareness can influence the consumer on consumer buying behaviour. Since the p-value also equal to 0.000, so researcher should reject the null hypothesis.

Based on the data analyse, it indicates a moderate with correlation coefficient of 0.648. This implicates that consumer experience is positive and moderate with relatively high in relation with consumer buying behaviour. The p-value is 0.000 which is less than 0.001 and it highly significant. Thus, there is a positive significant relationship between consumer experience and consumer buying behaviour towards homegrown cosmetic products among generation Z .

The result analysis correlation coefficient for price and consumer buying behaviour, it shows the Pearson correlation coefficient significant value and also number of respondents. The correlation coefficient for the price and consumer buying behaviour is 0.581, which is a positive good relationship between these variables. In addition, this situation can prove the price can influence consumer to buy or not buying the homegrown cosmetic products among generation Z. The p-value is 0.000 which is less than 0.001 and it highly significant. Thus, there is a positive significant relationship between consumer experience and consumer buying behaviour towards homegrown cosmetic products among generation Z.

5 DISCUSSIN & RECOMMENDATIONS

Overall of the result show that the relationship between each of independent variable and dependent variable that determine buying behaviour among generation Z. The researcher gain the p-value from the Pearson Correlation test is 0.00. When the p –value is less than 0.01, so the null hypothesis should be rejected. It shows that all the variables in this study have a positive good linear in relationship.

For the future research, the researcher recommends several suggestions to future improvement in term of the result of this study. This research can be used as reference to understand the consumer buying behaviour towards homegrown cosmetic products

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

among generation Z. The information about the consumer buying behaviour towards homegrown cosmetic products and the data collected were analyzed and valid. In addition, researcher also recommends the future researcher to integrate quantitative and qualitative methods during data collection from the respondents. Opinion if minor respondents might not be able to represent using questionnaire method. Hence, to obtain more information, this combination of approach method would help researcher a lot.

Potential researchers must use several methods to gather data instead of using Google application software for digital questionnaires. Future researchers may also use organizational data collection, such as the quest for more data appraisal methods, mainly on the university website, business or official agency, which may use a door-to-door survey to verify that researchers are in a position to respond correctly.

Other than that, retailers also must ensure that they are offering the prices that are suitable with the products. Consumers nowadays are looking for lower price to make the purchases. It is to help them to become thrifter due to the economics problem. By offering the lower price, it can attract more customers to come into the store. The retailers can make the promotion such as discounts, coupons and so on to cut the price. People are more attract with the promotions because it can help them to fulfil their need and wants without need to spend more money.

This study presented that there were independent variables tested which were attitude, brand awareness, consumer experience and price. The questionnaires were distributed to 137 respondents from generation Z which age 15 - 25 years old. This study had underlined four objectives to be achieved in this research. As a conclusion, the overall study has been discussed by identified and the findings of the data collected. After running the Pearson's Correlation, attitude, brand awareness, consumer experience and price had shown a significant relationship with consumer buying behaviour towards homegrown cosmetic products. The first higher value correlation is consumer experience followed by price, attitude and brand awareness. This can be said that the research objectives had been met and the entire hypotheses were accepted.

ACKNOWLEDGEMENT

First of all, I would like to express our gratitude to Almighty God for enabling us to complete this report with success. Successfully completion of any type of project requires help from several persons. I also have taken advice from different people for the preparation of this report, especially from Universiti Malaysia Kelantan students. There is a little effort to show our sincere gratitude to that helpful person.

I would like to convey our sincere gratitude to our supervisor, which is Madam Raja Rosnah binti Raja Daud. Without her kind of direction and proper guidance, this study would have been a little success. In every phase of the report, her supervision and

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

guidance shaped this project to be completed perfectly. I would also like to thank the Faculty of Entrepreneurship and Business for being part of our project successfully.

Last but not least, a special thanks to my parent and friends who have helped us with their valuable suggestions and guidance has been helpful in various phases of the completion of the project.

THE IMPACTS OF PRODUCT PACKAGING ON RETAIL CONSUMER SHOPPING PATTERNS TOWARDS PRIVATE LABEL BRANDS IN MALAYSIA

Hashwini A/P Somu and Norfazlirda Binti Hairani

Faculty of Entrepreneurship and Business,
Universiti Malaysia Kelantan,
Malaysia

Email: hashwini.a17a0958@siswa.umk.edu.my; fazlirda.h@umk.edu.my

Abstract:

In Malaysia, the sales for private label brands in the current market increasing dramatically. However, most Malaysians still avoid purchasing private label brand products due to the perceived quality of private label brand products. Consequently, the purpose of this study is to examine the impacts of product packaging on retail consumer shopping patterns towards private label brands in Malaysia. The study examines the impacts of product packaging in terms of packaging color, packaging material, and printed information. A quantitative approach had been applied in this study where 384 sets of online questionnaires had been distributed to target respondents by using a convenience sampling method to obtain necessary information. The data analysis of this research was acquired with the assistance of SPSS 25 throughout this study. This cross-sectional study was analyzed in terms of descriptive analysis, reliability analysis, normality analysis, and Pearson Correlation analysis. The results concluded that all three independent variables in this study were related to the retail consumer shopping patterns towards private label brands in Malaysia. In short, this study has certain limitations and recommendations for future researchers to explore more on the impacts of product packaging of private label brands.

Keywords: *Packaging color, Packaging material, Printed information, Private label brands, Retail consumer shopping patterns*

1 INTRODUCTION

In Malaysia, a variety of retailers including Tesco and Giant formed their brand to increase sales in the current market share (The Star, 2016). As stated by Stauder (2013) justified that private label brand provides 10 to 45 percent towards retail stores' sales. However, Malaysians still not aware of private brand label products due to the quality of the product and trust concern (The Malay Mail, 2015). A study from Rettie and Brewer (2000) appended that packaging is the best way to trigger consumer shopping patterns since packaging can be considered as a developing relationship between the brands. Therefore, this study indicated packaging color, packaging material, and printed information as independent variables in this study. Besides, the researcher strongly believes that this study capable to provide significant insights towards certain parties, especially retailers and marketers pertaining to the product packaging on private label brands able to affect consumers' shopping patterns in the retail store. The objective of this study is to examine the relationship between packaging color, packaging material, and printed information with retail consumer

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

shopping patterns towards private label brands in Malaysia.

2 LITERATURE REVIEW

2.1 Private Label Brand

The literature on private label brands demonstrates that low price attributes, packaging similarities, and perceived quality similarities have an impact on consumer preferences (Beneke, 2013). Buyers depend on symbols, shapes, and colors (Tversky, 2004) for decisions on the private label quality of the brands (Aribarg, 2014). Product packaging can inspire familiarity feelings that can enhance assessments of the quality of private label brands. This has increased the similarity between the way customers notice and classify brands and can change thinking and preference for different brands. Empirical test results indicate that the packaging is linked to perceived quality (Sprott and Shimp 2004).

2.2 Retail Consumer Shopping Pattern

According to (Asthana, Crauatts & Krzyzanowski, 1994) the deeper the communication between retailers and consumers, the more information will be acquired about retail consumer shopping patterns which will be beneficial to the retailers. Shopping patterns, in particular, are critical areas of study concerning to the product packaging, as the dose of the exposure of interest is determined by how frequently a customer shops the private label brand. Determination of dose is crucial to acknowledge more about how elements of the product packaging might be related to purchases and consumption of retail consumers (Jilcott Pitts, 2017). The packaging would impact consumers and, as a result, it shifts their shopping pattern towards that brand, which will help the company boost its sales (Deliya & Parmar, 2012).

2.3 Packaging Color

It is discovered by previous research that colors of packaging can evoke emotions and feelings in each shopper (Mutsikiwa, 2013; White, 2006). The colors of the packaging have the possibility to create an enduring impression and image of the product or brand. Marketers utilize colors for the packaging of goods to attract the attention of customers, which gives the brand or product a positive or negative impression. Asadhollahi & Givee (2007) recommended that the color package communicate, reflect, and display certain striking features and theoretical qualities of the brand. It implies, however, that the colors convey special brand messages which generate a unique selling proposition. Nevertheless, it should be noted that the colors of the packaging are typically the colors of the true product in the product packaging (Imiru, 2017).

2.4 Packaging Material

As per Smith and, Taylor (2004) shoppers connect the packaging materials associated by shoppers with certain essential values of the product. It is also considered that high- quality material able to draw customers more instead of low-quality material. Thus, the material of the packaging has a strong influence on retail consumer shopping patterns. As indicated by Smith (2004), with the goal that packaging material would bear temperature under zero or high temperatures in microwave contingent upon the product components and the needs and wants of a purchaser thus, packaging materials are made on that basis. The researchers supported the use of plastic containers and decided that

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

such containers were better than cardboard and glass containers, as their top cap screw protected the product and were less likely to spill (Lynsey Hollywood, 2013).

2.5 Printed Information

Printed information motivates the consumer to buy a product (Silayoi & Speece, 2004; Butkeviciene, Stravinskiene & Rutelione, 2008). Kupiec & Revell (2001) found that consumers pay more attention to printed information when purchasing high involvement products. Correctly transmitted packaging information has a considerable effect on customer buying habits because it eliminates confusion and builds product reputation (Silayoi & Speece, 2004). Coulson (2000) indicated that shoppers prove to be more careful about written information as well as to use the information about packaging more broadly, since it is more well-being and more mindful of nutrition. Printed information could be the only means of contact between a product and its consumer (Gonzalez, Thorhsbury & Twede, 2007) and thus it affects the buying patterns of retail customers (Butkeviciene, Stravinskien, & Routelione, 2008).

2.6 Hypothesis Statement

The three developed hypotheses of this research are:

H1: There is a relationship between packaging color and retail consumer shopping patterns towards private label brands in Malaysia.

H2: There is a relationship between packaging material and retail consumer shopping patterns towards private label brands in Malaysia.

H3: There is a relationship between printed information and retail consumer shopping patterns towards private label brands in Malaysia.

2.7 Conceptual Framework

Independent Variables

Dependent Variable

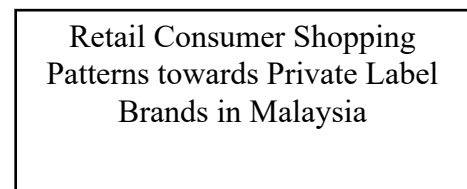

Figure 1: The Conceptual Framework of the Study

Figure 1 illustrates the conceptual framework of this study. Thus, this framework displays the relationship between independent variables namely packaging color, packaging material, and printed information with retail consumer shopping patterns towards private label brands in Malaysia which is the dependent variable of this study.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

3 METHODOLOGY

A quantitative approach was applied in this study where questionnaires were used to collect the data from consumers who have purchased the private label brands in Malaysia. The researcher applied the quantitative method because quantitative research is an approach for testing objectives theories by examining the relationship among variables (Creswell, 2017). The cross-sectional study was applied in this study to gather preliminary data to support the research on the impacts of product packaging on retail consumer shopping patterns towards private label brands in Malaysia. The sample size that has been taken for this study is 384 respondents in Malaysia according to the Krejcie and Morgan (1970) table. The convenience sampling method was selected in this study as the easiest way to access and cover the larger number of the survey quickly and cost-effectively.

The researcher distributed the questionnaire to target respondents via message and email and obtained the data through an online survey by using Google Form. The style of the rating scale was used in the questionnaire to form the questions. The scale was used to measure in a specific statement to identify the respondent's degree of agreement or disagreement. The researcher used a nominal and interval scale in section A a while 5- point Likert scale was applied in sections B1, B2, B3, and C. The data analysis of this research was entered and analyzed by using the Statistical System for Social Sciences (SPSS) software version 25. All the data collected were analyzed in terms of descriptive analysis, reliability analysis, normality analysis, and followed by Pearson Correlation analysis.

4 FINDINGS

4.1 Demographic Profile of Respondents

The researcher presented the respondents' demographic profile as obtained from Section A of the questionnaire in Table 1 below. Section A consists of 4 items such as gender, range of age, marital status, and race.

Table 1: Descriptive Analysis for Demographic Profile of Respondents

Demographic	Item	Frequency (n=384)	Percentage (%)
Gender	Male	148	38.5
	Female	236	61.5
Range of Age	18-21 years old	46	12.0
	22-25 years old	89	23.2
	26-29 years old	118	30.7
	30 years old and above	131	34.1
Marital Status	Married	200	52.1
	Single	184	47.9
Race	Malay	124	32.3
	Chinese	132	34.4
	Indian	101	26.3

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Others	27	7.0
--------	----	-----

Table 1 describes the demographic profile of respondents in this study. In analyzing the frequency, most of the respondents were female at 236 (61.5%) whereas male respondents were 148 (38.5%). This can be justified that females might favor purchasing private label brand products in retail stores compared to male respondents in this study. Besides, there were 131 respondents among 30 years old and above with (34.1%) which were the highest, while the lowest was 46 of respondents among 18-21 years old with (12%). This can be appended that individuals aged 30 years old and above are likely to purchase private label brand products due to the many product varieties and cheapest price. Furthermore, 200 (52.1%) of respondents were married whereas 184 (47.9%) of respondents are single in this study. This can be indicated that individuals who were married are likely to purchase private label brand products to save their budget. In summation, the majority of respondents in terms of the race were 132 Chinese respondents with (34.2%) while the minority were 27 of Others race with (7%). This can be justified that Chinese respondents like the product at the cheapest price and wide product range to choose from.

4.2 Descriptive Analysis

Table 2: Level of Mean

Variable	Mean	Interpretation
Packaging Color	3.83	High
Packaging Material	3.92	High
Printed Information	3.95	High
Retail Consumer Shopping Patterns	3.88	High

Based on table 2, it can be concise that the third independent variable which is printed information has the highest value of mean at 3.95. Besides, the second independent variable which is packaging material has the second highest value of mean at 3.92. Next, the third highest value of mean falls on the dependent variable of this study which is retail consumer shopping patterns at the value of 3.88. Furthermore, the lowest value of mean falls on the first independent variable which is packaging color at the value of 3.83. Summing up, the range of mean for both the independent variables and dependent variable lies within 3.67-5.00 which indicated the high level of acceptance based on the responses from target respondents in this study according to the justification from Hadiyanto and Suratno (2015). Hence, the outcome of the mean for each variable is distinguished as a good result.

4.3 Reliability Analysis

Table 3: Reliability Analysis

Variables	Cronbach's Alpha	Item	N (sample size)
Packaging Color	0.919	5	384
Packaging Material	0.910	5	384
Printed Information	0.912	5	384
Retail Consumer Shopping Patterns	0.912	5	384

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

By referring to the reliability analysis in table 3, according to Hair et al. (2010), the Cronbach's Alpha coefficient for packaging color is 0.919, while packaging material is 0.910, and followed by printed information which is at 0.912. These three are the independent variables of this study. Besides, the dependent variable namely the retail consumer shopping patterns shown the coefficient at 0.912. Hence, it is proven that all the constructs are excellent in the strength of association on the Rule of Thumb about Cronbach's Alpha coefficient size. It depicts that the consistency and stability of all items in this study are excellent thus it is reliable. Therefore, all the constructs of this study are strong and stable.

4.4 Normality Analysis

Table 4: Result of Normality Test of Correlation Analysis

Variables	Kolmogorov-Smirnov			Shapiro-Wilk		
	Statistic	df	Sig.	Statistic	df	Sig.
Packaging Color	0.141	384	0.000	0.895	384	0.000
Packaging Material	0.155	384	0.000	0.883	384	0.000
Printed Information	0.160	384	0.000	0.875	384	0.000
Retail Consumer Shopping Pattern	0.143	384	0.000	0.897	384	0.000

Based on table 4, the results of Kolmogorov-Smirnov and Shapiro-Wilk for all the variables in this study are abnormal. Because the significant value is 0.000 which is less than 0.05 as recommended by Hair et. al. (2016) appended the result of Kolmogorov- Smirnov and Shapiro-Wilk should be more than 0.05 for significant value to indicate the data of this study is normal. However, Tabachnick and Fidell (2007) justified that the data of a study can define as normal if the sampling size of the study is more than 200 although the result of Kolmogorov-Smirnov and Shapiro-Wilk are significant. In conclusion, the researcher justifies that the data in this study are normal based on the review from Tabachnick and Fidell (2007).

4.5 Pearson Correlation Analysis

Table 5: Results of Pearson Correlation Analysis between Variables

Variables	Retail Consumer Shopping Patterns	
Packaging Color	Pearson Correlation	0.696**
	Sig. (2-tailed)	0.000
	N	384
Packaging Material	Pearson Correlation	0.829**
	Sig. (2-tailed)	0.000
	N	384
Printed Information	Pearson Correlation	0.789**
	Sig. (2-tailed)	0.000
	N	384

** correlation is significant at the 0.01 level (2-tailed)

Table 5 presented the results of the Pearson Correlation analysis between variables on the impacts of product packaging on retail consumer shopping patterns towards private

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

label brands in Malaysia. The value of the Pearson correlation for packaging color is 0.696. It is shown that the relationship between packaging color and retail consumer shopping patterns is at a moderate positive level. For packaging material, the value of the Pearson correlation is 0.829. It indicated that the relationship between packaging material and retail consumer shopping patterns is at a high positive level. Followed by printed information, the value of the Pearson correlation is 0.789. It is shown that the relationship between printed information and retail consumer shopping patterns is at a high positive level. Hence, it can be determined that packaging color, packaging material, and printed information are related to retail consumer shopping patterns towards private label brands in Malaysia.

4.6 Hypotheses Testing

Table 5: Summary of Hypotheses Testing

Hypotheses	Statistical Analysis	Result
H1 There is a relationship between packaging color and retail consumer shopping patterns towards private label brands in Malaysia.	0.696	Accepted
H2 There is a relationship between packaging material and retail consumer shopping patterns towards private label brands in Malaysia.	0.829	Accepted
H3 There is a relationship between printed information and retail consumer shopping patterns towards private label brands in Malaysia.	0.789	Accepted

Based on table 5, it can be concluded that all the three independent variables namely packaging color has a moderate positive relationship, while packaging material and printed information has a high positive relationship on retail consumer shopping patterns towards private label brands in Malaysia. In short, three hypotheses in this study were accepted after Pearson Correlation testing was conducted.

5 DISCUSSION

5.1 Packaging Color

The results of hypothesis H1 were studied to answer RQ1. H1 proposed that there is a relationship between packaging color and retail consumer shopping patterns towards private label brands in Malaysia. From the finding, it revealed that there is a moderate positive relationship between packaging color and retail consumer shopping patterns towards private label brands ($r= 0.696$). Hence, H1 is accepted.

According to Waheed et. al. (2018) justified that packaging color must be aligned with consumers' cultural values to trigger their intention to purchase that product. Therefore, the researcher justified that the target respondents in this study pointed out that private label brands' product packaging color must be suitable with their cultural value which results in a positive shopping patterns to purchase private label brand products. Zekiri & Hasani (2015) indicated that packaging color allows consumers to distinguish between

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

their favorite brands and helps companies to draw consumer's attention and interest. Therefore, color and other packaging elements improve the marketing captivity and attractiveness thus differentiates it from other products. Mazhar (2015) found that packaging color has a positive relationship with consumers, as they are attracted to dark and attractive colors, hence they often buy the products.

5.2 Packaging Material

The results of hypothesis H2 were studied to answer RQ2. H2 proposed that there is a relationship between packaging material and retail consumer shopping patterns towards private label brands in Malaysia. From the finding, it revealed that there is a high positive relationship between packaging material and retail consumer shopping pattern towards private label brands ($r= 0.829$). Hence, H2 is accepted.

The researcher justify that eco-green friendly packaging towards private label brand products including recycling material packaging and biodegradable plastic give a great impact on shopping patterns among target respondents in this study which align with the review from Waheed et. al. (2018) stated that eco-friendly packaging has been a primary choice for the retail consumer during their purchase process. It has also been appended by Hussain et. al. (2015) that the quality of the packaging material can save the product and thus make it more preferable to create a positive perception for consumers. Smith and Taylor (2004) indicated that high-quality packaging material had a strong influence on retail consumer shopping patterns.

5.3 Printed Information

The results of hypothesis H3 were studied to answer RQ3. H3 proposed that there is a relationship between printed information and retail consumer shopping patterns towards private label brands in Malaysia. From the finding, it revealed that there is a high positive relationship between printed information and retail consumer shopping patterns towards private label brands ($r= 0.789$). Hence, H3 is accepted.

Waheed et. al. (2018) appended that information quality and details of information on products significantly influence consumers to purchase during the shopping process. In addressing this, the researcher justifies that high information quality and details of information on private label brand products will give a positive impact on shopping patterns respectively. Zekiri & Hasani (2015) justifies that printed information acts as a pivotal component and promotes the company's marketing communication strategies by establishing brand image and identity. It is supported by Shah et. al (2013) that printed information on packaging highly influences consumers' shopping patterns as a promotion of the product as compared to a highly expensive advertisement.

5.4 Limitations

There are some limitations in the study faced by the researcher in the course of this research. The scope of the discussion is the first limitation of this research. This is attributable to the fact that the sample of this study expected to focus only on those who purchase private label products in Malaysia. This has become one of the limitations of

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

this research since prior to this there is a lack of previous research studies in the field of this study.

The second limitation in this study is that the researcher used the closed-ended question with the Likert scale, such as scale 1 to 5, which allowed the respondents to choose a random answer. However, it is common for some respondents to answer the Google form questionnaire without reading it and to understand the questions very well. This may affect the data calculation, and could also affect the variables, thus the student who ticks the lowest scale might even make the result worse, which made it difficult for the researcher to find the actual result.

This study only identified three variables namely packaging color, packaging material, and printed information related to customer shopping patterns towards private label brands in Malaysia. Therefore, this cannot be fully explained for consumer shopping patterns towards private label brands in Malaysia since other variables can be considered.

5.5 Recommendations

Future researchers can explore more on the packaging color, packaging material, printed information, or other external impacts of product packaging of private label brands. Other than that, specific target respondents such as female shoppers, students, and male shoppers can be implemented in the future study since different perceptions occur based on the target respondents' demographic profile.

Next, this study used a 5-point Likert scale which limited target respondents gave their perception towards all variables in this study. Therefore, the future study can adopt a 7-point Likert scale in order to give target respondents close-ended questions.

In short, future researchers should carry out this study on an ongoing basis, by implementing different dimensions of product packaging such as font style and packaging design pertaining to retail consumer shopping patterns towards private label brands in Malaysia. Besides, mediating variables such as attitude can be included in the future study.

5.6 Conclusion

This study was implemented to examine the impacts of product packaging on retail consumer shopping patterns towards private label brands in Malaysia. This study presented that there are three independent variables tested namely packaging color, packaging material, and printed information. Apart from that, the collected data analysis was utilized to conduct tests on the demographic profile of respondents, descriptive analysis, reliability analysis, and followed by Pearson Correlation analysis. Furthermore, all the data analysis of this study is obtained through the survey of Google form questionnaires which was created by the researcher. In accordance with the findings as discussed earlier, it is revealed that all three independent variables in this study were related to retail consumer shopping patterns towards private label brands in Malaysia.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

ACKNOWLEDGEMENT

Firstly, I would like to express my deepest gratitude to my Supervisor Madam Norfazzlirda Binti Hairani for giving endless advice and more insightful knowledge to me during this journey of the Final Year Project. I am very grateful to have Madam Norfazzlirda as a Supervisor as she has always assisted me and provide guidance to complete this project successfully. Secondly, my acknowledgement to the library of University Malaysia Kelantan for providing the necessary materials and allowing me to utilize the facilities. In conclusion, I need thank to my respondents because they spend their precious time answering the questionnaire given. I will appreciate the handwork of respondents to fill up my questionnaire.

THE FACTOR THAT AFFECTING USER PROPENSITY TO USE QUICK RESPONSE (QR) CODE AMONG STUDENT IN UNIVERSITI MALAYSIA KELANTAN

Iqma Nazirah Abdul Hamid and Nurul Izyan Mat Daud

Faculty of Entrepreneurship and Business,
Universiti Malaysia Kelantan,
Malaysia

Email: iqmanazirah@gmail.com; izyan.md@umk.edu.my

Abstract

In this era, world is advancing with evolving technology that making everything need to be done quickly and in line with current development towards the real time processing of data and information. Smartphone is mobile device or known as essential device that works in various purposes in daily life include communication tool, tool for internet access, entertainment tool and others. Quick Response (QR) code become a well-known technologies that using by any companies in all industries. The purpose of this study was to examine the factor that affecting user propensity to use QR code among student in Universiti Malaysia Kelantan (UMK). This study also aimed on which factor that gives the most impact on the QR code usage propensity among student in UMK. In this study, four factors of affecting user propensity to use QR code were studied namely: Additional Information, Promotion, Payment and E-Feedback. This research discussed about the relationship between propensity to use QR code and the four factors as mentioned earlier. Questionnaire survey method was used to collect data from respondents. The data obtained were analyzed by statistical methods in the Statistical Package for Social Sciences (SPSS). Regression and correlation techniques will also be used in this study to study the relationship between dependent and independent variables.

Keywords: *Quick Response (QR) code, additional information, promotion, payment, e-feedback*

1 Introduction

Today, smartphones is an important asset for society to live their daily lives. This smartphone is not only owned by the younger generation but also all ages also own and use this smartphone to communicate and also for other things. Mobile technology has spread rapidly around the world. According to Statistic, the current number of smartphone users in the world today is 3.5 billion, and this means 44.81% of the world's populations own a smartphone (Turner, 2019). This figure is up considerably from 2016 when there were only 2.5 billion users, 33.58% of that year's global population.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

In addition, with this advance technology, marketers are taking the opportunity to market their products online to consumers out there. Quick Response (QR) code are usually trending used like marketing tech tool by many companies and marketers. An expanding number of firms and sales marketers are utilizing QR codes as a channel to spread their brands product to their customers' mobile gadget (Fine & Clark, 2015). This is because, today's society wants simple and fast things that can satisfy their needs and wants.

In fact, this sophisticated era has introduced the use of QR Code to technology entrepreneurs as well as consumers to further facilitate the business of sales and purchase activities. According to (Nofal, 2020), utilizing the QR codes is one of the most intriguing methods of carefully associating purchases to the internet through mobile phones since the gadget have become an essential interest of community.

There are some problems that arise among people in using QR codes in their daily life. (Othuon, 2018) mentioned problem that always arise from people is when to do a payment. The issues that bring about long queues during check out after purchased in mall or retail store. The payment that is offered by supermarket and mall is cash and credit card. So it gives difficult to people who are on emergency and want to settle payment immediately.

QR code can be found in product packages or brochures that marketers give to customers. So, users who have a smartphone can use it to detect the barcode that appears and directly link to the website that has been set. Therefore, the main purpose of this study is to examine the factor that affecting user propensity to use QR code among final year student in Universiti Malaysia Kelantan. This study also aimed on which factor that gives the most impact on the QR code usage propensity among student in UMK.

2 Literature Review

2.1 Additional Information

Additional information was the factor that consumer propensity to use towards QR codes. QR codes have big storage that can save much information about the product. As stated by (Uzun & Bilgin, 2016) QR codes and corresponding alphanumeric codes, which can be scanned to access information about a particular brand of product and service; alternatively, this information can be accessed through websites or social media. This functionality gives benefits to marketer and retailers that they must have to implement this QR code technology tools in product packaging. Consumer can easily find the additional information through matrix barcode and continued link to the URLs that provide.

H1: There is significant relationship between additional information and user propensity to use QR code.

2.2 Promotion

Marketers and retailers today's using technology include internet and mobile device to market their product quickly. QR code is one of the tools that can help them to fulfillment customer needs and wants immediately. According to (Okazaki, Navarro, Mukherji, & Plangger, 2019) explores consumers' motivation to scan QR codes embedded in advertisements and the conditions that impact this motivation. Thus, this research also state that the level of curiosity

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

likely plays a role in consumers' motivation to scan QR codes, but the extent of this role is uncertain. In marketing, promotion refers to any type of marketing communication used to inform or persuade target audience of the relative merits of a product, service, brand or issue. It helps marketers to create a distinctive place in customer's mind.

H2: There is a significant relationship between promotion and user propensity to use QR code.

2.3 Payment

QR code also function as payment tool using smartphone technology. According to (Tse, Wen, Wu, Yin, & Zhai, 2019) mobile payments can refer to a personal type using electronic devices such as smartphones connected to a network that supports the process of economic transactions to make payments. User can immediately do a payment without queue in ATM machine or others. (Derian, Marciella, & Mariani, 2018) did a study about people's readiness, available facilities, available gadgets, and other factors that bridges the transition from traditional to digitalization of payment. Smartphone nowadays have much accessibility include QR code reader application, so user can easily use which is take a picture or scan through QR code symbol that provide, and then user can gets the information entirely and purchase by connecting their smartphone with various ways to pay it like e-wallet (Wang & Kankham, 2018).

H3: There is significant relationship between payment and user propensity to use QR code.

2.4 E-Feedback

QR codes also technology tools that can use for collect feedback from customer using smartphone. People do not need to fill the form using paper, they just need to scan and fill in URLs that they provide. Making a QR code survey is a simple method. A complete online questionnaire is linked to a link that can be converted into a QR code through a free online application (Faggiano & Carugo, 2020). This study also stated, quick access to online surveys is then given to users by scanning a QR code with a smartphone or tablet camera. According to (Ramalingam, Tran, & Gangopadhyay, 2020) using their mobile device attending opened camera on smartphone application and continued it at QR code, which instantly took them to the online Survey Monkey.

H4: There is significant relationship between e-feedback and user propensity to use QR code.

2.5 User Propensity to Use Quick Response (QR) Code

QR Code stand for Quick Response Code which is a type of matrix barcode or two-dimensional barcode first designed in 1994 for the automotive industry in Japan. QR code is a tool that gives many of benefits to the consumer in various of purpose. QR code is a machine readable code consisting of an array of black and white squares, typically use for storing URLs or other information for reading by the camera or apps in smartphones users. According to (Kongarchapatara & Rodjanatara, 2018), they did a study adopted a widely acceptable technology adoption model and extended it with the addition factor, perceived credibility, and a moderator, perceived self-efficacy in order to investigate the factors which may affect users' adoption and usage of QR code payment application. The previous studies also stated that smart technology implementation is expected to provide great benefits such as lower labor costs and

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

increased efficiency for retailers and convenience, accessibility, and higher interaction for customers (Roy, Balaji, Quazi, & Quaddus, 2018).

2.6 Conceptual Framework

The conceptual framework describes the relationship between specific variables identified in the study and it is much more specific in defining this relationship. Researcher must have to be more explored in the investigation. In order to build this proposed conceptual framework, researchers have to review a lot of literature related to chosen research topic which is QR codes effectiveness. From that, researcher formulate own proposed conceptual framework to serve as guide in this research venture. This study provides independent variables which is QR codes effectiveness (additional information, promotion, payment and e-feedback) and dependent variable (user propensity to use towards QR codes) for research proposal.

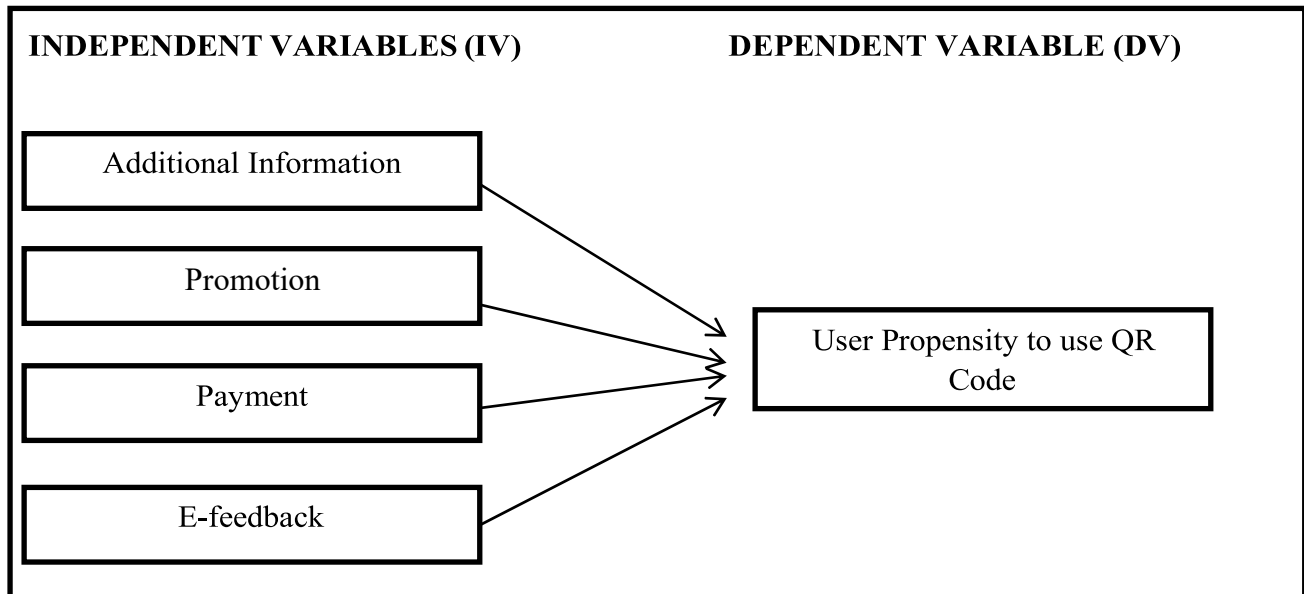

Figure 1: Research Framework

3 Research Methodology

For this research study, researcher using quantitative research design which is descriptive and correlational research. Researcher using non-probability convenience sampling method in collected the targeted respondents. The target population of this study is the user that have propensity to use towards QR codes among final year students faculty Entrepreneurship and Business (FEB) in Universiti Malaysia Kelantan (UMK) Kampus Kota. The total number of final year students FEB in UMK Kampus Kota is 740 students. Researcher using table Morgan and Krejcie as guideline for sampling size. So the total respondents are 254 approximately. After researcher collecting data, the total respondent is 255 students.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

The questionnaire is distributed using Google form link which is through online since all students stay at home. In addition, the questionnaire using 5 likert scale which is from 1 (strongly disagree) to 5 (strongly agree). In the questionnaire, there are consists three section which is section A demographic which include gender, race, and others. Section B is factors that affecting user which is additional information, promotion, payment and e-feedback. Section C consists of user propensity to use QR code.

In addition, researcher used Statistical Package from Social Science (SPSS) version 26 for analyze and measuring the data that has been collected from respondents. Data analysis method that the researcher used in this study is the reliability test and Pearson's Correlation Coefficient analysis. The functionality for each data analysis method will be further discussed in the next paragraph.

Researcher use reliability analysis to do a pilot test which consist of 30 respondents that purpose to identify the consistency or validity for each variables in this study. After finish the test, result of the reliability test is based on Cronbach's Alpha that value must be exceed 0.7. Furthermore, Pearson's Correlation Coefficient also used to analyze the data. The purpose of using this correlation is to test the significant relationship between the variables and to evaluate the strength of the relationship by values. Researcher also uses Multiple Linear Regression to determine the most factor that affecting user propensity to use QR code.

4 Research Findings

4.1 Frequency Analysis

Table 1 shows the summary of the 255 respondents demographic profile that has been collected through Google form. The demographic profile of respondents consists of gender, race, and others. It can be conclude that majority is from female 198 (77.6%) and also Malay 200 (78.4%) students. In addition, majority respondent has ever used QR code in various places that has been seen and various of purpose.

Variable	Frequency	Percentage %
Gender		
Male	57	22.4%
Female	198	77.6%
Total	255	100 %
Race Malay		
Chinese	200	78.4%
Indian	30	11.8%
Other	20	7.8%
	5	2.0%
Total	255	100 %
Have ever used Quick Response (QR) code		
Yes	254	99.6%

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

Not Sure	1	0.4%
No	0	0%

Table 1: Respondents Demographic Profile

4.2 Reliability Analysis

Table 2 shows that the results of the reliability test through the value of Cronbach's Alpha Coefficient for independent and dependent variable in this study best on the survey of 255 respondents among student of faculty Entrepreneurship and Business (FEB) in Universiti Malaysia Kelantan (UMK). The result shows that the Cronbach's Alpha value is on the range 0.796 to 0.859, which means all the variable include additional information, promotion, payment, e-feedback and also dependent variable which is user propensity to use is reliable as the value exceeds 0.7.

Variables	Number of item	Coefficient	Strength
Additional information	5	0.859	Very Good
Promotion	5	0.837	Very Good
Payment	5	0.836	Very Good

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

E-Feedback	5	0.844	Very Good
Users propensity to use QR code	5	0.796	Good

Table 2: Result of Reliability Coefficient Alpha for the Dependent Variable and Independent Variable.

4.3 Pearson's Correlation

In this part, the Pearson's Correlation Analysis will be used to examine that whether the independent variable which is Additional Information, Promotion, Payment, and E-feedback is statistically significant with dependent variable which is the user propensity to use QR code. In this case, the researcher had used Pearson Correlation Analysis (two-tailed) to investigate the relationship between QR code factor and user propensity to use QR code. The table below shows the result of the variables.

Table 3: Summary Result of Pearson's Correlation

Hypothesis	Result	Findings of Data Analysis
H1: There is a positive relationship between additional information and user propensity to use QR code.	$r = 0.535^{**}$ $p = 0.000$ Moderate positive (negative)	H1: Accepted
H2: There is a positive relationship between promotion and user propensity to use QR code.	$r = 0.546^{**}$ $p = 0.000$ Moderate positive (negative)	H2: Accepted
H3: There is a positive relationship between payment and user propensity to use QR code.	$r = 0.677^{**}$ $p = 0.000$ Moderate positive (negative)	H3: Accepted
H4: There is a positive relationship between e-feedback and user propensity to use QR code.	$r=0.646^{**}$ $p=0.000$ Moderate positive (negative)	H4: Accepted

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Table 3 shows the Pearson's Correlation coefficients. The correlation coefficients for additional information and user propensity to use QR code was 0.535 and it shows that the strength of correlation between additional information and user propensity to use QR code is moderate positive correlation according to rule of thumb for interpreting the size of a Correlation of Coefficient (Guilford and Fruchter, 1973). Besides that, the P value was 0.000 indicates the significant value for the analysis where it is lower than the alpha root which is 0.01. Therefore, there is significant moderate positive correlation relationship between additional information and user propensity to use QR code.

Moreover, the correlation coefficient for promotion and user propensity to use QR code was 0.546 and it shows that the strength of correlation between promotion and user propensity to use QR code is moderate positive correlation. Besides that, the P value was 0.000 indicates the significant value for the analysis where it is lower than the alpha root which is 0.01. Therefore, there is significant moderate positive correlation relationship between promotion and user propensity to use QR code.

In addition, the correlation coefficient for payment and user propensity to use QR code was 0.677 and it shows that the strength of correlation between payment and user propensity to use QR code is moderate positive correlation. Besides that, the P value was 0.000 indicates the significant value for the analysis where it is lower than the alpha root which is 0.01. Therefore, there is significant moderate positive correlation relationship between payment and user propensity to use QR code.

Lastly, the correlation coefficient for e-feedback and user propensity to use QR code was 0.646 and it shows that the strength of correlation between e-feedback and user propensity to use QR code is moderate positive correlation. Besides that, the P value which was 0.000 indicates the significant value for the analysis where it is lower than the alpha root which is 0.01. Therefore, there is significant moderate positive correlation relationship between e-feedback and user propensity to use QR code.

4.4 Multiple Linear Regression Analysis

Table 4: Simple and Multiple Linear Regression Analysis

Model	Unstandardized Coefficients		Standardized Coefficients Beta	Sig.
	B	Std. Error		
(Constant)	1.497	0.181		0.000
Additional Information	0.104	0.044	0.135	0.001
Promotion	0.130	0.040	0.168	0.000
Payment	0.305	0.042	0.400	0.001
E-Feedback	0.163	0.048	0.219	0.019

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

According to the Table 4, the factors such as additional information, promotion, payment and e-feedback were significant since the p-values were less than 0.05. The equation of regression can be written as follows

$$= + + + +$$

Where

= User Propensity to Use QR code

= Additional Information

= Promotion

= Payment

= E-Feedback

Hence, the equation becomes

$$= 1.497 + + + +$$

Unstandardized coefficients beta represents the strength of the effects of every single of the independent variables to the dependent variable. The higher the value of the beta coefficient, the stronger the effect of independent variable towards dependent variable. According to the Table 3, the most influence independent variables in measuring the user propensity to use QR code was the payment variable (= 0.305). The e-feedback ranked at second rank (= 0.163) and followed by the promotion ranked at third rank (= 0.130). The lowest influence consumer's attitude towards counterfeit products was the personal gratification (=0.104).

5 Discussion

5.1 Additional Information

The first correlation is between additional information and user propensity to use QR code. From the table, it shows that there is a significant relationship between promotion and user propensity to use QR code because the significant value is 0.000 which is less than 0.01. The positive correlation coefficient for payment and user propensity to use QR code is 0.535** means there is moderate relationship between payment and user propensity to use QR code. Hence, the H₁ of objective one which is to identify the relationship between additional information and user propensity to use QR code is accepted. It shows that additional information very give effect to use QR code in their daily life. As indicated by (Shivaratri Chandramouli, 2017) found that there is strongly positive relationship between additional information and QR code usage.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

5.2 Promotion

Secondly is the correlation between promotion and user propensity to use QR code. From the table, it shows that there is a significant relationship between promotion and user propensity to use QR code because the significant value is 0.000 which is less than 0.01. The positive correlation coefficient for payment and user propensity to use QR code is 0.546** means there is moderate relationship between promotion and user propensity to use QR code. Hence, the H₂ of objective two which is to find out the relationship between promotion and user propensity to use QR code is accepted. It shows that payment very give effect to use QR code in their daily life. As stated by (Okazaki et al., 2019) found that advertisement with good perceived fit has positive relationship with QR code scan intention.

5.3 Payment

Next is the correlation between payment and user propensity to use QR code. From the table, it shows that there is a significant relationship between payment and user propensity to use QR code because the significant value is 0.000 which is less than 0.01. The positive correlation coefficient for payment and user propensity to use QR code is 0.677** means there is moderate relationship between payment and user propensity to use QR code. It shows that payment very give effect to use QR code in their daily life. Hence the H₃ of objective three which is to investigate the relationship between payment and user propensity to use QR code is accepted. According to (Liébana-Cabanillas, Ramos de Luna, & Montoro-Ríos, 2015) found that there is strongly positive relationship between attitudes towards the use of the QR system and the intention to use the QR mobile payment system.

5.4 E-Feedback

Lastly is the correlation between e-feedback and user propensity to use QR code. From the table, it shows that there is a significant relationship between payment and user propensity to use QR code because the significant value is 0.000 which is less than 0.01. The positive correlation coefficient for payment and user propensity to use QR code is 0.646** means there is moderate relationship between payment and user propensity to use QR code. It shows that payment very give effect to use QR code in their daily life. Hence the H₄ of objective four which is to examine the relationship between e-feedback and user propensity to use QR code is accepted. According to (Snyder et al., 2018) the feedback system was significantly associated with usability of QR code-linked forms.

5.5 Most Factor

The last objective is to investigate the most important factor that affecting user propensity to use QR code among students in Universiti Malaysia Kelantan (UMK), City Campus. The most factor that affecting user propensity to use QR code is payment variable which the result is 0.305 from Mutiple Linear Regression analysis.

5.6 Hypothesis Testing

Based on the Pearson's Correlation Coefficient Analysis, it can be concluded that the additional information, promotion, payment and e-feedback has a significant relationship towards the user propensity to use QR code among student in Universiti Malaysia Kelantan. While from the

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Multiple Linear Regression Analysis, the most factor that affecting user propensity to use QR code is payment.

Hypothesis	Objective	Result
H ₁	There is significant relationship between the additional information and user propensity to use QR code.	Accepted
H ₂	There is significant relationship between the promotion and user propensity to use QR code.	Accepted
H ₃	There is significant relationship between the payment and user propensity to use QR code.	Accepted (Most Factor)
H ₄	There is significant relationship between the E-feedback and user propensity to use QR code.	Accepted

5.7 Recommendation

Every research definitely has limitations and obstacles in completing a final year research project. But every limitation and obstacle must have a solution. Researcher would like to make some recommendations for further research in the areas of factor that affecting user towards QR code technology usage on the basis of this report.

This research study has many shortcomings while completing it. Among them are reference sources from books on QR code technology. Most researchers get reference sources through the previous article which is in the internet. So, scientific resources from the library could not be reached due to the current pandemic situation and had to remain at home. Therefore, the researcher hopes and suggests that future researchers find scientific materials such as books in the library to further increase knowledge about QR code technology.

In addition, the researcher suggested that future researchers focus more on the topic of QR code usage among retailers and the effectiveness to consumers during shopping using QR code. This, can further reveal more widely about the use of QR codes and their impact on entrepreneurs, businesses and even society.

Finally, with the advancement of technology in this world, future researchers need to study the level of use of QR codes by all retailers and marketers. The researcher also suggested to do a study on QR code technology on all sectors including education, transportation, tourism and so on. To get a general understanding about this new technology and the levels of its use, many extensive interviews and surveys can be performed in different parts of the state.

5.8 Conclusion

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

The main aim of this research is to investigate the relationship between factors that affecting QR code and user propensity to use QR code. Total of 255 sets of questionnaires had been prepared and distributed to target respondents in completing this research which is among student in Universiti Malaysia Kelantan.

Overall, the Pearson Correlation Analysis had shown that all of the variables including additional information, promotion, payment, and e-feedback had a significant positive correlation to the user propensity to use QR code. Furthermore, all hypotheses had been tested, where all of the hypotheses including additional information, promotion, payment, and e-feedback had been accepted, meaning that additional information, promotion, payment, and e-feedback had a significant relationship with user propensity to use QR code. The most factor that affecting user propensity to use QR code is payment variable which the value is 0.305.

Acknowledgement

First of all, Alhamdulillah thanks to Allah SWT for protection and give me ability to do this research paper. I'm grateful to learn how to do this research paper until done. I hope all the information that we have learn in this subject can be used in the future. Hence, I would like to express the deep appreciation and praise particularly. First and foremost, I would like to extend my deepest to Allah the Almighty who has given me the strength, patient, determination, courage and good and healthy heart to complete this research. This study is a collaborative effort of many people. To begin with, I most thanks goes to my supervisors, Dr Nurul Izyan Binti Mat Daud for imparting me with the wealth of knowledge, valuable guidance and support. In addition, a big honor and appreciation to my family in helping me encourage in running this research paper. I also want to thank to my friends in Universiti Malaysia Kelantan (UMK) including coursemates in sharing ideas with their helpful insight, cooperation and stimulating comments. I would also like to express my apologies for any mistake and shortcoming in carrying out this research.

FACTOR AFFECTING CONSUMERS BUYING BEHAVIOUR OF SMARTPHONE AMONG UMK CITY CAMPUS STUDENTS

Ku Madhiah binti Ku Adnan and Yusrinadini Zahirah Binti Md. Isa@Yusuff

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Faculty of Entrepreneurship and Business,
Universiti Malaysia Kelantan,
Malaysia

Email: madhihah.a17a0160@siswa.umk.edu.my; yusrinadini@umk.edu.my

Abstract:

The purpose of this paper is to explore the various factors of consumer behavior in buying smartphones and their choices among UMK City Campus students. This study uses a sample of 361 real users who have purchased a smartphone. Responses were collected through a structured Likert scale questionnaire. Correlation and regression analysis was performed using SPSS 26.0. The three factors we found from this study were price, brand and social influence. This study helps to understand the changing patterns of demand and assists in product development. This study resulted in the finding that social influence has the highest level of relationship between other independent variables namely price and brand name. These findings provide guidelines for smartphone marketers to develop better value propositions and promotional combinations for their smartphones.

Keywords: *Smartphone, Consumer Behavior, Price, Brand Name, Social Influence*

1 Introduction

This chapter discusses the effects of buying consumer behaviour on Smartphones among University Malaysia Kelantan City Campus (UMK) students. "Consumer behaviour is the study of individuals, groups, or organizations and the processes they use to select, protect, and products, services, experiences, or ideas for the needs and effects of these processes on consumers and society. According to Kuesteur and Sabine (2012), the behaviour of each individual consumer differs from the other depending on the buying choices influenced by buying habits and the choices altered by psychological and social motivators influencing the purchasing decision process.

Besides that, KEYS (2011) argues that consumer behaviour regarding decision making is difficult to define and is a system unpredictable shortcuts and practical rules Shortcuts in decision-making vary from person to person and focus on past user experience; we can predict future trends by bringing profitable products and services to market in this modern world, the popularity of interactive media such as World Wide Web is increasing day by day at a rapid rate. With reference to marketing, it is consistently

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

realized that the two main factors observed due to the WWW are 1) A large number of companies conduct their business online and make their website an exhibition of their products and services. 2) The rapid growth of the consumer segment due to increased demand and including online shopping as well (Häubli & Trifts, 2000).

Research from Strategy Analytics revealed 1 billion smartphones are used worldwide, penetration is 1 in 7 while in Malaysia, penetration for comparison is 1 in 4 and the highest percentage, 17.3% of smartphone users aged between 20-24 years. In the current situation, users are no longer just looking at smartphones as a device for calling and texting, but as a multipurpose device for playing, socializing and downloading applications that result in radical changes in behavior patterns. A survey conducted by Ericsson, (2014) reports that smartphone usage is projected to increase sharply in the coming years with smartphone subscriptions growing nearly fivefold between 2013 and 2019 which will result in more than 700 million smartphone subscriptions in Southeast Asia and Oceania (Rahim et al., 2016).

That is a smartphone, its existence has changed lives, services and other goods to always move forward in line with the technology provided. People always want work that is fast, easy, cheap and friendly has made everything possible to do at your fingertips. The impact and effect is so great that some other industries such as telecommunications, automotive, electrical goods, public services to fashion have also changed and need to keep pace with the use of smartphones.

1.1 Research Objectives

To examine the relationship between price and consumer buying behaviour among UMK City Campus students.

To examine the relationship between brand name and consumer buying behaviour among UMK City Campus students.

To examine the relationship between social influence and consumer buying behaviour among UMK City Campus students.

1.2 Significance of Study

To the Economic

The increase in the use of Smartphones in Malaysia has prompted telecommunications companies to develop 5G technology in Malaysia. Minister of Communications and Multimedia Gobind Singh Deo (2019) said the use of fifth generation technology or better known as 5G technology will have a huge impact on the Malaysian economy. The technology will also affect the way we shape a society that is ready to face the future economy in the direction of the Fourth Industrial Revolution (IR4.0).

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Academicians and Future Researchers

This study also aims to educate and provide information on behavior as well as related factors. Consumers have many factors that require the effectiveness of consumer behavior research users must use these three factors also play an effective role. The results of this study may be a catalyst for researchers to conduct similar studies in areas related to social influence, price, brand name and product. This research can also be used for comparison purposes or to create new theories based on existing variables to have a broader knowledge and scope at the national level.

2 Literature Review

2.1 Price

Product price is the amount of money expected, required, or given as payment for a product. There are two types of product pricing. High-priced products are market brands where image is seen as a key factor. Cheap brands tend to be bought for utilitarian value, with consumers relying on perceived value. Consumers usually look for low priced brands or substitutes to get the best value (Swani and Yoo, 2010). Basically, price is the amount of money that consumers are willing to pay in exchange for products and services that they consider valuable. The value of money varies from person to person. Some consider it worthwhile for a high price but others may consider it worthless for the value of money. There are so many pricing methods, such as markup price, target-return price, perceived value price, price increase and promotional price (Kotler and Keller, 2012). If the discount rate is low, it must be stated in its value; whereas if the discount rate is high, it should be shown in the form of percentage, so that customers will have a higher desire to buy (Isabella, 2012).

2.2 Brand Name

Brand names can be names, terms, symbols and designs to differentiate an organization from competitors. According to Cornelis (2010), most organizations emphasize on brands that can be invaluable assets for their products and services. This can be a competitive advantage for the organization.

Brands are more than just names and symbols. It is also an element of the relationship between company and customer (Kotler and Armstrong, 2010). "Brand name is a valuable asset that helps to adjust quality and propose accurate brand-related knowledge structures" (Srinivasan and till, 2002). The importance of the brand is shaping consumer behavior towards smartphones that have been recognized in the study (Lay-Yee, Kok Siew and Yin Fah, 2013; Wollenberg and Thuong, 2014 and Malviya, Saluja and Thakur, 2013).

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

2.3 *Social Influence*

According to Kotler and Armstrong (2010), “Consumer behavior is influenced by social factors, such as the role and status of family, and social groups”. Ernest (2010), show that the purchasing decisions of Malaysians are influenced by direct and indirect role models. Indirect role models like celebrities have a higher impact than direct role models which is parents. According to previous studies, social influence has a direct influence on buying behavior (Ajzen, 1991; Venkatesh and Davis, 2000; Mudondo 2014). During the decision-making process, users tend to be constantly influenced by social groups, which are their people. Social influence is also the cause of a person making changes to his feelings, attitudes, thoughts, and behaviors, intentionally or unintentionally (Chow et al., 2012). This is the result of interaction with each other. According to Nelson and Mcleod (2012), social influence includes the influence of the media, parents, and peers. Depending on various factors, users may listen to and trust different social groups, perhaps to those who are more professional in a particular field. The purchase of Smartphones among students, perhaps social influence comes from friends, family members and spouses. In general, peers are the main influence followed by the media and parents (Chow et al., 2012).

2.4 Hypothesis

There is a significant relationship between price and consumer buying behavior of Smartphones among UMK City Campus students.

There is a significant relationship between brand name and consumer buying behavior of Smartphones among UMK City Campus students.

There is a significant relationship between social influence and consumer buying behavior of Smartphones among UMK City Campus students

2.5 Theoretical Framework

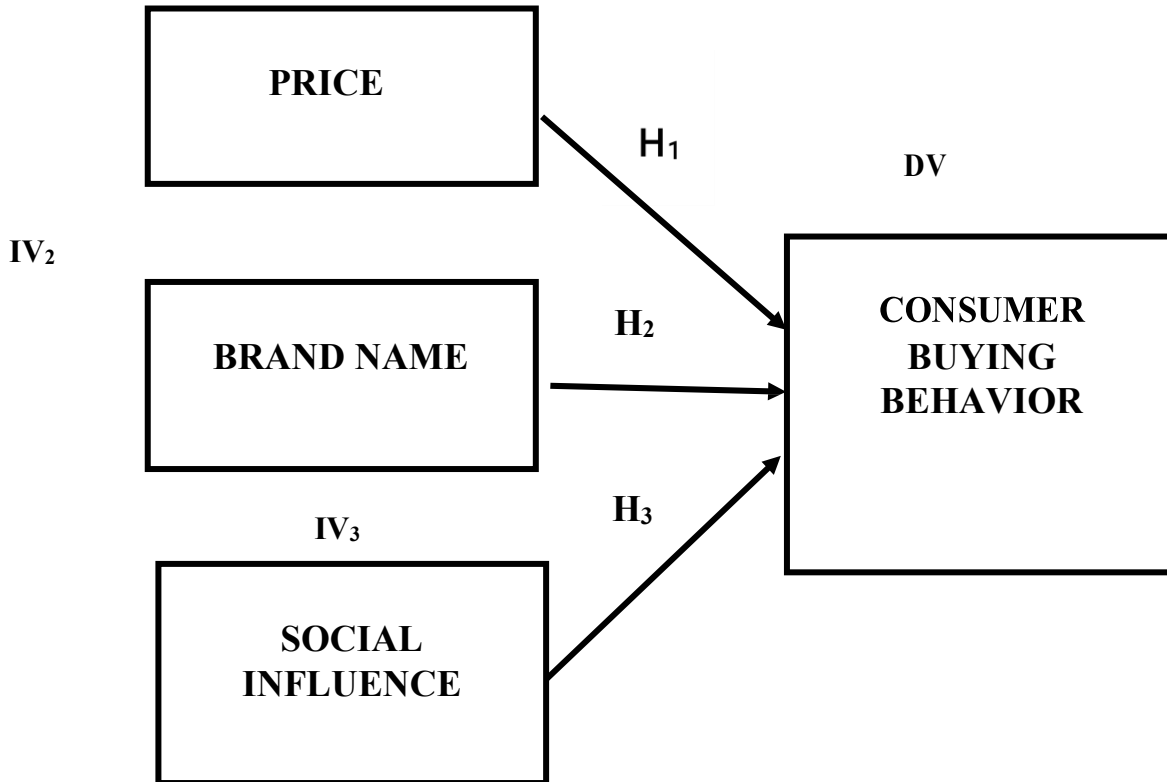

Figure 1: Theoretical framework of Factor Affecting Consumers Buying Behaviour of Smartphone among UMK City Campus Students.

3 Methodology

3.1 Research Design

Quantitative research is embedded in this research for the purpose of determining the variables that will change the purchasing behavior of students in choosing a smartphone. In addition, it tests hypotheses and measures data from questionnaires, combining research questions and literature views. Descriptive studies explained how independent variables (name, price and social influence) behave differently in student purchases.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

3.2 Population

Population refers to the person targeted by the researcher to investigate the study (Mukesh, 2013). The selected population consists of students from University Malaysia Kelantan (UMK City Campus). This study focuses on students because almost all students at UMK City Campus have smartphones. UMK City Campus has a total of 5,864 students by 2020.

3.3 Sample Size

Sample size is the number of samples or observations from the population where the statistical conclusions for the entire population are made. It is always a positive integer and usually denoted by *n*. The sample population of this study is 5,864 students. Based on the (Krejcie & Morgan, 1970) method of calculation the sample size of the result is 361 students due to the population size. It is the convenient and ideal number of sample sizes for the population since the population is more than 5,000.

3.4 Data Collection

Primary data is the information obtained directly from the first hand sources which means survey, experimentation and observation. Those data are not being previously published in the website or anywhere and are new or original data collected from the respondent such as sources from marketing surveys. Secondary data have three main types which are documentary, survey and multiple sources, documentary secondary data is important for the research study in written material which is to collect published information for the purpose of supporting the research study as a reference such as a book, journal, magazines articles and newspaper.

3.5 Sampling

Non- probability convenience sampling method was chosen as the sampling technique where the sampling frame is hard to define in this study. The convenience sampling technique enables researchers to choose any of their preferable respondents who are available instead of selecting from entire populations (Hair Jr, Page, & Brunsveld, 2019). Furthermore, the convenience sampling method was applied in this study because this method could save the time and cost of the researchers in collecting the data (Smith, 2016). The respondents of the questionnaire would be the students of UMK City Campus who use Smartphones.

3.6 Research Instrument

Respondents for this research are UMK City Campus students who have bought and used smartphones. The questionnaire used is bilingual in Malay language and English. The questionnaire was divided into three sections: Section A, Section B and Section C. The 5-point Likert scale used in Sections B and C for the respondents showed their agreement with the given statement: 1 = Strongly Disagree, 2 = Disagree, 3 = Neutral, 4 = Agree, 5 = Strongly Agree.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Table 1: Sources of Questionnaire

Section	Description	Sources	No of Item
Section A	Demographic	-	-
Section B	Price	Sinhaa & Batrab 1999; Bauddhik, 2014	5
	Brand Name	Rio, Vazquez, and Iglesias, 2001	5
	Social Influence	U Akkucuk & J Esmaili, 2016 ; Bauddhik, 2014	5
Section C	Consumer Buying Behavior	U Akkucuk & J Esmaili, 2016	5
		Total	20

3.7 Data Analysis Technique

Analysis of data is the process to analyse and summarize all the data collected from the research questionnaire to interpret the result. Statistical package for the Social Science or well known as SPSS by International Business Machine (IBM) is a software tool to complete the tasks. The data collected will be analysis by using SPSS Version 26.0 software from surveys, improves results in structure and problem solving. SPSS provides fast and effective data management, offers better results and provides a variety of options for researchers to analyse quantitative data.

4 Data Analysis and Findings

4.1 Demographic Profile

A total of 361 respondents participated in this research. There were 215 (59.56%) respondents representing women, and 146 (40.44%) respondents representing men. This indicates that the number of female respondents is higher compared to the male respondents in this research.

Age is divided into 3 categories. The highest number of respondents is in the age range of 22-24 years, 233 (64.54%) respondents. Next, in the age range of 19-21 years there are 106 (29.36%) respondents. Finally, the lowest number of respondents is at the age of 25 years and above, which is 22 (6.09%) respondents only. In addition, for the Malays there are 219 (60.66%) of respondents. Next, the Chinese were 89 (24.65%) respondents. While India represents 46 (12.74%) respondents. Lastly, for the rest of the race was 7 (1.94%) respondents.

Among the three selected faculties, the highest Faculty of Business Entrepreneurship (FKP) is 216 (59.83%). Next, Faculty of Hospitality, Tourism and Health (FHPK) 91

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

(25.21%). Finally, FPV 54 (14.96%). Next, the highest year of study answered was year 4 which is 136 (37.67%), followed by year 3 which is 108 (29.92%). Next, year 1 is 59 (16.34%) and finally year 2 is 58 (16.07%).

The highest frequency of mobile phone purchases is very rarely 145 (40.39%). Next, every three years 125 (34.82%), followed twice a year 63 (17.55%) and finally once a year 26 (7.24%).

Respondents using Apple 101 brand smartphones (28.0%) were the highest respondents. The second highest group was the Huawei 60 (16.6%) brand followed by Oppo 58 (16.1%). Next, Xiaomi 55 (15.2%) was followed by Samsung 52 (14.4%) and another 35 (9.7%).

Among all the groups that spent money to buy smartphones, respondents who bought smartphones for RM2001 and above were 40 people (11.08%). The highest was RM1001-RM2000 with 232 (64.27%). The lowest group were those who bought smartphones at a price of RM500 and below at 14 (3.88%) and the second lowest group bought smartphones at a price of RM501-RM1000 was 75 (20.78%).

4.2 Descriptive Analysis

The descriptive analysis tested 20 items according to their variable and listed on the summary of the mean and standard deviation of computed items in Table 2.

Table 2: Summary of the Means and Standard Deviation of Computed Items according to Variable

Variables	Mean	Std. Deviation
Price	4.40	0.56
Brand Name	4.33	0.66
Social Influence	4.25	0.71
Consumer Buying Behavior	4.17	0.83

4.3 Reliability Analysis

According to Sekaran and Bougie (2013), consistency and suitability will be measured by the reliability analysis without any bias and error. To indicate the items in a variable is positively correlated with other, Cronbach's Alpha will be used as the reliability coefficient. The high reliability means the items are relevant to the variable that needs to measure.

Table 3: Actual Reliability Test

	Cronbach's Alpha	N of Items	Results
Independent Variable			
Price	0.778	5	Good
Brand Name Social Influence	0.861	5	Very Good
	0.814	5	Very Good
Dependent Variable			
Consumer Buying	0.915	5	Excellent

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Behavior

The alpha coefficient for the brand has the highest coefficient value of 0.861. For social influence measurement shows 0.814 while price measurement is 0.778. The value of the coefficient to influence consumer buying behaviour is 0.915 which is known to be in excellent coefficient value.

4.4 Spearman Correlation Analysis

Spearman correlation coefficient analysis is used to show the strength of the association between two quantitative variables namely independent and dependent variables that measure in ordinal scale (Kumar, Talib, & Ramayah, 2013). To examine the research question, a Spearman level correlation was performed to assess the relationship between the two variables. Spearman correlations can lead to the importance or insignificance of Pearson correlation coefficients despite large data sets, in line with logical understanding of the differences between the two coefficients (Hauke & Kossowski, 2011). As a non-parametric test, Pearson correlation assumptions (including normality and homoscedasticity) do not apply to Spearman Correlation.

Table 4: Spearman Correlation Result

Variable	Mean(SD)	Price	Brand Name	Social Influence	Consumer behaviour
Price	4.40 (0.56)	1	0.366	0.557	0.453*
Brand Name	4.33 (0.66)	0.366	1	0.512	0.629*
Social Influence	4.25 (0.71)	0.557	0.512	1	0.647*
Consumer behaviour	4.17 (0.83)	0.453	0.629	0.647	1

**correlation is significant at the 0.01 level (2-tailed).

Based on Table 4, it can be seen that all independent variables whose price, brand name and social influence are significantly correlated with the dependent variable which is consumer buying behaviour at the level of 0.01 (2-tailed). There is a significant, strong and positive relationship between price, brand name and social influence on the dependent variables that are consumer buying behaviour ($r = 0.00$, $r = 0.00$, respectively, $p < 0.01$). The relationship between the variables, 0.70 is strong, in the range of 0.30 to 0.60 is moderate and below 0.30 is weak. The table shows that the relationship between price change is expressed as 0.453, brand name is stated 0.629 and social influence is expressed as 0.647. Thus, all independent variables had a strong relationship with the dependent variables in this study.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Summary

Number of Hypothesis	Statement of hypothesis	Result	Significant Value
H1	There is a significant relationship between price and consumer buying Behaviour	Accepted	0.000
H2	There is a significant relationship between brand name and consumer buying behaviour	Accepted	0.000
H3	There is a significant relationship between social influence and consumer buying behaviour.	Accepted	0.000

5 Discussion and Recommendation

For future studies, the researchers recommend some suggestions for future improvement in terms of the results of this study. This research can be used as a reference to understand the buying behavior of consumer smartphones. Information on the buying behavior of smartphone users and the data collected were analyzed and verified.

In addition, researchers also recommend future researchers to integrate quantitative and qualitative methods during data collection from respondents. This is recommended because different people may have different opinions on things. Small respondents may not be able to represent using the questionnaire method. Therefore; to get more information, this combined approach method will help the researcher a lot. In addition, future researchers should add more independent variables such as brand image, peer influence, product features etc. to test reliability and do more research and explore new independent variables. Future researchers can also improve the results of studies. In this research, the researchers only mentioned 3 independent variables namely price, brand name and social influence.

In this research, research respondents focused on students aged between 18-25 years. The narrowness of respondents helped determine the purchasing behavior of smartphone users but did not represent the entire population of all students. Therefore, researchers recommend that future studies be conducted in different group such as older adults, working people, the elderly, or others.

5.1 Conclusion

In conclusion, this research has achieved the main objective which is to study the factors that influence the behavior of consumers buying smartphones among UMK Campus City students. Three determinants that influence consumer buying behavior were identified and studied in this study, namely brand name, price, and social influence. On the other hand, all hypotheses are supported and this shows that social influence is the most influential smartphone buying behavior for UMK City Campus students.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Acknowledgements

I would like to thank University Malaysia Kelantan for the excellent opportunity to conduct this study. It has been a good experience for me to conduct this study in such a place and time frame. I have gained great knowledge, skills and experience throughout this study and managed to achieve it.

First of all, I would like to express my deepest appreciation and gratitude to my supervisor, Dr Yusrinadini Zahirah Binti Md. Isa @ Yusuff, Lecturer, Faculty of Entrepreneurship and Business, University Malaysia Kelantan for valuable guidance. She always helped and advised me as my supervisor. Then, thank you for your patience, motivation and support so that I can complete my research project successfully. Apart from that, I would also like to thank the coordinator of last year's research project, Dr Nur Ain Ayunni binti Sabri for concentrating on the final year project and also giving me a complete guide in this research project.

Finally, I would like to thank my family, friends and respondents who have answered the questionnaire on my research. All of them always help me complete this research project. Thank you for their financial support, sacrifice of time and energy and also the encouragement from starting this research to the end of this research project. Maybe I could not have completed this research project without them.

THE IMPACT OF COVID-19 ON SMALL AND MEDIUM SCALE ENTERPRISES (SMES) PERFORMANCE IN MALAYSIA

Lawaniya A/P Gunalan and Wan Farha Binti Wan Zulkifli

Faculty of Entrepreneurship and Business, Universiti Malaysia Kelantan,
Malaysia

Email: Lawaniya.a17a0908@siswa.umk.edu.my; farha@umk.edu.my

Abstract:

Small and medium-sized enterprises (SMEs) play a vital role in the economic development of nations. The study is a quantitative research factor that evaluate the impact of Covid-19 on Small and Medium Scale Enterprise (SMEs) performance in Malaysia. The study using a questionnaire to collect data and SPSS software to analyses data where descriptive statistic, reliability and multiple analyses has been conducted. The dependent variable are SMEs Performance while the independent variable was operations, supply chain and purchasing behavior. This study was conducted to Klang Valley Area employees by using a quantitative research approach, and 384 respondents participated in the study. Therefore, the finding of this study offers a direction towards better the operations, supply chain and purchasing behavior which lead to an increase the SMEs performance in Malaysia,

Keywords: Covid-19, , Operation, Purchasing Behavior, SMEs Performance, Supply Chain.

1 Introduction

SMEs performance is the result of the evaluation of the company's work achieved by a person or group with the division of activities in the form of tasks and roles in a certain period with the standards of the company (Mutegi, Njeru, & Ongesa, 2015). Business performance at SMEs can be seen from the company's success in product quality, innovation, human resource management, and customers and finance. Where this shows that the company has a development orientation and sees opportunities for continuous innovation.

The impact of coronavirus on worldwide SMEs business activities are tremendous. Although stringent government policy and response to curb the disease is necessary, but most businesses are expose to negative effects in either short or long- term period. Major hurdles are cash flow problems, closure of operation, laying off workers, retrenchment and diluted firms' capacity for future expansion (Wahyudi, 2014). Changes of business strategies, operations and business conduct, as well as pressures to search for new sources and opportunities for redevelopment are recognize as crucial survival challenges for most SMEs (Cassia & Minola, 2012). Reports emanating from various SME's indicates that they are have been numerous job losses, shutdown of SME's, operating at loss because of poor responses from customers to their products and services, not able to produce at full capacity, revenue losses among others.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

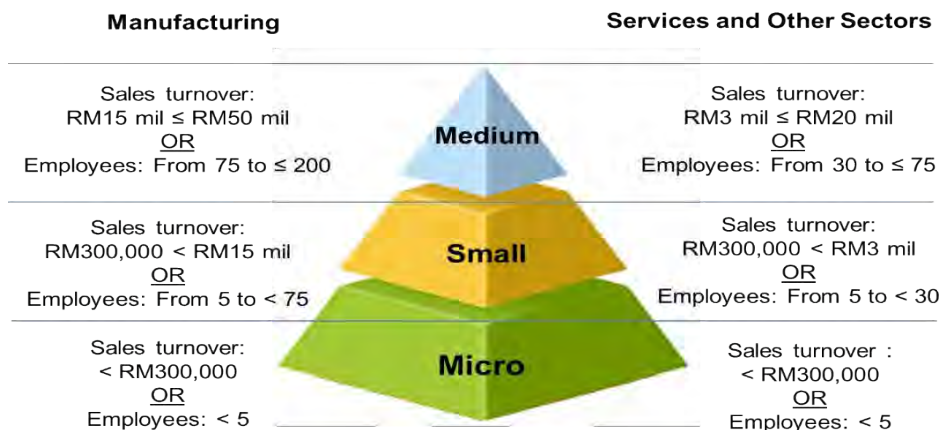

Figure 1.1: Definition of small and medium enterprises in Malaysia.(SMECorp, 2019)

The finding of the study might be evaluating the impact of Covid-19 on small and medium scale enterprises performance in Malaysia. Therefore, this study will be emphasising on how the impact of Covid-19 on SMEs performance which are operations, supply chain and purchasing behaviour. Furthermore, the researchers focus on the performance of Malaysian SMEs by service sector, which is more focus on food and beverage services. SMEs employment for Services sector had a total of 4.6 million persons. The researcher choose type sub-sector of SMEs are Food and Beverages Service. This is because the researcher target respondents are focused to SMEs employees. The researcher chooses respondents who are stay at Klang Valley as respondent for this study.

1.1 Research Objectives

There are three objectives of this research:

- To find out the relationship between operations with the impact of Covid-19 towards small and medium scale enterprises (SMEs) performance in Malaysia.
- To examine the relationship between supply chain with the impact of Covid-19 towards small and medium scale enterprises (SMEs) performance in Malaysia.
- To determine the relationship between purchasing behaviour with the impact of Covid-19 towards small and medium scale enterprises (SMEs) performance in Malaysia.

1.2 Significance of the Study

Government

This research can also help the government provide an overview or give them a background about the impacts of Covid-19 pandemics on SMEs performance. The theory proposed can used as reference data to support the development of any useful information. This research will provide that how the Covid-19 affected SMEs performance which includes the independent variables that are the operations, supply chain and purchasing behaviour.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Future Researcher.

The findings of this analysis can also be used as references in future research. To make it possible for other researchers to explore their knowledge and develop a study of the possibilities that could occur, including factors relevant to this subject that can assist in the future.

2 LITERATURE REVIEW

The whole literature review relating to the impact of Covid-19 on Small and Medium scale Enterprises in Malaysia. In this chapter, readers will get more understanding about the dependent variable which is the SMEs Performance and the independent variable is operation, supply and purchasing behavior. So, this chapter will provide the definition and explanation of the dependent and independent variable. Additionally, a conceptual framework will be constructed and the factors developed for the variables will be discussed as well.

2.1 Research Hypothesis

In this study, there were four hypotheses statement of the impact of Covid-19 on SMEs performance in Malaysia:

H1: The operations had significant relationship with impact Covid-19 towards small and medium scale enterprises performance in Malaysia.

H2: The supply chain had significant relationship with impact Covid-19 towards small and medium scale enterprises performance in Malaysia.

H3: The purchasing behaviour had significant relationship with impact Covid-19 towards small and medium scale enterprises performance in Malaysia.

2.2 Research Framework

A research framework has been conducted to investigate the connection between SMEs performance in Malaysia as depicted in the Figure 2.1 of the conceptual framework which was concluded from several previous researches. The research consists of an independent variable, which is the operation, supply chain and purchasing behavior. The research will focus on the analysis of independent variables towards the dependent variable which is the SMEs performance.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

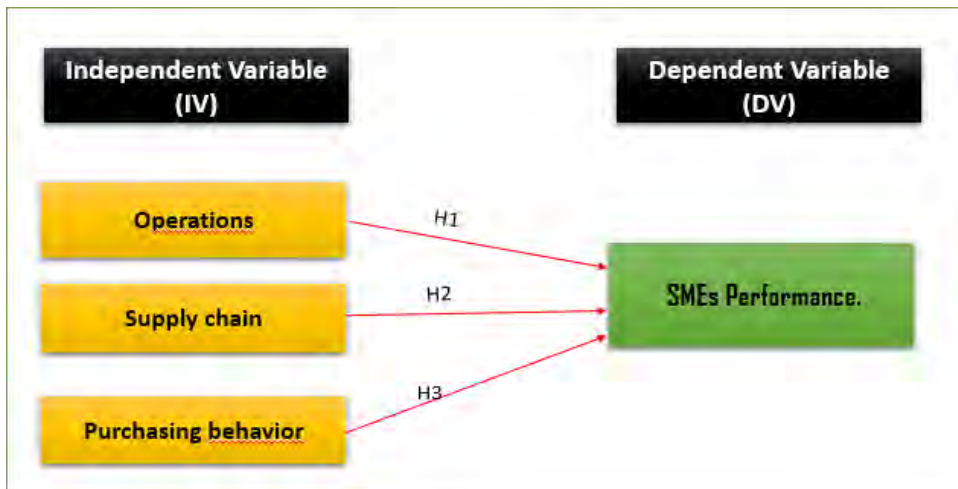

Figure 2.1 Conceptual Framework on Impact of Covid-19 on Small and Medium scale Enterprise performance in Malaysia.

3 METHODOLOGY

3.1 Research Design

This study used the quantitative method that can be referred to the raw and numerical data collection and then analysed in terms of values and variables. These data will be gathered from survey questionnaires. The questionnaire was designed and implemented using Google Forms.

3.2 Data Collection

In the first stage, data collection methods can be divided into two groups which can be classified as primary data collection methods and secondary data collection methods. The primary data collection methods based on statistical analysis including questionnaire. The secondary data collection methods based on library research.

The second stage of data collection was a fieldwork. A set of questionnaires was distributed to the population to collect the data for this research the population is the employees based on SMEs in Selangor area that is Klang valley which has many regions. The researcher randomly distributes 384 questionnaires to the respondent.

3.3 Sampling

A sampling method is a technique that will take the sample of members in a population. Sampling methods can be divided as either probability or non-probability. The sampling method used in this study was the sample size of 384 respondents from 1368000 SMEs employee of the populations in Selangor, this research will be utilizing a probability sampling technique which is simple random sampling.

In achieving reliable and valid sample of this study, the researchers used the equation from Krejcie & Morgan (1970) to determine the sample size. The formula will be shown as below:

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

$$S = \frac{x^2 N p (1 - p)}{e^2 (N - 1) + X^2 p (1 - p)}$$

n = sample size

N = population size

e = the degree of accuracy expressed as proportion (0.05)

X = the table value of chi-square (using 1.96% for 95% confidence level) p = proportion of population (if unknown, 0.5)

3.4 Data Analysis

There were three data types of data analysis used in this study, that were reliability analysis, descriptive analysis, Spearman's rho correlation, multiple regression analysis, and pilot test. The data obtained was analysed by using Statistical Package for the Social Science (SPSS).

4 FINDINGS

The study was conducted to identify the impact of Covid-19 on Small and Medium scale Enterprises performance in Malaysia. The focus point of this study is to identify the impact of Covid-19 on Small and Medium scale Enterprises performance between operations, supply chain and purchasing behavior. In this study, primary data from online questionnaires were collected via the Goggle Form for feedback from the respondent and secondary data from the journal and study.

The dependent variable in this study was significant for the performance of small and medium-sized enterprises. Whereas, a collection of independent variables, which include operations, supply chain and purchasing behavior. 384 responses were identified by the researcher to perform data collection through online questionnaires. The data collected was analyzed using the SPSS version 25.0 software and the analysis was based on the research methodology in this research.

The analysis of data includes descriptive analysis, reliability analysis and Spearman's rho Correlation Coefficient. The reliability test was conducted in this study to measure consistency, precision, repeatability and trustworthiness of this research. Spearman's rho Correlation also used in this research to denote relationship between two or more quantitative variable. Based on the result that researcher gained from chapter 4, the impact of Covid-19 on Small and Medium scale Enterprises performance in Malaysia. It shows that there were similarities that occur between previous study and current study which were supporting the hypothesis that has been stated in previous study.

5 DISCUSSION

This research has three objective which are to identify the relationship between the operations with impact Covid-19 towards small and medium scale enterprises performance, to identify the relationship between the supply chain with impact Covid-

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

19 towards small and medium scale enterprises performance, and to identify the relationship between the purchasing behavior with impact Covid-19 towards small and medium scale enterprises performance.

The relationship between the operations with impact Covid-19 towards small and medium scale enterprises (SMEs) performance in Malaysia.

RO: To find out the relationship between operations with the impact of Covid-19 towards small and medium scale enterprises (SMEs) performance in Malaysia.

RQ: It that any relationship between operations with the impact of Covid-19 towards small and medium scale enterprises (SMEs) performance in Malaysia?

Besides that, researchers have identified that there is significant relationship between operations with the impact of Covid-19 towards small and medium scale enterprises (SMEs) performance in Malaysia. According to the result the index of Spearman's rho Correlation Coefficient, this research accepting significant relationship between operations with the impact of Covid-19 towards small and medium scale enterprises (SMEs) performance in Malaysia because the result 0.626 with significant value $p,0.05$, it means it mean that there is a significant relationship exist between operations with the impact of Covid-19 towards small and medium scale enterprises (SMEs) performance in Malaysia. Therefore, the null hypothesis (H_0) was rejected because the p-value is 0.00 which is less than 0.05 and that mean there is no significant relationship that exist between both independent and dependent variable.

SMEs performance is playing a significant role in evaluating the efficiency and efficiency of every task give to the employee for a target performance area. This is because the employee can develop the strategies to achieve their target and encourage, they motivate to perform their work. Developing strategies approach can determine what activities you can devote to depending on what resources you have, which will reinforce their competitive advantage (Ballowe,2009). This situation makes the employee can give the creative idea to builds their company to be more success from their competitors.

The relationship between the supply chain with impact Covid-19 towards small and medium scale enterprises (SMEs) performance in Malaysia.

RO: To examine the relationship between supply chain with the impact of Covid-19 towards small and medium scale enterprises (SMEs) performance in Malaysia.

RQ: It that any relationship between supply chain with the impact of Covid-19 towards small and medium scale enterprises (SMEs) performance in Malaysia?

Besides that, researchers have identified that there is significant relationship between supply chain with the impact of Covid-19 towards small and medium scale enterprises (SMEs) performance in Malaysia. According to the result the index of Spearman's rho Correlation Coefficient, this research accepting significant relationship between supply chain with the impact of Covid-19 towards small and medium scale enterprises (SMEs) performance in Malaysia because the result 0.508 with significant value $p,0.05$, it means it mean that there is a significant relationship exist between supply chain with the impact of Covid-19 towards small and medium scale enterprises (SMEs) performance in Malaysia. Therefore, the null hypothesis (H_0) was rejected

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

because the p-value is 0.00 which is less than 0.05 and that mean there is no significant relationship that exist between both independent and dependent variable.

SMEs also play an important role in the political economy, helping to promote and strengthen reforms. Economically, they have an inherent interest in promoting policies that favour a level playing field, while politically, a thriving SME sector empowers and grows a strong middle class, which can then serve as a constituency seeking democratic reform and sound economic governance.

The relationship between the purchasing behavior with impact Covid-19 towards small and medium scale enterprises (SMEs) performance in Malaysia.

RO: To determine the relationship between purchasing behavior with the impact of Covid19 towards small and medium scale enterprises (SMEs) performance in Malaysia RQ: It that any relationship between purchasing behaviour with the impact of Covid-19 towards small and medium scale enterprises (SMEs) performance in Malaysia?

Moreover, researcher has identified that there is no significant relationship between purchasing behavior with the impact of Covid19 towards small and medium scale enterprises (SMEs) performance in Malaysia. Based on the result of the Spearman's rho Correlation Table 4.18 this research is rejected H3 because -0.252 with significant value $p < 0.05$, it means that there is a no significant relationship exist between purchasing behavior with the impact of Covid19 towards small and medium scale enterprises (SMEs) performance in Malaysia. Therefore, the null hypothesis (H0) was accepted because the p-value is 0.00 which is more than 0.05 and that mean that their significant relationship between both independent variable and dependent variable.

SMEs performance is very important due to its role in enhancing the economic conditions. To ensure sustainability, it requires understanding that it is affected by both internal and external factors. The external factors are defined as those factors where the occurrence wholly cannot be controlled by the respective SMEs or sometimes, they have a very little or minimal control over its occurrence. Those factors can be in terms of supporting economic, social, political environment, availability of funds and so forth.

6 RECOMMENDATION

The future researcher can manage to conduct the research in different area of Malaysia to enrich the local context. Different state of Malaysia will have different culture in the workplace. Future researcher can find out more information about the impact of Covid-19 on SMEs performance in Malaysia. Future researcher can know how importance of the impact of Covid-19 on SMEs performance between operation, supply chain and purchasing behaviour.

Next, the future researcher is recommended to expand the sample size and the population in order to get more accurate and diverse outcome of the study. The study was conducted only at Klang Valley Area. It is recommended that future researchers perform similar research in different states or even in Malaysia as it will lead to a different outcome. In addition, in order to improve the quality of the data obtained, the number of respondents can be expanded for future studies. To get an accurate result from larger amount of responses, future researchers must take a longer duration for data collection and analysis. In conclusion, the future researcher should consider to use quantitative method for research. Future researcher may gain deeper understanding about the relationship of

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

the impact of Covid-19 on SMEs performance in Malaysia. Therefore, using quantitative method may get different perspectives of the relationship between SMEs performance.

7 CONCLUSIONS

This study focuses on the impact of Covid-19 on SMEs performance in Malaysia. Organizations can use the outcome of this study to determine the effectiveness and impact of Covid-19 on SMEs performance between operation, supply chain and purchasing behavior in Malaysia. This is because it will help to build a great partnership between undergraduates and industries. Malaysian companies from either government or private sectors can also use the data to determine SMEs performance in Malaysia specially in Klang Valley Area of all Malaysian undergraduates and the impact on the future development of the country.

The minimum requirement for reliability analysis has been met from the study of the overall variable since the value of the Cronbach's Alpha coefficients is above 0.6. The independent variables identified as the operation, supply chain the significant relationship to the dependent variable known as the SMEs performance. Based on the hypothesis result, two of the H0 have been rejected while H1 and H2, have been accepted in this study. The one of the hypothesis H3 have been rejected while H0, have been accepted in this study. Most notably, this study has established that all Malaysian are nowadays really aware of the real impact of Covid-19 on SMEs performance in Malaysia They are also really concerned about the specifications of the organizations that they wish to want to work and perform well. These employee or fresh graduates are really willing to accept this operation, supply chain and purchasing behavior as necessary criteria for applying for a job or performing well in a work environment. This research was successfully completed.

ACKNOWLEDGEMENTS

The researcher would like to take this opportunity to express gratitude to all the people who have dedicated their time and efforts that have greatly supported me in this research study and made the research process easier to achieve. First of all, the researcher would like to express gratitude to the University of Malaysia Kelantan for the opportunity to work on this project.

The researcher would like to say thank you to her supervisor, Dr. Wan Farha Binti Wan Zulkiffli, as well as him examiner, Prof. Madya Dr. Mohammad bin Ismail, for the guidance to complete this research study smoothly. All the advice and tips given are highly respected because they helped me to make things easier. Understand and lead her to the successful conduct of the research.

In addition, special appreciation is also expressed to her beloved relatives and to my family. Fellow friends for continuous encouragement, prayers, and practical advice that works as an individual. Inspiration and encouragement to researcher still have the confidence to do the best thing in life.

FACTOR INFLUENCE CUSTOMER SATISFACTION IN ONLINE SHOPPING DURING COVID-19 PANDEMIC EVENTS

Lee Hoe Yin and Siti Afiqah Binti Zainuddin

Faculty of Entrepreneurship and Business,
Universiti Malaysia Kelantan,
Malaysia

Email: lhyin.a17a0167@siswa.umk.edu.mu; sitiafiqah@umk.edu.my

Abstract:

Customer satisfaction has become the crucial phenomenon in relation to online shopping. The investigation of what cause customer satisfaction has become a paramount for online business. It is necessary to explore analyse the connection between customer satisfaction and diverse determinant in order to increase the participation of online shopping. Therefore, the purpose of the study was to identify the factors influence the customer satisfaction in online shopping during the Covid-19 pandemic events. The study measure the influence of website designs, customer services, security perception, product information quality, purchasing process convenience during the convid-19 pandemic events. The research collected data through online survey method by a structured questionnaire with five-point Likert scale from 385 respondents. Quantitative analysis and convenience sampling techniques was used in order to ensure the archiving of research objectives. There were 385 respondents have enrolled from 26,353,017 of internet users in online shopping in this quantitative study. The 385 respondents was from different gender, ages, ethnicity, religion and education level. SPSS has been use to execute reliability test, descriptive analysis, the Pearson correlation coefficient analysis, multiple regression analysis and test on the hypotheses developed. The result of the analysis exhibited that all factors had a positive and significant associated with customer satisfaction in online shopping during covid-19 pandemic events.

Keywords: *Customer satisfaction, website designs, customer services, security perception, product information quality, purchasing process convenience, Covid-19*

1 Introduction

Unusual retail consumer behaviour has reported all over the world during March 2020 when the COVID-19 virus escalated into a pandemic (Miri et al., 2020). The COVID-19 outbreak has affected almost every aspect of people around the world including Malaysia. With most people needing to stay home more, Malaysians have been adapting to both the outbreak and the regulations.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Technologies advancements has significantly influence any organizations in different ways. (Cascio & Montealegre, 2016). Let us not to forget about that the covid-19 pandemic events has major impact of the consumer purchasing habit. Due to the pandemic events, consumer tends make purchase through the social network platform while staying at home. Therefore, it directly leads to increase of consumption in online shopping, and with the spreading of technologies and development of smart phones appliances, the e- retail business might expanded faster than the worldwide expectation. Therefore, in order to grab more attention and views among the customer to purchase on certain e-commerce website, the company must first fulfilled the customer satisfaction.

The development of the internet web has become a stirring progress in information technology. Meanwhile, the online shopping has become widely accepted as a way to purchase product in service. It has become a more popular trending in the Internet world (Bourlakis, Papagiannidis, & Fox, 2008), especially during the Covid-19 pandemic events. Most of the people has being forced to stay at home during the pandemic. Therefore, the number of consumer purchasing through online shopping is increased.. It also provides consumer more information and choices to compare product and price, more choice, convenience, easier to find anything online (Butler & Peppard, 1998). It helps consumers to make purchases anytime and save their time as online shopping continues to evolve technologically, the firm has to understand what factor will influence the customer decision-making and their decision.

The consumer will have different spending experiences in an online channel. Although they have purchased the same product online, the product they purchase in different retailers have given different purchasing experiences to the customer. Most of the e-commerce business is trying to keep customers returning and help them remain loyal to the business (Hudson, 2020). When the customer satisfy with the particular store, they will make purchase there more (Khalifa & Liu, 2007). The e-commerce business is also trying to build loyalty to the customer because there are wide choices of products that provided in the market and the customer can easily switch between a few options as consideration. In fact, when the performance of the online store doesn't meet the customer expectation, it will lead to dissatisfaction on customer perspective, whereas the customer will satisfied when the performance meets the expectation (Swan & Combs, 1976). In generally, a highly satisfied customer will stay for a company for a longer period of time (Williams & Naumann, 2011). When the customer has many choices, the customer power is build and most of the firm will try to catch the customer's eyes.

The past finding and research about the customer satisfaction is inconsistent and some contradictory findings. Hence, it is believed that there are no agreement among the research about the significant factors influencing customer satisfaction. Therefore, the main purpose of this study is to identify the factors influencing the customer satisfaction in online shopping during the Covid-19 pandemic events. The result of this study will contributed to developing a theoretical model to measure factors influence customer satisfaction in online shopping during Covid-19 pandemic events.

Research Objectives

The objective of the research is to study what factor will influence the customer satisfaction in online shopping during the Covid-19 pandemic event. This research also aim to examine

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

the independent variable of design of websites, the quality product and service, the security and privacy of websites and the price of product and service offered during the Covid-19 pandemic event. More specifically, the proposed study is:

To determine the influence of website design on customer satisfaction during the Covid-19 pandemic events.

To determine the influence of customer services on customer satisfaction during the Covid-19 pandemic events.

To determine the influence of security perception on customer satisfaction during the Covid-19 pandemic events.

To determine the influence of the product information quality on customer satisfaction during the Covid-19 pandemic events.

To determine the influence of the purchasing process convenience on customer satisfaction during the Covid-19 pandemic events.

Significance of Research

Organizations

Through this research, the organizations in Malaysia can understand and get valuable insights on how the factors give impact and influence the customer satisfaction towards online shopping during the pandemic event in the future.

Consumer

From the consumer point of view, consumers are able to get more concern from the marketers with the online shopping dimensions such as security perception, product information quality, customer services and website design. Hence, consumers tend to feel relaxed and pleased while making purchases through online shopping meanwhile feel secure and safe too when doing payment and transaction via online shopping.

Future Researcher

This research may provide a guideline for future researchers to investigate the factors influencing customer satisfaction in online shopping with certain improvement and development of new theories. It contributes to the future research where researchers can address some of the limitations from this study and have advanced research on suggesting better factors to improve online industry management and strategies in order to alter the customer satisfaction toward online shopping during any pandemic event in the future.

Literature Review

Dependent Variable

Customer Satisfaction

According to research, customer satisfaction is defined as customer expectations prior to purchase or use of the product or services, then the building of perceptions towards performance of the consumed product or services. (Anderson & Karunamoorthy, 2003) Customer satisfaction is achieved when the actual performance of the products/ services meets or exceeds the initial expectation of the performance. Customer satisfaction is crucial

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

as it is the indicator that leads to customer repurchases intentions and loyalty. (Copley, 2017)

Independent Variable

Website Design

Some key of website satisfaction and trust is how the information design, navigation design and visual design is being applied for the website. One of the features of websites quality is a creative and attractive design that offers uncluttered screens, simple search path, appropriate content and fast presentation. Well-designed website helps customers to find the information faster and indirectly reduce mismatches that leads to acceptance of the site. Normally people will first recognize how credit a website is by considering other factors (Park & Kim, 2003). The quality of the website and feature is important to be consider because it has influenced the consumer in online shopping. An in-affective and poorly designed website will scare the customer away (Ha & Stoel, 2012). The customers are less likely to return to a site after a bad experience (Ha & Stoel, 2012) Majority of the customers will continuously visit a website when the website is effective and attractive (Park & Kim, 2003). (Kim & Stoel, 2004) has stated that people will stop to visit a website if it is not attractive. Therefore, the design and layout of the website is important because a good website will help the e-commerce operator expand its sphere of influence and create leads in e-commerce platforms.

Security Perception

One of the important features to catch customer satisfaction and trust are by having a good security and privacy implementation. Security and Privacy refers to security of the online purchasing environment in terms of hackers' attacks, credit card fraud, non- delivery risk, bank information disclosure, post purchase service and keeping personal privacy secure. In simple, it includes data or transaction security and authentication of the user are protected from any unauthorized use of information disclosure during the online shopping. Privacy related to the situation where customer data is being kept safely and their credit card is secure. Besides, the functionality and usability, e-commerce websites must pay attention to their security and privacy policies. According to (Suh & Han, 2003), security and privacy are the biggest issues in online shopping. The higher the system security, the higher will be the customer satisfaction, and the speed of service. (Oxley & Yeung, 2001) confirmed that online shopping is widely preferred because it provides easy access to large amounts of information. (Kolsaker & Payne, July 2002), maintain that

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

security reflects perception regarding the reliability of the payment methods used and the mechanism of data transmission and storage. Therefore, the security perception has strong relationship with customer satisfaction in online shopping.

Customer Services

In general, customer service can be identified as willingness of personnel to help in solving problems and provide prompt responses to enquiries (Chang & Chen, 2009). Several researches have been undertaken to examine the effect of customer service on customer satisfaction. There are some researcher whom mentioned that customer services as the strong determinant factor in affecting the customer satisfaction. (Ranjbarian, Fathi, & Rezaei, 2012); (Trong, Khanh N. T. V., & Gim, 2014); (Guo, Ling, & Liu, 2012) and (Nugroho & Dharmesti, 2012). Also, the finding of their result has indicated that customer services has strong significant relationship with the customer satisfaction. (Thilakarathne & Abeysekara, 2016) have stated customer service as a hygiene factor in which influence the customer satisfaction. Therefore, the absence of quality customer service can have an adverse impact on customer satisfaction.

Product Information Quality

Product information quality refers to whether an online website provides sufficient, up to date, understandable and consistent information about its products (Madinios & Theodoridis, 2010). A product is an anything that can be found in a market in which can satisfy individual has needs and wants. It can be anything likes goods, services, place, people, an idea or things that can fulfil and satisfying consumer needs and wants. According to (Tjiptono, 1997), a good quality product can characterised as a product free of defects and defects that can be recognised by eight main parameters, such as product performance, product characteristics, product reliability, product validation, product longevity, serviceability, aesthetics and quality perception. (Liu, He, Gao, & Xie, 2008), stated that the details of product information should provide since the product is intangible in the online platform. Therefore, customer is highly rely on the information that provides by the website during the purchasing process. The quality information presented by the website assists customers in comparing products, making informed purchase decisions and enhancing transaction security (Lin, 2007). Therefore, the product information

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

quality listed by the website has strong relationship with customer satisfaction which might give impact in influencing the customer buying decision.

Purchasing Process Convenience

Purchasing process convenience refers to the level of convenience and easiness of a user is on purchasing a product (Kim H.-R. , 2005). It highlighted the easiness, comfortable and convenience associated when making a purchase through online shopping websites. According to (Madininos & Theodoridis, 2010), it is imperative for an online shopper to provide simplified, easy and quick purchasing process for the customer. A few study and statement has revealed that the more convenience is the purchasing process for the customers, the higher the level of satisfaction they have attributed toward the online shop. This statement of relationship has been further confirm by few researcher and studies whom are (Szymanski & Hise, 2000) (Cho & Park, 2001) (Kim H.-R. , 2005) (Schaupp & Bélanger, 2005) (Madininos & Theodoridis, 2010) (Gelard & Negahdari, 2011). On the research study (Deyalage & Kulathunga, 2019) the Sri Lanka context also conclude that customer experience during the Internet Banking activities is directly influenced by customer satisfaction (Silva & Abeysekara, 2012). Consumers tend to have online shopping activities on the websites that they assume that it is transaction safe, simple, profitable, and low risk. When the website provide an easy and convenience purchasing process, it will increase the customer satisfaction which will lead to increase of customer enrolment on the online store.

Conceptual Framework and Hypothesis

This framework is adopt from (Deyalage & Kulathunga, 2019). This research is aimed to investigate the impact of the factor on customer satisfaction in online shopping with variables shown in figure 1. Based on the relevant conceptual framework that has stated in the previous section, the four independent variables are website design, security perception, customer services and product information quality. The dependent variable in this research is customer satisfaction in online shopping. The conceptual framework is develop based on the theoretical framework proposed by (Deyalage & Kulathunga, 2019).

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

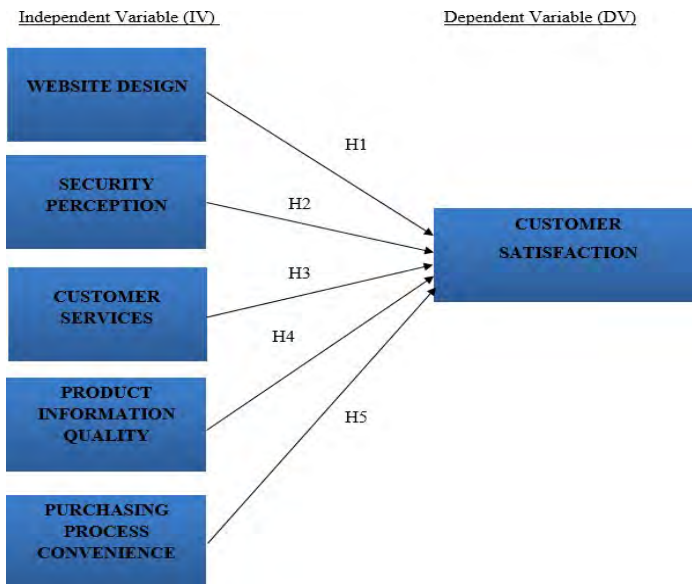

Figure 1: Proposed Conceptual Framework Sources: (Deyalage & Kulathunga, 2019)

The following hypotheses were formulated and verified using a quantitative research design;

H₁: There is a positive and significant relationship between the design of website design and customer satisfaction in online shopping during Covid-19 pandemic events.

H₂: There is a positive and significant relationship between customer services and customer satisfaction in online shopping during Covid-19 pandemic events.

H₃: There is a positive and significant relationship between the security perception and customer satisfaction in online shopping during Covid-19 pandemic events.

H₄: There is a positive and significant relationship between the product information quality and customer satisfaction in online shopping during Covid-19 pandemic events.

H₅: There is a positive and significant relationship between the purchasing process convenience and customer satisfaction in online shopping during Covid-19 pandemic events.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Methodology

Research Design

This research study will use quantitative research methods. Quantitative approach is select for a larger target respondents' sample size and includes multiple types of measurement and analysis (Sekaran U. , 2003). According to (Madrigal & McClain, 2012), conducting research by using this method allows researchers to gather and analyse data collected and use for further hypothesis tests in order to determine the relationship between dependent variables (customer satisfaction) and independent variables (website design, product information quality, security perception, and customer service).

Data Collection

Data collection is a crucial part of any type of research study. Where in this study, this part plays a vital role in collecting information from all the relevant sources. Both primary data and secondary data will be used in the research. Both data are collected for the purpose of doing statistical analysis.

Sampling Techniques

In our research which studies customer satisfaction in online shopping during Covid-19 pandemic event, they show that it consists of a big area of size. That is why convenience sampling is the most suitable compared to other techniques. A convenience sample is simply one where the units that are selected for inclusion in the sample are easiest to access. Convenience sampling is a specific type of non-probability sampling method that relies on data collection from population members who are conveniently available to participate in study. We used a website platform. In its basic form, convenience-sampling methods can be applied even in Facebook, Google Form or WhatsApp if they were shared by some individuals.

Population

Population is a group of individuals that is related to research studies taken from the general population who share a common characteristic, such as gender, age, income or employment status (McLeod, 2019)Therefore, the respondents of this study are targeted at customers who experienced online shopping during Covid-19 pandemic event.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Sample Size

Sample size is the number of respondents in this research study, which represents a subset of the population (Sekaran U. , 2003). According to the research by (Internet World Stats, Usage and population statistics,, 2020), the total population in Malaysia is 32,365,999 and there are around 26,353,017 of internet users which penetrates 81.4% of the population. Based on survey portal Statista, 30million of people will be accessing the internet in 2020. The statistic projected that the users would grow up to 33.5 million by 2025. Therefore, the sample sizes for a population more than 10,000,000 at the 95% confidence level are 385 respondents. (Saunders, Lewis, & Thornhill, 2020)

Research Instrument Development

Survey questionnaires are used as an instrument to find numerous aspects of respondent perception in this research. There are three sections in the design of the questionnaire. The first section of the questionnaire allows the researcher to know the identity of respondents that take part in this research (demographic information) such as gender, age, education, etc. The second section of the questionnaire elaborated the five main independent variables (website design, customer services, security perception, purchasing process convenience and product information quality. The third section of the questionnaire elaborated the dependent variable (customer satisfaction) of the research. Five-point scale option would be used in this research, ranging from “strongly disagree” to “strongly agree”.

Table 1: The adoption of questionnaire measurement.

Construct	Adapted From

Customer Services	(Wang, Tang, & Tang, 2001); (Liu, He, Gao, & Xie, 2008); (Chang, Wang, & Yang, 2009); (Jiang & Rosenbloom, 2015)
Security Perception	(Yue & Liang, 2002); (Park & Kim, 2003); (Liu, He, Gao, & Xie, 2008); (Madininos & Theodoridis, 2010)

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

Product Information Quality	(Cho & Park, 2001); (Park & Kim, 2003); (Kim H.-R. , 2005); (Madininos & Theodoridis, 2010)
Purchasing Process Convenience	(Park & Kim, 2003); (Kim H.-R. , 2005); (Madininos & Theodoridis, 2010)
Customer Satisfaction	(Liu, He, Gao, & Xie, 2008); (Flavián, Guinalú, & Gurrea, 2006); (Tandon, Kiran, & Sah, 2017)

Data Analysis and Findings

Data are collected from respondents who have already made online purchase and encoded in SPSS 25.0 software for analysis. It is analysed using descriptive statistics analysis, reliability statistics analysis, Pearson Correlation coefficient and multiple regression analysis.

Respondent's Profile

Table 2: Demographic profile of sample

Demographic Factors	Categories	Frequency	Percentage
Gender	Female	246	63.9
	Male	139	36.1
Age	19 years old or under	82	21.3
	20-25 years old	215	55.8
	26-30 years old	58	15.1
	31 years old and above	30	7.8
Ethnicity	Malay	46	9.5
	Chinese	285	58.8
	Indian	36	7.4
	Others	18	3.7
Religion	Islam	45	11.7
	Buddhist	222	57.7
	Hindu	39	10.1
	Others	79	20.5
Education Level	SPM	12	3.1
	STPM	34	8.8
	Diploma	34	8.8
	Bachelor of degree	211	54.8
	Master	14	3.6
	PhD	15	3.9

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

	Others	65	16.9
Online Shopping Habits	No	23	4.7
	Yes	362	74.6
Frequency of Online Shopping	Everyday	53	13.8
	3-4 times weekly	144	37.4
	1-2 times weekly	188	48.8

As presented in Table 2, analysis of respondents' demographic characteristics indicated a higher percentage of female respondents (63.9%) compared to male respondents (36.1%). In addition, majority of the respondents (55.8%) were from the age group 20 – 25 years old. On the other hand, the highest amount of group of respondents in ethnicity is Chinese with 185 respondents (58.8%). Same to the religion, Buddhist has the highest number of respondents with 222 (57.7%). In terms of highest education level, 211 respondents (54.8%) has undergoes Bachelor of degree. there are a large number of respondent, 362 whom have online shopping habits with the percentage of 74.6% compare to the respondent who don't have the online shopping habits is only 23 respondents with 4.7%. Furthermore, 188 (48.8%) respondents have online shopping 1 to 2 times weekly and 144 (37.4%) respondents have online shopping 3 to 4 times weekly. There are only 53 (13.8%) of respondents whom have online shopping in every day.

Reliability Analysis

Based on (Lavrakas, 2006), the level of reliability can be categorized into 6 groups, which are excellent reliability that range more than 0.9, good reliability range between 0.80 to 0.90, acceptable reliability that range between 0.70 to 0.80, questionable reliability range between 0.60 to 0.70, poor reliability that range between 0.50 to 0.60 and lastly the unacceptable reliability that range lower than 0.5.

Table 3: Reliability Test Results

Variable	Dimensions	Cronbach's Alpha	Reliability
Dependent variable	Customer Satisfaction	0.728	Acceptable
Independent Variables	Website Design	0.724	Acceptable
	Customer Services	0.720	Acceptable

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

	Security Perception	0.744	Acceptable
	Product Information Quality	0.765	Acceptable
	Purchasing Process Convenience	0.549	Poor

Based on the result of reliability test, there are two level of reliability consist in this questionnaire, there are poor internal consistency of reliability on the Purchasing Process Convenience. Otherwise, the Cronbach's Alpha value for the rest valuable is lie between the value of 0.70 to 0.80 which label as acceptable internal consistency of reliability.

Pearson Correlation Coefficient

Table .4: Summary for Pearson Correlation

	Customer satisfaction			
	Pearson Correlation	P- Value	Interpretation	Hypothesis result
Website Design	0.726	0.000	Strong and positive relationship	Supported
Customer Services	0.758	0.000	Strong and positive relationship	Supported
Security Perception	0.733	0.000	Strong and positive relationship	Supported
Product Information Quality	0.767	0.000	Strong and positive relationship	Supported
Purchasing Process Convenience	0.754	0.000	Strong and positive relationship	Supported

As shown in Table 4, Pearson correlation coefficients for website design, security perception, customer service, purchasing process convenience and product information quality are positive and significant ($p < 0.05$). This indicates that each of these five

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

variables has a positive and significant effect on online customer satisfaction. Therefore, hypotheses H1, H2, H3, H4 and H5 are accepted.

Multiple Regression Analysis

Table .5: Summary for Multiple Regression Analysis

Coefficients ^a						
Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	.436	.128		3.413	.001
	Website Design	.191	.044	.186	4.323	.000
	Customer Services	.200	.055	.186	3.670	.000
	Security Perception	.099	.046	.107	2.155	.032
	Product Information Quality	.219	.046	.233	4.749	.000
	Purchasing Process Convenience	.392	.069	.250	5.659	.000

a. Dependent Variable: Customer Satisfaction

According table 4.23, the independent variable which are from purchasing process convenience, security perception, website design, product information quality, customer services has positive effect with customer satisfaction. The p-value for purchasing process convenience, security perception, website design, product information quality, customer services is less than level of significance (0.05).

5.0 Discussion and Recommendation

There are a few thoughts of recommendation for the future researcher in enhancing the online shopping customer satisfaction during the Covid-19 pandemic events. The researcher are recommended to expand their sample size and population of the study worldwide but not only in Malaysia. The bigger the population is for the sample size, the higher the accuracy of the significant relationship between the determinant factors and customer satisfaction in online shopping. Therefore, future researcher can continue the

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

research with more respondents in order to get an accurate data about the most significant relationship of the factor and customer satisfaction in online shopping during the Covid-19 pandemic events.

In order to have more accurate measurement during the process of data collection, future researcher were suggested to look for more significant method of distribution of questionnaire to gain more accurate result from the respondents. An implementation of good data collection method in distribution of questionnaire might lead to gain more respondents from different demographic profile. Future research might consider to use a professional survey website in collecting response from respondents. A wider range of respondents can be reach and more data that are accurate can be measured through the survey website

Lastly, the researcher are recommended to increase the variable in demographic profile such as income level. Analysing more on the difference between demographic profiles would give a good explanation on the trait of the targeted respondent. The data collected would be more accurate with the increase of variable in demographic profile.

6.0 Conclusion

The objective of the study was to identify the factors influence customer satisfaction in online shopping during covid-19 pandemic events. The literature review has formed in order to achieve this objectives. Based on the conceptual framework built, there researcher suggested five hypothesis for this study. Data collected were analysed using Statistical package for social sciences (SPSS). The system is used to execute reliability test, descriptive analysis, the Pearson correlation coefficient analysis, multiple regression analysis and test on the hypotheses developed. Through the data analysed, it has revealed that all the determinant factor which are the customer service, website design, security perception, product information quality and purchasing process convenience have significant effects on online customer satisfaction. Amongst the factors, product information quality was identified as the most important factor followed by customer services, purchasing process convenience, security perception and lastly, website design.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

There are a few limitations can be found in this research for the future researcher. Despite the advantages from this research, the limitations from this research might give attention to the future researcher in order to help them in learning and gaining knowledge. The use of method encountered a lot of challenge and barriers during process of data collection. In order to prevent the similar problems occur in the future research, some recommendation and suggestion have been done to avoid similar circumstances happens in future research.

First of all, the conceptual model is developed using only five independent variable which are purchasing process convenience, security perception, website design, product information quality, customer services. The research had also done by many researcher in the past. Therefore, there are other more factors affecting the customer satisfaction in online shopping which were not examined in this research. Future researcher is advised to study more factors to give further proved the past research. In order to accurately measure the factor influence the online shopping customer satisfaction, some innovative ideal can be occur during the process of building the research.

Furthermore, the method used in distribution is done by using Google Form link through social network platform. The distribution getting from social network but not in real-time were believed that the response had no insight regarding the respondents' honest opinions and perceptions. Some data might not accurate cause the research outcome to be limited.

8.0 Acknowledgements

I would like to express my sincere appreciation and thanks to several individuals and organizations who gave guidance and support to me throughout the working of my research paper.

First and foremost, I would like to give sincere appreciation to my Final Year Project Supervisor, Madam Site Abiah binti Zainuddin, for her patient, insightful comments, helpful information, inspiration and guiding me throughout the entire research project. Without her support and guidance, this project would have been a failure. I could not have imagined having a better supervisor in my study.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

I also wish to give special thanks to University Malaysia Kelantan (UMK) for giving us the opportunity to be involved in the research. Throughout this research, we gain a lot of experience, knowledge and exposure to a new circumference which is going to benefit us in the future.

Finally yet importantly, we would like to express our ultimate appreciation to those respondents who are willing to help by spending their precious time responding to the questionnaire of the research project. Besides that, we would like to thank our family members, friends, course mates and group mates for helping and supporting us until the research project ends.

FACTORS AFFECT THE ATTITUDE OF ONLINE PURCHASING DURING PANDEMIC COVID-19 AT MUKIM HULU LANGAT

Mohamad Kamal Bin Bujang and Norfazlirda Binti Hairani

Faculty of entrepreneurship and business ,
University Malaysia Kelantan,
Malaysia

Email: kamal.a16a0357@siswa.umk.edu.my; fazlirda.h@umk.edu.my

Abstract:

Online shopping is a trend that is now growing rapidly. A look at the main players in this industry's exponential growth shows that there is still a huge pool of online shopping platform and potential. The convenience of online shopping makes it a trend that is emerging among consumers. The proliferation of online shopping has increased at Mukim Hulu Langat.

1 INTRODUCTION

In this chapter one deals with the introduction to this thesis and comprises seven key components, which are background of study, problem statement , research objective, research questions , scope of study, and study purpose. This study focuses primarily on factors that affect the attitude when online purchasing during pandemic covid-19 among Mukim Hulu Langat residents. In this study, the researcher analyze the factors that affect the attitude of Mukim Hulu Langat resident to buy online purchasing during pandemic covid-19.

2 SIGNIFICANCE OF STUDY

Based on this study, the researcher who attempted to state the findings of this study could provide a brief explanation of the significance of the study given to five groups, namely government, online merchants, transportation companies, customers, retail students and future researchers.

3 LITERATURE REVIEW

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

3.1 RELATIVE ADVANTAGE

The relative advantage is that an invention is considered to deliver more advantages than it does (Rogers, 2003). Consumers use online shopping on the basis of the principle of progress if they see relative gain over conventional shopping. Shopping strategies, such as reduced prices or saving time and effort, are more convenient for shopping online (Choudhury and Karahanna, 2008). The user should be happy with these extra benefits, or choose to remain in the conventional buying system, or turn to online shopping (Hsiao, 2009).

3.2 PERCEIVED WEBSITE REPUTATION

Corporate credibility is commonly described as insofar as companies and people in industry assume that companies are honest and caring for their customers (Keh and Xie, 2009). Websites are known to be the degree of popularity websites are accessible to users" (Hsiao et al. 2010, p. 940), but their visuality, uniqueness, originality, clarity and accuracy are typically a justification for the popularity and reputation of the website.

3.3 TRUST

The confidence has been theorised as the direct determinant of the attitude because of the high degree of unsureness and dynamism of the Internet (Gefen and Straob, 2003; Hassanein and Head, 2007; Lin, 2011). Given the ambiguity and multidimensionality of the term (Hassanein & Head, 2007), in related literature there are many different meanings of confidence. For instance, Barney and Hansen (1994, pp. 176) described trust as the reciprocal trust that no exchange party will exploit the vulnerabilities of another party." Mayer et al. (1995) established "a party's readiness to be vulnerable to the actions of a third party on the basis that the other person is required to perform some action which is relevant for the trustee

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

3.4 HYPOTHESES STATEMENT

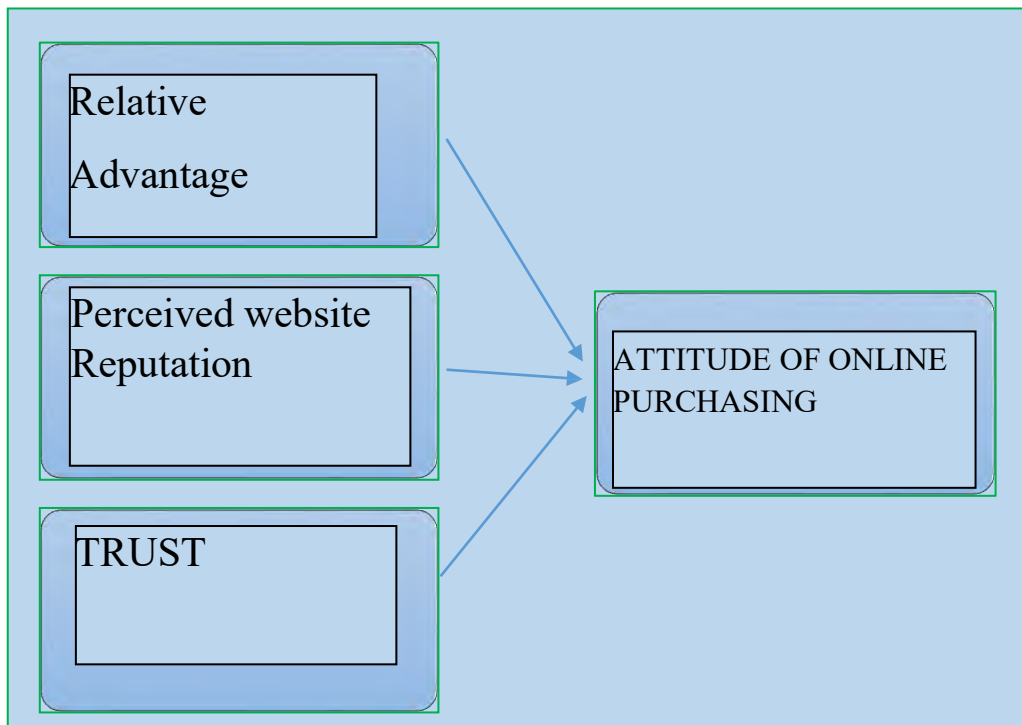

H1: Relative advantage has a significant positive influence on attitude toward online shopping.

H2: Perceived website reputation has a significant positive influence on perceived website image.

H3: Trust has a positive significant impact on attitude toward online shopping

3.5 CONCEPTUAL FRAMEWORK

Table 2.4.1: Conceptual Framework

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

3.6 RESEARCH DESIGN

Analysis methods are research techniques, from underlying theory to the design and collection of research data (Myers & Avison, 2002). This trial uses cross-sectional experiments to gather data only once. In addition, the survey method appears to be very reasonable because it is the best methodology for this analysis. According to the survey Zikmund (2000), data collection from study respondents is cheap and highly efficient. The evaluating unit involves people who make transactions online from Mukim Hulu Langat. Self-managed questionnaires were used to collect about each element of study.

3.7 DATA COLLECTION METHODS

The data collection method is based on John Dudovskiy (2014) to collect information from all relevant sources in order to find answers to the research issue, test the hypothesis and analyse results. Data collection methods can be classified into two categories: primary data collection methods and secondary data collection methods. The sources obtained firstly in the study are secondary data published in both faculty offices (data from publicly accessible sources).

3.8 SAMPLING

Sampling is an investigation of evidence that uses an advanced number of experiences from a wider population. The method used to examine a wider population depends on the type of investigation that is carried out, but may involve subjective inspection or orderly monitoring. The analyst will use tests without chance as an inspection technique for this exploration. Nonprobability inspections are a review technique, where an example of a process that does not allow every single person equal opportunity to be chosen in the population. Five sampling techniques, such as quota sampling, convenience sampling, selective sampling and snowball sampling, are available for unlikely sampling.

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

3.9 PROCEDURE FOR DATA ANALYSIS

Data Analysis is the method by which raw data is gathered from questionnaires, according to Jay Sridhar (2018) to find useful and useful information. In order to evaluate the data obtained from respondents, we have used the Social Sciences Statistical Kit (SPSS). SPSS is a programmed to assist researchers in the input and analysis of the data and to also improve table analysis, according to Daniel (2014). Selected techniques were evaluated for the results of this study based on the research objectives.

**4 FINDING 4.1
DEMOGRAPHIC**

Descriptive analysis was performed for the knowledge continuum in Section A, where the baseline data on the statistical profile of 424 respondents participating in the study were simplified. All the questionnaires were completed and taken as a sample. In the first section, Section A of the questionnaire was the population profile of the respondents. Section A questioned about age, gender, race, status, employment, monthly income and online buying frequency

Table 4.1: Profile of respondent

Variable	Category	Frequency	Percentage
Age	20years<	47	11.1
	21-30year	229	54.0
	31- 40	102	24.1
	years	46	10.8

BUSINESS COLLOQUIUM 2020/2021**

4.4 DISCUSSION

Variable	Simple linear regression			Multiple linear regression		
	b	t (95% CI)	P=value	b	t (95% CI)	P=value
Relative advantage	0.66	15.19(0.61,0.79)	<0.001	0.36	6.58(0.25,0.47)	<0.001
Perceived website reputation	0.77	17.99(0.68,0.85)	<0.001	0.54	10.48(0.44,0.64)	<0.001
Trust	0.58	7.13(0.48,0.68)	<0.001	0.05	0.83(-0.06,0.15)	0.41

4.5 HYPOTHESIS

Hypothesis testing are summarized in the Table 4.6.3 as below:

	Hypothesis	Significant value	Strength Of Association	Supported or Rejected
H1	There is significant relationship between relative advantage and attitude of online purchasing	0.60	Substantial	Accept hypothesis is supported
H2	There is significant relationship between perceived website reputation and attitude of online purchasing	0.66	Substantial	Accept hypothesis is supported
H3	There is significant relationship between trust and attitude of online purchasing	0.50	Substantial	Accept hypothesis is supported

5 RECOMMENDATIONS

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

In order to carry on future research on this topic, many aspects can be improved. The present study has been performed in Mukim Hulu Langat and respondents from different backgrounds in this field were targeted. For more researchers, the sample size and population should be expanded in order to obtain more precise results. In other districts the study may be carried out to further assess the other. Different fields of sampling may acquire different results of study. More respondents should be used in future studies.

6 CONCLUSION

This study has been carried out to determine the attitude of online purchasing. Researchers collected and collected data through a questionnaire involving several consumer attitudes established in this research. This research was therefore carried out for the resident of Hulu Langat in order to find the location of online buying in Mukim Hulu Langat.

FACTORS THAT INFLUENCES THE CONSUMER INTENTION TO USE FOODPANDA SERVICE IN MALAYSIA

Mohamad Nur Najmi Bin Zahari and Nadia Hanum Binti Amiruddin

Faculty of Entrepreneurship and Business,
Universiti Malaysia Kelantan,
Malaysia

Email: najmi.a17a0216@siswa.umk.edu.my; nhanum@umk.edu.my

Abstract:

The purpose of this research is to examine the factors that influence the intention of consumers to use the Foodpanda service. Nowadays, many people order food using the Foodpanda app. They are just waiting for the food ordered to be delivered by the Foodpanda delivery to their home. fluctuating and current economic conditions are unstable. Over time, the service provided by Foodpanda has become better and more customers. Therefore, this research examines the relationship between service quality, price, customer service, and delivery time with consumer intentions. The quantitative research design was used and conducted on 384 respondents consisting of Foodpanda users in Malaysia. The results show that all factors such as quality service, price, customer service, and time delivery have a significant positive relationship between consumer intention to use Foodpandade service. Based on reability, the price factor is the most dominant factor that affects the intention of consumers to use Foodpanda service. The result is to increase the knowledge of researchers and clothing marketers to better understand the buying behavior on clothing trends among women in Kelantan in particular. The proposal for future research is to conduct research in each state to obtain more detailed and in-depth data.

Keywords: *Service Quality, Price, Customer Service, Time Delivery, and consumer Intention*

1 Introduction

Foodpanda was founded in Berlin, Germany in 2012 and developed its business as a mobile food delivery marketplace recently available in 11 countries. Foodpanda has expanded its business in Malaysia since 2018. It offers cooking styles from more than 115,000 restaurants around the globe. The organization licenses customers to orchestrate their optimal sustenances from close by bistros and spot orders by methods for the site or flexible application.

The mission of Foodpanda is to make a relationship between the culinary master and customers and bring scrumptious sustenance for the customers. Foodpanda contains different food classes and diner menus in the food door enabling the customers to orchestrate the food through the applications or the site. By then, it will genuinely quantify and send the solicitation to the associate diners. Starting there forward, the laborers will pass on the food and remind the customers to assemble their solicitations by sending the SMS or the call. The customer may make portion with either cash close by or web banking (Sparta, Alsumait, and Joshi, 2019). Agent Loyalty is one of the critical components for the achievement of Foodpanda. The affiliation's unfaltering quality makes their delegates trust the association and promises them to contribute. Agent immovability is basically the specialist vow to relinquish their preferred position for affiliation (Elegido, 2013).

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

In Malaysia, such an application isn't diverse to us since we had Foodpanda transport before this yet people still enthusiastically to buy using Grab Food application. In Malaysia, food delivery service is a very common service provided by Malaysian beside transport service. Beside restaurant, people who do not have a restaurant also offer food delivery service. Nowadays, there are many food delivery systems that are available in Malaysia. For example, FoodPanda Food Delivery & Takeout, Mammam Deliveries and KFC Delivery. However, there is no current food delivery system that allow people who do not have a restaurant that offers food delivery service to promote the service. I want to study about Foodpanda because it is one of the main uses for consumers to order food. This is because the number of users who use the Foodpanda service is constantly increasing every year. Apart from that, I would also like to know about the factors that influence the intention of consumers in use Foodpanda service in Malaysia.

1.1 Research Objectives

To examine the relationship between service quality and consumer intention to use Foodpanda service in Malaysia.

To examine the relationship between price and consumer intention to use Foodpanda service in Malaysia.

To examine the relationship between customer service and consumer intention to use Foodpanda service in Malaysia.

To examine the relationship between time delivery and consumer intention to use Foodpanda service in Malaysia.

To examine the most factor, influence consumer intention to use Foodpanda service in Malaysia.

1.2 Significance of Study

This study examines the factors influencing the intention of consumers to use Foodpanda services in Malaysia. The significance of this investigation is to know the principle points of interest of foodpanda contrasted with others. Foodpanda consumer will have the option to know the benefits of Foodpanda contrasted with other food conveyance organizations. Furthermore, this examination is significant for Foodpanda riders. They will know the benefits of Foodpanda and will be more keen on working with Foodpanda. Next, this examination is likewise significant for eatery proprietors. This is on the grounds that they will find out about Foodpanda. Eatery proprietors will be more keen on working with Foodpanda and they will have more trust in the administrations offered by Foodpanda because of this investigation. This is on the grounds that trust is a significant idea in internet shopping since it can help decrease customer vulnerability and lessen the dangers related with buying from sellers (McKnight, D.H., V. Choudhury, and C. Kacmar, 2002). The consequences of this exploration are significant and valuable to Foodpanda shopper, foodpanda riders, and café proprietors.

2 Literature Review

2.1 Foodpanda service quality

The service quality greatly influences consumers to use the company's services. Basically, service quality is a type of client recognition during the buy cycle and furthermore when items/administrations are conveyed and perceived as holes model that is an examination between clients the view of administration is felt as per their desires. As per Zeithaml et. Al. (2002) the nature of e-administrations is characterized as the degree to which site encourages proficient, powerful buy, buy and conveyance items and administrations and quality Websites assume a

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

significant part in deciding the web client experience. Again the nature of administration E can be characterized in general client assessment and assessment of administration conveyance greatness and quality in the virtual market (Santos 2003).

Service quality measures has been applied to evaluate the nature of virtual network sites (Kuo 2003), fulfillment with online business channels (Devaraj et. Al.2002), and determinants site achievement (Liu and Arnett 2000). For foodpanda clients, great help is their expectation when they use foodpanda administration.

As it is a lot simpler to think about item specialized highlights and costs online than through conventional channels, e-administration quality turns into a critical factor for clients (Santos 2003).

By and large online clients anticipate equivalent or more elevated level of administration quality than customary channels clients (Lee and Lin 2005). Fassnacht and Koese (2006) suggest that specialist organizations ought to offer quality support since it is a wellspring of upper hand.

2.2 Foodpanda price

Price is a significant business conduct and contending organizations regularly play a value battle to pull in clients. So does Foodpanda consistently put client well disposed costs on their shoppers? Notwithstanding value, administration is additionally a significant factor impacting client buying choices. For instance, in the car business, monetary administrations, for example, car advances, protection, and upkeep administrations assume a significant function in picking a brand for clients. Clients of cell phones, PCs, etc, regularly esteem after-deals administration. In the inexpensive food industry, some cheap food binds try to pull in clients by adding gourmet sandwiches or premium breads to their menu, and it is likewise discovered that numerous new sandwich guests additionally desire the climate, particularly among very good quality clients eating sandwiches (Leung, 2002). Be that as it may, the firm should pay the expense for the administration. Thusly, foodpanda must make the trade among venture and benefit from offering types of assistance. What is the ideal cost and level of administration for foodpanda?

Inferable from infrequent variables or functions, market request turns out to be profoundly unsure across numerous ventures.

The individuals from flexibly bind need to settle on the choices, for example, value, creation amount, and speculation dependent on the figure for future interest. For instance, on account of Dell, Intel gives processors to Dell PCs.

Intel takes half a month to produce processors, yet Dell can't stand by that long after a client request. Intel must deliver processors ahead of time. Along these lines, Dell and Intel need to make their requesting and creation plans under interest vulnerability (Chopra and Meindl, 2001).

2.2 Foodpanda customer service

Employee attitude and customer service performance admittedly, there is a call to determine more precisely between proximal intermediaries between employee attitudes and customer satisfaction (Brown & Lam, 2008; Hong et al., 2013). For example, follow the meta-examination of an assessment that reviews the association between delegate satisfaction and shopper reliability, Brown and Lam (2008, p. 253) reason that 'intentionally organized investigation is required to give a more precise applied record' the association among delegate and customer viewpoints. Thusly, if foodpanda treats their customers well, they will get unwavering customers and their customers will create. To lay it out simply, it really

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

exists the need to all the almost certain get where and how laborer points of view impact customers satisfaction. Hence, our first responsibility is to beaten this opening by focusing in on aggregates laborer guarantee to the affiliation and how it impacts purchaser devotion through customer help transport.

From the distinctive potential viewpoints that have been considered in organization advantage change testing and human resource the chiefs models, progressive obligation and occupation satisfaction are the most broadly perceived and definitive in nature obligation can should be a more accurate marker of customer uphold execution given the close by determined relationship with motivation (Meyer, Becker, and Vandenberghe, 2004), whereas satisfaction is closer to satisfaction and thus will when all is said in done be sooner than direct (Bowen and Schneider, 2014).

2.3 Foodpanda time delivery

Pickup and delivery problems (PDPs) comprise a significant class of vehicle steering issues in which items or individuals must be shipped among sources and objections. These issues, which have been read for over 30 years, emerge in numerous settings, for example, coordinations, wandering administrations, and considerably more. It is less difficult to depict enlistment and improvement (PDP) issues as displayed by the going with three clear field plans, structures, visits, and vehicles. For foodpanda, their development time phenomenally impacts customers to utilize their associations. The main field, called the structure, picks its number explanation continually for the thing. In different issues, there are centers can fill in as a source or clarification behind any item. In one to different to one issue, the item was from the beginning found at the station and set out toward client point what's more, the thing open to the client is foreordained terminal.

Client get and development sets are not for the most part self-governing (Ropke and Pisinger, 2006b) and from time to time agree, similar to the case in the spread of drinks and plan of void holders and compartments (see, e.g., Priv'e et al., 2006).

At long last, autonomously issue, every thing has a particular explanation a ton. Issues from this sort emerges, for instance, in dispatch activities and entryway to-gateway transportation associations (see, for instance, Cordeau and Laporte, 2003a). The resulting field gives data in transit pickup and transport practices are performed at the client organization.

2.4 Research Hypothesis

H1: There is a positive relationship between service quality and consumer intention to use Foodpanda service

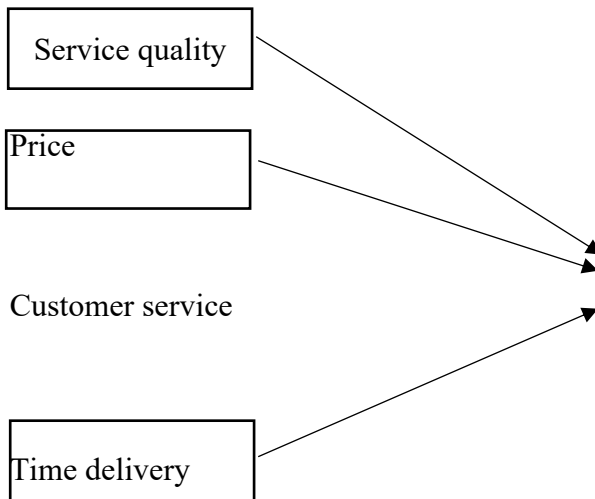

H2 : There is a positive relationship between price and consumer intention to use Foodpanda service

H3: There is a positive relationship between customer service and consumer intention to use Foodpanda service

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

H4 : There is a positive relationship between time delivery and consumer intention to use Foodpanda service

2.5 Conceptual Framework

Independent Variable

Dependent Variables

Dependent variable

3 RESEARCH METHODS

3.1 Research Design

This study develops the study model and empirically studies the model with collect data from foopanda service users. Research design is defined as an action plan or structure for finding research answers to research questions as explained by Stacks (2016). This framework outline the systems needed to acquire data to fabricate showcasing research issues in advertising research ventures (Malhotra, 2006). Hence, research configuration is basic for the information assortment cycle to keep blunders from showing up. In this exploration, scientists decide to move toward quantitative examination. The primary concern of quantitative examination is to assemble and apply research goals through observational appraisals including the estimation and investigation of numbers (Sekaran and Bougie, 2016).

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Quantitative research focuses on mathematical and constant information and in detail, joined thinking from various thinking (Babbie, 2010). A respectable investigation undertaking starts with the assurance of the subject, issue or zone of revenue, similarly as the perspective (Creswell, 1994; Mason, 1996). Stanage (1987) followed „paradigm“ back to its Greek (paradeigma) and Latin initiations (paradigma) which implies model, model or model. A perspective is the planning of the contemplating an individual; it is a crucial model among models, a model or model to follow as shown by which design moves are made. Unmistakably communicated, a perspective is a movement of submitting to a view (Stanage, 1987). This view is maintained by Denzin and Lincoln (2000, p. 157) who describe an assessment perspective as "a fundamental remittance of religious desires that direct movement", overseeing first principles, „ultimates“ or the researcher“s viewpoints . Therefore, researchers will use quantitative research to gather representatives data from the target population. This is because quantitative research can measure the relationship between the extent to which foodpanda influences consumer behavior to use their services.

3.2 Population

Target population is defined as people in the group who are interested in researchers and prefer analysis to obtain relevant information based on research objectives (Sekaran & Bougir, 2016). The purpose of this study is to examine the extent to which Foodpanda influence, consumer behavior to use their services. , The number of Foodpanda customers in Malaysia are around 8000 to 10000 consumers. Therefore, the target population of this research is Malaysians who have experience using Foodpanda service. Everyone who has experience using Foodpanda service will be taken as respondents and their data will be reviewed.

3.3 Sample Size

Sample size is a significant issue in exploration to gauge amount singular examples are determined or assessments utilized in the study. Test size required decide unmistakably dependent on the specific number of examining outlines. All things considered, specialists have not had the option to distinguish the specific number Foodpanda consumer. The number of Foodpanda customers in Malaysia is increasing every year. In Malaysia alone, there are about 8000 to 10000 consumers of the Foodpanda service. The respondents chose comprised of varying backgrounds who

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

utilized foodpanda administration from the age of 16. Accordingly, the objective of this examination respondents are online clients who use Foodpanda administration from the age of 16 to 39 years. The explanation specialists pick online clients between the ages of 16 and 39 as the objective respondents is on the grounds that the more youthful age is happy to utilize new and focused energy innovation to direct online reviews prior to setting out on an excursion.

The research with sample size that more than 30 and less than 500 are suitable for most of the researchers (Roscoe, 1975). According to Thompson (2004), it is advisable that more than 200 respondents must be sampled in order to obtain stability in factor analysis. Therefore, the researchers select 384 target respondents to perform data collection to maximize the result.

3.4 Data Collection

Primary data as data collected through research studies whose purpose solve specific problems (Malhotra, 2006). Key data can be obtained from the questionnaire activities. Primary data can be collected through surveys and interviews, observations and experiments (Ghauri & Grønhaug, 2005). This is because the questionnaire shared by the researcher to the target respondents based on different demographic characteristics, population and social status. Therefore, the researcher must maintain cooperation between respondents because the authenticity of the date depends on it.

3.5 Sampling Techniques

Sampling is a type of non-probability sampling. Internet research has become increasingly popular due to researchers being able to reach millions of respondents online through the use of opt-in panels. Optin panels are groups of people that are recruited (typically by a marketing or research firm) to participate in studies through the Internet using computermediated survey software (Baker et al., 2013). They are often incentivized in some way for their participation. Most often this comes in the form of points an individual earns for participating in a study.

Over time their points aggregate and they can cash them in for a prize, such as a gift card. Opt-in study participant recruitment is a form of convenience sampling, also known as river sampling (Baker et al., 2013). It is important to immediately recognize that non-probability sampling is not random. People have to be willing to opt-in or sign up to be a part of a pool of individuals that may be contacted when a group needs

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

respondents. Where people from the target people that meet sure practical models, for instance, ease transparency, geographical partition, openness at a given time, or availability to take a premium is joined for research purposes (Dörnyei, Z, 2007). It also insinuates people study subjects that are adequately accessible by researchers (S. K., and Given Lisa M., 2008). So the population of foodpanda has different ages, genders and living standards.
Research Instrument

Research instrument involves questionnaire design, and construct measurement that talks about the instrument that examines the instrument that will be utilized to gauge the viability of online media on buying dynamic. Rowley (2014) claimed that the questionnaire is recognized as the best research tool when a researcher is faced with a huge number of respondents in various locations; for easy analysis of the finding, standardized data from the similar questionnaire, and to request almost straightforward information.

The questionnaire is divided into three parts, Part A, Part B and Part C. Part A for demographic profiles related to personal information such as gender, age, marital status, race, employment status, level of education respondents and income with multiple choice answer options with closed design. In section B, the researchers want to know the factors that influence consumers to use foodpanda service. In Section C, public opinion concerns the measurement of the structure of review some independent variables, such as Foodpanda quality service, Foodpanda price, Foodpanda customer service and Foodpanda delivery time.

3.6 Data Analysis Technique

The data analyzed the data collected using pearson correlations conducted by the researchers to examine the correlation between two variables X and Y (Goodwin & Leench, 2006). Researchers will use pearson correlation to analyze their data since this association can be used when available is a straight association between factors. This examination will achieve the objective thinks about that are the association between the factors affecting the determination of pilgrims travel decisions. Next, this analysis will also achieve this hypothesis study positive linear relationships between variables. Possible research the hypothesis for this statistical model is that there is a positive linear relationship between variables.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

After that, Pearson correlation measures linear direction and level the relationship between the two variables. According to Goodwin (2006), there is no linear relationship between two variables when the number is 0. Value -1.00 or + 1.00 shows a strong correlation between the two variables. However, the problem multicollinearity should not exceed +/- 0.90 (Hair, Bush, & Ortinau, 2006). Various collinearities occur when there are two highly correlated independent variables, which can be detected by testing the correlation matrix between all independent variables in his study. If a multicollinearity problem occurs, one of the variables is independent related to it should be discarded.

3.7 Procedure for Data Analysis

The data analyzed the data collected using Pearson correlations conducted by the researchers to examine the correlation between two variables X and Y (Goodwin & Leench, 2006). Researchers will use Pearson correlation to analyze their data since this association can be used when available is a straight association between factors. This examination will achieve the objective thinks about that are the association between the factors affecting the determination of pilgrims travel decisions. Next, this analysis will also achieve this hypothesis study positive linear relationships between variables. Possible research the hypothesis for this statistical model is that there is a positive linear relationship between variables.

4 DATA ANALYSIS AND FINDINGS

Demographic Profile of Respondents

Firstly, gender. The result of respondent's gender of male is 272 (70.8%) respondents and the gender of female respondent's is 112(29.2%). The total were 384 (100%) of respondent's gender ratio.

Next, race. The result show that majority of the respondents that answered the survey question was Malay, which is 325(75.8%). Followed by 30(7.8%) of Chinese respondents and 24(6.3%) come from Indian respondent while the rest come from other races which is 5(1.3%),

Then, marital status. The result show the largest group of respondents were single, which is 325(57.8%). Followed by 46(12%) of the respondents that were married while 11(2.9%) of the respondents were divorced and 2(0.5%) of respondents were widowed

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Moreover, age. From the questionnaire result, that the majority of the respondent's average age is between 16 to 21 years old that is 74(19.3%) . Followed by 270(70.3%) of respondent those are aged between 22 to 27 years old. There was little number of respondents that aged between 28 to 33 years old, which is only 36(9.4%). The rest 4(1%) were respondent that are aged between 34 to 39 years old.

Besides, level of education. From the questionnaire result, the most of the respondent was from Degree level that is 274(71.4%). Follow by Master graduate which was 35(9.1). 64(16.6%) of the respondent comes from Diploma/Stpm/SPM. Only 11(2.9%) of respondent have a PhD educational level.

Lastly, the income level of the respondents. The most of the respondents earn below RM1000, which is 224(58.3%). Followed by the 79(20.6%) of the respondents earn RM1001 – RM2000. 56(14.6%) and 22(5.7%) of the respondent earn RM2001 to RM3000 and RM3001 to RM 4000 above respectively. The lowest respondents earn RM4001- RM5000, which is 3(0.8%).

Descriptive Analysis

Variables	N	Mean	Srd. Deviation
Service Quality	384	4.5010	.069207
Price	384	4.4135	.78179
Customer Service	384	4.4703	.69894
Time Delivery	384	4.4396	.72255
Consumer Intention	384	4.4641	.73464
Valid N (listwise)	384		

Table 4.1 shows the average mean for all independent variables namely Service Quality, Price, Customer Service, Time Delivery, and Customer Intent. Service Quality recorded the highest mean level of 4.5010. The price recorded the lowest mean of 4.4135. Then, the mean for customer service is 4.4703, and the mean for time delivery is 4.4396. Finally, the mean for consumer intent is 4.4641. Thus, all four of these variables indicate that they obtain a high level score.

Reliability Analysis

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

Variables	Cronbach's Alpha	N
Service Quality	.928	5
Price	.946	5
Customer Service	.943	5
Time Delivery	.935	5
Consumer Intention	.934	

Table 4.2

Based on the results from Table 4.2, Cronbach's Alpha for service quality is 0.928. Also, Cronbach's Alpha for the price is 0.946. Next, Cronbach's Alpha for customer service is 0.943, and Cronbach's Alpha for delivery time is 0.943. Finally, Cronbach's Alpha for consumer intention is 0.934

4.1 Correlation Analysis

Variables	Mean(SD)	Service Quality	Price	Customer Service	Time Delivery	Consumer Intention
Service Quality	4.50(0.69)	1	0.887	0.899	0.899	0.896
Price	4.41(0.78)	0.887	1	0.896	0.889	0.896
Customer Service	4.47(0.69)	0.899	0.896	1	0.916	0.895
Time Delivery	4.44(0.72)	0.889	0.889	0.916	1	0.892
Consumer Intention	4.46(0.73)	0.896	0.896	0.895	0.892	1

*p-Value<0.05 Person correlation analysis applied.

Size of Correlation	Strength of Correlation
0.00-0.25	Little or no correlation
0.26-0.50	Fair correlation
0.51-0.75	Moderate – good correlation
0.76 – 1.00	Very good correlation

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

4.2 Hypothesis

H1. There is a positive perfect significant relationship between service quality and consumer intention ($p < 0.05$, $r = 0.896$)

H2. There is a positive perfect significant relationship between price and consumer intention ($p < 0.05$, $r = 0.896$)

H3. There is a positive perfect significant relationship between customer service and consumer intention ($p < 0.05$, $r = 0.895$)

H4. There is a positive perfect significant relationship between time delivery and consumer intention ($p < 0.05$, $r = 0.892$)

5 Discussion and Recommendation

5.1 Discussion

Hypothesis 1

There is a positive perfect significant relationship between service quality and consumer intention ($p < 0.05$, $r = 0.896$)

There was a positive perfect significant relationship between service quality and user intention ($p < 0.05$, $r = 0.896$). Based on the results of the service quality study has a significant positive relationship with consumer intentions. This relationship is also a perfect relationship. This proves that service quality greatly affects the intention of users to use the Foodpanda service. Therefore, Foodpanda must upgrade their service quality so that their consumers will be satisfied with the service they offer.

Hypothesis 2

There is a positive perfect significant relationship between price and consumer intention ($p < 0.05$, $r = 0.896$)

There was a positive perfect significant relationship between price and consumer intention ($p < 0.05$, $r = 0.896$). Based on these results, it shows that price has a significant positive relationship with consumer intentions. The relationship between price and consumer intent is also a strong relationship. Therefore, Foodpanda should charge appropriate and reasonable prices to consumers. This is because consumers will buy and use food delivery services if the price offered is in accordance with the rate of food ordered and the price must be reasonable.

Hypothesis 3

There is a positive perfect significant relationship between customer service and consumer intention ($p < 0.05$, $r = 0.895$)

There was a positive perfect significant between customer service and consumer intent ($p < 0.05$, $r = 0.895$). Based on the results of the study, there is a significant positive relationship between customer service and user intentions. This relationship is also a perfect relationship. Therefore, this factor greatly affects the intention of consumers to use the Foodpanda service. This is because the better Customerpanda customer service, the higher the customer satisfaction. Therefore, they will be satisfied with Foodpanda customer service.

Hypothesis 4

There is a positive perfect significant relationship between time delivery and consumer intention ($p < 0.05$, $r = 0.892$)

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

There is a positive perfect significant relationship between time delivery and user intention ($p < 0.05$, $r = 0.892$). Based on the results of the study, time delivery has a significant relationship with consumer intentions. That relationship is also a perfect relationship. Therefore, Foodpanda needs to speed up the delivery time of food for customers. Their delivery time must also be consistent and not slow. If it is slow, users will be angry and dissatisfied with the Foodpanda delivery time. Therefore, Foodpanda needs to take this seriously. This is because the delivery time must be exactly as promised. Otherwise, consumers will complain and may switch to another food delivery company.

5.2 Recommendation

As the time and duration of this study are limited, several subject-related hypotheses have emerged explored, but not from a general point of view, to provide a broad picture for the reader. Therefore, if further study is needed, an in-depth review should be conducted to complete the research objectives of this study. Certainly useful and interesting to make case companies as a source of research. Through observing the case company, may provide a difference between what the organization feels strive and what consumers see when they make the intention to buy at Foodpanda on an ongoing basis. These findings will help the company to get a clear view and determine the real thing strategies for dealing with the situation.

The researcher will choose the questionnaire over the interview because it is the most actions recommended for survey. The researcher will then show the guide to the person who has difficulties with questionnaires. This will help reduce uncertainty among people towards the questionnaire.

In addition, future researches can also use interview method when conducting the survey instead of using online questionnaire only. This is because by using the interview method, the researchers can directly ask to the respondents and explain about the question so that the respondents do not misunderstanding and interpreting the questions by themselves. By using interview, it may take time but can give good results 75 than using online questionnaire. This approach can reduce misunderstanding and produce better results of study.

Lastly, in this research, the researchers choose to approach quantitative research. The main points of a quantitative research are to build and employ the research objectives through empirical assessments that involve numeric measurement and analysis. However, future research may take in account for the study by including qualitative study in which the respondents are interviewed or allowed to make comments at the end of the survey or answer some open-ended questions. Future research can conduct longitudinal studies instead of relying on cross-sectional data and should consider collecting additional data to further validate this research model.

6.0 Conclusion

In conclusion, the researcher presents a conceptual framework for research factors that influence the intention of consumer to use the Foodpanda service. The the effects of variables such as Foodpanda quality service, Foodpanda price, Foodpanda customer service, and Foodpanda delivery time are positively linked to factors influencing consumer intention to use Foodpanda service. Additionally, all data is collected through questionnaire. Data were analyzed by SPSS software based on descriptive analysis, Pearson reliability test and correlation analysis. From the result, the relationship between independent variables and dependent variables has been identified. Based on coefficient values, all variables have a positive correlation. Conclude and discuss it inference analysis, descriptive analysis and limitations in the last chapter, as well recommendations have been clarified and future

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

research has been prepared.

ACKNOWLEDGEMENT

I would like to express my deepest gratitude to my supervisor, Mrs. Nadia Hanum binti Amiruddin who has the attitude and nature of genius, she continues and reassured me in terms of the research of this study. Without his guidance and continued help may not be able to complete this study. A part from that, thanks are also due to Puan Raja Rosnah binti Raja Daud who is the examiner for this study. Finally, I would also like to thank Universiti Malaysia Kelantan for giving me the opportunity to complete this research. namely FACTORS THAT INFLUENCES THE CONSUMER INTENTION TO USE FOODPANDA SERVICE AT MALAYSIA. With this, we will be able to know the factors that influence the intention of consumers in using the Foodpanda service in Malaysia. There is nothing more important to me in implementing this project than our family members. I want our loving parents and guidance with us in whatever we pursue. They are the main role models.

STUDY THE LEVEL OF FINANCIAL CRISIS EXPERIENCED BY HAWKERS IN TELUK INTAN PERAK DURING COVID 19

Mohammad Shafiq Bin Mohd Hashim and Nur Ain Ayunni Binti Sabri

Faculty of Entrepreneurship and Business,
Universiti Malaysia Kelantan,
Malaysia

[Email:shafiqhashim58@gmail.com](mailto:shafiqhashim58@gmail.com); ayunni.s@umk.edu.my

Abstract:

The primary objective of this study is to examine the hawkers strategy to sustain the small business during the pandemic among hawkers in Teluk Intan Perak. The data will be collected using the online platform like Google Form to approach and get the number of respondent of business owner in Teluk intan, Perak. For this study, the cross-sectional study will use convenience sampling as 167 data collected in Rembau. This data will be analysis using the Statistical Package for the Science Social (SPSS). This software to show the relationship between independent variables and dependent variables in the method of regression, correlation or factor analyzes. On other hand, it was very convenience and simple way for the researchers to convey the responses from the respondent with the way coded accordingly before being transferred into data file for the subsequent analyze procedures. spearman's correlation Analysis will be used in this study to get the hypothesis. For the final, they can found that all independent were significant with the dependent variable and get the reach the objectives.

Keywords: *Hawkers , Business ,Covid 19*

1 Introduction

In retail the meaning of retail is the mechanism by which manufactured products or services are distributed to consumers by several distribution networks in order to make profit. The supply chain has been used by the retailers to meet demand. The word "retailer" is generally appropriate where a service provider fills in a few orders from a few wholesale, business, or government clientele for several people who are

consumers rather than massive orders. In general, shopping applies to the purchase act. Often the finished items, including supplies such as food and clothes, are obtained; often it is performed as a leisure exercise. Hobby shopping also requires shopping and navigation of windows: it does not necessarily end in shopping. (Retailing Market Research Reports & Retailing Industry Analysis | MarketResearch.com, 2020)

The standard informal street retail industry is available in many countries including Malaysia (Lee, 2008; Ealham, 2008; Sookram & Watson, 2008; Franck, 2011; Rahman, Haque & Khan, 2013, Hassan, 2003). Yukio (2011) notes that street shopping provides a significant number of people in developed countries with work and livelihoods. Recently, in most cities in Malaysia, street retailers or hawks have become an overwhelming occurrence (Hassan, 2003). In Malaysian towns and cities, the growing number of informal street retail operations has also imposed negative disturbances and disrupted traditional businesses (Harian, 2015). The conduct of informal businesses is thus important to grow the firms as

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

progressive business

start-ups and yet other types of formal enterprises are not cannibalised.

In Malaysia, according to the Local Government Act 1976, a "hawker" means A individual who offers merchandise for sale or creates a stall to sell goods to itinerant, static or temporary hawkers. With the increasing number of hawking types, its definition becomes increasingly difficult. Currently, Malaysia classifies hawkers by the types of structures they occupy or where they manage as stalls, (secured), hawker centres, kiosks, night markets (licenced), night markets (unlicensed) and food courts. Travellers (peddlers) are defined as mobile hawkers.(Hassan, 2003).

The Malaysian economy can be improved by entrepreneurship growth and entrepreneurs who are willing to produce innovative goods from home. These new independent retail businesses and small retailers should be recognised and assisted, among other items, in financial support and skill preparation for the nation's informal economy.(Ishak et al., n.d.)

1.1 Significant of Study

This learn about contributes some great value which deliver benefits to several parties which encompass researches and entrepreneurs. Future study is able to follow the steps of previous research in order to find out about new causes and choices in order to provide community with additional very helpful data and knowledge. This find out about gives higher understanding and expose of thinking as well as the determinants of hawker and financial crisis. This research enables hawkers to forecast and design strategies in survive during pandemic outbreak of Covid 19 . The results obtained from this study will help the hawkers industry who still try to survive and have a clear vision to survive during outbreak.

2.0 LITERATURE REVIEW

2.1 Strategies

Strategy is a strategic method for meeting one or more long-term or overall targets under unclear circumstances. The word was used during the Sixth century C.E. in the spirit of the "art of the general" and comprised many sub-sets of abilities, including military strategy, siegecraft, logistics etc. in Eastern Roman vocabulary and only in the 18th century was converted into Western vernacular languages. From then up to the 20th century, the term "strategy" in an armed war in which all enemies engage, denoted "a comprehensive way to try to pursue political ends, including the threat or actual use of force, in a dialectic of wills" Freedman, Lawrence (2013).

Strategy is necessary since there are typically minimal resources available to accomplish targets. In general, this approach involves setting objectives and strategies, determining actions to accomplish goals, and mobilising resources to carry out actions. Freedman, Lawrence (2013) A strategy explains how the aims are accomplished by means of resources. Simeone, Luca (3 July 2020 A strategy may be planned or can emerge as a course of operation, as the company adapts or competes with the environment.

Henry Mintzberg, from McGill University, defined strategy as an example of the decision-making stream, which opposes strategy as planning Henry Mintzberg (May 1978). The strategy's nature is defined by Henrik von Scheel as a single combination of value-added tasks, preferring to conduct activities differently or to carry out activities separate from competitors. Dr. Vladimir Kvint defines strategy as a system of finding, formulating, and developing a doctrine that will ensure long-term success if followed faithfully." Kvint, Vladimir (2009) The theorist of complexity defines strategies as the unfoldment, in a socio-economic sense, of the internal and external aspects of an organisation which results in actions Kvint, Vladimir (2009).

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

The relationship between relationship between the strategies that been apply and the business survival. Strategies have big impact in terms of survival in in the pandemic outbreak.

2.2 Time pressure

Generally, time pressure is defined as subjective perceived time pressure or imposition of deadlines to improve individual and group performance rates to make decision making (Kelly & Karau, 1999). But preliminary studies in psychology have shown that consumers can reduce the adverse effects of time pressure and task complexity for better choices by increasing the speed of processing information (Payne, Bettman, & Johnson, 1988). Time pressure also is one of the most critical external cues affecting consumer decisions (Park, Iyer, & Smith, 1989)

The relationship between the time pressure and the financial crisis during MCO. Time pressure is for the hawkers who have more debt in order to pay during MCO . there is some difficulty to all hawkers to pay because of the pandemic outbreak.

2.3 Technologies

Technology is the sum of the techniques, abilities, strategies and procedures used to manufacture products or services or fulfil goals such as science analysis. Technology may be the understanding of methods, procedures and the like, or it can be incorporated in computers that run without comprehensive operational knowledge.

Systems (for instance machines) use technology by input, adjust it according to the system's operation and then generate a result called technology systems or technical systems.

The simplest type of technology is the creation and use of fundamental instruments. The prehistoric discovery of how to manipulate fire and the later Neolithic Revolution expanded the supplies of food available, and the advent of the wheel helped people travel and control their climate. Historical advances, including the printing press, telephone and the Internet have lowered the barriers to physical contact, allowing people to communicate openly internationally.

Technology has many consequences. It led to creating more mature economies (including the global economy today) and enabled a leisure class to grow. Many technological processes create harmful by-products called waste to the detriment of the Earth's atmosphere and deplete natural capital. Innovations have often shaped society's ideals and posed new problems of scientific ethics. Examples include the raise of the notion of human production performance and the problems of bioethics.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

There is a relationship between the strategies that been apply and the business survival. During pandemic not all hawkers know about the technologies so the some of them close their business during pandemic outbreak because MCO.

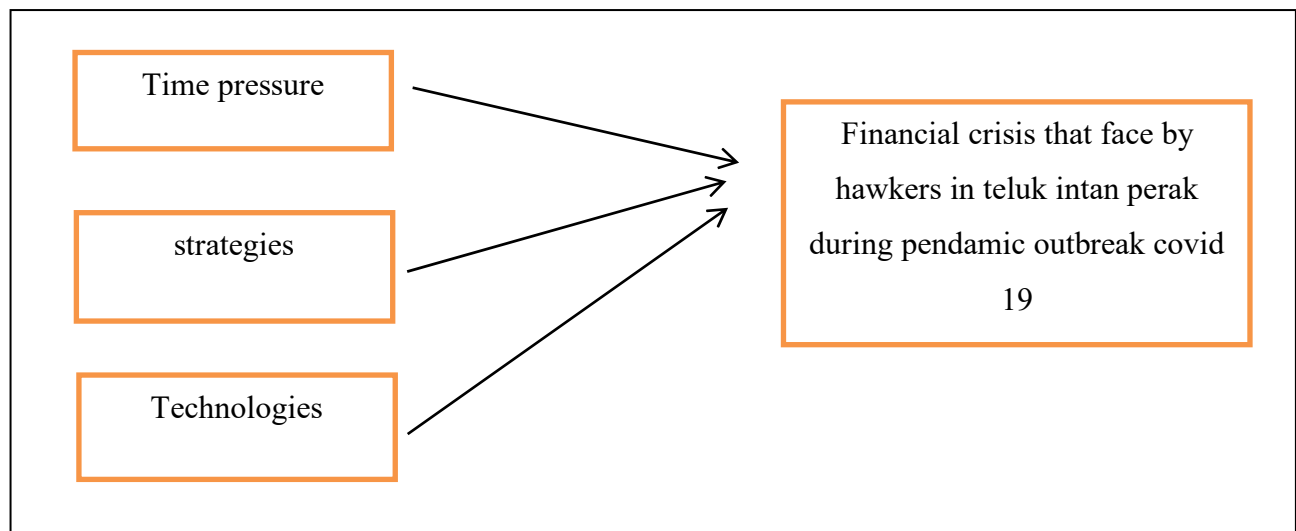

2.4 Research Hypothesis

H1 : There is a significant relationship between technologies and financial crisis that been occur to hawkers .

H2 : There is a significant relationship between the time pressure and the financial crisis during MCO

H3: There is a significant relationship between the strategies that been apply and the business survival

2.5 Conceptual Framework

3 RESEARCH METHODOLOGY

Research methodology is used to collect and analyse data that were used for answering the research questions in a more systematic and organized way. This chapter consist of the research design, data collection method, population of research, sample size, unit of sampling, research instrument and data analysis. Furthermore, the objective of this chapter is to ensure appropriate research procedures are followed to have better understanding and evaluating the outcome of the research.

3.1 Data Collection Method

Primary data will be used through questionnaire. The primary data will be collected directly from questionnaire. The data collected will become the main sources for this research.

Primary Data

Primary data sources are an original data, which the data are collected first hand by the researcher for a research. The researcher had used questionnaire to collect data from primary data sources. The primary data collected have become the main sources for this research.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

3.2 Study Population

Target population is the main step of the sampling design. Target population is very important as it was the complete group of objects or elements relevant to the study (Hair, 2015). In this study, the population of this research study was hawkers around Teluk Intan. There are 334 hawkers at around Teluk Intan (Majlis penbandaran Teluk Intan) the hawkers that receive one-off assistance of sellers & small traders in Teluk Intan municipal council area and based on self-observation there are 202 hawkers that work at night market. So the total is 536 hawkers. The purpose of this study is to examine factors that financial crisis experienced by them. The questionnaire for this study will be distributed on hawkers at around Teluk Intan.

3.3 Sample Size

A sample in the context of science research and statistics is a representative subset of a population. According to Sekaran and Bougie (2016), the application of sample size to help researchers to obtain more reliable results. In this study, researchers used the equation of Krejcie and Morgan (1970) to determine the sample size.

Thus, 270 respondents have been selected as sample size for this study based on Krejcie and Morgan equation.

Beside the researchers also refer to the size table by Krejcie et al. (1970) for finite population. Krejcie et al. (1970) sample size is shown as table 3.0 below. In this study, population is 536 hawkers which required 270 students as sample size for this study.

3.4 Sampling Techniques

In a sampling method, sampling is a process where a researcher chooses their sample accordingly and sampling is something that is not too straightforward just like what it looks. There is a set of processes to help the researcher to choose a good sample into their study (Boyd, 2019). There are two types of sampling in business research. Which are non-probability and probability sampling techniques (Sekaran & Bougie, 2016).

This study used convenient sampling that the respondents chose based on their availability and this method could save the time and cost of researchers in collecting the data. The convenience sampling technique enable the researchers to choose any of these preferable respondents who are available instead of selecting from the population (Hair, 2015). Therefore, the non-probability sampling method is chosen as the sampling technique where the sampling framework is difficult to determine in this study.

3.5 Research Instrument

The research instrument is the process by which the data is gathered. The method used in this analysis is asking questionnaire. Based on Sekaran and Bougie (2016), note that the questionnaire is a series of questions that must be answered by the respondents to interpret the response. The best method is designed to compile vast quantities of quantitative data in several places. Besides that, the question set out in the questionnaire should be easy to understand even without the researcher's guidance the respondents will answer the question.

3.6 Pilot Test

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

A pilot test was conducted to determine the reliability and validity of the items in the questionnaire before the final questionnaire being distributed in the actual study.

3.7 Questionnaire Method

The questionnaire was designed with the study questions and variables in mind. The close-ended style with bilingual English and Malay script would be included in the questionnaire which used in this study. According to Kumar et al. (2013), adding the closing questions in the study will minimize respondents' time and energy when reacting to the questions.

The purpose of this study is to study the level of financial crisis experienced by the hawkers at Teluk Intan. The design of questionnaire was divided into 3 section which section A, B and C respectively. The questionnaire consisted of 39 questions which section A consisted of 9 question on demographics information, section B consisted of 6 questions on dependent variable which Hawkers in Teluk Intan Perak

and while section c consisted of a total of 24 questions on independent variable which is Strategies, technologies and time pressure

3.8 Measurement Of The Variables

Demographic

In part A, researcher used nominal scale to obtain information about demographic profile. Nominal scale is using to identify the general information of respondent like age, race and online business experiences.

In IV section the interval scale is used to measure data about the statements. All independent used interval scale to determine how strongly and not strongly the respondent agree about the statements given. The scale is based on strongly disagree, disagree, neutral, agree and strongly agree.

The respondents will answer questions based on a scale that helps the respondents to convey how much they agree with the argument or disagree with it. According to Kumar et al. (2013), the Likert scale has been described as the most common

non-comparative scaling technique usually used in the study. The respondent suggests a degree of consensus or inconsistency with each of the statements set. Besides, the Likert scale also makes it simpler to build and implement to make it harder for the respondents to answer the questions since the response is already given and the respondents merely have to express their opinion using the scale.

4 DATA ANALYSIS

Data analysis has been conducted after data collection from the target respondents. Kumar et al. (2013) stated that analysis data is the process which turn the raw data into useful information for a study. The research analyzed the data collected from questionnaire by using Statistical Package for the Social Science (SPSS) in this study. SPSS is a programming language for conducting statistical analysis which to test and interpret the results at the end of the research. Accordingly, this research applied pilot

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

test, descriptive analysis, reliability analysis and Pearson correlation analysis to the collected data. Details of each analysis were explained as below.

According to Hair (2015), the word reliability is related with the extent of consistency to which the research findings regarding the form of questions. The reliability analysis is used to indicate the extent to which the items measured are stable and has a consistent measurement of variables. The Cronbach's Alpha Coefficient is a test for reliability that measures the internal consistency of the instruments. Hair (2015) had discussed about the strength of association regarding to the Cronbach's Alpha value. If the Cronbach's Alpha is 0.6 and above is consider as acceptable. Based on Table 3.2 had clearly showed the strength of association regarding the Cronbach's alpha coefficient size.

4.1 Descriptive Analysis

Descriptive study is importance to explain the basic feature in the study and it helps the researches to summary the data or measure in the sample. Descriptive analysis is a fundamental component of this process which helps to identify research questions and generating hypotheses based on what has been observed (Loeb et al., 2017).

Descriptive analysis enables researchers to understand and interpret data using simple summaries about the sample and the measures. Descriptive statistics helps to describe, show or summarize the responses obtained into significant data.

Researchers will be collected data about demographic information in section A, dependent variables which is financial crisis among the hawkers in section B and independent variable include each element of determination such as price, time pressure, lifestyle and health conscious in section C. Descriptive statistics was useful for this study as to describe and analyze the frequency and central tendency of the items measured.

4.2 Inferential Analysis

According to Zikmund, Carr, and Griffin (2013), inferential analysis is defined as the inferences made or generalization from samples to an entire population. Pearson Correlation Coefficient Analysis is being used on this study.

4.3 Pearson Correlation Coefficient Analysis

The Pearson correlation analysis is a technique for clarity the relationship between the variables in this study. Pearson Correlation Coefficient Analysis to test and measure the association between independent variables and dependent variables. The correlation analysis helps research This analysis is appropriate to achieve the research objectives which to investigate the Study the level of financial crisis experienced by Hawkers in Teluk Intan Perak during Covid 19.

Pearson's correlation coefficient used for measuring the strengths of linear relationship between paired data. It is represented by r and design in the range of $-1 \leq r \leq 1$. Hence, the value of r is 0 refers as no correlation relationship among variables. (Hair, 2015)

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

4.4 Findings

4.4.1 DEMOGRAPHIC

Frequency		Percent	Valid Percent	Cumulative Percent
Valid	Lelaki	169	62.4	62.4
	Perempuan	102	37.6	100.0
Total		271	100.0	100.0

From 271 respondent 169 (62.4 %) was male and 102 (37.6%) was female respondents were involved in answering this questionnaire. Majority respondent are male and it can be conclude that the population of male who has business is more than female.

AGE

4.4.2 AgeUmur

Frequency		Percent	Valid Percent	Cumulative Percent
Valid	18 – 25 years / 18 – 25 tahun	34	12.5	12.5
	26 – 34 years / 26 – 34 tahun	58	21.4	33.9
	35 – 40 years / 35 – 40 tahun	47	17.3	51.3
	41- 49 years / 41- 49 tahun	59	21.8	73.1
	Over 50 years / Lebih 50 tahun	73	26.9	100.0
Total		271	100.0	100.0

Based on table 4.1.2, out from 271 respondent, 34 (12.5 %) was 18-25 years old , 58 (21.4%) was 26-34 years old , 47 (17.3%) was 35 -40 years old , 59 (21.8 %) was 41-49 years old and last 73 (26.9) was respondent over 50 years old. So we can see that most of the hawkers was over 50 years old.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

4.4.3 MARTIAL STATUS

Frequency			Percent	Valid Percent	Cumulative Percent
Valid	Divorced / Bercerai	3	1.1	1.1	1.1
	Married/ Berkahwin	163	60.1	60.1	61.3
	Single / Bujang	105	38.7	38.7	100.0
	Total	271	100.0	100.0	

Based on the pie chart above, from 271 respondent 3(1.1%) was divorced , 163(60.1%) was married and 105(38.7%) was single. So the conclusion is most of the hawkers at Teluk Intan is married.

4.4.4 RACE

Frequency			Percent	Valid Percent	Cumulative Percent
Valid	Chinese /Cina	74	27.3	27.3	27.3
	India/ India	31	11.4	11.4	38.7
	Malay /Melayu	166	61.3	61.3	100.0
	Total	271	100.0	100.0	

Based on pie chart 4.1.4 from 271 respondent 74 (27.3%) was Chinese , 31 (11.4%) was Indian and 166 (61.3%) was Malay. So most of the hawker at Teluk Intan is Malay.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

4.4.5 RELIGION

Frequency			Percent	Valid Percent	Cumulative Percent
Valid	Buddha	50	18.5	18.5	18.5
	Christian	49	18.1	18.1	36.5
	Hindu	5	1.8	1.8	38.4
	Islam	167	61.6	61.6	100.0
	Total	271	100.0	100.0	

Based of pie chart above, form 271 respondent , 50 (18.5%) was Buddha , 49 (18.1%) was Christian , 5 (1.8%)was Hindu and 167 (61.6 %) was Islam . so most of the respondent was Islam

4.4.6 TYPE OF EMPLOYMENT

Frequency			Percent	Valid Percent	Cumulative Percent
Valid	Bekerja Sendiri / Self-employed	236	87.1	87.1	87.1
	Kerajaan / Government	28	10.3	10.3	97.4
	Swasta / private	7	2.6	2.6	100.0
	Total	271	100.0	100.0	

Based of pie chart above, form 271 respondent, 236 (87.1%) was self employed , 28 (10.3%) was work for Government and 7 (2.6%) was work for private. So most of the hawkers is self employed

4.4.7 MONTHLY INCOME

Frequency			Percent	Valid Percent	Cumulative Percent
Valid	RM 2 001 – RM 4000	93	34.3	34.3	34.3

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

RM 2,000 and below / RM 2,000 dan ke bawah	81	29.9	29.9	64.2
RM 4 001 – RM 6 000	48	17.7	17.7	81.9
RM 6 001 – RM 8 000	47	17.3	17.3	99.3
RM 8 001 and above / RM 8 001 dan ke atas	2	.7	.7	100.0
Total	271	100.0	100.0	

Based of pie chart above, form 271 respondent 81 (29.3%) have an income below RM 2000, 93 (34.3%) have income RM 2001 - RM 4000 , 48 (17.7%) have an income RM 4001 - RM 6000 , 47 (17.3) have an income RM 6001 - RM 8000 and 2 (0.7%) have income RM 8000 and above. So most of the respondent is having income form RM 2001 - RM4000.

4.4.8 Spearman Correlation Analysis

Spearman's correlation coefficient is a mathematical indicator of the strength of a monotonous relationship between paired data. In the sample, the configuration is constrained as follows and its meaning is identical to that of Pearsons, e.g. the closer the greater the monotonous relationship. Correlation is the scale of the effect, so we can orally explain the intensity of the effect.

Table 4.2.1 Relationship between the time pressure and the financial crisis during MCO

Correlations

DV		IV1		
Spearman's rho	DV	Correlation Coefficient	1.000	.572**
		Sig. (2-tailed)	.	.000
		N	271	271
IV1	IV1	Correlation Coefficient	.572**	1.000
		Sig. (2-tailed)	.000	.
		N	271	271

** . Correlation is significant at the 0.01 level (2-tailed).

H 1 There is a significant relationship between the time pressure and the financial crisis during MCO

This table shown the relationship between the time pressure and the financial crisis during MCO with a correlation 0.572. This implies that the relationship between the time pressure is positive and moderate the financial crisis during MCO toward the Hawkers. The P value of time

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

pressure is 0.000 which is less than the highly significant level of 0.01. this can be seen through the 58.2% dependent variable(financial crisis) influenced by the independent variable (time pressure). therefore There is a significant relationship between the time pressure and the financial crisis during MCO

Table 4.2.2 relationship between the strategies that been apply and the business survival

Correlations

			DV	IV2
Spearman's rho	DV	Correlation Coefficient	1.000	.530**
		Sig. (2-tailed)	.	.000
N			271	271
	IV2	Correlation Coefficient	.530**	1.000
		Sig. (2-tailed)	.000	.
N			271	271

** . Correlation is significant at the 0.01 level (2-tailed).

H 2 There is a significant relationship between the strategies that been apply and the business survival . This table shown the relationship between the strategies and the financial crisis during MCO with a correlation 0.530. This implies that the relationship between the strategies is positive and moderate the financial crisis during MCO toward the Hawkers. The P value of time pressure is 0.000 which is less than the highly significant level of 0.01. this can be seen through the 53.0% dependent variable(financial crisis) influenced by the independent variable (strategies). therefore There is a significant relationship between the strategies that been apply and the business survival

Table 4.2.2 relationship between technologies and financial crisis that been occur to hawkers .

Correlations

DV			IV3	
Spearman's rho	DV	Correlation Coefficient	1.000	.524**
		Sig. (2-tailed)	.	.000
N			271	271
	IV3	Correlation Coefficient	.524**	1.000

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

	Sig. (2-tailed)	.000	.
	N	271	271

** . Correlation is significant at the 0.01 level (2-tailed).

H 3 There is a significant relationship between technologies and financial crisis that been occur to hawkers .

This table shown the relationship between the technologies and the financial crisis during MCO with a correlation 0.524. This implies that the relationship between the technologies is positive and moderate the financial crisis during MCO toward the Hawkers. The P value of time pressure is 0.000 which is less than the highly significant level of 0.01. this can be seen through the 52.4% dependent variable(financial crisis) influenced by the independent variable (technologies). therefore There is a significant relationship between technologies and financial crisis that been occur to hawkers .

5 CONCLUSION

5.1 Time Pressure

The relationship between the time pressure and the financial crisis during MCO with a correlation 0.572. This implies that the relationship between the time pressure is positive and moderate the financial crisis during MCO toward the Hawkers. The P value of time pressure is 0.000 which is less than the highly significant level of 0.01. this can be seen through the 58.2% dependent variable(financial crisis) influenced by the independent variable (time pressure). therefore There is a significant relationship between the time pressure and the financial crisis during MCO

5.2 Strategies

the relationship between the strategies and the financial crisis during MCO with a correlation 0.530. This implies that the relationship between the strategies is positive and moderate the financial crisis during MCO toward the Hawkers. The P value of time pressure is 0.000 which is less than the highly significant level of 0.01. this can be seen through the 53.0% dependent variable(financial crisis) influenced by the independent variable (strategies). therefore There is a significant relationship between the strategies that been apply and the business survival

5.3 Technologies

The relationship between the technologies and the financial crisis during MCO with a correlation 0.524. This implies that the relationship between the technologies is positive and moderate the financial crisis during MCO toward the Hawkers. The P value of time pressure is 0.000 which is less than the highly significant level of 0.01. This can be seen through the 52.4% dependent variable (financial crisis) influenced by the independent variable (technologies). Therefore, there is a significant relationship between technologies and financial crisis that has occurred to hawkers.

5.4 Recommendation

Research on the degree of financial crisis faced by Hawkers in Teluk Intan Perak during Covid 19. Based on the outcome, few recommendations are suggested for tourists to revisit the region. From this analysis, researchers find that business tactics are very important for the maintenance of business, but two other factors, time pressure and technology, are also important for the maintenance of business. During this crisis, most companies are facing worries about their businesses, which may see a decrease in profits. The idea is that owners should do business online to help their business like hawkers; they should develop their business like distributing or enter the online distribution business like grab food, food panda and jommakan. More variables must be included in future research to make the results more reliable.

5.5 Limitations

Limitations have an important role to play for prospective researchers. This is because of limitations will encourage prospective researchers to develop and increase the consistency of their study. First limitation of this analysis is the restricted findings of quantitative studies. Quantitative analysis involving a standardized questionnaire with closed questions has been used in this study and findings have been reduced. The researcher applied the five-point Likert scale (strongly unhappy, dissatisfied, neutral, accepted and strongly agreed) in the sample and the respondents had restricted choices of response depending on the researcher's collection. Respondents who have confused themselves with the questions can implicitly provide more neutral answers and make the result wrong. Second disadvantage of this analysis is a particular viewpoint for the respondent. This is because each of the target respondents comes from diverse origins, age, ethnicity, income level, profession, faith, status, community and lifestyle. These elements would influence the opinion of the respondents at the conclusion of the questionnaire study.

5.6 Conclusion

Today, small business has grown faster from time to time. It could be the first sector in the hawkers industry. All hypotheses have been supported and accepted. From the finding, the financial is the most hawkers' strategy to sustain the hawkers' business among the hawkers in Teluk Intan Perak. With a stable financial presence in a small business, the business can continue to grow over time. In addition, small enterprises should continue to follow the latest trends in order to improve their business.

FACTORS THAT INFLUENCING CUSTOMER ACCEPTANCE TO SELF-SERVICE TECHNOLOGY AT MCDONALD'S IN WAKAF CHE YEH, KELANTAN

Mohammad Shahrul Aidil Bin Maktar and Norfazlirda Binti Hairani

Faculty of Entrepreneurship and Business,
University Malaysia Kelantan
Malaysia

Email: aidilmaktar97@gmail.com; fazlirda.h@umk.edu.my

Abstract:

This study examines the factors that influence customer acceptance of self-service technology at McDonald's in Wakaf Che Yeh, Kelantan. The objective of this study is to identify the relationship between the three variables namely performance expectations, perceived uses and functionality of customer acceptance on the use of this self-service technology at McDonald's. Dependent of this study is self-service technology. This study uses a very simple sampling method such as collecting 373 data of respondents in Wakaf Che Yeh. This study found that all independent variables were significant against the dependent variables and achieved the objectives.

Keywords: Performance Expectancy, Perceived Usefulness, Functionality, Self-service technology

1 INTRODUCTION

The idea of establishing McDonald's as a fast food company began in the United States, which was established in 1940. The idea of establishing this restaurant was from McDonald's founders Richard and Maurice McDonald, and the first McDonald's settlement was opened in San Bernardino, California, USA. McDonald's as we know it is the largest fast food restaurant brand in the world according to the high income achieved and the many branches available all over the world. At the beginning of the establishment of McDonald's in Malaysia in 1982 until now is still firmly one of the best fast food restaurants in the world. In Malaysia it has been established for 39 years as a Malaysian company. McDonald's in Malaysia has expanded their branches to every state in Malaysia including Kelantan. The McDonalds Wakaf Che Yeh branch was opened in 2009 and they have been based in Kelantan for almost 11 years. The move to use self-service technology (SST) into the services sector, especially the restaurant industry has had a huge impact on customers, employees, and management, especially given the huge impact felt by the company itself. McDonald's is one of the restaurant industries that uses this self-service technology but not in all branches provided including McDonald's in Wakaf Che Yeh, Kelantan. This technology was developed based on a literature review showing the factors that influence customer acceptance. The results of the study show that the influencing factors regarding SST have a direct and indirect effect through the influence on customer acceptance.

1.1 SIGNIFICANT OF STUDY

Researchers

To future researchers who want to dig deeper information and gain more knowledge about customer acceptance of self-service technology at McDonald's Wakaf Che Yeh, Kelantan. Through this research, researchers focus on the importance of factors on customer acceptance of self-service technology, namely performance expectations, perceived uses and functions of self-service technology. These are the factors that play an important role in influencing customer acceptance. Through this research they will know that all the factors mentioned are very important to attract customers using self-service technology.

Retail Industry

Through the implementation of this research, it can benefit the retail industry to make a lot of profit to any company that wants to increase their retail income. Not only makes it possible to reach saturated customers, but it can also increase revenue and customer satisfaction as well. Using technology like this in strategic place to place orders can attract more customers and build a bigger brand identity and be known by more customers. This study is also an important factor for every retailer to understand customer buying behaviour and the factors that influence customer acceptance by using self-service counters more accurately and well.

Retailing Student

This study can also help especially students in the retail field to understand the important factors that will influence the purchasing decision by using this self-service counter technology. As retail course students, we can determine the importance of benefits using self-service counters that can attract more customers to purchase products. The use of this technology can be key to generating increased revenue, increasing brand loyalty, increasing customer loyalty, and increasing employee loyalty. This technology will be the method that causes many retailers to use it and is very effective in accelerating the growth of any grocery store.

2 LITERATURE REVIEW

Self-service Technology

Self-service technology is a simple and fast technology to attract customers and consumers, especially in the restaurant industry according to (Hanks, Line, & Mattila, 2016). Self-service technology (SST) is one of the best forms and innovations of technology and facilitates customers to use services that are independent and more comfortable than direct service employee involvement (Blut, Wang, & Schoefer, 2016). The implementation of self-service technology (SST) allows customers to provide their own services through interaction with electronic or machine services instead of using the services of such business employees. Among the examples of self-service technology that we always use without realizing it is one of the SST is self-service laundry, airport kiosk tickets, online banking and hotel websites to make reservations in advance before traveling.

Performance Expectancy

Performance expectations can be described as the extent to which users' expectations of the use of the system will help them achieve work and service performance. Thus, performance expectations can be understood when users are more likely to use technology if they believe that the technology can help and improve their work performance and facilitate their work. In another study it was written that performance expectations are individuals' perceptions of system use will improve their work performance. All studies only mention the relationship between performance expectations and consumer acceptance of the technology used.

Perceived Usefulness

Perceived use means action that needs to be taken to capitalize on the technology and complexity of the service delivery process (Hong & Slevitch, 2018). In fast food restaurant vending machines, some researchers reported a positive effect on perceived consumption. That is, if users navigate the interface without problems or a lot of effort, they will be more satisfied with the use of technology as quoted by (Hong & Slevitch, 2018). Perceived usability determines every perceived ability and expertise of the perceived customers that enables them to use self-service technology efficiently in fast food restaurants and facilitate their every action (Li & Huang, 2019). The use that customers feel is related to what they can do on their own. When consumers want to use self-service technology, they must have the skills and confidence needed to complete tasks in technology systems (Li & Huang, 2019).

Functionality

Functionality can be defined as processes or movements that occur according to customer requests, and include accessibility, response, customization, ease of use and excellent SST services initially (Gures et al., 2018). Using SST allows users to perform and provide their own services without direct assistance from employees, and this allows customers to enjoy efficient and customized services (Ujang et al., 2016). The function of technology has the potential to have a positive impact on the customer experience of facing waiting times to place shorter orders, queue for short queues, and greater customer control (Hanks et al., 2016). The drive to use self-service technology (SST) has been mentioned by (Considine & Cormican, 2016) as an important element in controlling costs and improving the customer experience. The quality of SST services can be assessed by examining through various dimensions including functions. Self-service customers should often take into account environmental and social influences when completing transactions other than employee engagement, which can directly influence the attractiveness of this channel's choice (Collier et al., 2015).

2.1 RESEARCH HYPOTHESIS

In this study, there are three hypotheses about the significance between the two variables namely performance expectations, perceived usability, functionality and customer acceptance of this service technology.

H1: There was a significant study on the relationship between performance expectations and customer acceptance of self-service technology at McDonald's.

H2: There was a point in a significant study of the relationship between perceived usability

and customer acceptance of self-service technology at McDonald's.

H3: There were several statements in the study that are significant on the relationship between functionality and customer acceptance of self-service technology at McDonald's.

2.2 CONCEPTUAL FRAMEWORK

The research framework was conducted to analyse the relationship between independent variables consisting of performance expectations, perceived uses and functions. While customer acceptance of self-service technology is a dependent variable.

Figure 2: The Self-Service Technology

3 METHODOLOGY

Research Design

Research design is a concept that shows the structure in planning a study that provides a specification of procedures that should be used by each researcher who conducts their research in an effort to obtain each piece of information in detail and test the hypotheses formulated from the study. Research design is basically divided into several types for example qualitative and quantitative research used by each researcher to obtain research information and data. In this study apply descriptive research to examine each example of customer representation to regulate independent variables such as performance expectations, perceived use, functions that influence customer acceptance of the use of self-service technology. The data collected using the techniques that will be used by most researchers is quantitative. According to (Bernard, 2017) the data collected by the researcher is quantitative based on methods such as direct observation, questionnaire, and pile type. The function of the use of quantitative data is to inform and understand procedures and understandings in a way that cannot be duplicated by the only approach.

Data Collection

The first phase of the method used in the information collection process includes library research. A study library is a library that contains a complete collection of content on one or more topics such as reading journals, articles and so on. In general, through library research we

will be able to understand in more detail to do research because it includes primary and secondary sources and easy to understand. A research library can be a reference library that does not lend ownership, or a loan library that lends ownership to all or part of it (Mohd Ikhwan Aziz ,2016).

The second method used in the implementation of this research is the questionnaire method. This method is one of the most popular information gathering methods and many researchers use this method. It is a questionnaire concept used by every researcher (Mohd Ikhwan Aziz ,2016). Questionnaires will be distributed to customers and residents in the Wakaf Che Yeh area who are experienced in using self-service technology and buying products at McDonalds Wakaf Che Yeh. This is also known as the process of completing this study. This respondent will answer the questionnaire which is to answer all the questions in the questionnaire where the researcher will give the form online or offline as a questionnaire form to participants who are residents of Wakaf Che Yeh or customers who have purchased products at McDonalds Wakaf Che Yeh.

Sampling

Sampling method is defined as the process of population sampling. This is meant as a process of selecting a group of participants in a smaller scope to tell the researcher what the larger population can know if the researcher asks the same question to each member of the larger population (Adwok J ,2015) Simple random sampling is defined as the type of probability sampling in which numbers are given to units that compile populations. A set of random numbers will be generated and units with this number will be included in the sample (Adwok J ,2015). Due to the large customer population and Wakaf Che Yeh population which are around 10290 populations, the use of this method makes it easy for me to select a sample and distribute the questionnaire form to the respondents who will be targeted smoothly.

Data Analysis

Data collected from respondents in this research will use Statistical Package for Social Science (SPSS). The function of using the SPSS method is to process the received data and extract the results in statistical data. Data will be received to answer all questions about the objectives studied in this study. Part A is mostly about the profile of the respondents, which is the demographics related to the personal information of each respondent who answered the questionnaire. Section B is about questions designed to measure respondents' experience using SST and all questions are measured through 5 interval scales. Part C it measures the independent variables that influence the acceptance of the use of this self-service technology. The last part, part D, is about the dependent variables in the study. Data collection from this section is mainly for the use of variables based on the actual use of SST.

4 FINDINGS

Demographic

The profiles of the respondents are explained in Table 1 of 373 respondents which is 265 males and 108 females. The majority of them are in the age category of 24 - 28 years as many as 208 with 55.8%. Then, the Malays have leaded the highest amount with 72.4% (n = 270). The majority of respondents had a bachelor's degree with 47.7% (n = 178). From the occupation,

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

respondents from the private sector became the highest respondents with 40.2% (n = 150). The highest income level with 39.7% (n = 148) is the respondents who have income level from RM 1, 201 to RM 2, 500. The last part is marital status. According to the number of respondents through age stated most respondents are single with 49.6% and 48.8% of respondents are married and included the others with 1.6% (n = 6).

Table 1: Demographic profile

Characteristics	Items	Frequent	%
Gender	Male	265	71.0
	Female	108	29.0
Age	<18 years old	10	2.7
	19-23 years old	37	19.6

Others		6	1.6

4.1 ANALYSIS RELIABILITY

Reliability analysis was conducted for a total of 373 respondents to determine the consistency of independent variables such as performance expectations, perceived uses and functions as well as dependent variables that are customer acceptance of self-service technology. Scale and subscale reliability analysis shows that various measurements have good internal consistency as expressed by alpha coefficient values. As shown in the table below, the Cronbach's Alpha values of all dimensions and dependent variables are greater than 0.7.

Reliability test

Variables	N o. of ite m s	No. of items deleted	Cro nba ch' s Alp ha
Perform ance expectan cy	5	None	0.9 09
Perceive d usefulne ss	5	None	0.8 65
Function ality	5	None	0.8 99
Custome r acceptance towards self-service technology	5	None	0.9 01

4.2 DESCRIPTIVE STATISTIC

The table below shows descriptive statistics for the two variables namely performance expectations, perceived usability, functionality and customer acceptance of self-service technology which includes mean values and standard deviations.

Descriptive Statistics of Performance Expectancy

Questions	N	Mean	Standard deviation
-----------	---	------	--------------------

It is easier for me to use self-service technology at McDonald's			
I'm prefer to use self- service technology provided at McDonald's

4.5 PEARSON'S CORRELATION

Pearson's correlation is implemented to study the relationship between two variables namely independent variable and dependent variable. To test the relationship of each variable, the mediator in this study is considered as a dependent variable. Correlation coefficients will be used in statistics to measure how strong the relationship between the two variables is.

Performance Expectancy

H1: There are a significant on relationship between the performance expectancy and customer's acceptance towards self-service technology at McDonald's.

		Customer's acceptance
Performance Expectancy	Pearson's Correlation	0.681
	Sig. (2 tailed)	0.000
	N	373

Perceived Usefulness

H2: There are a significant study on relationship between the perceived usefulness and customer's acceptance towards self-service technology at McDonald's.

H3: There are a significant study on relationship between the functionality and customer's acceptance towards self-service technology at McDonald's.

		Customer's acceptance
Functionality	Pearson's Correlation	0.697
	Sig. (2 tailed)	0.000
N		373

5 DISCUSSION

RO1: To examine the relationship between performance expectations and customer acceptance of self-service technology at McDonald's

RQ1: What is the relationship between performance expectations and customer acceptance of MacDonal'd's self-service technology?

Based on the research that has been done, the results of the research show that the positive relationship between performance expectations and customer acceptance of self-service technology at McDonald's. The research shows the results of the correlation coefficient that the value of r is 0.681 and the value of p is significant which is 0.000 at $p = 0.000 < 0.001$. The result shows that the significance is strong because the value is less than the alpha route 0.5 between the two variables namely performance expectations and customer acceptance of self-service technology. This indicates that customer acceptance of self-service technology emphasizes performance expectations on the self-service technology provided. Expected performance of self-service technology is important to ensure that the machines found by users are realized by them.

According to the results in the article (Haeng-Nam Sung et al., 2015) it shows the result of a positive relationship between performance expectations and Mobile Learning Services. Moreover, this article tends to explain the relationship of performance expectations to the use of mobile learning systems. Next, referring to the article (Min et al., 2008; Jambulingam, 2013) it also shows positive results on the relationship between performance expectations and behavioral acceptance of the technology used. The article expresses strong support for the results obtained from this research

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

RO2: To identify the relationship between perceived uses and customer acceptance of self- service technology at McDonald's

RQ2: What is the relationship between perceived usefulness and customer acceptance towards self-service technology at McDonald's?

Based on the research that has been done in this study, it shows the results of a positive relationship between perceived use and customer acceptance of self-service technology. The results in this research show the correlation coefficient that the value of r is 0.692 and the value of p is significant which is 0.000 at $p = 0.000 < 0.001$. Its value shows a strong significance because the value is less than the alpha route 0.5 between perceived uses and customer acceptance of self- service technology. This shows that customers' acceptance of self-service technology at McDonald's is also concerned with the perceived usefulness of self-service technology. The perceived use of self-service technology can be attributed to saving customers time in service or process in serving food at McDonald's.

Based on the results in this research, researchers have confirmed that the results of previous studies have stated about the number of studies agreed and felt to be among the factors that influence positive acceptance as quoted from (Hong & Slevith, 2018). Furthermore, (Hong & Slevith, 2018) have explained that some researchers report a positive influence on perceived uses. Then, referring to the article from (Li & Huang, 2019) it shows a significant positive relationship between perceived use and acceptance of the use of self-service technology. Most of the journals read and researched have supported the results of this research.

RO3: To find the relationship between functionality and customer acceptance of self-service technology at McDonald's

RQ3: What is the relationship between functionality and customer acceptance towards self- service technology at McDonald's?

Referring to the research that has been done, the results show a positive relationship between functionality and customer acceptance of self-service technology. In the results of this study shows the correlation coefficient that the value of r is 0.697 and the value of p is significant which is 0.000 at $p = 0.000 < 0.001$. The results show a strong significance because the value is less than route 0.5 between the two variables namely the function and customer acceptance of self- service technology. This shows that the customer's acceptance of self-service technology at McDonald's is very much a function of good self-service technology. Among the functions of self- service technology are accessibility, response and adaptation. The function of self-service technology is also to ensure that customer requests are expressed and functioning properly without any errors.

According to an article from (Hanks et al., 2016) tells that the function of technology has the potential to have a positive impact on every aspect especially is the customer experience through shorter waiting times, shorter lines, and greater customer control to place their food orders. In addition, there are other journals that give full support to the results of this research as can be referenced in the article (Blu et al., 2016) it proposes a positive relationship between the perceived technology and its use. This means that the journals support all the factors listed as a positive result in customer acceptance.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

6 RECOMMENDATION

From the study, based on the discussions and findings available on this technology, it should be made in every McDonald's branch because it not only gives advantages to customers but also gives advantages to restaurants in terms of more effective and systematic service. Based on a successful study, the use of self-service technology in restaurants provides high profits to both parties, namely customers and McDonald's in Wakaf Che Yeh itself. So in conclusion, in the future, McDonald's branches especially in Wakaf Che Yeh must use self-service technology in restaurants to achieve significant improvement in various aspects.

Furthermore, current research hypotheses can be further expanded in future research if there are researchers who want to do research on this topic. It can be studied in more depth by not only focusing on self-service technology alone. Self-service technology must actually be used in restaurants especially fast food restaurants that already have big brands in the global market. In the future, the type of machine must be improved from higher features, usage and security when placing a purchase order to ensure customer safety.

Conducting research requires high costs. In the future, researchers who are capable and have great expenses and if have a good team should make improvements in this research and learn and learn more about self-service technology. Thus, the establishment of self-service technology in turn can improve functionality and develop many new features on new machines.

The results of the application of this self-service technology are based on the variables from this study. The variables from this research are the performance expectations, uses and functions of self- service technology at McDonald's. Research is done to ensure that customers also have knowledge of this self-service technology and also ensure that they know the factors that influence their acceptance of this self-service technology.

7 CONCLUSION

Overall summary for this research, this study has three independent variables namely performance expectations, perceived uses and functions of self-service technology. Based on the research done, it shows that self-service technology has become one of the technologies used in the daily life of customers and self-service technology is also one of the factors that increase the profitability of a business. This is one of the marketing strategies to existing businesses to improve their performance and increase company revenue.

With this research, fast food restaurant organizations, especially McDonald's, can further develop their understanding of self-service technology. This will compete with other developed countries by improving business performance. With the results of this research, I hope in the future customers are ready to accept this self-service technology and maybe McDonald will reduce counter space and each employee is placed in the most difficult part before the use of this self- service technology. This also gives more space in the restaurant and gives more comfort to customers. By knowing the customer's choice, the retail industry can continue to develop the company's performance well while obtaining more sales revenue and achieving every goal set by the company.

IMPACT OF AFTER SALES SERVICES CHARACTERISTICS ON CUSTOMER SATISFACTION AMONG UNIVERSITY MALAYSIA KELANTAN STUDENT

Mohd Syahyusrizal Ashraf Bin Zakaria and Md Zaki Bin Muhamad Hasan

Faculty of Entrepreneurship and Business,
Universiti Malaysia Kelantan,
Malaysia

Email: syahyusrizal97@gmail.com; zaki.mh@umk.edu.my

Abstract:

Researcher examines the impact of after sale service characteristics on customer satisfaction among University Malaysia Kelantan student. To what extent does characteristics like delivery service, warranty time of product, and quality of service provided satisfies customers? In this globalized market, organizations try to differentiate themselves, so they tend to provide value added services to its customers according their needs and wants. After detail and extensive review of literature researcher found that after sale service is essential in retaining and satisfying customers. Due to limited time, quantitative study is not possible. Practically our study benefitted for the manager of the organization that are mostly related to home appliances, so that they can check the customers trend toward safter sale services characteristics.

1.0 INTRODUCTION

This research is mainly focus on customer satisfaction among University Malaysia Kelantan students. In this study, the researchers examine the after sales services characteristics on customer satisfaction among University Malaysia Kelantan students. The pre-study stage found certain indications that the supplier and customer could perceive things differently and that this would make customers and suppliers decision making even more complex

Service positions in the organization have to interact with the customers. They have to deliver high satisfaction to them. However, the capabilities of these front-line workers to satisfy customers mainly depend on the environment the organization Customer satisfaction is considered very important now a day, it shows how firms are committed to provide quality product or services to their customers that eventually increase customers loyalty. Satisfying the customer is one of the basic objectives of the organization, as it is often said that customer is boss and boss is always right, so it means customer is right when he demands for after sale services. After sales service is an emerging concept in the business community. Organizations have to provide better after sale services to retain and satisfy its customer. Making and retaining valuable relationship with customer while using every aspect of taking, retaining and enhancing customer is known as customer relationship management(Kotler and Armstrong, 2010).Through customer relationship management, organizations can achieve their objective of retaining and satisfying customers. Customer satisfaction results in increased demand of product or service and the organization or brand reputation increases. When organization sell product effectively it has to make effective planning for services after sale, such planning is a part

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

of customer relationship management. After sales services has been important for organization to compete in the market by using such extended services (Vitasek, 2005).

2 LITERATURE REVIEW

Technology Acceptance Model

Figure 2.1: Technology Acceptance Model

Figure 2.1 shows the theoretical model that has created by Ali Iftikhar Choudhary, Syed Azeem Akhter, Muhammad Asif, Rashid Mehmood Choudhry, Zafarullha Siddique, Asif Mughallqra University, Islamabad Campus, Islamabad, Pakistan. Figure above shows five factors (independent variable) that influence online customer satisfaction. The independent variable is delivery, installation, warranty, service quality, feedback while the dependent variable is the customer satisfaction. For this research, the researcher chose delivery, warranty and service quality. Moreover, based on this study, it shows that delivery, warranty, services quality has a positive relationship with the customer satisfaction.

2.1 Consumer Satisfaction

Customer satisfaction is an output, resulting from the customer's pre-purchase comparison of expected performance with perceived actual performance and incurred cost (Churchill & Surprenant, 1982). Arnould and Price (1993) and Westbrook and Oliver (1991) pointed out that customer satisfaction through an understanding of the emotional content of services encountered. Customers could experience positive, negative or both feelings during services delivery process. Price et al. (1995) noted that customer satisfaction and positive feelings can be provided by extra attention given to the customers by the service provider.

2.2 Delivery services

A proper customer service delivery approach improves customer satisfaction and loyalty to the product (Rajesh and Uday, 2004). The product life cycle time shrinks due to technological progress, so companies must ensure timely delivery of the product, since IBM implements the integrated product delivery system for this. Four solutions for distribution management , product programme management , enterprise release management , quality and test lab management, and

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

final software library are supported by the Integrated Delivery System.

Product delivery raises the satisfaction of the consumer excessively (Shaharudin et al., 2009). For delivery of service and product Dealers, independent Service center, franchised Service center and mobile service centers can be used. Delivery of the product defined by two dimensions that is speed and reliability (Michael, 2001), and ensuring that the correct product is delivered from the right source to the right individual at the right price at the right destination at the right time in the right quantity (Michael, 2001).

2.3 Warranty

A warranty is believed to be a seller 's duty or a seller's liability and the buyer's satisfaction with the long-term service of the commodity (Udell and Anderson, 1968). The main aim of the warranty offering is to illustrate that compared to similar products, the product can work and last for a longer time. To provide warranty organisations, the standard of a product must be improved to the degree that they can produce a consistent and better product and offer long-term warranty to their customer (Kelly, 1988)

2.4 Service quality

The service quality is the key categories where companies are facing challenges these days, this concern is mostly in the service sector where consumers also complain about service quality. To retain and satisfy consumer to greater extent it is necessary that service quality should be high (Cronin, J.and Taylor,S.1992). Functional quality is very important dimension in services and dimensions of quality are interrelated (Christian, 1984)

2.5 Proposed Conceptual Framework

The framework is design to explain about the relationship between dependent variables (Customer satisfaction) and independent variables (Delivery service, warranty, services quality). From this framework, it has proven that delivery services, warranty, services quality can influence online purchasing behaviours among Umk students.

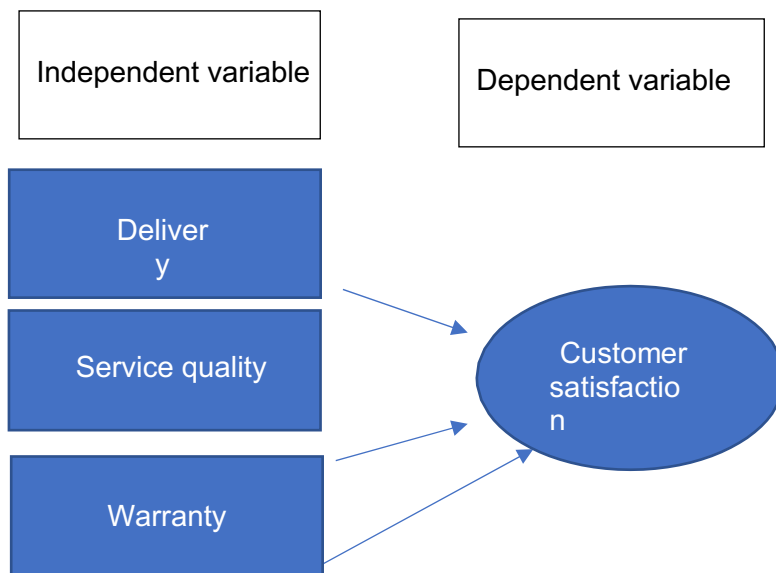

Figure 2.6 Research Framework (Develop for the research)

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

3.0 RESEARCH METHOD

This research used descriptive, reliability test and Spearman correlation. Descriptive research was taken to investigate the impact of after sales services in Malaysia with the independent variables: Delivery services, warranty, and services quality. Descriptive assisted with reliability and correlation in order to accomplish research objectives. Moreover, it also consists of a research framework design and plan of action for the research. Most importantly, it is to ensure the data collected from field work are appropriate for solving the problems. Research instruments are measurement tools such as questionnaire or scales which designed by researcher to obtain data on a topic of interest from research project. Basically, questionnaire is the main instrument for researcher for collecting data in survey research. It is a set of questions for obtaining statistically useful or personal information from respondent and sometimes it will be in written or printed form questionnaire often with spaces for answer.

In this study, the close ended questionnaire with structured questions will be used. It will be designed and distribute to respondents in two type of language which is English and Malay from avoiding any difficulty and were simply wording which ease respondents to understand since they were differences in their background.

The closed ended questionnaire will have multiple choice of answer and it is allowing respondents to select a single choice from amongst them. This type of questionnaire can help to reach at opinions about a product or service in a more efficient manner. Likert scale questions have been choosing from one of the type of close ended questionnaire for this study. It is it is designed to examine how strongly the respondents agree or disagree with the statements that has been provided and it is also appropriate to measure the attitudes, behaviour and opinion and typically a three, five or seven-point agreement scale used to measure respondents' agreement with a variety of statements. As a consequence, for this study, there are four point Likert with closed ended questionnaire scales ranging from 1 (Strongly Disagree), 2 (Disagree), 3 (Agree) and 4, (Strongly Agree) were used as the instrument in this study.

4 ANALYSIS AND DISCUSSION

Demographic profile of respondent

Table 4.1.1: Frequency Analysis on Respondent's Age

AGE (YEARS OLD)	FREQUENCY	PERCENT (%)
19-21	48	32.0
22-24	83	53.3
25-27	15	10.0
28 and above	4	2.7
Total	150	100.00

The number of the respondent based on age. Based on the collected result from the total number of respondent is 150. There are 48 respondent aged between 19-21, at frequency 83 are aged between 22-24 years old, 15 respondents are aged between 25-27 years old, for frequency 4 are aged 28 and above years old. The result clearly stated that most of the respondent are from the age range between 22-24 years old, with highest percentage 53.3% and the result shows that most of the respondents are aged between 22-24 years old in University Malaysia Kelantan.

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

Table 4.1.2: Frequency Analysis on Respondent's Gender.

GENDER	FREQUENCY	PERCENT %
Male	50	33.3
Female	100	66.7
Total	150	100.00

The number participant is 150. There are 100 respondents from female, and 50 respondents from male. The result clearly stated that most of the respondent are from the female with highest percentage 66.7% and the lowest percentage is male with 33.3% student in University Malaysia Kelantan.

Table 4.1 on Respondent's.3: Frequency Analysis Race

RACE	FREQUENCY	PERCENT %
Malays	121	80.7
Chinese	16	10.7
Indian	8	5.3
Others	5	3.3
Total	150	100.00

The number of the respondent based on race. Based on the collected result from the total number of respondent is 150. There are 121 respondents from malays, and 5 respondents from others. The result clearly stated that most of the respondent are from the malays with highest percentage 80.7% and the lowest percentage others with 3.3% student in University Malaysia Kelantan.

Customer satisfaction

Table 4.2.1 Reliability Analysis

Reliability Statistics

Cronbach's Alpha	N of Items
.811	5

In this study, five questions were used to measure impact on after sale service that influence customer satisfaction. The Cronbach's Alpha result of customer satisfaction was 0.811, which was resulted as high. Thus, the coefficient obtained for the questions of customer satisfaction is valid and reliable.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Delivery service

Reliability Statistics

Cronbach's Alpha	N of Items
.691	3

In this study, five questions were used to measure impact on after sale service that influence customer satisfaction. The Cronbach's Alpha result of delivery service was 0.691, which was resulted as moderate. Thus, the coefficient obtained for the questions of delivery service is valid and reliable.

Warranty

Reliability Statistics

Cronbach's Alpha	N of Items
.652	3

In this study, five questions were used to measure impact on after sale service that influence customer satisfaction. The Cronbach's Alpha result of warranty was 0.652, which was resulted as moderate. Thus, the coefficient obtained for the questions of warranty is valid and reliable.

Service quality

Reliability Statistics

Cronbach's Alpha	N of Items
.890	3

In this study, five questions were used to measure impact on after sale service that influence customer satisfaction. The Cronbach's Alpha result of warranty was 0.890, which was resulted as high. Thus, the coefficient obtained for the questions of service quality is valid and reliable.

4.2 HYPOTHESES TESTING

Using Spearman's Rho Correlation Coefficient Analysis, the researcher can make a hypothesis regarding the relationship between dependent variables, namely customer satisfaction with three independent variables (delivery service, warranty, service quality). Therefore, the table below shows the hypothesis for each independent variable and dependent variable.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Delivery service

Table 4.4.1: Correlation Between delivery service and customer satisfaction

	N	Spearman's Rho Correlation
delivery service ↔ customer satisfaction	150	.656**

** . Correlation is significant at the 0.01 (1-tailed)

H1: There is a significant relationship between delivery services and customer satisfaction Table shows the correlation between delivery service and customer satisfaction. The relationship between is significant due to the p-value as 0.000, which less than the alpha value 0.01 ($p < 0.01$). The result showed a positive relationship between delivery services and customer satisfaction, with the value of the correlation coefficient of 0.656 being moderate. This can be seen through a 65.6% dependent variable (customer satisfaction) is influenced by an independent variable (delivery service). As a result, hypothesis 1 is accepted and there is significant positive relationship between delivery services and customer satisfaction.

Based on the result of our study, the hypothesis H1 is accepted. There is positive significant relationship delivery service and customer satisfaction. A proper customer service delivery approach improves customer satisfaction and loyalty to the product. Organizations without a strategic product or service delivery strategy are similar to those that begin their journey without knowing the final destination. As we can see, delivery service is one of the impact on customer satisfaction among University Malaysia Kelantan student.

Warranty

Table 4.2.2.: Correlation Between warranty and customer satisfaction

	N	Spearman's Rho Correlation
Warranty ↔ customer satisfaction	150	.706**

** . Correlation is significant at the 0.01 (1-tailed)

H2: There is a significant relationship between warranty and customer satisfaction Table 4.2.2 shows the correlation between warranty and customer satisfaction. The relationship between is significant due to the p-value as 0.000, which less than the alpha value 0.01 ($p < 0.01$). The result showed a positive relationship between warranty and customer satisfaction, with the value of the correlation coefficient of 0.706 being strong. This can be seen through a 70.6% dependent variable (customer satisfaction) is influenced by an independent variable (warranty). As a result, hypothesis 2 is accepted and there is significant positive relationship between delivery services and customer satisfaction.

According to our study result, the hypothesis H2 is accepted. There is positive significant relationship between warranty and customer satisfaction among University Malaysia Kelantan student. A warranty is believed to be a seller 's duty or a seller's liability and the buyer's satisfaction with the long-term service of the commodity (Udell and Anderson, 1968). The main aim of the warranty offering is to illustrate that compared to similar products, the product can work and last for a longer time.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Service quality

Table 4.4.3: Correlation Between service quality and customer satisfaction

	N	Spearman's Rho Correlation
service quality ↔ customer satisfaction	150	.799**

** . Correlation is significant at the 0.01 (1-tailed)

H3: There is a significant relationship between service quality and customer satisfaction Table 4.4.3 shows the correlation between warranty and customer satisfaction. The relationship between is significant due to the p-value as 0.000, which less than the alpha value 0.01 ($p < 0.01$). The result showed a positive relationship between service quality and customer satisfaction, with the value of the correlation coefficient of 0.799 being strong. This can be seen through a 79.9% dependent variable (customer satisfaction) is influenced by an variable (service quality). As a result, hypothesis 3 is accepted and there is significant positive relationship between delivery services and customer satisfaction.

According to our study result, there is positive significant relationship between service quality and customer satisfaction among University Malaysia Kelantan student. Service quality helps to assess the global distribution mechanism of the product or service companies, customer satisfaction and service quality have causal relationships with each other, and service quality influences the potential buying behaviour of organisations (H, -H. Hu et al., 2009). It is important that service quality should be high in order to attract and satisfy customers to a greater extent (Cronin, J. and Taylor, S. 1992). Service / product quality has a positive effect on client satisfaction.

5.0 DISCUSSION

This study basically is to understand impact of after sales service toward customer satisfaction. From the impact given in this study may help e-retailer to penetrate customer satisfaction in order to planning a strategy to attract consumer for their retail store or online retails. Moreover, as a new entrances online marketer, they can refer to this study for the knowledge impact on after sales service toward customer satisfaction before enter to this market business. This will help the marketer to focus on what they need to do to attract and gaining customer interest in their business. As the other factor, it also need to have in the store or website as the attraction for consumer to revisits to the store or websites and become loyal customer. In a nutshell, this research concludes that all of the independent variables which are delivery services, warranty, service quality have positive related towards customer satisfaction among University Malaysia Kelantan student. It is important that the company to adopt a good after-sales service management to enhance the effectiveness and efficiency to serve the customer. For example, by implementing extensive customer relationship management (CRM) with sophisticated software and analytical tools, this can help to integrate customer information and build stronger capabilities in delivery, warranty, and service quality

6.0 ACKNOWLEDGEMENT

The completion of this research would not complete without assistance and participation of so many people whose names that cannot be enumerated. The researchers are very much thankful to En.Md Zaki bin Muhamad Hasan who provided detail guidance, expertise and valuable advice in the process of writing this research. She has been motivating and encouraging us to strive in finishing the research in the best manner. The researchers would like to express deep indebtedness

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

and appreciation to all the respondents who were willing to participate in the survey in spite of their busy schedule. Their contributions to this research are sincerely appreciated and acknowledged. The researchers' gratitude also extended to family and friends for their support and sacrifices. This research would not succeed without them.

-Universiti Malaysia Kelantan,
Malaysia

Email: sina.a17a0243@siswa.umk.edu.my; azwa.mk@umk.edu.my

Abstract:

The accessibility of the internet nowadays already exists all over the world and has become a world phenomenon without matching the creation of several generations of the internet such as 3G, 4G, and 5G. As such, many e-commerce platforms are developed by many parties such as shopee, Lazada and Alibaba. However, this platform still lacks the full trust of customers. Furthermore, attitudes and subjective norms and perceive behaviour control were examined to determine factor that influence customers repurchase intention on e-commerce. Theory Planned behavior will be used as the main basis of this study. First, attitudes, customers influence the repurchase of customer intentions in e-commerce. In other words, when customers believe in business activities in e-commerce they will easily buy more in the future. Second, our study shows that perceiving bahaviour control over repurchase intention is very important because information from people around is very helpful in binding purchase decisions. Finally, perceive behavior control have a positive and strong relationship with the intention to repurchase when the customer has the supportive resources in making a repurchase in e-commerce. The results of the study shed light on important issues relating to the behavior of customer. To remain competitive, e-commerce companies should constantly work at enhancing customer trust, satisfaction and loyalty.

Keywords: *Repurchase Intention, E-commerce, Theory of Planned Behavior, Attitude, Subjective Norm, Percieve Behaviour Control, Customer Intention, Buy Back*

1 Introduction

In this age of globalization, the invention of the internet is a great success that must be appreciated by everyone. This is because the reason for the accessibility of the internet nowadays already exists all over the world and has become a world phenomenon without matching the creation of several generations of internet such as 3G, 4G and 5G. The use of the internet nowadays has affected all aspects such as industry, education, economy and social. According to (Liu & Tsai, 2010) due to the fast growth of Internet technology, consumers' lifestyles have changed drastically. From the social aspect we can see that society is now no stranger to the existence of the internet which helps a lot from their daily affairs and activities, especially in disseminating information quickly without using letters that will be posted less effectively nowadays. According to (Turban et al., 2017) the Internet is a useful tool for dispersing information to customers as it is being flexible, open, informal, and interactive. The economic sector has also undergone major changes in the last decade. This has been led by the internet which has given birth to several e-commerce websites such as Lazada, Shopee, Alibaba and Groupon. E-commerce is an

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

online commerce that allows consumers buy goods directly from sellers over Internet by using the internet browsers (Bhagat, 2015). These changes have indirectly affected user behaviour. Previously, researchers have seen that consumer behaviour before the use of online shopping is the complete customer has no choice in making a purchase compared to after almost all consumers in Malaysia use e-commerce and can make a choice in purchasing. Therefore, the researcher will conduct this study in the area around Kota Bharu, Kelantan to conduct interviews and surveys.

Today, there are reports that there is an increase in online purchases, but some customers still use the offline purchase method. This is because there are some negative specifics on online purchases that use the customer's mind. According to E-Commerce-Milo, "lack of trust" is the root cause of people not shopping online (Wong, 2016). This "lack of trust" factor probably comes from the experience you have had while making an online purchase. In addition, there is likely to be a service experience faced by those around them who have bought them in online shopping. In addition, online products can't be physically touched by offline products that can be seen directly and they do not need the product made to make payment.

Next, a lack of confidence in the protection of personal privacy information on online shopping websites. Privacy refers to the degree to which the online shopping website is safe and protects the customer's information (Chiu, Chang, Cheng, & Fang, 2009). This shows the importance of information that needs to be protected by online shopping. However, there are further, According to Nielsen, a Malaysian online shopper, there are still some who are careful and do not feel safe by providing credit card information when they make online payments because there are many credit card scams. This has affected the repurchase in online shopping.

There are three objectives of this research:

To examine the attitude of customers repurchasing intention on E-commerce.

1. To examine the subjective norm of customers repurchasing intention on E-commerce.
2. To examine perceived behaviour control towards customers intention repurchase on E-commerce.

In the current economic situation, there is a change in consumer behavior in online purchases. Looking at the context of the increase in e-commerce today, it has a significant impact on society today, especially during the Covid-19 season. Besides, countless e-commerce has made it easy for many consumers to make the best choice so that they feel

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

satisfaction in purchasing. With this study, researchers can help upgrade educational institutions and social institutions in Malaysia.

2 LITERATURE REVIEW

2.1 Underpinning Theory

Theory of Planned Behaviour

The construct 'perceived behavioural control' is formed by combining the perceived presence of factors that may facilitate or impede the performance of a behaviour and the perceived power of each of these factors. Actual behavioural control refers to the extent to which a person has the skills, resources, and other prerequisites needed to perform a given behaviour. Actual behavioural control is difficult to accurately assess and so perceived behavioural control is measured through specially designed questionnaires and serves as a proxy measure of the influence. In the TPB, behavioural intention is controlled by a dynamic mix of attitude, subjective norm and Perceived Behavioural Control variables. Actual behaviour is again derived largely from behavioural intention, but is mediated to some degree by perceived behavioural control (Rajput & sharma, 2019).

Previous Study

Attitude

There are several factors of attitude towards repurchase including e-commerce in customer satisfaction with an e-commerce website Customer satisfaction in making a purchase is very important. According (Wen, Prybutok, & Xu, 2011), Consumer satisfaction has a positive effect on repurchase intention. The satisfaction of a consumer when shopping at a marketplace or shopping online will encourage consumers to return to the same marketplace.

Subjective Norm

The subjective norm in Malaysia do plays an important role where family members, friends, and a colleague are an individual strong reference point (Afendi, Azizan, & Darami, 2014). The environment of society also influences customer repurchase in e-commerce. One's experience with e-commerce will affect the people around him, or others' experience will influence the buyer in making online purchases. This is proven based on (Nasermoadeli, Ling, & Maghnati, 2013) assume the time "Every social experience can have an impact on individuals in social procedures through family, school, peers, and mass media. Each of these social effects has the power to influence thinking, our feelings and activities. "Social experience will change the behaviour in socializing from consumers.

Perceive Behaviour Control

Perceived behaviour control involves two factors including internal factors such as skills, abilities, information, emotions and external factors such as, the situation or environment

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

of the individual is usually quite rational and able to use the information they have systematically. So, if an individual feels he does not have the resources or opportunity to do something, then the individual will not engage in behaviour that requires that resource, even in situations where the individual has a positive attitude and subjective norms that approve of that behaviour.

Research Hypothesis

In this study, there are four hypothesis:

H₁: There is significant relationship between the attitudes of customers repurchasing intention on E-commerce.

H₂: There is significant relationship the subjective norm of customers repurchasing intention on E-commerce.

H₃: There is significant relationship between the perceived behaviour controls towards customer intention repurchase on E-commerce.

Research Framework

Figure 1: Research Framework of ‘Factors that Influence Customers Repurchase Intention on E-commerce at Kota Bharu Kelantan’.

3 Methodology

Research Design

In this research, a quantitative research method has been applied. Meanwhile, 383 questionnaires are distributed via Google Form. Respondents are the population Kota Bharu, Kelantan. Target respondents is those who have used e-commerce websites. The sampling technique used to select respondents is convenience sampling and data is collected through online channels such as Facebook, and WhatsApp. Section A has eight questions that are multiple-choice. For section B to section dependent variables which are a question about repurchase on e-commerce. Section C until section E is a question about independent variables there have 13 questions for this section. Likert scale is applied in the research for section B to section E. The scope ranges from 1= very, disagree, 2= disagree, 3=Natural”, 4=agree, and 5=strongly agree, There are several types of analytical

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

techniques that are used to check the accuracy of the data collected throughout the research such as descriptive analysis, Spearman correlation coefficient analysis.

4 Analysis and Discussion

Descriptive Analysis

Demographic Profile of Respondents

Table 4.1: Respondent' Demographic

Items		N	Percentage (%)
Gender	Male	157	41
	Female	226	59
Age	24 And Below	99	25.8
	25-34	114	29.8
	35-44	120	31.3
	45-54	41	10.7
	55 And Above	9	2.3
Status	Single	169	44.1
	Married	182	47.5
	Divorce	32	8.4
Ethnic	Malay	268	70.0
	Indian	53	13.8
	Chinese	61	15.9
	Sabah	1	0.3
Academic qualification	SPM	64	16.7
	STPM	53	13.8
	Diploma	137	35.8
	Degree	121	31.6
	Master	2	0.5
	SRP	2	0.5
	STAM	1	0.3
	MBA	1	0.3
	PHD	2	0.5
Profession	Student	97	25.3
	Employee	276	72.1
	Unemployee	4	1.0
	Housewife	5	1.3
	Retiree	1	0.3
Income	Below RM 1000	111	29.0
	RM 1000- RM2999	214	55.9

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

	RM 3000-RM4999	45	11.7
	RM 5000 And Above	13	3.4
Ecommerce users	Shopee	265	69.2
	Lazada	71	18.5
	Alibaba	45	11.7
	Zalora	2	0.5

N=383 respondents

The demographic of the respondent is collected and recorded in table 4.1. The demographic includes gender, age, academic qualification, profession, ethnic, status, income, and e-commerce user. Based on the result, there is 59% of the female respondents and 41% of male respondents in the data. It concludes that the total of female respondents is more than the total of male respondents. As for the age the majority is in the age range of 35 – 44 who agreed to participate in the studies which are 31.3% of the respondents. The majority of the respondents have a diploma holder as their academic qualification level which is 35.8%. As for the status, there are 47.5% of the respondents are married. A married person can be categorized as a mature respondent in answering questions. As for the profession, the majority of the respondents in Kota Bharu have jobs which is 72.1% of the respondents. RM 1000 until RM 2999 is the salary earned by the respondent where 55.9% is higher than the others. Finally, Shopee is the most common user of respondents for this questionnaire study which is 265 respondents with 69.2%.

Spearman Correlation Analysis

Table 4.2: Result Spearman Correlation Analysis

Correlations						
			RE	ATT	SN	PBC
Spearman's rho	RE	Correlation Coefficient	1.000	.231**	.323**	.424**
		Sig. (2-tailed)	.	.000	.000	.000
		N	383	383	383	383

The table 4.2 shows the result of spearman correlation on this research. The highest value is perceive behaviour control (PBC) with 0.0.424 while the lowest is attitude (ATT) with 0.231. Besides that, subjective norm shows that value with 0.323. However, the p-value is significant for all variables with the value of 0.000. That's mean all independent variable has a significant relationship between dependent variable in this study.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

4.4 Hypothesis Testing

4.3: Summary of Hypotheses Testing

Hypothesis	Statement	Significant Value	Result
H ₁	There is significant relationship between the attitudes of customers repurchasing intention on E-commerce.	0.000	Accepted
H ₂	There is significant relationship the subjective norm of customers repurchasing intention on E-commerce.	0.000	Accepted
H ₃	There is significant relationship between the perceived behaviour controls towards customer intention repurchase on E-commerce.	0.000	Accepted

Based on Table 4.3, all of the hypotheses showed the same significant value, which is 0.000. So, all hypothesis is significant because the p-value is below 0.005. All hypothesis, which is H₁, H₂, and H₃ are accepted.

5.0 Recommendations

As a result of the results obtained from this study, several factors drive customers' intentions in making repurchases in E-commerce, among them are attitude, subjective norm, and belief behaviour control has shown promising results in this study Kota Bharu, Kelantan. Therefore, the researchers suggest that website developers use the report results from this study in marketing the products available in their e-commerce. This study report can also be used by every educational institution such as University and school for those interested in studying repurchase; they can use the existing independent variables as drivers for new ideas that they want to present in their study.

Besides that, retailers in e-commerce in using this study report in improving service to customers so that the influence of the customer environment can attract people's interest. Most customers value quality service before making a purchase other than seeing a reasonable price based on their ability. Every retailer must understand the attitude and behaviour of customers in making a purchase.

Future research suggests that this study does not represent the general population around Kota Bharu, Kelantan. Researchers only took a sample of 383 respondents. This can be used as an example and reference for future researchers by getting feedback from respondents. The study location can also be expanded to obtain more accurate data and obtain opinions in understanding the study related to repurchase intentions.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

6.0 Conclusion

In this research, there are three main independent variables such as attitude, subjective norms, and behaviour control. To conduct this research, researchers collected data through questionnaires. This questionnaire was distributed to 383 residents around Kota Bharu, Kelantan as respondents. This area is liked by researchers because this area is nearby and will make it easier for researchers to do this research. In addition, respondents around Kota Bharu will be screened based on online purchases on E-commerce websites. The purpose of this study is to identify the factors that influence the intention to repurchase customers in E-commerce. The results of the researcher's study found that the independent variables presented by the researchers such as attitudes, subjective norms, and perceive behaviour control have a positive relationship with repurchase in E-commerce. This has thus made the objectives of this study have all been achieved. These three variables are important factors to consider for every E-commerce website developer. This will make the customer will repeat the purchase and E-commerce website can successful if these factors are taken into consideration.

Acknowledgements

It gives me immense pleasure to present this proposal on The Factor that Influence Customers Repurchase Intention on E-commerce in Kota Bharu, Kelantan at Research Project Retailing 1 (ARS4112). In partial fulfilment of Bachelor of Entrepreneurship (Retailing). No work can be carried out without the help and guidance of various kind persons. I am happy to take this opportunity to express my gratitude to those who have been helpful to me in completing this research. I would like to thank my supervisor for this research, Miss Nurul Azwa Binti Mohamed Khadri, for her guidance. I also would like to thank my parents, friends, and well-wisher who encouraged me to do this research work and those involved directly in completing this research.

FACTORS AFFECTING USAGE OF E-WALLET PAYMENT DURING THE PANDEMIC COVID-19 AMONG GENERATION Z

Muhammad Hamizam Bin Zameri and Raja Rosnah Raja Daud

Faculty of Entrepreneurship and Business,
Universiti Malaysia Kelantan,
Malaysia

Email: hamizam.a17a0275@siswa.umk.edu.my; rosnah.d@umk.edu.my

Abstract:

The purpose of this study was to identify the factors affecting usage of e-wallet payment during the pandemic Covid-19 among generation Z at University Malaysia Kelantan (UMK). The element investigated the perceived ease of use, perceived usefulness, social influence, and facility condition were selected and justified by researcher form literature review. This study was conducted by using quantitative research approach with total of 139 respondent involved in this study. The respondents were selected by using a convenient sampling method among Generation Z students at University Malaysia Kelantan. This study analysed the data by using the Statistical Package for Social Science (SPSS) software. The finding shows that all elements had significant relationship with usage E-wallet payment among Generation Z students. Next this research also can be used for other researcher as a reference for their future research.

Keywords: *E-wallet payment, perceived ease of use, perceived usefulness, social influence, facility condition, generation Z*

1 INTRODUCTION

The recent growth and acceleration of innovation in information technology have emerged as a catalyst to promote commercial transaction users in their everyday lives (Keng-Soon & Chong, 2019). Financial technology advances have helped business entities build a more exclusive model of financial transactions aimed at satisfying client needs (Salmony, 2014). This can be illustrated by the rising consumption of banking services, which, following developments in the financial sector, is increasing annually. This presumption is then integrated into non-cash transactions to show that consumption is one of the variables that strengthens society's class advantage and preserves community ties (Welly, Yerisma, Supitriyani, Yusnaini, & Sudirman, 2020).

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Children of the Internet, Digital Generation, Digital Natives 87F, Media Generation, .com Generation, iGen 8F or Instant Online (Levickaite, 2010) are often referred to as Generation Z, which consists of people born since 1995. Dependence, independence, individualism, addiction to technology and pace are the most distinctive characteristics of Generation Z. This research was carried out on the basis of several unresolved issues concerning variables that drive Generation Z to use E-Wallet, and other reasons why this study was conducted are because this study was the first to be conducted in University Malaysia Kelantan. The issue of the research is that the use of E-Wallet as a platform for non-cash transactions and variables that drive Generation Z's ability to use E-Wallet as part of the Uncertain Cash Association is not yet optimal (Rif'ah, 2019).

Problem Statement

The country's survival is now threatened due to the Covid-19 epidemic that has hit our country. It is now impossible for Malaysians to purchase products at nearby shops because they have to follow the prescribed Standard operating procedure (SOP). So, Malaysians can purchase products from home using E-Wallet to prevent this corona virus from spreading further. While the issue of covid-19 is well known around the world, this e-wallet facility is not used by all societies. Although e-wallet payments have become the subject of research in the last year (Blockchains, 2018; Halim, Efendi, Butarbutar, Malau, & Sudirman, 2020; Intarot & Beokhaimook, 2018) There is a lack of research exploring this perceived ease of use of the e- wallet on Generation Z. Few studies investigate the perceived ease of use effect of Fintech on behaviour. (Bagla, Kumar, & Sancheti, 2018; Huei, 2018). Thus in the sense of e-wallet payment, the effect of perceived ease of use on generation Z belief can shed some light on existing technologies and contribute to the growth of the public.

Research Objective

There are four objectives of this research:

To examine relationship between affecting usage of e-wallet payment during the pandemic covid-19 among generation z.

To examine relationship between perceived ease of use affecting usage of e-wallet payment during the pandemic covid-19 among generation z.

To examine relationship between perceived usefulness affecting usage of e-wallet payment during the pandemic covid-19 among generation z.

To examine relationship between social influence affecting usage of e-wallet payment during the pandemic covid-19 among generation z.

Significance of study

Researchers

Future researchers able to follow the footsteps of past researchers to continue the study in discovering more factors in order to provide more beneficial information and knowledge to the young generation.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

E-Wallet

For further research on the adoption of E-Wallet, additional researchers are expected to be able to establish and explore issues related to previous research variables, or to incorporate other variables related to and not included in this report, such as risk perception, safety factor, advancement in technology, trustworthiness, and promotional appeal.

2 LITERATURE REVIEW

Underpinning Theory

The Unified Theory of Acceptance and Use of Technology (UTAUT) Model

UTAUT has been used in various sectors of the industry in the last few decades to research different applications of technology for organisational reinforcement. UTAUT environments have been modified to fulfil these criteria as technology is increasingly used for individual use, by incorporating additional constructs: hedonic motivation, habit, price value, and perceived pleasure (Kim, Li, & Kim, 2015). A paradigm used to describe the interest of users in their consumption actions is the Unified Theory of Acceptance (UTAUT). The UTAUT model consists of four systems, including performance goals, work expectations, social impact (SI) and conditions of the facility. It can be considered that UTAUT is a TAM renewal model, which is used to describe how technology acceptance and adoption can alter the behaviour patterns of people (Venkatesh, Morris, Michael, Davis, & Davis, 2016). The TAM and UTAUT models are typically used simultaneously or only one of them in a report on the adoption of technology. Based variables are often frequently added to quantify the actions of technology adoption, such as social effects, protection, and facility condition. Linked studies of mobile banking, electronic money, digital payments (Nidhi, Srivastava, & Sinha, 2017) include studies by (Beheshti, Benatallah, & Motahari-Nezhad., 2018) using the TAM and UTAUT models.

Research Framework

A research framework has been conducted to investigate the connection between independent variable and dependent variable of usage E-wallet payment applications during coronavirus 2019 pandemic period.

Figure 1: Conceptual Framework

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

3 METHODOLOGY

Research Design

In the current research, the study design by Cavana, Sekaran, and Delahaye (2001) is adapted. Since the features of phenomena in a situation are known and the researcher is able to explain them more clearly, the object of the present study falls under descriptive study and hypothesis testing. Thus, from an individual perspective, the present thesis explores the essential aspect of the phenomenon of interest. Subsequently, the present study includes the creation and testing of hypotheses to clarify the proposed relationship in order to make a prediction of research results on the consumer.

In order to achieve the research goals, it is important to explain the forms of investigation to ensure that the research understands the concept of the research issue clearly. The present analysis opts for a correlational study in which the researchers try to look for important variables that can resolve the issue of the study. The study needs to find a correlation between the independent variable and the dependent variable relation in the current study. However, there are other variables that are mediating and moderating variables that can influence the direct relationship between these variables.

Data Collection Method

Data are values that belong to a collection of things for a qualitative and quantitative variable (Smith, 2016). To perform this analysis, primary data will be used. Primary data means initial data that has never been obtained before, according to Burns and Bush (2014), the primary data, such as survey, interview, observation, and questionnaire, can be gathered from various sources (Smith, 2016). The questionnaire will be used as the basis for the primary data collection for this analysis. The questionnaire was distributed directly to the relevant respondents, who are also the target population at the University of Malaysia Kelantan, using the convenience process.

Sampling

In market analysis, there are two types of sampling techniques, which are techniques of non-probability and probability sampling (Sekaran & Bougie, 2010). Smith (2016) indicated that the technique of probability sampling requires a general sampling frame specification. A non-probability convenience sampling method was therefore selected as the sampling technique where it is difficult to define the sampling frame in this analysis. The technique of convenience sampling allows researchers to choose any of their chosen respondents available rather than choosing from the entire population (Hair, Celsi, Samouel, Money, & Page, 2015). In addition, the method of convenience sampling was implemented in this analysis because this method could save researchers time and expense in collecting the data (Smith, 2016). The respondents to the questionnaire will be the students of Generation Z at University Malaysia Kelantan Pengkalan Chepa.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Data Analysis

The process of data analysis starts with the selection of the correct programme to conduct the analysis process that fits the aims of the current report. This research uses statistical software, such as the Statistical Kit for Social Sciences (SPSS) and Structural Equation Modeling (SEM). For the data entry process, data conversion and running for descriptive statistical analysis, SPSS software is intentionally used to obtain demographic results. Meanwhile in the current research, SEM software was used to analyse complex structures.

Data entry is the first step in the process of analysis of data. To get the mean percentage of sample distribution, standard deviations and normality test for variables and demographic profiles, the researcher uses SPSS software to key in data and runs the study for descriptive statistical analysis. After that under a new project, the SPSS data set is stored as a Comma Separated Value (CSV) file and imported into SmartPLS programme. Since SmartPLS programme is unable to read other file formats such as excel or word files, the SPSS file should be stored in a CSV file. The researcher must acquire basic knowledge of this programme before conducting the SmartPLS analysis. On the option of Structural Equation Modeling and SmartPLS, the following subheading further describes.

4 FINDINGS

Preliminary Analysis

Table 1: Pilot Test Result of 30 Respondents

Variables	Cronbach's Alpha
Perceived Ease of Use (PE)	0.891
Perceived Usefulness (PU)	0.823
Social Influence (SI)	0.801
Facility Condition (FC)	0.838
Usage E-wallet payment during pandemic COVID-19 (DV)	0.812
TOTAL	0.965

Table 1 shows the pilot test result and its coefficient of Cronbach's Alpha by each variable from 30 respondents at University Malaysia Kelantan. Base on the value of Cronbach's Alpha the highest value which is Perceived Ease of Use (PE) is 0.891 can be considered as very good. While the lowest value of Cronbach's Alpha is Social Influence (SI) which is 0.801 and can be considered as very good. The total value Cronbach's Alpha of 5 Variables is 0.965 is consider as excellent. So, researcher can run the research because all of 5 variable is accepted.

BUSINESS COLLOQUIUM 2020/2021**

Demographic Profile of Respondent

Table 2: Demographic Profile (N = 139)

<u>Demographic Characteristic</u>	<u>Category</u>	<u>N</u>	<u>Percent (%)</u>
Gender	Male	56	40.3
	Female	83	59.7
Age (years old)	20 - 23	104	74.8
	24 - 26	35	25.2
Marriage Status	Married	2	1.4
	Single	137	98.6
Races	Malay	111	79.9
	Chinese	12	8.6
	Indian	16	11.5
Education Level	Matric	18	12.9
	STAM	19	13.7
	STPM	58	41.7
	Diploma	30	21.6
	Bachelor's Degree	14	10.1
Frequency Analysis on E-wallet use times of Respondents	1 to 3 times	66	47.5
	4 to 6 times	46	33.1
	7 to 9 times	12	8.6
	10 times or more	15	10.8
Frequency Analysis on Buying Items Using E-wallet of Respondents	Accessory	24	17.3
	Electronic	20	14.4
	Food	23	16.5
	Other	72	51.8

Table 1 shows the demographic of respondents. As can be seen from the table above,

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

40.3 percent of respondents are male and 59.7 percent of respondents are female. Moreover, 74.8 percent of respondents were from the age range 20 to 23 years old, and 25.2 percent of respondents were from age range 24 to 26 years old. For marital status of the respondents, there are 137 respondents are single which is 98.6 percent and 2 respondents are married which is 1.4 percent. Based on the information shown above, there are 111 Malay respondents, 16 respondents are Indian and the remaining 12 respondents are Chinese. The percentage of each of the categories are 79.9 percent, 11.5 percent, and 8.6 percent respectively. There are five levels of educational qualification that discussed in the survey where consist of STPM, STAM, MATRIC, Diploma, and Bachelor's Degree. Table 2 had clearly stated the educational qualification of the respondents. Most of the respondents had the educational qualification on STPM where there are 58 respondents or 41.7 percent of them. After that, there are 30 respondents have complete their Diploma and contributes 21.6 percent from the total of 139 respondents. Followed by the STAM respondents who are 19 of them and contributes 13.7 percent in the survey. There are only 18 respondents who have MATRIC qualification which consist of 12.9 percent. The smallest group for the educational level is fall under Degree category and there only 14 of them which consist of 10.1 percent from the overall. Based on the data collected, the highest ranking E-wallet use times by respondents is 1 to 3 times which 66 respondents which represented 47.5 percent. Second higher ranking is 4 to 6 times which 46 respondents which represented 33.1 percent. Next ranking of E-wallet use times by respondents is 10 times or more which is 15 respondents or 10.8 percent. The rest 12 respondents was use E-wallet 7 to 9 times which is 8.6 percent. Table 2 show percentage of the frequency the items that respondents buy using E-wallet among University Malaysia Kelantan students. It was categorized into four group which were Accessories, Electronics, Food, and Other. Based on the data collected, the higher ranking items buy among respondents is 'Other' items which is 72 respondents with 51.8 percent represented. Second higher ranking is Accessories which is 24 respondents with represent 17.3 percent. Next is Food where there has 23 respondents with 16.5 percent represented and the rest is Electronics items which has only 20 respondents with represent 14.4 percent.

Reliability Test

Table 3: Reliability Test

	Cronbach's Alpha	Cronbach's Alpha Based On Standardized Items	N Of Items
Perceived Ease Of Use	0.928	0.930	5
Perceived Usefulness	0.920	0.920	4
Social Influence	0.866	0.867	3
Facility Condition	0.862	0.866	3

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

Usage E-Wallet Payment During Pandemic Covid-19	0.879	0.880	3
---	-------	-------	---

Based on the reliability analysis in Table 3, it can be concluded that the Cronbach's alpha based on standardized items which is 0.930. This means the consistency and stability of 0.930 is excellent according the Rules of Thumb about Cronbach's Alpha Coefficient Size (Hair Jr., Celsi, Money, Samouel, & Page, 2011). According to the reliability analysis, it can conclude that the coefficient alpha for reliability of independent variable perceived usefulness is 0.920. This means the consistency and stability of 0.920 is excellent refer to the Rules of Thumb about Cronbach's Alpha Coefficient Size. Based on the reliability, it can conclude that the coefficient alpha for reliability of independent variable Social Influence is 0.866. This means the consistency and stability of 0.866 is very good referring to the Rules of Thumb about Cronbach's Alpha Coefficient Size. According to the reliability analysis, it can conclude that the coefficient alpha for reliability of independent variable Facility Condition is 0.862. This means the consistency and stability of 0.862 is very good refer to the Rules of Thumb about Cronbach's Alpha Coefficient Size. Based on the reliability, it can conclude that the coefficient alpha for reliability of dependent variable Usage E-wallet Payment is 0.869. This means the consistency and stability of 0.869 is very good referring to the Rules of Thumb about Cronbach's Alpha Coefficient Size.

Spearman Correlation Analysis

Table 4: Spearman's correlation of independent variable and dependent variable

Correlations		PE	PU	SI	FC	EP	
PE	Pearson Correlation	1	.909**	.849**	.887**	.914**

N	139	139	139	139	139

** . Correlation is significant at the 0.01 level (2-tailed).

Based on Table 4, it can be seen that all of variables which were perceived ease of use (PE), perceived usefulness (PU), social influence (SI), Facility Condition (FC) and usage E-wallet payment (EP). The highest correlation coefficient between independent variable and independent variable is perceived ease of use and perceived usefulness, which is 0.909. Secondly, the lowest correlation coefficient between independent variable and independent is social influence and facility condition, which is 0.821. The dependent variable of this research is usage E-wallet payment (EP). Next, the highest correlation coefficient between independent variable and dependent variable is perceived ease of use, which is .0.914. Moreover, the lowest correlation coefficient between independent variable and dependent variable is facility condition, which is 0.816.

5.0 CONCLUSION

In this research, there are four independent variables include perceived ease of use, perceived usefulness, social influence, and facility condition. In order to conduct this research, the researcher collected the data by using questionnaire. The questionnaires was distributed to 139 Generation Z student at University Malaysia Kelantan during the pandemic Covid-19. This research is to find generation Z who use E-wallet payment as platform to buy goods. However, commitment and guided from supervisor, Madam Raja Rosnah binti Raja Daud help researcher to finish this research smoothly.

According to the result, perceived ease of use is the highest factor influence the generation Z continuance intention to use E-wallet payment applications during coronavirus 2019 pandemic period. Besides that, perceived usefulness facility condition also influence customers to choose what the suitable E-wallet payment application that they want to use. Moreover, social influence also has a significant relationship with customer's continuance intention of using E-wallet payment applications. It is because social influence, such as your best friends will attract to use this applications because it their save time and easy to pay when you shopping.

In conclusion, the results for this study have contributed beneficial information to their future

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

research about the factors determining usage of E-wallet payment among Generation Z during coronavirus 2019 pandemic period. Besides that, the present study gives an understanding of this factors, especially to application developers. Last but not least, there are some limitations for the present study, it is hoped that the first step taken in studying about the factors determining customer's continuance intention of using E-wallet payment applications during coronavirus 2019 pandemic period is significant for future justification, especially students of University Malaysia Kelantan

Abstract:

This paper aims to analyze customer satisfaction with the services provided by analyzing the five service quality dimensions; tangibility, empathy, reliability, assurance, and responsiveness. In this research, the SERVQUAL model is used to identify the comparison between E-hailing and Taxi toward customer satisfaction. Primary data was collected from people that experience both services using a Likert type scale questionnaire. The target population for the study was people that experience E-hailing and Taxi services. The questionnaire includes 147 respondents followed by a data statistical Cohen analysis table. Data were cleaned and edited to eliminate errors and omissions then coded to assign numbers to responses and were arranged against each research question. The data were analyzed using descriptive statistics, reliability test, normality test, and Spearman analysis. The overall findings conclude that all the five service dimensions in E-hailing and Taxi have a significant correlation towards customer satisfaction.

Keywords: Service Quality Dimensions, SERVQUAL Model, E-hailing, Taxi, Customers Satisfaction

1 Introduction

In this modern era, E-hailing services are increasingly common in the city. E-hailing service is a service that links the customer with the driver with a smartphone or device linked through the internet and Taxi is a type of rental vehicle driven by a driver to transport one or a small number of passengers to their destination of choice compared to other public transport where the volatility location is set by the service operator, not the passenger even though the taxi service in this country was very common in the past but now it is increasingly affected because introduction of E-hailing before this, and because of that, now Taxi has growth through application such as MyTeksi, Public Car and others . E-hailing services apply to the booking of transport services using the smartphone application as they operate with transport network firms (Pham et al., 2017). In today's technology, customers worldwide, including Malaysia, are growing and embraced. E-hailing services have been legalized in Malaysia since 2017 and there are currently 5 cars operating in Malaysia including Grab, Pink Riding, PicKnGo, and MULA (Rao, 2018). Grab and Uber are famous among the service providers because of their services in Malaysia.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

During decades of other modes, taxis offered rental service without real competition. However, in 2018, Malaysia was turned over by ride-hail services like Uber and Grab. Business model by using mobile applications to connect drivers to drivers. The mainstream press has been pitting taxis against the ride-hail services both as well as policy initiatives since 2012, mostly concentrating on the condition of the taxi driver, and the potential elimination of these legacy services (Nelson, 2016).

Therefore the purpose of this paper is to investigate the relationship between the service quality and customers satisfaction toward E-hailing and Taxi services in Malaysia. Specifically, this study aims to evaluate the five service quality dimensions, namely tangibility, efficiency, responsiveness, assurance, and empathy, towards customer satisfaction on ride-hailing services in Malaysia. The results of the study will provide further insight into the ride-hailing services especially in filling the research gap by empirical testing on the relationship between the service quality dimensions and customer satisfaction in the E-hailing and Taxi services industry in Malaysia. Moreover, this study will raise awareness of the value of the standard of service for enhancing customer satisfaction, leading to further retention of customers and increased business performances by e-hailing and taxi service providers.

1.1 Research Objectives

Based on the outlined objectives of the research, the research questions that need to be addressed as follows :

To examine the relationship between reliability and customers satisfaction toward E-hailing and Taxi services

To examine the relationship between assurance and customers satisfaction toward E-hailing and Taxi services

To examine the relationship between tangible and customers satisfaction toward E-hailing and Taxi services

To examine the relationship between empathy and customers satisfaction between E-hailing and Taxi services

To examine the relationship between responsiveness and customers satisfaction between E-hailing and Taxi services

1.2 Significance of Study

This research would compare customer satisfaction with service quality with e-hailing and taxi services. Understanding the dimensions of service quality: Reliability, assurance, tangibility, empathy, and responsiveness (Ananthanarayanan Parasuraman, Zeithaml, & Berry, 1988) to customer satisfaction . It provides more customers with positive or negative customer satisfaction responses. The positive reaction we know is E-hailing since it links us through online services, which will make it easier for people around Malaysia. Users simply use the device and mobile phone and collect the drives in the given time. It is more convenient than a taxi to wait for passengers to pick up a taxi from their location. The researcher are already aware that the comparison will be negative and positive because most of them are in daily need to Malaysian people. In addition, the researcher find out that certain Taxi services has got negative reaction

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

from people but still got positive reaction from most people in Malaysia compare to E-hailing has positive reaction from the people because of the functional of the application .

2 Literature Review

Service Quality

The contrast between service expectations and perceptions depends on the quality of services (Arun Parasuraman, Berry, & Zeithaml, 1991). It is difficult to describe the quality of services since services are primarily intangible. Most researchers have adjusted the quality of the services in five main dimensions to SERVQUAL created by Anantharanthan Parasuraman, Zeithaml, and Berry (1985) ; reliability, assurance, tangibility, empathy, and responsiveness.

Reliability

The dimension of reliability in this study is more focused on the ability of drivers who are on duty to fulfill promises through the provision of quality services to passengers such as on time faster and more efficient so that passengers do not have to wait. Reliability is a key factors that influence the perception of the quality of service by consumers in providing a service (Alex & Ondiek, 2014).

Assurance

Assurance means employees' knowledge of the courtesy of the company and its staff and the ability to inspire confidence. As a result, the quality of service that customers assess by the quality of service rendered by the service provider is considered by the customers as a significant factor (Kang & James, 2004).

Tangibility

The physical facilities, equipment, and personal presence of all those involved in the operation, including taxis and E-hailing, are tangible. Consumers consider a substantial effect on the consumer's view of service quality from the service provider's tangibility factor (Kotler & Keller, 2012).

Empathy

The element of empathy is a feeling that exists when a taxi driver or E-hailing understands the feelings of the customer by offering services that satisfy the customer. One of the main elements of service quality that impacts customers' understanding of service quality is the empathy of the service provider (Kotler & Keller, 2012).

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Responsiveness

The willingness to help customers and offer a speedy service is responsiveness. The focus of this dimension is to address customer requests, questions, complaints and problems in a quick and effective manner. For example, services are delivered in good time and meet the needs of customers, consumers are aware of the high standard of service quality (Al-Azzam, 2015)

Customer Satisfaction

Customer satisfaction is characterized to the degree that a customer realizes that an individual, firm, or company has made a product and service accessible that meets the customers' requirements in such a way that the customer knows about and/or utilizes the service (Oliver, 1977).

2.1 Research Hypothesis

The hypothesis of the research is known as a scientific hypothesis and involves the statement of the relation between two variables. The findings or outcomes of the analysis are also suggested (Haber, 2010). This research, therefore, proposed to test the relationship between the two variables, independent and dependent. The hypothesis of the present study can be summarised in the following way, based on the literature review and the research question that discussed:

H_{1a}: There is a significant relationship between reliability and customers satisfaction on E-hailing in Malaysia.

H_{1b}: There is a significant relationship between reliability and customers satisfaction on Taxi services in Malaysia.

H_{2a}: There is a significant relationship between assurance and customers satisfaction on E-hailing services in Malaysia.

H_{2b}: There is a significant relationship between assurance and customers satisfaction on Taxi services in Malaysia.

H_{3a}: There is a significance relationship between tangibility and customers satisfaction on E-hailing services in Malaysia.

H_{3b}: There is a significance relationship between tangibility and customers satisfaction on Taxi services in Malaysia.

H_{4a}: There is a significant relationship between empathy and customers satisfaction on E-hailing services in Malaysia.

H_{4b}: There is a significant relationship between empathy and customers satisfaction on Taxi services in Malaysia.

H_{5a}: There is a significant relationship between responsiveness and customers satisfaction on E-Hailing services in Malaysia.

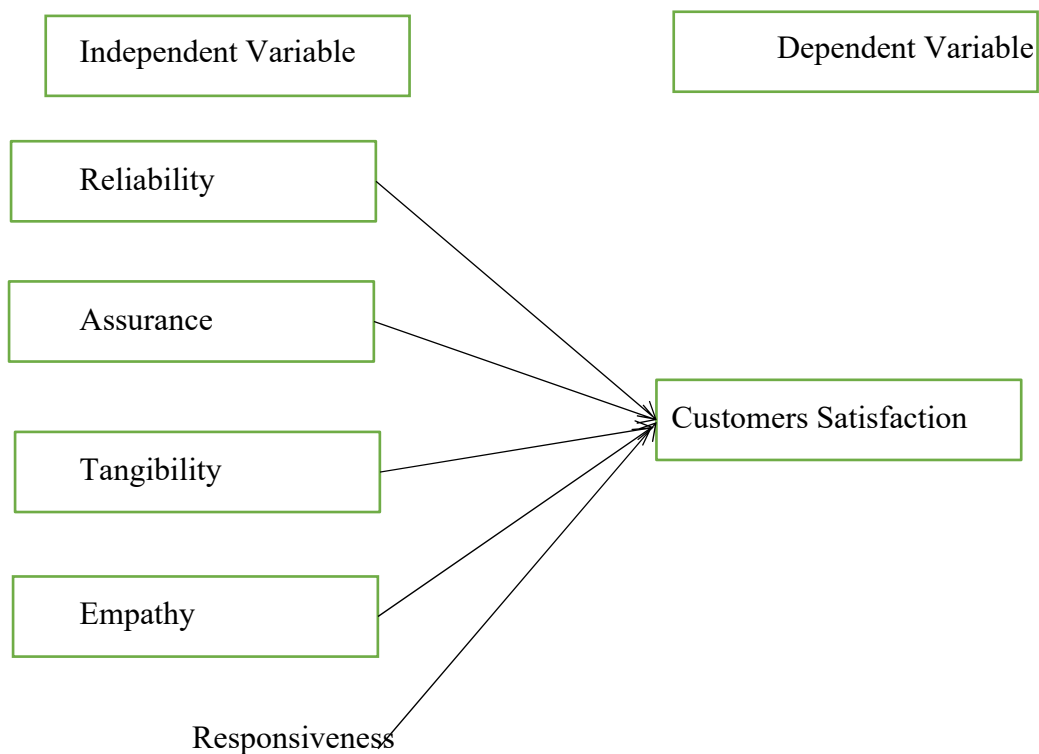

H_{5b}: There is a significant relationship between responsiveness and customers satisfaction on Taxi services in Malaysia.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

2.2 Research Framework

Based on the literature review, the conceptual framework has been developed. Which the conceptual framework had included five independent variables and one dependent variable. The independent variables are travel environment, accessibility, infrastructure and heritage attraction while the dependent variable is about the tourist satisfaction to the heritage museums. The conceptual framework is shown as below figure:

Figure 1 : Conceptual Framework

3 METHDODOLOGY

3.1 Research Design

Research design for this study conducted by using a quantitative method. Quantitative research can be defined as the study of systematic phenomena by collecting measurable data and performing statistical, mathematical, or statistical techniques (Adi Bhat, 2020) and it also used to quantify behaviours, opinions, attitudes, and other variables and make generalizations from a

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

larger population (Formplus, 2019). Researchers prefer to use quantitative research rather than qualitative research because it involves data that have large amount to be collected and analysed statistically. At the end of this study, researchers will find the same number when analysing data. Next, researchers have more control over how the data are collected. External perspectives can also be obtained using this quantitative research method. Next, researchers have more control over how the data are collected. External perspectives can also be obtained using this quantitative research method. Last but not least, the quantitative analysis aims to design the study before it begins and uses research to evaluate a hypothesis that researchers either end up accepting or rejecting.

3.2 Data Collection Methods

Data obtained from first-hand sources using methodologies such as surveys, interviews, or studies are the primary data in the first stage.

The second stage of data collection was a fieldwork but through online platform. The researchers used the Google form questionnaire to be distributed to the experienced people that use E-hailing and Taxi services through Whatsapp groups in Malaysia. In the questionnaires, the researchers will set one of the questions to identify whether the person is meeting the criteria or not before answering the survey.

3.3 Population

Population refers to the number of data that can be obtained based on elements required to fulfill the study criteria. In Malaysia, the researcher's research on the comparison of the service quality dimension to customer satisfaction between E-hailing and Taxi services. E-hailing and taxi users in Malaysia will be from the population survey.

3.4 Sample Size

Population refers to the number of data that can be obtained based on elements required to fulfill the study criteria. In Malaysia, the researcher's research on the comparison of the service quality dimension to customer satisfaction between E-hailing and Taxi services. E-hailing and taxi users in Malaysia will be from the population survey.

the researchers select 147 target respondents based on Cohen 1992 statistical power analysis table to perform data collection to maximize the result. The number of respondent need to achieve the statistical power of 80 per cent for detecting R values of at least 0.10 with a 5 per cent probability of error.

Source: Cohen, J. A power primer. *Psychological Bulletin*, 112, 155-319.

3.5 Sampling Technique

Non-Probability sampling was used as the sampling design in this study as the samples are collected in a method that does not offer equal opportunities for all people in the population for being selected. In the judgemental sampling it is known as a survey type in which a population sample is chosen based on its own knowledge and judgement instead of using statistical sampling techniques. Samples on this research were taken from Malaysian people that has been experience Ride-Hailing and Taxi users. In order to obtain sample data for this study, we have provided some form of questionnaire to distribute to the respondents that will be selected. The questionnaire will also be distributed through online to collect all the required data and information beside reduce cost and time consuming.

3.6 Research Instrument

The questionnaire had designed and distribute to respondents in two type of language which is English and Malay from avoiding any difficulty and were simply wording which ease for the respondents to understand all the question. Besides, Likert scale question have been choosing by the researcher from one of type of close ended questionnaire of this study. Each set of the questionnaire will consist of 30 question in total and the survey questionnaire will be separated into four main sections and there were listed in Table 2.

4 RESULTS AND DISCUSSION

Table 2: Sources of Questionnaire

Section E	Demographic	-

4.1 Data Analysis Technique

The researchers have used version 26 of the Social Sciences Statistics Package (SPSS) for this study. The results of this study include descriptive analysis, validity and reliability test, and overall hypothesis testing if this study is shielded. Researchers may use the statistics of IBM SPSS for data interpretation, analysis, prediction, and research preparation.4 Data Analysis and Findings.

4.2 Demographic Profile

The demographic profile of the respondents included information about gender, age, race, salary

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

income, the current level of education, and usage. From the sample collected, the majority of the respondents come from females (52.4%) and males (47.6%). It can be concluded that males become the most consumed in the use of E-hailing and Taxi. in terms of race, the majority of the respondents are Malay which contributes 84 (57.1%) to the total number of 147 respondents. The Chinese and Indian are contributes in second and third highest which are 37 (25.2%) and 24 (10.3%). There were respondents in this research that other races that contribute 2 (1.4%) in this survey.

based on segmentation of age. The highest of respondents is category 20-30 years with the total age group 89 (60.5%). The second highest is 31-40 years with the total age group 30 (20.4%) followed by 41-50 years 19 (12.9%) and 51 and above 9 (6.1%)

in terms of salary income, less than RM 1000 is the highest number in salary income 85 (57.8%) and followed by second highest and third highest RM 1001 - 3000 and RM 3001 - 5000 with 36(24.5%) and 17(11.6%). The lowest salary income is more than RM 5000 with 9(6.1%).

Next, based on the education level shows the highest number of education level in this survey is Degree with 70(47.6%) and second highest is Diploma with 20(13.6%). The number of education level in third-highest SPM with 17(11.6%). The fourth highest in education level has the same frequency and percent is STPM 14(9.5%) and Master 14(9.5%). After that, followed by No Education 9(6.1%) and Ph.D. 3(2.0).

Lastly, that the highest number of usage between respondents is 1-2 per weeks 50(34.0%) and the second-highest number of usage is 1-2 per month 36(24.5%) and followed by 1-2 per year 34(23.1%) and 1-2 per day 27(18.4%).

The result of the service quality dimension also has a positive effect and is based on variables consisting of reliability, assurance, tangibility, empathy, and responsiveness this is in a good ranking in the opinion of the respondents. The independent variable for E-hailing is reliability(0.828, Good), assurance (0.806, Good), tangibility (0.721,Acceptable), Empathy (0.851,Good), and responsiveness (0.772, Acceptable). Other than that, the independent variable for Taxi is Reliability (0.906, Very Good), Assurance (0.905, Very Good), Tangibility (0.898, Good), Empathy (0.906, Very Good), and Responsiveness (0.887, Good)

Result of customers satisfaction has a positive effect on the dependent variable for E-hailing is Customers Satisfaction 0.898 which is Good and dependent variable for Taxi is Customers Satisfaction 0.821 is also Good.

4.3 Descriptive Analysis

The descriptive analysis was tested according to their variables and listed out on the summary of the mean and standard deviation of computed items in the table below :

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

Table 3 Descriptive Analysis for E-hailing

	N	Minimum	Maximum	Mean	Std. Deviation
Reliability	147	3.00	5.00	4.5279	.38673
Assurance	147	3.00	5.00	4.5306	.38009
Tangibility	147	3.00	5.00	4.5429	.39169
Empathy	147	3.00	5.00	4.4871	.42592
Responsiveness	147	3.00	5.00	4.5211	.39348
Customers Satisfaction	147	3.00	5.00	4.6204	.43839
ValidN (lightwise)	147				

Table 4 Descriptive Analysis for Taxi

	N	Minimum	Maximum	Mean	Std. Deviation
Reliability	147	2.00	5.00	4.1578	.64201
Assurance	147	2.00	5.00	4.2912	.54659
Tangibility	147	1.40	5.00	4.2313	.57132
Empathy	147	2.00	5.00	4.2558	.60172
Responsiveness	147	2.00	5.00	4.2871	.54197
Customers Satisfaction	147	1.40	5.00	4.1946	.55539
Valid N (lightwise)	147				

Table 3 and Table 4 showed that all the independent variables consist of reliability, assurance, tangibility, empathy, and responsiveness that seems to measure the service quality toward E-hailing and Taxi. Based on the result, for the E-hailing the highest mean value came from tangibility based on the description, which was 4.5429, where respondents agreed more for this variable, while the lowest mean value was 4.4871 for the variable on empathy, where respondents agreed lower with that variable in this study. While, Based on the result, for the Taxi, the highest mean value came from assurance based on the description, which was 4.2912, where respondents agreed more for this variable, while the lowest mean value was 4.1578 for variable on reliability, where respondents agreed lower with that variable in this study.

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

4.4 Reliability test

Sekaran and Bougie (2016) indicated that internal consistency reliability can be defined as a test for respondent's responses whether is consistency at all sections. Cronbach's Alpha can be used as the reliability coefficient to determine the items in a variable are positively associated with others. The high reliability means that the goods are acceptable to the variable to be tested.

Table 5 Reliability Statistic for E-hailing

Variables	Cronbach's Alpha Value	No. of Item	Strength
Reliability	.746	5	Acceptable
Assurance	.732	5	Acceptable
Tangibility	.757	5	Acceptable
Empathy	.750	5	Acceptable
Responsiveness	.735	5	Acceptable
Customers Satisfaction.	.893	5	Good

Table 6 Reliability Statistics for Taxi

Variables	Cronbach's Alpha Value	No. of Item	Strength
Reliability	.867	5	Good
Assurance	.855	5	Good
Tangibility	.846	5	Good
Empathy	.827	5	Good
Responsiveness	.897	5	Good
Customers Satisfaction.	.897	5	Good

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Based on the result of Table 5, the Cronbach's Alpha of customers satisfaction in E-hailing as the dependent variable is 0.893 and showed all the items of the customer's satisfaction are related with the title and it indicated as a "Good" result because it is closed to 1.0. Other than that, the Cronbach's Alpha result for reliability was 0.746 which result is "acceptable". Thus, the coefficient obtained for these questions about reliability variable is good. For assurance is obtained an "acceptable" result, which is 0.732. The Cronbach's Alpha result for tangibility is 0.757 which also resulted as "acceptable". For empathy is obtained an "acceptable" result which is 0.750 and responsiveness is an "acceptable" result with 0.735. Overall for this analysis, all of the items in this research can be accepted and there is positively correlated with each other.

Based on the result of Table 6, the Cronbach's Alpha of customers satisfaction in Taxi as the dependent variable is 0.897 and showed all the items of the customer's satisfaction are related with the title and it indicated as a "Good" result because it is closed to 1.0. Other than that, the Cronbach's Alpha result for reliability was 0.867 which result is "good". Thus, the coefficient obtained for these questions about reliability variable is good. For assurance is obtained an "good" result, which is 0.855 The Cronbach's Alpha result for tangibility is 0.846 which also resulted as "good". For empathy is obtained an "good" result which is 0.870 and responsiveness is an "good" result with 0.827. Overall for this analysis, all of the items in this research can be accepted and there is positively correlated with each other.

4.5 Spearman Correlation Analysis

According to Kumar and Talib (2013) the Spearman's Correlation Coefficient is used to show the strength of association between two quantitative variables which is the independent variable and dependent variable that measure in ordinal scale. The results of the Spearman's Correlation Coefficient analysis showed in this study that the independent variable between the E-hailing and Taxi reliability, assurance, tangibility, empathy, and responsiveness with the customers satisfaction as dependent variable.

Table 7 Spearman Correlation Coefficient E-hailing

**. Correlation is significant at the 0.01 level (1-tailed).											

Based on Table 7 Spearman Correlation Coefficient E-hailing, it can be seen that all of the independent variables which are reliability, assurance, tangibility, empathy, and responsiveness are significantly correlated to the dependent variable which is customer satisfaction at 0.01 level (1-tailed). The relationship between variables, 0.70 is strong, within the range of 0.30 to 0.60 is moderate and below 0.30 is weak. The correlation coefficient between the independent variable between independent variable showed that reliability was 0.599, assurance was 0.522, tangibility was 0.588, empathy was 0.629, and 0.563. Thus, all of the independent of this study have a strong relationship between the dependent variable.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Based on Table 8 Spearman Correlation Coefficient Taxi, it can be seen that all of the independent variables which are reliability, assurance, tangibility, empathy, and responsiveness are significantly correlated to the dependent variable which is the customer's satisfaction at 0.01 level (1-tailed). The relationship between variables, 0.70 is strong, within the range of 0.30 to 0.60 is moderate and below of 0.30 is weak. The correlation coefficient between the independent variable between independent variable showed that reliability was 0.684, assurance was 0.693, tangibility was 0.668, empathy was 0.687, and 0.665. Thus, all of the independent of this study have a strong relationship between the dependent variable.

4.6 Hypothesis Testing

Table 9 Hypothesis Test for E-hailing and Taxi

	Hypothesis	Significant Value	Magnitude Relationship	Supported or Rejected
H1a	There is a significant relationship between reliability and customers satisfaction on E-hailing in Malaysia.	.599**	Moderate	Accept H1a hypothesis supported
H1b	Hypothesis 1b: There is a significant relationship between reliability and customers satisfaction on Taxi services in Malaysia.	.684**	Moderate	Accept H1b hypothesis supported
H2a	Hypothesis 2a: There is	.552**	Moderate	Accept

H5b	Hypothesis 5b: There is a significant relationship between responsiveness and customers satisfaction on Taxi services in Malaysia.	.665**	Moderate	Accept H5b hypothesis supported

5 Conclusion and Future

5.1 Suggestion for the Future Research

In this analysis, there were three constraints. Some guidelines will be released in order to resolve these limitations. First of all, The researchers cannot get the correct data of respondents because some respondents are in hurry to answer the question. Besides that, even though the researcher only specific on experience people but in google form, a handful of people answer No in column answer and the researcher has excluded these people from the data review to get more accurate data about the sample.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

In addition, for researchers to get accuracy in data collection, the time constraint is the biggest challenge. Both responses are evaluated using the questionnaire method to verify the hypothesis for the relationship between the dependent variable and the independent variables. From here, because it may take time to sort all these mistakes, no scanning of biased answers or constantly answering the same scale for each question was done. Future research may expand the time to sort the actual data and examine only the perfect random scale that has been addressed.

Last but not least, the information searched from the internet sometimes was not subscribed by the library event though we have a lot information from My Athens in UMK library but the study that researcher analyze doesn't have lot information because this topic is still new to the researcher. Researchers unable to get the full or complete information. Sometimes of the information was not fulfil the information that researchers need to use as references in this study. Besides that, all the information come from the blog, so it was not suitable to use for complete this research in a good performance. Furthermore, the data available on the internet were limited and some information were even cannot be accessed through the internet. So this study did not get fuller proposal to make as a references.

5.2 Conclusion

The main objective of this research is to investigate the relationship between the service quality dimension which are reliability, assurance, tangibility, empathy, and responsiveness and dependent variable customers satisfaction toward E-hailing and Taxi. In addition, all data collection was collected through an online questionnaire and the data was analyzed using SPSS software based on descriptive analysis, reliability analysis and Spearman's Correlation Coefficient analysis. As a result, the relationship between the independent variable and the dependent variable was positively associated with the high and moderate relationship.

This research concludes the key findings, discussions, implications, limitations and recommendations. The Spearman Correlation Analysis showed that all variables, including reliability, assurance, tangibility, empathy and responsiveness, had a significant positive relationship with the customers satisfaction. In addition, all the assumptions had been tested, where all the assumptions about reliability, assurance, tangibility, empathy, and responsiveness had been accepted.

Finally, the researcher also discussed some limitations encountered during the course of the research, as well as some recommendations for improvement in future research. As a final word for this study, this study aims to give an overview to the community about awareness toward service quality dimension and customers between E-hailing and Taxi.

Acknowledgement

First of all, I would like to thank my lecturer, Mrs. Nadia Hanum Binti Amiruddin, a lecturer at the University of Malaysia Kelantan. In the first place, I want to thank you very much. With her awareness, patience, and inspiration, she constantly supports me completely in this final year. Her advice offers me feedback on this research project for the last year, still. The guidance of Mrs. Nadia Hanum also helps me to develop my research skills.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Other than that, I want to thank the University of Malaysia Kelantan's office and knowledge management, which offers you a place full of content. I have discovered the necessary material for the research study. This research project also gives me a relaxed environment.

After that, I want to thank my friends who always help me in completing my research project. The friend who can tell me in writing the research project their various ideas and understanding of IT.

**FACTORS AFFECTING CONSUMER BUYING DECISION
TOWARDS ONLINE SHOPPING IN PENGKALAN CHEPA**

Muhammad Luqman Bin Adenan and Nurul Azwa Binti Mohamed Khadri

Faculty of Entrepreneurship and Business,
Universiti Malaysia Kelantan,
Malaysia

Email: luqman.a17a0919@siswa.umk.edu.my; azwa.mk@umk.edu.my

Abstract:

Online shopping is a trend that is now growing rapidly. A look at the main players in this industry's exponential growth shows that there is still a huge pool of e-commerce market potential. The convenience of online shopping makes it a trend that is emerging among consumers, particularly the consumer at Pengkalan Chepa. The proliferation of online shopping has increased retailers' interest in concentrating on this area. This analysis was therefore to establish relationship between quality information provided, security of website, brand reputation of product and consumer buying decision towards online shopping in Pengkalan Chepa. Online shoppers that currently living in Pengkalan Chepa were selected as the subject of analysis. 400 sets of questionnaires distributed and valid for coding, analysing and testing the hypothesis. Collected data were then analysed using SPSS version 25.0 and this study can be used in future in this field.

Keywords: *online shopping, consumer buying decision, quality information provided, security of website, brand reputation of product.*

1.0 Introduction

The Internet played an important role in human life following the trend of the digital revolution (Liu et al., 2013), which enables communicators to interact around the world (Katawetawaraks and Cheng, 2013). It has been used as a marketing tool for retailers as a market and transaction channel both domestically and globally (Lim et al. 2015). The Internet's increasing trend allowed users to buy products online and even on the Internet through e-commerce (Wang et al., 2015). All normal trade activities are carried out via the internet, such as the production, distributing, presentation, procurement and payment via the internet (Aren et al., 2013).

The population of customers who approved online shopping has increased year by year (Liu et al., 2013). Online shopping continues to develop in Malaysia, but has already drawn the interest of Malaysians. As a result of Malaysia's internet and mobile connectivity, as well as public sector encouragement, Malaysia has high rates of ecommerce usage. According to government statistics, Malaysia boasts 16.53 million online shoppers (50 percent of the population) and 62 percent of mobile users use their devices to shop online.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Online shopping is taking its place in Malaysia, said Masaya Ueno, the president and chief executive of Rakuten Online Shopping Malaysia (Zieman, 2014). It can be seen from the newly launched webstore such as 11street, a South Korean brand considered to be the formidable intimidator in the already dynamic domestic e-commerce market in Malaysia (Law, 2015). Pengkalan Chepa is one of the cities that influence to the online shopping trend. Thus, this research is primarily to identify factors affecting consumer buying decision towards online shopping in Pengkalan Chepa.

2 Literature Review

Stimulus-Organism-Response (S-O-R) Model Theory

The theory was applied in this research is Stimulus-Organism-Response (S-O-R) model by Mehrabian and Russell (1974). By using the S-O-R model, physical stimuli on human emotions and behavioral responses can be used to investigate results (Mehrabian & Russell, 1974). This show the completing of stimulus as an independent variable throughout the S-O-R model, organism as mediator and response as the dependent variable (Goi, Kalidas & Zeeshan, 2014). This model may involve people with many sets of actions and present the individual's pattern of behavior in a conduct setting. The combinations of this model show stimuli, organism and response making the research easier to use as a research guide. The situation therefore represents the relationship between elements of the holistic system at a given time.

Figure 2.1: S-O-R Model Theory (Source: Mehrabian and Russell (1974))

Stimulus is described as an influence that stimulates the individual and factors that influence the internal state of the individual. It is combined with mixed marketing variables and other environmental statements (Chang et al., 2011). It is the organism that interferes between stimulus and response. Organisms should consider that effectiveness is seen as the dominant measure produced between environmental stimuli and a person's response cognition (Jacoby, 2002).

Thus, the organism as a mediator for the respondent makes an assessment and decision-making process because when a respondent makes a decision based on their circumstances such as what they see, touch, hear and smell (Chang et al., 2011). Dominance reflects control over environmental perceptions by respondents (Zimmerman, 2012).

The variables applied in the S-O-R model in this research are conditions using environment and experience. This study can complement the limitations in the S-O-R model and also improve current academic knowledge with the S-O-R model by

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

investigating how different variables can contribute to the consumer buying decision towards online shopping in Pengkalan Chepa.

2.1 Consumer buying decision

Similar to other customers, online shoppers often have a procedure before making a buying transaction. It is necessary to visit the retail websites in order to purchase products via the Internet. Consumers will request information about the goods or services they want before they make a decision (Mathew, 2013). Most customers want to shop smart in productive way (Miyatake et al., 2016). Online shopping helps customers where they can shop anywhere and at any time (Miyatake et al., 2016).

The customer's experience of making a decision is a consideration that could affect consumer circumstances (Iyer & Kuksov, 2010). Each customer had different characteristics when making a decision, fear of making a wrong decision is an obstacle for them to try new things and to be loyal to quality products (Lamour & Robertie, 2016).

2.2 Quality Information Provided

Quality information is a measure of accuracy or precision, of the ability and relevance of this information to inform which allows customers to make decisions and assumptions while shopping online. Quality information is also described as the ability to provide information on the attributes of goods, brands or companies that are useful for the assessment of customers (Milan et al., 2015). It enables consumers to make important decisions on the product or service aspect and attributes based on website details, while in conventional retail, decisions and evaluations can only be made by using product visualisation in a direct way. In the online world, quality information enables customers to make buying decisions in the absence of physical contact with products that lead to the satisfaction of online customers (Ghasemaghahi & Hassanein, 2013). Quality information therefore is relevant since customers seek information on the online website.

H₁: There is significant relationship between quality information provided and consumer buying decision towards online shopping.

2.3 Security of Website

In consumer buying studies, the perception of security can be described as a degree of trust between the security of online vendors or websites and consumers. It is a big concern when customers make changes to information such as credit card numbers. Security is a significant factor that affects customers when making online buying decisions, and customers are still worried about it in consumer buying studies (Chung-Hoon & Young- Gul, 2003; Katawetawaraks & Wang, 2011; Meskaran et al., 2013).

H₂: There is significant relationship between security of website and consumer buying decision towards online shopping.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

2.4 Brand Reputation of Product

Reputation for strong market positioning and branding have always been associated. Reputation theory relies on the core popular perception and observation about the recent actions of the company. Consumers are more focused than products on their perception of the brand (Hur et al., 2014). Only if the brand has a high reputation and commercial first-class reputation (Zhang, 2015). "Brands must acknowledge that if they offer privacy choices, they will not lose customers; instead, they'll set the stage for a bond of trust" (Bundhoo, 2013).

H₃: There is significant relationship between brand reputation of product and consumer buying decision towards online shopping.

2.5 Proposed Theoretical Framework

The purpose for this research to identify the factors affecting consumer buying decision towards online shopping in Pengkalan Chepa. It is illustrated by three factor which is quality information provided, security of website and brand reputation of product. Figure 2.2 shows theoretical framework for this research.

Figure 2.2: Proposed Theoretical Framework (Source: Develop for this research)

3.0 Research Methods

In this research, a quantitative research method has been applied. The researcher applied a survey in this research study. Out of 400 questionnaires are distributed, 400 questionnaires are collected from the target respondents. Respondents are the online shopper consumers around the target location. Convenience sampling techniques applied to the target population for the purpose of a research study as if they meet certain criteria, to be interviewed or willing to participate and readily available to provide information to the study. Likert scale is applied in the research. Section A has ten questions which are intended with an arrangement of nominal scale. The nominal scale is applied to identify the respondents' wide range info which is gender, age, race, marital status, education level, employment, income, platform used, time spend and types of products. The 5-point likert scale in section B and C allows respondents to indicate their consent or disagreement with the statement of problem. The scope ranges from "strongly disagree", "disagree", "neutral", "agree" and "strongly agree". There are several types of analytical techniques that are used to check the accuracy of the data collected throughout the

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

research such as descriptive analysis, reliability analysis and Spearman's rho correlation coefficient.

4 Analysis and Discussion

4.1 Demographic Profile of Respondents

The demographic of the respondent is collected and recorded in the table 4.1. The demographic includes with gender, age, race, marital status, education level, employment, income, platform used, time spend and types of products. It concludes that the total of female respondents is more than the total of male respondents. The result explained online shopping dominated by a female. As for the age majority of them who agreed to participate in the studies in the range of 22-24 years old which is 37.8% of the respondents. Majority of them are Malay with 94.8% of the respondents. As for marital status, the single status mostly dominated than married status which is 86.0%. Most of the respondents are undergraduate degree as their educational level which is 49.0%. It can be seen that the students are the most respondents that participate this study which is 60.5%. It obviously the online shopper mostly from the group of students. Respondents which monthly income range of below RM1,000 dominated with 65.8%. The respondents pretend to use Shopee as the platform to purchase product which is 85.3%. As for the time spent on online store, most of respondents spent below 3 hours per week which is 63.7% and the most type of product purchased is fashion which is 32.8%.

Table 4.1: Respondent's Demographic

Respondent profile (n = 400)	Demographic	Category	Frequency	(%)
	Gender	Male	107	26.8
		Female	293	73.3
	Age	18 years old	35	8.8
		19-21 years old	131	32.8
		22-24 years old	151	37.8
		25-27 years old	42	10.5

4.2 Descriptive Analysis

Based on the table 4.2, the descriptive statistics of the variables. Consumer buying decision has the highest mean of 4.2775. Then, it followed by Quality Information Provided and Brand Reputation of Product which are 4.2100 and 3.9150 respectively. However, the security of website has the lowest mean of 3.8994. The result shows majority of respondents agreed that Quality Information Provided is the most factor to consider before making buying decision while the Security of Website is the less factor to consider before making buying decision. In addition, standard deviation shows how close the data is to the mean. In this case, Security of Website has the highest standard deviation which is 0.73408, followed by Brand Reputation of Product which is 0.68031. Then, standard deviation for Consumer Buying Decision is 0.64272. Lastly, Quality Information Provided has the lowest standard deviation which is only 0.62148.

Table 4.2: Descriptive Analysis of The Variables

Variable	Frequency (N)	Mean	Std. Deviation
Consumer Buying Decision	400	4.2775	0.64272
Quality Information Provided	400	4.2100	0.62148
Security of Website	400	3.8994	0.73408
Brand Reputation of Product	400	3.9150	0.68031

4.3 Reliability Analysis

Table 4.3 shows the Cronbach's Alpha values of the questionnaire were above the acceptance level with the value range above than 0.70 based on Rule of Thumb for Cronbach's Alpha. The dependent variable or response that is consumer buying decision found to be an acceptable reliable (4 items; $\alpha = 0.774$). The stimulus or independent variable that is quality information provided showed a good reliability (4 items; $\alpha = 0.836$). The second independent variable that is security of website showed a good

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

reliability (4 items; $\alpha = 0.832$) and the last independent variable that is brand reputation of product found to be questionable reliability (3 items; $\alpha = 0.677$).

Table 4.3: Reliability Analysis of Variables

Variable	Number of items	Cronbach's Alpha	Strength of Association
Consumer Buying Decision	4	0.774	Acceptable
Quality information provided	4	0.836	Good
Security of website	4	0.832	Good
Brand reputation of product	3	0.677	Questionable
All	15	0.915	Excellent

4.4 Spearman's rho Correlation Coefficient Analysis

Based on the literature review and the current studies, the hypotheses can be formulated as the quality information provided, security of website and brand reputation of product have a significant relationship with consumer buying decision towards online shopping. Table 4.4 shows the result of Spearman's rho correlation coefficient analysis. The objective of Spearman's rho correlation coefficient is to a measure the strength and direction of association between two ranked variables.

Based on the results, the three independent variables (quality information provided, security of website, brand reputation of product) have a positive relationship with consumer buying decision towards online shopping. The correlation coefficient for the quality information provided towards consumer buying decision is 0.633 which is fall under the coefficient range of ± 0.5 to ± 0.69 . Meanwhile the value for security of website towards consumer buying decision is 0.556 which is fall under the coefficient range of ± 0.5 to ± 0.69 . Besides, the value for brand reputation of product towards consumer buying decision is 0.568 which is fall under the coefficient range of ± 0.5 to ± 0.69 . The variables indicate that there is moderate relationship between two variables.

Table 4.4: Spearman's rho correlation coefficient analysis

Variable	Mean (SD)	Consumer Buying Decision (DV)	Quality Information Provided (IV1)	Security of Website (IV2)	Brand Reputation of Product (IV3)
Consumer Buying Decision (DV)	4.28 (0.64)	1	0.633*	0.556*	0.568*

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

Quality Information Provided (IV1)	4.21 (0.62)	0.633	1	0.653	0.678
Security of website (IV2)	3.89 (0.73)	0.556	0.653	1	0.713
Brand Reputation of Product (IV3)	3.92 (0.68)	0.568	0.678	0.713	1

*p-value<0.05, Spearman's rho correlation analysis

In addition, table 4.5 shows the summary of hypotheses testing. The results show that the three independent variables have a significant relationship between consumer buying decision towards online shopping. As the significant value is lower than 0.01 level in 1-tailed test, it can be concluded that all of the hypotheses are accepted.

Table 4.5: Summary of Hypotheses Testing

	Hypothesis	Spearman Correlation	Supported or Rejected
H1	There is significant relationship between quality information provided and consumer buying decision towards online shopping.	r = 0.633 p = 0.000	Supported
H2	There is significant relationship between security of website and consumer buying decision towards online shopping.	r = 0.556 p = 0.000	Supported
H3	There is significant relationship between brand reputation of product and consumer buying decision towards online shopping.	r = 0.568 p = 0.000	Supported

Note: ***Correlation is significant at the 0.01 level (1-tailed)

5.0 Conclusion and Recommendations

This research concludes all the independent variables which are quality information provided, security of website and brand reputation of product have a significant relationship between consumer buying decision towards online shopping in Pengkalan Chepa. However, based on the results, it shows that quality information provided became

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

the most factor to consider by consumer before making a buying decision towards online shopping. Most of consumer interested in specific item in providing information. Thus, it is important to online sellers make sure that they provide clearly and accurately information to influence consumer make buying decision towards online shopping.

Besides that, the future researcher should discuss additional factors that affecting consumer buying decision or apply the similar variables in different context to identify the main factor affecting buying decision among online shoppers. The future researcher also can expand the study area from Pengkalan Chepa to wide range area or the big cities. Lastly, the questionnaires should not be circulated privately in order to avoid responses from similar races, social class, income level and values. In order to include more respondents from different demographic statuses, researcher suggested to look for a more accurate form of questionnaire distribution. For new researchers, a professional survey website might be a good option to get different and more respondents.

6.0 Acknowledgements

The completion of this research would not complete without assistance and participation of so many people whose names that cannot be enumerated. The researcher appreciative of the endless efforts and dedication to Miss Nurul Azwa Binti Mohamed Khadri who provided detail guidance, expertise and valuable advice in the process of writing this research. She has been motivating and encouraging us to strive in finishing the research in the best manner. The researchers would like to express deep indebtedness and appreciation to all the respondents who were willing to participate in the survey in spite of their busy schedule. Their contributions to this research are sincerely appreciated and acknowledged. The researchers' gratitude also extended to family and friends for their support and sacrifices. This research would not succeed without them.

Universiti Malaysia Kelantan,
Malaysia

Email: syafiq@gmail.com; nhanum@umk.edu.my

Abstract

The research is aimed to examine the factors that influence e-wallet usage among generation Y in Malaysia. The study examines the adoption of E-wallet by including independent variables of privacy and safety, perceived usefulness, convenient to use and social factor with the aid of The Technology Acceptance Model (TAM). Target respondents that included in the research are generation Y in Malaysia where age average 24 to 39 years old by collecting data with a total of 137 sets of survey questionnaires. SPSS version 25 is used to assist in our data analysis along the research. The quantitative methodology is adopted for this study and the result concluded that the independent variable of privacy and safety, perceived usefulness, convenient to use and social factor have significant relationship toward e- wallet usage among generation Y in Malaysia.

Keyword: E-wallet usage; Generation Y

1 Introduction

Nowadays, Payment is the movement of money, products or services in return for goods and services in appropriate quantities that have already been settled upon by all the parties concerned. Pay instrument is one of the payment systems for electronic graphics. It can be likened to a method that helps to achieve a mission. Tools make it really convenient. It can be described as a means of payment for services or products through electronic means without the use of cash or checks. That is also known as an automated banking device or an electronic payment system. The root of digital payment is related to the beginning of the Internet, which has transformed the environment like never else. If the internet weren't there, there wouldn't be e-services and retail retailers. The history of the Internet started in 1969 with the Advanced Research Projects Administration Network (ARPANET), a combat network that was intended to be a contact network during the Vietnam War. However, a significant turning point happened in 1989 when Tim Berners-Lee found the so- called "pages" or "places" that made it simpler to view and publish knowledge on the Internet (Angela, 2016).

The integration of multifunctional electronic devices, the payment system and the rise of wireless telecommunications have changed the means of purchasing in the western world, in addition to cards and currency. However, the e-wallet has now become the next big change in payment technology. In Malaysia, there are two main e-payment systems have been used is the large value payment system

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

(SIPS), which involves the real time electronic transfer and securities system (RENTAS).

E-wallet is one of the payment methods used in multi-functional electronic devices to store money and purchases online and offline on any smart device. Consumers can only load the funds into a virtual wallet in order to continue to enjoy the services. Contrarily to holding cash or checks, users literally store payment details on smart devices. Some e-wallets use QR code scanning to create links between customers and vendors, others use near-field communication NFC while others are confined to internet transactions. The strongest advantages of e-wallet is the immediate payment that would be approved within seconds relative to any other e-payment that could take longer, within hours or business days (Valchev, 2019).

Nowadays, e-wallet have been sprouting in Malaysia over the last few years. There are 40 e-wallet licences issued by Bank Negara Malaysia. The country's central bank aims to make Malaysia a cashless nation by 2020, with electronic transfers as a payment transaction. Generation Y consumers remain a remarkable group in the world economy (Noble, Haytko & Phillips, 2009). Chaston (2009) said Generation Y is the largest consumer group of any economy. According to Branchik (2010), Generation Y is worth the interest of both marketing professionals and analysts because of its purchasing power and scale. Therefore, this study conducted to measure factors that influence e-wallet usage amongst the majority of digital technology users is generation Y. The research is based on the TAM model which has been widely used in the technology adoption studies.

2 Literature Review

Technology Acceptance Model

The Technology Acceptance Model (TAM) was created by Fred Davis in 1986 and primarily tailored to model users' acceptance of new product information structures or technologies. The purpose of Davis (1989) TAM is to understand the general determinants of technology adoption that contribute to an understanding of consumer activity over a large variety of end-user software technologies and user populations. The study centred on the Technology Acceptance Model established by Venkatesh and Davis (1996) after the core results of both perceived value and perceived ease of use were found to have a direct effect on purpose, removing the need to establish an attitude.

The two essential principles in TAM are perceived utility and perceived ease of use. TAM further postulates the perceived simplicity of usage stimuli perceived utility that the simpler it is to use a single platform e-payment method, the more beneficial it is to be perceived by the single platform e-payment system. There are empiric analyses of TAM, including this association, and the results share a significant connection between these two variables (Moon and Kim, 2001; Van der Heijden, 2003; Shih, 2004).

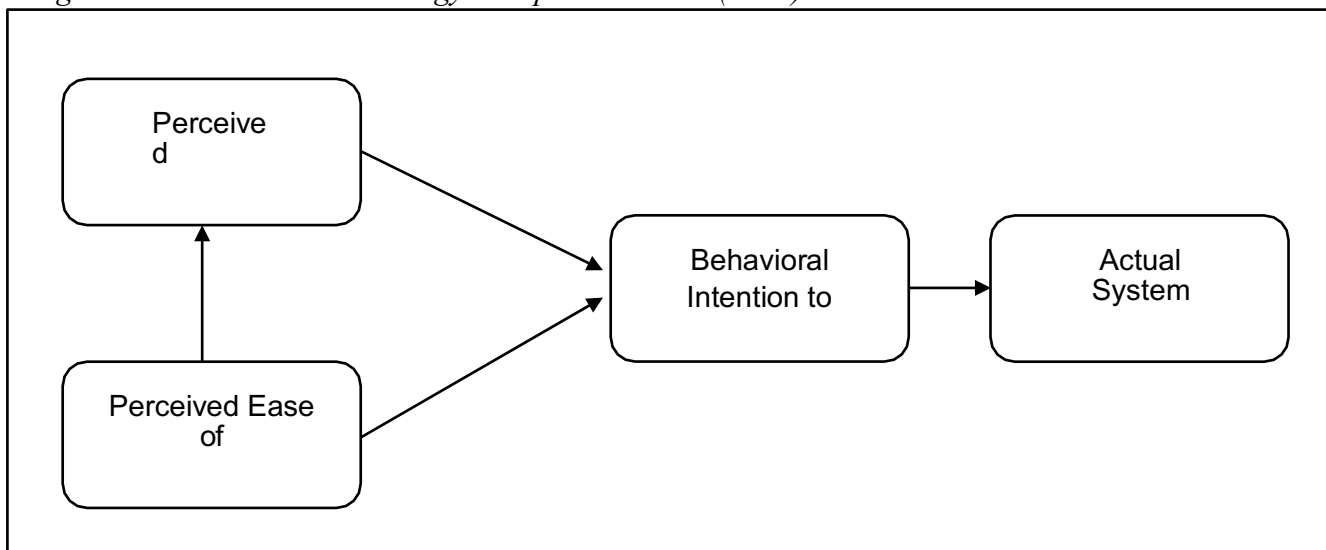

The theories have been developed to explain the consumer's intention to use technology. TAM models have been widely discussed in a variety of literatures (Davis, 1989) and it is in reality the philosophy of communication systems that model how people implement and use a specific technology (Dauda, et al., 2015). A number of researchers have expanded the TAM paradigm and adapted it to a range of innovations, including e-learning (Cheung and Vogel, 2013; Al-Marroof

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

and Al-Emran, 2018), m-commerce (Barry, et al., 2018) and quick messaging services (Muk, et al., 2015). TAM is known to be well-recognized extensions of empirical science to research the adoption and use purpose of new technology (Aydin, et al., 2016).

However, the initial TAM variables do not adequately represent the key biases that influence customer perceptions towards e-shopping. Privacy and safety is one of the expanded variables considered to be positive for social intention to use emerging technologies (Barry, et al., 2018). Centered on the aforementioned assertions, this analysis uses privacy and protection as one of the expanded variables (Barry, et al., 2018) to examine the behavioural purpose of using an e-wallet. The remaining two factors are interpreted as utility and ease of usage.

Figure 1: Framework Technology Acceptance Model (TAM)

Source: Davis et. al. (1989), Venkatesh et. al. (2003)

Privacy and safety

Past studies have shown that privacy is defined as an individual's right to directly control self-relevant details (Cliquet et al., 2015). Wang (2005) reported that privacy and safety have a direct connection with customer adoption of technology. Luan and Lin (2005) claimed that the intention of consumers to use mobile banking is highly influenced by privacy and safety. Their results have showed that privacy and safety have a greater effect on customers' decisions to use mobile banking than perceived utility and ease of usage. Since the effect of perceived reputation on the decision to use online technologies is strong, this design is difficult to overlook in this analysis.

Furthermore, according to the Marimuthu and Roseline (2020) the e-wallet has gained prominence due to effortless transactions, but still lack of knowledge and understanding among citizens and fear of transactions due to security issues are main factors that need to be considered. Customers can not trust the information system vendor and will hesitate to make any transaction through e- payment unless privacy and protection features are involved (Gitau, et al., 2014). Customers with

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

little expertise in the area of technology usage may have privacy and safety issues. Since the exponential growth in technology and its security issues are of significant concern to consumers who use smart technology for purchases. Ahmad et al. (2010) suggests that owing to the accelerated development of technology, consumers have been increasingly worried with privacy and safety concerns and that this has led to their reluctance to reveal their financial information (i.e. debit or credit card details) on the Internet and on e-commerce pages.

Perceived Usefulness

From various researches, perceived usefulness is one of the variables built in the technology acceptance model (Davis, 1989), while the TAM model is focused on the theory of reasoned action (TRA) (Ajzen & Fishbein, 1980) which seeks to understand the actions and purpose of using technology. From the point of view of TAM, perceived usefulness is described as the degree to which an individual believes that using a particular application can improve his or her success experience (Redzuan et al., 2016). In other terms, while the application is strong in perceived usefulness, it contributes to a favourable usage partnership where customers will use it again and favour it over other payment methods (Umek, 2016; Davis, 1989).

In addition, according to the diffusion theory Rogers (1995), consumers are able to consider innovations if inventions have some benefits over current solutions. Dependent on the TAM sense, this is expressed in the construction of perceived usefulness. According to Davis (1989), usefulness is described as the degree to which an individual believes that using a device can increase the efficiency of his or her work. Several current study experiments have tested the effect of perceived usefulness on plan to use. Wong and Hiew (2005) observed that the usage of mobile commerce is strongly influenced by the usability of mobile devices, including customization, ubiquity, localization, timeliness and network stability. This construct also illustrates how mobile payment systems will help users meet the goals of their tasks, such as productivity and efficacy. Previous research, identified a favourable association between perceived usefulness and actual propensity to use electronic textbooks (Baker-Eveleth and Stone, 2015; Stone and Baker-Eveleth, 2013), wireless service providers (Abbas & Hamdy, 2015), internet travel platforms (Li & Liu, 2014).

Convenient to use

In general, convenience may also be characterised as an individual's desire for a convenient product or service and a means of deciding if the good or service is easy, it relies on time and commitment (Khrais, 2017). This can involve the mental and physical work involved in the process and are deemed convenient if it saves time or decreases the cognitive, emotional and physical stress on the customer (Ambali & Raufu, 2014). Moreover, many consumers wishing a service to be short and convenient have often related to the definition of convenience (Tai & Liu 2015). Lai and Ariffin (2015) claim that it provides a convenient and fast way to perform basic online transactions. There are many e-payment systems in recent times, one of which is e-wallet payment. In other terms, since consumers will spend less time and resources to facilitate a purchase, the relative utility of the payment system is higher. In addition, according to the Barry and Jan (2018) showed that the positive and significant impact of convenient usage on perceived utility and perceived use on behavior intention to use a specific system was positive and significant.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Paripunyapat & Kraiwanit (2018) also mentions in their Bangkok research that simplicity and pace are the key factor why the implementation of financial technology is gaining popularity.

Social factor

As the past researcher pointed out, social factor have a major role to play in different aspects of human behaviour, such as product and service use. One mainstream in social impact science, social contagion theory claims that individuals in the same social community are behaving in the same manner and that customers prefer to obey what their peers and family choose (Herrera, Armelini & Salvaj 2015). These forms of power can be seen as local knowledge which drives actions in certain respects, such as how people create lifestyle decisions and desires, and as they hear more about them, they are considered to be more useful than others (Lwoga & Lwoga, 2017).

This is attributed to a person's understanding of the need to behave in a certain manner to satisfy societal expectation, and individuals adjust their ideas and behaviour to meet the expectations of a social community (Haderi & Aziz, 2015). According to Stockman (2017), citizens want to behave, even though they are not themselves supportive to its effects, if they believe that one or more significant referents think that they can use the new framework as an e-wallet, which allows them enough willing to cooperate with the referents. Under the social advice paradigm of Zhang et al. (2016), social factor may be classified as local and global in order to influence e-wallet usage.

H1. There is a significant relationship between privacy and safety and e-wallet usage among generation Y in Malaysia.

H2. There is a significant relationship between perceived usefulness and e-wallet usage among generation Y in Malaysia.

H3. There is a significant relationship between convenient to use and e-wallet usage among generation Y in Malaysia.

H4. These is a significant relationship between social factor and e-wallet usage among generation y in Malaysia.

3 Research Methodology

This study highlighted the factors that influence e-wallet usage among generation Y in Malaysia. Therefore, a quantitative methodology was adopted for the present study. Quantitative approach is to illustrate objective and statistical, analytical or computational data analysis obtained by questionnaires using pre-existing statistical data using analytical techniques. (Babbie, 2009). The quantitative approach centred on collecting and generalizing numerical data through groups of people or describing a specific phenomenon (Mujis, 2010).

Besides that, this study also utilized questionnaires as a survey to the targeted respondents. The survey was carried out in the generation Y group that is age range starting from 24 years old to 39

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

years old were born between 1981 to 1996. The consumers at this age mostly make purchases which are often required to make a payment for every purchase of a product or use of a service. Respondents included both male and female who are Malaysian citizens within the generation Y group. Hence, the data sampling population is therefore between 24 and 39 years of age who tend to make payments on every purchase of products and services.

Furthermore, this study were selected using the judgmental sampling technique. Researchers often believe that they can obtain a representative sample by using a sound judgment, which will result in saving time and money” Black (2009). Judgmental sampling is a non-probability sampling method and it occurs when “elements selected for the sample are chosen by the judgment of the researcher. Judgmental sampling technique may prove to be effective when only limited numbers of people can serve as primary data sources due to the nature of research design and aims and objectives Saunders, Lewis and Thornhill (2012). Judgmental sampling is one of the most cost- effective and time-effective sampling methods available. This data was analyzed using Statistical Packages for the Social Sciences (SPSS) version 25.

4 Finding and Discussion

Demographic Profiles of Respondent

Demographic	Frequency	Percentage
Gender Male Female		
Total	84	61.33%
	53	38.7%
	137	100%
Age		
24-29 years old	102	74.5%
30-35 years old	33	24.1%
36-39 years old Total	2	1.5%
	137	100%
Ethnicity Malay Chinese Indian	116	84.75
Total	14	10.2%
	7	5.1%
	137	100%
Status Single Married		
Total	108	78.8%
	29	21.2%
		100%

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

Current Level Monthly Spending Using E-wallet		
Below Rm 150.00	63	46.0%
Between Rm 151.00 to Rm 250.00	58	42.3%
Between Rm 251.00 to Rm 350.00	10	7.30%
Between Rm 351.00 to Rm 450.00	5	3.60%
Above Rm 451.00 Total	1	0.70%
	137	100%

For the present study, there are 84 male respondents which was (61.3%) of the population and the balance of the respondents are female which is (38.7%) which consisted of 53 respondents. Based on table 4.3.1 and the figures 4.3.1, the difference between both genders were 31 people which was (22.6%). Next, three stages of age in our research questionnaire which was 24 to 29 years old, 30 to 35 years old, and 36 to 39 years old. The majority of 102 respondents which was (74.5%) of the population were from the age of 24 to 29 years old. For the age of 30 to 35 years old, 33 respondents were involved which was (24.1%). For the next stage of age 36 to 39 years old who contributed 2 respondents which was (1.5%). Besides, 3 types of ethnicity listed in the questionnaire which is Malay, Chinese, Indian and Others. Based on Chart 4.3.3, Malay respondents are taking the lead which is more than half of the respondent and consisted of 116 (84.7%) people. Followed by chinese respondents which was 14 (10.2%) of the respondents. Indian respondents were in third place by 7 people (5.1%). Furthermore, the status of the respondents consisted of single and married. From the figures 4.3.4, (78.8%) of the population which is 108 of the respondents were single and the rest of the percentage which is (21.2%) or 29 of them were married. Finally, the current level of monthly spending using e-wallet. Out of 137 respondents, there were 63 (46.0%) respondents monthly spending using e-wallet below Rm150.00, 58 (42.3%) respondents monthly spending using e-wallet between Rm151.00-Rm250.00, 10 (7.3%) respondents monthly spending using e-wallet between Rm251.00-Rm350.00, followed by 5 (3.6%) respondents monthly spending using e-wallet between Rm351.00-Rm450.00 and 1 (0.7%) respondent monthly spending using e-wallet above Rm 451.00.

Overall Reliability Analysis

Variable	Number of Item	Cronbach's Alpha	Strength of Association
E-wallet usage	5	0.890	Good
Privacy and safety	5	0.898	Good
Perceived usefulness	5	0.822	Good
Convenient to use	5	0.885	Good

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

Social factor	5	0.815	Good
All	25	0.967	Excellent

According to the reliability test for all variables at table 4.5.1, it shows the result of the reliability test on both independent and dependent variables which is e-wallet usage, privacy and safety, perceived usefulness, convenient to use and social factor. There are 25 questions used to test for these variables and the researcher uses likert scale to measure the questions. Cronbach's Alpha for both independent and dependent variables show 0.967 which is considered as excellent, which means that this variable is reliable.

Cronbach's Alpha value of privacy and safety showed 0.898 which is the highest value among all the variables. This indicated that perceived usefulness is the most reliable variable compared to others. Besides that, the variable of e-wallet usage showed that the Cronbach's Alpha value is 0.890 which falls under 0.9 to 0.8. Followed by the convenient to use and perceived usefulness which show the Cronbach's Alpha value for each variable is 0.885 and 0.822 respectively. Also followed by social factors which show Cronbach's Alpha value is 0.815. Thus, these five variables have the same level of reliability with the speed which is under the good reliability level. Based on the result of Cronbach's Alpha, all the values were between 0.8 and 0.9. It can be defined as these variables had a good reliability and fulfilled the requirement of the Cronbach's Alpha.

Normality test

Tests of Normality						
	Kolmogorov-Smirnov ^a			Shapiro-Wilk		
	Statistic	Df	Sig.	Statistic	df	Sig.
Privacy and safety	.173	137	.344	.635	137	.506
Perceived usefulness	.117	137	.093	.720	137	.000
Convenient to use	.176	137	.117	.789	137	.639
Social factor	.121	137	.046	.718	137	.000

a. Lilliefors Significance Correction

Data normality was tested and analyze by SPSS system Kolmogoroc-Smirnov Test and the Shapiro-Wilk Test. The Shapro-Wilk Test is more appropriate for small sample size which is lower than 50. But, it also can handle a large sample size such as 2000 samples. For this reason, the researcher used the Shapiro-Wilk Test as assessing normality of the data. In this method, if the Sig. value of the Shapiro-Wilk Test is greater than 0.05, the data can interperate as normal.

Based on Table 4.6.1, it is shown that the result of the normality test is Kolmogorov- Smirnov and Shapiro-Wilk. In both tests, there are two the significance of privacy and safety is .506 and

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

convenient to use is .639 that shown in the table is more than 0.05. This show normality test using SPSS was normal data. Meanwhile, there are two the significance of perceived usefulness and social factor. The p-value of this independent variables was 0.000 which is less than 0.05, ($p < 0.05$). The result shows that the data do not follow a normal distribution. Therefore, the null hypothesis for this variable is rejected.

5 Conclusion and Limitations

The results and finding of this research, facility providers and entrepreneurs could get some guidelines from the findings to provide more efficient services. Moreover, existing businesspersons can pay attention to the element that will improve E-wallet services while for future entrepreneurs can have estimation on what the consumer desires in E-wallet. Furthermore, financial institutions can improve privacy and convenience of transactions in order to increase attraction of consumers in adoption. Through this, they will be able to increase their ability in order to compete with others in the market. From this research, future studies can use this research as a reference to carry out their future research.

However, there are some limitations in this research. In the research, the target audience only focuses on generation Y in Malaysia. Second, this study only focused on comparing the gender difference rather than the field of study. In future study, researchers are recommended to expand the range of age and involve different education levels of target audiences. Besides, this research proposed that fields of studies should be included in future study and make comparison toward adoption of E-wallet.

MEASURING THE EFFECTIVENESS OF PROMOTIONAL SCHEMES AT RETAIL STORES AMONG AMPANGAN, SEREMBAN CONSUMER

Muhammad Syahiman bin Azahar and Md Zaki Bin Muhamad Hasan

Faculty of Entrepreneurship and Business,
Universiti Malaysia Kelantan,
Malaysia

Email : ssyahiman@gmail.com; zaki.mh@umk.edu.my

Abstract :

Promotional schemes is a temporary discount on one or more products. Promotional schemes help businesses become successful as lower prices for a limited period of time to attract more customers. The idea is to make people aware, attract and induce to buy the products. The study aim to develop conceptual framework using promotional schemes theories to measuring the effectiveness of promotional schemes at retail stores among Ampangan, Seremban consumer. Three independent variables were selected for this research namely: sales promotion, personal selling and advertising. This study was conducted using quantitative research and 303 respondents among the residents of Ampangan, Seremban area were selected for data collection. All responses were analyzed with SPSS software. The results show that the three independent variables in this study are related to the effectiveness of promotional schemes in retail stores in Ampangan, Seremban. This study is important for future researchers if they intend to study which promotional scheme is more influential for consumers.

Keywords: Advertising, Personal Selling, Promotional Schemes, Sales, University Malaysia Kelantan

1 Introduction

Basically promotional schemes for business is an activity to increase the quantity of goods purchased in business by the organization. However, there are several techniques that can be used to achieve that goal, one of which is sales promotion (Palmer, 2004). Promoting products and services are one of the main instruments of marketing activities in any company and stores. Companies now have a large number of promotional methods and techniques, so they need to adapt well to mixed elements of promotional schemes including as advertising, catalogue sales, sales promotion, internet marketing and personal selling to consistent and reliable messages in the market (Jobber and Fahly, 2006).

However, according to some of authors, the key element of promotional mix is sales promotion (Blattberg and Neslin, 1990; Oyedapo, Akinlabi and Sufian, 2012; Palmer, 2004). This is why the need to explore the importance and effectiveness of sales promotion is set as a necessity. As we know that there are many ways to increase business sales by implementing various methods of promotional schemes tools including promotion and advertising. The majority of marketers think that the products they produce have their own price or value, and they use promotional schemes as a way to change this price mix by increasing the value or reducing the value assessed with additional components of the marketing mix such as advertising, personal commerce and publicity). Much research has been done on the promotion of sales worldwide, in developed countries and the developing countries. Sigue et al, (2008) found that sales promotion tools are for consumers and retailers; Zhang et al, (2008) evaluated three thoughtful effects in the context of major media namely television, internet and newspapers. There are also various platforms to promote sales using mass media or the internet. By using this method, the promotion conducted is more effective and fast to attract customers. Therefore, sales revenue will increase more rapidly. However, with regard to research conducted in Malaysia, there are many academic

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

articles, which usually refer to insufficient resources.

A highly competitive environment forces sellers to use different and effective marketing tools and strategies to attract new customers and thus increase their profits. Sales promotion is one of the best tools to attract new customers and gain the trust of old loyal customers including marketing activities to add value to the product for a limited time, to stimulate consumer purchasing and intermediary effectiveness. According to Palmer (2004) distinctive, they offer additional incentive to buy. Gilbert and Jakarta (2002) show that sales promotion consists of several highly varied short-term promotional tools designed to generate good and desired response from customers. The growing interest in the use of sales promotion as a marketing strategy or tactics has led to great growth in research in this field.

According to J. Stiincamp (2005) promotional schemes help to increase consumer sensitivity, evoke a desire to switch between brands, which further increases brand popularity. Sales promotion usually lowers the price of product in larger quantities purchased. This will result in the value of product price felt by the customer leading to the purchase decision initiative. The step by step promotional schemes are urged more in order to achieve quick results, but should be combined with other things to increase sales as well. These promotional combination tools not only help build customer loyalty to the brand but also drive increased sales. To survive in today's serious competition situation, sellers also use other marketing activities such as advertising, community relations, personal sales and direct marketing.

1.1 Research Objectives

The objective of this research is :

To identify effectiveness of promotional schemes towards consumer attracted among consumer in Ampangan, Seremban.

To investigate things that affect of customer mind towards promotional schemes among consumer in Ampangan, Seremban.

To investigate the impact of promotional tools on consumer satisfaction and type of offer that attract them most among consumer in Ampangan, Seremban.

To identify the internet marketing instrument that most effective on customer among consumer in Ampangan, Seremban.

1.2 Significance Study

Customers

This is because customers can know a quality of the product with the promotion or discount made. This can give new customers confidence in an existing product. They can choose whether to buy a new product or an old product. Therefore, customers will be able to buy more affordable products in their view

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Researcher

This study can be a reference for future researchers who want to do research on this topic. This study is also reliable and important for postgraduate and undergraduate students as a reference in doing their assignments or research and even for future business.

2 Literature Review

2.1 Independent Variables

Sales Promotion

Sales promotion is defined as compilation of varied driving tools usually short-term, designed to drive faster purchases and / or ideal of a particular product or all users (Kolter, 1999). Mendez et al. (2015) reported that sales promotion is the beginning of a good and systematic technique for acquiring marketing communications. According to Ahmad and Fatawu (2014) sales promotion increases the competition between the provision of mobile network services so as to convince sellers in manufacturers to offer quality services to their customers thus earning more profit for their consumers. Totten & Block (1994) asserts that sales promotion phrases refer to various types sales incentives and planned ways to have a direct or short-term sales effect. According to Peattie and Peattie, (1994); Lehman and Winer (2002) and Walsh (2000) argue that sales promotion can be termed a 'special provision'.

Personal Selling

Personal sales are straight verbal communication between the seller and possible customers, normally in person but occasionally over the phone. Personal sales functional as a communication path between the organization and the community. It is effective because it allows straight two-way communication between consumers and vendors. This gives organizations a greater chance of researching their user needs and greater pliability in their offerings to meet these needs (Perreault and McCarthy, 2000; Doyle and Stern, 2006). Examples of good personal selling are available at perfume and cosmetics department stores. Customers can continue to inquire about the product. Expensive products are often sold using personal sales.

Advertising

Advertising can be defined as any form of paid strategic communication by an identified sponsor that aims to inform and convince the recipient of the object of the advertisement and traditionally it is delivered through time spent in the media (Thorson & Rodgers, 2012). In economic terms, advertising is a subcategory and the most important part of all brand- promoting activities. In addition, price or other forms of marketing communication such as personal sales. Advertising plays a variety of important social roles (Fennis & Stroebe, 2010, pp. 5–6; Tellis, 2004, pp. 3–5).

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

2.2 Research Hypothesis

A research hypothesis is the statement created by the researcher when they speculate upon the outcome of a researcher or experiment. A hypothesis is needed in the study at the core of its structure, as the ultimate aim of the experiment. There are few hypotheses have been predicted in this study:

H1: There is significant relationship between sales promotion and the effectiveness of promotional schemes on consumer in Ampangan, Seremban.

H2: There is significant relationship between personal selling and the effectiveness of promotional schemes on consumer in Ampangan, Seremban.

H3: There is significant relationship between personal selling and the effectiveness of promotional schemes on consumer in Ampangan, Seremban.

2.3 Theoretical Framework

Figure 1 show the theoretical framework on the measuring the effectiveness of promotional schemes at retail stores among Ampangan, Seremban consumer. There is two type of variables. The first variable is independent variables, which consist of sales promotion, personal selling and advertising. The second variable is dependent variable, which is promotional schemes.

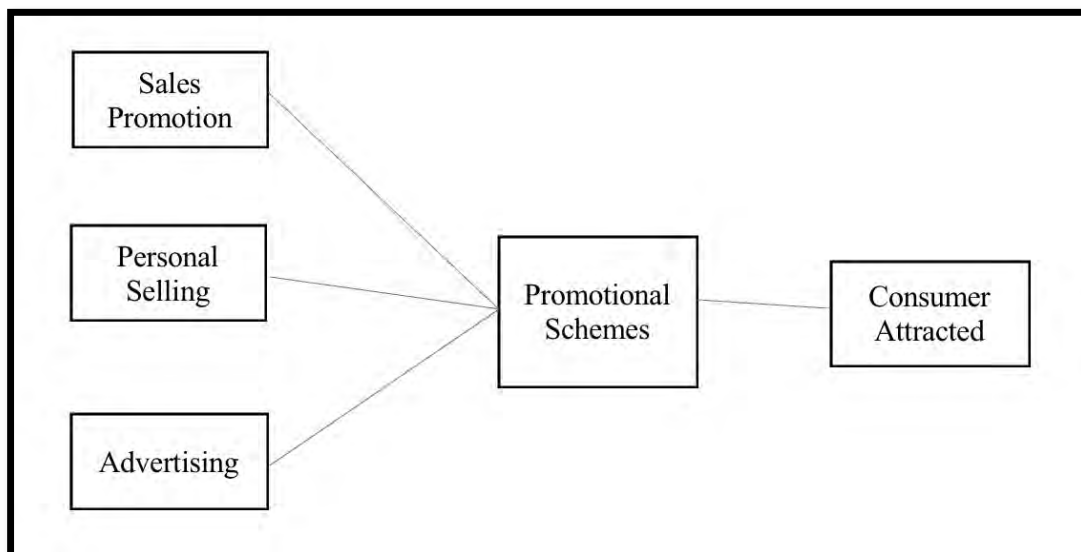

Figure 1: Theoretical Framework of measuring the effectiveness of promotional schemes at retail stores among Ampangan, Seremban consumer.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

3 Methodology

3.1 Research Design

Study design refers to the methods and methods used during research to analyze and gather all the information obtained (Burns & George, 2009). Sampling design will be used in this analysis to obtain important information as this study is to measure the objectives. In this research, quantitative approach will be used to define the variable that will effectiveness of promotional

schemes. It was, therefore, appropriate for us to utilize questionnaires in this research in collecting sampling data from a large number of target respondents.

3.2 Population

Population refers to the entire group of people, events, or interest that the researcher wishes to investigate. It is simple defined as the target audience for this study. This study is identifying the effectiveness of promotional schemes on consumer in Paroi, Seremban. Then the target population is the community who stay in area Ampangan, Seremban. According to the JPS District Johor Bahru, the total number or people in Ampangan, Seremban is 131,016. The total number of people in Ampangan, Seremban is known as population and it is denoted by “N”.

3.3 Sample Size

Researchers will use the non-probability sampling techniques for sample selection. The questionnaire is designed by using manually, through word and will be in google forms and distributed to the community in Ampangan, Seremban. The researcher will distribute the questionnaire to community, residential area and so on.

Table 3.1
Table for Determining Sample Size of a Known Population

N	S	N	S	N	S	N	S	N	S

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

3.4 Data Collection

Primary data are first-hand data obtained by a researcher using techniques such as surveys, interviews or experiments. It is directly obtained from primary sources with a studies project in mind. (Sekaran et. al., 2016).

In the research, primary data was collected through an online questionnaire survey. The questionnaires were distributed to consumer in Ampangan, Seremban who are 20 years old and above. The online questionnaire was chosen because it covers a wide geographical location, population environment and a wider range of occupations. The survey was made using Google Forms online distributed through social media platforms.

3.5 Sampling

Probability sampling was selected as a sampling design indicating that respondents tended to be attached to their selection as the sample subject. In sample collection, sampling is easy to choose because a quick and effective response can be obtained. It manages to obtain data from respondents who are willing to provide it easily.

3.6 Research Instrument

Questionnaires will be used as research tools in this study. Questionnaires are the best research tool to process the large number of respondents (Nardi, P.M, 2018). The questionnaire consists of four parts, namely part A, part B, part C and part D.

Part A consists of the background information of the respondents, among them are age, gender, race, status, occupation, salary and frequently visited stores. Meanwhile, in section B, C and D ordinal scale was effectiveness on promotional schemes and factors influencing consumer interest in promotional schemes.

3.7 Data Analysis Technique

Data analysis is the process of evaluating research data and to identify each component of the data that has been obtained. The data collected in this study will be interpreted using Statistical Package for Social Sciences (SPSS). Analysis of analytical data in this study using descriptive analysis method, Pearson correlation. and multiple linear regression analysis.

4 Data Analysis and Findings

4.1 Demographic Profile

The demographic profile of the respondents included the information of gender, age, race, status, monthly income, shop most visited. It is shown that the age gap of our respondents in Ampangan, Seremban. Among the 303 respondents, the majority in this age there were only 143 respondents (47.2%) who were 20 years old to 30 years old. Follow with age between 31 years to 40 years which has a total of 55 respondents (18.2%). Next, aged between 40 years to 50 years with a total of 47 respondents (15.5%). Finally, that aged 50 years and above had a total of 58 respondents (19.1%).

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Gender shows that a total of 136 (44.9%) respondents in the research are male, of which the remaining 167 (55.1%) respondents are female.

There race a total of 268 respondents (88.4%) are Malay. Next is the Chinese respondents, which consists of 13 respondents (4.3%). Followed by the majority of respondents were Indian, consisting of 11 respondents (3.6%). Finally, there are only 11 respondents from other races.

Status shows that a total of 159 (52.5%) respondents in the research are single, of which the remaining 144 (47.5%) respondents are married.

It is shown that the income per month gap of our respondents in Ampangan, Seremban. Among the 303 respondents, there were only 119 respondents (39.3%) were below <1000 per month. Follow with that between 1001-2000 per month which has a total of 71 respondents (23.4%). Next, between 2001-3000 per month with a total of 34 respondents (11.2%). Finally, that above 3000> had a total of 79 respondents (26.1%).

It is shown that the most people visited. Among the 303 respondents, there were only 74 respondents (24.4%) were went to hypermarket. Follow with that supermarket which has a total of 147 respondents (48.5%). Next, convenience store with a total of 19 respondents (6.3%). After that, mini market with a total of 18 respondents (5.9%) . Finally, that went to family store had a total of 45 respondents (14.9%).

4.2 Descriptive Analysis

The descriptive analysis tested 4 variables consisted of dependent variables and independent variables. A summary of the mean and standard deviation is listed in table 4.7. Based on the summary, the highest mean value is from advertising which is 4.3245 where respondents agree more on this variable while the lowest mean value is on the effectiveness of the promotion scheme which is 4.2614 which shows respondents agree lower for the variable in this analysis. The data set of 303 respondents with a standard deviation of less than 1, showed a more reliable value.

Table 4.7 : Dependent Variable (DV) and Independent Variable (IV)

	N	Mean	Std. Deviation
Promotional Schemes (DV)	303	4.2614	.45492
Sales Promotion (IV)	303	4.2921	.44763
Personal Selling (IV)	303	3.9164	.71640
Advertising (IV)	303	4.3245	.53905
Valid N (Listwise)	303		

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

4.3 Pearson's Correlation Analysis

In this section, Pearson Correlation Analysis will examine that whether the independent variables, is sales promotion, personal selling and advertising are statistically significant with the promotional scheme, are dependent variables. In this case, researchers have used Pearson Correlation Analysis (two-sided test) to investigate the relationship between consumer and the effectiveness of promotional schemes. The table below shows the interpretation of the coefficient of strength with the variables Guilford and Fruchter (1973)

		Correlations			
		PSc	SP	PS	ADs
PSc	Pearson Correlation	1	.969**	.445**	.603**
	Sig. (2-tailed)		.000	.000	.000
	N	303	303	303	303
SP	Pearson Correlation	.969**	1	.530**	.683**
	Sig. (2-tailed)	.000		.000	.000
	N	303	303	303	303
PS	Pearson Correlation	.445**	.530**	1	.664**
	Sig. (2-tailed)	.000	.000		.000
	N	303	303	303	303
ADs	Pearson Correlation	.603**	.683**	.664**	1
	Sig. (2-tailed)	.000	.000	.000	
	N	303	303	303	303

** . Correlation is significant at the 0.01 level (2-tailed).

According to Table, the correlation is significant at the 0.01 level, which means there is less than one in a hundred chances to be wrong when testing the hypothesis. Sales promotion reached its highest correlation at 0.969, followed by advertising at 0.603, and last personal selling at 0.445.

4.4 Normality Test

Quantitative plots, Q-Q plots, or short QQ plots are popular plots among plot forms to check the distribution of data samples. The researcher will compare the ideal sample distribution when the plot is produced. The opposite of the standard normal cumulative versus the compiled observations shows in the plot. The point will be made in a straight line when the underlying data distribution is normal.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

4.5 Summary

From the data, the findings will be analyzed and a number of solutions and recommendations can be made. In addition, Pearson correlation analysis was used to identify the strength of the relationship between the dependent and independent variables. The results show that a moderate positive correlation result has been achieved by both of these variables. The hypothesis of this study was also tested at the end of the chapter and the results of the hypothesis showed that there was a significant relationship between consumer attracted and the effectiveness of the promotion scheme.

5 Discussion and Recommendation

This study was conducted to measure the effectiveness of promotional schemes at retail stores among Ampangan, Seremban consumer. Among the available promotional schemes, researchers choose to check are personal selling, sales promotion and advertising. The main purpose of this study is to determine the promotional scheme that affects consumers in Ampangan, Seremban. For this study, primary data were handled using a set of questionnaires to obtain responses from respondents consisting of residents in Ampangan, Seremban. According to the wikipedia website, the population in Ampangan, Seremban in 2019 is 130,823 people. This study analyzes how promotional schemes such as personal selling, sales promotion and advertising affect consumers in Ampangan, Seremban.

In this research, the effectiveness of the promotion scheme is influenced by 3 variables. The data collected in this research is very useful and beneficial to help retail stores in Ampangan, Seremban to understand what are the factors that can affect business performance and continue to improve these factors.

To increase the promotional scheme in retail stores in Ampangan, Seremban must continue to improve the quality of their services so that customers are satisfied. Improving quality will keep the business growing. A large number of respondents are in the area and the age of the population is between 20-50 years and above in this finding. This research can see the possibility of a store surviving and the possibility of transforming into a larger company in the future.

To increase customer satisfaction, store managers or employees can examine the impact of business decisions on sales promotion networks by increasing the promotional methods and prices offered by them, as the majority of respondents have agreed with statements on sales promotion can ensure effectiveness for sales promotion operations in retail stores. Furthermore, for personal selling, the majority of respondents have agreed that this personal selling method or face-to-face method will provide effectiveness to retail stores in Ampangan, Seremban, and therefore, will encourage all retail stores to use this method to facilitate users who visit. Finally, for advertising, which means most respondents agree that retail stores that use this method of advertising are able to maintain and always be effective in a business. Therefore, it encourages retail stores to continue to use this effective method to attract the attention of consumers and customers such as displaying billboards or advertisements in the mass media for customers to make an assessment.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Moreover, time constraints are the biggest problem for researchers to obtain accuracy in data collection. Using the questionnaire method, all responses were analyzed to test the hypothesis of the relationship between the dependent variable and the independent variable. From here, there is no one-sided or always-scanned answer scans for each query as the time required may be required to resolve all of these errors. Future research can extend the time to compile actual data and analyze only the perfect random scale answered.

Finally, relevant parties such as the population of Negeri Sembilan should provide specific statistical data of the population in Ampangan, Seremban. This party plays a key role in collecting certain statistical data and avoiding outdated data age because researchers need the latest information. This will influence the results to infer hypotheses on how retail stores performance depends on sales promotion methods to grow their business in the future.

5.1 Conclusion

The main purpose of this research is to measuring the effectiveness of promotional schemes at retail stores among Ampangan, Seremban consumer. A total of 303 sets of questionnaires were distributed to the target respondents in completing this research. In the final step of the research, all questions and objectives of the research have been answered and achieved during the data analysis in Chapter 4.

Overall, Pearson Correlation Analysis has shown that all variables including sales promotion, personal selling and advertising have a significant positive correlation with the promotional scheme in retail stores Ampangan, Seremban, where sales promotion has reached the highest correlation at 0.969. In addition, all hypotheses were tested, where all hypotheses including sales promotion, personal selling and advertising were accepted, which means that sales promotion, personal selling and advertising have a significant relationship with the effectiveness of promotional schemes in Ampangan, Seremban retail stores.

Finally, the researchers also discussed some of the limitations encountered while conducting research, as well as some suggestions for improvement for future research. In conclusion, researchers have expected the purpose of this research findings is to provide insight to retail stores in Ampangan, Seremban in improving their business performance.

Acknowledgement

First of all, we would like to express our appreciation to our supervisor, Dr. Mohd Zaki, Lecturer of Faculty of Entrepreneurship and Business, University Malaysia Kelantan. She continuous give fully support for us in this final year research project with her knowledge, patience, and motivation. Her advice gives us a direction in writing this final year research project all the time. The guidance from Dr. Mohd Zaki also helps us improved our knowledge in making research.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Besides the supervisor, we would like to thank the office and knowledge management of University Malaysia Kelantan, which provides a place that full of material. We can find out the suitable material for writing the research project. It also provide a comfortable environment for us to discuss our research project together.

After that, we would like to extend our gratitude to my friends, who always gave me a lot of support and help to complete my research project. The friends can share me with their different ideas and knowledge of IT in writing the research project.

Last but not least, we feel thankful to our family. Our parents and peers always give us mental support in writing the research project. Their supporting helped us to release our stresses that gain from the processing of the research project.

**THE IMPACT OF CELEBRITY ENDORSEMENT IN SOCIAL
MEDIA THAT INFLUENCE CONSUMER PURCHASE
INTENTION AMONG STUDENTS IN UNIVERSITY MALAYSIA
KELANTAN CITY CAMPUS**

Natasya Farhana Nia Binti Muhammad Busrak and Noorshella Binti Che Nawi

Faculty of Entrepreneurship and Business,
Universiti Malaysia Kelantan,
Malaysia

Email: natasya.a17a0308@siswa.umk.edu.my; norshella@umk.edu.my

Abstract:

In order to analyze the impact of celebrity endorsement in social media that influence consumer purchase intention among students in University Malaysia Kelantan City Campus, this study outlines four objectives, first, to identify the influence between celebrity endorsement in social media from trustworthiness aspect and consumer purchase intention. Second is to study the influence between celebrity endorsement in social media from expertise aspect and consumer purchase intention. Third is to determine the influence between celebrity endorsement in social media from familiarity aspect and consumer purchase intention. To achieve all the objectives, the survey method was conducted on students in University Malaysia Kelantan City Campus. The results of the study found that there is a significant positive relationship between the impact of celebrity endorsement in social media and consumer purchase intention in University Malaysia Kelantan City Campus. So trustworthiness, expertise, and familiarity will affect consumer purchase intention in University Malaysia Kelantan City Campus. Future research could also use different methodologies such as focus group and interviews.

Keywords: Source Credibility Model, Source Attractiveness Model, trustworthiness, expertise, familiarity.

1 Introduction

Social media can be defined as an applications or sites that give users experienced to communicate and interact with each other, input about community-based, content sharing, and even collaborating with various people (Rouse, 2020). Nowadays, social media users among people not just only in Malaysia but in the whole wide world are very widespread. People tend to use social media such as Facebook, Instagram, and Twitter as a platform to discuss or argue about current issue. The use of social media in running business is also very widespread among the users. This is because social media can be used for market the products, promoting the brands, associate with current and potential customers, and encourage new business. Regarding the feedback from the customer, social media makes it simple to inform the organization and people about their experiences with that organization or company, regardless those experience are positive or negative. In running a business, getting consumer trust and confident are very important.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

The marketing from famous people is not new, however its fame has increased alongside the rush of social media (Wilcox, 2019). nothing can influence someone more than another person itself, and of course it is famous people who are more influencing (Smart Insights, 2017). It is critical in terms of attracting publicity and making strong recalls from consumers. Endorsements may be either be in the form of celebrity or a created spokesperson. The use of well-known and popular people to advertise and promote products is a common practise with a long tradition of marketing. The celebrity must be well recognised enough to increase the brand's visibility, image and reaction (Keller, 2013).

1.1 Research Questions

There are three questions in this research:

1. Does celebrity endorsement in social media from trustworthiness aspect influence consumer purchase intention?
2. Does celebrity endorsement in social media from expertise aspect influence consumer purchase intention?
3. Does celebrity endorsement in social media from familiarity aspect influence consumer purchase intention?

1.2 Research Objectives

There are three objectives in this research:

4. To identify the influence between celebrity endorsement in social media from trustworthiness aspect and consumer purchase intention.
5. To study the influence between celebrity endorsement in social media from expertise aspect and consumer purchase intention.
6. To determine the influence between celebrity endorsement in social media from familiarity aspect and consumer purchase intention.

2 Literature Review

2.1 Previous Study

There are three independent variables that will be determine by the definition under this research which are purchase intention, trustworthiness, expertise, and familiarity.

2.1.1 Purchase Intention

Purchase intention intends to buy is greatly influenced by external factors where the interest comes for certain reasons. It promotes more profitable businesses to the industry, particularly when they are satisfied with the production (Xiao, Yang, & Iqbal, 2018) Hence, purchase intention has been recognized as one of the most important parts of the business sector. It is also responsible for determining if a product meets the customer's expectations and needs to explore their assessment of goods and services further. More importantly, this is the key to promoting long-term business success, which helps keep customers and collect customer lifetime value

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

2.1.2 Trustworthiness

The level of certainty of the recipient in believing the message conveyed by the celebrity is the model of trust in communication (Abdulmajid & Wahid, 2012). Users are more willing to consider the product recommended by celebrities that they find reliable (Liu et al., 2015). People make meaningful purchase decisions based on their level of confidence in the goods, salesperson, and the business (Hosmer, 1995). The potential of celebrities to draw consumer interest has made it the most common promotional tactic among marketers. Celebrity endorsement space has grown dramatically over the past decade. Capitalizing on the celebrity fandom, driven by the immense impact of social media such as Instagram, Facebook and Twitter, has made it more strong than ever before. According to Tzoumaka, Tsiotsou, and Siomkos in 2016, found that celebrity trustworthiness is the only character of celebrity that affects the purchase intention. Celebrity-brand partnerships that associate with celebrities have given them the potential, as a trusted source for customers, to use their social media channel to affect customer belief in the brand-sponsored message (Kapitan & Silvera, 2016).

2.1.3 Expertise

The competence of the endorser is identical to the skill of the source, which strongly affects the degree of conviction for persuading customers to buy what is endorsed. Expertise has a favourable impact on purchase intention (Till & Busler., 2000). If a customer believes that a celebrity endorser has a high degree of competence, they are more likely to be swayed by the message in the commercial (Amos, G. Holmes, & D. Strutton, 2008). According to (Erdogan, 1999) the expertise may be obtained from the assumed accuracy of the claims made by the endorser. The level of expertise experienced by customers relies on their confidence in the source of knowledge and competence in the field of expertise. By using social media platform, celebrity interacted with their followers with professional experience, knowledge and personal observations that enables celebrities to display expertise and makes their followers feel extra confident about them (Kapitan & Silvera, 2015).

2.1.4 Familiarity

Familiarity refers to the degree of trust between the source and the customer, and familiarity implies that whether the source is viewed as "known" or has a relationship with the consumer, they are more positive and are more secure making a decision (Lee & Yurchisin, 2011). The source must be viewed as trustworthy in order for the information to have a preferred influence on consumers. The same principle often relates to online sales, as familiarity has a beneficial impact on online confidence and thus raises the probability of online purchases from a familiar store (Fanoberova & Kuczowska, 2016).

2.2 Conceptual Framework

Based on the conceptual framework, there are three factors that impact e-service quality on customer behaviour in online shopping at UMK Students. First is the website design, second is the customer service and lastly is the security/privacy which has contributed to the overall e-service quality.

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

Figure 2.1: The conceptual framework

3 Methodology

3.1 Research Design

In this research, quantitative method is selected because the data and information from this method is more efficient and capable to test the hypothesis. This research attempts to analyse the influence between celebrity endorsement in social media and consumer purchase intention using quantitative methods. The study used quantitative method following the survey methods conducted, and data were obtained using online questionnaire which is google forms and will be shared through social media platforms such as WhatsApp either it is groups or personal message, Facebook, Twitter, and Instagram.

3.2 Data Collection

There are two data collection methods that being used in this research which is primary and secondary data. In this study, the method used to get the primary data is questionnaires. Questionnaires are a list of questions that are either open-ended or closed-ended and answered by the respondents. It is the most widely used method in the survey to collect all relevant information. The secondary data that being used in this study are article, journal, internet, and textbook which identified with the research. It is to get more information about the study of celebrity endorsement that influence consumer purchase intention since the data can be obtained from various sources form secondary data.

3.3 Population

The target population in this research are students of University Malaysia Kelantan City Campus aged in between 18 years old and above. This samples then been further reduced to users who have social media account such as Facebook, Instagram, and Twitter and they followed celebrity on their social media. Researcher choose university's students as respondents in this study because nowadays students are more preferred to purchase items through online platform.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

3.4 Sample Size

The number of individuals in that age group who will be surveyed in this situation will provide the sample size. There were a total of 5,631 students in UMK City campus as of the year 2020. As proposed in the sample size of Krejcie and Morgan's table, a total of 364 sample would be suggested as appropriate for this research.

3.5 Sampling

For this study, the type of sampling used is non-probability sampling technique which is convenience sampling. The convenience sample is basically one in which the units chosen to be used in the sample are the most easily accessible. This is in contrast to the probability sampling methods, where the choice of units is rendered at random. As the aim of convenience sampling is easy access, researcher may simply choose to give the online questionnaire which is the Google Form and forward it to WhatsApp groups and personal message of UMK students where it would be easy to reach the many students to take part in the research.

3.6 Data Analysis

For this research, Statistical Package Social Science (SPSS) version 26 is being used to understand the data, analyse, forecast and plan about the study. The results are descriptive analysis, validity and reliability test, spearman's correlation and overall hypothesis testing.

4 Findings

4.1 Demographic Profile

Demographic analysis include gender, age, race, the frequency of connecting to social media per day, and consumer purchase that influence by celebrity. The data is gather from the students of University Malaysia Kelantan in Pengkalan Chepa. There are a total of 364 respondents but only 357 data of the respondents that being used in this study.

4.1.1 Gender

Table 4.1: Frequency Analysis of Gender

		Frequency	Percent (%)	Valid Percent (%)	Cumulative Percent (%)
Valid	Female	220	61.6	61.6	61.6
	Male	137	38.4	38.4	100.0
	Total	357	100.0	100.0	

Table 4.1 shows the gender of the respondents. From the total of 357 respondents, there are 220 female respondents which is 61.6% and 137 male respondents with the percentage of 38.4%.

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

4.1.2 Age

Table 4.1: Frequency Analysis of Age

		Frequency	Percent (%)	Valid Percent (%)	Cumulative Percent (%)
Valid	19-21 years old	91	25.5	25.5	25.5
	22-24 years old	252	70.6	70.6	96.1
	25 years old and above	14	3.9	3.9	100.0
	Total	357	100.0	100.0	

Table 4.2 shows the age of the respondents. There are three range of age that take part in the online questionnaire survey. The highest group age is 22-24 years old which is 252 respondents with the percentage of 70.6% and the lowest group age is 25 years old and above which is 14 respondents with 3.9%. For group age of 19-21 years old, it consists of 91 respondents with percentage of 25.5%. As a result, it shown that most respondents are in age between 22-24 years old

4.1.3 Race

Table 4.3: Frequency Analysis of Race

		Frequency	Percent (%)	Valid Percent (%)	Cumulative Percent (%)
Valid	Arabian	2	.6	.6	.6
	Chinese	7	2.0	2.0	2.5
	Indian	2	.6	.6	3.1
	Malay	346	96.9	96.9	100.0
	Total	357	100.0	100.0	

Table 4.3 shows the race of the respondents. From the 357 respondents, 346 of them are Malay with the highest percentage of 96.9%. 7 Respondents are Chinese with 2.0% and 2 respondents are Indian with the percentage of 0.6%. 2 respondents from other race is Arabian with 0.6%.

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

4.1.4 The frequency of user connecting to social media per day

Table 4.4: Frequency Analysis of User Connecting to Social Media Per Day

		Frequency	Percent (%)	Valid Percent (%)	Cumulative Percent (%)
Valid	4-6 times	13	3.6	3.6	3.6
	7-9 times	63	17.6	17.6	21.3
	More than 10 times	281	78.7	78.7	100.0
	Total	357	100.0	100.0	

Table 4.4 shows the frequency of user connecting to social media per day. From the 357 respondents, 281 respondents answer is more than 10 times with the highest percentage of 78.7%. 13 respondents chose 4-6 times with the lowest percentage of 3.6%. Meanwhile, there are 63 respondents that answer 7-9 times with 17.6%.

4.1.5 Consumer purchase that influence by celebrity

Table 4.5: Frequency Analysis of Consumer Purchase That Influence by Celebrity

		Frequency	Percent (%)	Valid Percent (%)	Cumulative Percent (%)
Valid	No	7	2.0	2.0	2.0
	Yes	350	98.0	98.0	100.0
	Total	357	100.0	100.0	

Table 4.5 shows the number of respondents based on their purchase that influence by celebrity. From the total number of 357 respondents, 350 respondents which is 98% answers is yes while the other 2% that consists of 7 respondents answer no for the purchase that influence by the celebrity. Because of this, researcher delete the data for 7 respondents as their answer for this question is no and only use 357 data for the research.

4.2 Descriptive Analysis

The descriptive analysis was tested according to their variables and listed out on the summary of the mean and standard deviation of computed items in table 4.6

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

Table 4.6: Results of the Descriptive Analysis

Descriptive Statistics			
	N	Mean	Std. Deviation
TRUSTWORTHINESS	357	4.3204	.62184
EXPERTISE	357	4.3412	.65292
FAMILIARITY	357	4.3412	.70057
PURCHASE INTENTION	357	4.4667	.71228
Valid N (listwise)	357		

Based on the mean analysis in table 4.6, the range of mean value in this study is 4.3204 until 4.4667. By comparison the mean value between independent variable which is trustworthiness, expertise, and familiarity, the highest mean value is 4.3412 which indicated expertise and familiarity are the most acceptable independent variables in this study.

4.3 Reliability Analysis

Reliability analysis is calculated by achieving the proportion of systematic difference in the scale that can be accomplished by determining the relation between the scores received from the various scale administrations. Thus, if the correlation in the reliability analysis is high, the scale shows accurate findings and is thus reliable.

Table 4.6: Reliability analysis for all variable

Variable	Total items	Cronbach's Alpha Value	N (sample size)
Trustworthiness	5	0.924	357
Expertise	5	0.932	357
Familiarity	5	0.945	357
Purchase Intention	5	0.977	357

The result of reliability analysis shows that all variables above 0.7. The result of Cronbach's Alpha value shows the range from 0.924 until 0.977. Therefore, the results are accepted as it is above the 0.7 Cronbach's Alpha value. This alpha value can be accepted because 0.7 as suggested HR-Guide, LLC (2018) state that if alpha value is below 0.5 cannot be accepted, the value 0.6 and above are normal, 0.7 is more than normal, 0.8 is good and 0.9 is better. Moreover, the alpha value of reliability coefficient for independent variables trustworthiness is 0.924, expertise is 0.932, and familiarity is 0.945, which are in range better and the reliability is accepted.

4.4 Normality Test

Normality test is a statistical method used to assess if a variable or a set of data matches the regular normal distribution. If the result of normality test is normal, Pearson's Correlation Coefficient will be use by the researcher and if the result is abnormal, researcher will have to use Spearman's Correlation Analysis.

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

Table 4.7: Normality test for all variables

Tests of Normality						
	Kolmogorov-Smirnov ^a			Shapiro-Wilk		
	Statistic	df	Sig.	Statistic	df	Sig.
TRUSTWORTHINESS	.208	357	.000	.818	357	.000
EXPERTISE	.222	357	.000	.778	357	.000
FAMILIARITY	.237	357	.000	.740	357	.000
PURCHASE INTENTION	.269	357	.000	.724	357	.000

a. Lilliefors Significance Correction

Based on the table 4.7, the test of normality of Kolmogorov-Smirnov^a for trustworthiness, expertise, familiarity, and purchase intention is 0.00, while Shapiro-Wilk for trustworthiness, expertise, familiarity, and purchase intention is 0.00. Since the significant value is less than 0.05, therefore all variables in this study is abnormal. Thus, Spearman’s Correlation Coefficient will be used for the data analysis in this study

4.5 Hypothesis Testing

Table 4.8: Hypothesis testing

Objective	Hypothesis	Result of analysis	Decision
To identify the influence between celebrity endorsement in social media from trustworthiness aspect and consumer purchase intention.	H1: There is significant relationship between celebrity endorsement in social media from trustworthiness aspect and consumer purchase intention.	r = 0.703	Accepted
To study the influence between celebrity endorsement in social media from expertise aspect and consumer purchase intention.	H2: There is significant relationship between celebrity endorsement in social media from expertise aspect and consumer purchase intention.	r = 0.860	Accepted

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

To determine the influence between celebrity endorsement in social media from familiarity aspect and consumer purchase intention.	H3: There is significant relationship between celebrity endorsement in social media from familiarity aspect and consumer purchase intention.	r = 0.672	Accepted
---	---	-----------	----------

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Based on the table 4.8, it can be summarized that all three independent variables which are trustworthiness, expertise, and familiarity have a relationship towards purchase intention. All the hypothesis is accepted as the p-value is less than 0.05

5 Discussion and Conclusion

5.1 Suggestion for Future Research

For future research, the researchers can enlarge the scope of the study to not only focus for students in University Malaysia Kelantan, but also can include people from many sectors. As we all know, students have no permanent job yet and they also did not have any monthly income so it will be hard for them to spend their money on pricey things.

Other than that, this research was conducted only in Malaysia and it is sampled by Malaysian respondents. This means that the findings could only be valid on the Malaysian market. Since cultures are diverse across countries, different outcomes can be obtained by performing this research in other countries. The impact of Celebrity can be higher and vice versa in other countries.

In addition, future studies may consider using foreign celebrities in their research. If the research is to be carried out only in Malaysia, the future researchers may also include celebrities from various countries or other religions. Because of local consumers may also opt for international products, and these products can use international celebrities for their marketing strategies. Foreign celebrities may also influence the purchasing intentions of local consumers. As a result, their influence could be greater compared to local celebrities. In the end, this could lead to different outcomes.

5.2 Overall Conclusion of the Study

From the results of this study, it can be interpreted that celebrity endorsement in social media will influence consumer purchase intention by UMK students in Kota Bharu. The studies show that trustworthiness, expertise, and familiarity has a significant impact towards consumer purchase intention among UMK students in Kota Bharu. This study was conducted to the target population of UMK city campus students with a sample size 357 respondents.

This study used the source credibility model and source attractiveness model as independent variables and purchase intention as dependent variables. Based on the Spearman's Correlation result findings got from SPSS analysis, all of the strategies have a positive relationship towards consumer purchase intention among students in University Malaysia Kelantan City Campus. In this chapter, the researcher has listed some limitations faced by the researcher during the process of this study. The researcher also proposed some recommendations and suggestions that can be used by future research and to know the purchase intention in details by UMK city campus students.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

6 Acknowledgement

First and foremost, I would like to express my thankfulness to Allah S.W.T, the Almighty, for His continuous blessing which had helped me in completing the research study. I would like to thank all people who given me helpful advices, suggestions, and assistance that help to contribute of completion of this study.

Secondly, I would like to express my deepest thanks to my supervisor, Prof Madya Dr. Noorshella Binti Che Nawi for her patient and greatest assistance for this paper. She always gives me support and provide me with her insightful point of view, guide me to conduct a proper and systematic research. Her useful opinions and knowledge is much appreciated.

Besides my supervisor, I also would like to thank my examiner, Prof. Madya Dr Noor Hasmini Binti Abd Ghani. Thank you for her valuable comments and opinions to improve my research project during final year project presentation.

Apart from this, great appreciation goes to the participants which helped me to conduct the survey questionnaire. Thanks to their help, I am able to collect data for analysis and their opinion towards my research.

Lastly, a special thanks and appreciation to my friends and families for their endless support and advice to complete this research.

IMPACT PERCEIVED RISK ON ONLINE IMPULSE BUYING : A STUDY OF CONSUMERS AT KOTA KINABALU, SABAH

Nabilazzahra binti Mustaring and Noorhazila binti Nik Mud

Faculty of Entrepreneurship and Business,
Universiti Malaysia Kelantan,
Malaysia.

Email: nabilazzahra9707@gmail.com; noorhazila.nm@umk.edu.my

Abstract:

This study was conducted to identify the impact perceived risk (product risk, convenience risk and non-delivery risk) towards online impulse buying of the consumers at Kota Kinabalu, Sabah. The purpose of this study to determine which perceived risk that significant towards online impulse buying. Data were collected through questionnaires obtained from 384 respondents from consumers at Kota Kinabalu, Sabah. Convenience sampling was applied to allow the researchers to collect the responses easily and quickly because of our population just in a large range. Results: The study utilized descriptive analysis and multiple linear regression to analyze the data. From this research, the factors that significant are convenience risk ($p < 0.004$, $\beta = -0.141$) and non-delivery risk ($p < 0.001$, $\beta = 0.636$). Online Impulse Buying effect most the perceived risk were non-delivery risk.

Keywords: *Online Impulse Buying, Perceived risk, Product risk, Convenience risk, Non-delivery risk*

1 INTRODUCTION

The phenomena now had surge by a pandemic virus called Covid-19. The people had to stay at home to avoid the virus became serious. This make the consumers had many time in online context. As we know, technology now growing rapidly and the consumers live became more easily. The needs and wants of the consumers can be determine by one finger. This will make the consumers became desire to doing online purchasing due to the product is convenience and the online store operated 24/7 hours. The products also can be compared around the worldwide. As compared to the tradisional store, the online text will be more encouraged the consumers to impulsiveness in online decision making will be benefits to the retailers. According to the Moksina, Fungb, Ahmadc, and Nazrid (2019), in Malaysia, the government had been made

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

effort to increasing the nationwide internet usage. This is because to government Malaysia's want to stimulate the online shopping activities in Malaysia. Therefore, only 9.3% of the internet user that purchased online even though the Malaysia e-commerce industry has been immerse growing. The phenomena impulse buying behavior became popularity recent times because the researcher actively search new dimension about consumers behaviour towards the online text. Consumers will overspending money on online text because of the special attributes that attract consumers to become impulsiveness buying. According to the (Abrar, Naveed, & Ramay, 2017), the impulse buying is the basic human traits and its varies from person to person.

1.1 PROBLEM STATEMENTS

The previous studies that Al-dweeri, Obeidat, Al-dwiry, Alshurideh, and Alhorani (2017) had mention is their more focus in the trust and loyalty in online purchasing. Many research talk about how to maintain their trust and loyalty towards the customers with many way. The researchers want the impact of the online purchasing can maintain their trust and loyalty towards business. Although the increase of the competitive environment, thee-retailers must determine of their online division channels in terms of the influence of this e-loyalty and e-satisfaction and service quality (Al-dweeri et al., 2017)

As we know, the online text has many advantages and disadvantages either for consumers or retailers. The problem that the researcher found is the risk of the perception that personal information of consumers will be leaked out. This will makes the consumers became wary towards the online shopping. Other than, consumers worry about the product or services that sold in the online text. This is because consumers can be cheated by the retailers online. Lastly, the researcher always wary about the online impulse tendency of consumers when shopping in online. This is very serious problem that always happen to the consumers.

1.2 RESEARCH OBJECTIVES

The first objective of this research was to measure the relationship between product risk and online impulse buying. Next objectives was to measure the relationship between convenience risk online impulse buying. Thirdly, the research objectives is to measure the relationship between non-delivery risk and online impulse buying and the last research objectives was to determine most effect impact perceived risk on online impulse buying.

2 LITERATURE REVIEW

The literature review of this study researchers will research the impact perceived risk on online impulse buying : a study of consumers at Kota Kinabalu, Sabah. The researchers will explore theoretical background that online impulse buying, previous study, research hypothesis, conceptual framework from this study. The independent variables of this research was product risk, convenience risk and non-delivery risk and how these variables affect to online impulse buying at Kota Kinabalu.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Online Impulse Buying

According to the Mathur (2019), the impulse buying is an enigma in the field of marketing for a long period of time. This is because the impulse buying is a dark side of consumer in the behaviour literature. Usually, the consumers very addicted towards the tradisional buying but the growing e-commerce driving the consumer to online purchasing. The impulse buying behaviour are connected to the sudden buying with accompanied by a strong feeling of joy and excitement (Akram, Hui, Khan, Yan, & Akram, 2018).

Perceived risk

Perceived risk is a consumers conscious of contradictory consequences and insecurity as a result of buying a service or product (Abrar et al., 2017). Perceived risk also a belief of an individual consequences from their decision. The consumer perception is uncertainty and unintended consequences doing the online shopping. There are more risk in the online context. There are many different perceptive risk but currently study focus at product risk, convenience risk and non-delivery risk. Biucky and Harandi (2017) mention in their study about perceived risk area multidimensional concept and it is will bring impact on the consumers buying behaviour with focus on the multiple risk. Thus, according to the Zendehdel, Paim, and Delafrooz (2016), the perceived risk is the trade platform of online text between retailers and consumers but also had to secure the protected operation policy and authorized the verification means.

Product risk

Product risk define as the protection the most significant effect on the cognitive trust on the perceived risk (TRAN, 2020). The online purchasing usually had the higher confusion and risk compare to the offline text due the influence attitudes of online buying. The cognitive attitudes of consumers on online even very important. Other than that, product risk also known as performance risk, it means that the chance of failure to the consumers requirement (Bhatti, Saad, & Gbadebo, 2018). According to the article (Hong, Zulkiffli, & Hamsani, 2016), the product risk are the significant effect on the quantity of purchase online. This is due to the product risk that conventional when it is being purchase online, especially the some product that cannot be test attributes online and cannot be examine due to the shippers.

Convenience risk

The losses of time while search, compare or buy product on online are called as time or convenience risk (Abrar et al., 2017). Thus, convenience risk is associate with consumer perception that consumer will faced difficulty in order place, unable to cancel one order, delay in receiving product or returning product (Bhatti et al., 2018). Although, the convenience risk does not have the strong influencer over the online buying behaviour than other dimension of

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

perceived risk. According to the Moksina et al. (2019) the convenience risk is the inconvenience that will occurs during the online transaction such as difficult to submit the order and search the product, hard to cancel the order once the order is placed or delay in receiving the products.

Non-delivery risk

Non-delivery risk known as not get the product after complete the settlement and doing the payment to the online store (Abrar et al., 2017). According to the Wai, Dastane, Johari, and Ismail (2019) mention that the damage or losses of the product are related to the potential delivery is loss and it is consumers to worry their product did not receive on time. Consumers will find it very uncertainly while deal with the new online retailers for making the payment due to the risk of the vendors will not deliver their product. According to the Hong et al. (2016), the non-delivery risk is the potential fail of delivery.

2.1 HYPOTHESIS

This research will analyse and examine the impact perceived risk on online impulse buying. Three hypothesis have been developed:

H1: There is significant positive relationship between product risk and online impulse buying.

H2: There is significant positive relationship between convenience risk and online impulse buying.

H3: There is significant positive relationship between non-delivery risk and online impulse buying.

2.2 CONCEPTUAL FRAMEWORK

The conceptual framework is an analytical tool with several and contexts. It can be applied in different categories of work where an overall picture is needed. It is used to make conceptual distinctions and organize ideas. The aims of this study is the impact of perceived risk on online impulse buying : a study of consumers at Kota Kinabalu, Sabah.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Figure 1: Conceptual Framework

Figure 1, this research model is study of the relationship between the perceived risk on online impulse buying that is based on the literature review. Based on the framework, research can make the relationship between independent variables and dependent variables.

3 METHODOLOGY

This study will use primary data which is quantitative of questionnaire method data collection to measure the respondent toward impact perceived risk on online impulse buying . A 5-point Likert Scale will be used on the questionnaire to gain the response from respondent which is (1) strongly disagree (2) disagree (3) neutral (4) agree (5) strongly agree. Three sections of questionnaire which is Section A is about demographic respondent while section B consists of independent variables which is product risk, convenience risk and non-delivery risk, and Section C is question based on dependent variables which is online impulse buying. The questionnaire will be arranged in the number of population in Kota kinabalu which is 527,600,000 people (Malaysia, 2019) The number of respondents is 384 based on sample size Krejcie & Morgan (1970). The data collected from questionnaire had been analysed by using SPSS v 26 (Statistical Package Science Social) version 26.0. Lastly but not least, the data will be analysed by using descriptive analysis, reliabilty analysis, normality test, correlation analysis, simple liner regression and multiple regression.

4 FINDINGS

Data of demographic respondents obtained from Section A such as age, gender, race and other more. There are some other questions also in demographics that researcher want to analysed from respondents and researcher will be shows the demographic respondent based on using the table

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

Table 1: Descriptive Analysis for Demographic Profile of Respondents

Demographic	Item	Frequency (n=384)	Percentage (%)
Gender	Male	64	16.7%
	Female	320	83.3%
Age	15-25 years old	292	76.0%
	26-35 years old	53	13.8%
	36-45 years old	23	6.0%
	46 years old and above	16	4.2%
Occupation	Student	278	72.4%
	Self-employed	24	6.3%
	Profesional	38	9.9%
	Retiree	12	3.1%
	Unemployed	25	6.5%
	Others	7	1.8%
Race	Malay	282	73.4%
	Chinese	28	7.3%
	Indian	18	4.7%
	Other	56	14.6%
Monthly Income	No Income	293	75.34%
	RM500-RM1000	41	10.7%
	RM1001-RM2000	21	5.5%
	RM2001-RM4000	19	4.9%
	RM4001 and above	10	2.6%
Often purchasing online	0-2 times	224	58.3%
	3-5 times	64	16.7%
	More than 6 times	96	25.0%

According to descriptive analysis, based on table 1, which is the demographic respondents of the age it has been stated that the highest number from the age group of 15-25 years old which is about 76.0% and under is 292 respondents. This shows that respondents aged between 15- 25 years answered this survey more compared to the other age group While the lowest age group was 46 and above which is 4.2% (n=16). Next, the gender respondents shows that the highest of female respondents is 320 with a percentage 83.3%. This shows that there are more female answer respondents that answer this survey compared the male with percentage of 16.7% and under is 64 respondents answered this survey. Then, the highest of race respondents which is Malay respondents with percentage 73.4% (n=282). This shows that there are more

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Malay race groups answered this survey and the lowest is Indian group of respondents with 4.7% and 18 respondents just answered the questions. Furthermore, the highest of occupation sector is student which is 72.4% (n=278) and followed by the lowest occupation is other groups which 1.8% (n=7). Next, the highest of monthly income is no income which is 75.34% and 293 respondents answer that survey. Meanwhile, the lowest income is RM4001 and above which 2.6% (n=10). Lastly, 0-2 times is the most often purchase online is 58.3% and 224 respondents. Besides that, the lowest is 3-5 times which 16.7% (n=64).

Table 2: Level of Mean

Variable	Mean	Interpretation
Product risk	4.32	High
Convenience risk	3.40	High
Non-delivery risk	4.42	High
Online Impulse Buying	4.78	High

Based on table 2, it can be summarized that the most higher it can be summarized that for the dependent variable of this study which is the online impulse buying. From the result, it is stated that majority respondents agree with all the respondents of the perceived risk will be affected to the online impulse buying. Thus, this variables has the highest number mean which is 4.78 compared other independent variables as believe that online impulse buying very important to the consumers.

Next, the second highest value of mean for independent variables of this study which is the non-delivery risk which is 4.42. From the result, it is stated that majority respondents is agree with all the questions of this variables. Thus, it has been stated that respondents agreed with all questions that non-delivery risk is will be effectively to the online impulse buying.

Then, product risk is the third highest value of mean for the independent variable of this study which is 4.32. Thus, from these outcomes, it can be stated clearly that there are some respondents who agree with the item that provided in this section of variables. Therefore, the respondents believe that when the online text will causes the product risk to effect the online impulse buying. In addition, it can be summarized that for the independent variables of the study which is convenience risk is the lowest in effected the online impulse buying which is mean 3.40. From the result, it is stated that the minority respondent agrees with all questions of this variable. Thus, it has been stated that the respondent agrees with all questions that non-delivery risk is more effecting the online impulse buying.

As conclusion, in this research study, the range of mean for each variable are (3.0 <> 5.0). The outcome mean for each variable is classified as good result.

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

4.1 Normality test

Table 3: Normality test

Items	N	Mean	Std. Deviation	Skewness		Kurtosis	
				Statistics	Std. Deviation	Statistics	Std. Deviation
Mean Product risk	384	4.316	0.874	-0.797	0.125	-0.864	0.248
Mean Convenience risk	384	3.395	0.986	0.559	0.125	-0.698	0.248
Mean Non-delivery risk	384	4.418	0.746	-0.791	0.125	-0.785	0.248
Online Impulse Buying	384	4.737	0.438	-2.168	0.125	3.962	0.248

Based on table 3, it shows that there is a simple linear regression results show that there is a significant linear reliability of customer loyalty $b=0.49$ which is increase compared other variables.

4.2 Spearman's Correlation Analysis

Table 4: Results of Spearman's Correlation Analysis between Variables

Variables	Correlation coefficient
Product risk	Spearman Correlation 0.603** Sig. (2-tailed) <0.001 N 384
Convenience risk	Spearman Correlation 0.194** Sig. (2-tailed) <.001 N 384
Non-delivery risk	Spearman Correlation 0.662** Sig. (2-tailed) <.001 N 384
Online Impulse Buying	Spearman Correlation 1 Sig. (2-tailed) <.001 N 384

** correlation is significant at the 0.01 level (2-tailed)

Table 5 presented the results of the Spearman's correlation analysis between variables on the effectiveness of Foodpanda service affect customer loyalty in Sabah. The value of the Spearman's correlation for responsiveness 1.000. It is shown that the responsiveness is

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

moderate positive level. Followed by trust,, the value of the Spearman's correlation trust is 0.550. It is shown that the trust is at a high positive level. Next, the value of the Spearman's correlation reliability is 0.454 It is shown that the trust is at a positive level. Last but not least, the value of the Spearman's correlation customer loyalty is 0.496 It is shown that the trust is at a high positive level.

4.3 Hypothesis Testing

Table 6: Summary of Hypotheses Testing

	Hypotheses	Statistical Analysis	Result
H1	There is a significant positive relationship between product risk and online impulse buying	-	Unsupported
H2	There is a significant positive relationship between convenience risk and online impulse buying	-0.141	Supported
H3	There is a significant positive relationship between non-delivery risk and online impulse buying	0.636	Supported

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Based on table 6, it can be concluded that all the three independent variables namely non-delivery risk has a high positive with statistical analysis is 0.636, while convenience risk has a good positive with statistical analysis is -0.141. In short, only two hypotheses in this study were accepted after Spearman's correlation testing was conducted.

5 DISCUSSION

Convenience risk

From the research, it shows that convenience risk gives the most effect towards online impulse buying. Based on Multiple Linear Regression, convenience risk showed a result $\beta = -0.141$, $p < 0.004$. Hypotheses (H2) was accepted as there was a significant positive relationship between convenience risk and online impulse buying.

Convenience risk is known as the time spent on the purchase of the product and time wasted for the product or services choice (Silaban, Jaunanda, & Ferdinand, 2020). The case of convenience risk happen when the consumers tries to find the information related certain product or services. In addition, convenience risk happen when the shoppers lose their time due to the challenges of fast navigation or delays in submit order, find appropriate websites and receive the products (Aminu, Olawore, & Odesanya, 2019).

Non-delivery risk

From the research, it shows that non-delivery risk gives the most effect towards online impulse buying. Based on Multiple Linear Regression, non-delivery risk showed a result $\beta = -0.141$, $p < 0.001$. Hypotheses (H3) was accepted as there was a significant positive relationship between non-delivery risk and online impulse buying.

Delivery risk is known as a potential loss that relate to the loss of purchase product, quality loss because of damaged during delivery process and the destination is loss because of the deliverance of wrong address after shopping (Silaban et al., 2020). Many consumers may avoid for shopping online due to the delivery problem and return of incorrect product (Aminu et al., 2019). Besides that, A various factor may impact whether the product received by the consumers (Wai et al., 2019). For example, improper deals during the delivery process.

5.1 RECOMMENDATION

Implications

The main theoretical implications were the interlinking of the different roles of product risk, convenience risk and non-delivery risk. In addition, research focused on the online impulse buying. The results indicated that the product risk was a non-effect for consumers who were not affected by the online impulse buying consumers. In addition, product risk sensitivity were not important for research as long as the delivery of product meet their expectation. Due to a lack of research.

Limitations

There are several limitations in this study. First, the lack of peer reviewed scientific articles on consumer buying impulse behaviour in an online context has forced researchers to explore literature in an economic crisis context rather than in a real context. As a result, future researchers aiming to study the impact perceived risk on online impulse buying should first explore literature in an online impulse buying context. Secondly, the non-delivery risk for the product during the delivery process. Future researchers could also compare countries with the same levels of restrictions or different levels of restrictions as they would provide insights into how restrictions affect the online impulse buying, and can also look at the role of different risk that consumers will faced on online text. Third, all of the interviews were conducted online, which might have limited the researcher's ability to gather more insights from the respondent, although the respondent used a Google form questionnaire, thought that face-to-face interviews could have increased the reliability.

Practical Recommendations for Future Research

From the study, the researcher found that the non-delivery risk is important to the online impulse buying. But not only are the other two independent variables, the product risk and convenience risk, also important. This research only wants to know what the risk that have had an effect towards the online impulse buying.

During the multiple regression analyses, the non-delivery risk is the only one affected by this, because the consumers very panic towards the product that online retailer's delivery through the shipping company. This is because the consumers worry that need to face uncertainty towards the new online retailers due to their product will not be received. It is therefore recommended that future researchers include more variables, such as financial risk and security risk, which also play an important role in creating new discoveries in their investigation. Finally, future researchers can also use qualitative methods instead of questionnaires only when conducting a survey.

5.2 CONCLUSION

This research was carried out with a view to the perceived risk that affected on online impulse buying. The impact that affected the product risk, convenience risk and non-delivery risk. In addition, this research was carried out by the researcher at consumers Kota Kinabalu. The research focuses on the design of the research, data collection methods, population study, sample size, sample techniques, development of the research instrument, variable measurement and data analysis procedure.

On the other hand, the data analysis of the researchers shows the results obtained throughout the survey questionnaire. Data analysis was collected from the survey to conduct a test of reliability, descriptive analysis and multiple linear regressions. The researcher determined the significance of the research hypothesis in the study. As a result, from this chapter, we can conclude the significant between the independent variable and the dependent variable. And, lastly, from the entire chapter of this research, there are many things that can be improved and can be a reference benefit for online impulse buying and future research.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

ACKNOWLEDGMENT

First of all, I would like to express my special thanks to gratitude supervisor Madam Nik Noorhazila binti Nik Mud for giving me the opportunity to research and providing invaluable guidance through this research. Her dynamism, vision, sincerity and motivation have deeply inspired me. It was a great privilege and honor to work and study under her guidance. I am really thankful.

Secondly, I would like to thank my examiner, Dr. Nurul Izyan binti Mat Daud for her support throughout presentation time, sincere guidance and inspiration in completing this project and I would like to thank the Faculty of Entrepreneurship and Business by providing me the information to complete this project and I really indebted to my University which is Universiti Malaysia Kelantan providing platform for me.

Secondly I would also like to thank my parents and friends who helped me a lot in completing this project. I am making this project not only for marks but to also increase my knowledge and finally I would like to express my deep appreciation to all the respondents which have been cooperative in answering my questionnaire. I really appreciate all your time and sacrifice by helping me to complete my project.

Abstract:

A new infectious disease, Coronavirus, is now plaguing the planet. The virus was first identified in Wuhan, China, and currently, there are 89,416,559 cases of COVID-19 worldwide, including a number of deaths of 1,935,028. The current epidemic of Coronavirus has had a devastating impact on the economic sector and has brought about drastic changes in the way business is conducted. When the Malaysian government implemented the Movement Control Order (MCO) that forced many business activities to close, the situation becomes worsened. The continuity of business needs to be sustained becomes a question mark for Food Hawker. This research was therefore carried out to study the factor of influencing financial risk toward food hawker during COVID-19 outbreak at Johor Bahru.. In this study, debt, lack of preparation and increase of rival and seller can influence financial risk. This study was compiled through an online survey (google form) and through the dissemination of questionnaires to food hawker. The target respondents in this study are food hawker then use non-probability and snowball techniques sampling methods for data analysis. With 127 respondents, the data will be analysed into the descriptive analysis, reliability analysis, Pearson correlation analysis. Then, Spearman's Correlation also used in this study to test the normality. Three of the financial risk factor were generated and tested using Statistical Package for the Social Science (SPSS). The factor of financial risk toward food hawker during COVID-19 provides evidence that it has something to do with food hawker. These findings indicate that all Covid-19 effects have a significant positive relationship with financial risk.

Keywords: COVID-19, Financial Risk, Food Hawker

1 INTRODUCTION

Coronavirus is a Covid-19 native to Wuhan State, China. The estimated spread of Covid-19 is December 2019. This pandemic was declared in March 2020 by the WHO. Pandemic Covid-19 has had a huge impact on the social and economic life of a country as well as globally. This pandemic also had a huge impact on the demand for product, food and need of customer, various sectors and jobs. Covid-19 has also had a detrimental effect on large, medium and small economic sectors. Furthermore, according to previous study, the loss of cash flow induced by the partial, complete and gradual lockdown rendered it impossible for workers to meet the compensation and pensions of staff, thereby lowering expenses in the form of salary increases, layoffs and

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

termination steps (Madinah, 2020). An example that can be linked to this study is, employees who will be laid off from work will have problems in meeting their basic daily needs. For example, workers who are laid off from the job of hawking food who have been laid off need patience because they want to find a new job to cover the cost of their daily lives.

In addition, the employer must take into account and need to feel sympathy for the laid off employee or they make various initiatives so that at the same time can continue the business and not dismiss the employee who has long served in his business. Employees were advised to work as much as possible at home to prevent office congestion in order to minimise the chance of illness and reduce operating cost (Madinah, 2020). For example, related to the study, food hawker employers need to be prepared in continuing their business, for example traders work and take food orders from customers and make food preparation at home then make delivery to customer home. Delivery and order can be made online such as using Food Panda, Grab food and so on.

Food hawker is someone who handles and sells local food around in residential areas, downtown areas, bus top areas or by the roadside. Researcher from previous studied found that the open air food market is generally referred to as "hawker stalls," which are arguably a distinctive characteristic of the culinary culture in Malaysia (Leong, Stephenson, & Research, 2020). Furthermore, hawkers or known as street food vendors, they will usually bring their own cooking utensils or merchandise that can move on their own such as cars or stalls to continue their daily business operations. Usually, these food vendors will place their sales in places allowed by the authorities such as city buses for business, night markets or so on. There are also found that the traders who trade in a permanent location, as well as traders who do not trade in a permanent place (Kiem, 2013).

Other previous studies defined the sense of the Malaysia Local Government Act 1976, the word "hawker" applies to anyone who offers products for sale to individuals and may be classified as "temporary hawker," "static hawker," or "nomad (In & Adnan; Leong et al., 2020). Furthermore, the word "hawker food" is synonymous with other traditional words such as "street food", "ready-to-eat food" or "prepared-on-demand-food: manufactured by smaller entrepreneurs from the stalls they developed for the on-site consumption or take-away of their customers (Leong et al., 2020). Next, other studied also found the financial risk is a risk resulting purely from the financial arrangement of the business (Cornell & Shapiro, 1987) and (Berger, Udell, & finance, 1998). Identified the risk that the organisation would be unable to fulfil its financial obligations (Ufo, 2015) (Utami & Business, 2011). Besides, the financial risk is the added risk

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

levied on common owners as a result of the debt funding decision. (Singapurwoko, El-Wahid, & Sciences, 2011). For example, using and making loans from companies or banks will increase the likelihood of bankruptcy. This is because, the nature of the contract in the payment of interest and principal on the borrowed funds makes the risk to the company directly related to the debt portion.

There are three objectives of this research:

1. To identify the relationship between debt that can influencing financial risk toward food hawker during COVID-19 outbreak at Johor Bahru.
2. To identify the relationship between lack of preparation that can influencing financial risk toward food hawker during COVID-19 outbreak at Johor Bahru.
3. To identify the relationship between increase of rival and seller that can influencing financial risk toward food hawker during COVID-19 outbreak at Johor Bahru.

1.1 Significance Of The Study

1.1.1 Researchers

This study will show the relationship between the factors influencing financial risk toward food hawker during COVID-19 outbreak at Johor Bahru. For example, the debt incurred by food hawkers can be a factors of financial risk in their business. Apart from that, there is also a lack of preparation from hawker food in starting a business. In this study will also discuss the importance of experience, business knowledge and experience that need to be emphasized to start a business. Increase of rival and seller that will be explained about the competition during COVID-19. There are many who sell food products through the Food panda application, with this service can help sellers do business without restrictions during this COVID-19.

1.1.2 Food Hawker

This study can help them to make initial preparations about the risks that will be faced in the business. With enough knowledge, business will always be thriving and strong.

2 LITERATURE REVIEW

2.1 Underpinning Theory

The theories that related and suitable to this research is the stream of entrepreneurship theory. Therefore, in other word of entrepreneurship theory is multi-functional approaches (Freiling, 2007). The entrepreneurship theories are allowing for a balance view of opportunities approaches. This reminds one to point out the understandings carefully. The fundamental logic of the multi-functional plan to which we refer. The interpretations. The business process theory is traditional and can be outlined as follows. For example, the knowledge, skill, brave to taking the risk in management and lacking of motivations of the entrepreneurs asymmetrically distributed. Without the knowledge and the skills in business, all entrepreneurs are difficult to survive in retail industry (Freiling, 2007).

2.1.1 Debt

Figure 2.1.1: Framework of Previous Study independent variable of Debt (Shikumo, Oluoch, & Wepukhulu, 2020)

Furthermore, the figure 2.1.1 show the previous study framework that related in this study is theory of growth of the firm. The theory was propagated (Geroski & Research, 2002). Penrose was argues that companies do not own and have long-term determinations will provide constraints and problems within a certain period of time to the business (Geroski & Research, 2002). Financial means by retained revenue, borrowing, and new issues of stock shares, financial means for growth could be sought. In addition, retained profits are one of the most critical sources of finance for new projects in developing economies where capital markets are not well established. However, businesses in the start-up age may not face a restriction on their development project because their original investment has not yet matured or their investment venture is considerably higher than their existing profits, if not enough financial resources from their retained obtained.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

2.1.2 Lack of Preparation

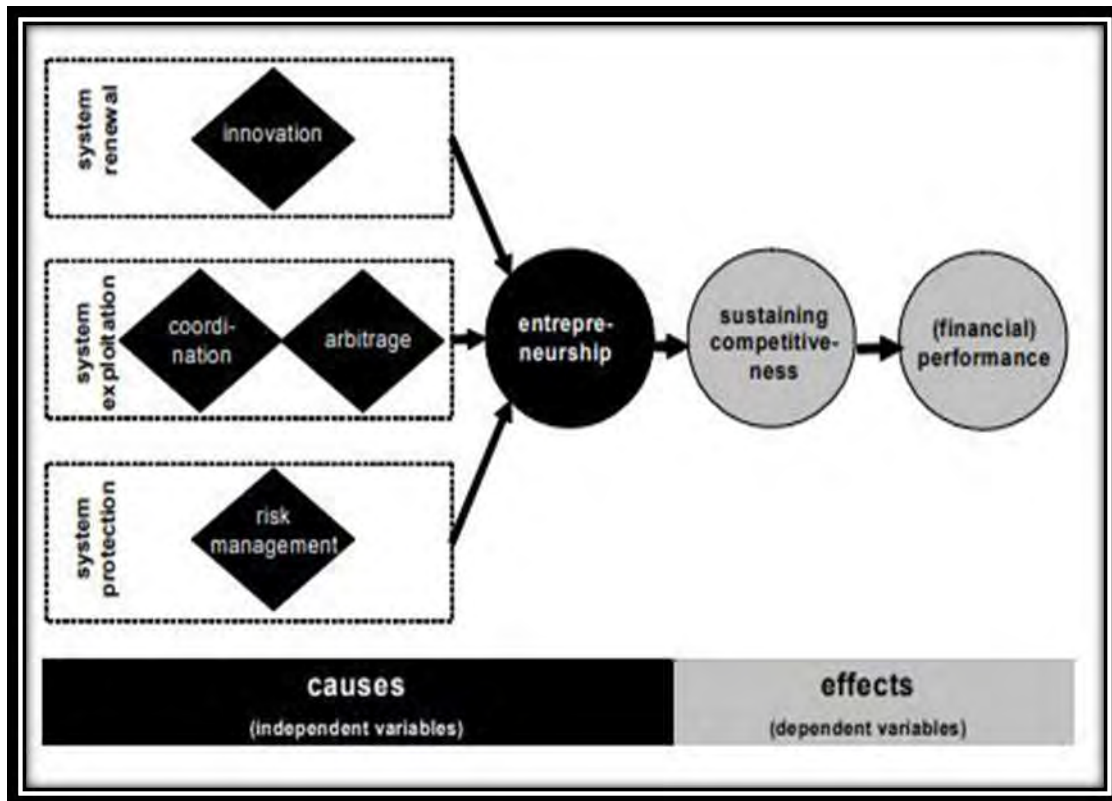

Figure 2.1.2: The Theories That The Cause And Effect That Related To Financial Risk And Performance Toward Entrepreneurship (Freiling, 2007).

Furthermore, the figure 2.1.2 show the theories that related to second independent variable is lack of preparation which is human capital theory. For example, of lack of human capital theory is the added importance of human capital is discussed of human resources in their self (Van Teeffelen, 2012). For the concept that related to this theory of human capital's equivalent to the concept of capabilities is RBV which means to manage and utilize the firm's tangible resources (Van Teeffelen, 2012). For example, that can have related to this theory is human capital encompasses the formal education, age, gender, skill and knowledge of entrepreneurs (Van Teeffelen, 2012). Furthermore, with this skills, it can be more talented and can developed skill through education, training and personal experience of entrepreneurs, retailers and food hawker (Van Teeffelen, 2012).

Lastly, theories that related to the third independent variable which is increase of rival and seller is theoretical; work that tries to keep pace with this innovation. This is because, the

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

theories that see attempts to recognise if not direct modern organisational conduct, yearning for social gain and for the many technologies themselves (Donaldson & Walsh, 2015). For example, studies from previous that found (Prahalad & Hart, 1999) proposed to formulate a modern business behaviour theory, one that requires us to look to the weakest of us for both new product and service innovations and markets (Donaldson & Walsh, 2015) and offered positive theory of social entrepreneurship (Donaldson & Walsh, 2015) and (Kolk, Rivera-Santos, Rufin, & Society, 2014).

2.2 Research Hypothesis

In this study, there were three hypothesis that are positively related between the factors of influencing financial risk toward food hawker during COVID-19 outbreak at Johor Bahru.

H1: There is significant relationship between debt and the factors influencing of financial risks toward food hawker during Covid-19 Outbreak at Johor Bahru.

H2: There is significant relationship between lack of preparation and the factors influencing of financial risk toward food hawker during Covid-19 Outbreak at Johor Bahru.

H3: There is significant relationship between increase of rival and seller and the factors influencing of financial risk toward food hawker during Covid-19 Outbreak at Johor Bahru.

2.3 Research Framework

Based on the literature review, the conceptual framework has been developed. Which the conceptual framework had included four independent variables and one dependent variable. The independent variables are debt, lack of preparation and increase of rival and seller while the dependent variable is about the financial risk.

The conceptual framework is shown as below figure:

Figure 2.3: Research Framework

3.0 METHODOLOGY

3.1 Research Design

Research design for this study conducted by using a quantitative method. In this study, quantitative research will measure the independent variables for debt, lack of preparation and increase of rival and seller via a questionnaire survey. The purpose of quantitative research is to validate the relationship between independent variable and dependent variables. According previous studies it discussed the following design strategies that are commonly used in choosing population (Fitzmaurice et al., 2017).

3.2 Data Collection

In the first stage, primary data is a source collected at hand for specific research problem using the right method. Some method can collect the primary data for research, such as surveys, questioners, interview, observation, and focus groups. The second stage of data collection was a fieldwork but through online platform. The researchers used the Google form questionnaire to be distributed to the random people for used pilot test. And Face-to-face interview, the researcher normally searches the respondent and will distribute the questionnaire and record the data from respondent. For the secondary survey method, researcher collected data from previous study which is journal and article.

3.3 Sampling

In this study, researcher is using G*Power to calculate the fix amount of respondent. G*Power is a software which is a tool to compute statistical power analyses for many different F test. This is also can be used to compute effect sizes and to display graphically the result of power analyses. After calculate the total of respondent or sample size by G*Power will be receive minimum 119 respondents but researcher decided to collect 127 respondents to complete the questionnaire that distribute by researcher. Furthermore, respondents are required to read the instructions and answer all the questionnaire to complete the survey on their own without the presence of an interviewers. In this research the researcher are using non-probability sampling which is snowball sampling techniques. The questionnaire was distributed by manually found the food hawker in the area which is Skudai and Iskandar Puteri.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

3.4 Data Analysis

The data analysis presents the finding of this study, which were obtained from the various analyses. The chapter starts with the preliminary analysis. This chapter is intended to examine the implications and conclusions of the report. This segment would include the respondent's demographic analysis, reliability analysis dependent on Cronbach's Alpha, descriptive analysis and Spearman's Rho Correlation analysis. The results were obtained from 127 respondents of food hawker by using quantitative information. In version 25 of the Social Science Statistical Package (SPSS) the data was evaluated.

4.0 FINDINGS

In this study, the reliability test was performed by 127 respondents of food hawker using the survey. It was measured using Cronbach's Alpha Coefficient showing a range from 0.685 to 0.704 which indicated that the result was moderate to good where increase of rival and seller has the maximum Cronbach Alpha value of 0.704, lack of preparation has the second highest alpha value of Cronbach, which was 0.689, and then followed by debt (0.685). Thus, all variables fulfilled the minimum criterion of reliability, as all Cronbach alpha coefficients of all variables were greater than 0.6.

In the Descriptive Analysis for Independent Variables, the maximum mean value was 4.50 increase of rival and seller, followed by lack of preparation (4.47). While the debt is was the lowest mean value for independent variables. The total mean value was 4.36. It was concluded that the increase of rival and seller had the biggest factor that influencing financial risk toward food hawker during COVID-19 outbreak at Johor Bahru.

The researchers carried out the correlation analysis in order to calculate the linear association between the two variables defined as the purposes of this report. A review of Spearman's Rho Correlation Analysis indicating that the linkage between the debt and financial risk is 0.574 which mean that there was a strong positive correlation, while increase of rival and seller and financial risk was in a moderate positive correlation (0.563), and the lowest value of correlation was lack of preparation and financial risk which only 0.536 and was in a moderate to strong in relationship. A correlation table of these variable as shown as below.

	N	127

Table 4.0: Spearman's Rho Correlation Analysis

5.0 DISCUSSION & RECOMMENDATION

5.1 Debt

Based on the result of Spearman's Rho Correlation, the researcher had identified that there was a significant relationship between debt and financial risk. A strong correlation relationship between debt and financial risk toward food hawker during COVID-19 is showed. In testing the relationship between variables, 0.70 is very strong, within the range of 0.30 to 0.60 is considered moderate and less than 0.16 would be weak. Furthermore, retained earnings are one of the most significant sources of financing for new ventures in emerging economics where capital markets are not well developed. However, companies in the start-up era when their initial investment has not matured yet or their investment venture are significant greater than their current earnings, may not ample financial capital from their retained earned will face a constraint on their growth project. The relationship between the variables is stated as 0.574, which further reinforces the relatively strong relationship between the IV and the DVs. This correlation indicates that the higher the debt, the higher the financial risk.

5.2 Increase of Rival and Seller

According to this study, there was a significant relationship between increase of rival and seller and financial risk. A moderate correlation relationship between increase of rival and seller and

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

financial risk toward food hawker during COVID-19 is showed. For example, service delivery will become a competitor at the same time further enhancing a business that uses this service. This is because, most customers easily by ordering food through online only will get the food ordered up in front of their home or office. Employees are not of the valuable resources for Food Panda especially driver, due to higher demand (Kamilah et al., 2020) and (Maroofi et al., 2017). The relationship between the variables is increase of riva; and seller as 0.563, which the relatively strong relationship between the IV and the DVs. This correlation indicates that the higher the increase rival and seller, the higher the financial risk.

5.3 Lack of Preparation

A moderate correlation relationship between lack of preparation and financial risk toward food hawker during COVID-19 is showed. The relationship between the variables is stated as 0.536, which further reinforces the relatively strong relationship between the IV and the DVs. This correlation indicates that the higher the number of lack of preparation, the higher the financial risk. Many studies have identified the vital role of training programmes and reasons that connect and contribute to the performance of entrepreneurship and business that affect financial risk and management (N. A. Rahman et al., 2015). In addition, entrepreneurs will get the positive outcome in their industry by getting a good programme training that applied to company expertise and skills. And this is so both founders can contribute to their organisation with well- prepared expertise

6.0 RECOMMENDATION

There are several directions that can be taken by future researchers relevant to the factor influencing financial risk toward food hawker during COVID-19 outbreak at Johor Bahru, Johor. First, this study's data has been collected in two district which is Skudai and Iskandar Puteri at Johor Bahru and focuses on all food hawker that running their business at the morning until night. Therefore, the future can carry out a new study that focuses on a comparative study financial risk between the food hawker versus the retailer. This research will get exciting, and the future researcher can compare how counterfeit goods important for them. Second, under part data collection method, the quantitative designs are used in this study. The future researcher can be study about how the food hawker manage their financial during COVID-19 outbreak. The study

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

could be broader in order to get more honest answers. Besides, communication becomes more manageable, and information and news can be spread quickly.

7.0 CONCLUSION

In conclusion, the research finding that the three factor really influencing financial risk toward food hawker. Three factor that influencing financial risk is debt, lack of preparation and increase rival and seller. For the debt, it is strongest related to debt issues will guide managers to have confidence ability to manage to pay off debts. Furthermore, lack of preparation are having a good training programme, an entrepreneur is expected to be well equipped in term of knowledge for managing a business which subsequently good result to their business. For increase of rival and seller can related during COVID-19 there are more people doing the online selling to rise income. Lastly, financial risk was very affect the food hawker when the high capital injection in their business.

8.0 ACKNOWLEDGEMENT

I would like to take this opportunity to express my appreciation to all the groups of people who have contributed their time and efforts to make the research process easier to accomplish and greatly helped me in this research study. I would like, first of all to express my gratitude to Universiti Malaysia Kelantan for the opportunity to work on this research.

Secondly, I would like to say thank you to my supervisor, Dr Nur Ain Ayunni Binti Sabri. To lead me to the conclusion of this research study. Throughout the entire process of finishing this mission, she is still gracious. I would not have achieved it within the time limit without her encouragement and help and I also like thank to Faculty of Enterurship and Business was provided the information for finishing the final year project.

Nevertheless, I am grateful toward my family, classmates and friends for their understanding and assistance during my writing phase. I would like to thank our respondents for their cooperation. Thank you.

THE FACTORS AFFECTING PURCHASE INTENTION OF CUSTOMERS TO SHOP AT HYPERMARKET AMONG UMK STUDENTS

Nor Farrahin Binti Rohadi and Md Zaki Bin Muhamad Hasan

Faculty of Entrepreneurship and Business,
Universiti Malaysia Kelantan,
Malaysia

[Email:farrahin.a17a0347@siswa.umk.edu.my](mailto:farrahin.a17a0347@siswa.umk.edu.my); zaki.mh@umk.edu.my

Abstract:

This study was conducted to investigate the factors affecting purchase intention of customers to shop at hypermarket among University Malaysia Kelantan students. So, this study concentrates to find out the relationship between the factors affecting purchase intention. The independent variable in this study product quality, brand image and social influence; whereas the dependent variable in this study is purchase intention. The quantitative research method was used and 361 respondents were evaluated in this study. Questionnaires were distributed to collect the primary data as a survey with online questionnaire and personally to get the information needed for this study. Data collected is analyzed by using IBM SPSS software based on descriptive statistics, reliability analysis, Person's correlation, and multiple regression analysis. As for the result, most of the independent variables (product quality, brand image, social influence) that had been studied in this research have a significant relationship with the dependent variable (purchase intention) among the students University Malaysia Kelantan. Through this study, it will understand the factor that the factors affecting purchase intention to shop at hypermarket and have a better understanding and knowledge that affect the implementation of purchase intention

Keywords: *Hypermarket, Product Quality, Brand Image, Social Influence, Purchase Intention*

1 Introduction

The definition of the customer and the consumer is not the same. Consumers are also the end customers of products or services, but they do not need to purchase them. In the meantime, the customer is indeed a purchaser of products or services who may become a business entity who would buy them with reselling purpose. This research is evaluated to identify the purchase intentions of the customer. In addition, this research also explores the relationship between factors and their intention to purchase hypermarkets.

A hypermarket sector in Malaysia have made a major step into modern retail concept (Hassan, Mahdee, Sade, & Rahman, 2015). In 2013, the Malaysian Department of Statistics has shown that the central region has the highest distribution with hypermarket outlets as a big hypermarket participant than in any other region. Many such young people have relocated from another country to a central region to better living standards. As a result, population proportions were expected to be more

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

balanced when there are more hypermarkets in a given area. It is because hypermarkets have had the competence to become a platform for people to make more profits to their living standards (Hassan, 2013).

Among the most significant considerations influencing the purchasing intention of the hypermarket consumer is the quality of the goods (Leow et al., 2011). Most organizations understand the product consistency has become one of the main factors driving consumer loyalty. Also as effect, many companies are changing the company practices in order to face strong competition from emerging competitors with new product styles, new product features and new technological products. That's really relevant because consumers have even more options of same product they will buy.

Brand image drives quality in such a number of ways, helping consumers process content, recognizing products, creating purchasing motives, offering positive emotions and creating opportunities for growth. Aaker's (1991).

Social influence may have an active or passive effect on the consumer. Active social control refers to concrete physical or verbal encounters which are both understood and communicated by the parties (the actor and the focal customer). Examples of such a sort of influence may involve a salesperson physically telling the focal customer about in an in-store deal, another unknown shopper unintentionally approaching a focal customer, or two friends shopping around each other.

1.1 Research Objectives

Based on the problem statement, any objective of the customer's purchase intention in a hypermarket among UMK students is:

- i. Identifying the relationship between product quality and purchase intention of customer to shop at hypermarket.
- ii. Identifying the relationship between brand image and purchase intention of customer to shop at hypermarket.
- iii. Identifying the relationship between social influence and purchase intention of customer to shop at hypermarket.

1.2 Significance of Study

That customer has been a purchaser of goods or services. That purchasing power of a customer is influenced through their desires and the intentions. Even so, just few other studies have been performed also on issue of customer purchase intentions in the hypermarket. A thorough analysis of these relevant issues would also provide a good understanding for advertisers to figure out the purpose of consumers to purchase hypermarket products and services. Also as consequence, the method in which hypermarkets perform retail operations must be focused on the customer's intentions.

Next, it researches also allows advertisers to relation to the meaning the potential of hypermarket goods and the customer's propensity to buy services. And it will be helpful to grow the local hypermarket companies in order to increase the overall sales and to benefit the industry.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

2 Literature Review

2.1 Dependent Variables

2.1.1 Purchase intention

Purchase intention may have been described as such advanced plan in the future, for the procurement of certain services or goods, although this arrangement not necessarily contribute execution, as its affects the ability to delivers (Davis & Warshaw, 1985). Many other, what else the customer feels and buys in the heads is the purchase intention (Miniard, Blackwell, & Engel, 2001). In addition, purchasing intention also assess the likelihood for a buyer to take a purchase decision by identifying the frequency of the desire to buy, although that is a significant chance of buy a certain product whenever purchase intention was higher (Grewal, 1991, Schiffman & Kanuk, 2000 Dodds, Monroe).

2.2 Independent Variable

2.2.1 Product quality

The consistency of goods and services offered in stores is a significant aspect in customer loyalty. Quality was its ability of thea commodity to fulfil the unique needs of its consumers. Perceived quality relates to the appraisal by the customer of goods or brands which satisfy the standards of the individual. One such appraisal by individuals is the perception of two brands of items. And according Chowdhury & Andaleen (2007), the quality of the commodity increases the competitive advantage. Compared to Local and personal brands, customers prefer for prefer national brand and there more families, trustworthy and greater advertising attention (Chen et al., 2007, Besharat, 2010;). Product quality are generally calculated by the characteristics of the product, the advantages and the potential to meet the needs needed, and so forth. It's also known to be among the essential determinants of customer purchase intention (Gilmore, 1974).

2.2.2 Brand image

That image of a brand determines the process people see a specific business or product. Hsieh & Liljander (2009) described the image of a brand as a psychological impression dependent over its interaction with its a brand. Organization are seeking to build strong identity the consumers recognise like a particular product. Next, to the need to establish market awareness for particular, many companies often want that product or business to get a particular logo or be perceived in that certain manner. Brand image is thus the ultimate perception in the mind of customers which is created by all modes of contact with the company. That image of a brand will outline how them distribute the product, the kind of product them distribute, a types of ads they promote, and also the type of consumers they represent. That origins of a product, including the country of production and the producer, influences the interpretation of customer brand picture (Koubaa, 2007). That indicates that perhaps the recall process is focused on previous knowledge with the company, market image and product characteristics, which could have some effect on customer reactions and buying behaviour (Chowdhury & Andaleeh, 2007). Good brand value exceeds the aspirations of consumers. Strong portrayal of a company enhances the popularity and brand equity of an entity (MSG, 2014).

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

2.2.3 Social influence

The study aims to develop the perception of social effects to purchase intention and behaviour of simulated user societies. Online communities may be a major source of knowledge a social effect on buying intentions (Schindler & Bickart, 2001). That were based on the mutual experiences, such relationships are established and expectations were exchanged (Lin, 2008). Members with these communities search and share applicable information to a brand of products and shops. A result of a lack of understanding in the sector of virtual user communities, increased social consciousness impact the impacts buying intentions among these consumers has been improved. The definition of the purpose of the consumer is main with mostly on TRA (Ajzen & Fishbein, 1975). The TRA has accounted for the social effects of actions by adding the concept of a subjective norm.

2.3 Research Hypothesis

The research hypothesis would be a relevant, clear and verifiable proposition or even a theoretical statement on the potential outcome of a scientific research analysis focused on a demographic specificity, such as the supposed difference between populations on even a specific variable or the relationship among variables. In this research, few hypotheses have indeed been assumed:

Hypothesis 1 – Product quality

H₀: There really is no significant relationship between product quality and purchase intention of customers of hypermarkets among UMK students.

H₁: There really is significant relationship between product quality and purchase intention of customers of hypermarkets among UMK students.

Hypothesis 2 – Brand image

H₀: There really is no significant relationship between brand image and purchase intention of customers of hypermarkets among UMK students.

H₁: There really is significant relationship between brand image and purchase intention of customers of hypermarkets among UMK students.

Hypothesis 3 – Social influence

H₀: There really is no significant relationship between social influence and purchase intention of customers of hypermarkets among UMK students.

H₁: There really is significant relationship between social influence and purchase intention of customers of hypermarkets among UMK students.

2.4 Theoretical Framework

That framework below is adapted from of the literature review, with three independent variables (product quality, brand image, social influences) being established that describe the relation to dependent variables (purchase intention). Their relationship with dependent variable (purchase intention).

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

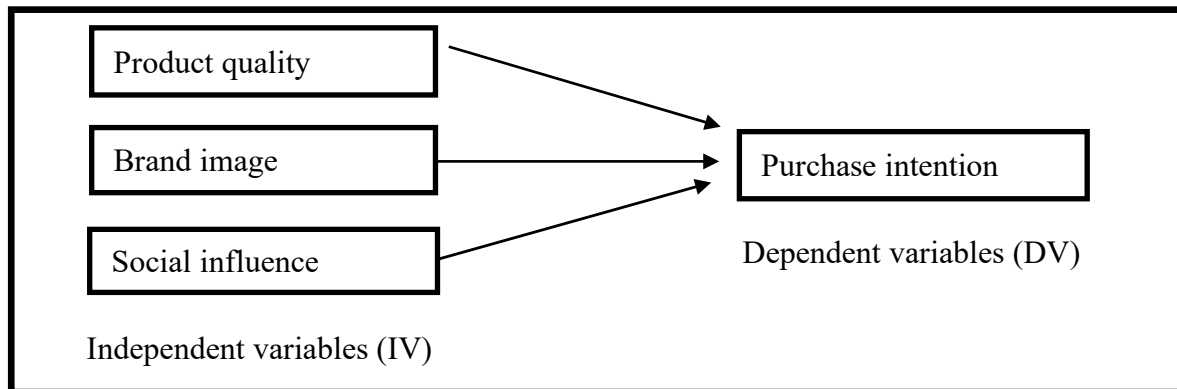

Figure 2.1: Conceptual framework of the study

3 Methodology

3.1 Research Design

The question will be produced in the questionnaire form to collect data from the target respondents. That questions would be created more by secondary data collected from previous surveys about related topics like the demographic profile, their expectation of a respondent and even the factors influencing the purchase intention. Questionnaire were designed Evaluate a relationship between a dependent variable and a independent variable. That show how factors affecting purchase intention of customers to shop at hypermarket among UMK students.

3.2 Data collection

Primary data were information gathered directly from the first data, — for example survey, experiment and analysis. These statistics really aren't recently released on the website or elsewhere and are recent or original data obtained again from respondents, like marketing survey sources. Throughout this research review, a survey questionnaire approach was its primary data collection method as that of the key information source. Sets of questionnaire would be provided random to some students of UMK in 1,2,3 and 4 years in Pengkalan Chepa, Kota Bharu, using the online form.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Secondary data with three types that were survey, documentary, and multi-source, secondary documentary data are useful to the evaluate of written content that collected existing information for proper of supporting the researcher study as a basis such as a book, journal, journal articles and newspaper. Secondary data was collecting online like articles and online journals. Simplicity to accessible and performance, research uses Google for the primary application check or secondary data collection method of Google Scholar as well as the website library sponsored by the University of Malaysia Kelantan.

3.3 Population

The population that's the whole through with a statistical survey is take. The population would apply the whole group of individuals, activities, hospital visits, things, or measurements. Therefore, the population would be assumed to become the abstract analysis for subject group in together with a specific function. The research focuses on undergraduate student who still currently studying in UMK to find out factors affecting purchase intention of customers to shop at hypermarket. this will include only one campus of UMK which are campus Kota locate in Pengkalan Chepa, Kota Bharu. Total population of UMK Campus Kota was 5988 students UMK 2020.

3.4 Sample Size

Selection of the sample size was its process of selecting a number of samples or recreates to be used in the statistical sample. That size of the sample is also an important element of every detailed research where the aim would be to make inference regarding the sample population. 361 students will be the sample size to represent the whole population for this research.

Table 3.1: Krejcie and Morgan (1970) table

$n = \frac{X^2 N p (1 - p)}{e^2 (N - 1) + X^2 p (1 - p)}$
n = sample size
N = population size
e = acceptable sampling error
X^2 = chi-square of degree of freedom 1 and confidence 95% = 3.841
P = proportion of population (if unknown, 0.5)

3.5 Sampling

This research uses the probability sampling technique where a sample is chosen using random selection and each element the populated does had a known possibility to been choose. Next, analysis uses stratified random sampling so it is easy to distribute and compile the questionnaire. The researcher guarantees that population becomes equal and independent probability of been chosen to be part of sample and that there no risk of bias. Sampling from different types of non-probability sampling methodology is often known to

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

be usable and straightforward.

3.5 Research Instrument

Various ways for data collection may be used by the researcher for such a structured questionnaire and personal interview. Researchers will design a series of questions based on variables of the study such as the factors affecting intention of customers to shop at hypermarket among UMK students. The questionnaire will be calculated using the Likert Scale five-point.

Table 3.2: The table of five-point Likert Scale

Characteristics	Strongly disagree	Disagree	Neutral	Agree	Strongly agree
Number	1	2	3	4	5

3.6 Data Analysis Technique

The data analysis is being meaning as a technique an examining the data for the evaluation within each aspect of the data collected.

3.6.1 *Statistical Package for Social Science (SPSS)*

The Statistic Package for Social Sciences (SPSS) for version 22.0 of the International Business Machine (IBM) would be a software platform for achieve that tasks. Use of such computer software would make it easier and safer to gather data and enable quantitative analysis. Next, SPSS to analyses a data which was already obtained in important to maintain also that data is handled in line only with standard of quality.

3.6.2 *Frequencies analysis*

That frequency methodology involved figure and diagrams provides which are helpful also for definition of several variable types. Graphic representations involve histograms, bar graphs, pie charts and frequency tables. Through transforming data through graphical, it's indeed helpful to evaluate and evaluate the data of each variable throughout the analysis. Usually, demographic data was the first part of the correspondence to be evaluated by frequency analysis. In this study, the frequency distributions were used to view demographic data and to rate the demographic significance accordingly.

3.6.3 *Descriptive analysis*

Descriptive analysis would be evaluating result including its demographic questions of a respondent. In the descriptive analysis in this study, the researcher would evaluate the central trend of mean, mode, median and standard deviations. Descriptive statistics are being used in this study to describe the data gathered with its questionnaire. Descriptive statistics have been used in a analysis to summarise the information collected with its questionnaire.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

3.6.4 *Person's correlation*

Pearson's correlation coefficient was its statistical test which tests the statistical relation or connection between two continuous variables. It's also recognized as the best method of calculating the association between variables with concern even though it is focused on the correlation coefficients method.

3.6.5 *Multiple linear regression*

Multiple linear regression would be type that using measure the linear relationship with the independent variable and multiple dependent variables. It's being used to make identify the relationship of multiple independents variables with dependent variables to make the accurate prediction in each other's and it is often used to predict effects or impacts of changes. Helps prove when to use dependent variables adjust as independent variables change. In this analysis, multiple linear regressions will be evaluated as a quality product, brand image and social influence affecting purchase intention of customers t shop at hypermarket among UMK students.

4 Data Analysis and Findings

4.6 Demographic Profile

The demographic profile of the respondents included the information of gender, age, race, course and marriage status. From the sample collected, majority The total respondent of 361 participated in the survey questionnaire. The result of gender analysis consists of 98 males and 263 females. Percentage of male is 27.1% while female is 72.9%.

In terms of age, the major occurs in the age range from The result of the survey indicates the most of the 317 respondents age 23 to 25 years old (87.8%). Age of 20 to 22 years old and 26 years old and above have the same number respondents is 22 (6.1%).

Next, eight different course groups of respondents who answered the questionnaire. The respondents are majority came from retailing which are 132 respondents (36.6%). It followed course commerce with a frequency of 66 respondents (18.3%). The third highest are come from logistics and distribution trade, and Islamic banking and finance which constituted by 39 respondents (10.8%). Then, there are 25 respondents of wellness course that represent (6.9%). The remaining 8 respondents represent by hospitality with (2.2%) and 3 respondents by tourism course with (0.8%)

Furthermore, the respondents come from the race respondents are Malay which amounted to 323 respondents (89.50%). The second highest are Chinese which is 29 respondents (8.0%). Indian has 8 respondents (2.2%) while others had only 1 respondent (0.3%).

Lastly, table 4.6 and figure 4.5 shows marriage status of respondents. As shown in the pie chart, there are 353 respondents (97.8) are single while 8 respondents are married (2.2%).

4.7 Descriptive Analysis

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

The descriptive analysis tested 361 items according to their variable and listed out the summary of the mean and standard deviation of computed items.

Product quality

Table 4.1: Descriptive statistics for product quality

Variables	Statements	N	Mean	Std. Deviation
P1	I find product high quality in the hypermarket that gave me the satisfaction of shopping	336	4.6786	0.48032
P2	I like to shop at hypermarket because product in hypermarket is Durable	336	4.6012	0.50832
P3	I find fresh product in the Hypermarket	336	4.6875	0.52458
P4	I find product with clear label and original in the hypermarket	336	4.6905	0.48194
P5	Products in hypermarket are safe to use and harmless to costumers	336	4.6875	0.48311

Table 4.1 shows the N, mean and standard deviation for the items to measure the product quality. There were five questions measured with the highest mean of 4.6905 for the item on statement “I find product with clear label and original in the hypermarket” which indicate respondent agree on the item. Meanwhile, the lowest mean with 4.6012 was for the item “I like to shop at hypermarket because product in hypermarket is durable” which indicate respondent very close to agree on the item. The mean value for other three items were 4.6875 “I find fresh product in the hypermarket”, 4.6865 “Products in hypermarket are safe to use and harmless to costumers” and 4.6786 “I find product high quality in the hypermarket that gave me the satisfaction of shopping”.

In terms of standard deviation, the items that scores the lowest of the standard deviation which is 0.4803 and the items that scored the highest of standard deviation which is 0.52458. Then followed 0.50832, 0.48311 and 0.48194.

Brand image

Table 4.2: Descriptive statistics for brand image

Variable	Statements	N	Mean	Std. Deviation
B1	Brand image is my priority when making a purchase decision	336	4.4345	0.66953
B2	I will make my purchase according to brand image, regardless of the price	336	4.1845	0.94720
B3	I will consider the reputation of brand image before purchasing it at Hypermarket	336	4.3869	0.75192
B4	Brand images makes a good impression of me on other people	336	4.4107	0.70249

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

B5	Brand images provides solution to my Expectations	336	4.3810	0.72326
----	---	-----	--------	---------

Table 4.2 shows the descriptive statistics for brand image. In terms of brand image, the item which scored lowest for mean was “I will make my purchase according to brand image, regardless of the price” which scored 4.1845. The next item which scored the second from the lowest was “Brand images provides solution to my expectations” which is 4.3810 and next is “I will consider the reputation of brand image before purchasing it at hypermarket” which is 4.3869. The item that scored highest was “Brand image is my priority when making a purchase decision” which is 4.4345. “Brand images makes a good impression of me on other people” is the item that score second highest which is 4.4107. In terms of standard deviation for items used to measure brand image, the item with the highest standard of deviation which 0.94720 and the second highest with a standard of deviation score of 0.75192. The item which came in third which is 0.72326 and followed by 0.70246. The item with the lowest score with a score of 0.66953.

Social influence

Table 4.3: Descriptive statistics for social influence

Variable	Statements	N	Mean	Std. Deviation
S1	Most of my friends and family shop at Hypermarket	336	4.7113	0.46036
S2	Friends and family are very helpful to me making decision of purchase at Hypermarket	336	4.6667	0.51447
S3	I will ask the opinions from my friends and family when I shop at Hypermarket	336	4.6548	0.54623
S4	I trust my friends and family about their advice and opinions purchase at Hypermarket	336	4.7173	0.47044
S5	I will shop at hypermarket because my friends and family recommend to me	336	4.6964	0.48572

Table 4.3 shows the mean and standard deviation for item used to social influences. There were five questions measured with the highest mean of 4.7173 for the item on statement “I trust my friends and family about their advice and opinions purchase at hypermarket” which indicate respondents agree on the item. Meanwhile, the lowest mean with 4.6548 was for the item “I will ask the opinions from my friends and family when I shop at hypermarket” which indicate respondents very close to agree on the item. The mean value for other three items were 4.7113 was “Most of my friends and family shop at hypermarket”, 4.6964 which is “I will shop at hypermarket because my friends and family recommend to me” and 4.6667 was “Friends and family are very helpful to me making decision of purchase at hypermarket” respectively which indicate the respondent agreed on the item.

The item with the highest score in standard deviation with a score 0.54623. It then followed with a score of 0.51447 and the third highest with a score 0.48572. The lowest score in standard deviation which scored 0.46036 and followed which 0.47044.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Purchase intention

Table 4.4: Descriptive statistics for purchase intention

Variable	Statements	N	Mean	Std. Deviation
I1	I intend to shop at the supermarket in the near future because I am interested	336	4.7560	0.45050
I2	I search for information about shop at hypermarket from time to time	336	4.6875	0.54687
I3	I always talk about purchase at hypermarket with my friends	336	4.7232	0.49853
I4	Purchasing at hypermarket is beneficial for my daily life	336	4.7411	0.48399
I5	I willing recommend my friend to shop at hypermarket	336	4.7530	0.43878

Table 4.4 shows descriptive statistics for purchase intention. There were five questions measured with the highest mean of 4.7560 for the item on statement “I intend to shop at the supermarket in the near future because I am interested” which respondent agree on the item. Meanwhile, the lowest mean with 4.6875 was for the item “I search for information about shop at hypermarket from time to time”. The mean value for other three items were 4.7530 was for the item “I willing recommend my friend to shop at hypermarket”, 4.7411 for the item “Purchasing at hypermarket is beneficial for my daily life” and 4.7232 was for “I always talk about purchase at hypermarket with my friends”. The item with the highest score in standard deviation with a score of 0.54687. It then followed by the score of 0.49853. The third highest with a score of 0.48399. The lowest scored in standard deviation which scored 0.43878 and 0.45050.

4.8 Reliability Analysis

Reliability test relates to the fact that the scale can accurately represent the configuration that it is measuring. Cronbach's alpha is the most frequent indicator of reliability. It is most widely used when you have several Likert questions in a survey/questionnaire that create a scale, and you want to decide whether the scale is reliable. Cronbach's alpha is a measure used to evaluate the reliability or internal accuracy of a set of scale or test objects. Cronbach's alpha is one way to calculate the strength of this accuracy.

Table 4.5: Reliability test output by using Cronbach's Alpha

Variable	Cronbach's Alpha	Number of items
Independent variable:		
Product quality	0.785	5
Brand image	0.879	5
Social influence	0.866	5
Dependent variable		
Purchase intention	0.863	5

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

4.9 Normality test

Normality tests have been used to evaluate whether the data set is well-modelled by the normal distribution and to measure how probable it is that the random variable representing the data set is naturally distributed. The main tests for the assessment of normality are Kolmogorov-Smirnov test, Shapiro-Wilk test, skewness test and kurtosis test. Among these, Kolmogorov-Smirnov test is a much used test and the Kolmogorov-Smirnov test and Shapiro-Wilk tests can be conducted in the SPSS explore procedure.

Table 4.6: Table of normality test

Tests of Normality						
	Kolmogorov-Smirnov			Shapiro-Wilk		
	Statistic	Df	Sig.	Statistic	df	Sig.
IV: Product quality	0.262	336	0.000	0.820	336	0.000
IV: Brand image	0.212	336	0.000	0.874	336	0.000
IV: Social influence	0.332	336	0.000	0.744	336	0.000
DV: Purchase intention	0.373	336	0.000	0.711	336	0.000
Lilliefors Significance Correction						

Table 4.6 show the result of Kolmogorov-Smirnov test and Shapiro-Wilk test for the normality test. The highest value of Kolmogorov-Smirnov is 0.373 and the lowest values are 0.212. The other value is 0.332 and 0.262. For the Shapiro-Wilk, the highest value is 0.874 and the lowest value are 0.711. the other value is 0.820 and 0.744.

4.10 Pearson correlation coefficient

Pearson's correlation coefficient is the test statistics that calculate the statistical relation or association between two continuous variables which is dependent variable and independent variable. It is known as the best way of calculating the relation between the variables of interest even though it is based on the covariance method.

4.7: Table of Correlations

Correlations					
		Purchase intention	Product quality	Brand image	Social influence
Purchase intention	Pearson Correlation	1	.511**	.341**	.631**
	Sig. (2-tailed)		.000	.000	.000
	N	336	336	336	336
Product quality	Pearson Correlation	.511**	1	.342**	.506**
	Sig. (2-tailed)	.000		.000	.000
	N	336	336	336	336
Brand image	Pearson Correlation	.341**	.342**	1	.273**
	Sig. (2-tailed)	.000	.000		.000

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

	N	336	336	336	336
Social influence	Pearson Correlation	.631**	.506**	.273**	1
	Sig. (2-tailed)	.000	.000	.000	
	N	336	336	336	336
**. Correlation is significant at the 0.01 level (2-tailed).					

4.11 Multiple Regression Analysis

Multiple regression analysis is an analysis including one dependent variable and two or more independent variables. In many other terms, a correlation study in which the results of two or more independent variables on a single, interval-scaled, dependent variable is analyzed concurrently.

Table 4.8: Summary of Multiple Regression Coefficients

Model		Unstandardized		Standardized	T	Sig.
		Coefficients		Coefficients		
		B	Std. Error	Beta		
1	(Constant)	1.057	0.226		4.688	0.000
	Product quality	0.237	0.052	0.221	4.594	0.000
	Brand image	0.084	0.027	0.134	3.099	0.002
	Social influence	0.469	0.046	0.482	10.252	0.000
a. Dependent Variable: Purchase intention						

Based on the table 4.20, coefficients show that product quality, brand image, social influence is significant to predict dependent variable is purchase intention. This is because p-value is less than alpha value 0.05, the highest of standardized coefficients Beta is social influence which is 0.486. Then, followed by product quality (0.134) and brand image (0.134). this result was showed that independent variables have a strong relationship between dependent variable. This indicates the independent data was less than 0.05.

5 Discussion

The independent variables for product quality was showed the positive result to purchase intention (dependent variable). It shows a moderate positive relationship was found between the two variables. The quality of products and services purchased in shops is an important factor in customer loyalty. Quality is the ability of a commodity to fulfil the unique needs of its consumers. Perceived quality refers to the appraisal by the customer of goods or brands that satisfy the standards of the individual. Such an analysis by individuals is the perception of two brands of items.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

The independent variables for brand image was showed the positive result to purchase intention (dependent variable). It shows a weak relationship was found between the two variables. Based on the research, most of customers disagree about the statement which is "I will make my purchase according to brand image, regardless of the price." That is because more customers are more concerned about price than image brand. A weak brand image can also reduce buying intentions or lower purchasing intentions. Most customers are less concerned with brand image than product quality and social influence on shopping.

The independent variables for social influence was showed the positive result to purchase intention (dependent variable). It shows a moderate positive relationship was found between the two variables. Social influence motivates the specific processing of knowledge by concentrating people on a relevant collection of information that includes reality, interactions with others, and self. As discussed in the remaining parts of this article, these factors of influence can alter the social significance of consumption and purchase decisions.

6 Recommendation

In the future, there are few suggestions for researchers. Firstly, it is suggested that research should be carried out in the whole country if time is allowed, so it is more reliable than only choosing one state to do so, such as considering all the state in t whole of Malaysia. It is preferable to include all countries in the world when doing the research, because it helps to reduce the demographic gap between individuals, there would be a difference in thought about the variables that influence the purchase intention to shop in the hypermarket.

Besides, future researchers will proceed their research by providing other independent variables that can evaluate the factors affecting the purchase intention of hypermarket customers among Kelantan University students in Malaysia. Even then, researchers need to be more careful when selecting independent variables, since only the correct variables will maximize the value of R².

Next, the primary data collected for the studies must not be compromised just the quantitative method, but rather the qualitative method, such as interviewing. Qualitative results collected from the interview session will produce high reliability when there is a two-way conversation between researchers and respondents. This would mean that the respondents understand the study well and that they will make a greater decision.

In the end, researchers were recommended to use interviews during the survey. Its use of interviews can minimize the limitations by using questionnaires so respondents can understand the researcher's questions clearly instead of reading the questionnaires. This eliminates people's misunderstandings when answering the questions in the questionnaire. The respondent would then be able to explain an opinion or explanation on the basis of the variables. Researchers would be able to recognize and correct weaknesses, such as adding definitions to a few words to avoid misunderstandings or uncertainty over the questions asked.

7 Conclusion

As a conclusion, the researcher make a conclusion of the study based on the research objectives which show in chapter 1. The implication of this research has already been analysed in this chapter on the impact of this research. In addition, the researchers discussed the limitation of the research and made a set of recommendations to strengthen research.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Based on the problem statement, the researcher evaluates that the factors affecting purchase intention of customers to shop at hypermarket among University Malaysia Kelantan students. It shows that the factors are one of the key that affect the purchase intention of customers to shop at hypermarket.

The objective of this research is to identify the relationship between the factors and purchase intention of customers to shop at hypermarket. Complete number 400 questionnaires have been distributed to students University Malaysia Kelantan, Kota Bharu and the data obtained has been analysed and analysed using SPSS the result of which provided both informative and inferential analysis. All the hypothesis is accepted where there is significant positive relationship between product quality (IV1), brand image (IV2) and social influence (IV3) with purchase intention of customers to shop at hypermarket.

Next, the findings show that the product quality is also one of the factors affecting purchase intention of customers to shop at hypermarket. Product quality is a continual process of change that improves the value of the product and, ultimately, the fulfilment o the needs of the consumer. Production can be increased at all times. A higher quality product produces a higher purchasing intention for poorer quality goods.

Besides, the brand image can give affecting purchase intention of customers to shop at hypermarket. Brand image is established in the minds of the consumers on the basis of the perception and engagement of the customers with the brand, experiences can take place in different forms and not generally only through the purchasing or use of the product and service.

In addition, social influence is also one of the key factors affecting purchase intention of customers to shop at hypermarket. Social influence involves any manipulative strategy, process, method or coercion that relies on the social psychological nature of the organism as a way of generating or altering the belief or behaviour of the subject, whether or not this attempt is based on the particular acts of the influence agent or the product of the self-organizing nature of the social structures.

In summary, all independent variables (product quality, brand image and social influence) and dependent variables (purchase intention) are positive result, which shows that the results of the research are appropriate, accurate and important, thus, this research may be carried out for further research and learning.

8 Acknowledgement

First of all, I would like to thank the administrators of University Malaysia Kelantan by giving me the opportunity to conduct this research project. It was enable me to learn and gain more experience in conducting a research.

Other than that, I would like to thank my supervisor, Md Zaki bin Muhamad Hasan, who has given me guidance with the patient to make sure I always stay on the right track. Without he helps, this project would not be completed successfully. In addition, I would like to thank my examiner, Mahathir bin Muhamad, who pointed out the mistakes I made during the presentation. Without him, my mistake will not be apprehended and is likely to cause

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

serious consequences.

Furthermore, I would like to special thanks to my family and husband for giving me moral and financial support all the time. Thank you to the ones who helped me to distribute the questionnaires. During the progress of the research project, the respondents have given their valuable feedback on the protesting of questionnaire.

Finally, sincerely thank all those who have helped me directly or indirectly in the success of this project.

E-BUSINESS PERFORMANCE: THE IMPACT OF COVID-19 ON RETAIL INDUSTRY IN KELANTAN

Nor Shazana binti Mohd Zakariyah and Wan Farha Binti Wan Zulkiffli

Faculty of Entrepreneurship and Business,
Universiti Malaysia Kelantan,
Malaysia

Email: shazana.a17a0359@siswa.umk.edu.my; farha@umk.edu.my

Abstract:

Nowadays, e-business is an important role in order to facilitate business transactions in business especially during Coronavirus (Covid-19). This thesis is conducted to study the relationship between consumer behaviour, retail competition, shortage of product and e-business performance. The main purpose of this research is to identify the impact of e-business performance during Covid-19 on retail industry in Kelantan. This study will be conducted to investigate the relationship between dependent variable with independent variables. Dependent variable in this study is the impact of e-business performance, while the independent variables in this study are the consumer behaviour retail competition, and shortage of product. A set of questionnaire will be used to collect data and will be distributed to 200 respondents among online retailers in retail stores and food & beverage industry which located in Kelantan. Thus, this research is to identify the impact of e-business performance that influences online retailers and will be an added advantage to the retailers to gain some information on e-business performance during pandemic.

Keywords: Consumer Behavior, Retail Competition, Shortage of Product, E-business Performance

1. Introduction

Internet is one of the mediums accessible to users around the world to communicate, contact each other and get information in just one click. The most popular Internet over the past two decades has created a new way for consumers to start making online purchase using e-business. However, the use of e-business platforms is increasing after the Covid-19 outbreak. It has cut off the supply chain of the business. The production and the manufacturers are expected to be hampered more. China is the central manufacturing hub for many businesses globally. Therefore, any disruption in china's output will simply have repercussions (Meyer, S. (2020).

During this pandemic season, it has affected many retailers as they have to figure out the most effective way to continue their business. While fashion, apparel & luxury retailers, such as Zara, H&M and Macy's, have stopped production, other industries, such as retail and food & beverage, have seen an unprecedented surge in demand ([Andy Nemes](#), April 3, 2020). According to Salini Devi Rajendran, Siti Norida Wahab, Yeow Way Ling and Lim Shin Yun (2018) have said that the process of selling and buying products or services can be done easily through the Internet. As a result, there are many online retailers nowadays. However, the performance of this online retailer depends on the level of consumer behavior, online retailer competition and also product shortage. Therefore, there are many effects of Covid-19 on e-business performance in this retail industry. Although COVID-19 has wreaked havoc on the retail industry and the general economy, retailers will always search for opportunities to interact with their existing

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

customers or embrace new ones and capitalise on them. There are a variety of factors that customers will be searching for from retailers and brands now and in the future which is cleanliness, accountability, leadership, empathy and versatility are some of the most significant ones. Making up for missed revenue and controlling the bottom line will still be priorities, but it is more important for retailers to concentrate on the customer right now and to direct business decisions by taking into account their emotions, worries, financial realities and values (Diana Smith, Associate Director, Retail and e Commerce).

There are three objectives of this research:

1. To identify the relationship between consumer behavior and e-business performance during Covid-19.
2. To determine the relationship between retailer competition and the e-business performance during Covid-19.
3. To examine the relationship between shortage of product and e-business performance during Covid-19.

1.1 Significance of the Study

1.1.1 Academic

In academic can record proposals that have related to the impacts of Covid-19 on e-business. Academic can also be a reference for the people who want to know about the e-business performance and the impact that happened to the retail industry during the pandemic. This study is useful for academics to serve as a source of reference in the future.

1.1.2 Community

Community also can identify about the impacts of Covid-19 on e-business performance. So, they can know the problem when they have buying in the e-business platform. Also, this study can make the community to understand about the retailers that also have the impact when the pandemic season Covid- 19 had approached. The community can see through this study about the online retailers have to facing the problem that have burdened them to supply the goods to the consumer in the right condition and quality.

1.1.3 Industries

This study also can give the benefits to the industries especially the retail industry as they can find information on this study to improved more benefit to this industry so that they can be prepared when it come to the natural disaster. Readers in the industry also will increase their knowledge of the problem among retailers during pandemic season and can make the best decision to development the retail industry e-business performance by reading this study.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

2. Literature Review

2.1 Research Hypothesis

In this study, there were four hypotheses statement of the impact of e-business performance during Covid-19:

H1: There is a significant study on the relationship between e-business performance during Covid-19 and ways to overcome the issues.

H2: There is a significant study on the relationship between the consumer behaviour e-business performance during Covid-19.

H3: There is a significant study on the relationship between the retail competition and e-business performance during Covid-19.

H4: There is a significant study on the relationship between the shortage of product and e-business performance during Covid-19.

2.2 Research Framework

A research framework has been conducted to investigate the connection between e-business performance during Covid-19 as depicted in the figure 2 below which was concluded from several previous researchers. The research consists of independent variables, which is the consumer behaviour, retail competition and shortage of product. The research will focus on the analysis of independent variables towards the dependent variable which is e-business performance.

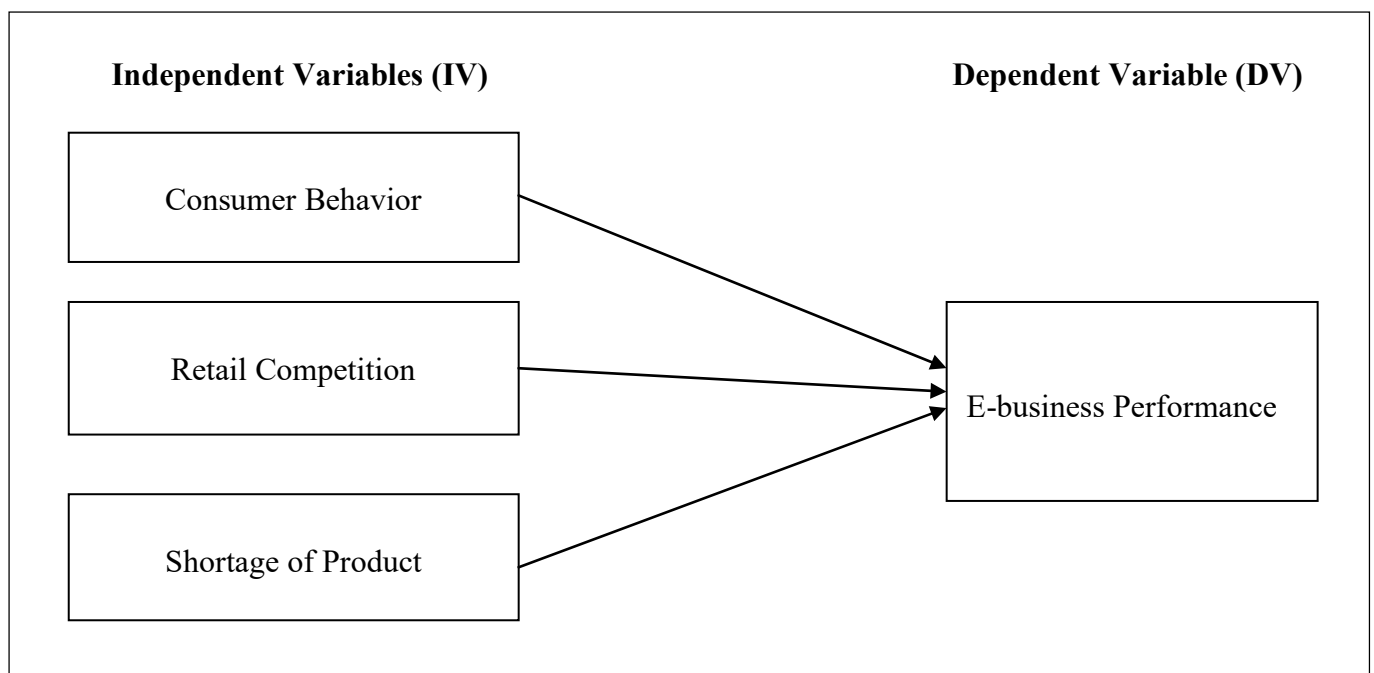

Figure 2: Proposed Conceptual Framework

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

3. Methodology

3.1 Research Design

A structured questionnaire will be used with the quantitative research as this research instrument. According to Zikmund & Babin in Nell, C. (2013), quantitative research refers to which consists of larger representative sample by placing the research objectives from an experiential assessment that involves numerical measurements and analysis. This study will select questionnaire strategy to collect the data. Researcher will do a questionnaire in Google form, then will given to online retailers to answer the questions asked.

3.2 Data Collection

In the first stage, the data collection used in this study was primary data collection method and secondary data collection method. Primary data is the type of data that is collected by researchers directly from main sources. It can be obtained and gained by the distribution of questionnaire. This questionnaire is developed in this research to gain cooperation and clarification from the target respondents.

The secondary data is a type of data sources obtained from indirect and through others source. All other data often gathered from written resources such as newspaper, books, documents, the internet and others. It is also the data or information obtains from other sources such as articles, books and journals.

3.3 Sampling

Sample size is the number of population observations selected. The researchers focus on the respondent which is online retailers in Kelantan to answer the research goals for this study. In this research, the researcher choosing the sample size which randomly consisting of 384 online retailers as a respondents and they need to answer all the questions that ask in questionnaires of Google form.

The sampling method used in this study was the non-probability sampling technique which is the convenience sampling method determined in this analysis. To obtain a representative sample, the researcher will cover the entire population. Based on this study, researchers will decide online retailers from various age categories who conduct business online in Kelantan.

3.4 Data Analysis

The questionnaire that already collected which would be analysed and explained by using three types analysis which were Descriptive Analysis, Validity and Reliability Analysis, and Multiple Linear Regression Analysis. The data obtained was analysed by using Statistical Package for the Social Science (SPSS).

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

4. FINDINGS

4.1 Descriptive Analysis

Table 1: Demographic Profile of the Respondents

Demographic profile	Category	Frequency	Percentage (%)
Gender	Male	79	39.5
	Female	121	60.5
Age	Below 20	6	3.0
	20-29	72	36.0
	30-39	87	43.5
	40 and above	35	17.5
Race	Malay	126	63.0
	Chinese	63	31.5
	Indian	11	5.5
Mutual Status	Single	78	39.0
	Married	98	49.0
	Others	24	12.0
Education Level	Pmr/pt3	7	3.5
	Spm	74	37.0
	Stpm/stam	42	21.0
	Diploma	52	26.0
	Bachelor degree	20	10.0
	Master	3	1.5
	Others	2	1.0

(Sources: Developed of the Research)

Table 1 showed the overall descriptive statistics for respondents' demographics which include gender, age, race, mutual status and education level. There are 200 respondents through Google form that are successfully collected. The number of female respondents was the highest where it made up of 60.5%. The highest number of age respondents falls under category between 30-39 years old with total of 87 from 200 respondents. In term of race, the majority of respondents are Malay which contributes 63.0%. The highest number of respondents who married was 49.0%. Meanwhile, 37.5% respondents come from the SPM students.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Table 2: The Descriptive Statistics of Independent Variables and Dependent Variable

Item	N	Mean Score	Standard deviation
IV1: Consumer Behaviour	200	4.6500	0.49177
IV2: Retail Competition	200	4.4875	0.58764
IV3: Shortage of Product	200	4.4688	0.61439
DV: E-business Performance	200	4.4638	0.60380

(Sources: Developed of the Research)

Table 2 shows that the mean values range between 4.4638 to 4.4875 and the highest value which is retail competition. This study adopted 5-point Likert Scale that range from 1 (Strongly disagree) to 5 (Strongly agree).

4.2 Validity and Reliability Analysis

Reliability test is conducted to determine the understandable of respondents towards all items and it could be measured by using Cronbach's Alpha values (Hair et al., 2012). Table 3 present the results of reliability test in this study from all variables.

Table 3: Reliability Analysis

Item	Cronbach's Alpha	Cronbach's Alpha Based on Standardized Items	N of items
IV1: Consumer Behaviour	0.737	0.773	4
IV2: Retail Competition	0.884	0.885	4
IV3: Shortage of Product	0.817	0.821	4
DV: E-business Performance	0.880	0.879	4

(Sources: Developed of the Research)

Table 3 shows that the value of Cronbach's Alpha is range from 0.737 to 0.884. The values indicated that all the variables in this study are reliable and valid since the Cronbach's Alpha value is exceed 0.7 as suggested by Hair et al. (2012).

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

4.3 Spearman Correlation Analysis

Table 4: Summary of Spearman Correlation

Correlations						
			IV1	IV2	IV3	DV
Spearman's rho	Consumer Behaviour (IV1)	Correlation Coefficient	1.000	.638**	.630**	.690**
		Sig. (2-tailed)	.	.000	.000	.000
		N	200	200	200	200
	Retail Competition (IV2)	Correlation Coefficient	.638**	1.000	.617**	.659**
		Sig. (2-tailed)	.000	.	.000	.000
		N	200	200	200	200
	Shortage of Product(IV3)	Correlation Coefficient	.630**	.617**	1.000	.720**
		Sig. (2-tailed)	.000	.000	.	.000
		N	200	200	200	200
	E-business Performance (DV)	Correlation Coefficient	.690**	.659**	.720**	1.000
		Sig. (2-tailed)	.000	.000	.000	.
		N	200	200	200	200
**. Correlation is significant at the 0.01 level (2-tailed).						

(Sources: Developed of the Research)

4.4 Multiple Linear Regression

The independent variable in this study, which are consumer behaviour, retail competition, and shortage of product were entered into same regression equation to predict either there was any significant relationship with the e-business performance.

Table 5: Model Summary for Regression Analysis

Model Summary^b					
Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	Durbin-Watson
1	.783 ^a	.613	.607	.37868	1.819
a. Predictors: (Constant), Shortage of Product, Retail Competition, Consumer Behaviour					
b. Dependent Variable: E-business Performance					

(Sources: Developed of the Research)

The table 5 showed R² for this model is 0.613. Thus there were 61.3% of the impact of e-business performance during Covid-19 on retail industry in Kelantan can be

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

explained by the three independent variables which were Shortage of Product, Retail Competition, Consumer Behaviour.

5. DISCUSSION & RECOMMENDATION

The positive of result for research question 1 is, “There is significant relationship between consumer behaviour and e-business performance during Covid-19”. From this result, it is proven that the H2 of the study is accepted while for H0 of the study is rejected. The main focus is to study is there significant relationship between consumer behaviour and e-business performance during Covid-19. The result presented revealed that the value of Spearman Correlation for organizational context is 0.000, $p < 0.05$ which is there is significant relationship between consumer behaviour and e-business performance during Covid-19. In sum, the result shows that the H0 is rejected and H2 is accepted in the hypothesis testing.

The positive of result for research question 2 is, “There is significant relationship between between the retail competition and e-business performance during Covid-19”. From this result, it is proven that the H3 of the study is accepted while for H0 of the study is rejected. The main focus is to study is there significant relationship between retail competition and e-business performance during Covid-19. The result presented revealed that the value of Spearman Correlation for organizational context is 0.000, $p < 0.05$ which is there is significant relationship between retail competition and e-business performance during Covid-19. In sum, the result shows that the H0 is rejected and H3 is accepted in the hypothesis testing.

The positive of result for research question 3 is, “There is significant relationship between the shortage of product and e-business performance during Covid-19”. In this study have shown a strong positive relationship was found between the two variables. The result shows there is significant relationship between the shortage of product and e-business performance during Covid-19. The result presented revealed that the value of Spearman Correlation for organizational context is 0.000, $p < 0.05$ which is there is significant relationship between the shortage of product and e-business performance during Covid-19. In sum, the result shows that the H4 is accepted and H0 is rejected in the hypothesis testing.

For recommendation, the researcher have found out that there are some spaces for improve the quality of this study in the future. The study can be conducted using different independent variable to get better results on the impact of e-business that influences retail stores and also food and beverage industry at Kelantan and not from whole Malaysia. So, in the future the researcher can conduct the research at others country in Malaysia.

Then, researcher prescribed some strategies that the government and its agencies responsible for online retailers to develop their business. The government should play a leading role in educating retailers which is beginners on the incentives available to them and how to access them. Such incentives will help them to improve their e-business performance. These incentives should be delivered through an establishment that really cares for the success and sustainability on online business during Covid-19.

Lastly, this study will give benefit to future researcher to conduct their study. This journal will be a reference and guideline to them to improve their studies in e- business performance during pandemic season. This thesis can be displayed at the libraries and can be uploaded in website to the future researcher’s reference. They will have proper guide when they understand about this case study and also the limitations.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

6. CONCLUSION

The conclusion of this research study is it aim to find out and examine the impact of e-business performance during Covid-19 on retail industry in Kelantan. This study tried to evaluate factors that impact e-business performance with factors of consumer behaviour, retail competition, and shortage of products. Research framework is developed based on the literature that been viewed. The researcher planned to investigate the relationship of each elements in the independent variables to the dependent variables.

In this study, a total of 200 respondents were collected through questionnaire method. The data was evaluated using SPSS software and methods of Descriptive Analysis, Reliability Test and Multiple Linear Regression Analysis are used. As stated in Chapter 4, the reliability analysis was excellent for the independent variables and dependent variables. The minimum requirement for reliability analysis has been met from the study of the overall variable since the value of the Cronbach's Alpha coefficients is above 0.7. The independent variables identified as the consumer behaviour, retail competition, and shortage of product to the dependent variable known as the e-business performance.

In conclusion, the researcher can study the relationship between independent variables towards dependent variable. This research also can define the real way to analyse the data. Some of limitation of the study can give chance to researcher to give more recommendation to improve the quality of the research.

7. ACKNOWLEDGMENT

In the name of Allah, the Most Gracious and the Most Merciful Alhamdulillah, all praises to Allah for the strengths and His blessing in completing this thesis. Then, researcher would like to express our appreciation to supervisor, Dr. Wan Farha binti Wan Zulkifli, as well as the examiner, Prof. Madya Dr. Mohammad bin Ismail, for continuous gave fully support in this final year research project with their knowledge, patience, and motivation. Their advice gave us a direction in writing this final year research project all the time and also helps us improved our knowledge in making research.

After that, researcher would like to extend a gratitude to our friends, who always gave a lot of support to complete the research project. The friends can share wih their different ideas and knowledge of IT in writing the research project.

Besides that, researcher would like to thanks the office and knowledge management of University Malaysia Kelantan, which provided a place that full of material. Researcher found out the suitable material for writing the research project

Last but not least, researcher also would like to thankful to family. It is because of parents and family always gave us mental support in writing the research project. Their supporting helped researcher to release the stresses that gain from the processing of the research project.

THE FACTORS THAT INFLUENCING CONSUMERS PREFERENCE ON BRAND LOVE IN THE CLOTHING INDUSTRY: A STUDY AT THE PADINI CONCEPT STORE IN KOTA BHARU KELANTAN

Norhalili Binti Zainual and Nik Noorhazila Binti Nik Mud

Faculty of Entrepreneurship and Business,
Universiti Malaysia Kelantan,
Malaysia

Email :norhalilizainual97@gmail.com ; noorhazila.nm@umk.edu.my

Abstract:

This thesis is to investigating the factors that influencing consumers preferences on brand love in the clothing industry : a study at the Padini Concept Store in Kota Bharu Kelantan. The purpose of this study is to identify and find out whether factors such as consumer characteristics, references groups, store attributes, promotion, and product attributes influence consumer preferences at Padini Concept Outlet as one of the clothing industry. The data is collected by means of questionnaire obtained from 387 respondents in Kota Bharu Kelantan. Non-probability sampling was applied to allow the researcher to collect the responses easily and quickly because of population is large. This study use Descriptive Analysis, Pearson correlation Analysis and Multiple Linear Regression Analysis. From the result, all the independent variables are significant with the dependent variables with the value of ($p < 0.005$) and the most factors influencing consumers preferences on brand love in the clothing industry is customer characteristics with the value of ($p < 0.005$), ($b = 0.267$). Factors related to the influence of consumer choice on the clothing industry are

Keywords: *factors, consumer preferences, brand love, clothing industry, Padini Concept Store*

1 Introduction

One of the largest sectors in the world is the clothing industry and many challenges that the industry has faced with enormous sustainable growth impact. To maintain the level of performance and development seen in recent times, the clothing industry needs solutions involving the global side. As the growth of the population and the use of such products in the larger technical applications and garment industry lead to the growth of extraordinary textile demand, the development of innovative designs, processes and materials become very important (Shishoo Consulting AB, 2014).

Consumers in the market today hope to be satisfied with the product or brand they are buying. However, customer satisfaction is not enough to establish a lasting relationship with the brand. It is necessary to forge emotional bonds that exceed satisfaction to provide consumer loyalty. Brands play a major role in the consumer decision-making process (Fischer, Volckner and Sattler, 2010). Consumers may pay premium prices for some brands and continue to choose these brands in a timely manner (Fischer et al., 2010).

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Nowadays, consumers spend less of their income on clothing than ever before, although consumers spend more often and buy more clothing items than ever before. The response from manufacturers to the challenge of slow demand growth is to build consumer interest in variety and provide new fashions and various sizes, colors, designs, etc. At regular rates. Details of these developments and their impact on the international trade in textiles and apparel are discussed in this section (Hildegunn Kyvik Nordas, 2014). The objectives of this study will be to investigate The Factors That Influencing Consumers Preference On Brand Love in the Clothing Industry : A Study At The Padini Concept Outlets in Kota Bharu, Kelantan.

2 Literature Review

2.1 Underpinning Theory

2.1.1 Theory of Planned Behaviour

Theory of Planned Behavior (Ajzen, in 1985; in 1991) is an extension of the Theory of Reasoned Action. According to the authors, the need for this new model stems from behavioral limitations over which people have no control. Thus, Ajzen added a third element to his model, which he said influenced one's intention to perform a behavior he referred to as behavior control. Submission of Papers The handling of perceived behavior refers to the resources, skills, and opportunities available as well as one's own perception of the importance of achieving results. The concept of Perceived Behavioral Control is close to the concept of self-efficacy Bandura (1982). The latter explains that a person's belief in his or her effectiveness can influence his or her choice of activities, his or her preparation to perform activities and ultimately on the efforts he or she will undertake during the intended activity. Thus, if for example two people have a strong intention to learn a new language, the person who thinks that he will succeed in mastering it, is the person who will tend to survive more than the others who doubt his ability (Ajzen, in 1991).

2.2 Previous Studies

2.2.1 Customer Characteristics

Personal characteristics affect consumption and purchase volume (Tarasi et al., 2013). Therefore, it can be assumed that these characteristics will also affect the company's income and profits, i.e. its performance, while from the company's perspective it is useful not only to recognize the characteristics of its customers, but also influence them to increase the company's income and profits. PCs most commonly used in customer satisfaction research are age and income (refer to Tarasi et al., 2013), with gender also often emerging (refer to Anderson et al., 2008). Some researchers (e.g. Peterson & Ekici, 2007) describe these variables as demographic characteristics. Given the large number of PC variables and methodologies for conducting research, we will refer to the group of variables of age, income and gender as demographic characteristics, and the group of Personality variables as PC.

H₁ : There is a relationship between consumer characteristics and consumer preferences

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

on brand love in clothing industry.

2.2.2 References Group

Referral groups are social groups that customers refer to when making decisions (Kotler et al. 2016: 140), and the influence of such reference groups varies between products and brands (Rani 2014: 55). Customers obtain information to make purchasing decisions by communicating with people they trust and respect, and those whom they value (Van Staden & Van Aardt 2011: 38). Customers purchase and use the product to relate to or become a member of a reference group (Lamb et al. 2015: 111). Customers relate to the values and norms of the reference group (Van Staden & Van Aardt 2011: 38). Referral groups can include family members, friends, colleagues, sports associates or fellow church members who pressure customers to adapt to the group's product and / or brand choices. Therefore, opinion leaders such as celebrities are also used as brand ambassadors who can influence product and / or brand choices. (Kotler et al. 201: 140- 141).

H₂ : There is a relationship between references groups and consumer preferences on brand love in clothing industry.

2.2.3 Store Attribute

Martineau (1958) suggested that a picture of a store can be defined in the minds of consumers as a combination of the quality of store function and the effect of the psychological nature of the store. The study also found that the better the picture, the more likely consumers are to buy and sell at the store. In an effort to identify the determinants of retail protection, researchers have highlighted store image as the most important determinant (Erdem et al., 1999). The image of the store has various dimensions and should be measured with various attributes as suggested by Kim and Jin (2001a, b). According to Yue and Zinkhan (2006), the store atmosphere mainly focuses on physical store attributes. In fact, the atmosphere of the store is often designed to evoke emotions in the buyer. Elements in the store such as display, lighting, music, aroma, color, useful workers and product or sample demonstrations are designed to evoke positive feelings in the buyer environment (Solomon, 2007).

H₃ : There is a relationship between store attributes and consumer preferences on brand love in clothing industry.

2.2.4 Promotion

Madura (2007), argued that, "Promotion is the act of informing or reminding consumers about the specifications of the product or brand". Tjiptono (2007), states that "the purpose of promotion is to inform, influence, and persuade and remind customers about the company's objectives and marketing mix". Swastha and Irawan in Angipora (1999) states that, "the promotion is short-term incentives to encourage the purchase or sale of a product or service". Promotion is an important element in corporate campaigns and promotional campaigns are best done by satisfied customers. Therefore, the campaign needs to be addressed carefully because the problem is not only related to how to communicate with customers but also about how much it costs, and the cost should be tailored to the circumstances and capabilities of the company.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

H₄ : There is a relationship between promotion and consumer preferences on brand love in clothing industry.

2.2.5 Product Attribute

Various product attributes or features serve as criteria for users evaluating the product. Previous studies have identified important properties used by consumers when evaluating clothing products. Attributes such as price, quality, design, brand image, and marketability are used in the evaluation of clothing products. However, the results of this study are inconsistent (Jin, Park, & Ryu, 2010). For example, one study showed that consumers value comfort and fitness when evaluating jeans (Wu & DeLong, 2006), but color and suitability are found to be important attributes of jeans in other studies (DeLong, LaBat, Nelson, Koh, & Kim) , 2002). However, other studies show that price and brand name are important for consumers who purchase jeans (Lennon, 1984).

H₅ : There is a relationship between product attributes and consumer preferences on brand love in clothing industry.

2.3 Conceptual Framework

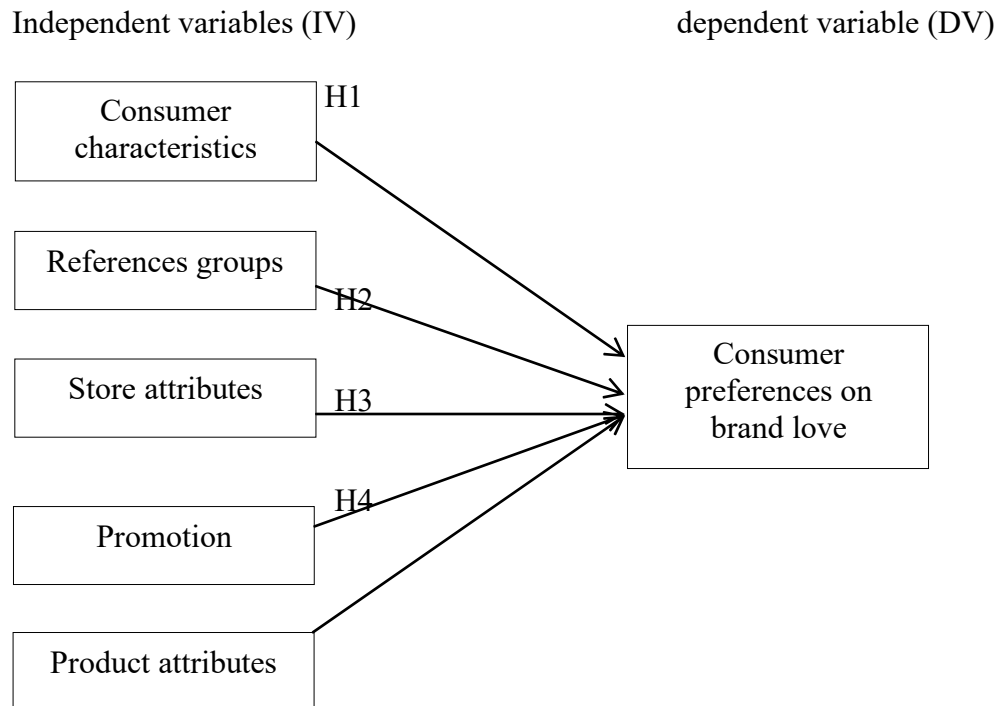

Figure 1 : The Research Framework

3 Research Methodology

3.1 Data Collection and Sample Selection

In this research, data will be collected through the use of quantitative research while

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

being able to measure something accurately in business research. The target population of this study is people who visit Padini Concept Store around Kota Bharu Kelantan which consists of two main stalls, namely Padini Concept Store at KB Mall and Padini Concept Store at Aeon Mall and the number of respondents who have been selected for this study sample is 384 people.

3.2 Measurement and Scales

Questionnaire were used in this analysis as instrument. To measured the questionnaire, researcher using 6 point Likert Scale. The 6 point likert scale was used to calculate the target respondents in Kota Bharu Kelantan, based on their level agreement on the relationship of factors that influencing consumer preferences on brand love in clothing industry.

3.3 Data Analysis

The data collected will be analyzed using Statistical Package for the Social Sciences (SPSS) version 26. The responses from the respondents will be indicated as a requirement before organized enters the data to proceed to the next step.

Therefore, pilot test which to test the reliability, Descriptive Analysis, Pearson Correlation Analysis and Multiple Linear Regression were used to the objectives and hypothesis of the study.

4 Data Analysis

4.1 Reliability Analysis

Table 1 : Dependent and independent reliability analysis

Variables	Total items	Cronbach's Alpha
All variables	31	.950
Consumer characteristics	5	.761
References group	6	.824
Store attributes	6	.816
Promotion	4	.927
Product attributes	5	.775
Consumer preferences	5	.834

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Table 1 summarizes the findings of the reliability test of each variables in this study. According table 1, the range of Cronbach's Alpha for each variables is .950 to .761 which means the items for each variables are excellent based on the rule of Thumb of Cronbach's Alpha coefficient.

4.2 Descriptive Analysis

Table 2 : Respondent Demographic Profile

Items	Categories	Frequency	Percentage (%)
Gender	Male	205	53.0%
	Female	182	47.0%
	Total	387	100%
Age	<17	16	4.1%
	18-25	153	39.5%
	26-33	138	35.7%
	34-41	51	13.2%
	42-50	22	5.7%
	>51	7	1.8%
	Total	387	100%
Education	PMR	15	3.9%
	SPM	58	15.0%
	STPM	109	28.2%
	Dip.	117	30.2%
	Deg.	87	22.5%
	Other	1	0.3%
	Total	387	100%
	Income	<RM1000	99
RM2000-RM3000		223	57.6%
>RM4000		41	10.6%
Total		387	100%
Job sector	Gov. Sector	56	14.5%
	Pri. Sector	112	28.9%
	Self-Empl.	146	37.7%
	Student	70	18.1%
	Others	3	0.8%
	Total	387	100%
Marital Status	Single	178	46.0%
	Married	204	52.7%
	Other	5	1.3%
	Total	387	100%

Table 2 show that male respondents are dominant in this study. Most of the respondents are age between 18 to 25 years old with the value of n=153 (39.5%) and majority of the respondents were from Diploma with the value of n=117 (30.2%), and their income from RM2000 to RM3000 with the value of n=223 (57.6%). Besides, majority of respondents from self-employed with the value of n=146 (37.7). Lastly, the respondents show that their marital status and married had the highest value of n=204 (52.7%).

	N	387	387	387	387	387	387

** . Correlation is significant at the 0.01 level (2-tailed).

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

The Pearson correlation analysis between independent variable and dependent variable is shown in table 3. The result showed that there were a significant relationship between all independent variables that is customer characteristics ($p < 0.005$, $r = 0.598$), references group ($p < 0.005$, $r = 0.647$), store attribute ($p < 0.005$, $r = 0.609$), promotion ($p < 0.005$, $r = 0.528$), and product attribute ($p < 0.005$, $r = 0.587$) on consumer preferences brand love in clothing industry showing a very high positive correlation between variables since $p < 0.001$. Therefore, the null hypothesis was rejected and the alternative hypothesis was supported by the research.

4.4 Multiple Regression Analysis

Table 4 : Multiple Linear Regression

Variables	Simple linear regression			Multiple linear regression		
	b ^a	t-stat (95% CI)	p-value	Adj. b ^a	t-stat(95% CI)	p-value
Cust. characteristic	.662	14.635 (.573,.751)	.001	.267	6.314 (.184,.350)	.000
References group	.600	16.656 (.529,.671)	.001	.197	4.272 (.106,.288)	.000
Store attribute	.642	15.060 (.558,.726)	.001	.227	4.760 (.133,.321)	.000
Promotion	.472	12.214 (.396,.548)	.001	.171	3.492 (.075,.267)	.001
Product attribute	.603	14.209 (.519,.686)	.001	.119	3.192 (.046,.193)	.002

After data exploration and cleaning, indistinguishable analysis was performed using Simple Linear Regression (SLR) and the results as shown in table 4.6.4. Simple Linear Regression identified five important factors that did not adjust to a value of $p < 0.25$ to be included in the selection of variables. The factors are customer characteristics, references group, store attribute, promotion and product attribute. The variables selection method is extended using the smart step method. In this study, customer characteristics, references group, store attribute, promotion and product attribute became significant with $p < 0.001$. No multicollinearity and interaction were detected in this study.

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

4.5 Hypothesis Testing Result

Table 4 : Hypothesis Testing Result

Objective	Hypothesis	Result of Analysis	Decision
To identify the relationship between customer characteristics and consumer preferences on brand love in the clothing industry.	H₁ : There is a relationship between consumer characteristics and consumer preferences on brand love in clothing industry.	R=.598	Supported
To identify the relationship between references groups and consumer preferences on brand love in the clothing industry.	H₂ : There is a relationship between references groups and consumer preferences on brand love in clothing industry.	R=.647	Supported
To identify the relationship between store attributes and consumer preferences on brand love in the clothing industry.	H₃ : There is a relationship between store attributes and consumer preferences on brand love in clothing industry.	R=.609	Supported
To identify the relationship between promotion and consumer preferences on brand love in the clothing industry.	H₄ : There is a relationship between promotion and consumer preferences on brand love in clothing industry.	R=.528	Supported
To identify the relationship between product attributes and consumer preferences on brand love in the clothing industry.	H₅ : There is a relationship between product attributes and consumer preferences on brand love in clothing industry.	R=.587	Supported

The table 4 shows, it can be summarized that all the five independent variables which are customer characteristics, references group, store attribute, promotion and product attribute has a significant relationship between consumer preferences on brand love in clothing industry at Padini Concept Store Outlet in Kota Bharu, Kelantan. Hence, all the hypothesis is supported as the p-value is less than 0.05.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

5 Discussion and Recommendation

Based on the findings in the research of factors influencing consumer preference on brand love in the clothing industry, researchers come out with several suggestions for future improvements to improve factors such as customer characteristics, reference groups, store attributes, promotions and product attributes.

As a recommendation, the researcher suggested using probability sampling methods to collect survey data. For future studies, researcher can use systematic sampling to collect data. By using probability sampling, it will reduce bias in selecting samples. However, findings based on probability sampling can be generalized to the target population with a specified level of confidence.

In addition, because this research is only concentrated in the state of Kota Bharu, Kelantan, researcher can expand research to all state in Malaysia to improve the accuracy of the factors that influences consumer preferences on brand love in clothing industry. This allows future researcher to obtain more accurate data and large responses as well as a broader perspective.

Furthermore, the findings if future studies can be enhanced by collecting extensive data on more clothing store such as Brand Outlet store, H&M store and other clothing store. This will help the researcher to get an idea of the exact satisfaction in the customer. Therefore, they will get more respondents from various clothing store and more accurate information.

6 Conclusion

The purpose of this study is to determine the factors that influence consumer preferences on brand love in the clothing industry. In this study, consumer preferences was influenced by customer characteristics, references groups, store attributes, promotions, and product attributes. Therefore, consumer preferences is represented by residents living in the area around Kota Bharu, Kelantan which is a dependent variable. In addition, there are three independent variables which is customer characteristics, reference groups, store attributes, promotions and product attributes

The independent and dependent variables were analyzed by Pearson correlation coefficient. This indicates that the dependent variable is influenced by the independent variable. Then the results show the relationship between customer characteristics, references groups, store attributes, promotions, product attributes and consumer preferences is very significant. In conclusion, the findings of this study prove that there is a relationship between customer characteristics, reference groups, store attributes, promotions, product attributes and consumer preferences by residents living in the area around Kota Bharu, Kelantan.

7 Acknowledgement

Foremost, I would like to express my sincere gratitude to my supervisor Puan Nik

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Noorhazila Binti Nik Mud for the continuous support of my research, for her patience, motivation, and immense knowledge. Her guidance helped me in all time of research and writing of this final year project. I could not have imagined having a better supervisor for my degree study. Secondly, I would also like to thank my family, my parents and friends who helped me a lot in finishing this project within the limited time. I am making this project not only for marks but to also increase my knowledge.

FACTORS INFLUENCING THE CHOICE OF FRANCHISING AS BUSINESS START-UP: A STUDY OF FINAL YEAR STUDENTS (BACHELOR OF ENTREPRENEURSHIP (RETAILING) HONOR

Norshafika binti Yusop @ Zakaria and Nurul Ashykin binti Abd Aziz

Faculty of Entrepreneurship and Business,
University Malaysia Kelantan,
Malaysia

Email: shafika.a17a0379@siswa.umk.edu.my; ashykin.a@umk.edu.my

Abstract:

This study is to discuss the factors that influence the final year of retail students who have taken the franchise and license course in the selection of the franchise as a business starter. In addition, this study also discusses the factors influencing the choice of franchising as a business start-up such as franchise fee, recognizable company name or brand, business model and business training and management program. This study uses quantitative methods to obtain data. The quantitative method is a technique associated with changing the information of the image or study into the number which mean this study will represent in number (Bernard, 2006). The target of this research is final year students of retail costs who have taken franchise and license costs. The total number of respondents in this study is 103 people based on the table Krejcie & Morgan (1970). The population is a final year student of retail costs at University Malaysia Kelantan. In addition, in this study, researchers used quantitative methods by distributing questionnaires to respondents. Methods will be analyzed using correlation coefficient. Data will be analyzed using Statistical Package for the Social Science (SPSS) version 26. Sampling technique used by researchers is purposive sampling. The researcher chose this technique because it reduced the cost, reduced time needed to collect information compared to surveys, saved a lot of time and limited source.

Keywords: Franchising, franchise fee, recognizable company name or brand, business model, business training and management program

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

1. Introduction

Most entrepreneurs choose franchising in order to develop their own company and to construct their own destiny. The chance to become one's own boss is seen as one of the entrepreneur's key reasons and the hand on work experience as a means of entrepreneurial self-fulfillment. (Hizam- Hanafiah & Li, 2014). Franchising is a cloning strategy for the organization by replicating an established business and management structure (Hoy et al., 2017: 1). In compensation for royalty contributions or other fee payments, franchisees are denied the authority to lead the business in a prescribed manner within a designated geographical location. (Weaven et al., 2009). Franchising plays a significant role in the advancement of global entrepreneurship. (Chirico et al., 2011) and the accumulation of significant impact on the development (Croonen and Brand, 2015), Value- adding to national and global economies (Grunhagen et al., 2012). Franchising would also be a mechanism in which the franchisor provides a permit, brand and product symbol, as well as resources and cooperation in the organization, distribution and management of business as a lengthy business partnership. In other terms, franchising is a contractual arrangement between a grantee (franchisee) and the grantor (franchisor) for the sale of the product of the franchisor using the name of the franchisor and the patented business method at a particular location for a defined period of time (Dant and Grunhagen, 2014).

According to Vincent Megaline (2019), getting the first client is one of the toughest components of starting any new company, that's one of the reasons why so many people change to franchising. When the entrepreneur purchases a franchise, the entrepreneur receives to eliminate a tremendous amount of work that goes through advertising and branding a new unknown franchise, the entrepreneur has access to a proven, existing customer base and potential selection of employees. By bringing in clients and prospects, buying an existing and recognized brand will provide an accelerated path to profitability. It takes time to create a name and establish a strong brand identity and requires far more than a slogan and a logo like Nike. The ancient Greek goddess who personified victory is also the name of this well-known brand. Behind those letters, there is a great deal of powerful sense. Instead, these large corporations often open their doors without contemplating the creation of a strong brand identity, despite the many advantages brand identity can offer. According to Eric Dontigney, 2012, a poor brand name does not create an instant impact and creates a range of drawbacks. By brand extension, brands with a good grip on customer minds will build on that hold. The new products gain consumer success, at least potentially, on the power of the brand. A poor brand name that lacks this grip on the minds of customers will not offer a new product strength to gain market share. While the new product can be popular on its own merits, on the basis of a poor brand identity, a company should not expect a new product to succeed (Eric Dontigney, 2012).

Research Problem

There are a few problems which there are some factor effect the entrepreneur choosing the use franchise as a business growth, the problem is cost. Cost of opening an expensive franchise depends on the name of the company or brand of the product in the market today. Growing a new franchise location is more expensive than starting a new business is one of the disadvantages of a franchise. To buy a franchise, the franchise charges a number of payments such as business start- up expenses, utilities, rent, franchise fees, employees as well as set taxes. The cost charged is

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

divided into two types, namely initial cost, and continuous cost. The first is the start-up cost. The initial cost is the initial franchise cost that is not returned to the buyer. This is because the franchisee pays the franchisor after joining their system and then pays the percentage of their gross sales as royalties. In addition, the franchisee also charges some expenses except early payment such as rental royalties, advertising fees, equipment maintenance, insurance and inventory, percentage of sales to the franchisor (Bohi, 2010).

Then, even the effective businesses frequently open their entryways without giving adequate thought to creating a solid brand title, in spite of the numerous benefits solid branding can offer. Think of Walmart and business person likely summon a prompt sense of taken a toll investment funds. This quick impression happens since Walmart has a solid brand title built on that thought. A frail brand title falls flat to invoke a quick impression and makes a number of drawbacks (Eric Dontigney, 2012). A frail brand title falls flat to invoke a quick impression and makes a number of drawbacks. The unused items get footing within the advertisement, at slightest in hypothesis, on the quality of the brand title. A powerless brand title that needs this hold on customer minds cannot loan quality to a modern item to capture showcase share. In spite of the fact that the modern item may appreciate victory on it's possess merits, commerce cannot anticipate an unused item to succeed on the premise of a frail brand title. (Eric Dontigney, 2012).

2. Factors influencing the choice of franchising as business start-up

Franchise fee

Franchise fee is the compensation a franchise pays to the franchisor for the ability use the company's name, product and property rights. Depending on the length of the franchise agreement, this may be accomplished up front or on an ongoing basis. Rather than building a company from scratch, a franchisee profits from either the brand awareness or system already established by the franchisor. But these advantages come with an expense (Don Daszkowski, 2020). According to Dev, 2016 it is possible to split the franchise fee down into two major groups. Initially, there is also an initial franchisee fee and, second, there are several recurring fees. Initial payment is the enable the entrepreneur to use the franchisor's business system or product include the right to the company's registered trademark, copyright, operating manual, certain proprietary information or computer programs. Franchise fees also cover important points such as initial preparation, materials management and lease negotiation assistance, site build-out assistance, supplier access, employee necessity and training assistance, opening and startup marketing that help entrepreneurs get company up and running. Then, for different ongoing fees, once the entrepreneur has paid the initial fee and the location is up and running, the entrepreneur will expect the franchise company to pay different ongoing fees.

Business model

According to Beshel, 2001, Holmes,2003, Boone & Kurtz,2010, it is because of a profitable business model that the entrepreneur prefers the franchise as a business start-up. Franchising provides a proven and tested business model with a clear connection to new business failure, which decreases the risk of a new venture. This seems to be possible because the company will survive

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

in the long term thanks to a strong and creative business model, especially in today's increasingly difficult economy (Bojan R.Jovanovski, Valentina Gecevska, Rdmil Polenakovik, Dragan Sutevski, Nana stankovska, August, 2015). Entrepreneurs have the freedom to trace simple financial support from banks and other financial institutions with lower risks of business failure. In contrast to the new ones, the Bank chooses to promote an established business model, so the probability of funding is greater than that of sole proprietorship (Salar and Salar, 2014). The business model is important to every organization. (Magretta, 2002). That because the business model provides strong ways of knowing, assessing, communicating and managing strategic decisions (Pateli & Giaglis, 2004; Osterwalder et al., 2005; Shafer et al., 2005). The business model is used as a medium for the representation, creativity and assessment of business logic in start-ups and existing organizations (European Commission, 2012). The business model is also used as an obstacle between the strategy of an organization and its business procedures (Moris et al. 2005; Di Valentin et al.2012).

Recognizable company name or brand

Branding is recognized as one of the strong market components that has contributed to brand awareness in the mind of the consumer. This suggests that franchising as a business model gives investor reputation benefit and flexibility to use the popularity of the brand since the beginning of the business (Oni, Sekwele, Khusto, Tafadzwa & Pester 2014). According to Srivastava Fahey and Christensen (2001) in order to distinguish their product from the other in competition to increase consumer values, it is also a tool for franchisees. The identifiable name or brand of the company refers to the consumer's ability to distinguish a particular brand or name by its characteristics over another. A term used in advertisement and marketing is brand awareness. When people are able to identify a brand through visual or auditory means such as logo, slogans, packaging, colors or jingle rather than being directly introduced to the name of a business, it is considered effective (Will Kenton, 2018). Branding is recognized as one of the strong business elements that have contributed to brand awareness in the minds of consumers. This shows that shaping franchising as a business mode gives the entrepreneur the value of brand awareness and flexibility to use the competitive advantage of the company since the beginning of the business (Oni, Sekwele, Khusto, Tafadzwa, and Pelser, 2014).

Business training and management program

Training is necessary to help them deal with the new challenge effectively and train them for the progress of the future, resulting in increased results and more identify any potential (Gerbman, 2000 & Satterfield and). Hughes, 2007). According latest study of Salar and Salar (2014) franchising offers the benefit of advertisement, networking, training, technological assistance, such as which individuals cannot afford much of the time, thereby being perceived as a significant advantage of franchising over other types of business. Then, although the franchise business investor has the ease of setting up a company that magnifies the most effective barrier to entry into the market and eliminates the obstacle, franchisors can easily help the setup (Salar & Salar, 2014). Business training and management support encourage the encouragement of entrepreneurs to

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

choose a franchise as a company and also demonstrate that entrepreneurial management skills are also important in franchise business management (Oni, Sekwele, Matiza, and Pleser, 2014). Training will be given, such as an operations manual, headquarters training, on-site training, ongoing training and, eventually, an evaluation. Next, the operations manual covers franchise priorities, regular processes, finances, customer support, staff subjects, and employee training. There is confidentiality of the information contained in the manual. Mostly, before starting this process, franchisees are required to sign a non-disclosure agreement. The franchisor also describes basic performance standards as well as provide sales results with guidance. Franchisees are brought to headquarters for hands-on training after the operations manual training. New franchise owners visit the facility at this point to observe the experts in motion. It is a great opportunity for franchisees during this tour to ask questions and test what they have learned. This is also a time to see for the first time how to work the machines and/or make recipes. Training will last from a few days to a week at headquarters. That would be the moment when franchise owners need to understand every concept in order to run their business. Franchisees are encouraged to bring along a manager or employee who can train other employee members on-site in certain instances. (Kerry Crocco, 2019).

Theoretical Framework

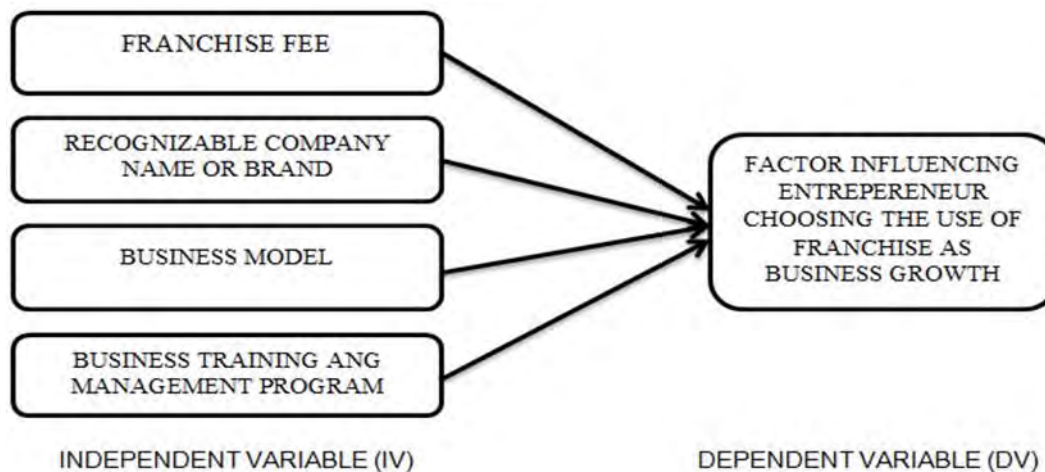

Figure 1: Theoretical framework

Hypothesis

H1: There is significant relationship between franchise fee and the choice of franchising as business start-up.

H2: There is significant relationship between business model and the choice of franchising as business start-up.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

H3: There is significant relationship between recognizable company name or brand and the choice of franchising as business start-up.

H4: There is significant relationship between business training and management program and the choice of franchising as business start-up.

3. Research Methodology

This study emphasizes on the factor influencing the choice of franchising as business start-up among final year students of retail costs who have taken the subject of franchise and license at University Malaysia Kelantan. An analysis perspective helps the researcher to arrange the questionnaire into the usually sharpened and specific perspectives on how the examination is driven with a clear true aim to keep a focus on the conclusion. (Haryani, 2016). In this study, researchers have used quantitative methods to obtain data on the factors that influence the selection of franchises as a business start-up. Among the factors that affect the franchise fee, business model, recognizable company name or brand and business training and management program. The quantitative method is a technique to change the data from the picture or work to the number, which means that this analysis will be presented in number (Bernand, 2006). The quantitative methods were used by distributing questionnaires to respondents. The target of this research is final year students of retail costs who have taken franchise and license costs. The total number of respondents in this study is 103 people based on the table Krejcie & Morgan (1970). In general, a research population is a large number of individuals or items that is the primary subject of the research investigator's research. (Sekaran & Bougie, 2013). The population is a final year student of retail costs at University Malaysia Kelantan. In addition, in this study, researchers used quantitative methods by distributing questionnaires to respondents. Methods will be analyzed using correlation coefficient. Data will be analyzed using Statistical Package for the Social Science (SPSS) version 26.

Sampling technique used by researchers is purposive sampling. Sampling is the process of drawing conclusions regarding the whole population using a limited number of sections or a large population. Purposive sampling is the systematic collection of informants based on their ability to elucidate a particular subject, idea or phenomenon. This method was chosen by the researcher because to reduce cost, to reduce time required collecting data compared to census, saving time and limited source. Four independent variables are franchise fee, recognizable company name or brand, business model and business training and management program to complete this study, the researcher describes. Then, for the dependent variable is the choice of franchising as business start-up. Then, the researcher uses the nominal scale for the variable calculation to calculate data from the demographic component to collect personal data such as gender or age. The researcher then uses the interval scale to determine the relationships between the independent variable and the dependent variable. The interval scale used by the respondent to calculate a variable from the scale point to the numerous.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

4. Finding

The study of a population based on variables such as age, ethnicity, and sex is demographic analysis. Demographic data refers to statistically expressed socio-economic statistics, including employment, schooling, wages, rates of marriage, rates of birth and death and more variables.

Demographic Profile of Respondent

Table 1: Demographic Profile Analysis

Gender		Frequency	Percent	Valid percent	Cumulative percent
	Female	84	81.6	81.6	100.0
	Male	19	18.4	18.4	18.4
	Total	103	100.0	100.0	
Age	18-24	94	91.3	91.3	91.3
	25-39	9	8.7	8.7	100.0
	Total	103	100.0	100.0	
Religion	Muslim	82	79.6	79.6	79.6
	Buddha	9	8.7	8.7	88.3
	Hindu	11	10.7	10.7	99.0
	Other	1	1.0	1.0	100.0
	Total	103	100.0	100.0	
Race	Malay	78	75.7	75.7	75.7
	Chinese	8	7.8	7.8	83.5
	Indian	11	10.7	10.7	94.2
	Other	6	5.8	5.8	100.0
	Total	103	100.0	100.0	

Demographic analysis is a method used to gain an understanding of the age, gender identity, occupation, working history, and various statics of a population or the targeted interest group associated with a particular action. The information collected by the respondent in the separate associations were gender, age, religion, and race with the ultimate purpose of this study. As seen in the table above, the questionnaire respondents were mainly Female, 84(84%) with 19 Male (18.4%). The highest number of respondent is found in between 18-24 years old 94% and 25-39 years old 9%. As for the religion 79.6% respondents are Muslim, 8.7% are Buddha, 10.7% are Hindu and 1.0% of respondent are other religion. In highest Race 75.7% of the respondent are Malay which is the highest 10.7% respondent are Indian, 7.8% are Chinese and 5.8% of respondent are other.

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

Reliability Test

Variable	No. of Item	Cronbach's Alpha	Measurement Rule	Ranting
Over all	24	.965	>0.70	Excellent
Franchise fee	5	.904	>0.70	Excellent
Business Model	5	.929	>0.70	Excellent
Brand Name	5	.958	>0.70	Excellent
Training	5	.932	>0.70	Excellent
Choice	4	.912	>0.70	Excellent

Table 2: Normality Test- Reliability Test

Reliability is the degree to which the technique or methods of data accumulation can provide continuity in the discoveries, opinions or conclusions drawn by various observers, or how the crude knowledge was generated is straightforward. The reliability test in this analysis is to determine how accurate the items in the questionnaire are, which is to assist its supported variables. In mostly sociology reviews, reliability estimation lead is set in a perfect world over 0.70 is considered worthy. Structure of the size or greater asserts that with their associated element and a sign that the questionnaire is valid, items in the questionnaire are emphatically defined. The reliability of the test instrument (questionnaire) for this analysis will be the rate of using Cronbach's Alpha after the estimation lead as discussed. Referring to Table 3, the estimation of all factor, franchise fee (0.904), business model (0.929), Brand name (0.958) , training (0.932) and the choice of franchising as business start-up (0.912) as shown by the acknowledgement review for the reliability test, they are considered to be acceptable and reliable on the basis of that.

	Mean	Std. Deviation

Business Model	4.3417	.61652
Brand name	4.4000	.62371
Training	4.4155	.60045
Choice	4.4393	.58939
Valid N (listwise)		

Table 3: Descriptive Statistic

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Descriptive test is a method to analyze whether the example data is derived from a traditionally distributed population. There are two techniques, the graphical approach and numerical strategies, for measuring normality. Everything appreciation shows that polls were apart from the satisfactory scope of ordinary dispersion within the satisfactory scope of ordinary dispersion from first variable is franchise fee which is FF1 at 4.15, FF2 at 4.21, FF3 at 4.42, FF4 at 4.37 and FF5 at 4.29. Then, for second variable is business model which is BM1 at 4.38, BM2 at 4.31, BM3 at 4.37, BM4 at 4.38 and BM5 at 4.27. For the next variable is brand name which is BNC1 at 4.41, BNC2 at 4.42, BNC3 at 4.42, BNC4 at 4.38 and BNC5 at 4.38. Then, for the variable training which is BT1 at 4.43, BT2 at 4.50, BT3 at 4.33, and BT4 at 4.42 and BT5 at 4.41. Lastly, for the last variable is the choice influencing which is FR1 at 4.47, FR2 at 4.40, FR3 at 4.47 and FR4 at 4.43. The response was 103 and according to the table 4 of descriptive statistics franchise fee has value of (Mean 4.2874) and (Standard Deviation 0.61464), Business model (Mean 4.3417) and (Standard Deviation 0.61652), brand name (Mean 4.4000) and (Standard Deviation 0.62371), training (Mean 4.4155) and (Standard Deviation 0.60045), the choice of franchising (Mean 4.4393) and (Standard Deviation 0.58939).

Table 4: Correlation Analysis

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

A correlation coefficient is a way to deal with putting a source of inspiration in the relationship. The correlation coefficient of an approximation between -1 and 1. A '0' means that there is no relation between the component, while -1 or 1 indicates that the negative or positive connection is faultless (negative and positive relationship here implies the sort of outline the relationship will deliver) (Hippael, 2010). This study uses Pearson analysis. Pearson's correlation measures the linear relationship between two measured variables. A correlation coefficient is referred to as the number describing the Pearson's correlation. The Pearson's correlation coefficient, the significant value and the number of case which is 103. The index for franchise fee $p = 0.798$ and $p - \text{value} =$

0.00 which is highly significant. Since 0.798 is relatively close to 0.61 to 1.00, this indicated that both variable are strong correlated ($p = 0.798, p < 0.01$). Then, the researcher accepted the hypothesis (H1) and rejected the first null hypothesis (H0). Then, the index for business model $p = 0.859$ and $p - \text{value} = 0.000$ which is highly significant. Since 0.859 is relatively close to 0.61 to 1.00, this indicated that both variable are strong correlated ($p = 0.859, p < 0.01$). Then, the researcher accepted the hypothesis (H1) and rejected the first null hypothesis (H0). Next, for recognizable company name or brand, the index is $p = 0.832$ and $p - \text{value} = 0.000$ which is highly significant. Since 0.832 is relatively close to 0.61 to 1.00, this indicated that both variable are strong correlated ($p = 0.832, p < 0.01$). Then, the researcher accepted the hypothesis (H1) and rejected the first null hypothesis (H0). Lastly, The index for business training and management program $p = 0.859$ and $p - \text{value} = 0.000$ which is highly significant. Since 0.859 is relatively close to 0.61 to 1.00, this indicated that both variable are strong correlated ($p = 0.859, p < 0.01$). Then, the researcher accepted the hypothesis (H1) and rejected the first null hypothesis (H0).

Regression

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Regression Coefficient

Coefficients^a

Model	Unstandardized Coefficients		Standardized Coefficients	t	Sig.
	B	Std. Error	Beta		
(Constant)	.453	.203		2.231	.028
Franchise fee	.113	.086	.117	1.306	.195
Business Model	.378	.123	.395	3.079	.003
Brand Name	-.006	.120	-.006	-.048	.962
Training	.427	.096	.435	4.457	.000

a. Dependent Variable: The choice of franchising as business start-up

Table 6: Regression Coefficient

Regression analysis is the method of statistical techniques used to estimate the relationship between a dependent variable and one or more independent variables. The objective of this analysis to identify whether franchise fee, business model, brand name or company and business training and management program has relationship between the choices of franchising as business start-up. Alluding above table with respect to the R square, the r square esteem is 0.637 that show in rate as 36% of the needy variable to gauge for the autonomous factors which are franchise fee, business model, brand name and training. The table has demonstrate that the r square esteem is 0.637 which demonstrates that the model is normal fit model as the esteem is lower than the dependable guideline connected in this exploration which is 0.798 above for a solid match. The Durbin-Watson esteem is 2.201. Standardized coefficient beta is used to determine which independent variable gives the most influence to the dependent variable. The result indicate that, business training and management program is the most influential factor toward the choice of franchising as business start-up with the highest beta value of 0.427 with significant level $p < 0.05$.

5. Discussion of finding

Based on the analysis done by the researcher with correlation coefficient through reliability test, descriptive analysis, correlation analysis and regression analysis found that the An independent variable that significantly affects respondents to select a franchise as the beginning of their company is a business model and a business training and management program that records the same point that is 0.859. This shows that, the selection of franchises as the start of their business is very important in terms of business model of a business as well as training programs offered to individuals who want to start a business as a franchise. This is also possible because a strong and imaginative business model enables the company to thrive in the long term, especially in today's increasingly difficult economy. (Bojan R.Jovanovski, Valentina Gecevska, Rdmil Polenakovik, Dragan Sutevski, Nana stankovska, August, 2015). In addition, for independent variables such as recognizable company name or brand recorded a result of 0.832 while for independent variable franchise fee recorded the lowest result among other variables which is 0.798. This situation indicates that respondents are less motivated by franchise fees and familiar company name or brand to select a franchise as the start of their company. This may be because the franchise fees offered

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

are so high which respondents react to choosing a franchise as their business. In conclusion, the hypothesis accepted after performing correlation coefficient analysis is the first hypothesis that there is a significant relationship between franchise fee and franchising choice as a start-up company, therefore it was accepted for the second hypothesis that there is a significant relationship between business model and franchising choice as a start-up company and there is a significant relationship between the recognizable company name or brand and the choice of franchising as a business start-up for the next hypothesis that was accepted. Finally, the theory that was agreed is that there is a major connection between the franchising option as a business start-up and the business training and management program. In the meantime, the hypothesis was rejected that there is no significant relationship between franchise fee, business model, recognizable company name or brand name and business training and management program and franchise choice as a start-up.

6. Conclusion

In conclusion, the researcher found that many would-be entrepreneurs strongly agree with the factors that influence the respondents that are the factors that influence the choice to choose a franchise as a business start is such as franchise fee, business model, recognizable company name or brand and business training and management program. After doing a detailed analysis, the researcher found that almost all the respondents strongly agreed with the factors stated by the researcher in the distributed questionnaire.

ACKNOWLEDGE

The success and outcome of this assignment required a lot of helpful guidance and assistance from many people and friends and researcher feel very fortunate to have got this all along with the completion of assignment work. Whatever, researcher have done is only due to such guidance and assistance and researcher would not forget to thank them. Researcher respect and feeling thankful to subject lecturer, Dr. Nurul Ashykin Binti Abd Aziz for allowing researcher to conduct this assignment work and providing researcher all support and guidance wish make researcher complete the research study on time.

CONSUMER'S ATTITUDES TOWARD RECYCLABLE PACKAGING PRODUCTS IN TANAH MERAH KELANTAN

Nur Adlin Syuhada Saidi and Mahathir Muhamad

Faculty of Entrepreneurship and Business,
Universiti Malaysia Kelantan,
Malaysia

Email : adlin.a17a0390@siswa.umk.edu.my; mahathir.m@umk.edu.my

Abstract:

The main cause of environmental degradation is the ongoing rapid growth in the economy, the trends of consumer consumption and actions worldwide. As the environment continues to deteriorate, developed countries have become a persistent public concern and have recently awakened developing countries to the green movement. To identify the most impacting influence on consumer attitudes towards recyclable packaging goods in this context and also to identify the relationship between environmental concern, demographic role, and government role of independent variables. In this context, 249 respondents were considered for this were selected by using random sampling method and data were collected from by using structured questionnaires. Descriptive analysis, correlation analysis, were used in analysis and key findings are consumer's attitude towards recyclable packaging products in Tanah Merah Kelantan is strong positive. Eventually, it was concluded that consumers in Tanah Merah Kelantan are very concerned about the environment and their community. Therefore, the results of this study contributed to the government's identification of what action should be taken to avoid environmental pollution in Tanah Merah and contributed to manufacturing by identifying what the consumer's reaction would be if their goods were made using environmentally friendly packaging materials.

Keywords: *consumers attitudes towards recyclable packaging product, environment concern, demographic role, government role.*

1.0 INTRODUCTION

This chapter will introduce the concept of the recyclable packaging product and define the term as it will be used in this study so as to differentiate it from other common products. Therefore, the study findings enable to determine what steps should be taken in the state of Kelantan to avoid environmental pollution and contribute to development by identifying what would be the customer response in the case of manufacturing recyclable packaging materials for their goods. As a result, the need for the idea of recyclable packaging is now rapidly spreading among customers and producers. However, the effectiveness of the introduction of a recyclable packaging policy would depend on whether or not customers adopt this type of package.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

2.0 LITERATURE REVIEW

2.1 ENVIRONMENT CONCERN

Market demand of goods and services has risen over the past year. Throughout the planet, the scarcity of natural resources and extreme harm to the ecosystem is growing tremendously (Chen & Chai, 2010). The environmental concern of customers is becoming more serious because there are many natural disasters currently occurring. It occurs because of the consumer's attitude toward those who still neglect and really don't think about the environment and pollute the environment in different ways at all times. Industrial companies and more retailers are now becoming more concerned with issues of packaging sustainability. Consumers have also recently opted to make choices and to make better sense of their everyday consumption. According to (Akehurst, Afonso, & Gonçalves, 2012), Green consumers are consumers that are interest to practice and aware about environmental issues in their daily day.

H₀. There is no significant relationship between environment concern and consumer's attitude towards recycle packaging.

H₁ - There is significant relationship between environment concern and consumer's attitude towards recycle packaging.

2.2 DEMOGRAPHIC ROLE

(Straughan & Roberts, 1999) found that younger individuals were more likely to be more sensitive to environmental concerns based on ecologically aware consumer behaviour. The findings of their analysis showed that demographic variables such as age and sex were strongly associated with ecologically conscious consumer behaviour when viewed individually. Over all ages and incomes excluding schooling, the purpose of green purchases correlates positively (Soonthonsmai, 2001). Several studies have demonstrated substantial differences between men and women in environmental attitudes, with men having more negative environmental attitudes compared with women (Eagly, 1987; Tikka et al., 2000).

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

H₀. There is no significant relationship between demographic and consumer's attitude towards recycle packaging.

H₂ – There is significant relationship between demographic and consumer's attitude towards recycle packaging.

2.3 GOVERNMENT ROLE

In order to encourage a sustainable consumption activity among Malaysians, the Malaysian government has promoted various strategies for the continuous consumption and production of appliances. In addition, the government of Malaysia is also committed to social issues. Media exposure to inform and foster the community's understanding of the environment (Haron, Paim, & Yahaya, 2005). Many people have high concern on ecological but they have some sentiment that the government is a prime responsibility in preservation of our environment (Ab Rahim et al., 2012).

H₀. There is no significant relationship between government role and consumer's attitude towards recycle packaging.

H₃ – There is significant relationship between government role and consumer's attitude towards recycle packaging.

2.4 CONSUMER ATTITUDES

Green marketing has created profitable opportunities for both large and small companies amid consumer willingness to spend more money on personal health and the environment. Recent surveys find that almost 90 percent of consumers are more likely to buy products from companies with the best reputations for social responsibility, when price, quality and services are equal. After profitability, the Investor Responsibility Research Centre listed environmental problems as the third most active shareholder concern in 1995, indicating that environmental problems are not just market issues (Donnelly, 1995)¹

2.5 CONCEPTUAL FRAMEWORK

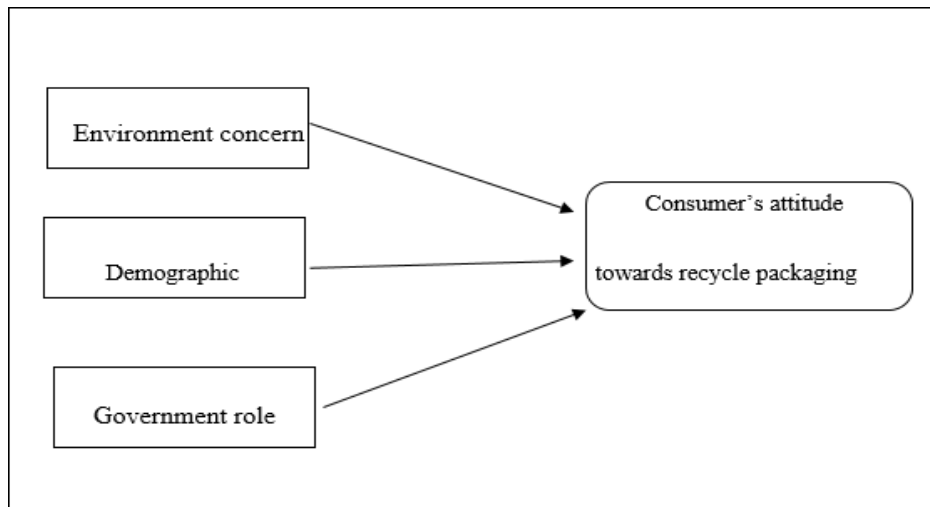

Figure 1 : Conceptual Framework

Figure 1 shows the relationship between independent variables and dependent variable. Based on the figure 1, shows the relationship between environment concern, demographic role and the government role among consumers in Tanah Merah, Kelantan. The main objective of the study is to investigate consumer attitudes towards recyclable packaging products. The importance of this study is also to determine the variables that influenced the consumers while making their evaluation. The independent variables are environment concern, demographic role and government role. The dependent variable is the consumer's attitudes towards recyclable packaging products in Tanah Merah, Kelantan.

3.0 METHODOLOGY

3.1 RESEARCH DESIGN

Based on (Sekaran & Bougie, 2016) mention that a research design is a decision making choice. Research design can also be defined as a system of methods and techniques chosen by a researcher to relatively logically combine different components of research so that the research problem is handled effectively. Quantitative analysis will be used for this research by distributing questionnaires as a guide to the respondents. Quantitative analysis is a method that uses mathematical and statistical modelling, calculation, and testing to explain behaviour. The goal of quantitative analysis is to reflect, in terms of numerical value, a given fact. The objective of this study is to obtain credible evidence of the cause and effect of the research study by the researcher on the relationship between the consumer attitudes toward recyclable packaging.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

3.2 DATA COLLECTION

Data collection is how the information are collected about certain study in a systematic way that might be come from primary data or secondary data. Primary data research involves collecting information specifically for the study in hand from the actual sources such as consumers, user/non-users or other entities involved in the research. Secondary data research involves any information from published sources which has been specifically collected for the current research problem. There are two types of method in data collection which are qualitative and quantitative. In this research, the quantitative method being used to collect the data.

To the purpose to collect the data for this study, the researcher has chosen three day to distribute the questionnaire to the respondent which is among consumer at Pantai Timur, PKT and KS Chu in Tanah Merah town in Kelantan. The total respondent is 248 consumer which will be divided into three supermarket which is Pantai Timur, PKT and KS Chu.

3.3 SAMPLE SIZE

The sampling method used in this study was through convenience sampling techniques. As checked by (Taherdoost, 2016), convenient sampling selects participants where they are readily available. The sample groups are select from individual consumer in Tanah Merah town in Kelantan. Researchers create a questionnaire and distribute a questionnaire to the population members who come from individual consumer which based in Tanah Merah town, Kelantan. In this study, 248 sets of questionnaires were distributed to individual users in Pantai Timur Supermarket, PKT Supermarket, KS Chu Supermarket.

3.4 RESEARCH INSTRUMENT

These three sections were constructed based on the study. Section A focused on demographic gender, age, occupation and others. While Section B focus on consumer attitudes toward recyclable packaging product. Section C is about independent variables, namely environment concern, demographic factors and government role. There are five questions formed for each variable in this questionnaire. In the demographics section, the nominal scale is used, and in the other sections that consist of the respondent choosing from scale 1 to scale 5 for each question, the interval scale is used. The scale that have been used is Likert Scale.

3.5 PROCEDURE FOR DATA ANALYSIS

From the data collection and questionnaire, the researcher used statics package for social science (SPSS) version 26. There were three types of data analysis used in this study which is descriptive analysis, reliability test & Spearman's correlation and pilot study used to see the reliability of the study.²

BUSINESS COLLOQUIUM 2020/2021**

4.0 RESULTS AND DATA ANALYSIS

4.1 DEMOGRAPHIC

Table 4.1 shows the summary of 249 respondent's demographic background that has been collected by questionnaire in Google Form. There are seven questions were asked such as gender, age, ethnicity, academic qualification, profession, monthly income and status.

Table 4.1 Demographic Profile

Variables	Frequency	Percentage
Gender:		
Male	53	21.4
Female	195	78.6
Age :		
17-22	44	17.7
23-26	51	20.6
27-32	113	45.6
32 and above	40	16.1
Ethnicity:		
Malay	225	90.7
Chinese	22	8.9
India	1	4
Academic Qualification:		
Pmr	8	3.2
Spm	16	6.5
Stpm	19	7.7
Undergraduate	171	69
Postgraduate	34	13.7
Profession:		
Student	72	29
Employed	170	68.5
Unemployed	6	2.4
Monthly Income :		
Below RM 1000	63	25.1
RM 1000-RM 2999	20	8.1
RM 3000-RM 4999	120	48.4
RM 5000 and above	45	18.1
Status:		
Single	79	31.9
Married	162	65.3
Divorce	7	2.8

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

The demographic used in this research is 249 respondents, and result are all summarized. Among 249 respondents, the majority show females with a frequency of 195 (78.6%) and males with 53 (21.4%). The highest number of the respondents' age is from the generation between 27-32 years old that is 113 (45.6%). The majority ethnicity was Malay with a frequency of 249 respondents that is 225 (90.7%) and the most percentage of respondent's academic qualification with the frequency of 249 respondents is undergraduate, which is 171 (69%). The majority profession is employed that is 170 (68.5%) and the majority result for the monthly income is RM 3000 – RM 4999 that is 120 (48.4%). The most percentage of respondent's marital status is married respondents there were 162 respondents (65.3%).

4.2 DESCRIPTIVE STATISTICS

Table 4.21 Mean and Standard Deviation

Items	N	Mean	Std. Deviation	Level
Consumer attitudes toward recyclable packaging product	248	4.2353	.83784	High
Environment concern	248	4.1727	.87707	High
Demographic role	248	4.1606	.85547	High
Government role	248	4.2281	.82110	High

Table 4.21 shows the descriptive statistics of consumer attitudes toward recyclable packaging product, environment concern, demographic role, and government role. Descriptive statistics refer to a set of data summarizing the sample data. According to the table, consumer attitude toward recyclable packaging product has the highest mean of 4.2353 and followed by government role and environment concern which are 4.2281 and 4.1727 respectively. Demographic role had the lowest mean which are 4.1606.

4.3 RELIABILITY TEST

Table 4.3.1 Reliability Test

CONSTRUCT	CRONBACH'S ALPA	NO ITEM
Consumer's attitudes toward recyclable packaging product	.941	5
Environment Concern	.929	5
Demographic role	.931	5
Government role	.920	5

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

The table shows reliability analysis for consumer attitudes toward recyclable packaging product. Cronbach's alpha coefficient shows the value of 0.941 and based on the rules of thumb about Cronbach's Alpha Coefficient, the value of 0.941 is excellent. For the reliability analysis for environmental concern the alpha coefficient of Cronbach exhibits a value of 0.929. Next, shows reliability analysis for demographic profile. The value of 0.931 is shown by the Cronbach alpha coefficient and lastly shows reliability analysis for government role. Cronbach's alpha coefficient shows the value of 0.920. Thus, this questionnaire is excellent accurate and can be used to research.

4.4 CORRELATION

According to (Yadav, 2018) Spearman's correlation coefficient was the statistical measure of the strength of a monotonic (increasing/decreasing) relationship between independent variables with the dependent variables. Besides spearman's was used to test if the hypothesis can be accepted or rejected. There are one main dependent variables; consumer attitudes toward recyclable packaging product while three independent variables namely environment concern, demographic role and government role (Schober, Boer, & Schwarte, 2018).

Table 4.4.1 Spearman's Correlation

		Environment Concern	Demographic role	Government Role
Consumers Attitudes toward recyclable packaging product	Spearman's Correlation	0.724	0.732	0.678
	Sig.(2tailed)	.000	.000	.000

Table 4.4.1 shows the Spearman's Correlation Analysis (two-tailed) that have been used to examine that whether the independent variable which is environment concern, demographic role and government role is statistically significant with dependent variable which is the consumer attitudes toward recyclable packaging product.³

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

5.0 DISCUSSION

5.1 ENVIRONMENT CONCERN

The table 4.3.1 shows that the value of Spearman's Correlation (r) is 0.724 which indicates as good positive correlation. Therefore, it can be concluded that environment concern had significant relationship between consumer attitudes toward recyclable packaging product among residence at Tanah Merah Kelantan. Hence, null hypothesis was rejected after Spearman's correlation analysis was conducted and it means that this study (H1) is accepted. (Kodituwakku & Kanagasabai, 2015); (Chen & Chai, 2010) also identified the above results in their study. Among the positive correlated variables, highest correlation shown in environmental concern.

5.2 DEMOGRAPHIC ROLE

The table of 4.3.1 demographic role shows that the value of Spearman's Correlation (r) is 0.732 which mean as good positive correlation. Consequently, it can be determined that demographic role had a good relationship of consumers attitudes toward recyclable packaging product. Hence, null hypothesis was rejected after Spearman's correlation analysis was conducted and it means that this study (H2) is accepted. Based on previous study demographic factor showed moderate positive correlation with the consumer's attitude towards green packaging.

5.3 GOVERNMENT ROLE

The table of government role (4.23) shows that the Spearman Correlation (r) value is 0.678, which is a strong positive correlation. It can therefore be concluded that the role of the government was to relate consumer attitudes towards recyclable packaging products to Tanah Merah Kelantan's residence. Hence, null hypothesis was rejected after Spearman's correlation analysis was conducted and it means that this study (H3) is accepted. (Ansar, 2013),(Ibok & Etuk, 2014) (Tanner & Wölfing Kast, 2003) also identified government role is the second highest, effecting factor on consumer's attitude towards green packaging.⁴

BUSINESS COLLOQUIUM 2020/2021**

5.4 HYPOTHESIS TESTING

Table 5.4.1 : Summary of Hypotheses Testing

Hypothesis	Spearman 's Correlation	Result
H ₀ . There is no significant relationship between environment concern and consumer's attitude towards recycle packaging. H ₁ - There is significant relationship between environment concern and consumer's attitude towards recycle packaging.	0.724	H ₁ accepted
H ₀ . There is no significant relationship between demographic and consumer's attitude towards recycle packaging. H ₂ - There is significant relationship between demographic and consumer's attitude towards recycle packaging.	0.732	H ₂ accepted
H ₀ . There is no significant relationship between government role and consumer's attitude towards recycle packaging. H ₃ - There is significant relationship between government role and consumer's attitude towards recycle packaging.	0.678	H ₃ accepted

6.0 DISCUSSION & RECOMMENDATION

The main objective of this study is to identify the relationship between environment concern, demographic role, and government role among residence of Tanah Merah town in Kelantan. Based on findings in chapter 4, researcher agreed environment concern, demographic profile and government role had the relationship of recyclable packaging product in the residence of Tanah Merah town.

According to the analysed data, all the independent variables positively correlated with dependent variable. There are three objectives of this research. First, relationship between environment concern and consumer attitudes toward recyclable packaging product. Second, relationship between demographic role and consumer attitudes toward recyclable packaging product Third, there is relationship between government role and consumer attitudes toward recyclable packaging product.

The researcher strongly recommends that the idea of recycled packaging should be promoted in Tanah Merah Kelantan through advertising, leaflets and posters. Researcher suggests that manufacturers turn their conventional packaged approach into green packaged, resulting in more sales.

Producers must be more concerned with the consistency of the product and the longevity of the product. Since it has been heavily focused on by customers. Tax relief and loan facilities should be provided to manufacturers who wish to turn their conventional packaging strategy into a green packaging strategy. Consumers should be informed regarding the proper form of

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

recycling, the value of recycling, the harmfulness of packages that are unfriendly to the environment, and diseases that can be caused by contaminated environments.

It is necessary to establish and enforce strategies and policies in relation to green goods in order to lead and support retailers and customers towards a green transition. Businesses should concentrate on generating a green product that has a general public demand that also aligns with the organization's core positioning.

7.0 OVERALL CONCLUSION OF THE STUDY

This study is focus on the consumer attitudes toward recyclable packaging products among residence in Tanah Merah, Kelantan. From the analysis of the entire variable, it has been satisfied the minimum requirement of reliability since all the Cronbach's Alpha coefficients shows greater than 0.6 which is all the independent variable (environment concern, demographic role, government role) had the significant relationship to the dependent variable (consumer attitudes toward recyclable packaging product). Regarding the result it is found out that all independent variables has significant relationship to consumer attitudes toward recyclable packaging products. Hence, researcher finally concludes that consumer's in Tanah Merah are concern about their environment very intensively. Furthermore, researcher finally concludes that improving environment concern is more appropriate to increase consumer's attitude towards recyclable packaging products.

ACKNOWLEDGEMENT

In the name of Allah, the most benevolent and merciful. All praises be for Allah for giving the opportunity, patience and guidance in completing this Project Paper as a partial fulfilment of Bachelor of Entrepreneurship (Retailing) with Honours. For this I would like to express my greatest appreciation to En. Mahathir B Muhammad, my project supervisor and also the lectures of the Faculty of Entrepreneurship and Business (Retailing) for their guidance and advises throughout the preparation of this Project Paper. Deepest gratitude to my mom and dad who constantly pray for my success and supporting me since the day I was born and also very thanks to my brother and sisters for their support. Last but not least, to all my friends, thanks for your help and support. Thanks a lot and may Allah bless you all.

Abstract:

The primary objective of this study is to examine the retail's strategy to sustain the small business during the pandemic among retailer in Rembau, Negeri Sembilan. The objective of this study is to identify the relationship between business knowledge and sustain the small business, relationship development and sustain the small business and financial and sustain the small business. The scope of study only focuses to small business in Rembau, Negeri Sembilan. The study was using the descriptive statistics, reliability analysis and Pearson Correlation. For this study, the cross-sectional study will use convenience sampling as 167 data collected in Rembau. This data was been analysis using the Statistical Package for the Science Social (SPSS). The correlation coefficient for business knowledge and sustain the business is 0.677 and strength of correlation between business knowledge and sustain the business is moderate positive correlation. The p value is .000, which is lower than 0.01. and there is significant moderate correlation relationship between business knowledge and sustain the business. Other than that, the correlation for relationship development and sustain the business is 0.699 and strength of correlation between relationship developments and sustain the business is moderate positive correlation. The p value is .000, which is lower than 0.01. and there is significant moderate correlation relationship between relationship developments and sustain the business. For the financial, the correlation coefficients are 0.735 and strength of correlation between financial and sustain the small business also moderate positive correlation. Other than that, the p value is .000, which is lower than 0.01 and also there is significant moderate correlation relationship between financial and sustain the business. As conclusion, strategy of financial the most factor that effect the strategy of sustain the business.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

1.0 INTRODUCTION

Small business is the privately owned corporation, partnership or sole proprietorship that has fewer employees and/or less annual revenues than a regular sized business or corporation. Businesses are defined as "small" in terms of being able to apply for government support and qualify for preferential tax policy varies depending on the country and industry. small businesses

can also be classified according to other methods, such as annual revenues, shipments, sales, assets, or by annual gross or net revenue or net profits, the number of employees is one of the most widely used measures.

It is important for a small business owner to recognize when the complex nature of the organization extends beyond their capability, and relevant external expertise is needed (Keating, Geiger, & McLoughlin, 2013). Chrisman, McMullan, Ring, and Holt (2012) stated that limitations exist for all business owners, despite education, knowledge, or experience; hence, the need to access external assistance when evaluating new ideas or strategies

The objective of this study is to examine the relationship between business knowledge, relationship development and financial toward sustain the small business. Furthermore, this study to identify the most significant factor that influence sustain the small business.

1.1 Significant of Study

This study contributes to examine the retail strategy to sustain the small business during pandemic among retailer in Rembau, Negeri Sembilan. There a lot of retail shop in Rembau was growth follow the trend. This study will be benefit to new retail to start the business in Rembau also can benefit to student and future researcher who like to carry out the research and retailer who considered improving their business.

2.0 LITERATURE REVIEW

2.2.1 Business Knowledge

Business knowledge is referring a business owner's extensive reservoir of understanding on customers' needs and preferences, business environments and their dynamics, staff skills, experiences and potentials, and the business' overall foreseeable direction. When effectively gathering and utilizing business knowledge, a continued and optimal business growth, as well as more opportunities for financial success, may be ensured. Some factors that could contribute to small business failures are inadequate planning, lack of strategy, and poor implementation (Phillip, 2011). Risk management and poor decision-making by management are key factors that can lead to increased business failures (Phillip, 2011). Keating et al. (2013) also concluded that small business owners must recognize when their organization's ability to sustain without his or her capacity requires bringing in external expertise.

H1: Business knowledge has a positive significant on sustain the business

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

2.2.2 Relationship Development

Relationship building skills are essential to the sustainability of small business. Building relationships with customers is important, and building internal relationships with employees is essential. The importance of building relationships in the sustainability of their business without networking and building a positive relationship with our community, we would have closed our doors years ago. Establishing trust with customers, suppliers, vendors, employees, and other industry professionals is one key component of building a sustainable small business (de Klerk & Saayman, 2012). The overall statements made by participants align well with the research of de Klerk and Saayman. The authors mentioned that no relationship can be ignored and that all have to be cultivated in order for businesses to be successful. Networking has taken an enhanced view with the presence of social media. They noted that community based relationships are key, but using social media enables them to enhance business knowledge, vendor outreach, alternative funding sources, and general support on a global scale. Though this global reach is inspiring and free, therefore cost effective, it cannot replace the power of handshake relationships at the local level.

H2: Relationship development has a positive significant on sustain the business

2.2.3 Financial

Financial is a broad term that describes activities associated with banking, leverage or debt, credit, capital markets, money, and investments. Basically, finance represents money management and the process of acquiring needed funds. Financial management is strategies as a key component of building a sustainable business. They each continued that they wish they had been better prepared regarding financial management strategies and encouraged any small business owner to gain additional knowledge first but to also surround themselves with key expertise in all things financial. Many of my fellow small business owners have gone under because of cash flow issues.

H3: Financial has a positive significant on sustain the business.

2.3 Research Hypothesis

Hypothesis 1: There is significant relationship between business knowledge and sustain the business

Hypothesis 2: There is significant relationship between the relationship developments and sustain the business

Hypothesis 3: There is significant relationship between financial and sustain the business

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

2.4 Conceptual Framework

Figure 1 show the conceptual framework for this study. This research model is to study the significant of retail strategy to sustain the small business.

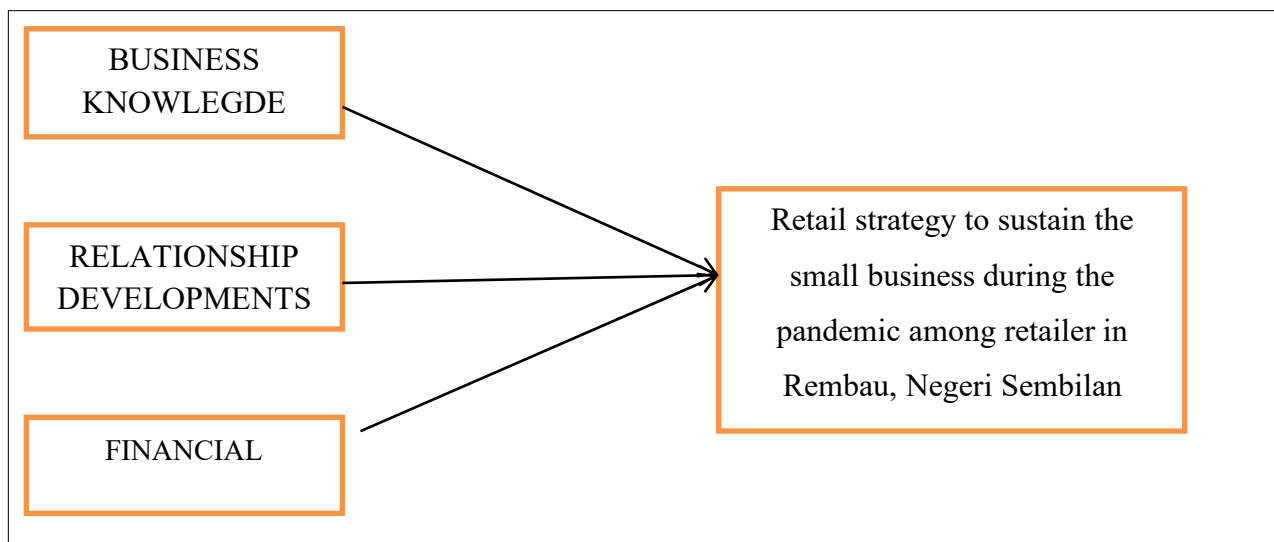

Figure 1: Research Model

3.0 RESEARCH METHODOLOGY

3.1 Research Design

This study was used the quantitative method that questionnaire was distributed to 167 small retailer. Furthermore, research design may help researcher in carry out research objective. The research design is the plan or strategy researchers use to answer the research question which is underpinned by philosophy, methodology and method (Ylona Chun Tie, 2019). Research will used cross-sectional study in this study since the data will gathered at single moment in time.

3.1 Measurement Development

Research instrument is the method how the data will be collected. The instrument that use in this research is questionnaire. According to Beckman (2017), questionnaire is a prepared set of questions to which respondents record the answers. Questionnaire is one of the methods to collect the data for the study (Derrick, 2016).

3.2 Sample Size

The important steeplechases to be exceeded, one must obtain an approximation of one or more error variances and stipulate an effect size of important. There is the temptation to take some

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

shortcuts. According to Krejcie & Morgan (1970) table, the total 162 sets of questionnaires have been distributed to the target respondents. This is due to the total amount of the owner of small business 288 shops

3.3 Data Collection

Data was being collected using the online platform like Google Form. For this study, a convenience sample will be used by research due to the target respondent of this research study is the owner of the small business during the pandemic in Rembau. Finally, 167 respondents were answer the questionnaire and it used for analysis data.

3.4 Data Analysis

The collected data was analyzed by using Statistical Package for the Social Sciences (SPSS). SPSS is a programming language for conducting statistical analyze. There are types of data analysis used like frequency analysis, descriptive analysis, reliability analysis, Pearson Correlation analysis.

4.0 FINDINGS

4.1 Demographic Profile of Respondent

Socio-demographics are nothing more than characteristics of a population. Generally, characteristics such as age, gender, ethnicity, education level, marital status are being considered as socio-demographics and are being asked in all kinds of surveys.

4.1.1 Gender

Table 1: Frequency for Gender

Gender	Frequency	Percentage (%)
Male	77	46.1
Female	90	53.9
Total	167	100

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Table 1 shows, out of 167 respondents, 77 male (46.10%) and 90 (53.90%) female respondents were involved in answering this questionnaire. Majority respondent are female and it can be conclude that the population of female who has business is more than male.

4.1.2 Age

Table 2: Frequency for Age

Age	Frequency	Percentage (%)
Below 30 year old	78	46.7%
31-40 year old	46	27.5%
41-50 year old	34	20.4%
Above 50 year old	9	5.4%
Total	167	100

Table 2 shows 2 consist of 4 categories of age which is 78 (46.70%) of respondent are categories in below 30 year old. For the 32-40 year old, the frequency for that is 46 (27.50) and followed by 41-50 and above 50 year old with 34 (20.40%) and 9 (5.40%) respectively. The majority respondent are from age the below 30 year old and the least respondents are from the age group of above 50 year old. The group of below 30 year old are mostly has a business in Rembau, Negeri Sembilan.

4.1.3 Ethics

Table 3: Frequency for Ethics

Ethics	Frequency	Percentage (%)
Malay	98	58.7
Chinese	43	25.7
Indian	25	15
Other	1	0.6
Total	167	100

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Table 3 shows, Malay was the majority of the respondent with 98 (58.70%), Chinese with 43 (25.70%) also followed by Indian and other 25 (15%) and 1 (0.60%) respectively. It can be conclude that Malay are the most respondents other that ethics. This is because the Malay owners are the majority compare to other ethics in Rembau, Negeri Sembilan.

4.1.4 Marital Status

Table 4: Frequency for Marital Status

Marital Status	Frequency	Percentage (%)
Single	79	47.6
Married	85	50.6
Divorced	3	1.8
Total	167	100

Based on table .4, the most respondent is married with 85 (50.6%) and the number of single is 79 (47.6%) and the least of respondent is divorced with 3 (1.8%). It can be conclude that married is the most owner business in Rembau, Negeri Sembilan

4.1.5 Education Level

Table 5: Frequency for Education Level

Education Level	Frequency	Percentage (%)
SPM	59	35.3
Diploma	42	25.1
Bachelor Degree	48	28.7
Other	18	10.8
Total	167	100

Based on table 5, there have 4 type of education level which is SPM, Diploma, Bachelor Degree and Other. For the number of SPM is 59 (35.30%), for the diploma is 42 (25.1%) followed by bachelor degree with 48 (28.7%) and the least of the respondent is other with 18 (10.8%)

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

4.2 Pearson Correlation Analysis

Pearson Correlations Analysis is a test which used to measure the relationship between the variables. The purpose of using Person Correlation Analysis is to test whether the correlation is statistically significant or not and to identify the hypothesis should be accepted or rejected.

4.2.1 Business Knowledge

Table 6: Correlation Coefficient for Business Knowledge and Sustain the Business

		Sustain the Business
Business Knowledge	Pearson Correlation	.677**
	Sig. (2-tailed)	.000
	N	167

** . Correlation is significant at the 0.01 level (2-tailed).

The correlation coefficient for business knowledge and sustain the business is .677 and strength of correlation between business knowledge and sustain the business is moderate positive correlation. Other than that, the p value is .000, which is lower than 0.01. Therefore, there is significant moderate correlation relationship between business knowledge and sustain the business.

4.2.2 Relationship Development

Table 7: Correlation Coefficient for Relationship Developments and Sustain the Business

		Sustain the Business
Relationship Developments	Pearson Correlation	.699**
	Sig. (2-tailed)	.000
	N	167

** . Correlation is significant at the 0.01 level (2-tailed).

The correlation coefficient for relationship development and sustain the business is .699 and strength of correlation between relationship development and sustain the business is moderate positive correlation. Other than that, the p value is .000, which is lower than 0.01. Therefore, there is significant moderate correlation relationship between relationship development and sustain the business.

4.2.3 Financial

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Table 8: Correlation Coefficient for Financial and Sustain the Business

		Sustain the Business
Financial	Pearson Correlation	.735**
	Sig. (2-tailed)	.000
	N	167

** . Correlation is significant at the 0.01 level (2-tailed).

The correlation coefficient for relationship development and sustain the business is .735 and strength of correlation between financial and sustain the business is moderate positive correlation. Other than that, the p value is .000, which is lower than 0.01. Therefore, there is significant moderate correlation relationship between financial and sustain the business.

4.3 Hypothesis Testing

This research assessed the retail strategy to sustain the small business during the pandemic by using Pearson Correlation Analysis. It can determine the business knowledge, relationship development and financial to sustain the small business.

5.0 CONCLUSION

5.1 Business Knowledge

Based on the result, business knowledge has a moderate positive significant relationship with sustain the small business (0.677). When effectively gathering and utilizing business knowledge, a continued and optimal business growth, as well as more opportunities for financial success, may be ensured. Some factors that could contribute to small business failures are inadequate planning, lack of strategy, and poor implementation (Phillip, 2011). Keating et al. (2013) also concluded that small business owners must recognize when their organization's ability to sustain without his or her capacity requires bringing in external expertise. Management education and experience were referred to by Chinomona (2013) as being a component that small business owners must possess when seeking to build a sustainable operation.

5.2 Relationship Development

According the result shown, the correlation coefficient for relationship development and sustain the business is .735 and strength of correlation between financial and sustain the business is moderate positive correlation. Establishing trust with customers, suppliers, vendors, employees, and other industry professionals is one key component of building a sustainable small business (de Klerk & Saayman, 2012). The overall statements made by participants align well with the research of de Klerk and Saayman. The authors mentioned that no relationship can be ignored and that all have to be cultivated in order for businesses to be successful. Networking has taken an enhanced view with the presence of social media. They noted that community based relationships are key, but using social media enables them to enhance business knowledge, vendor outreach, alternative funding sources, and general support on a global scale. Though this global reach is inspiring and free, therefore cost effective, it cannot replace the power of handshake

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

relationships at the local level.

5.3 Financial

The value of Pearson correlation for the financial is .0735 and strength of correlation between financial and sustains the business is moderate positive correlation. Many of my fellow small business owners have gone under because of cash flow issues. They were making money but the inability to manage actual cash flow caused them to go under “Many startups are grossly underfunded. After tapping friends and relatives, maxing out credit cards, nothing is left to turn that last corner in business. Often it has made the difference between success and failure. Small business owners’ ability to manage the finances is well served by building key relationships with bankers, funding agents, vendors, and employees. They need to tap the resources of various expertise’s in a cost effective manner, but must also continually enhance their own personal knowledge about finance.

5.4 Recommendation

The research does a study of retail strategy to sustain the small business during the pandemic among retailer in Rembau, Negeri Sembilan. Based on the result, few recommendations are suggested to enhance tourist to revisit there. From this study, the researchers found that business knowledge is very important to maintain business but two other variables namely relationship and

finance are also important in maintaining business. During this epidemic most businesses experience concerns about their business which will experience a decline in income. The suggestion is that owners should do business online to support their business like restaurants; they should improve their business like doing delivery or should join foodpanda. For the future research must include more variable to get results will be more reliable.

5.5 Limitations

Limitations of this study makes the problem cannot be solved. In this research, the researchers limited the sample size only to the business owner. Therefore, future researchers can conduct research in Rembau. The larger the sample size of respondents, the results would be more reliable. First, the limitations of this study are that the respondents did not fully understand the contents of this study. Respondents usually misunderstood the purpose of the questionnaire. A large number of respondents need guidance to answer the questionnaire. With this method, the researcher was not able to identify the truth of the respondents while answering the questionnaire. The respondents answered questions in different ways based on their understanding. Then, there will be the result of bias and subjectivity may not be known.

5.6 Conclusion

Today, small business was growth faster from time to time. It can be a first sector in industry retailer. The cross-sectional study was using for business knowledge, relationship development and the financial and the significantly affect toward to sustain the small business among retailer in Rembau. All the hypotheses was supported and accepted. From the finding, the financial is the most retail strategy to sustain the small business among retailer in Rembau. With a stable financial presence in a small business can help the business continue to grow over time. In addition, small

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

businesses should continue to follow the latest trends to improve their business.

THE E-SERVICE QUALITY FACTOR INFLUENCE ON CONSUMER LOYALTY: A STUDY ON SHOPEE PLATFORM

Nur Athirah Syazwani Aziz and Nurul Izyan Mat Daud

Faculty of Entrepreneurship and Business,
University Malaysia Kelantan,
Malaysia

Email: athirah@gmail.com; izyan.md@umk.edu.my

Abstract:

The growing love of online shopping among Malaysian have been proven with increasing numbers of online shopping application trying to penetrate the Malaysia market such as Shopee, Lazada, 11Street, Lelong, and Zalora. Due to the fierce competition between the online shopping platform, consumer tend to choose the platform that are friendly user and less complicated. In another words, the electronic service quality provided by the platform now will determine the engagement with their virtual consumer such as customer loyalty. Here, the report that a combination of five variable which is in independent variable we have e-service quality (Ease of use, reliability, responsiveness and security and for dependent variables we have customer loyalty. This study used Statistical Package for Social Science (SPSS) to analysed the data and derived the descriptive analysis, reliability. Spearman's Correlation and Multiple Linear Regression used in this research to test the hypotheses and to determine the significance of the relationship between independent variables and dependent variable. The result shows that ease of use, reliability, responsiveness and security have a significant influence on customer loyalty. This study fulfils the lacks of study on the relationship between E-service Quality and loyalty for online shopping consumer. However, the study suggest a number of future research possibilities including another dimensions of E-service quality especially E-learning content that slowly growing along with technology.

Keywords: *ConsumerLoyalty Towards Online Shopping Platform, Ease of Use, Reliability, Responsiveness, Security.*

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

1 INTRODUCTION

Electronic service, short as e-service is a general terms that refers to services over the information – communication technologies (Terezia Kvasnicova, 2016). This terms also also used in different name in the different situations for example, e-commerce, e-banking, e- government and e-learning. Both service providers and customers are benefited using e-service (Ramakrishnan Ramanathan, 2016). While e-service quality means by Santos (2003) is the degree to which customers’ expectations are fulfilled by the online service provider. There is many example of e-service quality for example fulfilment, efficiency, assurance, empathy, information available, process quality, website design, system availability, recovery and aesthetic however in this study only four were use which is ease of use, reliability, responsiveness and security. The study will measure e-service quality in online shopping platform. The chosen platform is Shopee application, where nowadays these online shopping platform Shopee have been one of the most popular website and application throughout the SEA country including Malaysia (Magazine, 2019). Beside that, the study also want to determine whether E-service quality affecting consumer’s loyalty in online shopping platform. Online shopping is a form of activity which allows consumers to directly buy goods or services from a seller over the Internet using a web browser such Google and applications (News, 2020).

This study will be investigating the e-service quality factors that influence consumer loyalty towards online shopping among students. Specifically, the objectives of this study are:

- I. To investigate does e-service quality in aspect of “ease of used” has an influence on consumer loyalty in online shopping platform.
- II. To analyze whether e-service quality in aspect of reliability has an impact on consumer loyalty towards the online shopping platform.
- III. To measuring does the e-service quality in aspect of responsiveness would influence the consumer loyalty in online shopping platform.
- IV. To identify whether e-service quality in aspect of it security would influence the consumer loyalty in online shopping platform.
- V. To find out the which e-service quality factor (ease of use, reliability, responsiveness, and security) that have the most influence on consumer loyalty in online shopping platform.

The scope of a study explains the extent to which the research area will be explored in the work and specifies the parameters within the study will be operating. Similarly, it also have to define what the study is not going to cover. This will come under the limitations. Generally, the scope of a research paper is followed by its limitations. The study will investigate the influence of e-service quality and trust on customer loyalty by using Shopee as online shopping platform as a sample. The respondent is among UMK’s FKP undergraduate student in their final year. The data will be collected via online questionnaire.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

2 LITERATURE REVIEW

2.1 Ease of Use

The terms ease of use is used to mean a concept where it describes how easily users can use a product to achieve effectiveness, satisfaction, and efficiency in its context of use (ISO, 1998). Ease of use is described as how easily users can use a product. In short, users must be able to tap and find within 3 seconds of accessing the interface and also aim to optimize ease of use while offering maximum functionality and respecting business limitations. Also, numerous studies by (William H. Delone, 1992); (Torkzadeh, 1988); (Manuel J. Sánchez-Franco, 2005); (Rong-An Shang, 2005); (Zhilin Yang, 2005) have identified various factors of ease of use, such as website structure, user interface, and ease of navigation. According to Chien-Chung Tu (2012) ease of use perception related features in online platforms are important to increase consumer's loyalty.

H1: There is a significant relationship between ease of use and consumer loyalty in online shopping platforms.

2.2 Reliability

Reliability means the correctness of order fulfillment, prompt delivery, and billing accuracy (Yang, 2001). In the case of e-service quality, it has no less importance. According to studies made by Iddrisu (2015) have found that reliability has a significant impact on consumer loyalty which indicated that a percentage increase in the variable (reliability) will lead to a 28.01% increase in consumer's loyalty.

H2: There is a significant relationship between reliability and consumer loyalty in online shopping platforms.

2.3 Responsiveness

Responsiveness is the willingness to help customers and provide prompt service (Trade, 2014). This dimension emphasizes attentiveness and promptness in dealing with customer's requests, questions, complaints, and problems. Responsiveness is communicated to customers by the length of time they have to wait for assistance, answers to questions, or attention to problems (UKEssays, 2018). Parasuraman (1985) has stated that responsiveness also captures the notion of flexibility and ability to customize the service to customer needs. Other words, responsiveness is one of the e-quality service dimensions that may or will lead to gaining loyalty of the consumer.

H3: There is a significant relationship between responsiveness and consumer loyalty in online shopping platforms.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

2.4 Security

Terms of security generally means a measure that taken to ensure a place were protect and people only can enter and leave with permission give (Dictionary C.) The terms also means how the service provider or applications assure each of transaction made by customer are totally safe and secured (2011). It is indeed one of the most critical customer concerns cause for example for the customers believe the site is safe to use and that personal information is protected (Valarie A. Zeithaml A. P., 2002). Hamed Taherdoost (2017), defined security as customer's confidence in the safety of the site from intrusion and protection of privacy and stated that it is one of the Web-based service quality attribute.

H4: There is significant relationship between security and consumer loyalty in online shopping platform.

2.5 Consumer Loyalty in Online Shopping Platform

Consumer's loyalty is a term with relevant relevance in terms of literature, given the belief that it contributes to the creation of sustainable competitive advantage and consequent profitability for companies, through the act of buying or communicating with a recommendation about it before others (Mustafa Rehman Khan, 2018). While online shopping, also known as e-shopping or Internet shopping, refers to the channel through which consumers can do their shopping activities over the Internet (Hsiao, 2016). According to Astuti (2013) consumer's loyalty within online platform is emerged from experience means if the consumer have good experience using the website there is possibility the consumer will be loyal to the online platform.

2.6 Conceptual Framework

The figure 2.2 below shows the theoretical framework of e-service quality factor as independent variables that influence customer loyalty the dependent variables.

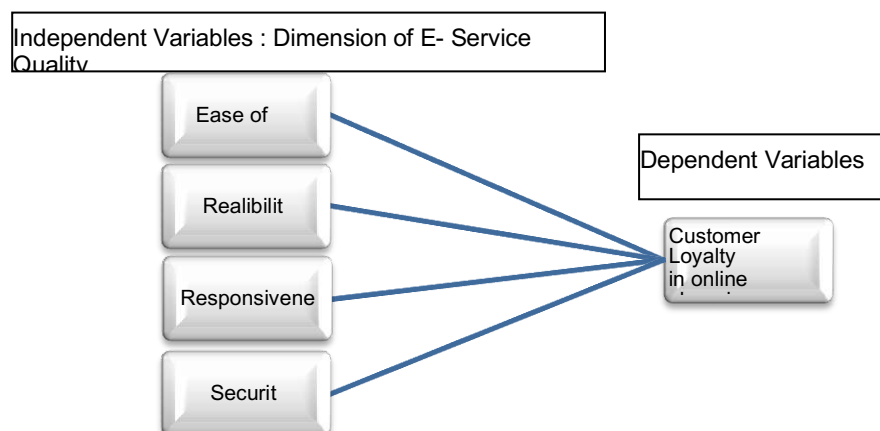

Figure 1: Theoretical Framework of e-service quality influence on customer loyalty in online shopping platform.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

3 RESEARCH METHODOLOGY

The Research design is systematic framework for collecting and analysing data. Exploratory, descriptive and cause are the three basic types of research design (Kent, 2007). This study use descriptive design. Descriptive research design is a procedure of collecting raw data and creates data structures that describe the existing characteristics of a defined target group.

According to Eric descriptive research design is appropriate for researches that aim to determine the degree of relationship among different variables whereby the purpose of it (2009). Through this study we will try to find out the answer of a specific research question that attempts to explain the relationship between consumer loyalty and selected dimensions of e-service quality of Shopee among undergraduate student of University of Malaysia Kelantan in Pengkalan Chepa.

The Information sources are divided into primary and secondary types. Primary data come from the original sources and are collected specially to answer our research question. Studies by others for their own purposes represent secondary data. This study is mostly using a secondary data which comes from books and media sources.

Next is survey, where the quantitative research collects data through formalized question and predetermined response options in the questionnaires which is administered to a large number of respondents this study are using questionnaires to utilize to collect data via the internet survey (Eric Shiu, 2009). The questions are displayed on website, and then respondents will provide an answer by choosing the option or clicking the icon.

For this study, non-probability voluntary response sampling technique is chosen. Instead of contacting the respondent, the student volunteers themselves to answer the questions (McCombes, 2020). About 248 respondent based on Morgan table to determine the sample size for this studies because the studies population is total of 733 final year student based on Morgan Table.

The questionnaire contain Section A, and B. After the information had gathered from respondents, the researcher started to collect and analyse the questionnaires. The respond of respondents were changed into numerical values before enter the data in the spread sheet. Statistics Package for the Social Science (SPSS) was choose and applied to collect and analysed the gathered information.

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

4 RESEARCH FINDINGS

4.1 Descriptive Analysis

Table 1 shows that the summary of 248 respondent demographic profile that has been collected through Google Form. The data analysis will focus on analysing factor influence E- service quality (ease of use, reliability, responsiveness and security) on consumer loyalty.

Table 1: Respondent Profile

Variable		Frequency	Percent (%)
Gender	Male	29	11.7
	Female	219	88.3
Total		248	100%
Age	21-22	70	28.2
	23-24	174	70.2
	25+	4	1.6
Total		248	100%
Ethnics Groups	Malay	187	75.4
	Indian	14	5.6
	Chinese	46	18.5
	Others	1	0.4
Total		248	100%

It can be concluded that most of the respondent is a female (88.3%) and less than are from male (11.7%) population with the differences of 77% between the two genders. About 70% majority respondent are at the age of 23 to 24 while the age of 21 to 22 consist of 28.2% respondent and the least is age of 25 and above that only have 1.6% respondent. Lastly, with the majority from Malay race (75.4%) followed by Chinese (18.5%) and Indian (5.6%) races and with only one respondent from other ethnic group which is from Bajau ethnic represent 0.4%.

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

4.2 Reliability Analysis

Table 2: Result of Reliability Coefficient Alpha for the Dependent Variable and Independent

Variable

Variables	Number of Items	Cronbach's Alpha Strength Of	
		Coefficient	Association
Ease of Use	5	0.844	Good
Reliability	5	0.831	Good
Responsiveness	5	0.858	Good
Security	5	0.859	Good
Consumer Loyalty	5	0.861	Good
Total	25	0.927	Excellent

Table 2 shows the value of Cronbach's Alpha Coefficient for dependent variables and independent variables. For the consumer's loyalty which is the dependent variable, the Cronbach's Alpha Coefficient was 0.861 which indicates as good. For the result independent variable, the ease of use, reliability, responsiveness and security had a good Cronbach's Alpha Coefficient of 0.930, 0.831, 0.858, 0.859 respectively. Generally, the results showed that the variable of Cronbach's Alpha Coefficient was occurred to be reliable and acceptable by 0.927 which is excellent.

4.3 Pearson's Correlation

Table 3: Summary Result of Pearson's Correlation

Hypothesis	Result	Findings of Data Analysis
H1: There is a positive relationship between ease of use and consumer's loyalty in <u>online shopping platform.</u>	$r = 0.587^{**}$ $p = 0.000$ Moderate positive (negative)	H1: Accepted

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

H2: There is a positive relationship between reliability use and consumer's loyalty in online shopping platform.	$r = 0.644^{**}$ $p = 0.000$ Moderate positive (negative)	H2: Accepted
H3: There is a positive relationship between responsiveness and consumer's loyalty in online shopping platform.	$r = 0.683^{**}$ $p = 0.000$ Moderate positive (negative)	H3: Accepted
H4: There is a positive relationship between security and consumer's loyalty in online shopping platform.	$r = 0.781^{**}$ $p = 0.000$ High positive (negative)	H4: Accepted

Table 3 shows the Pearson's Correlation coefficients. According to rule of thumb for interpreting the size of a Correlation of Coefficient (Dennis E. Hinkle, 2003). Besides that, the P value was 0.000 indicates the significant value for the analysis where it is lower than the alpha root which is 0.01.

The correlation between ease of use factor influencing consumer loyalty in online shopping. From the table 4.5, it shows that there is a significant relationship between ease of use factor influencing consumer loyalty in online shopping because the significant value is 0.000 which is less than 0.01. The positive correlation coefficient for ease of use influencing consumer loyalty in on line shopping is 0.587** means there is a moderate relationship between ease of use influencing consumer loyalty. It shows that ease of use does influencing consumer loyalty in online shopping platform. Hence, the H1 of objective 1 which is to identify the relationship between ease of use and consumer loyalty in online shopping platform is accepted.

The correlation between reliability factor influencing consumer loyalty in online shopping. From the table 4.5, it shows that there is a significant relationship between reliability factor influencing consumer loyalty in online shopping because the significant value is 0.000 which is less than 0.01. The positive correlation coefficient for reliability influencing consumer loyalty in on line shopping is 0.644** means there is a moderate positive relationship between reliability influencing consumer loyalty. It shows that reliability does influencing consumer loyalty in online shopping platform. Hence, the H2 of objective 2 which is to identify the relationship between reliability and consumer loyalty in online shopping platform is accepted.

The correlation between responsiveness factor influencing consumer loyalty in online shopping. From the table 4.5, it shows that there is a significant relationship between responsiveness factor influencing consumer loyalty in online shopping because the significant value is 0.000 which is less than 0.01. The positive correlation coefficient for responsiveness influencing consumer loyalty in on line shopping is 0.683** means there is a moderate positive relationship between responsiveness influencing consumer loyalty. It shows that responsiveness does influencing consumer loyalty in online shopping platform. Hence, the H3 of objective 3

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

which is to identify the relationship between responsiveness and consumer loyalty in online shopping platform is accepted.

Lastly, the correlation between security factor influencing consumer loyalty in online shopping. From the table 4.5, it shows that there is a significant relationship between security factor influencing consumer loyalty in online shopping because the significant value is 0.000 which is less than 0.01. The positive correlation coefficient for security influencing consumer loyalty in on line shopping is 0.781** means there is a high positive relationship between security influencing consumer loyalty. It shows that security does influencing consumer loyalty in online shopping platform. Hence, the H4 of objective 4 which is to identify the relationship between security and consumer loyalty in online shopping platform is accepted.

4.4 Multiple Linear Regression Analysis

Table 4: Table of coefficient analysis

Model	Unstandardized Coefficients		Standardized Coefficients	Sig.
	B	Std. Error	Beta	
(Constant)	0.696	0.218		0.002
Ease of Use	-	-	-	0.345
Reliability	0.212	0.062	0.197	0.001
Responsiveness	-	-	-	0.099
Security	0.639	0.068	0.636	0.000

*p-value<0.05

According to the Table 4, the factors such as reliability and security were significant since the p-values were less than 0.05. The equation of regression can be written as follows

= + +

where

= Consumer's Loyalty

= Reliability

= Security

Hence, the equation becomes

= 0.696 + +

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Unstandardized coefficients beta represents the strength of the effects of every single of the independent variables to the dependent variable. The higher the value of the beta coefficient, the stronger the effect of independent variable towards dependent variable. According to the Table 4, the most influence independent variables in measuring the consumer's loyalty towards online shopping was the security variable (= 0.639). The lowest influence consumer's loyalty towards online shopping was the personal gratification (= 0.212).

5 DISCUSSION

The first objective of the research was to investigate does e-service quality in aspect of "ease of used" has an influence on consumer loyalty in online shopping platform among students in UMK, City Campus. The strength of correlation between ease of use and consumer's loyalty towards online shopping platform has moderate positive correlation. The theory deals with the indicators such as gadget and technology that people use. Johanna (2004) found that the level of the ease of use is expected to affect loyalty directly, since it provides physical evidence of the service provider competence as well as facilitating effortless use of the service.

The second objective of the research to analyse whether e-service quality in aspect of reliability has an impact on consumer loyalty towards online shopping platform among students in UMK, City Campus. The strength of correlation between reliability and consumer's loyalty towards online shopping platform has moderate positive correlation. Wolfenbarger and Gilly (2003) found out that customer loyalty can be predicted from reliability ratings.

The third objective of the research to measuring does the e-service quality in aspect of responsiveness would influence the consumer loyalty in online shopping platform among students in UMK, City Campus. The strength of correlation between responsiveness and consumer's loyalty towards online shopping platform has moderate positive correlation. According to James B. Oldroyd, (2009) the immense impact that responsiveness has on sales, and customer loyalty is clear as the study shown, the number of conversion versus the number of minutes since the customer request and the result seemingly insignificant change between responding in 10 minutes rather than 5, results in an 80% reduction in leads.

The fourth objective of the research to identify whether e-service quality in aspect of security would influence the consumer loyalty in online shopping platform among students in UMK, City Campus. The strength of correlation between security and consumer's loyalty towards online shopping platform has high positive correlation. According to Mohammad Younus (2011) if consumer can use the website without feeling uncomfortable that would lead to gaining their loyalty as per stated security is directly related to loyalty since it signals the service provider's integrity.

The last objective is to investigate the most important factor of E-service quality that influence on consumer loyalty in online shopping among students in Universiti Malaysia Kelantan (UMK), City Campus. The most factor is reliability and security as shown in multiple linear regression result in table 3.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

6 RECOMMENDATION

A research considering the effect of E-service quality for E-banking, E-learning or E-government instead of online shopping would be interesting topic to be covered. Especially in E-learning service now that we have Youtube channel that enable people to create knowledgeable content for example in Malaysia we have AJAR channel whereby the study topic could be the influence of Youtube as a medium for E-learning towards student. Finally, a future research in online shopping for new ways of reaching the audience would be very helpful, since it is hard to collecting the relevant information

7 CONCLUSION

It is hoped that this research which “The E-service Quality Factor Influence on Consumer Loyalty: A Study on Shopee Platform” give a clearer view on the influence of E-service quality which is ease of use, reliability, responsiveness and security on customer loyalty in online shopping platform. About 248 respondent among UMK’s final year student have participate in answering the questionnaire from 15th December until 30th December 2020. The result of correlation shown there is moderate and high positive correlation of independent variable (ease of use, reliability, responsiveness, and security) towards dependent variable (consumer’s loyalty). The E-service quality most factors of this research is reliability and security.

8 ACKNOWLEDGMENT

I would like to thank all the participants and respondents for participating in this study also deeply grateful to supervisor, Dr Nurul Izyan binti Mat Daud, for her guidance, patience and support. I feel grateful to my parents and family members for their continuous support and encouragement. They always have been beside me through the thick and the thin. Also thanks to many people including UMK’s librarian for the help throughout the research process and 248 who participle actively in the survey.

Abstract:

Service quality is a thing that a retailer does to give a satisfaction toward customer, while customer satisfaction is a feeling of customer after using the service provided. The objective of this study is to study about the effect of service quality based on customer satisfaction toward convenience store self-service. Self-service is a service that provided by retailer for customer use it by their self. There are service quality dimension that will be examines in this study that its tangibility, reliability, and responsiveness. The total of 250 questionnaires will be accepted to collect the data by using sample sampling through Google form. All of the data will be collected and be analyzing by using SPSS to look in term of reliability test, Pearson correlation, and multiple linear regression. The result will concluded tangibility, reliability, and responsiveness based on customer satisfaction toward convenient store self- service. The most factor that effect service quality toward customer satisfaction are responsiveness. This study has some limitation and recommendation to provide a good viewpoint for future researcher, retailers and other sector that provided service quality to their customer in Malaysia. Ogiemwonyi. et al. (2020)

Keywords: Service Quality, Tangibility, Reliability, Responsiveness, Customer Satisfaction

1 INTRODUCTION

The delivery of quality services is related to the quality of a company while customer satisfaction reflects the closeness of customers with the services received. Service quality has the result of five key dimensions that include tangibility, reliability, responsiveness, assurance and empathy. This entire dimension is really giving an impact toward customer satisfaction. But for this research will use only three dimension that its tangibility, reliability, and responsiveness service quality factors that give effect toward customer satisfaction. This dimension are really importance to study as its result will goes good or bad according to how the retailer using the dimension. Then, customer satisfaction defined as a level of situation which a person produces a feeling after comparing the performance of a perceived product or service. This service quality really importance to see and study but sometime retailer just take the service quality provided easily and make customers feel dissatisfied. This may be due to communication gaps. Where, convenience store failure to deliver promises, failure to keep customer informed and failure to listen on communicate in a customer way to be understood. If this happen than the business will be in crisis as its will make the customer dissatisfaction with them. Because of this, they need to ensure that the level of performance or quality of their service meets customer expectations of the goods or services that they want. Hence, this research attempts to study the investigated the effect of service quality based on the customer satisfaction toward convenience store self-service in Negeri Sembilan.

1.1 Significance of the study

This research will specifically be carried out to study about the effect of service quality based on customer satisfaction toward convenience store self-service in Negeri Sembilan. This research may also have implication for the development of a good service quality, as the consumer will demand on high quality of service and focus on that quality to intensify image that is based on sales and revenue increment. This mean that, when the convenience store self-service not match with their expectation, the customer will condemn and begin to buy at other place then they will never come back to that place. Because of that, service qualities are really importance to convenience store. It's not just importance on one industry but also to other industry such as government, hospitality and other. Hence, the students and future researcher also can be beneficiary to carry out more study about this service quality toward customer satisfaction.

2 LITERATURE REVIEW

2.1 Tangibility

Tangibility is a factor where tangible refers to the physical characteristics of a service provided by an industry. Tangible refers or relate to physical facilities, equipment, personnel and communication materials. Most of the industry must provide the best and most complete equipment for customers. It also includes visual appeal, cleanliness, views, display of shop, furniture, decorations and lighting, appearance of facilities, staff conduct, the room space and the parking facilities (Haverila, Haverila, & Arora, 2019). Umoke et al. (2020) similarly stated that tangibility has a significant correlation with the customer satisfaction level toward the service that they use. Due to that, the provision of service with this tangible aspect is very important. Where, the provision of the best and most complete facilities will give a good customer perception of a business.

2.2 Reliability

Reliability refers to the ability to perform the promised services accurately and systematically. Where, this is related to the promise of service that wants to give to the customers should be given as they expect. As a result, employees in service companies play an important role in establishing emotional relationships with customers and are burdened with recognizing customer desires and fulfilling their choices (Haverila et al., 2019). According to Umoke et al. (2020), when the service provided has been promised, then the service must be implemented and provision the service at time as it's promised. This can also increase customer trust in a business because they believe and has felt or going through their own experience service that has been promised in accordance with their expectations. Due to that, reliability is important in being a factor for customer stay and buying in a business.

2.3 Responsiveness

According to Haverila et al. (2019), responsiveness is related to a service that employee willing to help customer and provide full service not only regarding to the speed but also to the nature of the response to customers. Waiting time is very important for customers, as they will do business with existing employees. Customers will be satisfied if all the business they want to do is carried out very quickly and runs smoothly. Responsiveness also is an information that provided by a business, explanation of the product, treatment of the service, and willingness of the staff to listen to the customer (Umoke et al., 2020). When all these are met and implemented well, then this will improve customer confidence on the product or service that they provided and will help them in making purchase decisions as well. So, this responsiveness is really important to provide fast and thorough service to customers.

2.4 Customer Satisfaction

Customer satisfaction is a feeling in customer that feels pleasure or disappointment based on comparison of product perceived performance that relation with customer expectations (Junaidi et al., 2019). Because of that, this customer satisfaction is important to maintain and fulfill their expectations are likely to come from previous real buying experiences with certain other stores that sell the same thing. According to Hamadamin, Z. F., & Singh, U. S. (2019), customer satisfaction is a customer reaction that has a difference between the desire they had previously and the actual execution of the item or administration as having seen it's when they use. Where, in the future consider fulfillment is a general assessment after purchase by the buyer. This proves that the generally accepted fulfillment is a reaction of customer satisfaction toward a service provided.

2.5 Research Hypothesis

The hypotheses of this study can be concluded in the following manner:

H1 There is a significant relationship between tangibility and customer satisfaction toward convenient store self-service.

H2 There is a positive relationship between reliability and customer satisfaction toward convenience store self-service.

H3 There is a positive relationship between responsiveness and customer satisfaction toward convenience store self-service.

2.6 Conceptual Framework

The research framework as illustrated in the Figure 1 below which is in this study, researcher develop a survey research instruments called SERVQUAL that has modified from Zeithaml and Bitner (2003).

Figure 1: Conceptual framework adapted from Setapa, Zaman, Mustapha, Kanafiah, and Noor

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021
(2020)**

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

3 RESEARCH METHODOLOGY

3.1 Research Design

The aim of this study is to provide a greater understanding on how service quality gives effect to customer satisfaction. Primary data has been choosing in conducting this study. Primary data is the information that collects by researchers for the specific purpose on the study. Collecting primary data will be use self-administered survey method and a cross sectional survey will require the customer of convenience store that provided self-service to answer the question.

3.2 Measurement Development

Research developments are using an online questionnaire to collect the data. In this study, researchers use three scales of measurement in order to meet the requirement of measurement to conduct the questionnaire. First, the questionnaire will be use a Likert scale, that its 1 = strongly disagree, 2 = disagree, 3 = neutral, 4 = agree and 5 = strongly agree. Then, researcher will use in Section A is nominal and ordinal scales and the measurement that will use in Section B and C is interval scale.

3.3 Sample Size

A sample size is a group of people that taken from a larger population for measurement. The sample should be representative of the population to ensure that it can generalize the findings from the research sample to the population as a whole. There are customer that use self-service of 3 sample convenient store in Negeri Sembilan will be select. Based on proportionate, a total of 250 customers will be select out of 1.1 million people in Negeri Sembilan. All statements in questionnaires will be written in English and Malay. Both of all section will be develop by researchers and will be validate to seek its reliability and validity. So, pilot testing will be conduct to test the reliabilities all of the instruments in order to secure the internal validity of the study.

3.4 Data Collection

The data will be collect after make a questionnaire to all respondents through the online method by using the Google form platform. This is to avoid problems that may be encountered when collecting data from respondents during the current situation that is pandemic outbreak. The questionnaire will be shared though social media such as WhatApps, Facebook, Instagram, Twitter, and others. The question that will be distributed will have an additional question to ensure that the respondent who answers this question is a customer who uses self-service at the convenience store. In this way, the researcher will be easy to isolate the data by selecting only the desired data. After that, the data will compile and sorting. Then, the data will be analyze by using pilot test SPSS. At last, the final report will prepare to finish it after 25 days and then generate the Turnitin for the report before submit at the last day. The following show the data collection procedure of establishing, distributing and collecting the questionnaires.

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

3.5 Data Analysis

The data will be analyzed by using Statistical Package for Social Science (SPSS). This SPSS are really convenience as its can analyze the reliability test (pilot test), frequency analysis, descriptive analysis, Pearson correlation analysis and multiple regression analysis for his study.

4 FINDINGS

4.1 Demographic Profile of Respondents

There are a set of demographic profile of respondent that is gander, age, ethnic, marriage status, academic qualification, and income that has been examined and presented in Table 1. The questionnaires were collect and distributed by using Google form and share via social media. There are 250 respondents that has answers the question in the Google form. These descriptive analyses are making to make sure or to understand the profile of respondents.

Table 1: Demographic of the respondent.

Demographic		Frequency	Percentage (%)
Gander	Female	152	60.8
	Male	98	39.2
Age	Below than 20 year old	74	29.6
	21 – 31 year old	113	45.2
	32 – 41 year old	35	14
	Higher than 42 year old	28	11.2
Ethnic	Malay	220	88
	Chinese	11	4.4
	Indian	17	6.8
	Other	2	0.8
Marriage status	Single	170	68
	Marriage	80	32
Academic qualification	PMR	30	12
	SPM	75	30
	STPM	23	9.2
	Diploma	49	19.6
	Degree	73	29.2

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

Income	Below than RM 1000	123	49.2
	RM 1001 – RM 2000	60	24
	RM 2001 – RM 3000	44	17.6
	RM 3001 – RM 4000	13	5.2
	Higher than RM 4001	10	4

Table 1 show the demographic profile of respondent that has 250 respondents that answer the question in this study. There were 152 (60.8%) female and 98 (39.2) male are involved in this study. The higher ages are 21 to 31 year old with 113 (45.2%) respondent follow by the ages of below than 20 year old with 74 (29.6%) respondent, then 32 to 41 year old with 35 (14%) respondent and lastly 28 (11.2%) respondent age of higher then 42 year old. Next, the ethnic for this research are Malay with 220 (88%) of respondent, Chinese 11 (4.4%) respondent, Indian with 17 (6.8%) respondent, and other with 2 (0.8%) respondent. After that, the marriage status has two categories that it's single with 170 (68%) respondent and marriage with 80 (32%) of respondent in this study. The academic qualification are PMR with 30 (12%), SPM with 75 (30%), STPM with 23 (9.2%), diploma with 49 (19.6%) and degree with 73 (29.2%) respondent. The last demographic are income that has below than RM 1000 with 123 (49.2%), RM 1001 to RM 2000 with 60 (24%), RM 2001 to RM 3000 with 44 (17.6%), RM 3001 to RM 4000 with 13 (5.2%) and higher than RM 4001 with 10 (4%) respondent. All of that is a demographic profile of the respondent.

4.2 Pearson Correlation Analysis

Correlation analysis is applied to describe about the strength of linear relationship between both variables. Table 2 shows the result of the correlation analysis the effect of service quality based on customer satisfaction will be accepted or not.

Table 2: Results of Pearson Correlation Analysis.

Variable	Acceptant of customer satisfaction	Supported or rejected
Tangibility	0.665*	Supported
Reliability	0.744*	Supported
Responsiveness	0.802*	Supported

*p-value<0.05, Pearson correlation analysis applied

In the table above, there is a positive perfect significant correlation relationship between tangibility and customer satisfaction ($p < 0.05$, $r = 0.665$). Next, there is a positive perfect significant correlation relationship between reliability and customer satisfaction ($p < 0.05$, $r = 0.744$). Lastly, there are very positive perfect significant correlation relationship between responsiveness and customer satisfaction ($p < 0.05$, $r = 0.802$).

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

4.3 Hypothesis Testing

The hypothesis on significant relationship between tangibility, reliability, and responsiveness with customer satisfaction were tested by using Pearson correlation analysis. All hypotheses were accepted as $p\text{-value} < 0.05$.

Multiple Regression Analysis

The preliminary analyses are using the multiple liner regression simple in SPSS. The data are normal in normality test. So, the multiple liner regression can be used in this analysis.

Table 3: Multiple liner regress of the independent variable.

Variable	Simple	Linear	regression	Multiple	linear	regression
	B	t-stat (95% CI)	p-value	b	t-stat (95% CI)	p-value
Tangibility	0.67	14.01(0.57,0.75)	<0.001	0.16	3.14(0.06,0.27)	0.002
Reliability	0.73	17.53(0.65,0.81)	<0.001	0.2	3.11(0.07,0.33)	0.002
Responsiveness	0.77	21.12(0.70,0.84)	<0.001	0.5	8.05(0.38,0.62)	<0.001

There is a significant effect of tangibility, reliability, and responsiveness toward customer satisfaction ($p < 0.05$). In every unit increase of tangibility (X), customer satisfaction (Y) will increase by 0.16(b). In every unit increase of reliability (X), customer satisfaction (Y) will increase by 0.20(b). In every unit increase of responsiveness (X), customer satisfaction (Y) will increase by 0.50(b).

5 DISCUSSION

5.1 Tangibility

Based on the Pearson Correlation analysis table, the result show that independent variable 1 that its tangibility had moderate positive influence in customer that use self-service in convenience store. The result of the Person Correlation value are $r=0.665$ that has shown the moderate positive correlation relationship between tangibility and customer satisfaction. Based on the study by Ogiemwonyi et al. (2020) which is a study on service in hypermarkets. They stated that this tangibility is about the direct impact of the physical environment, facilities and the means of communication of personnel. Where, tangibility is a service tool that delivers the quality of a hypermarket to the customer who consumes it. So, this is very important in managing any management matters that are done by the customer in a company. This means that, the result of the research objective and research question are achieved and answered.

5.2 Reliability

Based on the Pearson Correlation analysis, the result show that independent variable 2 that its reliability that had moderate or good positive influence in customer that use self-

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

service in convenience store. The result of the Person Correlation value are $r=0.744$ that has shown the moderate or good positive correlation relationship between reliability and customer satisfaction. Based on the previous study done by Idayati, Kesuma, Aprianto, and Suwarno (2020), their study about the service quality dimension toward government. Based on their observations, this reliability is a level of probability or possibility of a product successfully performing its function in a certain period of time. They also stated that reliability is efforts to provide punctuality, equal treatment to customers without a single point of error that can make customers increase their trust in the government system. This shows that reliability is important in fostering customer trust in a company, including convenience stores. The research objective and research question are achieved and answered in this study.

5.3 Responsiveness

On the Pearson Correlation analysis, the result show that independent variable responsiveness had moderate or good positive influence in customer that use self-service in responsiveness. The result of the Person Correlation value are $r=0.802$ that has shown the higher of positive correlation relationship between responsiveness and customer satisfaction. In Junaidi and Sabar (2019) study, they are study about Redkendi Application, in the study, if the website or application to provide information is affected then responsibility is the most important to overcome this problem accurately and quickly. They also state that responsiveness is one of the capabilities that can help customers quickly to meet their needs. So if a conclusion is made by combining this statement with the situation at the convenience store, this responsiveness is important in managing the service at the convenience store. Where, when there is a problem with the equipment provided in the convenience store such as equipment does not work, the customer will ask for the help of employees there and they will give the best response to solve the problem. So, this is really important.

5.5 RECOMMENDATION

In this part will be answer the last research objective. First of all, I would like to give a suggestion to each sector that has self-service to fully focus on the factors that are in the independent variable, namely tangibility, reliability, and responsiveness. Where, they need to provide an understanding where each company needs to ensure that all these factors are handled well as these factors can have positive and negative effects according to the way they are controlled. Therefore, this is very important as the factor can to ensure that customers always visit the business.

This quality service dimension is important in managing the service well and providing aspects that can keep a good feeling of need to customer visit the business calmly and well. Due to that, I suggest future researchers to make this study in more depth due to this service factor are very important nowadays. Researchers also need to do a lot of analysis to study this study by finding more articles that can help them complete their study more thoroughly and quickly. Researchers also need to diligently search and ask questions to complete this task, as there are some limitations that may need to get encouragement from others.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

5.6 LIMITATIONS

This study has the limitation of the study as well as other studies. The sample of this study is convenient store customer, so the result of this research has limitation among the customer at the convenient store. Since the result shows the factor of service quality based on the customer satisfaction toward convenience store self-service in Negeri Sembilan, it cannot be used for other customer at other retail store type except convenience store that has self-service provided. In addition, it can't be used for other sector except retail sector. In addition, researchers who carry out the cross-sectional study will not provide well defined information about cause-and-effect relationship like longitudinal research. This is because cross-sectional research is the research which being carry out in the short period of time. Then, this research is carrying out to determine the service quality among customer at convenience store self-service. So, the self-reported of the convenient store self-service will not be used. Lastly, cost also one of the limitations for researcher. Since all of the researcher are final year students, so their researcher need to make sure of their cost minimizes.

5.7 CONCLUSION

All the data that has been collect are normal and positive between independent variable and dependent variable. The tangibility, reliability, and responsiveness are positively relate to customer satisfaction in convenience store self-service. The higher positive are responsive, this is maybe due to the time require to get the service as customer like something that fast to get. So, the responsiveness are the really importance thing to the customer self-service. The other independent variable like tangibility and reliability also importance as if there no physical service tool and the trust of customer toward the convenience store, the customer will not satisfice with the shop as there not enough thing. So, these factors of service quality are really importance to make sure customer satisfice not only in convenience store but also at other industry.

FACTORS INFLUENCING UMK STUDENT'S ONLINE PURCHASE INTENTION IN BOOK INDUSTRY

Nur Fatini Binti Mohd Zulmee@Mohd Zamree and Nurul Azwa Binti Mohamed
Khadri

Faculty of Entrepreneurship and Business,
Universiti Malaysia Kelantan,
Malaysia

Email: fatini.a17a0930@siswa.umk.edu.my; azwa.mk@umk.edu.my

Abstract:

This research is to investigate the factor influencing online purchase intention in books industry among University Malaysia Kelantan student. This research will investigate the factor that influencing online purchase intention towards Convenience, Product Variety and Price. The target respondents for this research are University Malaysia Kelantan students that have academic qualification from the university itself. In addition, this study was designed to acknowledge other online book retailers in attracting their customer to purchase books through their websites. Furthermore, the questionnaires were distributed through online by using convenience sampling technique. In result, 385 set of questionnaire were collected to see whether all the factors are influencing UMK students in purchasing book through online. This research will be analysed by using Statistical Package for Social Science (SPSS) version 25. SPSS will be using to conduct descriptive analysis, frequency analysis, correlation analysis, reliability test and multiple regression analysis. Additionally, this research shows the result which independent variable that consists Convenience, Product Variety and Price has a positive relationship between Online Purchase Intention. Moreover, this research shows the clearer overview regarding the online book retailers in term of factor that drive UMK students in buying book online. Lastly, the limitations on doing this research were identified and implications for further research were recommended.

Keywords: *Online purchase intention, Convenience, Product Variety, Price and UMK Students.*

1.0 Introduction

Since the internet transition into interconnection network for sharing and delivery information, internet has emerged as a useful marketing tool to serve as a platform for domestic and international transaction. According to A.T Kearney (2015), retail e-commerce has grown nearly to US\$840 billion in 2014 surpassing the sales of US\$695 billion in year 2013 and it was estimated to increase to US\$1506 billion in 2018. The continuous sales increment indicated that e-commerce that includes the book industries have an enormous market potential.

Internet usages have been grown rapidly in Malaysia and online shopping has become one of the hobbies among Malaysian people. The creation of internet has changed the focal point of communicating and conducting businesses. It is used smartly as a tool for communicating,

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

source for information, meant for entertainment and medium for international businesses. The growth of internet technology has pushed the interest of consumer on internet. According to International Telecommunication Union (2014), as cited in Voice of America News, dated, "Number of internet Users Worldwide Approaching 3 billion" (2014) it forecasted to be around 44% of global household will have Internet access by 2014. Furthermore, Internet World Stats (2012) stated that there was a drastic increase of 2000 million of worldwide Internet users from 2000 to 2012. This shows that the global usage of Internet is advancing rapidly. Moreover, Asia has the highest number of Internet user which is the addition for 44.8% among the entire worlds region.

Focus into Malaysia market, Malaysia internet user has grown as much as 18 million in 2017 which is 60.7% from its total population. By comparing in 2017, which there is only 2 million rise in Internet subscribers (Internet World Stats, 2014). However, the Internet usage has not been fully exploited hence there is potential as according to the official website of Finance Malaysia (2013), shown that the number of local subscribers are expected to reach 25 million in 2015. Meanwhile the online shopping market size was RM 1.8 billion in 2010 hence there is so much potential. Hence most companies have practiced globalization strategy. Therefore, Internet is the leading medium to conduct international business.

The intention of consumers to purchase books online has become a significant trend as stated in the Nielsen Global Consumer Report (2010).Based on the survey conducted on 27,000 respondents globally, the priority choice that global consumers intended to buy from Internet in the next six months was books. It occupied 44% which is the highest percentage among all the choices.

Looking into Malaysia market, Nielsen Company (2011), as cited in Ho (2011), mentioned that Malaysians spent RM 1.8 billion in online shopping in 2010 and the figure is estimated to grow triple in the next three years. In addition, Malaysian shoppers prefer to purchase books from foreign website and the main reason was due to the unavailability of the items locally. Furthermore, consumers 'online purchase in books has grown by 9% from 2010 to 2011 (The Star Online, dated, "More Malaysians Shopping Online", 2012).

2.0 Literature Review

2.1 Underpinning Theory

The theory of planned behaviour is an extension of the theory of reasoned action (Ajzen & Fishbein, 1980; Fishbein & Ajzen, 1975) made necessary by the original models limitations in dealing with behaviours over which people have incomplete volitional control.

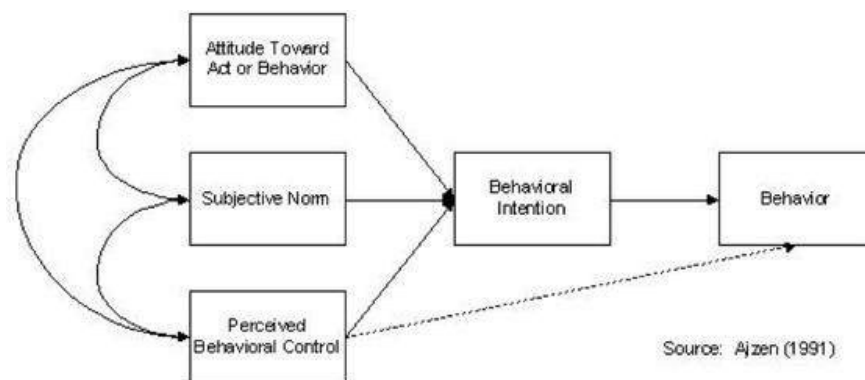

Figure 2.1: Theory of Planned Behaviour

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

Figure 2.1 depicts the theory in the form of a structural diagram. A central factor in the theory of planned behaviour is the individual's intention to perform a given behaviour. Intentions are

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

assumed to capture the motivational factors that influence a behaviour they are indications of how hard people are willing to try, of how much of an effort they are planning to exert, in order to perform the behaviour. As a general rule, the stronger the intention to engage in behaviour, the more likely should be its performance. It should be clear, however, that a behavioural intention can find expression in behaviour only if the behaviour in question is under volitional control, if the person can decide at will to perform or not perform the behaviour. Although some behaviour may in fact meet this requirement quite well, the performance of most depends at least to some degree on such motivational factors as availability of requisite opportunities and resources. Collectively, these factors represent people's actual control over the behaviour. To the extent that a person has the required opportunities and resources, and intends to perform the behaviour, he or she should succeed in doing so.

2.2 Customer's online purchase intention

Purchase intention can be defined as customer own wills to buy the goods and services by using online platform, (Ailawadi, Neslin and Gedenk, 2001). Online purchase intention alludes to the benefit of the consumer's arrangement to complete a specific acquiring conduct over the Internet (Salisbury, Pearson and Miller, 2001). It could also be defined as the desire of buyers to make a genuine buy through the online retail shops (El-Ansary and Roushdy, 2013). According to Poddar, Donthu and Wei (2009), online purchase intention can be used to forecast the actual purchase behaviour. It refers to a result of consumers 'evaluation on the quality of website, availability of information and products.

2.3 Convenience

Stated by the findings of Eastlick and Feinberg (1999); Rohm and Swaminathan (2004), convenience is defined as the advantage such as time and efforts saving that the consumers will receive from online purchase. It could be reflected in shorter time and lesser vitality spent, incorporating decreases in transportation cost and furthermore less groups and lines (Su and Huang, 2011). In addition, Hermes (2000), as cited in Katawetawaraks and Cheng (2011) mentioned that consumers can experience the convenience of online purchase as they can send inquires even after business hours.

H₁: There is significance positive relationship between convenience and customer's online purchase intention.

2.4 Product Variety

Product variety refers to the depth or breadth of product assortment according to Simonson (2012). Chernev (2014) further defined breadth as the variety of different food categories while depth as the number of items within a specific product group. Besides, Lancaster (2010) stated that product variety as number of depth within a focus range of product category and also showed as number of brands 'as the term used in marketing field.

H₂: There is significance relationship between product variety and customer's online purchase intention.

2.5 Price

The general concept of cost has been taunted by couple of scientists over the most recent several of decades. As stated by the previous researcher Jacoby and Olson (1977), as referred to in Chiang and Dholakia (2003), price is explained as the perceptual portray of buyer or the

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

abstract view of the target price of the goods. Li and Green (2011) had explained cost into monetary and non- monetary articulation.

H₃: There is significance relationship between price and customer's online purchase intention.

2.6 Conceptual Framework

The framework shows the connection between independent variable and dependent variable. The framework is to help the researcher see clearly variables of the study. The independent variable is consist the brand name, convenience, product variety, and price while for the dependent variable are consists factor in influencing UMK student's online purchase intention in books industry

Figure 2.2 Research Frameworks.

3.0 Research Methods

In this chapter describes the research standpoint and research questions inform which means of the literature review. It describes and justifies the research approach and methodology adopted and the stages and techniques for data collection, analysis and validation. For this research, 351 copies of e-survey questionnaire were distributed through online to the respondent but researcher only chose qualified respondent to answer the questionnaire. Primary data does not require cost and does not take long to process but provides relevant information as it is up-to-date. Besides, the researcher use snowball sampling technique to collect the data from respondent (UMK student) and this sampling technique has used to convince researcher to get the data researcher use Google Form to every school and faculty in UMK to pass the link to their friend (friend to friend). On the other hand, the dependent variable is online purchase intention which consists of five questions. In this section, all the items are measured in five-point Likert scale, in which it is ranging from 1 to 5 where 1= Strongly Disagree and 5= Strongly Agree. There are several types of analytical techniques that are used to check accuracy of the data collected throughout the research such s descriptive analysis, reliability test and Pearson correlation analysis.

4.0 Analysis and Discussion

4.1 Demographic Profile of Respondents

The demographic of the respondents is collected and recorded in the table 4.1. The demographic includes with gender, age, marital status, race, educational level, income, employment, platform and

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

time spender. The results showed the gender analysis of the respondent. The total number of male respondent is 154 respondent 40%. Meanwhile, the total number of female respondent is 231 respondent 60%. It concludes that the total of female respondents is more than the total of male respondents. As for the age, majority is in the age range of 22 - 24 years old who agreed to participate in this studies which is 35.3% respondents. The single category showed the highest percentage with 278 respondents' percentage 72.2%. While, the race analysis of respondents showed that the most answered the questionnaire is from Malay category with 299 respondents 77.7%. Majority of the respondents is undergraduate degree as their educational level which is 56.9%. There are 201 respondents that are been student which is 52.2% with the highest percentage of income is below RM 1,000 with 186 respondents 48.3%. There are 238 respondents with 61.8% use Shopee to purchase product or service. Meanwhile, majority of the respondents are visited on online store below 3 hours with 35.8% of respondents.

Items	Frequency (n)	Percentage (%)
Gender		
Male	154	40
Female	231	60
Age		
18	30	7.8
19-21	74	19.2
22-24	136	35.3
25-27	87	22.6
28-30	45	11.7
Marital status		
Single	278	72.2
Married	92	23.9
Divorce	15	3.9
Race

Time Spender		
Below 3 hours	138	35.8
3 hours to 6 hours	76	19.7
6 hours to 9 hours	41	10.6
9 hours to 12 hours	16	4.2
12 hours and above	109	28.3

4.2 Descriptive Analysis

VARIABLES	N	MEAN	STD. DEVIATION
DV	385	4.0634	0.63339
IV1	385	4.187	0.56387
IV2	385	4.2437	0.56029
IV3	385	4.2052	0.57688

Table 4.2 Descriptive Statistics

The Table shows the descriptive statistics of Dependent Variables (DV) is Online Purchase Intention, while Independents Variables are Convenience (IV1), Product Variety (IV2) and Price (IV3). Product variety has the highest mean which is 4.2437. Then, it followed by Price, Convenience and Online purchase intention which are 4.2052, 4.187 and 4.0634 respectively. However, online purchase intention has the lowest mean which is 4.0634. The result shows that majority of the respondents agreed that product variety that most important on online purchase intention.

In addition, standard deviation shows how close the data is to the mean. In this case, online purchase intention has the highest standard deviation which is 0. 63339, followed by Price which is 0.57688. Then, standard deviation for convenience and product variety are 0.56387 and 0.56029.

4.3 Pearson Correlation Coefficient

By using the Pearson Correlation Coefficient table, the study can determine the relationship between the dependent variable and the independent variables. Therefore, the Pearson Correlation Coefficient also may check whether multicollinearity exists among the independent variables. On the other hand, to define significant, p-value must be lower than 0.05 (<0.05). Based on Table it shows that all the variables have substantial significant positive correlation with online purchase intention which is factor convenience ($r = 0.664$), product variety ($r = 0.542$) and price ($r = 0.592$) This table also shows that the multicollinearity does

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

not exist since all pairs of the correlation value between the independent variable is less than 0.80. The Table show the correlation of Online Purchase Intention with convenience, Product variety and Price there is significant relationship between the variables.

Variables	Online Purchase Intention (Dv)				
	Online Purchase Intention (Dv)	Convenience (Iv1)	Product Variety (Iv2)	Price (Iv3)	
DV	Pearson Correlation	1	.664**	.542**	.592**
	Sig. (2-tailed)		0	0	0
	N	385	385	385	385
IV1	Pearson Correlation	.664**	1	.665**	.627**
	Sig. (2-tailed)	0		0	0
	N	385	385	385	385
IV2	Pearson Correlation	.542**	.665**	1	.769**
	Sig. (2-tailed)	0	0		0
	N	385	385	385	385

	Sig. (2-tailed)	0	0	0	
	N	385	385	385	385

Table 4.3 Pearson Correlation Coefficient

4.4 Hypotheses Testing

Table 4.4 shows the summary of hypothesis testing. To conclude, there are relationship between all independent variables (convenience, product variety and price) against dependent variable (customer’s online purchase intention). All these hypotheses to address research question one ,two and three. The proposed theoretical framework are accepted.

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

Hypothesis	Statement of Hypothesis	Significant Value	Magnitude Relationship	Result
H1	There is significance relationship between convenience and customer's online purchase intention.	0.664	Substantial	Supported
H2	There is significance relationship between product variety and customer's online purchase intention.	0.542	Substantial	Supported
H3	There is significance relationship between price and customer's online purchase intention.	0.592	Substantial	Supported

Table 4.4 Summary of Hypothesis Testing

5.0 Discussion and Conclusion

By dealing with this problem, there are a few solution that researcher recommended to create better environment in influencing UMK'S student to use a website as a platform in buying books. First, the researcher should expanding research by expand the target respondent other than UMK'S student since UMK'S student is not the only one that use online bookstore.

Second, the researchers recommend adding on another independent variable to see whether other factors are influence towards online purchase intention in buying books. Moreover, it will help the online book retailers in improve their marketing ways by takes into account the factors affecting the purchase of online books.

In this study, these researches are focus on the UMK'S online purchase intention in books industry and to see whether the convenience, product variety and price has influenced UMK'S student in purchase books through website. Based on the discussion that had been

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

made, all the hypotheses were supported. This research had pointed that independent variable such as convenience, product variety and price has a significant positive relationship with online purchase intention among UMK'S student in books industry which is the dependent variable in this research.

6.0 Acknowledgements

My most profound thankfulness goes to my supervisor, Cik Nurul Azwa Binti Khadri for all his patience, scientifically proven, creativity encouraging guidance and many discussions that made this study to what it is. Without his understanding, consideration and untiring advice, this dissertation would not have been completed successfully. Also would like to express my gratitude to my supportive parents and who have never failed to accommodate my needs. Devoid of their love and care, I would not make it to finish line as it is now. The continuous supports and encouragement from my friends and colleagues have been a source of motivation to me.

Abstract:

Nowadays, online shopping is the most popular activity and is often done by the whole community around the world. In Malaysia, there are many types of online shopping platforms or E-commerce platforms that offer products and services to customers. The big influence of customers buying online is because of their high buying intentions towards the products and services offered. Therefore, this study was conducted to understand the factors that influence purchase intentions in online shopping platform and its main objective is to identify the relationship between the three independent variables (website quality, trust, and perceived risk) with online purchase intention. Snowball sampling is used in data collection through questionnaires made using Google Forms and distributed through social media platforms such as Whatsapp and Facebook Pages. A total of 397 respondents were involved in this study which consists of active online users in Manjung, Perak. Reliability test, normality test, Spearman correlation analysis and descriptive analysis were performed using SPSS version 26. The results of this study found that there is a positive relationship between independent variables and dependent variables.

Keywords: *Online Purchase Intention, Trust, Website Quality, Perceived Risk, Online Shopping Platform.*

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

1 Introduction

Online shopping is a popular trading method and is mostly used by people all over the world. Online shopping is a form of electronic commerce that allows users to use a web browser or mobile application to purchase products or services directly from sellers using the Internet. The online recruitment process is known as Business-To-Consumer (B2C). Customers use online shopping platforms as the primary medium to purchase products or services delivered directly from retailers through their online platforms such as retail websites. Lazada, Shopee and Mudah.com are the top three of the 10 best platforms in Malaysia (Lab, 2020)¹.

A statistic report providing data about the domestic of statistic Malaysia (Mahidin, 2020)², it is stated that the population in Malaysia in 2020 is estimated to be 32.7 million. Due to the Internet and mobile access that are available in Malaysia, the use of e-Commerce rate becomes high. In addition to this, the high rate is also influenced by public sector encouragement. It is clarified in the report from (export.gov, 2020)³ that 50% of Malaysia's population which is amounted to 16.53 million online purchasers including 62% of smartphone users utilize their smartphones when purchasing online.

In the opinion of the same report, the percentage of online users discussing each operation in the past month (January 2019) is also shown in the data. It is also stated that 88% of online search for goods or services is shown. The same amount of percentage goes to the total visitors for an online retail store on the web using any computer. In addition to this, the data also mentioned that 75% purchase an online product or service on any device, while an online purchase via laptop or desktop is summed up as 44% in which online purchase via mobile device is summed up as 58%. Meanwhile, the types of items purchased are such as fashion & cosmetics, electronics & physical media, food & personal care, furniture & appliances, toys & hobbies/sports, travel (including accommodation), digital music and video games as well.

From the study of "Factors Influencing Malaysian Youth Consumers' Online Purchase Intention of Travel Products" by (Tee, 2018)⁴, there's some outcomes influence online purchase intention which included website quality, trust and perceived risk.

Therefore, this study focuses on the relationship between the three independent variables (website quality, trust, and perceived risk) and online purchase intention. Customers will answer questions based on how the website quality, trust and perceived risk influence them in making online shopping.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

2 Literature Review

2.1 Online Purchase Intention

Previous studies shown by (Sethi, Kaur, & Wadera, 2018)⁵, intentions are determined by the person's attitude and subjective norm of behaviour and intentions predict behaviour. Hence, the intention of purchasing can predict buying behaviour among consumers. In addition, purchase intentions measures have been successful in identifying the buying likelihoods for products in a defined time and situation. Customer who has reported intentions to purchase a product has also possessed a higher actual buying rate as compared to those consumers who have no intention of buying.

A recent study by (Chakraborty, 2019)⁶ concludes that purchase intention determines the strength of consumer willingness to purchase. However, it is crucial to recognize consumer's action usually predicted through their intention.

2.2 Website Quality

According to (Dapas, Sitorus, Purwanto, & Ihalauw, 2019)⁷, there three categories that can be measured in website quality, which is the quality of information, the quality of interaction and quality use. The quality of information includes authentic and reliable information, new information according to the topic of discussion, ease of understanding of information, information analysis and design appropriate to the delivery of information. Next, the quality of interaction is the ability to provide a sense of security during the transaction, have a good reputation, facilitate communication, provide personal information, create more personal feelings, create a specific community, and give confidence in the promises to be fulfilled. In addition, quality use includes website facilities for learning, ease of understanding, ease of use, attractiveness on the website, enjoyable efficiency and provide a more enjoyable new experience. So, the better the website quality, the more the influence of online purchase intention.

H₀: There is no significant relationship between website quality and purchase intention on online shopping platform among consumers in Manjung, Perak.

H₁: There is significant relationship between website quality and purchase intention on online shopping platform among consumers in Manjung, Perak.

2.3 Trust

Trust is particularly important especially in the context of online shopping. According to a psychologist, trust refers to the depth of honesty, fairness, truth, and goodness. Trust also known as the belief when buyer creates strategic knowledge with the seller and seller can trust upon so that condition of the customer is met for a longer period time. A past study by (Liu, Li, & Hu, 2013)⁸ has mentioned that when there is

unreliability present in online shopping or trade buyer take the support of trust in the process, this will help in reducing uncertainty.

H₀: There is no significant relationship between trust and purchase intention on online shopping platform among consumers in Manjung, Perak.

H₂: There is significant relationship between trust and purchase intention on online shopping platform among consumers in Manjung, Perak.

2.4 Perceived Risk

(Chiu, Wang, Fang, & Huang, 2014)⁹ stated that, the perceived risk of online risk is often due to the buyer not being able to fully monitor the content of the seller or the behaviour of online shopping safety concerns. When consumers know that online shopping will bring bad effects, they will avoid shopping online because they want to prevent such bad effects. According to (Gong, Stump, & Maddox, 2013)¹⁰ risk categories such as functional loss, financial loss, time loss and loss of opportunity are risk categories related to products and services and also related to online transaction risks such as privacy, security and rejection.

H₀: There no significant relationship between perceived risk and purchase intention on online shopping platform among consumers in Manjung, Perak.

H₃: There is significant relationship between perceived risk and purchase intention on online shopping platform among consumers in Manjung, Perak.

2.5 Conceptual Framework

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

3 Methodology

3.1 Research Design

As mentioned by (Boru, 2018)¹¹, a research design is a procedure for collecting, analyzing, interpreting and reporting on data in a study. In this study, researchers use quantitative research methods to identify the characteristics of observed phenomena and the correlation between independent and dependent variables (Sekaran & Bougie, 2010). This study is conducted using descriptive methods through an online survey. The cross-sectional design is used to ensure that at least one or more population sample can be select and sample information obtains simultaneously. In this study, data from groups of individuals who are users of online shopping platforms will be collected at a specific time to enable researchers to answer research questions.

3.2 Data Collection

As mention by (Rabianski, 2003)¹² there are two types of data collection method which is primary data and secondary data. Primary data has been taken from online questionnaire through Google Form. Secondary data obtained the data of population in Manjung, Perak from the Department of Statistic Malaysia, (2010).

3.3 Sample Size

The sample for the population of this study was conducted on the population in the district of Manjung, Perak. Based on the most suitable sample size to use in this research is 383. This sample size is taken based on the table (Krejcie & Morgan, 1970)¹³. However, the researcher has managed to obtain more data than the minimum sample of 397 respondents.

3.4 Research Instrument

The questionnaire consists of three parts, namely Section A, Section B and Section C. Section A collects data on the personal details of the respondents which include gender, age, occupation, and others. Section B is about user screening questions related to online shopping platforms. Section C is about independent variables, namely website quality, trust, and perceived risk while the dependent variables are about online purchase intention. There are five questions formed for each variable in this study questionnaire. Nominal scale has been used in Section A and Section B. The interval scale is applied to Section C using 5-Point Likert Scale.

3.5 Procedure for Data Analysis

Researchers used Statistics Programmers for Social Science (SPSS) version 26 to calculate the data faster and easier. Pilot test, descriptive analysis, reliability test, and Spearman correlation analysis is a type of data analysis used in this study.

BUSINESS COLLOQUIUM 2020/2021**

4 Result and Data Analysis

4.1 Demographic Profile

For sample this study table shows that the demographic profile and screening question of the respondents of 397 participants among active online users in Manjung, Perak. This can be seen by frequencies and percentage for every demographic analysis.

Table 1: Descriptive of Demographic Analysis.

No. Category	Details	Frequency (397)	Percentage (%)
1. Gender	Male	134	33.8
	Female	263	66.2
2. Marital Status	Single	242	61.0
	Married	155	39.2
	Others	0	0
3. Age	18-24	173	43.6
	25-34	122	30.7
	35-44	68	17.1
	More than 45	34	8.6
4. Ethnicity	Malay	326	82.1
	Chinese	41	10.3
	Indian	27	6.8
	Others	3	0.8
5. Employment Status	Student	109	27.5
	Self-employed	64	16.1
	Private sector	118	29.7
	Government sector	66	16.6
	Others	40	10.1
6. Income	Less than RM3000	280	70.5
	RM3001-6000	93	23.4
	RM6001-RM9000	20	5.0
	More than RM9000	4	1.0
7. Have you ever made purchasing online	Yes	397	100
	No	0	0
8. Which online shopping platform do you often use to make online purchase	Lazada	41	10.3
	Shopee	303	76.3
	Mudah.com	10	2.5
	Zalora	15	3.8
	Others	28	7.1
9. Which type of product is the buyer's choice when buying using online shopping platform	Clothing	144	36.3
	Cosmetic	34	8.6
	Stationary	11	2.8
	Food and beverage	17	4.3
	Gadget	84	21.2

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

	Others	107	27.0
9. How often do you shop using the online shopping platform	More often than a week	27	6.8
		37	9.3
	Once a week	107	27.0
	Once a month	131	33.0
	Several times a month	95	23.9
	Several times a year	0	0
	Never		

4.2 Reliability Test

Table 2: Reliability Test

Variable	Number of Item	Cronbach's Alpha	Internal Consistency
Dependent Variable Online Purchase Intention	5	0.913	Excellent
Independent Variable Website Quality	5	0.888	Good
Trust	5	0.884	Good
Perceived Risk	5	0.822	Good
Overall Variables	20	0.917	Excellent

Table 2 shows the results of independent variables and reliability analysis of dependent variables for this study. Cronbach's Alpha results for website quality were 0.888, followed by 0.884 confidence and for perceived risk was 0.822. Next, the Cronbach's Alpha result for the dependent variable (online purchase intention) is 0.913. This means that Cronbach's Alpha results for the overall variables used in this study show excellent consistency and stability which is 0.917. Therefore, the reliability coefficients obtained for this study are reliable.

4.3 Correlation

(Yu & Hutson, 2020)¹⁴ have described Spearman coefficient is a measure of nonparametric correlation and it is defined as Pearson correlation coefficient between sample levels. Spearman correlation is a measure of nonparametric rating correlation (statistical dependence between two variables). As mentioned by (Schober, Boer, & Schwarte, 2018)¹⁵ the coefficient scale ranges from -1 to +1, where 0 does not show a linear or monotonic relationship, and the relationship will be stronger and closer to a straight line known as the Pearson correlation.

¹⁴ Yu, H., & Hutson, A. D. (2020). A Robust Spearman Correlation Coefficient Permutation Test.

¹⁵ Schober, P., Boer, C., & Schwarte, L. A. (2018). Correlation coefficients: appropriate use and interpretation. *Anesthesia & Analgesia*, 126(5), 1763-1768. doi:<https://doi.org/10.1213/ANE.0000000000002864>

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

Table 3: Spearman's Correlation Analysis

		Mean Online Purchase Intention	Mean Website Quality	Mean Trust	Mean Perceived Risk
Mean Online Purchase Intention	Spearman Correlation	1.000	.614**	.558**	.263**
	Sig. (2- tailed)		.000	.000	.000

Table 3 shows the Spearman correlation analysis that has been used to determine whether the independent variable (website quality, trust, and perceived risk) is statistically significant with the dependent variable which is online purchase intention.

5 Discussion

5.1 Website Quality

Based on Table 3, there is strong correlation, which is 0.614 and ρ value is less than 0.01. The result expose that, there have positive relationship between website quality and online purchase intention. To build purchase intentions, website quality plays an important role. According to (Octavia & Tamerlane, 2017)¹⁶, the good quality of the website would increase the intention of purchasing customers. This can be seen from the result in which the value 0.614 it can indicate that website quality has the high influence in online purchase intention. Therefore, the online shopping intention among consumers in Manjung, Perak is influenced by the website quality.

5.2 Trust

Based on Table 3, there are moderate significant between trust and online purchase intention which is 0.558 and the ρ value is less than 0.01. The result showed that, there have positive relationship between trust and online purchase intention. Based on the studies that have been made by (Jamaludin & Ahmad, 2013)¹⁷ trust have a positive significant relationship with online purchase intentions. However, it can be concluded that in principle, users will start to trust the website when they visit the website periodically and their chances of trusting and making purchases from the website also increase. It can be concluded that the influence of purchase intention in online shopping platform among consumers in Manjung, Perak is due to the influence of their high trust in the vendor and the website itself.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

5.3 Perceived Risk

Based on Table 3, the result shows that, there is a weak significant correlation, which is 0.263 and ρ value is less than 0.01. The result showed that, there have a weak positive relationship between perceived risk and purchase intention in online shopping platform among consumers in Manjung, Perak. According to the past research by (Ariffin, Mohan, & Goh, 2018)¹⁸, the results of previous studies found that perceived risk often has a negative relationship with online purchase intention. However, in this study, the results of the study found that the results for the perceived risk were positive even though the correlation with the dependent variable was weak. This may be because users of online shopping platforms in Manjung, Perak often have a positive shopping experience and may also be the risk they face when shopping is low.

5.4 Hypotheses Testing

Table 4: Summary of Hypothesis Testing

Hypothesis	Spearman Correlation	Result
<p>H₀: There is no significant relationship between website quality and purchase intention on online shopping platform among consumers in Manjung, Perak.</p> <p>H₁: There is significant relationship between website quality and purchase intention on online shopping platform among consumers in Manjung, Perak.</p>	0.614	H ₁ accepted
<p>H₀: There is no significant relationship between trust and purchase intention on online shopping platform among consumers in Manjung, Perak.</p> <p>H₂: There is significant relationship between trust and purchase intention on online shopping platform among consumers in Manjung, Perak.</p>	0.558	H ₂ accepted
<p>H₀: There no significant relationship between perceived risk and purchase intention on online shopping platform among consumers in Manjung, Perak.</p> <p>H₃: There is significant relationship between perceived risk and purchase intention on online shopping platform among consumers in Manjung, Perak.</p>	0.263	H ₃ accepted

6 Recommendation and Conclusion

There are so many aspects that can be improved in the future will come on this topic. The study was conducted in Manjung, Perak and the respondents focused on consumers who often use online shopping platforms. Future researchers are recommended to

¹⁸ Ariffin, S. K., Mohan, T., & Goh, Y.-N. (2018). Influence of consumers' perceived risk on consumers' online purchase intention. *Journal of Research in Interactive Marketing*.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

enlarge the size and population of the sample to obtain more accurate data for the study results. Researchers can do it elsewhere in Malaysia and not just concentrate in Manjung, Perak.

In future research, researchers are advised to use different research methods. In this study, the researcher only collected data from the respondents by distributing the questionnaire online. However, researchers recommend future researchers to use different research methods such using telephone call interviews or face-to-face interviews.

Future studies may further enhance their research topics by conducting research on independent variables (website quality, trust, and perceived risk) separately in the study to see a deeper impact on online purchasing intentions. Researchers are also advised to involve demographic characteristics such as gender, age, marital status and other demographic characteristics as independent variables or mediators in determining purchase intention on online shopping platform among consumers. This is because different demographic features among users can produce reliable study findings due to different user perceptions based on their experience and purchasing results in an online shopping platform.

Overall, this study was conducted to find out about the factors that influence purchase intention on online shopping platform among consumers in Manjung, Perak. The main objective of this study was to identify the relationship between independent which is website quality, trust and perceived risk and the dependent variable which is online purchase intention.

In this study, there are three hypotheses developed to test the relationship between the dependent variable and the independent variable. Researchers have used non-probability sampling which is snowball in the collection of respondent's data. The minimum sample for this study is 383 respondents. However, the researcher has managed to obtain more data from the respondents which is a total of 397. Reliability tests, normality test, descriptive analysis, and Spearman correlation analysis were implemented using SPSS software.

The results of the Spearman correlation analysis have shown that there is a positive relationship between the variables (website quality, trust, and perceived risk) to the dependent variables (online purchase intention). All independent variables in this study had a positive relationship with the dependent variables. Therefore, it can be concluded that all independent variables influence the purchasing intentions of users online shopping platform in Manjung, Perak.

7 Acknowledgement

Alhamdulillah. In the name of Allah, the Most Gracious, the Most Merciful, and the mercy of Allah SWT to our last beloved prophet, Muhammad S.A.W and his relatives, all his companions and those who followed. All praise and thanks be to Allah SWT, His Majesty and Almighty, with His pleasure, the researcher was able to complete the

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

research report which is the last task to meet the requirements of the main course in the field of retail at University Malaysia Kelantan (UMK) even during the spread of COVID-19.

First, the researcher would like to thank University Malaysia Kelantan (UMK) for providing the opportunity to implement this research project. Apart from that, the researcher would also like to thank her supervisor, Encik Mahathir Bin Muhamad for his patience, guidance, support, encouragement, and advice throughout the process of completing this research project. Researchers would also like to thank for the assistance and time spent during the research project consultation time.

In addition, the researcher would also like to thank all the respondents involved in this study. All respondents were supportive and very cooperative when answering the questionnaire provided. The researcher would also like to thank all the respondents for being willing to take the time to complete the survey for this study.

Finally, the researcher would like to express her deepest appreciation to all the friends and family members who have been relentlessly providing support and encouragement throughout the period of this study. Without the support and encouragement from them, of course the researcher will find it difficult to complete this study on time.

FACTOR INFLUENCING JOB PERFORMANCE AMONG RETAIL EMPLOYEES IN KELANTAN

Nur Natasya Khaleeda Binti Abd Khalib and Mardhiah Binti Kamaruddin

Faculty of Entrepreneurship and Business,
Universiti Malaysia Kelantan,
Malaysia

Email: khaleeda.a17a0484@siswa.umk.edu.my; mardhiah.k@umk.edu.my

Abstract:

This paper present the fundamental characteristics of Final Year Project (FYP) for student Bachelor of Entrepreneurship (Retailing) (Hons). This study was conducted to examine the factors influencing job performance among retail employees in Kelantan. The independent variables of this study is comprise empowerment, service training and job attitudes. Whereas dependant variables in this study is job performance. This study had two objective which is to identify the level of empowerment, service training and job attitudes among retail workers in Kelantan and to identify the factors influencing job performance among retail workers. The quantitative is selected for research method and the research instrument were using a questionnaire to collect data. Non-probability technique which is convenience sampling method were used in this study. Data that collected was using a questionnaires which is Google form format. Data was analysed by using Statistical Packages for Social Science Version 24 (SPSS Version 24) software based on descriptive statistic and multiple linear regression analysis. As for result in this study, the independent variables (empowerment, service training and job attitudes) that have been studied have a significant relationships towards dependent variable (job performance) towards retail employees in Kelantan. Through this study, it will understand the factors influencing job performance among retail employees in Kelantan and a better understanding and knowledge about which factor that most influence in job performance among retail employees.

Keywords: Empowerment, Service Training, Job Attitudes, Job Performance

1. Introduction

This research are focuses on job performance among retail employees in Kelantan. This study explains the factors influencing job performance among retail employees in Kelantan. Some factors that influence this study are empowerment, service training and job attitudes.

Performance weightage is relevant to the aspects recognized by many managers as necessary with the roles, responsibilities and competencies expected of each employee. These systems incorporate five categories of criteria for evaluating and ranking an individual which is a major competencies, interpersonal skills, intellectual capability, planning and organizing capabilities, motivation, career orientation, and others similar criteria that reflect company objectives.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Usually these appraisals are done by supervisors or a representative from the human resource department who analyzes each employee and assigns a score based on the employee's performance over the prior year. In most companies reviews try to focus on the positives and use constructive criticism unless there are frequent problems or issues that need to be discussed. When issues arise, many times employers will discuss them with the employee in an attempt to identify strategies that will result in improvement. These strategies may involve training programs, skills development, teamwork or any other program used to improve an employee's work performance.

There are two objectives of this research:

1. To identify the mean of empowerment, service training and job attitudes among retail employees in Kelantan.
2. To identify the factors influencing job performance among retail employees.

1.1 Significant of the study

1.1.1 Retail Students

This study can give significant change to retail sector which from this research they can find an opportunities and can generate more skills for their future when they through in this situation.

1.1.2 Academics

This research can be use to students who has study in this scope as a references for their knowledgement in retail industry.

1.1.3 Retail Sectors

This will increasing the number of retailer and entrepreneur in Malaysia in retail sector. This research also attempts to determine the ways to overcome the issues of influencing job performance among retail employees.

2 Literature Review

2.1 Theory to Performance at work

In organizational psychology (Carson, 1969; Leary, 1957; Sullivan, 1953; Wiggins, 1979), socio analytic theory (R. Hogan, 1983, 1991, 1996) is rooted in and is meant to describe social disparities in job achievement. The theory is based on two generalizations applicable to organizational behaviour In terms of status hierarchies, people often live (work) in groups and groups are always organized. In personality psychology, getting together and getting ahead are familiar topics (cf. Adler, 1939; Bakan,)

2.2 Management Theory And Practice

Management theory and experience is that understanding the construction is minimal and sometimes frustrating. For example, as a collection of administrative strategies, most management scholars have dealt with empowerment and have not paid adequate attention to its essence or the mechanisms underlying the build. This may reflect the theorists' realistic or realistic outlook and the result may be an incomplete understanding of the principle of dominance and its theoretical rationale for associated

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

activities. Empowerment has not as a construct, obtained the same empirical treatment from management theorists as the power or influence construct.

2.3 Learning Theories and Training

The method of learning new skills to help perform a job is preparation (Jucious, 1963). It allows individuals to become professional and proficient in doing those jobs (Dahama, 1979). Usually, an organisation promotes the learning of workers by preparation such that their changed activity leads to the fulfilment of the goals and objectives of the organization.

2.4 Theory of Work Attitudes and Performance

The data was checked for the hypothesis of career features of work attitudes and efficiency (Hackman & Oldham, 1975, 1980). This hypothesis claims that employee workplace satisfaction, enthusiasm for inherent jobs and efficiency are a function of a job's characteristics. Skill-variety, role identity, task importance, autonomy and feedback are the central features. The theory further notes that employee behaviour and efficiency are moderated by the need for psychological improvement of the employee. Employees with low growth need strength are less receptive to work features than employees that need strength with high growth. Data collect from experiments aimed at evaluating the hypothesis demonstrated poor support for the proposals relating to work satisfaction and inherent motivation. There was no support for measures relating to competitiveness. In addition, the moderating effects of development need to improve the relationships between work features and result indicators have been overestimated. It was found that descriptions of job features, especially skill-variety, were not well- stated and it was proposed that this may partially account for the inability of many studies to define individual job features.

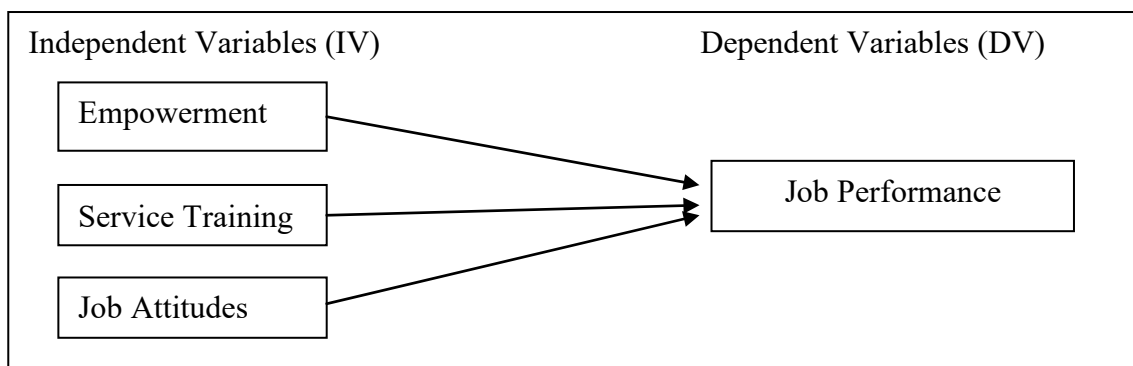

2.5 Research Hypothesis

The hypothesis of this study is based on the factor of empowerment, service training and job attitudes that influencing job performance among retail employees in Kelantan. Based on the study, the hypothesis will be created and to be tested:

1. H1: There is significant factors empowerment, service training and job attitudes influencing towards job performance among retail employees in Kelantan.

2.6 Research Framework

This model creates to find and search the significant among independent variable and dependent variable into this research. The entire variable that chooses in our research related and adapted to the study before. The research is design to confirm all the independent variables which is empowerment, service training and job attitudes.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

3 Methodology

3.1 Research Design

In this study, the researcher will applied the cross-sectional study design. In cross-sectional study, the data is collected just once to enable the researcher to answer the question. All the study variables are measured at the same point of time. A study investigate the factors influencing job performances among retail employees in Kelantan. Thus, cross-sectional study involves looking at data from a population at one specific point in time. The ways is researcher will doing a questionnaire in Google form, then given to employees to answer the questions asked. It is a formal, objective, systematic process in which numerical data describe variables, examine relationships among variables and determine cause-and-effect interactions between variables (N. Burns, Grove, & Gray, 2011). This study choose the cross-sectional design due to cost and time constraints.

3.2 Data Collection

For this study, the researcher has decide to use quantitative research which is using methods such as questionnaires in Google form. The questionnaires is distributed to respondent of employees in retail industry at Kelantan during their breaks time as primary data collection tool. The questionnaires will be uses for this study and its will be distribute to the respondents of employees among retail workers at Kelantan.

3.3 Sampling

The sample size is a subset of the population. According to Sekaran and Bougie (2010), sample size applications are designed to help researchers achieve more accurate results. The researcher takes an alternative plan to the small sample size from the employees surrounding to be more researcher use place at Kelantan city. For research purposes, sample size is the number of population observations selected. The researchers focus on the respondent who are working in retail industry at Kelantan to answer the research goals for this study. For this study, sample size will be distributes for 251 respondents from the retail employees in Kelantan. They need to answer all the question that ask in questionnaires of Google form.

The sampling method used in this study is the non-probability sampling techniques which is convenience sampling method are define in this analysis. This study are mainly focused to employees in retail industry at Kelantan. There are people who is age range 18 until 37 years old and above have been target in this sampling method. Then, the respondents of the questionnaire would be the people who are working in the area of Kelantan.

3.4 Data Analysis

The total number of 251 respondents which is from retail employees in Kelantan were collected. The questionnaire that already collected which would be analysed and explained by using four types analysis which were Descriptive Analysis, Validity and Reliability Test and Multiple Linear Regression Analysis. The data obtained was analysed by using Statistical Package for the Social Science (SPSS).

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

4 Findings

4.1 Descriptive Analysis

Table 1: The Demographic Characteristic of the Respondents

Demographic Characteristic	Category	Frequency	Percentage (%)
Gender	Male	103	41.0
	Female	148	59.0
Age (years)	18-25	151	60.2
	26-31	74	29.5
	31-36	13	5.2
	37 and	13	5.2
Marital Status	Single	177	70.5
	Married	74	29.5
Education Level	Pmr	4	1.6
	Spm	47	18.7
	Stpm / Stam	41	16.3
	Diploma	59	23.5
	Bachelor degree	96	38.2
	Master	4	1.6
Race	Malay	194	77.3
	Chinese	34	13.5
	Indian	20	8.0
	Others	3	1.2
Monthly Income	RM 1,000 and below	82	32.7
	RM 1,001 – RM 2,000	103	41.0
	RM 2,001 – RM 4,000	56	22.3
	RM 4,001 and above	10	4.0
Types of Retail Stores	Department stores	51	20.3
	Specialty stores	65	25.9
	Supermarket	61	24.3
	Convenience store	38	15.1
	Hypermarket / superstore	36	14.3

(Source: Developed for the Research)

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Table 1 showed the overall descriptive statistics for respondents demographic which is gender, age, marital status, education level, race, monthly income and types of retail stores. There are 251 respondents through Google form that are successfully collected to retail employees in Kelantan. The number of female respondents was the highest where it made up of 59.0%. The highest number of age respondents falls under category between 18-25 years old with total of age group of 151 from 251 respondents. In term of race, the majority of respondents are Malay which contributes 77.3%. The highest number of respondents who contributes in the survey was from specialty stores with the total of 25.9% of respondents.

Table 2: The Descriptive Statistic of Independent Variables and Dependent Variables

Variables	N	Mean	Standard deviation
Empowerment (IV1)	251	4.1833	0.75928
Service Training (IV2)	251	4.2478	0.68652
Job Attitudes (IV3)	251	4.2024	0.72122
Job Performances (DV)	251	3.6044	0.82899

(Source: Developed for the Research)

Table 2 showed mean and standard deviation for independent variables (empowerment, service training and job attitudes) and dependent variables (job performances). The mean value for dependent variables which is job performances is 3.6044. Thus, for independent variables of empowerment (4.1833) is slightly lower than job attitudes (4.2024) and followed by service training (4.2478) which is the highest mean for all variables.

In addition, standard deviation indicates how close the data is to the mean. In the case, between all independent variables, empowerment has the highest standard deviation which is 0.75928, followed by job attitude which is 0.72122. Then, service training has the lowest standard deviation which is 0.68652.

4.2 Reliability Analysis

Cronbach's Alpha is used to determine stability and consistency of the items and if the variables are reliable in questionnaire. If the value of Cronbach's Alpha is 0.9 and above, it shows that the questionnaire is reliability. If the value is less than 0.60 so the strength of association considered as poor relationship. The result will be based on table 3 is Rules of Thumb about Cronbach's Alpha Coefficient Size to indicates the strength of association of the reliability analysis.

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

Table 3: Reliability Statistics of Independent Variables and Dependent Variables

VARIABLES	No of item	CRONBACH'S ALPHA
Empowerment (IV 1)	6	0.907
Service training (IV 2)	5	0.909
Job attitudes (IV 3)	5	0.885
Job performance (DV)	7	0.925
TOTAL	23	0.862

(Source: Developed for the Research)

Table 3 showed the reliability test result and its coefficient of Cronbach's alpha by each variables from 30 respondents of retail employees at Kelantan. Based on Cronbach's alpha coefficient test were conducted on all four variables. The table above shows result of Cronbach's alpha for empowerment is (0.907), service training (0.909), job attitudes (0.885) and job performances (0.925). The overall Cronbach's alpha on this study is (0.8612). So, the overall scale is highly internally consistent.

4.3 Multiple Linear Regression

The independent variable in this study, which are empowerment, service training and job attitudes were entered into same regression equation to predict either there was any significant relationship with the factors that influence job performances among retail employees in Kelantan.

Table 4: Multiple Linear Regression

Variables	Simple Linear Regression		Multiple Linear Regression	
	b ^a (95% CI)	p-value	b ^b (95% CI)	p-value
Empowerment (IV1)	0.32 (0.19,0.45)	<0.001	0.32 (0.19,0.45)	<0.001
Service Training (IV2)	0.32 (0.17,0.46)	<0.001		
Job Attitudes (IV3)	0.26 (0.12,0.40)	<0.001		

(Source: Developed for the Research)

Based on table 4, there was only one independent variables which is empowerment (IV 1) that have strong relationship with dependent variables (job performance).

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

5 Discussion & Recommendation

The main purpose of this study is to identify the relationship between factor influencing job performance among retail employees in Kelantan. The influencing factors (independent variables) which are empowerment, service training and job attitudes are the factor that related towards job performance (dependent variables) among retail employees in Kelantan. The finalize result shown there are significant relationship between empowerment, service training and job attitudes with the job performance among retail employees in Kelantan.

Based in this research study, researcher had found that there are significant relationship between empowerment and job performance. This means that empowered employees will stay with their current retail industry and contribute to their service-oriented attitudes and behaviour. Employees can be empowered through the underlying formal structures such as having access to information, receiving support, having access to resources necessary to carry out their duties and having an opportunity to learn and grow. Thus, service managers should concentrate on building organizational empowerment structures. Besides, retail employees can obtain empowerment through service training and job attitudes within the organization.

The overall for descriptive statistics for respondents demographic which is gender, age, marital status, education level, race, monthly income and types of retail stores. There are 251 respondents through Google form that are successfully collected to retail employees in Kelantan. The number of female respondents was the highest where it made up of 59.0%. The highest number of age respondents falls under category between 18-25 years old with total of age group of 151 from 251 respondents. In term of race, the majority of respondents are Malay which contributes 77.3%. The highest number of respondents who contributes in the survey was from specialty stores with the total of 25.9% of respondents.

Then, in this study defined mean and standard deviation for independent variables (empowerment, service training and job attitudes) and dependent variables (job performances). The mean value for dependent variables which is job performances is 3.6044. Thus, for independent variables of empowerment (4.1833) is slightly lower than job attitudes (4.2024) and followed by service training (4.2478) which is the highest mean for all variables. In addition, standard deviation indicates how close the data is to the mean. In the case, between all independent variables, empowerment has the highest standard deviation which is 0.75928, followed by job attitude which is 0.72122. Then, service training has the lowest standard deviation which is 0.68652.

Finally, the independent variable in this study, which are empowerment, service training and job attitudes were entered into same regression equation to predict either there was any significant relationship with the factors that influence job performances among retail employees in Kelantan. In conclusion, there was only one independent variables which is empowerment (IV 1) which is $b^a = 0.32$, (95% CI) = 0.19,0.45 and p-value is ,0.001 that have strong relationship with dependent variables (job performance) which is $b^a = 0.32$, (95% CI) = 0.19,0.45 and p-value is ,0.001.

For the recommendation is by conducting research by two group generation the retail students retail sectors. This study can give significant change to retail sector which from this research they can find an opportunities and can generate more skills for their future when they through in this situation. Then, to retail sector, they will get more increasing the number of retailer and entrepreneur in Malaysia in retail sector. Then, for

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

academics, this research can be used by students who have studied in this scope as a reference for their knowledge in the retail industry.

This research also attempts to determine the ways to overcome the issues of influencing job performance among retail employees. Thus, theoretically, the findings of this research are expected to provide a tested model based on the data in Malaysia, where other researchers can generally grasp the provided knowledge and experience.

6 Conclusion

This research study aims to find out and examine the factors influencing job performance among retail employees in Kelantan. Through the study, the research framework is about the relationship between factors (empowerment, service training and job attitudes) influencing job performance among retail employees. Each factor was studied to find the relationship between the independent variables and dependent variables.

In this study, a total of 251 respondents were collected through the questionnaire method. The data was evaluated using SPSS software and methods of Descriptive Analysis, Validity and Reliability Test and Multiple Linear Regression Analysis are used. As stated in Chapter 4, the reliability analysis was excellent for the independent variables and dependent variables. The reliability analysis for empowerment, service training and job attitudes were 0.907, 0.909, 0.885 and 0.925 respectively. The results show it was excellent in strength of association according to the Rules of Thumb about Cronbach's Alpha Coefficient size. This shows that the result could be accepted.

The research study aimed to identify the mean of empowerment, service training and job attitudes among retail employees in Kelantan and to identify the factors influencing job performance among retail employees was accepted as the research objectives were fulfilled. The results obtained can be used in the future for further studies and help to justify that the factors did influence retail students to increase the entrepreneurial intention and hopefully will have new studies over time about the subject.

In conclusion, the researcher can study the relationship between independent variables towards the dependent variable. This research also can define the real way to analyse the data. Some of the limitations of the study can give chance to the researcher to give more recommendations to improve the quality of the research.

7 Acknowledgements

Firstly, we are very grateful to Allah S.W.T for the opportunity to complete this research. With His blessing, I would be able to finish this research paper within the allocated time and stay in good health during the time period in completing the study.

First of all, we would like to express our appreciation to our supervisor, Puan Mardhiah Binti Kamaruddin, Lecturer of Faculty of Entrepreneurship and Business, University Malaysia Kelantan. She continuously gave full support for us in this Final Year Research Project (FYP) with her knowledge, patience and motivation. Her advice gave us a direction in writing this final year research project all the time. The guidance from her, also helpful to us in improving our knowledge in making research.

After that, we would like to extend our gratitude to our friends, who always gave us a lot of support to complete our research project. The friends can share us with their different ideas and knowledge in writing this research project.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Last but not least, I feel thankful to my family. My parents always gave me a mental and physical support in writing this research project. Their supporting very helped me to release my stresses that gain from the processing of this research project.

THE ROLE OF AUGMENTED REALITY ON CUSTOMER BUYING BEHAVIOR IN PURCHASING AMONG ONLINE SHOPPER IN MALAYSIA

Nur Syuhada Binti Sapngai and Noorshella Binti Che Nawi

Faculty of Entrepreneurship and Business,
Universiti Malaysia Kelantan,
Malaysia

Email: syuhada.a17a0514@siswa.edu.my; norshella@umk.edu.my

Abstract:

Augmented Reality (AR) is an increasingly accepted innovation. Especially, in a highly competitive environment in business, shopping applications by AR appears to be a promising solution for retailers to attract customers and enhance the shopping experience. However, this mobile application of AR is an innovation, its user acceptance has only been scrutinized over the years. Augmented reality technology is also growing and widely used by the world such as education, business, fashion and entertainment who are the users of this technology. The use of augmented reality in business or fashion world has a unique potential for generating value by creating an experience in shopping online or offline. Purpose: The purpose of this study is to investigate the role augmented reality application on Customer buying purchase through Customer behavior, attitude and purchase decision with impact of AR for Online shopper. Theoretical Framework: The study in consumer behavior related to the quality of life of personal and community environments. This implies information about the current situation of the concept of AR and potential external factors as well as the customer behavior, attitude and purchase decision. This research use Theory of Planned Behavior. Methodology: Empirical data of this study is based on valid survey data of a probability sample of 459 respondents collected via an online questionnaire. Different statistical analytical methods were applied, namely a descriptive analysis, reliability tests including Cronbach's Alpha and correlations as well as a stepwise multiple regression. Findings: In fact, the results of the study provide significant contributions to the developed research questions. Firstly, there is significant relationship between augmented reality on customer behavior, attitude and purchase decision with impact of AR for Online Shopper. Altogether, the findings lead to the proposition that the shopping application is of high relevance for the development of the business industry.

Keywords: Key words: *Augmented Reality, Customer Behaviour, Attitude, Purchase Decision*

1. Introduction

Along with the rapid development of technology, the emergence of various types of technology is also increasing. One of them is augmented reality. Augmented reality or AR for short, AR is a technology that combines two-dimensional or three-dimensional virtual objects into a 3-d real environment and then projects them in real time. According to (Azuma, 1997) also states that this technology allows users to interact, manipulate, and watch 3d virtual media content in real environment and in real time. Augmented reality technology is also growing and widely used by the world such as education, business, fashion and entertainment who are the users of this technology. The use of augmented reality in business or fashion world has a unique potential for generating value by creating an experience in shopping online or offline. (Rafaeli et al., 2017) Augmented Reality is an emerging technology that refers to computer-generated virtual imagery,

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

which it is superimposed on physical environments to provide users an optimized perception of reality (Janssen & Nr, 2018). Within AR the popularity of Mobile Augmented Reality (MAR) applications has recently increased (Ahn et al., 2015). Augmented Reality technology is a technology that has existed for several years and allows customers easy access to technology. In fact, it creates an approach between customers and products that have offered several applications available on mobile systems such as computers and mobile phones that have been equipped with cameras or webcams to enable communication between the virtual and the real world (Taylor, Ong, Yuan, & Nee, 2008); (Wiedenmaier, Oehme, Schmidt, & Luczak, 2003). Consumers are now empowered to communicate, browse, and shop across various channels and touchpoints, whenever they please (Dave Chaffey, 2017).

Research reveals that consumers tend to use mobile-based touchpoints, such as mobile shopping applications and mobile websites, interchangeably when searching for product information or making product purchases (Stephanie Kumar, 2008). Customers wishing to purchase goods at the physical store or online store can provide positive effects for consumers if the premises of a business using the Augmented reality application. This is because it can help consumers make informed decisions on the purchase of goods. AR application can attract users because of the characteristics contained in the AR application that gives reality to reflect the situation of users. AR Application has features that help customers visualize a product that given the 3- dimensional (3D) which allows observation from every angle before making their purchases. This research investigates the role of augmented reality for the customer buying behavior of purchasing their product.

1.1 Research Objective

The objectives for this research are:

1. To examine the relationship between the role augmented reality application on Customer buying purchase through Customer behavior with impact of AR for Online shopper.
2. To examine the relationship between the role augmented reality on customer buying behavior through purchase decision with impact of AR for Online shopper
3. To examine the relationship between the role augmented reality of customer buying behavior through attitudes toward making purchases with impact of AR for Online shopper.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

1.2 Significance of Study

1.2.1 The Researcher

This study will be of interest to others to do the researcher to the research. This research will be a reference to other researchers.

1.2.2 Community

This study can use for the community to learn more about Augmented Reality for customer buying behavior in purchasing. Moreover, this research can increase awareness of augmented reality applications to people and the environment

1.2.3 People

This study is very important for people to create awareness among applications to help people buying the product. In this research, people know that function augmented reality and help people to make decision-buying behavior.

1.2.4 Technology

This study can help businesses in increasing sales and customer confidence in the technology provided. Augmented reality is one of technology nowadays to known for helping to increase sales of goods especially in the online store or physical store. Technology AR is very helpful in realizing the needs and wants of users. With this technology, it allows businesses or customers to make purchases in reality and look 3dimensional. This technology can reduce the risk of the purchase to the customer.

2. Literature Review

2.1 Theory of Planned Behavior (TPB)

There are two theories in the study of consumer behavior related to the quality of life of personal and community environments. (Correia, 2013). According to (Ajzen, 1991), by theory of planned behavior (TPB) and theory of reasoned action (Understanding attitude and predicting social behaviour, 1980) have stated.

Figure 1: Theory of Planned Behavior (Ajzen, 1991)

Figure 1 reveals that by (Ajzen, 1991) Theory of Planned Behavior. This theory provide three elements to help predict intention is attitude toward behavior, subjective norm and perceived behavior control (PBC). According to this theory, the PBC can be defined of

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

what makes someone a certain behavior is due to the intention to do and how does one believe that the behavior of the self itself.

2.2 Independent Variables

2.2.1 *Customer Behavior*

According to (Wayne D Hoyer; Deborah J MacInnis, 2007) states that consumer behavior is not only in the way consumers in buying a product but more meaningful than that. This shows that some decisions are made by users in choosing and determining their options such as the statement made that is why, when, where, who and how before they buy or determine something. (Blackwell, Miniard, & Engel, 2001) Stated that, in consumer behavior, there is a need and evaluate how a person makes understand and make decisions during a purchase by considering the results from the results of choosing alternatives from two or more possible options (Schiffman, 2002).

According to (Kotler, Wong, & Saunders, 2005), consumer behavior is influence by several factors in determining choices when making purchases including culture, personal, social and psychological as the figure shows:

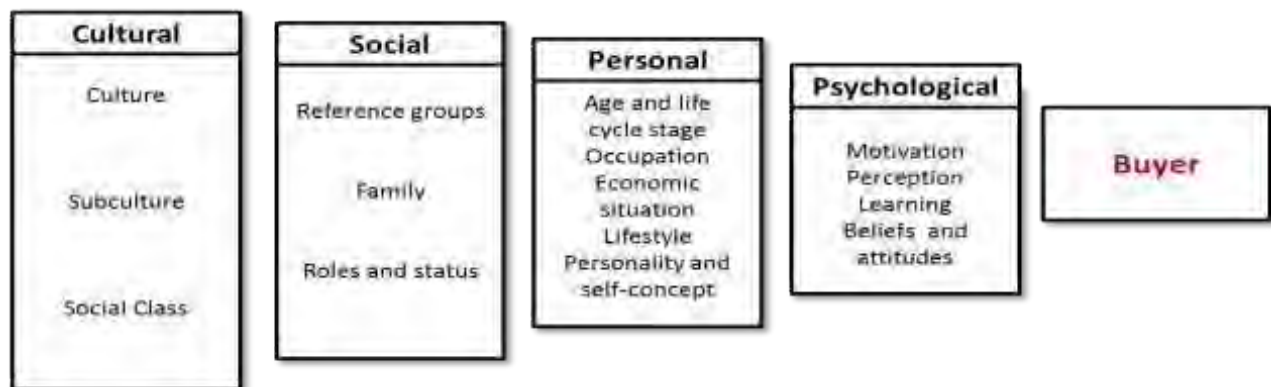

Figure 2: Factors influencing behavior – Principles of Marketing ((Kotler et al., 2005)

2.2.2 *Attitude*

Attitude plays a role in influencing buyer behavior. Based on previous research, (Correia, 2013) can be defined as an attitude that is relative in making judgments, feelings and consistent trend towards an object or idea. In addition, a person's attitude comes from a number of factors that influence a person's attitude towards the purchase especially on religion, clothing, food and other. The previous research in the field of consumer behavior has focused on the structure and determinants of attitudes or assessments that show the brand and persuasion techniques used in consumer attitudes (Brunel, Tietje, & Greenwald, 2004). Based (Ajzen, 2014) states that consumer attitudes to purchase is an important aspect in their purchasing decision.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

2.2.3 *Purchase Decision*

According to (Wharton University of Pennsylvania, 2011) state that purchase decision is the decision of the thought process that encourages consumers in identifying needs, making choices and choosing a particular product or brand desired. To making purchase decision, augmented reality is one platform to evaluate opportunity for consumer to get new experience with technology.

According to (Stoyanova, Brito, Georgieva, & Milanova, 2015) the technology is often used in a creative way to attract customer for use this AR application. The use of AR technology in purchasing is seen to be beneficial to consumers in determining the choice during their purchase such as the use of AR that can be felt by consumers and the pleasure felt when making choices, because AR provides characteristics combining virtual world and reality. This can affect the purchase decision in the use of AR technology to consumers.

2.3 Hypotheses Statement

H1 – Is there significant relationship between augmented reality on customer behaviour with impact of AR for Online Shopper.

H2 – Is there significant relationship between augmented reality on attitude with impact of AR for Online Shopper.

H3 – Is there significant relationship between augmented reality on purchase decision with impact of AR for Online Shopper.

2.4 Theoretical Framework

Figure 3: Framework on Augmented reality on customer buying behavior in Purchasing

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

3. Methodology

3.1 Research Design

This study was conducted to enable researchers to understand respondents about the role of augmented reality technology to customer buying behaviour. Research designed in this research used quantitative method. Quantitative is the standard experimental method. So, quantitative methods being used to achieve this study. Quantitative method is focus on statistical analysis of numbering data collected through the use of large scale such as survey and questionnaire. Primary data like questionnaire being used in this study to collect data from respondent regarding this research. It is quick and has the ability to reach more respondent at the lower cost and identified as the most appropriate method for the data collection procedure. The purpose of this study is to provide a greater understanding about the augmented reality on customer buying behavior. This research more focus to understanding an individual's attitude towards making choices when purchase decision used AR. The present study will be designed as a cross-sectional survey of people who are known the Customer Buying Behavior in Purchasing Among Online Shopper in Malaysia as targeted population.

3.2 Population

The target demographic is the entire population of individuals from which the sample can be selected. The Target Population of this study will need 459 out from 16.53 million totals of area at Malaysia. Population to be studied in this research is including both male and female in order to justify the detail information and data of people known or do not know about this application that the role of augmented reality on customer buying behavior in purchasing among online shopper in Malaysia.

3.3 Sample size

Definition of sample size is the proses of selecting a number of individual for a study is such a way that the individual represents the larger group from which selected. Sample size is the subset of the population where each individual of the sample is identified as subject and total quantity of subject in the sample. Sampling method that used in this research is by Krejcie and Morgan sampling method. The sampling method Krejcie and Morgan is to simplify the proses to simplify the process of determining the sample size for a limited population of respondent. This research uses quantitative and sample size for this research is 459 respondents for online shopper in Malaysia.

3.4 Data Collection

To achieve research objective, there are the basis of two sources of information primary sources and secondary sources. However, in this study was only use primary data only as the data that collected are from questionnaire that will be distribute. As for secondary data, there is no data that been taken from any journal and article. As for secondary data, there is the data from internet and books for the information.

3.5 Sampling Technique

The probability random sampling technique uses statistical theory to randomly select a small group of people (samples) from the existing large population and then predict that all their reactions together will fit the entire population. Simple random sampling will be used to choose respondent who intended for this study and sum 459 questionnaire

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

were collected during this process. Collected data will then insert and examined via SPSS (Statistical Package for Social Science) to generate random sampling.

The reason that researcher will be using simple random sampling because it easy to understood and the result is projectable. Other than that, in order to strength the result and simplify sampling researcher will be used convenience sampling. Convenience sampling is a process of choosing respondent because they can be readily and simply accessible. Generally, convenience sampling is quick and easy to implement.

4 Data Analysis and Findings

4.1 Descriptive Analysis

Demographic Characteristic	Category	Frequency	Percentage (%)
Respondent tried any application AR	Yes	415	90.4
	No	44	9.6
Gender	Male	227	49.5
	Female	232	50.5
Age	20 to 30 years	283	61.7
	31 to 40 years	159	34.6
	41 and above	17	3.7
Education level	Degree	242	52.7
	SPM	56	12.2
	STPM/ Diploma	161	35.1
Status Relationship	Married	208	45.3
	Single	251	54.7
Income	RM 0 – RM 1000	135	29.4
	RM 1001 – RM 3000	231	50.3
	RM 3001 – RM 5000	82	17.9
	RM 5000 and above	11	2.4
Would you install on your mobile phone/computer an application so you can take advantages of augmented reality	Yes	371	80.8
	No	88	19.2

Table 1: The demographic Characteristic of the Respondents

Table 1 shows the overall descriptive statistics for the demographics of the respondents covering respondent tried any application AR, gender, age, education level, status relationship, income, and would you install on your mobile phone/computer an application so you can take advantages of augmented reality. There were 459

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

respondents through successfully collected Google forms for online shopper in Malaysia. The number of respondent tried any application AR the highest answer is Yes (90.4%). The number of respondent gender is the highest is Female (50.5%). In the range age, the majority of respondents is 20 to 30 years (61.7%). The highest education level for respondent is Degree which is 52.7%. The highest for status relationship is single (54.7%). Income is the highest number of respondents which is 50.3% which is range RM 1000 – RM 3000. Finally, the highest number of respondent answer would you install on your mobile phone/computer an application so you can take advantages of augmented reality was Yes at 80.8%.

B	Purchase Decision (PD)	459	4.0889	.75308
	Dependent Variable			
C	Impact of AR for Online Shopper (IOAR)	459	3.9434	.72877

Table 2: The Descriptive Statistics of Independent Variables and Dependent Variables

Table 2 showed descriptive statistics for variables which including Customer behavior. Attitude, purchase decision (independent variables) and impact of AR for Online shopper (dependent variables). Descriptive statistics is using five point Likert Scale which start from “strongly disagree” to “strongly agree” It calculate and summarize depend on data. Descriptive statistics will analyse standard deviations, means, median, mode and other arithmetic information. Its shows that the majority of respondents agree on the questions in the questionnaires relating to which are attitude, subjective norm and perceived behavioural control (independent variables) are relating to entrepreneurial intentions (dependent variables).

4.2 Reliability Analysis

Questionnaire	Number Of Items	Cronbach's Alpha
Independent Variable		
➤ Customer behavior	5	0.950
➤ Attitude	5	0.943
➤ Purchase Decision	5	0.922
Dependent Variable		
➤ Impact of AR for Community	5	0.936

Table 3: Reliability Coefficient Analysis (Sources: Develop for the Research)

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Based on table 3 reliability coefficient for each section can be viewed to be the good standards and it is consistent to Cronbach's Alpha Rule of thumbs. As a results, all variables are consistent plus acceptable as the coefficient standards are in the range 0.9 and above which is 0.922 to 0.950. It also indicates that the variables are free from errors.

The coefficient alpha that been obtained in the actual reliability test for the first independents variable, Customer Behavior is 0.950 (Excellent). As for the next independent variable which is attitude, the coefficient alpha obtained was 0.943 (Excellent). Then last independent variable which is Purchase Decision, the coefficient alpha obtained was 0.922 (Excellent). Furthermore, impact of AR for Online Shopper which is dependent variable of the survey gain 0.936 as results of coefficient alpha and strength of association is excellent.

4.3 Spearman's rho Correlation Coefficient Analysis

		Customer Behavior	Attitude	Purchase Decision	Impact of AR for Online Shopper
Customer Behavior	Spearman's Correlation	1			0.779
	Sig (2 tailed)				0.000
	N of Items				459
Attitude	Spearman's Correlation		1		0.824
	Sig (2 tailed)				0.000
	N of Items				459
Purchase Decision	Spearman's Correlation			1	0.814
	Sig (2 tailed)				0.000
	N of Items				459

*Correlation is significant at the 0.01 level (1-tailed)

Table 4: Summary of Spearman's rho Correlation (Sources: Develop for the Research)

The table 4 shows that CB has a high positive correlation with IOAR. The value obtained is $r = 0.799$ and the result shows that it is significant level $p < 0.05$ i.e. $p = 0.000$. There is a positive perfect significant relationship between CB and IOAR ($p < 0.05$, $r = 0.779$). Therefore, hypothesis 1 (H1) accepted. The table 7 shows that AT has a high positive correlation with IOAR. The value obtained is $r = 0.824$ and the result shows that it is significant level $p < 0.05$ i.e. $p = 0.000$. There is a positive perfect significant relationship between AT and IOAR ($p < 0.05$, $r = 0.824$). Therefore, hypothesis 1 (H2) accepted. The table 7 shows that PD has a very high positive correlation with IOAR. The value obtained is $r = 0.814$ and the result shows that it is significant level $p < 0.05$ i.e. $p =$

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

0.000. There is a positive perfect significant relationship between PD and IOAR ($p < 0.05$, $r = 0.814$). Therefore, hypothesis 1 (H3) accepted.

4.4 Simple Linear Regression

4.4.1 Simple Linear Regression for Customer Behavior

Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of Estimate	Change Statistics				
					R square change	F change	Df 1	Df 2	Sig. F change
1	0.851 a	0.724	0.723	0.38333	0.724	1198.379	1	457	0.00

Predictors: (constant), CB

Table 5: Model Summary Customer Behavior

Table 5 show that the R square is 0.724 convert to percent is 72.4%. 72.4% of impact of AR for Online Shopper can be influence by customer behavior.

4.4.2 Simple Linear Regression for Attitude

Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of Estimate	Change Statistics				
					R square change	F change	Df 1	Df 2	Sig. F change
1	0.875 a	0.766	0.766	0.35274	0.766	1497.910	1	457	0.00

a) Predictors: (constant), AT

Table 6: Model Summary Attitude

Table 6 show that the R square is 0.766 convert to percent is 76.6%. 76.6% of impact of AR for Online Shopper can be influence by Attitude.

4.4.3 Simple Linear Regression for Purchase Decision

Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of Estimate	Change Statistics				
					R square change	F change	Df 1	Df 2	Sig. F change
1	0.909 a	0.826	0.826	0.30440	0.826	2168.142	1	457	0.00

a. Predictors: (constant), PD

Table 7: Model Summary Purchase Decision

Table 7 show that the R square is 0.826 convert to percent is 82.6%. 82.6% of impact of AR for Online Shopper can be influence by Purchase Decision.

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

4.5 Discussion & Recommendation

4.5.1 Key Findings

This study to examine the role of augmented reality on customer buying behavior in purchasing among people in Malaysia. The independent variable of this study are customer behavior, attitude and purchase decision while the dependent variable are impact of augmented reality on online shopper.

Based on table 8 show that the research is to investigate both variable whether these factors have a relationship between independent variable and dependent variable. This study also determines the relationship between customer behavior, attitude, purchase decision with impact of AR for online shopper in Malaysia. Research objective are achieved. It has proven and conclude that all independent variable has a relationship between dependent variable. From this study, researcher can also identify the dominant factor that have a positive perfect relationship with impact of AR for online shopper in Malaysia.

Research question	Hypotheses	result	Initial Decision
1. Is there any the significant relationship between augmented reality on customer behavior with impact of AR for Online Shopper in Malaysia?	H1: There is significant relationship between augmented reality on customer behavior with impact of AR for Online Shopper.	r=0.779 p=0.000 (positive perfect correlation)	H1:Accepted
2. Is there any significant relationship between augmented reality on attitude with impact of AR for Online Shopper in Malaysia?	H2: There is significant relationship between augmented reality on attitude with impact of AR for Online Shopper.	r=0.824 p=0.000 (positive perfect correlation)	H2:Accepted
3. Is there any significant relationship between augmented reality on purchase decision with impact of AR for Online Shopper in Malaysia?	H3: There is significant relationship between augmented reality on purchase decision with impact of AR for Online Shopper.	r=0.814 p=0.000 (positive perfect correlation)	H3:Accepted

Table 8: Discussion of the Key Finding

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

4.5.2 *Discussion of The Hypothesis*

There are three hypotheses tested in this study and all hypotheses are tested to identify whether they have a significant relationship and the test result are as stated below:

H1: There is significant relationship between augmented reality on customer behavior with impact of AR for Online Shopper.

The above of hypotheses that have been tested through research questions as well as to achieve research objective. According to Spearman's rho correlation analyze, it revealed that the independent variable 1 which is customer behavior there is a correlation with impact of AR on Online shopper. This is evidenced by the result obtained in the Spearman's rho correlation value which is 0.779, has shown a high positive correlation between customer behavior and impact of AR for online shopper. The result shows that it is significant level $p < 0.05$ i.e. $p = 0.000$. There is a positive perfect significant relationship between CB and IOAR ($p < 0.05$, $r = 0.779$). Therefore, hypothesis 1 (H1) accepted.

This shows the individual's tendency towards the use of AR technology that affects a user. The use of AR technology is giving an impact on the attitude of consumers in the purchase of goods, especially in the purchase of household items such as through the use of this technology, users can find information more carefully and suffering of individuals when making a purchase.

H2: There is significant relationship between augmented reality on attitude with impact of AR for Online Shopper.

The above of hypotheses that have been tested through research questions as well as research objective. According to Spearman's rho correlation analyze, it shows that independent variable 1 which is high positive correlation between attitude and impact of AR. This evidenced by the result obtained in Spearman's rho correlation value is 0.824, has shown high positive percent significant relationship between two variables which is AT and IOAR ($p < 0.05$, $r = 0.824$). Therefore, hypothesis 2 (H2) accepted.

The use of AR technology helps enable users to make purchases and to increase intention to purchase the needed items. In addition, use of technology is helping consumers in making the selection of items online without having to go to a physical store. Finally, the use of AR technology is so important in the business industry. This shows the tendency of individual attitudes towards the use of AR technology that affects a user. The use of AR technology greatly affects the attitude of consumers in the purchase of goods, especially in the purchase of household goods. This makes the relationship between attitude and IOAR.

H3: There is significant relationship between augmented reality on purchase decision with impact of AR for Online

The above are hypotheses that have been tested through research questions as well as research objectives. According to Spearman's rho Correlation analysis, it shows that independent variable 1 which is high positive perfect correlation between purchase decision and impact of AR. This evidenced by the result obtained in Spearman's rho correlation value is 0.814, has shown high positive percent significant relationship between two variables which is AT and IOAR ($p < 0.05$, $r = 0.824$). Therefore, hypothesis 3 (H3) accepted. The result shows that it is significant level $p < 0.05$ i.e. $p = 0.000$. There is a positive perfect significant relationship between PD and IOAR ($p < 0.05$, $r = 0.814$). Therefore, hypothesis 3 (H3) accepted.

The use of augmented reality technology to the online shopper can facilitate users in making decisions in the purchase of goods through the use of smartphones. In addition

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

to the use of online purchases, but with the availability of such technology in the business industry helps facilitate the purchase and acceptance of orders between two parties. This can save users time and cost. Users of such technologies can establish a relationship between two variables that help consumers in making decisions in purchasing.

4.6 Implication Of The Study

Researchers have spent their time in research aimed at achieving the objectives of the study. A lot of research has been done, collecting data, and running the collected data to obtain the required results. From this research, researchers have faced various challenges in completing this study such as data loss, data collection, and errors in obtaining data results. However, these studies were resolved by the commitment given by the researchers. From the study that has been completed, the researchers found that this study can help improve the understanding of the relationships that influence a person in the use of AR technology to Online shopper. A better understanding of factors that influence the role of augmented reality on customer buying behavior in purchasing among online shopper in Malaysia This research can also be used to help increase understanding of the impact of the use of AR technology applied to consumers. In addition, this study can also be used as a reference for research in a similar field of research. They can use this research to strengthen the evidence that use of technology can affect customer behavior, attitude and purchase decision affecting the relationship between the individual and technology.

4.7 Limitation Of The Study

To overcome the limitation of previous research, this study is not exempt from some specific limitations. The main limitation of this study is to find out the specifics of the augmented reality of customer buying behavior in purchasing among online shopper in Malaysia. Based on the limitation of the study, to obtain information from respondents, this study is to discover the interrelationship among customer behavior, attitude, purchase decision towards impact of AR for online shopper to buying purchase furniture in Malaysia. There are few limitations that need to be highlighted for future researcher that might use this study to refer. It is through a sample size given to respondents of 459 around the Malaysia. This method conducted to obtain information from respondents is namely online and provide a questionnaire through google form. Furthermore, this study only focused on few variables. There are only three augmented reality on customer buying behavior through customer behavior, attitude, purchase to impact of AR for Online shopper to purchasing that have been examined. Thus, it is considered limited as researchers can examine independent variables that relevant to this study. Besides, this study is limited to online shopper international that have been in Malaysia. This study might produce different results if it is applying to random respondents in Malaysia. Thus, these limitations should be overcome in order to achieve better results.

FACTOR INFLUENCING CUSTOMERS' PREFERENCE TOWARD HIPSTER CAFE IN KUANTAN PAHANG

Nurhidayatul Alya Syahira Binti Mohd Nordin and Nik Noorhazila Binti Nik Mud

Faculty of Entrepreneurship and Business,
Universiti Malaysia Kelantan,
Malaysia.

Email : hidayatul.a17a0531@siswa.umk.edu.my; noorhazila.nm@umk.edu.my

Abstract:

Customers' preferences are described as each user's subjective tastes, calculated based on their satisfaction with the product after they buy it. Sometimes this happiness is referred to as utility. It is possible to determine user value by how user services relate between different objects. So, this study is to investigate the factors that influences customers' preference toward hipster cafe in Kuantan Pahang. A conceptual framework comprising of different variables like service quality, price, product quality and store environment which it influences the customers' preference toward hipster cafe. This study was conducted by using a quantitative research approach and the total number of 384 respondents participated in the study. The data that collected were analyze by using the Statistical Package for the Social Science (SPSS). Thus, the data collected through the online questionnaire survey uses different method of data analyses such as descriptive, reliability and normality analysis were carried out from the study. The findings reveal that all the H0 have been rejected while the H1, H2 and H3 and H4 have been accepted in this study. It could be concluded from the results that there is significant relationship between the independent variables and dependent variable.

Keywords : *Customer's preference, hipster cafe, service quality, price, product quality and store environment*

1 Introduction

The term hipster refers to people, especially those considered to be outside the mainstream of culture, who follow the latest trends and fashions. This is a summary of the most relevant designs, fashions, and tastes that people and brands use. The mark makes it easy to put something on trends and translate it into something that can be purchased and sold, whether it be music, clothes or lifestyle offerings.

In the fast food industry worldwide, coffee is one of the fastest growing sectors. These foods can be described as serving breakfast, dessert and coffee, and drinks and integrated foods are believed to be the trend (Wong, 2014). IBISWorld's Cafes (IBISWorld, 2015) estimates that the cafe industry has emerged as an outstanding trend in the past five years. In line with popular trends, consumption in cafes is growing (Team, 2014).

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Cafes offering homemade and handmade 'Instagram Worthy' food with an old-fashioned and retro atmosphere are very common among customers. This strong combination of taste, lifestyle and preferences has also become known as the "hipster." A hipster cafe can be described as a unique restaurant that specializes in coffee making and offers different food from other coffee shops.

In recent years, with a large number of beautiful Kuantan cafes, a small town in Pahang, Malaysia, is slowly taking the cafe trend to this city. The town has a total up to 40 cafes in 2019 and the number will certainly continue to grow. This cafe's target market is not only for young customers, but also appropriate for all ages, and Malaysia will be a potential growth trend for this industry.

1.1 Research Question

Research questions are built on the basis of the study's objectives as follow-up.

- 1) How does service quality can influence customers' preference toward hipster cafes?
- 2) How does price can influence customers' preference toward hipster cafes?
- 3) How does product quality can influence customers' preference toward hipster cafes?
- 4) How does store environment can influence customers' preference toward hipster cafes?

1.2 Research Objective

This research objective represents distinctive between independent variable and dependent variable.

- 1) To examine the relationship between service quality and customers' preference.
- 2) To examine the relationship between price and customers' preference.
- 3) To examine the relationship between product quality and customers' preference.
- 4) To examine the relationship between store environment and customers' preference.

2 Literature Review

2.1 Eagle-Blackwell-Miniard Model

In the late 1960s, the Nicosia model was adapted by Engel, Kollat, and Blackwell (Engel, Blackwell, & Miniard, 1990) . The 'search' feedback or loop, which makes it possible to replicate partial recruitment outcomes, is one of the benefits of the revised model. Although the decision-making process can be made, there could be no intention of purchasing and thus the decision-making process can be halted or delayed

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

at any time providing feedback as the need arises to be used as input. Performing the procedure may be treated as an experiment to be recalled at a later time, or something more important prevents the process, or the customer has no ability to execute the remainder of the process.

2.2 Previous Study

There are four independent variables that will be determined by the definition under this research which are service quality, price, product quality and store environment.

2.2.1 Service Quality

Service quality has become one of the most important issues for cafe owners in recent years, and much research has been done and the results show that there is a link between the quality of service and customer satisfaction (Lim, 2010). Main determinants of the standard of cafe service need to be defined specifically for this study. Further research indicates that when they eat at a cafe, (Tripathi & Dave, 2016) the quality of service will begin to be taken into account by most customers, and the quality of service is felt to be accessible as a measure of customer satisfaction with the cafe. Cafe operators who can provide their customers with quality services can make immense profits from their rivals and attract customers and generate profit and growth due to fierce competition in the food service industry. (Ryu, Han, & Kim, 2010). Reliability is therefore important to assess (Tang & Bougoure, 2006) since this dimension is the most important factor in the quality of service in the food service industry in Malaysia (Jangga, Sahari, & Mohd Basir, 2012).

2.2.2 Price

Price refers to the amount of money paid for a product and service, or in other words, value when the profitability of a product or service is modified by a buyer (P.Kotler & Armstrong, 2010). (Xia, Monroe, & Cox, 2004) characterizes price justification as an emotionally essential customer evaluation and states that if price differences offered by traders and other competing suppliers are warranted, it is fair, reasonable and acceptable. Price is also known as the right, equitable or actual customer's subjective sense of price. (Gielissen, Dutilh, & Graafland, 2008) indicate that many variables can affect the market valuation, which is the competitor's reference price, suppliers' selling price (cost), bias & staff interest, and presumed seller motives. Other studies indicate that there are two factors that can decide the cost justification when the cost of dealing with suppliers and competing suppliers rises, that is whether it is an internal or external cause, or whether the trend of cost rises is justified and controlled (Ozer & Phillips, 2012).

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

2.2.3 Product Quality

People now emphasize product quality as a fundamental component of satisfying cafe customers (Rozecki et al., 2016). According to (M. R. Shaharudin, Hassan, & Mansor, 2011), an significant factor affecting buyers is the quality of products. The two properties of food, namely food freshness and food delivery, will be highlighted in this article. Customers are now really concerned about food safety concerns and are worried about those issues. Consumers need more fresh ingredients than artificial components or chemicals in food production and food storage, as a result of health habits. Fresh food is thus a modern concept that suits the perception of nutrition and quality of the customer, according to (Whiteball, Kerkhoven, Freeling, & Villarino, 2006), it is therefore an essential aspect that all parties involved in the food industry must master in order to satisfy the needs and preferences of their customers. Furthermore, most individuals want to go out to eat and they are drawn to the presence of food because of improvements in eating patterns (Johnson, 2011). Therefore, according to (M. R. Shaharudin, Mansor, & Elias, 2011), serving beautiful and decorated food effectively will promote the perception of quality by customers and will have a positive influence on customers emotions and moods on food consumption in hipster cafes.

2.2.4 Store Environment

(Boo, 2017) believes that customer choice is influenced by the cafe climate. In determining which cafes they want to eat, customers pay more attention to environmental issues. The cleanliness and fragrance of the setting are the two aspects of the cafe environment based on in this review. An significant factor influencing customers' preference is that the dining area of the cafe must be clean (Sienny & Serli, 2010). Consumers need a healthier food atmosphere today, as eating healthy food would help people to stay away from foodborne illness. (Miles, Braxton, & Frewer, 1999). Furthermore, Duberg found that if the cafe does not take care of cleanliness, it will give the customers a miserable experience and ruin the customer's appetite. In the mind of the customer, this would create a detrimental impact that can not be avoided so that the customer will not visit the cafe again. Another significant issue that must be taken into account to draw customers is the fragrance of the cafe environment. This is because it can impact consumers' buying behaviour (Fiore, Yah, & Yoh, 2000). In addition, (Spangenberg, Crowley, & Henderson, 1996) state that the purchase intention is influenced by an ambient aroma effect. It is also defined (Morrin & Ratneshwar, 2000) the ambient aroma will boost the assessment of some unidentified products. As reported in the previous study (Leenders, Smidts, & A. El Haji, 2016) how different scent levels influence the mood, actions and assessment of retail room customers, the aroma of the cafe atmosphere is significant because it will be related to the emotional response of the customer.

Another significant issue that must be taken into consideration to draw customers is the fragrance of the cafe environment. This is because the buying behaviour of customers can be influenced (Ryu & Han, 2010). It is therefore important for cafe owners to have a better knowledge and understanding of the products shown by

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

customers in order to provide customers with a better experience when enjoying their food.

Independent variable

Dependent variable

Figure 2.1 The conceptual Framework of study the factor influencing customers' preference toward hipster cafe.

3 RESEARCH METHODOLOGY

This study highlighted the factor that influencing customers' preference toward cafe hipster in Kuantan Pahang. Therefore, a quantitative methodology was adopted for present this research. The sample are withdrawn from customer in Kuantan Pahang. To collect data of this study, a simple random sampling technique was used. Besides, this research also utilized questionnaires as a medium to survey the target respondents. In overall, the number of respondents who participated in this study was 384. This data was analyzed using Statistical Packages for the Social Science (SPSS).

3.1 Sampling Techniques

This study choose probability sampling. In this research, the researcher use probability techniques which is simple random sampling. All who is involved has the same chance to be chosen as a study participant. In addition, it is cost-effective, easy, convenient and time-saving as well (Gravetter & Forzano, 2009).

3.2 Research Instrument Development

This study used the questionnaire as medium research tool. This questionnaire is divided into three parts which are Section A , Section B and Section C.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Section A consists of nine demographic profile such as gender, age, how recent of visit the hipster cafe, income and occupations and so on. Section B related to independent variable (service quality, price, product quality and store environment) and Section C related to dependent variable (customers' preference toward hipster cafe).

This research will be used the online platform to distribute the questionnaire such as WhatsApp, Instagram and Facebook.

4 FINDING AND DISCUSSION

The data gather from customers that visited at hipster cafe in Kuantan, Pahang. The researcher gather and get the data form 384 respondents in that location using google form questionnaires.

4.1 Demographic Profile of the Respondents

4.1.1 Gender

Table 4.1 : Gender of survey respondents

GENDER		
	Frequency	Percent
Female	196	51.0
Male	188	49.0
Total	384	100.0

The table 4.1 shows gender of the respondent. There are of 384 respondents in this research, 188 male and 196 female involved in the questionnaire. The pie chart show percentage are 49% and 51% respectively.

4.1.2 Age

Table 4.2 : Age of survey respondent

AGE		
	Frequency	Percent
15 - 25 years old	160	41.7
26 - 35 years old	172	44.8
36 - 45 years old	44	11.5
45 and above	8	2.1
Total	384	100.0

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

The table 4.2 show that 4 range of the age group. The highest group age is 26 to 35 years old, 172 respondents (44.8%). The second highest group is 15 to 25 years old, 160 respondents (41.7%). Next, third group is from 36 to 45 years old with 44 respondents (11.5%) and the last one group from 45 and above. It has 8 respondent as a customer in hipster cafe and represent 2.1%.

4.1.3 Occupation

Table 4.3 : Occupation of survey respondents

OCCUPATION		
	Frequency	Percent
Banker	1	.3
Work	1	.3
Cashier	2	.5
Clerk	1	.3
Crew	1	.3
Lorry driver	2	.5
Inventory staff	1	.3
Contractor	2	.5
Nurse	1	.3
Government worker	1	.3
Grab driver	1	.3
Lorry driver	1	.3
Assistance in grocery store	1	.3
Professional	99	25.8
Restaurant worker	1	.3
Retiree	2	.5
Food panda rider	1	.3
Sales promoter	1	.3
Self-employed	118	30.7
Seller	1	.3
SPM	1	.3
Stock manager	1	.3
Student	140	36.5
Housewife	1	.3
Private sector	1	.3
Waiter	1	.3
Total	384	100.0

The table 4.3 show that 26 types of occupation. The highest occupation is students, 140 respondents (36.5%). The second highest occupation is self-employed, 118 respondents (30.7%) and the third highest is professional workers, 99 respondent (25.8%). Banker, work, clerk, crew, inventory staff, nurse, government worker, grab driver, lorry driver, assistance in grocery store, restaurant worker, food panda rider, sales promoter, seller, spm, stock manager, housewife, work in private sector, waiter

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

are represent 1 respondent (0.3%) respectively. Cashier, lorry driver, contractor, retiree are represent 2 respondent (0.5%) each.

4.1.4 Race

Table 4.4 : Race of survey respondents

RACE		
Frequency		Percent
Chinese	100	26.0
Indian	47	12.2
Malay	237	61.7
Total	384	100.0

The table 4.4 show that 3 type of race that are 237 respondents (61.7%) are Malay, 100 respondents (26.0%) are Chinese, while Indian 47 respondent (12.2%) that fill the questionnaire.

4.1.5 Monthly Income

Table 4.5 : Monthly income of survey respondents

MONTHLY INCOME		
	Frequency	Percent
No income	67	17.4
RM0 - RM999	55	14.3
RM1000 - RM 2000	125	32.6
RM2001 - RM4000	106	27.6
RM4001 and above	31	8.1
Total	384	100.0

The table 4.5 show that 5 types of range monthly income. The highest monthly income is from RM1000 until RM2000, 125 respondents (32.6%). The second highest monthly income is from RM2001 until RM4000, 106 respondents (27.6%). For RM4001 an above have 31 respondents (8.1%). The second last represent RM0 - RM999, 55 respondent (55%). From the survey, it was found that in this categories more to students but doing part time while finish their study. The last one is no income, 67 respondents (17.4%).

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

4.1.6 When Was Respondents Recent Visit Hipster Cafe

Table 4.6 : When was respondent recent visit hipster cafe

WHEN WAS YOUR RECENT VISIT HIPSTER CAFE		
	Frequency	Percent
More than one month Ago	88	22.9
Within the past one Month	37	9.6
Within the past one Week	126	32.8
Within the past two Week	133	34.6
Total	384	100.0

The table 4.6 shows that 4 of period time that respondents recent visit hipster cafe. The highest time respondents recent visit the hipster cafe is within the past two week, 133 respondents (34.6%). The second highest time is within the past one week, 126 respondents (32.8%) and within than one month ago, 88 respondents (22.9%) and for within the past one month, 37 respondents (9.6%).

4.1.7 When Do Customers Dine Out The Most

Table 4.7 : When do customers dine out the most

WHEN DO YOU DINE OUT THE MOST		
	Frequency	Percent
Weekdays	154	40.1
Weekends	230	59.9
Total	384	100.0

The table 4.7 shows that 2 types of when do customers dine out the most. The higher is weekend, 230 respondents (59.9%) and for weekdays only 154 respondents (40.1%).

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

4.1.8 How Often Do Customers Come To Hipster Cafe

Table 4.8: How Often Do Customers Come To Hipster Cafe

HOW OFTEN DO YOU COME TO HISPTEER CAFE		
	Frequency	Percent
0 -2 times	187	48.7
3 - 5 times	159	41.4
6 - 8 times	28	7.3
More than 8 times	10	2.6
Total	384	100.0

The table 4.8 shows that 4 types of how often do respondents come to hipster cafe. The highest is 0 until 2 times, 187 respondents (48.7%). The second highest is 3 until 5 times, 159 respondents (41.4%). 6 until 8 times have 28 respondents (7.3%) and more than 8 times have 10 respondents (2.6%).

4.1.9 At What Time Of The Day Customers Eat The Most In Hipster Cafe

Table 4.9 : At what time of the day customers eat the most in hipster cafe

AT WHAT TIME OF THE DAY DO YOU EAT OUT THE MOST IN HIPSTER CAFE		
	Frequency	Percent
Breakfast	46	12.0
Dinner	163	42.4
Lunch	175	45.6
Total	384	100.0

The table 4.9 that have 3 categories of at what time of the day do customers eat the most in hipster cafe. The highest is lunch, 175 respondents (45.6%). The second higher is dinner, 163 respondents (42.4%) and the last one is breakfast, 46 respondents (12.5%).

4.2 Preliminary Analysis

Table 4.10: Preliminary analysis for variables of pilot test

Variables	Cronbach's Alpha	No. Of Items	n (sample size)
Service Quality	0.721	5	30
Price	0.805	5	30
Product Quality	0.815	5	30
Store Environment	0.767	5	30
Customers' Preference Toward Hipster Cafe	0.730	5	30

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Based on table 4.10, the range of Cronbach's Alpha value is between 0.7 until 0.9 for all constructs in this research which is known as good reliability. In this research, the Cronbach's Alpha coefficient for customers' preference toward hipster cafe is 0.730 which is classified as good reliability. According to the independent variable, the Cronbach's Alpha coefficient for service quality is 0.721 and it followed by the other independent which are price 0.805, product quality 0.815 and store environment 0.767.

4.3 Validity and Reliability Test

Table 4.11 : Independent and Dependent Reliability Coefficient Test

Variable	Total items	Cronbach's Alpha Value	n (sample size)
Service quality	5	0.811	384
Price	5	0.814	384
Product quality	5	0.831	384
Store environment	5	0.801	384
Customers' preference toward hipster cafe	5	0.801	384

The result of reliability analysis shows that all the variable above 0.7. The Cronbach's Alpha shows the result from 0.801 to 0.831 as shows in the table 4.3. This alpha value can be accepted because 0.7 as suggested HR-Guide, LLC (2018) state that if alpha value is below 0.5 cannot be accepted, the value 0.6 and above are normal, 0.7 is more than normal, 0.8 is good and 0.9 is better.

Table 4.3 above indicates the independent and dependent variable reliability coefficient for this study. The alpha value of reliability for the dependent variable construct 0.801 which is good. Thus, this result show he reliability is accepted. Moreover, the alpha value of reliability coefficient for independent variables service quality is 0.811, price is 0.814, product quality is 0.831, store environment is 0.801 , which are in range good and the reliability is accepted.

4.4 Normality Test

Table 4.12 : Normality test

Tests of Normality						
	Kolmogorov-Smirnov ^a			Shapiro-Wilk		
	Statistic	df	Sig.	Statistic	df	Sig.
Mean Service Quality	.173	384	.000	.823	384	.000
Mean Price	.185	384	.000	.874	384	.000
Mean Product Quality	.189	384	.000	.849	384	.000
Mean Store Environment	.197	384	.000	.802	384	.000
Mean Customer Preference Toward Hipster Cafe	.213	384	.000	.801	384	.000

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

As a result in table 4.12, outcome of normality test using SPSS revealed to be non-normality data set. Value of Shapiro-Wilk's Test and Kolmogorov-Smirnov's Test for all independent variables (service quality, price, product quality and store environment) and dependent variable (customers' preference toward hipster cafe) were 0.000, which is less than 0.05, this indicated that the data is non normality. Thus, non-parametric correlation will be used which refer to Spearman correlation from the hypotheses testing (Hinkle, Wiersma, & Jurs, 2003).

4.7 Hypotheses Testing

Table 4.13 : Hypotheses testing

Objective	Hypothesis	Result of analysis	Decision
To examine the relationship between service quality and customers' preference.	H1: There is a relationship between service quality and customers' preference toward hipster cafe in Kuantan Pahang	$r = 0.489$	Accepted
To examine the relationship between price and customers' preference.	H2: There is a relationship between price and customers' preference toward hipster cafe in Kuantan Pahang	$r = 0.557$	Accepted
To examine the relationship between product quality and customers' preference.	H3: There is a relationship between product quality and customers' preference toward hipster cafe in Kuantan Pahang	$r = 0.539$	Accepted
To examine the relationship between store environment and customers' preference.	H4: There is a relationship between store environment and customers' preference toward hipster cafe in Kuantan Pahang	$r = 0.562$	Accepted

Based on the table 4.13, it can be summarized that all four independent variable which are service quality, price, product quality and store environment have a relationship toward hipster cafe in Kuantan Pahang. All the hypothesis is accepted as the p-value is less than 0.05.

5 Discussion and Conclusion

5.1 Discussions

Table 5.1 : Hypotheses result

Code	Hypotheses	Result
H1	There is a relationship between service quality and customers' preference toward hipster cafe	Supported
H2	There is a relationship between price and customers' preference toward hipster cafe	Supported
H3	There is a relationship between product quality and customers' preference toward hipster cafe	Supported
H4	There is a relationship between store environment and customers' preference toward hipster cafe	Supported

Hypothesis 1 : There is a relationship between service quality and customers' preference toward hipster cafe in Kuantan Pahang.

Based on the result, reliability analysis showed the five items that were used to measure service quality were moderate with Cronbach's Alpha value of 0.811. Based on spearman correlation for service quality and customers' preference, the result is $p=0.000$. Thus, it means that H1 is accepted. Based on previous study, customers pleased with all facets of service quality would have a good customers' preference relationship (Al-Tit & Nakhleh, 2014). According to (Tan, 2016), researchers have shown that service quality factors have an important relationship with the choice of customers. Customers emphasize that the quality of service would have a significant relationship with customers' preference (Mee, Ariffin, & Rahman, 2014).

Hypothesis 2 : There is a relationship between price and customers' preference toward hipster cafe in Kuantan Pahang.

Based on the result, reliability analysis showed the five items that were used to measure price were moderate with Cronbach's Alpha value of 0.814. Based on spearman correlation for price and customers' preference, the result is $p=0.000$. Thus, it means that H2 is accepted. Based on previous study, the price impact on customers' preference is positive, especially when price increases are low (Martin, C.Ponder, & Lueg, 2008). According to (Rahman, Kalam, Rahman, & Abdullah, 2012), the customer's view of price can directly impact customers' preferences. Researchers have shown that service quality factors have an important relationship with the choice of customers (Cheng, Chiu, Hu, & Chang, 2011).

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Hypothesis 3 : There is a relationship between product quality and customers' preference toward hipster cafe in Kuantan Pahang.

Based on the result, reliability analysis showed the five items that were used to measure price were moderate with Cronbach's Alpha value of 0.831. Based on spearman correlation for price and customers' preference, the result is $p=0.000$. Thus, it means that H3 is accepted. Based on previous study, product quality is ranked as the most important attribute influencing cafe decision (Neha Joshi,2012). Next, elaborate product characteristics as those important features that have an intense influence on customers' preferences (Wickliffe & Pysarchik, 2001). According to (Buntak, Adelsberger, & Nad, 2012), based on the taste that a high quality product should be, if food and beverage products can please customers.

Hypothesis 4 : There is a relationship between store environment and customers' preference toward hipster cafe in Kuantan Pahang.

Based on the result, reliability analysis showed the five items that were used to measure service quality were moderate with Cronbach's Alpha value of 0.801. Based on spearman correlation for service quality and customers' preference, the result is $p=0.000$. Thus, it means that H4 is accepted. Based on previous study, (Baker, Grewal, & Parasuraman, 1994) lighting, music, layout, and more consist of the store setting. This acts as a trigger that supports the preferred response of the customer positively. As stated by (Hedrick, Beverland, & Oppewal, 2005), the environment of the store was successful in deciding or affecting the purchasing intentions of customers. According to (Donovan, Robert, & John, 1982), researchers have shown that an environment could change the mood of customers and affect the behaviour of retailers or the performance of service providers. Retailers begin to understand the significance of environmental signals and try to build a productive store atmosphere in order to maximize profit by attracting the target customer (Seock & Bailey, 2009).

5.2 Recommendations

For the future research, it is advisable that the future researcher focus the relationship between occupation, monthly income and customers' preference. Which mean choose the relevant occupation and monthly income and study how it influence the customers' preference in choosing method of hipster cafe. In this way, they can increase the value of their research, it means there will be more information has been gained.

Other than that, the researcher can perform this study at different state especially in rural area. In this way, the researcher will know how the rural population responds to hipster cafe acceptance. It will give the impacts of the data that researcher will be received.

Next, the researcher have to expect in the research and able to answer the question asked by the respondent to ensure that the respondent clear with the questionnaire that will distributed. The researcher have to simply the question so from that the respondent will not be bored.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

The researcher can make a short interview with the respondents while they are answering the given questionnaires. With this method, researchers will be able to know in more detail about customers' preferences for hipster cafe.

6 Conclusion

This research is aimed to measure customers' preference toward hipster cafe by investigating the relationship between four independent variables consists service quality, price, product quality and store environment and a dependent variable which customers' preference toward hipster cafe in Kuantan Pahang. Thus, there are four hypotheses have been developed between independent variable and dependent variable. On the limitation of the study, the researchers observed the restriction that faced during distributed the questionnaire and it was effected the collected data. Every dependent variable plays crucial role to achieve customers' preference toward hipster cafe.

7 Acknowledgement

I whereby, student of Faculty Entrepreneurship and Business (FEB) would like to acknowledge the contribution from a great number of people who had assisted and supported me during the process of completing this research project.

First of all, I would like to thank my research supervisor. She was providing me the best suggestion and integrating her passion, motivation and massive information with her research experience.

Furthermore, I also thankful to all participants involved in this research project as well as the owner of cafes who allows me to distribute questionnaires during their operating hours. Also, I would like to thank all respondent who had shown willingness in spending their valuable time and effort in understanding and complete the distributed questionnaires. Without their cooperation, this research could have come to this achievement.

Next, I would like to express my greatest gratitude to Universiti Malaysia Kelantan on giving me an opportunity to conduct research project during my final year.

Last but not least, I would like to thanks my parents because giving me moral support in accomplishing this research. I also would like to appreciate my friends that helping me give the ideas during this research.

FACTORS INFLUENCE CONSUMER LOYALTY TOWARDS ONLINE FOOD DELIVERY SERVICE

Nurul Fitriaty Binti Ramli and Nadia Hanum Binti Amiruddin

Faculty of Entrepreneurship and Business,
University Malaysia Kelantan,
Malaysia

Email: fitriaty.a17a0569@siswa.umk.edu.my; nhanum@umk.edu.my

Abstract:

The aim of the research is to examine the factors influence consumer loyalty towards online food delivery service. It involves a variable, i.e. the existence of online food delivery service to examine the loyalty among consumer towards online food delivery service for dependent variables. This research examines loyalty among consumer towards online food delivery service including independent variables of service quality, food quality and perceived value. The target respondents in this study are consumers that always using online food delivery services by collecting data with a total of 124 sets of survey questionnaires. Statistical Package for Social Sciences (SPSS) version 26 was used to assist in our data analysis along the research. Descriptive analysis, validity and reliability test, normality test and Spearman Correlation analysis was applied in the data analysis. The results were concluded that the independent variables service quality, food quality and perceived value have significance relationship with loyalty towards online food delivery service among consumer. Last but not least, there are some limitations of study and suggestions are included in this paper to provide a better idea for future researchers related to studies involving the loyalty towards online food delivery service among consumer in Malaysia.

Keywords: *Online Food Delivery Service, Loyalty Among Consumer, Service Quality, Food Quality, Perceived Value.*

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

1 Introduction

It has steadily become a major forum for entrepreneurs and organizations, since the launch of the Internet in the world. Nowadays, in many developing countries, the Internet is the most frequently used medium for buying and selling, giving consumers access to a variety of goods in real-time. E-commerce, which we use as a new platform for industry, has risen quickly, as distributors now allow customers to buy online anywhere in the world.

Online food delivery is a messaging service that delivers food to consumers from a restaurant or food supplier. Orders are usually made from a food ordering company via a restaurant, a website, or a grocery phone. Starters, side dishes, beverages, desserts, or food goods are the items supplied and typically shipped in boxes or bags. The customer can choose to pay online or by money or card in person depending on the delivery company.

The knowledge of internet consumers has increased for different firms, from small to big businesses. Besides, a modern online payment system has facilitated business transactions via web-based services, including online food delivery services (Kedah, 2015). According to Statista 2019, global e-commerce retail revenues amounted to \$2.3 trillion in 2017, with e-commerce revenue expected to grow to \$4.88 trillion in 2021 (Schwandt 2019). McKinsey and Company estimated that the global online food services industry accounted for around \$83 billion in its statistical results in 2016, accounting for 1% of the overall food and 4 percent of the fast food and restaurant market sold (Hirschberg, 2016).

As a result, Malaysian customers have also increased their use of online business growth in modern lifestyles, which has led to changes in urbanization (Sulastri, 2017). Statista (2020) also estimates that the wholly online food supply market in Malaysia is expected to rise by 17.9 percent annually, with sales of US\$ 370 million over a four-year time frame, according to Bernama (2020). Foodpanda was the first distribution company to operate in Malaysia to catch the moving first-time advantage among the major entrants to online food delivery services and along with that, other main players in the bandwagon industry were GrabFood, Uber Eats, Honestbee, Running Man Delivery, FoodTime, Dahmakan, Bungkusit, Hometaste, Dietmosta, SqueezeMeBaby, Petchef, The Naked Lunch.

The growing user population of the online food service industry as well as the rapid development of online food service providers based on the quality of the online food services sector is now crucial to understand how to satisfy customers (Goh, 2017). Numerous marketing experiments were performed and the link between service quality was investigated (Caruana & Ewing, 2010). It has also become clear that most scientists have been studying the nature of the product, loyalty, and customer service that are beneficial to consumers.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

This study focuses on loyalty towards online food delivery service among consumer in Malaysia. This is to find out what is commonly emphasized so that they use online food delivery service as a means of platform in their usual lives. The loyalty towards online food delivery service use consists of service quality, food quality, customer satisfaction and perceived value. The main objective of this study is to examine the relationship between all the independent variables with loyalty towards online food delivery services among consumer.

1.1 Research objectives

Based on the outlined objectives of the research, the research questions that need to be addressed are as follows:

1. Is there any relationship between service quality and consumer loyalty toward online food delivery service?
2. Is there any relationship between food quality and consumer loyalty toward online food delivery service?
3. Is there any relationship between perceived value and consumer loyalty toward online food delivery service?

2 Research Methodology

2.1 Research Design

For this research, researcher was chosen the quantitative research approach to define that loyalty towards online food delivery service among consumer. Therefore, the study should collect the information about factors influence consumer loyalty towards online food delivery service by online questionnaire.

2.2 Population

The complete number of individuals, activities, or objects in the population. The researcher needs to study common features needed by the researcher. Consumers who use online food delivery service were included in the analysis. In this report, the researchers are asked to include an online questionnaire for male and female respondents aged between 18 and 50 years. According Cohen 1992 notes that 124 respondents would be respondents to this study. This is because research has four variables with which loyalty among consumer towards online food delivery services can be associated.

2.3 Sample Size

As eloquently stated by Cohen (1992) develop a sample size larger than 30 and less than 500 are suitable research study. For this study, the researcher focused primarily on online food delivery users in Malaysia to strengthen the hypotheses related to online food delivery service. The researcher decided to distribute the questionnaire to 124 respondents to complete this study.

2.4 Data Collection

Primary data requires the gathering of specific research information for the study of actual resources, such as users/non-users of online food delivery service or their age perspective in this research. The online questionnaire becomes the only primary data instrument for this research. This is because of online questionnaire survey allowed in this study to look into the relevant variables and fit into the objective of this study.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

2.5 Sampling

Sampling technique falls into two different categories, which are probability sampling and non-probability sampling. This research chose to use non-probability sampling and it classified into four types, which is convenience sampling, quota sampling, snowball sampling and also judgemental sampling. For this research paper, the convenience sampling is the most suitable technique for this study. This technique main purpose is to collect respondent's information that is easily accessible and for general, respondents were choose as they happened to be in the right place at the right time.

2.6 Research Instrument

The questionnaire had designed and distribute to respondents in two type of language which is English and Malay from avoiding any difficulty and were simply wording which ease for the respondents to understand all the question. Besides, Likert scale question have been choosing by the researcher from one of type of close ended questionnaire of this study. Each set of the questionnaire will consist of 51 question in total and the survey questionnaire will be separated into three main sections and there were listed in Table 1.

Table 1: Sources of Questionnaire

Section	Description	No of Items
Section A	Demographic	11
Section B	Loyalty towards online food delivery service	6
Section C	Service quality Food quality Perceived value	6
		6
		6
TOTAL		35

2.7 Data Analysis Technique

For this analysis, the researcher used the Statistical Package for Social Sciences (SPSS) version 26. The results are descriptive analysis, validity and reliability test and overall hypothesis testing if this study is shielded. The researcher can use IBM SPSS Statistics to understand the data, analyse, forecast and plan about the study.

3 Analysis and Discussion

3.1 Demographic Profile

The demographic profile of the respondents included the information of have you ever used online food delivery service, gender, age, race, marital status, education level, employment, income, platform used to purchase, total frequency use per week and how much spend per week. From the sample collected, majority of the respondents ever used online food delivery service from yes with (100%). It can be concluded that mostly people use online food delivery service. In term of gender, majority of the respondents come from female (82.4%) and male (17.6%)

In term of age, this research involved few different age. From the sample collected, it is shown that the range of age by our respondents. Among the 108 respondents, majority of the respondents from 18-26 years old with a total of 76 respondents (70.4%). Continue by 27-35 years old total of 18 respondents (16.7%) and 36-43 years old with total of 11 of respondents (10.2%). For the minority of the respondents are from 44-50 years old which is 3 respondents (2.8%).

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Apart from that, race from Malay with total of 100 respondents (92.6%) and continue with Chinese with total of 3 respondents (2.8%). Continue with Indian with total of 3 respondents (2.8%). For the minority of the respondents is others with total of 2 respondents (1.9%). Next for marital status, single with total of 94 respondents (87%) and continue with married with total 12 of respondents (11.1%). For minority of the respondents is divorce/widow with 2 respondents (1.9%).

Next, education level from primary school with total 3 respondents (2.8%) and secondary school with total 32 respondents (29.6%). Continue with college diploma with 33 respondents (30.6%) and undergraduate degree with 37 total of respondents (34.3%). For minority, postgraduate degree with 3 total of respondents (2.8%). Besides that, employment from student with 55 total of respondents (50.9%) and employed with 44 total of respondents (40.7%). For housewife 1 total of respondents (0.9%). Last, unemployed and self-employed have same total with 4 respondents (3.7%).

Following the personal monthly income from RM 2,501 and above with 11 total of respondents (10.2%) and RM 2,001 to RM 2,500 with 12 total of respondents (11.1%). Continue with RM 1,001 to RM 2,000 is 26 total of respondents (24.1%). The last one less than RM 1,000 with 59 total of respondents (54.6%). Next, platform used to make purchase product or service from Food Panda with 48 total of respondents (44.4%) and Grab Food with 12 total of respondents (11.1%). For Dahmakan and Bungkusit, there are sama total of respondents with 4 respondents (3.7%). Last from other with 40 of total respondents (37%).

Lastly, Total frequency of use online food delivery services from once a week with 73 total of respondents (67.6%) and three times a week with 31 total of respondents (28.7%). Next, five times a week with 4 total of respondents (3.7%) and based from research, no one use seven times a week online food delivery service. Besides that, how much spend on per week from more than RM 200 with 1 total of respondents (0.9%) and RM 200 – RM 150 with 11 total of respondents (10.2%). From RM 150 – RM 100, 25 total of respondents (23.1%) and less than RM 100 with 71 total of respondents (65.7%).

3.2 Descriptive Analysis

The descriptive analysis was tested according to their variables and listed out on the summary of the mean and standard deviation of computed items in Table 2

Table 2: Result of the Descriptive Analysis

Descriptive Statistics

	N	Mean	Std. Deviation
Loyalty towards online food delivery service (DV)	108	3.8981	.71326
Service quality (IV1)	108	4.0741	.69688
Food quality (IV2)	108	3.9846	.63415
Perceived value (IV3)	108	4.0154	.75660
Valid N (listwise)	108		

Table 2 showed that all the independent variables consist of service quality, food quality and

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

perceived value that seem to be common for online food delivery service users to use. Based on the result, the highest mean value came from service quality which was 4.07, where respondents agreed more for this variable, while the lowest mean value was loyalty toward online food delivery service, where respondents agreed lower with that variable in this study.

3.3 Reliability Analysis

Rule of Thumb (2003) indicated that internal consistency reliability can be defined as test for respondent's responses whether is consistency at all sections. Cronbach's Alpha can be used as the reliability coefficient to determine the items in a variable are positively associated with others. The high reliability means that the good are acceptable to the variable to be tested.

Table 3: Result of Reliability Analysis

Variables	Cronbach's Alpha Value	No. of Item	Strength
Loyalty	.856	6	Very Good
Service quality	.899	6	Very Good
Food quality	.868	6	Very Good
Perceived value	.874	6	Very Good

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Based on the result of Table 3, the Cronbach's Alpha of loyalty as dependent variable is 0.856 and showed all the items of the loyalty are related with the title and it indicated as a "very good" result. Other than that, the Cronbach's Alpha result for service quality was 0.899 which result is "very good". Thus, the coefficient obtained for these questions about loyalty variable is very good. For food quality was 0.868 is very good result. The Cronbach's Alpha result for perceived value is 0.874 which also resulted as "very good". Overall for this analysis, all of the items in this research can be accepted and there is positively correlated with each other.

3.4 Spearman Correlation Analysis

According to (Kumar, Talib & Ramayah, 2013) the Spearman's Correlation Coefficient is used to show the strength of association between two quantitative variables which is the independent variable and dependent variable that measure in ordinal scale. The results of the Spearman's Correlation Coefficient analysis showed in this study that the independent variable between the loyalty towards online food delivery service among consumer, service quality, food quality, customer satisfaction and perceived value with the loyalty as dependent variable.

Table 4: Spearman Correlation Coefficient

		Loyalty	Service Quality	Food Quality	Perceived Value
Loyalty	Spearman Correlation	1.000	.805**	.781**	.772**
	Sig. (1-tailed)	.	.000	.000	.000
	N	108	108	108	108
Service Quality	Spearman Correlation	.805**	1.000	.827**	.738**
	Sig. (1-tailed)	.000	.	.000	.000
	N	108	108	108	108
Food Quality	Spearman Correlation	.781**	.827**	1.000	.789**
	Sig. (1-tailed)	.000	.000		.000
	N	108	108	108	108
Perceived Value	Spearman Correlation	.773**	.738**	.789**	1.000
	Sign. (1-tailed)	.000	.000	.000	.
	N	108	108	108	108

Based on the Table 4, it can be seen that all of the independent variables which are service quality, food quality and perceived value are significantly correlated to dependent variable which is the loyalty towards online food delivery service at 0.11 level (1-tailed). The relationship between variables, 0.70 is strong, within range of 0.30 to 0.60 is moderate and below of 0.30 is weak. The correlation coefficient between the independent variable between independent variable showed that service quality was 0.805, food quality was 0.781, and perceived value was 0.772. Thus, all of the independent of this study have a strong relationship between the dependent variable.

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

3.5 Summary

Table 5: Summary of the Hypothesis Results

	Hypothesis	Significant Value	Magnitude Relationship	Supported or Rejected
H1	There is significant relationship between service quality and loyalty toward online food delivery service	.805**	High	Accept H1 hypothesis supported
H2	There is significant relationship between food quality and loyalty toward online food delivery Service	.781**	High	Accept H2 hypothesis supported
H3	There is significant relationship between perceived value and loyalty toward online food delivery service	.772**	High	Accept H4 hypothesis supported

4 Conclusion and Future

4.1 Suggestion for the Future Research

In this analysis, there were two constraints. Some guidelines will be released in order to resolve these limitations. First of all, for example, some respondents did not completely contribute to answering the questionnaire by not having the information to answer the question. In order to avoid this scenario, as respondents respond, the researcher or student has the opportunity to assist and inform a target respondent by offering a clarification of each question to ensure that they rank on the correct scale.

In addition, for researchers to get accuracy in data collection, the time constraint is the biggest challenge. Both responses are evaluated using the questionnaire method to verify the hypothesis for the relationship between the dependent variable and the independent variables. From here, because it may take time to sort all these mistakes, no scanning of biased answers or constantly answering the same scale for each question was done. Future research may expand the time to sort the actual data and examine only the perfect random scale that has been addressed.

4.2 Conclusion

The main objective of this research is to investigate the relationship between the overall factors influence loyalty among consumer towards online food delivery service and to show that there are four independent variables tested which are service quality, food quality and perceived value. In addition, all data collection was collected through an online questionnaire and the data was analyzed using SPSS software based on descriptive analysis, reliability analysis and Spearman's Correlation Coefficient analysis. As a result, the relationship between the independent variable and the dependent variable was positively associated with the high relationship.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

This research concludes the key findings, discussions, implications, limitations and recommendations. The Spearman Correlation Analysis showed that all variables, including service quality, food quality and perceived value had a significant positive relationship with loyalty towards online food delivery service. In addition, all the assumptions had been tested, where all the assumptions about service quality, food quality and perceived value had been accepted.

Finally, the researcher also discussed some limitations encountered during the course of the research, as well as some recommendations for improvement in future research. As a final word for this study, this study aims to give an overview to the community about factors influence consumer loyalty towards online food delivery service around the world. As a society that is always sensitive to the current situation, it is not impossible for all communities to using online food delivery service.

5 Acknowledgement

First of all, I would like to thank the university for giving permission to complete this task without any problems. Without permission, of course my job could not be completed on the specified date.

Next, I would like to thank Madam Nadia Hanum bin Amiruddin a lecturer at the Faculty of Entrepreneurship and Business in University Malaysia Kelantan and also as my beloved supervisor for giving me permission and support throughout this task. Not only that, she also corrected my mistakes and provided a lot of information in case I had an unresolved problem. Without her help to assist me, this task will not be delivered on the due date.

In addition, I would like to thank my family, friends, team members, respondents, and people and parties who directly and indirectly participated and helped me in completing the research and cooperating with me. The constant encouragement, support, advice, and criticism from them throughout this research gave me a better understanding and valuable information in completing this research. This research solution could not have been done without the help of these people, I am very grateful.

IMPACT OF BRAND PERSONALITY AND BRAND UNIQUENESS TOWARDS BRAND EQUITY OF MUSLIMAH FASHION SMES

Nurulfatinah Binti Mohd Najib and Noor Hasmini Binti Hj Abd Ghani

Faculty of Entrepreneurship and Business,
Universiti Malaysia Kelantan,
Malaysia

Email :ulfatinah.a17a0608@siswa.umk.edu.my; hasmini.ag@umk.edu.my

Abstract:

This study primary aim to investigate the impact of brand personality and brand uniqueness towards brand equity of Muslimah fashion SMEs among consumers. A total of 226 SMEs consumers have participated as research respondents in this study. Researcher used Reliability and Multiple Regression analysis in testing the hypotheses. The findings indicated that both independent variables which are brand personality and brand uniqueness have a significant impact on brand equity of Muslimah fashion SMEs among consumers.

Keywords: Brand Equity, Brand Personality, Brand Uniqueness, SMEs, Muslimah fashion

1 Introduction

The year 2020 has been one of the most challenging years for all layers of society, especially among SME entrepreneurs. The spread of Covid-19 has a huge impact on the country's economy, including SMEs, which is one of the main pulses of the country, causing most of the SME entrepreneurs to go bankrupt. In fact, Muslimah fashion entrepreneurs also suffered the same fate because of this pandemic Covid-19. According to SME Corp Malaysia, 98.5% of business establishments in Malaysia have been contributed by SMEs and 20.6% of these business establishments are owned by women.

Currently, the items that are often bought online in Malaysian market are fashion items. Based on the website “The Women's Lifestyle Journal”, the journal stated that clothing has contributed 54% of all purchases made including during the festive season, followed by bags and accessories which have contributed 53% (Venus Buzz, 2012). Following the growing trend of online shopping, most SMEs have ventured into this field in attracting consumers to the goods that sold via online platforms. As Covid-19 pandemic

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

is spreading in the country, consumers are more likely to spend their time at home by making online purchases. Hence, this has become an initiative for fashion entrepreneurs in Malaysia to be more focused on this platform in the sale of their clothes. To further attract consumers' interest in the product being marketed, entrepreneurs need to build their brand equity.

An effective brand equity can encourage consumers to be more inclined in product selection through their perception of the brand after evaluating it through the Internet. But not all users will act in such a way. There are researchers who argue that it is possible that the Internet has made the brand currently irrelevant to consumers because they have free access to a large amount of information about the product features of the brand ([Chen, 2001](#); [Dussart, 2001](#)).¹

In this context, the fashion industry is no exception, in fact, also feels the same impact. This is because currently there are so many competitors in the fashion industry that produce the same type of product, but it can be distinguished through the brands brought by these SMEs entrepreneurs. Therefore, SMEs in Muslimah fashion industry need to play an important role in identifying the factors that can build brand equity through online enterprises because online brand equity is differ compared to offline brand equity. Past studies have proved that consumer experiences in an offline business environment are different which they can only interact with people rather than technology ([Rios & Riquelme, 2008](#)).²

Due to the challenges faced by SMEs in Muslimah fashion industry, it is important to study whether the building of brand equity significantly impacts on the performance of SMEs to warrant attention from the consumers. In this study, these two brands which are brand personality and brand uniqueness will be the main strategies that going to be focused or investigated towards the impact on brand equity.

2 Literature Review

2.1 Brand Equity

Brand equity refers to the intangible asset that creates an association between the brand and its consumers. It also can be viewed from three perspectives which are financial, brand extension and the consumer. Brand equity is an important part of a business because it can recognize the strength of the products while influencing the consumers to buy the product. Based on previous studies, there are three important roles in brand equity which are brand equity acts as a magnet to attract new customers to the company, serves as a reminder to the customers about the products and services provided by the company, and also the emotional relationship between customers and company ([Lemon, Rust, & Zeithaml, 2001](#)).³ Past study also shown that high levels of brand equity were found to be led to the consumer choice with high buying intentions as well as higher stock returns (Cobb-Walgren, Ruble, & Donthu, 1995; DA Aaker & R. Jacobson, 1994; Srivastava & Shocker, 1991). High brand equity will also provide an opportunity for

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

companies to successfully develop, resilience to competitive promotional pressures, and create barriers to entry into the competition (Farquhar, 1989).⁴ This can be seen through the definitions obtained from several researchers on brand equity as shown in Table 2.1.

Table 2.1: Definition of Brand Equity.

Researcher	Definition
Farquhar (1989)	Added value with whom a brand endows a product.
Aaker (1991)	A set of brand assets and liabilities linked to a brand, its name and symbol that add or subtract from the value provided to a firm or to that firm's customers (p.15).
Keller (1993)	The differential effect of brand knowledge on consumer response to the brand's marketing.
Yoo et al. (2000)	The difference in the choice of consumer between a branded and unbranded product which given the same level of features.

Moreover, brand equity is found to be one of the most important marketing variables and is widely discussed by researchers and marketing experts. The main reason for this reputation is the strategic role of brand equity in management decisions and creating a competitive advantage for an organization (Atilgan, Aksoy & Akinci, 2007). Brand equity construction can be categorized according to three approaches namely financial, corporate and customer. In a financial approach, brand equity is the increased cash flow earned through a specified product as well as the cash flow earned from selling nameless products. Whereas, in a corporate-based approach, brand equity is an added value to the company for the brand name and this revenue will not cover the same nameless product (Keller & Lehmann, 2004). The last one is customer-based brand equity (CBBE) which according to Keller (1993), it is the marketing effect of different brand knowledge on consumer response lies in brand marketing and increases the level of brand that is not unfamiliar to customers. He also argues that customer-based brand equity occurs in scenarios where the target customer has a high level of brand familiarity and awareness of the brand and has some strong, unique, and good brand contacts in memory.⁵

2.2 Brand Personality

According to brand personality theorists, brands can be linked to the nature of human personality through learning and experience. As consumers which have difficulty articulating perceived differences between competitive brands based on their physical nature, brand personality and image management have become an integral part of a company's marketing program. As noted by Levy (1985), the task of brand differentiation can be facilitated when consumers associate it with human characteristics, showing that conveying a clear brand image allows users to identify needs that satisfy the brand (Park, Jaworski, & MacInnis, 1986). It can be seen through

⁴Farquhar, P. H. (1989). Managing brand equity. Marketing research, 1(3).

⁵Keller, K. L. (1993). Conceptualizing, measuring, and managing customer-based brand equity. Journal of marketing, 57(1), 1-22.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

the several definitions of brand personality that obtained from different researchers which has shown in Table 2.2.

Table 2.2: Definition of Brand Personality

Researcher	Definition
Keller (1993)	Act as a symbolic function which is differ from "product-related features" that it tends to act as a utilitarian function for consumers.
Aaker (1997)	The set of human characteristics associated with a brand. (p. 347)
Azoulay & Kapferer (2003)	An enabler in identifying consumers with the brands.
Caprara et al., 2001; Louis and Lombart, 2010	A viable metaphor whose latent concept lies in the fact that a consumer based on his or her personality which creates affinities with the brands.

However, not every brand has its own personality. This is because brand personality is created and developed by any direct or indirect brand relationship experienced by the consumer (Shank & Langmeyer, 1994; Plummer, 1985), it is important for consumers to experience the brand first before they form subjective perceptions about, and personality traits related to the brand. The effect of that experience is the creation of a brand with its own personality. As suggested by Aaker (1996), the whole mix of marketing communication variables such as advertising, consumer image, price, packaging, symbols, logos, store location, word of mouth and every other exposure the brand receives creates a brand personality over time.⁶ Brand personality is stronger and clearer if these elements are deliberately adjusted, if the personality is distinctive, and if the personality remains consistent over time and the media (Batra, Lehmann, & Singh, 1993).

Brand personality is beneficial for marketers and consumers. For marketers, brand personality is an integral part of brand image and equity, and it relates to brand value in the minds of consumers (Keller, 1993). Brand personality is seen as a key driver in the formation of positive attitudes and priorities for brands (Biel, 1993),⁷ strong brand equity determinants, and effective methods for creating and building meaningful consumer-brand relationships (Sung & Tinkham, 2005). Developing strong brand personality will benefit a business by increasing perceived brand value and enhancing the consumer brand perceptions and thereby increasing the brand equity (Arora & Stoner, 2009; Tong & Hawley, 2009). Past literature has stated that brand personality is found to be related in the contribution of the brand equity (Aaker, 1996a). This is because brand personality is one of the important types of brand associations and it also influence the equity of the brand (Pappu et al., 2005). Brand personality can create and build bonds with consumers, especially if the personality is distinctive, assertive, desirable, and persistent (Lannon, 1993). Therefore, marketers view brand personality

⁶ Aaker, D. A. (1996). Measuring brand equity across products and markets. *California management review*, 38(3).

⁷ Biel, A. L. (1993). Converting image into equity. *Brand equity and advertising: Advertising's role in building strong brands*, 26(10), 67-81.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

as an effective method to differentiate a brand from its competitors, thus increasing marketing effectiveness.

2.3 Brand Uniqueness

The uniqueness of the brand is important for entrepreneurs in distinguishing their products from the competitors' products. The importance of brand uniqueness will certainly make a difference where consumers will be more likely to choose products that have a unique image of the brand. This has been proved by Walgren, Ruble, and Donthu (2012) which have mentioned that the tendency of consumers in choosing items that seemed unique and different. Brand uniqueness is found to be desirable characteristic of the brand that the brand aims to achieve (Keller, 1993; Netemeyer et al., 2004; Vigneron and Johnson, 2004). This is because it provides an edge over its rivals (Hakala, 2011; Keller and Lehmann, 2006; Ooi and Stober, 2008). On the other hand, if the brand is not considered as unique compared to the competitors, this will create difficulties in gaining customer attention and generating consumer expectations and commitment. Some authors argue that brands which have unique images are difficult to imitate and it will be costly to compete, hence it will be provide the firms that own that brands to have a competitive advantage (Davis et al., 2008). This can be seen through the several definitions from the previous literature about brand uniqueness which has shown in Table 2.3.

Table 2.3: Definition of Brand Uniqueness

Researcher	Definition
Netemeyer et al. (2004)	The degree to which customers feel the brand is different from competing brands and how distinct it is relative to competitors. (p. 211)
Golder, Mitra, and Moorman (2012)	The tendency of people to stand out from each other naturally.
Malik et al. (2019)	The degree to which a brand defers from similar rival brands on the market.
Hassan, Bashir, & Fahim (2019)	Property of a brand in which the brands have some superior advantages and unique characteristics than the rival brands.

The importance of uniqueness can also be linked to the brand equity. Although the uniqueness of the brand is studied under the different aspects of brand equity, but advantages and uniqueness are collectively considered suitable for measuring brand differentiation. Past study has discussed the uniqueness concept as the sub-dimension of differentiation (Netemeyer et al., 2003; Szócs, & Berács, 2015).⁸ The author also stated that uniqueness is positively associated with consumers' willingness to pay the premium price that ultimately ripen willingness to purchase (Netemeyer et al., 2004).⁹ In other words, brand uniqueness is important in determining the extent to which a brand image can be well perceived in the minds of consumers and the extent to which the brand can

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

provide high uniqueness which contains properties and advantages that make it special and different from competitors.

3 Methodology

3.1 Sampling and Data Collection

An online questionnaire is used for data collection method. The study is targeted on SMEs consumers that often to use online platform in purchasing Muslimah apparel. Apart from that, a snowball sampling is selected for determining the data of SMEs consumers from identified sample size. The study is designed to collect data from 200 valid samples based on the minimum sampling theory Sekaran (2003).

3.2 Research Construct

This study uses research construct as abstract ideas in measuring survey questions. The research construct below consists of independent and dependent variables, definitions, and several items from selected past literature.

Table 3.1: Research Construct

Variables	Definitions	Items
DV: Brand Equity (D. A. Aaker, 1991)	A set of brand assets and liabilities linked to a brand, its name and symbol that add or subtract from the value provided to a firm or to that firm's customers (p.15). These assets include brand awareness, perceived quality, brand associations, brand loyalty and other proprietary assets.	8 items
IV 1: Brand Personality (J. L. Aaker, 1997)	The set of human characteristics associated with a brand. (p. 347)	10 items
IV 2: Brand Uniqueness (Netemeyer et al., 2004)	The degree to which customers feel the brand is different from competing brands and how distinct it is relative to competitors. (p. 211)	4 items

3.3 Data Analysis Method

The data that have been collected in the study will be analysed by using computer software which is Statistical Programmers for Social Science (SPSS) version 26.0. Moreover, descriptive, reliability and Multiple Regression analysis also has been conducted in the study. In reliability analysis, Cronbach's Alpha for all variables exceeding 0.7 makes it acceptable, since it ranges from 0.7 to 0.9, it is acceptable for an excellent measure. This is also supported by Cronbach (2016) when Cronbach's Alpha is higher, which means that the internal consistency of the item from the scale is higher. For Multiple Regression, the p-value of the variable must be less than the value of 0.05 to accept the hypothesis.

BUSINESS COLLOQUIUM 2020/2021**

4 Result and Analysis

4.1 Sample Characteristics

This section discusses the sample characteristics of 226 respondents who use online platform in purchasing Muslimah apparel from SMEs brand. Apart from that, the section presented the findings about gender, marital, age, educational level, employment status, income, and screening questions.

Table 4.1: Sample Characteristics

Sample Characteristics	Frequency (226)	Percentages (%)
Gender		
• Male	46	20.4
• Female	180	79.6
Marital		
• Single	159	70.4
• Married	67	29.6
Age		
• 18 – 21	39	17.3
• 22 – 25	110	48.7
• 26 – 29	40	17.7
• 30 and above	37	16.4

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

4.2 Hypothesis Testing

This section discusses the result that obtained from Reliability analysis and Multiple Linear Regression of independent and dependent variables in the study.

4.2.1 Reliability Analysis

Table 4.2 indicates the result of reliability analysis in independent variables (Brand Personality and Brand Uniqueness) and dependent variable (Brand Equity) for this study. The result of Cronbach's Alpha for brand personality is 0.909, followed by brand uniqueness which is gained 0.900. In contrast, the result of Cronbach's Alpha for brand equity which represent as dependent variable is 0.904. The coefficient Alpha for reliability test of all variables is 0.958. These results have indicated that all variables in this study is an excellent in consistency and stability. Hence, the reliability coefficient which obtained by the researcher in the study is reliable and accepted.

Table 4.2: Reliability Analysis

Variables	N of Items	Cronbach's Alpha	Internal Consistency
Brand Equity	8	0.904	Excellent
Brand Personality	10	0.909	Excellent
Brand Uniqueness	4	0.900	Excellent
All Variables	22	0.958	Excellent

4.2.2 Multiple Linear Regression

According to Table 4.3 of model summary, the determination of R² (R Square) is 0.768. It means that 76.8% of all independent variables which are brand personality and brand uniqueness have explained to the variance of dependent variable (brand equity) in the study.

Table 4.3: Model Summary^b

Model	R	R Square	Adjusted R Square	Std. Error of The Estimate
1	0.876 ^a	0.768	0.766	0.32068

a. Predictors: (Constant) Brand Personality and Brand Uniqueness

b. Dependent Variable: Brand Equity

Based on Table 4.4, there is a significant effect of brand personality and brand uniqueness ($p < 0.05$) towards brand equity. In every unit increase of brand personality, brand equity will increase by 0.36 (β). Meanwhile, in every unit increase of brand uniqueness, brand equity will increase by 0.52 (β). The study proved that the most important variable which had a great impact in clarifying the consumers perceptions towards Muslimah SMEs brand is brand uniqueness with the beta value is 0.52 greater than 0.36 in brand personality. This result shows that how influential of the independent variables which are brand personality and brand uniqueness can influence brand equity of Muslimah fashion SMEs among consumers.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Table 4.4: Multiple Linear Regression (Coefficients^a)

Model	Unstandardized Coefficients		Standardized Coefficients	t	Sig
	β	Std. Error	β		
1 (Constant)	0.482	0.152		3.164	0.002
BP	0.364	0.056	0.330	6.447	0.000
BU	0.515	0.044	0.595	11.609	0.000

a. Dependent Variable: Brand Equity

5 Recommendation and Conclusion

As from the results stated, this study is focused on how brand personality and brand uniqueness can affect brand equity of Muslimah fashion SMEs among consumers. The results confirmed that both independent variables which are brand personality and brand uniqueness have a significant impact towards brand equity. Apart from that, the study also has a strong support for the research value on both independent variables.

Based on the analysis of the entire variables, it has been proved that the study has fulfilled the minimum requirement of reliability since all the value of Cronbach's Alpha coefficient indicates greater than 0.6 which all variables obtained an excellent in consistency. Moreover, the highest beta value which had a great impact in clarifying consumers perception towards Muslimah fashion SMEs brand is brand uniqueness, and then followed by brand personality. The result demonstrated that the variables are significant and supported the hypotheses in the study. Therefore, this research has fulfilled the objectives in investigating the impact of brand personality and brand uniqueness towards brand equity of Muslimah fashion SMEs among consumers.

Although this study has met the objectives of the research, but there are still limitations that need to be emphasized and need to be improved for future studies. Lack of academic literature is one of the limitations that obtained from the study. However, some areas of this study have not yet fully explored the need for future branding research, particularly in Muslimah fashion industry in Malaysia. Limitation also occurred since the current study is only investigate on the impact of brand personality and brand uniqueness towards brand equity of Muslimah fashion SMEs, yet it would be interesting if the future studies implement the study on other branding strategies like brand performance, brand trust, brand image, brand credibility etc.

Moreover, the current study is based on Aaker's brand equity model and it really recommended if the future studies apply this context in different theory such as Keller's brand equity pyramid or Yoo and Donthu brand equity model. Apart from that, the current study is limited on the industry which is Muslimah fashion SMEs brand. To avoid the sample bias in the study, it will be more interesting if future studies are conducted on a more diverse sample of users or in different sampling technique. It also necessary for future branding research in fashion industry to be conducted extend the line that only focus on one category which can avoid bias such as modest fashion etc.

6 Acknowledgements

All praise and thankfulness to Allah S.W.T, The Most Glorious and The Most Omnipotent, with His willingness, the researcher have completed the proposal even during covid-19 pandemic outbreak. The efforts made by the researcher in analyzing the chosen topic is worth within the given of period time.

Apart from that, the researcher would like to thank her supervisor, Assoc. Professor Dr. Noor Hasmini Binti Hj Abd Ghani and her examiner, Dr. Noorshella Binti Che Nawi for the dedication and guidance in giving clear instructions for her to carry out this research smoothly. All valuable advices and tips given are highly appreciated by the researcher as they have helped her to have a better understanding and lead through completing the project successfully.

Finally, a special thankfulness is also expressed to her beloved family, and fellow friends for the continuous supports, encouragements and prayers that act as an inspiration and strength for her to stay motivated as well as being her ears during the difficult time throughout the implementation of this proposal. Moreover, her deepest appreciation goes to the cooperative respondents which contributes their times and efforts in answering the distributed questionnaires and making this research possible.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021

**THE EFFECT OF THE PRODUCT QUALITY, SHIPPING
TIME AND DELIVERY COST ON CUSTOMER
SATISFACTION TOWARDS SHOPEE MALAYSIA**

Paviethra Suntharajan and Munirah Binti Mahshar

Faculty of Entrepreneurship and Business,
Universiti Malaysia Kelantan,
Malaysia.

Email: paviethra.a17a0935@siswa.edu.com.my; munirah@umk.edu.my

Abstract:

As the globalization happened, the information and technology is also rapidly growing and developing. Consequently, Malaysia has also been feeling the impact of the growing and developing information and technology. One of the biggest effect is the shifting customer behavior which makes people prefer buy things online through platforms like e-commerce, which is just one click away. Thus, the e-commerce should try to gain customer satisfaction that can be done by creating their competitive advantage. This research then examined the effect of the product quality, shipping time and delivery cost on customer satisfaction towards Shopee Malaysia, as one of the top rank e-commerce. Quantitative method was used to analyze the variable significance in the population that are represented by the samples, which are the respondents who have ever bought any product in Shopee and are living in West Malaysia. A total of 326 unknown respondents were participating through the online questionnaire. The study found that there is a significance effect of the product quality, shipping time and delivery cost towards customer satisfaction, both individually and simultaneously. The study will provide an insight and knowledge to Shopee, readers and future research in order to find out the influence of the factors in gaining competitive advantage and create a sustainable e-commerce business in Indonesia.

Keywords: e-commerce, Shopee, shipping time, delivery cost, customer satisfaction

1 Introduction

Shopee is one of the biggest e-commerce in Malaysia with the highest ranking in term of AppStore and PlayStore. It is one of the leading e-commerce in Taiwan and Southeast Asia. Customer satisfaction is whether the goods or services provided by the business match the expectation had by the customers. Logistic is important as it provides both cost and service for the customer. Many of the e-commerce has also been promoting their platforms in the form of free shipping cost. There are also some effects

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

on the delivery time and shipping charges in term of customer satisfaction and purchase intention.

1.1 Problem Statement

E-commerce helps customers to buy goods and services with just a mere click that can be done online with the help of internet (Handoko, 2016) . Customer satisfaction is whether the goods or services meet the customer expectation (Sharmin, 2012) that may be seen from a single characteristic or feature and also the product as a whole (Ilieska, 2013). However, customer satisfaction in using e- commerce has been decreasing in the recent year. As one of the most well-known e-commerce in Malaysia, of course Shopee Malaysia has also been impacted by the situation. The low performance of Malaysia's logistic as a result of lack in infrastructure has resulted to lots of problems. Malaysia which consists of islands also added up to the problems in logistic. In e-commerce, the delivery service in term of cost and time are the most important aspects (Lin, Wu, & Chang, 2011) . Therefore the researcher came up with the second and third statement of problems, which are: Is there an influence of shipping time on consumer satisfaction towards Shopee Malaysia? And is there any influence of delivery cost on consumer satisfaction towards Shopee Malaysia. It is also important for the research to reveal a study on whether there is any simultaneous influence of quality on shipping time and delivery service on consumer satisfaction towards Shopee Malaysia.

1.2 Research Questions

- 1)Is the product quality effects the consumer satisfaction on Shopee Malaysia?
- 2)Is the shipping time effects the customer satisfaction on Shopee Malaysia? 3)Is the delivery cost effects the customer satisfaction on Shopee Malaysia?

1.3 Research Objectives

- 1)To analyze is effect of product quality on customer satisfaction on Shopee Malaysia?
- 2)To analyze is effect of shipping time on customer satisfaction on Shopee Malaysia?
- 3)To analyze is effect of delivery cost on customer satisfaction on Shopee Malaysia?

1.4 The Significance of the Study

This study will provide an insight on whether the product quality or shipping time or delivery cost give biggest effect towards the consumer satisfaction and whether all of them have a simultaneous effect towards consumer satisfaction in Shopee. This study will then help Shopee Malaysia to have an in-depth understanding towards the factors that actually effect the customer satisfaction and create a strategy that may help the

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

company in order to satisfy the customer and create a competitive advantage to become a market leader in Malaysia e-commerce.

2 LITERATURE REVIEW

2.1 Theory of Planned Behaviour

The Theory of Planned Behaviour (TPB) was prepared to manage the restrictions of the Theory of Reasoned Action (TRA) and carry out to anticipate the intention of individuals to participate in behaviour inside a specific venue, time and to describe all behaviour over which and individual has the ability to apply self-control. Moreover, Theory of Reasoned Action (TRA) was created to estimate and appreciate human behaviour including attitude (Olumide, 2016). This bring meaning that how much people see a specific behavioural positively which is attitude, or predicts that considerable other need them to take part in the behaviour which is subjective norm and trust that they are fit for completing the behaviour which is perceived behavioural control, serve as immediate determinants of the degree of their intention to perform the behaviour (Yakasai & Jusoh, 2015).

2.2 Research Hypothesis

In this study, development of this hypothesis tested using an appropriate statistical analysis procedure to decide if it can be accepted or rejected relating to the relationship between product quality, shipping time and delivery cost on customer satisfaction towards Shopee Malaysia.

H1: There are significant relationship between product quality on customer satisfaction towards West Malaysia Shopee Malaysia.

H2: There are significant relationship between shipping time on customer satisfaction towards West Malaysia Shopee Malaysia.

H3: There are significant relationship between delivery time on customer satisfaction towards West Malaysia Shopee Malaysia.

2.3 Research Framework

A research framework has been conducted to investigate the connection between the product quality, shipping time and delivery cost on customer satisfaction towards Shopee Malaysia.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Figure 1: Research framework of the effect of product quality, shipping time and delivery costs towards Shopee Malaysia.

Source: The role of conceptual frameworks in epidemiological analysis (Victora, C. G., Huttly, S. R., Fuchs, S. C., & Olinto, M. T., 1997)

3 METHODOLOGY

3.1 Research Design

This research used a quantitative method and questionnaire was distributed to 326. In addition, research design may help researchers in order to carry out research objectives. West Malaysia Shopee users will be surveyed to answer the questionnaire.

3.2 Data Collection

Firstly, the data collection used in this study is questionnaire. This method is clear and uncertainties can be resolved. A questionnaire will be assigned randomly to the respondent and according to table of Krejcie and Morgan (1970), our respondent will be 326 West Malaysia Shopee users. Secondly, the next stage of data collection was a fieldwork. A set of questionnaires was distributed to the population which West Malaysians to collect the data. In this research, questionnaire will be divide into seven section which is Section A for demographics (gender, age and ethnics), Section B, Section C and Section D for independent variables (product quality, shipping time and delivery cost) and the Section E for dependent variable (customer satisfaction) In this questionnaire have use an ordinal scales to measure the levels of agreement or disagreement on some questions.

3.3 Participant

Participants were 326 West Malaysia Shopee users. 206 participants identified themselves as women and 120 participants identified themselves as men. Participants mostly in their 20-31 years old.

3.4 Sampling

For this research, researcher use probability sampling method which is cluster sampling as a sampling procedure. Researcher will use the cluster sampling because researcher divide the population into separate group called clusters. This method applied to make sure a fair and equal representation of the variables for this study.

3.5 Data Analysis

The data obtained will be analyse using Statistical Package for the Social Science (SPSS) and the data types of data analysis used are reliability analysis, descriptive statistic, and spearman correlation.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

4 FINDINGS

The study was conducted to identify the effect of customer satisfaction towards product quality, shipping time and delivery cost among Shopee Malaysia. The dependent variable in this study was important to identify the customer satisfaction. Whereas, a set of independent variables which product quality, shipping time and delivery cost. The analysis of data includes descriptive analysis, reliability analysis and Spearman Correlation Coefficient. This research has three objective which are to identify the relationship between product quality on customer satisfaction, to identify the relationship between shipping time on customer satisfaction, to identify the relationship between delivery cost on customer satisfaction among West Malaysia Shopee Malaysia users. Based on the result that researcher, the effect of product quality, shipping time and delivery cost towards customer satisfaction among West Malaysia Shopee Malaysia users. It shows that there were similarities that occur between previous study and current study which were supporting the hypothesis that has been stated in previous study. The three factors which is product quality, shipping time and delivery cost gave the significant effect on customer satisfaction towards Shopee Malaysia.

5 DISCUSSION AND RECOMMENDATION

It would be better if the future researcher may try to find a wider population and samples that may come in term of number of respondents or also the scope of the study. The researcher may also try to find the specific scope in order to know better the results in the area and become useful for the surroundings. Next, the future researcher is recommended to expand the sample size and the population in order to get more accurate and diverse outcome of the study. The study was conducted only at East Malaysia. It is recommended that future researchers perform similar research in different universities, states or even in Malaysia as it will lead to a different outcome. In addition, in order to improve the quality of the data obtained, the number of respondents can be expanded for future studies. To get an accurate result from larger amount of responses, future researchers must take a longer duration for data collection and analysis.

6 CONCLUSION

This study focuses on the effect of product quality, shipping time and delivery cost on customer satisfaction towards Shopee Malaysia among West Malaysia. Organizations can use the outcome of this study to determine the effectiveness. Shopee Malaysia is one of the top e-commerce in Malaysia and it is one of the upcoming e-commerce too. It is used by many people on Malaysia. This three factors are one of a big reason for this Shopee Malaysia growth. The minimum requirement for reliability analysis has been met from the study of the overall variable since the value of the Cronbach's Alpha coefficients is above 0.5. The independent variables identified as the product quality, shipping time and delivery cost indicates the significant relationship to the dependent variable known as the customer satisfaction. Based on the hypothesis result, all the H0 have been rejected while H1, H2 and H3 have been accepted in this study. Most notably, this study has established that most of the east Malaysian are influence with the this

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Shopee Malaysia. They are also really concerned about the specifications of the organizations that they wish to want to work and perform well. Finally this this three factors which is product quality, shipping time and delivery cost are give significant effect towards this Shopee Malaysia. East Malaysian wants the Shopee Malaysia to upgrade more for enjoy their online shopping.

**HOW DOES THE MANNEQUINS IN WOMEN'S RETAIL
STORE AFFECT THE CONSUMER BUYING
BEHAVIOUR IN KUALA LUMPUR**

Purnima Thayalan and Nik Noorhazila Binti Nik Mud

Faculty of Entrepreneurship and Business,
Universiti Malaysia Kelantan,
Malaysia

Email : purnima.a17a0616@siswa.umk.edu.my; noorhazila.nm@umk.edu.my

Abstract:

This thesis is investigating the Influencing factors of Mannequin that affect the Consumer Buying Behaviour in women's retail stores in Kuala Lumpur. The purpose of this study is to determine the Influencing factors of Mannequin that affect the Consumer Buying Behaviour in women's retail stores in Kuala Lumpur. The Data is collected by means of questionnaires obtained from 375 women respondents in Kuala Lumpur. Non-probability sampling which is a Convenience Sampling method has been implemented in this study in order to allow researchers to collect the respondents quickly and efficiently as the target respondent's population is large. This study used Descriptive Analysis, Spearman Correlation Analysis and Multiple Linear Regression Analysis. From the result, all the Independent Variables are significant with the Dependent Variable with the value of ($p < 0.05$) and the most dominant variable of the study is Features of Mannequin with the value of ($p < 0.05$), ($b = 0.333$). Factors of Mannequins that affect the Consumer Buying Behaviour will be the Colour Display of Mannequin, Features of Mannequin and Position of Mannequin while the most effective factor is Features of Mannequin in this study.

Keywords: *Factors, Mannequin, Consumer Buying Behaviour, Colour Display of Mannequin, Features of Mannequin and Position of Mannequin.*

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

1 Introduction

Over the past decade, Malaysia has been one of the leading manufacturing economies in South-east Asia. According to the survey conducted by (Cohen, 2014), the manufacturing sector in Malaysia returned to growth in June, growing sharply to (51%), its highest since September 2018. This was up from (45.6%) in May, reflecting an increase in the health of the products manufacturing sector in Malaysia and stronger economic growth more broadly. Thus, according to the retail industry, the retail sector is thus one of the main contributors to the Gross Domestic Product (GDP) of Malaysia¹ and also offers job opportunities and raises sales profits (Jaapar, Zawawi, Bari, & Ahmad, 2012). Hence, in this research, this study is to investigate the Influencing factors of Mannequin that affect the Consumer Buying Behaviour in women's retail stores in Kuala Lumpur. This paper will consider, along these lines, the argument on the variables of mannequin activities in the women's retail store for women's expectations in order to increase the awareness of the mannequins to the customers. The key motive behind this paper is to examine the variables of mannequins that affect the purchasing behaviour in women's retail stores in Kuala Lumpur (Shealy, 2016).

In the previous studies, the store display is a perfect sample to make effective use of this psychological framework (Mehta & Chugan, 2012). When consumers visit a retail outlet the window display is the first thing they consider. While, merchandise display, according to Zentes et al. (2017: 2019), is a term widely used in-store marketing (Upadhyay, Jauhari, & Singh, 2017). Now, in this research study, the researcher had conducted a research in examining and identifying the relationship between the Colour Display of Mannequin, the Features of Mannequin, and the Position of Mannequin as well the most Dominant factor of Mannequin (Colour, Features and Position) that affect the Consumer Buying Behaviour towards women's retail stores in Kuala Lumpur. The results of this study shows the importance of mannequin display to female consumers in particular and that mannequin should be physically enticing to draw customers to the store (Fister, 2009).

2 Literature Review

2.1 *Envisioning Theory*

This theory is described as the strength of consumers via pictures of customers on a mannequin in the clothing being shown. Envisioning enables the consumer to imagine themselves on a mannequin in the garments as they see it, as well to imagine how the clothing displayed would look on their own body and expect a degree of product fit, and consumer depend on the mannequin (Menon, Sigurdsson, Larsen, Fagerstrøm, & Foxall, 2016). Envisioning would refer to the degree to which customers would envision themselves wearing an outfit displayed on a mannequin and how in the context of a store environment the outfits portrayed would look². Envisioning factors in the context of Colour Display, Features and Position of the Mannequin can be the hypotheses used in these studies focused on the independent variables of mannequin characteristics to be introduced. Mannequins provide shoppers with a visualisation of whether the commodity is good for them or not (Anitha & Selvaraj, 2010).

The importance of Envisioning theory in these studies is to be described as the importance of photography in visual merchandising that had been highlighted by the previous studies of Lindström et al. (2015) that should take into consideration the life of an imaginary mannequin in a show³. With its unnatural proportions and colour as well as lack of facial characteristics, it may be daunting for customers to picture them individually wearing the clothes displayed on the display when looking at such strange body types. However, it is also true that the mannequin's abstractness will cause customers to replace themselves psychologically in their role (Nayak, 2017). For instance, consider another extreme practical mannequin with the right proportions of the body, hair colour, colour of the eyes, and a recognizable race. A customer with identical features to the mannequin can see that the mannequin naturally realises that it resembles them and hence conveniently represents the items (Engdahl & Gelang, 2019).

2.2 *Previous Studies*

Mannequin

For decades, the introduction of mannequin as a means of showcasing where the apparel was part of the presentation of clothing in brick and mortar shops (Cohen, 2014). The mannequin's history and its use in today's retail stores were documented in 1997 by Schneider. In order for the windows to draw customers into the shop, these mannequins were shown. One of the study participants said "The body shapes of those mannequins look good to my body, I can predict how I'm going to look nice at the lingerie patterns" (Wanniachchi & Kumara, 2016). The participant feels that "there is a short conceptual gap between my body shape and that seen in the window, "another participant said (Fister, 2009). The writers believe that the mannequin has a very similar body structure and proportions to consumers appear to leave consumers with a stronger perception. The authors also noticed that headless mannequins encourage customers to place

³ Young, H., Kwon, W. and Lennon, S. (2007), "Online visual merchandising (VMD) of apparel web sites", Article of Fashion Marketing and Management: An International Journal, Vol. 11 No. 4, pp. 477-493.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

themselves on the screen and picture themselves in the clothes featured (Anitha & Selvaraj, 2010). The customers also do not have to be fairly descriptive or have any realistic colour or facial features listed (Pegler & Bliss, 2006).

2.3 *Colour Display of Mannequin*

Colour Display of Mannequin is defined as the panel that can display various colours of mannequin in the store (Gudonavičienė & Alijošienė, 2015). A significant amount of study had been done to understand this association by identifying the stimuli by the colour of mannequins that affect consumer purchase decisions (Renko & Grgić, 2012). Many retail businesses have thus begun studying how to configure these stimuli to build a brand-appropriate retail picture in their shops and encourage their customers to visit the shop and make an order (Engdahl & Gelang, 2019). Previous study findings show that (75%) of visual merchandising stimuli such as mannequin colour influence the actions of customers' store choice and their purchase behaviour. However, despite their potential to influence Consumer Buying Behaviour, one of these significant triggers, mannequins, has been ignored in most studies (Park, Jeon, & Sullivan, 2015). The consumers would be drawn to it. The author concluded from his scientific study that about (65 %) of the factors of Colour Mannequins would ultimately alter the attitude of a consumer to be drawn to get their items in the shop (Randhawa & Saluja, 2017).

H1: There is a significant relationship between the Colour Display of Mannequin and the Consumer Buying Behaviour towards women's retail stores in Kuala Lumpur.

2.4 *Features of Mannequin*

From the aspect of Features of Mannequin, it has been stated that mannequins are an integral part of any powerful display, and ensuring that they have the right features is essential to a well-made display and performance (Joslin, 2017). In the previous research, the authors had stated that abstract ones are the most prevalent type of mannequins. According to Bickle, Burnsed, and Edwards (2015), the authors had conducted a research on Scale of Women happy with the environment of retail clothing stores via the Likert Scale Questionnaire method. In that research it had been stated that (28%) of the nation's clothing buying force is accounted for by plus-size female buyers (Binkley 2013). For example from the study, (63%) of plus-size women view shopping for plus-size apparel as more stressful than stressful, according to NPD Community (2012), shopping for plus-size clothing is viewed by (73%) of plus-size women as more challenging than shopping for standard-size clothing. Besides that, there was a study conducted by (Fister, 2009), stating that Mintel Group Ltd. (2012) the most popular stores patronized by plus-size women according to the state are Walmart (47%), Kohl's (37%), JCPenney (35%), and Target (27%).

H2: There is a significant relationship between the Features of Mannequin and the Consumer Buying Behaviour towards women's retail stores in Kuala Lumpur.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

2.5 *Position of Mannequin*

The researcher also had discovered the suggestions of position but despite that, retailers should understand that with imagination and an artful eye, the placement of mannequins should be achieved in attracting the customers⁴. There was a research stated that in mannequin placement, individual ideas are promoted (Wu, Kim, & Koo, 2015). Anything that can attract a prospective customer's eyes is fantastic. From the lighting, to props, to garments, as well as the theme, all should be considered. Both of these items are vital aspects of the presentation of mannequins, but they must be put before them by (Randhawa & Saluja, 2017). A mannequin used to show lingerie may be in a sensual pose, and an elegant pose may have a mannequin wearing evening wear in the middle of the store. While, Katz (1991) had conducted a research where if it is showing something billowy and flowing or have specifics on the leg that mannequins want to draw attention to the customers, a mannequin in a big leg stand is perfect. But when the mannequin is shown in a tight pencil skirt, this same wide-leg mannequin cannot be usable.

H3: There is a significant relationship between the Position of Mannequin and the Consumer Buying Behaviour towards women's retail stores in Kuala Lumpur.

2.6 *Consumer Buying Behaviour*

According to McKechnie (1992), for some considerable time, understanding the essence of Consumer Purchasing Behaviour has been a key component of marketing research. as a decision process consisting of a number of distinct but interlinked stages, much of the conceptual work has focused around the view of Consumer Purchasing Behaviour (Gudonavičienė & Alijošienė, 2015). There was a previous studies conducted by Engel et al., (1991), stating that the best example of this is the “Engel-Kollat Blackwell model”, which divides the decision-making process into 5 steps which are problem recognition; information search; evaluation of alternatives; purchase decision; and post- purchase behaviour. Moreover, there was a study conducted by Jaakkola (2007), the author explained that research on purchasing behaviour in the form of services has been predominantly conducted based on the use or choice of service suppliers (Ettenson and Turner, 1997; Farrell and Schroder, 1999; Gallouj, 1996; Hill and Neeley, 1988). On the other hand Hassouneh and Brengman (2015), had a survey on a study in the context of skilled consumer services, the purpose of this article is to examine buying decision-making. In this setting, and in the sense of organisational and customer purchasing, the distinct characteristics of purchase decision-making are contrasted, and a theoretical structure for purchase decision-making within professional services is proposed (Vinamra Jain & Sharma, 2012).

H4: There is a significant relationship between the Dominant factor of Mannequin (Colour, Features and Position) towards the Consumer Buying Behaviour.

BUSINESS COLLOQUIUM 2020/2021

2.7 *Conceptual Framework*

INDEPENDENT VARIABLES (IV)

DEPENDENT VARIABLE (DV)

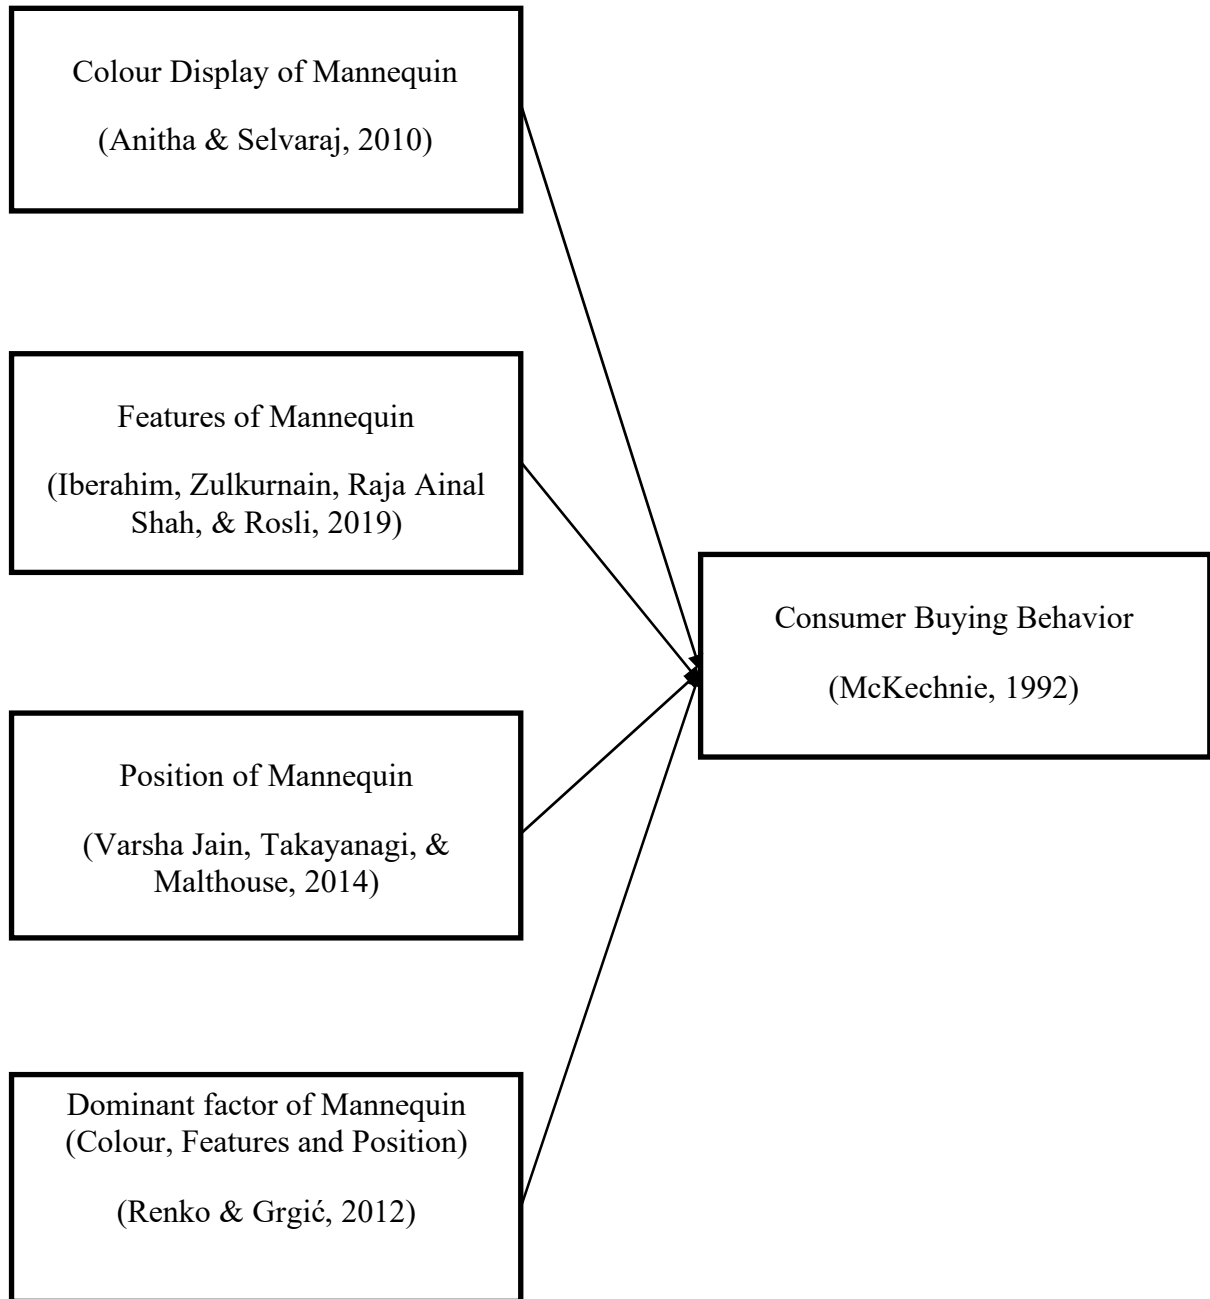

Figure 2.1: Conceptual Framework of the Influencing factors of Mannequin that affect the Consumer Buying Behaviour in women’s retail stores in Kuala Lumpur.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

3 Research Methodology

3.1 *Data Collection and Sample Selection*

In this research design, Quantitative research had been implemented which involves primary data gathering by collecting quantifiable data and carrying out statistical analytical or computational techniques of the 375 female respondents in Kuala Lumpur via google form. Quantitative analysis produces data by means of large-scale quantitative research using techniques such as questionnaires while for the Descriptive Analysis, this analysis had been used in this research to collect the sample size of the research and measure with simple graphic analysis such as for the demographic section of this research questionnaire (Library, 2020).

The sampling selection that had been used in this research is the methodology of Non-Probability Sampling Techniques. In Non-Probability Sampling the extent of bias in selecting the sample of respondents is not known. In this research, Convenience Sampling had been implemented in order to collect the data of the population of 7997 000 million The Department of Statistics (1949), which consists of 15.9 thousand female citizens into 375 respondents as the sample size⁵. The researcher tends to select any available respondents information quickly and efficiently without any obstacles. Hence, the researcher had then shared the questionnaire through online (Google Form) to all the respondents by approaching the respondents at the shopping malls and requesting the respondents to answer the questionnaires. Thus, the reason this sampling had been implemented in this research is because it is quick and easy for picking up the available respondents in Kuala Lumpur in order to collect the information (Gravetter, Wallnau, Forzano, & Witnauer, 2020).

3.2 *Measurement and Scales*

In this research study, the researcher had used two versions for the questionnaire in this analysis that is scaled response and close-ended questions. The questionnaires contained English and Malay languages to utilize in the paper-based form questionnaire. These questionnaires were divided into three sections which are Section A, Section B and Section C. Nominal and Ordinal scales are used for all the three sections of questionnaire of this study. Besides that, the researcher had implemented the Likert Scale scores for the questionnaire such as Scale 1 to Scale 5. The Likert scale would encourage respondents to quickly pick and address the problem without wasting more time answering the study questionnaires.

⁵ The Department of Statistics Malaysia, Wilayah Persekutuan Putrajaya

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

3.3 *Data Analysis Method*

The answered questionnaire will be collected from the respondents and will be converted into numerical form to key in the Statistics Package for the Social Sciences (SPSS) version 26.0. From the SPSS all the data will be derived. Pilot Study which is the Reliability Analysis, Descriptive Analysis, Spearman's Correlation Analysis and Multiple Linear Regression Analysis were used to test the research objectives and hypothesis.

4 Data Analysis

The study was conducted to determine the Influencing factors of Mannequin that affect the Consumer Buying Behaviour in women's retail stores in Kuala Lumpur. In this case, primary data was undertaken which is a set of questionnaires used to get feedback from respondents. According to (Krejcie & Morgan, 1970), based on the table rule of thumb that was developed, the number of the sample is 375 respondents were selected.

4.1 *Descriptive Statistics*

Table 4.1: Overall Demographic Profile Respondents (n= 375)⁶

	n(%)		n(%)
Age		Income(RM)	
21-30 years old	148(39.5)	below 1000	91(24.3)
31-40 years old	107(28.5)	1500-2000	101(26.9)
41-50 years old	56(14.9)	2500-4000	92(24.5)
51 years old and above	64(17.1)	above 4000	91(24.3)
Total	375(100)	Total	375(100)
Race		Shopping for Clothing's	
Malay	114(30.4)	Never	22(5.9)
Chinese	83(22.1)	Rarely	50(13.3)
Indian	90(24.0)	Sometimes	131(34.9)
Others	88(23.5)	Often	80(21.3)
		Always	92(24.5)
Total	375(100)	Total	375(100)
Current Occupation			
Businessperson	36(9.6)		
Service Holder	44(11.7)		
Student	131(34.9)		
Housewife	83(22.1)		

⁶ Statistics Package for the Social Sciences (SPSS) version 26.0

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Teacher	41(10.9)
Retired	40(10.7)
Total	375(100)

From table 4.1, the researcher had concluded that according to the age group, the highest numbers of respondents consist from age (21-30 years old) with the value of (39.5%). This is followed by the age group of (31-40 years old) which consists of (28.5%), then followed by the age of (51 years old and above) with the value of (17.1%) and the least number of respondents are from group (41-50 years old) with the value of (14.9%). According to the race group, the highest respondents are from Malay with the value of (30.4%), followed by Indian with the value of (24.0%), and then by others with the value of (23.5 %) and the least are from Chinese with the value of (22.1%). While, according to the Current Occupation group, majority respondents are Student with the value of (34.9%), followed by Housewife with the value of (22.1%), then by Service Holder with the value of (11.7%), followed by Teacher and Retired respondent's with the value of (10.9% and 10.7%) and the least number of respondents are Businessperson with the value of (9.6%). The highest income of respondents are from the range RM(1500-2000) with the value of (26.9%), followed by RM(2500-4000) with the value of (24.5%) and the least respondents income are from RM(below 1000) and RM(above 4000) with the equal value of (24.3%). Lastly the highest numbers of respondents whom shop for clothing's are from the group of Sometimes with the value of (34.9%), followed by Always Shop for Clothing's with the value of (24.5%), followed by Often with the value of (21.3%) and followed by Rarely with the value of (13.3%). This shows respondents consist of least amount are from the group that Never do Shopping for Clothing's with the value of (5.9%).

4.2 Reliability Analysis

Table 4.2 Reliability Test for Variables of Pilot Test⁷

Variables	Cronbach's Alpha	No. of Items	N (sample size)
Consumer Buying Behaviour	.816	5	30
Colour Display of Mannequin	.824	5	30
Features of Mannequin	.889	5	30
Position of Mannequin	.830	5	30

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Based on table 4.2, according to Hair et.al (2012), the Cronbach's Alpha coefficient for Consumer Buying Behaviour is 0.816 which is classified as good reliability. According to the independent variables of the study, the Cronbach's Alpha coefficient for Features of Mannequin is 0.889 and it is followed by the other independent variables which are the Position of Mannequin at 0.830 and Colour Display of Mannequin at 0.824. As a conclusion, the range of Cronbach's Alpha value is between ($0.8 \leq \alpha \leq 0.9$) for all constructs in this study which is known as good reliability.

4.3 Spearman Correlation Analysis

Table 4.3 Spearman's Correlation Analysis for Independent Variables and
Dependent Variable⁸

Variables	Mean(SD)	Consumer Buying Behaviour	Colour Display of Mannequin	Features of Mannequin	Position of Mannequin
Consumer Buying Behaviour	4.21(0.73)	1.000	.528**	.612**	.641**
Colour Display of Mannequin	4.15(0.75)	.528**	1.000	.687**	.690**
Features of Mannequin	4.18(0.75)	.612**	.687**	1.000	.733**
Position of Mannequin	4.20(0.78)	.641**	.690**	.733**	1.000

From the Spearman Correlation Analysis conducted, it can be summarized that all of the 4 Independent Variables in this study, had a significant relationship ($p < 0.05$) with the Consumer Buying Behaviour. Those are the Colour Display of Mannequin ($r = 0.528$), Features of Mannequin ($r = 0.612$), and Position of Mannequin ($r = 0.641$). Thus, all of these variables had a significant relationship which tends to have a high level with moderate significant factors that affect the Consumer Buying Behaviour. Accordingly in overall H1, H2, H3 and H4 were significant as they had a significant relationship with factors affecting the Consumer Buying Behaviour towards women's retail stores in Kuala Lumpur.

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

4.4 Multiple Linear Regression Analysis

Table 4.4 Model Summary of Multiple Linear Regression Analysis⁹

Variable	Simple Linear Regression			Multiple Linear Regression		
	b	t-stat (95% CI)	p-value	adj.b ^b	t-stat (95% CI)	p-value
Colour Display of Mannequin	0.499	11.595(0.414,0.583)	<0.001			
Features of Mannequin	0.570	15.059(0.496,0.645)	<0.001	0.333	5.165(0.206,0.459)	<0.001
Position of Mannequin	0.564	14.735(0.489,0.639)	<0.001	0.291	4.502(0.164,0.418)	<0.001

After the Simple Linear Method had been implemented, the variable selection had been proceeded with Multiple Linear Regression Analysis by using the stepwise method. In this study, Features of Mannequin and Position of Mannequin had been included in the stepwise method as the p-value is <0.05 while the Colour Display of Mannequin had been excluded. Hence, there is no multicollinearity and interaction was detected in this study. Thus, as a conclusion, there is a significant effect of Features of Mannequin and Position of Mannequin towards the Consumer Buying Behaviour (p<0.05) but according to the beta value, in this analysis, the most dominant variables that affect the Consumer Buying Behaviour will be the Features of Mannequin as it has the higher value of beta compared with the other variable.

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

4.5 Hypotheses Testing Result

Table 4.5: Result of Hypothesis Testing

Objective	Hypothesis	Result of analysis	Decision
To examine the relationship between the Colour Display of Mannequin and the Consumer Buying Behaviour towards women's retail stores in Kuala Lumpur.	H1: There is a significant relationship between the Colour Display of Mannequin and the Consumer Buying Behaviour towards women's retail stores in Kuala Lumpur.	r=0.528	Accepted
To identify the relationship between the Features of Mannequin and the Consumer Buying Behaviour towards women's retail stores in Kuala Lumpur.	H2: There is a significant relationship between the Features of Mannequin and the Consumer Buying Behaviour towards women's retail stores in Kuala Lumpur.	r=0.612	Accepted
To determine the relationship between the Position of Mannequin	H3: There is a significant relationship between the Position of Mannequin and the Consumer Buying Behaviour towards women's retail stores in Kuala Lumpur.	r=0.641	Accepted

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

and the Consumer Buying Behaviour towards women's retail stores in Kuala Lumpur.			
To identify the Dominant factor of Mannequin (Colour, Features and Position) towards the Consumer Buying Behaviour.	H4: There is a significant relationship between the Dominant factor of Mannequin (Colour, Features and Position) towards the Consumer Buying Behaviour.	b=0.333	Accepted (Features of Mannequin)

Based on table 4.5, it can be summarized that all the four independent variables which are the Colour Display of Mannequin, Features of Mannequin, Position of Mannequin and the Dominant factor of Mannequin (Colour, Features and Position) has a significant relationship among the Consumer Buying Behaviour in women's retail stores in Kuala Lumpur. Hence, all the hypothesis is accepted as the p-value is less than 0.05.

5 Discussions and Recommendations

5.1 *Discussions*

H1: There is a significant relationship between the Colour Display of Mannequin and the Consumer Buying Behaviour towards women's retail stores in Kuala Lumpur.

In the analysis, it was found that Colour Display of Mannequin had influenced the Consumer Buying Behaviour towards women's retail stores in Kuala Lumpur. The outcomes showed that Colour Display of Mannequin have a moderate significant relationship with the Consumer Buying Behaviour towards women's retail stores in Kuala Lumpur. This referred to the Spearman's Correlation Analysis (r value) which was 0.528 had shown a moderate significant correlation relationship between the independent variable and dependent variable. This can be seen when the author explained that Colour Display plays a vital role in attracting the customers to purchase their needs and wants (Fister, 2009). According to App, McIntosh, Reed, and Hertenstein (2011), the authors had stated that Colour Display of Mannequin demonstrates that merchandising is more than just the arrangement of items on the shelves. It is an important part of the retail picture in attracting customers. The most unique colour of Mannequin is from white, black and gold.

H2: There is a significant relationship between the Features of Mannequin and the Consumer Buying Behaviour towards women's retail stores in Kuala Lumpur.

Based on the analysis, it was found that Features of Mannequin had influenced the Consumer Buying Behaviour towards women's retail stores in Kuala Lumpur. The outcomes showed that Features of Mannequin have a moderate significant relationship with the Consumer Buying Behaviour towards women's retail stores in Kuala Lumpur. This referred to the Spearman's Correlation Analysis (r value) which was 0.612 had shown a moderate significant correlation relationship between the independent variable and dependent variable. It is supported by (Iberahim et al., 2019). The authors have stated that researchers have shown that Consumer Buying Behaviour occurs because there are certain internal and external influences, such as mannequin features, that affect consumers, not for any particular reason. Besides that, it becomes more important to please any customer who comes in the door of retail stores by the acceptance from the Features of Mannequin.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

H3: There is a significant relationship between the Position of Mannequin and the Consumer Buying Behaviour towards women's retail stores in Kuala Lumpur.

Based on the analysis, it was found that Position of Mannequin had a significant relationship with the Consumer Buying Behaviour towards women's retail stores in Kuala Lumpur. The outcomes showed that Position of Mannequin have a moderate significant relationship with the Consumer Buying Behaviour towards women's retail stores in Kuala Lumpur. This referred to the Spearman's Correlation Analysis (r value) which was 0.641 had shown a moderate significant correlation relationship between the independent variable and dependent variable. Thus, this hypothesis has been supported by Varsha Jain et al. (2014), stating that groups of Floor Mannequins should be arranged as if the mannequins were communicating with each other. This will make the presentations of these massive mannequins look more realistic and less obtrusive. Thus, the placement of mannequins can be performed with ingenuity and with an artful mind where altering the location of the mannequin daily basis is another significant feature of show positioning.

H4: There is a significant relationship between the Dominant factor of Mannequin (Colour, Features and Position) towards the Consumer Buying Behaviour.

The most dominant factor of Mannequin that influences the Consumer Buying Behaviour is the Features of Mannequin. This result can be seen through the Multiple Linear Regression Analysis. Thus, it showed a significant analysis with the value of (b=0.333). This hypothesis will be supported through the answers that have been collected via the google forms respectively. Besides that, according to Lee and Labroo (2004), it has been stated that mannequins play a very significant part in helping shop fixtures stand out against screen pictures. A mannequin is an opportunity for your store to offer customers what they can't see everywhere else, and your models are trying to turn that advantage into sales. Thus, this is the reason a dominant factor of mannequins should be examined to support a specific study.

5.2 Recommendations

5.2.1 Theoretical

In this Theoretical recommendations for the future research, the researcher would like to recommend to the future researcher to implement the use and practices of Envisioning theory by (Menon et al., 2016). Those authors will guide the researcher in many other factors and characteristics of Mannequins that brings advantages towards the retail industry in the future as well will help the shoppers to capture themselves wearing a Mannequin outfit and how the clothes represented would appear in the background of the shop settings (Pegler & Bliss, 2006).

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

5.2.2 Methodological

In this Methodological recommendation, in this analysis, only one form of approach which is the quantitative approach has been used to carry out the study, so only four variables can be tested. Thus, the researcher failed to study more towards the factor of Mannequins. Hence, in future, it is advised that the researcher have a qualitative approach, such as an interview session with customers who frequently shop for clothes, to study Mannequins further from the customer's point of view.

5.2.3 Practical

In this Practical recommendation, any strategic decision by retailers overseeing marketers to implement Mannequin tools and features as part of a company in this field should be followed by a deep understanding of the industry. Besides that, detailed research on how Mannequins are used by all clients need to be studied especially by users (Library, 2020). Thus, it is better for the future researcher to do research on both genders rather than focusing on one gender.

6 Conclusion

This study was conducted to provide an in-depth investigation on the Influencing Factors of Mannequin that influences the Consumer Buying Behaviour in women's retail stores in Kuala Lumpur. Through the analytical results, it indicates that all the independent variables, Colour Display of Mannequin, Features of Mannequin, Position of Mannequin and the Dominant factor of Mannequin that used in this study are significantly affecting the Consumer Buying Behaviour in women's retail stores in Kuala Lumpur. Meanwhile, the findings of this study also indicated that Colour Display of Mannequin, Features of Mannequin, and Position of Mannequin had positive correlation relationship towards the Consumer Buying Behaviour in women's retail stores in Kuala Lumpur and the researcher had concluded that the Features of Mannequin is the most dominant factor of this study.

Therefore, it can conclude that there are great opportunities especially for the retail providers if the retailers manage to integrate on the Mannequins functionalities into their existing business and create real communities around their brands, where customers can be seen and heard (Park et al., 2015). The study also highlights the limitations that occurred and some recommendations to support it. As a conclusion, the Features of Mannequin had the strongest impact towards the Consumer Buying Behaviour in women's retail stores in Kuala Lumpur.

7 Acknowledgements

First and foremost, I am grateful and would like to show my gratitude to our supervisor, for her excellent guidance, and patience to provide me with valuable knowledge and guiding us from the beginning till end. Next, I would like to appreciate the supports from all parties including our family members, friends, and all my fellow group members. Without their mental and financial support, this research may be harder for me to complete it. Last but not least, I would like to thank the respondents, who were willing to sacrifice their precious time to answer the questionnaires. Their sincerity provided me with detailed insight and paved the way for us to conduct all forms of data analysis and research findings smoothly.

FACTORS AFFECTING ONLINE SHOPAHOLIC BEHAVIOUR AMONG GENERATION Z

Santhanalatchumi A/P Subramaniam and Raja Rosnah Raja Daud

Faculty of Entrepreneurship and Business,
University Malaysia Kelantan,
Malaysia.

Email: santhanalatchumi.a17a0638@siswa.umk.edu.my; rosnah.d@umk.edu.my

Abstract:

This research study was carried out to explore the factors affecting online shopaholic behaviour among Generation Z. In this globalization era, online shopaholic platform become the popular topic over the internet but it is still consider new to Malaysia especially among generation Z. Researcher had examined four factors which include attitudes, subjective norms, perceived risks and perceived benefits. The Theory of Planned Behaviour (TPB) was used to explain the independent variables and dependent variables. Researcher gathered data systematically to gain more in depth understanding about online shopaholic behaviour. Quantitative data collection method and judgemental sampling technique has been used. A total 240 of generation Z were tested using questionnaires and being analysed by using Spearman rank correlation with Statistics Package for the social science (SPSS). The results indicates that all the elements have significant relationship with online shopaholic behaviour among generation Z. The implication and future direction of the study were discussed at the end of this paper.

Keywords: *Attitudes, Subjective norms, Perceived Risks, Perceived Benefits, Online Shopaholic Behaviour*

1.0 INTRODUCTION

These days, online business has been quickly growing as another correspondence channel and is contending with traditional channel (Kim and Peterson, 2017). Furthermore, the organizations which put resources into e-commerce will see an enormous number of rivals shortly (Clemons, 2016). Watched development in online deals can be considered as an aspect of the internet benefits because of arrangement of a high volume of quick and inexpensive information (Lee and Dion, 2012). So, to completely use the capability of this phenomenon, entrepreneurs who use e-commerce are a dispersion channel need to have a clear understanding of online purchaser, what they want to purchase on the web and their purposes behind shopping in order to increase their sales (Motwani, 2015). Online shopaholic platform become the popular topic ever over the internet, but it is still considered new to Malaysia especially among generation Z.

To be clear, the main goal of this research is to investigate the shopaholic behaviour which will determine the factors that affecting online shopaholic behaviour among generation Z consumers and those elements will help the sellers to improve their business strategies

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

towards online shopping. Each factor has the valuable contribution to examine the online shopaholic behaviour and there are four research objectives of this research:

- i. To examine the relationship between attitudes and online shopaholic behaviour among generation Z.
- ii. To examine the relationship between subjective norms and online shopaholic behaviour among generation Z.
- iii. To examine the relationship between perceived risks and online shopaholic behaviour among generation Z.
- iv. To examine the relationship between perceived benefits and online shopaholic behaviour among generation Z.

1.1 SIGNIFICANT OF THE STUDY

This study was conducted to measure the relationship between factors that affect online shopaholic behaviour among generation Z. This research will contribute to the deeper understanding in the existing literature about shopaholic behaviour and attitude in online purchasing in the circumstances of generation z.

This research study also will assist researcher to do the improvement on this issue. Four factors which are attitude, subjective norm, perceived risk, and perceived benefit will have a positive and significant relationship with generation Z online shopaholic behaviour. These four variables are chosen because in Theory of Planned Behaviour (TPB) stipulated that behavioural intention controlled by three major determinants which is attitude towards behaviour (AB), subjective norm (SN), and perceived behavioural control (PBC). This bring meaning that how much people see a specific behavioural positively which is attitude, or predicts that considerable other need them to take part in the behaviour which is subjective norm and trust that they are fit for completing the behaviour which is perceived behavioural control, serve as immediate determinants of the degree of their intention to perform the behaviour (Yakasai & Jusoh, 2015).

The research results would enable online shopping retailers and advertisers to improve and execute their strategies and plans for e-commerce marketing. It also enables online retail vendors to build and carrying out an effective marketing strategy. The study may have some implications in the selection of generation Z vary answer from the respondents and small data collection by the researcher.

2.0 LITERATURE REVIEW

Three main issues will determine by the definition of online shopaholic behaviour, related theory and model on online shopaholic behaviour and four factors that affecting online shopaholic behaviour among generation Z. Besides that, theoretical underpinning about online shopaholic behaviour, the literature on selected variables which are independent variables and dependent variables.

2.1 ONLINE SHOPAHOLIC BEHAVIOUR

According to George (2014), the online shopping behaviour of an individual is directly affected by perceived behavioural control. It showed that perceived behavioural control is positively significant linked to real online purchasing (Khalifa and Limayem, 2013).

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

It can be inferred that shopaholic is typically no matter how often they spend capital to purchase something as well as they can satisfy their desire to shop.

Based on the previous study, generation Y is a heavy user of internet which they are willing to accept the new technologies (Salahuddin and Abdullah, 2016). Generation Y also grow up at the information age and tend to be more familiar in conducting technology and has higher purchasing power compare to other generation before the appeared of generation Z (Lim and Othman, 2016). The generation Y consumers are starting to purchase their goods and services via online when they are busy with their working environment and lack of time to move to doorstep of the groceries shop to purchase (Eva and Robin, 2015).

2.2 ATTITUDES

In order to justify and predict customer decisions on consumer goods, attitude is an important factor (Ho, 2013). In other words, it is possible to classify the desires or behaviours of a person by recognising their attitudes (Voon et al, 2011). It shows that attitude represents the positive or negative feeling of individuals towards a specific action (Javadi et al., 2012). In a brief, attitude towards behaviour can be described as a psychological factor or individual factors that may affect an individual's positive or negative manner and thus affect their actions (Sultan & Uddin, 2011). It is an indicator of purpose and finally influences an individual's actual actions (Ho, 2013).

Many previous studies have indicated that the attitude towards online buying will have a significant impact on the online shopping behaviour of individuals (Javadi, 2012). Previous studies, including Choi and Geistfeld (2014) and Truong (2015), have shown that attitude is the major predictor of the purpose of an individual to use an online shopping platform.

2.3 SUBJECTIVE NORMS

The effect of subjective norms on the buying intentions of consumers was explicitly examined by Lee, Murphy and Neale (2013). A survey evaluating subjective criteria with regard to consumption characteristics and behavioural intentions was carried out among consumers between 18 and 24 years of age. The findings showed that among their cohorts, young consumers were susceptible to social effects. It is an intention-related determinant since people's behaviours are typically affected by people's expectations, judgments or opinions relevant to them, such as families, colleagues and friends (Javadi et al., 2012).

The results of past studies have shown that subjective norms are positively linked to the purchase behaviour (Javadi et al., 2012). It suggests that the more individuals convey the understanding of online shopping with each other, the most it will affect the intention of others to purchase online and thus affect others' probability of engaging in online shopping behaviour (Javadi et al., 2012). Subjective norms are one of behaviour intention because the motive and behaviour of individuals will be affected by these important factors (Javadi et al, 2012).

2.4 PERCEIVED RISKS

In online shopping, perceived risk is an essential topic in customer behaviour. This hinders the acceptance of online purchasing. The perceived risk in pursuit of a desired result can be defined as the personal expectation of the customer sustaining a failure (Javadi et al., 2012). According to Sinha and Kim (2012), perceived risks refer to the quantity or type of risks that shoppers can face throughout their purchasing activity. This relates to how much of a person's risks were considered when they were involved in the purchase decision.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

A study by Thompson and Kwon (2014) found there is a significant relationship between perceived risk and intention to shopping online. Perceived risk occurred when the consumers admittance the website by providing their personal information in order to purchase products and services (Zhan, 2012). As a conclusion, it is aligned with the finding of Javadi (2012) the perceived risk has a significant relationship between online shopaholic behaviour.

2.5 PERCEIVED BENEFITS

According to Fei and Liat (2015), perceived benefits are beliefs about the positive results identified with a conduct in response to real or perceived threat. Perceived benefits of the online purchasing are the consumers' subjective perception of gain from shopping online. Besides that, perceived benefits are the consumer needs or wants and the sum of the internet shopping focal points or satisfaction (Forsythe, Liu, Shannon and Gardner, 2016).

Based on the previous study, factors affect consumer behaviour towards online shopping was examined by Akroush and Al-Debei (2015). They discovered that the reputation of websites and the quality of websites was caused by various benefits. These are the key factors that influence the attitude of the customer towards online purchases. Therefore, the essential assumptions of consumer behaviour regarding online shopping seem to be trust and perceived benefits (AlDebei, Akroush, & Ashouri, 2015; Hajli, 2014).

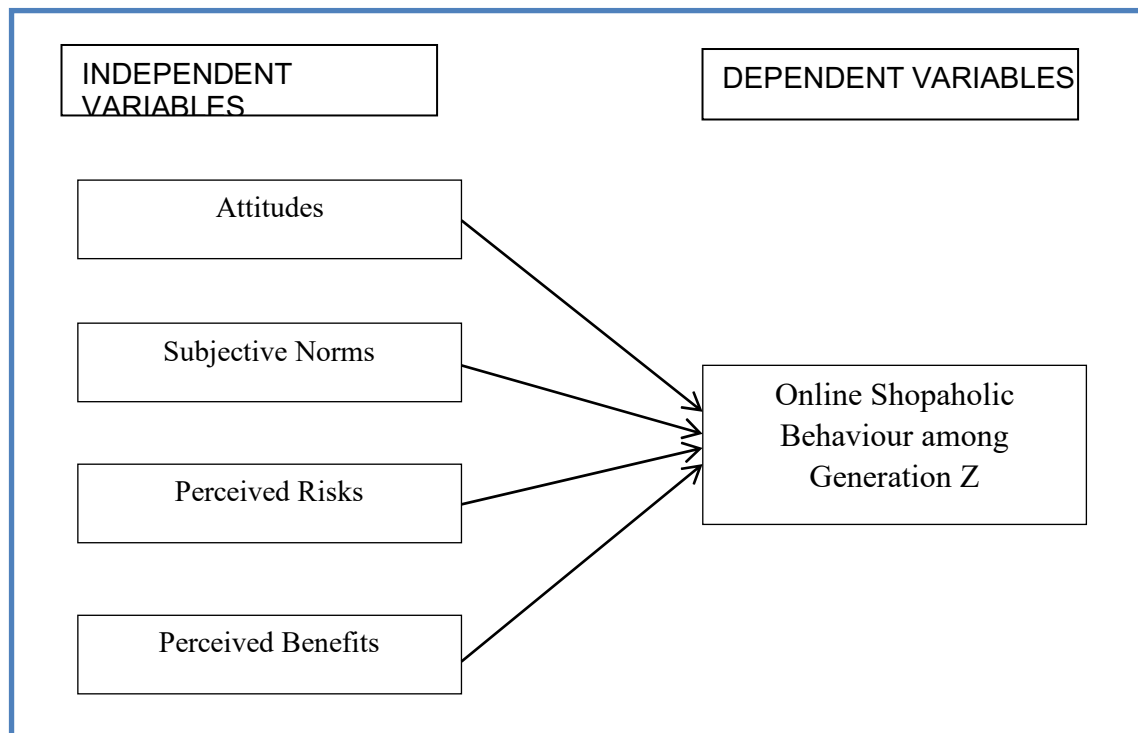

Figure 2.1: Research Framework

(Sources: Developed from Research)

3.0 METHODOLOGY

3.1 RESEARCH DESIGN

The research design was descriptive research. It is important for researchers to meet objectives of the study by selecting the suitable design. Moreover, descriptive research design was used in this study to depict consumer expectations. Among generation Z, there are maximum people online purchasing sites for purchase products. These consumers constitute the study population. Descriptive research was used to analyse demographic profile of the respondents such as gender, age, education, mode of study, nationality and money spent in a month online purchasing by the respondents. Besides that, judgemental sampling technique is used for collected by administering a structured questionnaire to respondents who utilize online for shopping.

Additionally, the present study engages with hypothesis development and testing in order to explain the proposed relationships to make a prediction on the research findings. Researcher collected information deliberately to earn more in depth knowledge about online shopaholic behaviour. Researcher of this study is allowed to adopt a research design as blueprint for the collection, measurement and analysis of data which then use to measure the four independent variables (attitudes, subjective norms, perceived risk and perceived benefits) to explore the main influence of each individual variable as well as their association with the dependent variable (online shopaholic behaviour among generation Z).

Quantitative research is acquiring an evaluated and generalized result from the sample of population. Researcher distributed questionnaires via online survey to get feedback from respondents to assess the variables that influencing online shopaholic behaviour and information gathering is translated in diagrams, tables and from in the following chapter.

3.2 DATA COLLECTION

Data collection can be classified into two which are primary data and secondary data. In this study, quantitative data collection technique will be applied. In primary data, the data will be collected through the online platform using Google form and share the survey link in websites such as Facebook and Instagram. 240 questionnaires will be distributed to the respondents. In secondary data, the sources is including internet sources. For example, the previous journals, articles, case study and more valid information were collected from the Internet which will time saving because the data is instant available since they were published and collected in the earlier study and relatively low cost.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

The reliability of a measure indicates the extent to which it is without bias (error free) and hence ensures consistent measurement across time and across the various items in the instrument. In other words, the reliability of a measure is an indication of the stability and consistency with which the instrument measures the concept and helps to assess the “goodness” of a measure. The first step in analyzing the data that mostly done by research was reliability analysis. The ability of a measure to remain the same over time despite uncontrollable testing condition or the state of the respondent themselves is indicative of its stability and low vulnerability to changes in the situation (Yücel, 2012). Based on the Table 4.1, all the results shown that the questionnaire are above 0.7, it means that all the questionnaire is valid and can be distributed to the respondent according to sample size.

Below is the analysis of the data obtained from factors affecting online shopaholic behaviour among Generation Z. The data analysis will focus on analyzing factors affecting online shopaholic behaviour in terms of attitudes, subjective norms, perceived risks and perceived benefits

Table 4.2: Summary of Demographic Profile of Respondents

Items	Frequency (n= 240)	Percentage %
Gender		
Male	64	26.7
Female	176	73.3
Age		
18-19 years old	24	10.0
20-22 years old	104	43.3
23-24 years old	112	46.7
Race		
Malay	71	29.6
Chinese	65	27.1
Indian	103	42.9
Others	1	.4
Education		
STPM/SPM	31	12.9
Diploma	97	40.4
Degree	102	42.5
Others	10	4.2
1. Have u ever made an online purchase before?		
Yes	240	100
No	0	0

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

2. How many times have you bought things online (during the past 2 months)?		
1-5 times	52	21.7
6-10 times	99	41.3
11 times and above	89	37.1
3. How long have you been shopping online?		
3-6 Months	19	7.9
6-12 Months	38	15.8
1-2 Years	84	35.0
3-4 Years	66	27.5
More than 5 years	33	13.8
4. How would be your estimate of online shopping expenditure (during the past 3 months)?		
Less than RM50	14	5.8
RM50-RM100	43	17.9
RM100-RM300	95	39.6
RM300-RM500	58	24.2
RM500 above	30	12.5

Sources: Developed from Research

Table 4.2 shows the summary of the demographic profile. Regarding to the table 4.1, it illustrates that 176 (73.3%) out of 240 respondents are female and the remaining 64 (26.7%) are male. In the term of age show that most of the respondent is among the age range of 23-24 years old, which achieve 46.7% (112 respondents) in this research. 43.3% (104 respondents) are in the age range of 20-22 years old. Meanwhile, there are only 24 respondents from the age range of 18-19 years old. Hence, the researcher can identify that the majority respondents for this study is aged between 23 years old to 24 years old. In the term of race, Indians monopolize in this study by 103 (42.9%), follow by Malay with 71 respondents (29.6%), Chinese 65 respondent (27.1%) and other races of only 1 respondent (0.4%). There are four categories of education level including SPM/STPM, Diploma, Degree and Others. The highest frequency was 102 respondents or 42.5% goes to Degree. The second highest frequency was Diploma which consists of 97 respondents or 40.4%. Next, the lower frequency was 31 respondents or 12.9% were SPM/STPM while the lowest frequency was others which only consist 10 respondent or 4.2%. The frequency of Degree is among the highest among generation Z. Furthermore, Based on the table above, the highest frequency was 99 out of 240 respondents or 41.3% which shows that 6 to 10 times. The second highest is 89 respondents out of 240 respondents or 37.1% which is 11 times and above. Besides, the

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

lowest frequency of bought things online is 52 respondents or 21.7% which is 1 to 5 times. Based on the findings, the researchers can conclude that more respondents have the frequency of 11 times and above to purchase online. The above table also shows the highest frequency of shopping online is 84 out of 240 respondents or 35.0% which shows 1 to 2 years. The second highest is 66 respondents out of 240 respondents or 27.5% which is 3 to 4 years. Besides, the third highest is 6 to 12 months which is 38 respondents or 15.8%. The second lowest is 33 respondents or 13.8% which is more than 5 years. The lowest frequency is 19 respondents or 7.9% for 3 to 6 months purchasers. Based on the findings, the researcher can conclude that more respondents have the frequency of shopping online is between 1 to 2 years. Based on the table above, the highest frequency is 95 out of 240 respondents or 39.6% which shows RM100 to RM300. The second highest is 58 respondents out of 240 respondents or 24.2% which is RM300 to RM500. Besides, the third highest is RM50 to RM100 which is 43 respondents or 17.9%. The second lowest is 30 respondents or 12.5% which is RM500 and above. The lowest frequency is 14 respondents or 5.8% for less than RM50 purchasers. Based on the findings, the researcher can conclude that more respondents have the frequency of online shopping expenditure is between RM100 to RM300.

Reliability Analysis

Table 4.3: Reliability Test

Variables	Cronbach Alpha	Number of items
Attitude	.887	5
Subjective Norms	.906	5
Perceived Risks	.950	5
Perceived Benefits	.909	5
Online Shopaholic Behaviour	.907	5

In view of the table 4.3 over the outcome show it is that all factors current research acquires the perfect estimation of Cronbach Alpha which is surpass 0.7. The table above is containing 20 items tried by utilizing reliability test. Accordingly, online shopaholic behaviour which is needy variable throughout 5 items and the huge coefficient alpha at 0.907. Independent variables through 20 things that the noteworthy coefficient alpha of attitude at 0.887. Besides that, subjective norms factor shows coefficient alpha at 0.906. Third factor is perceived risks show coefficient alpha at 0.950. Last factor is perceived benefits show coefficient alpha at 0.909. Moreover all responses towards the variables accomplished fantastic reliability test. The all four variables are grouped under excellent reliability consistencies.

DESCRIPTIVE ANALYSIS

Table 4.4: Descriptive statistic for dependent variable and independent variables

	N	Mean	Std. Deviation
IV1_Attitudes	240	4.2008	.78127

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

IV2_Subjectivenorms	240	3.6983	.86783
IV3_Perceivedrisks	240	2.6333	.25317
IV4_Perceivedbenefits	240	4.1800	.89214
DV_Onlineshopaholicbehaviour	240	4.3233	.85116

The table above shows the mean and standard deviation of independent variable and dependent variable which include attitudes, subjective norms, perceived risks and perceived benefits. Based on the result above, the highest mean was recorded among the independent variable is attitudes, with value of mean 4.2008, followed by perceived benefits which is 4.1800, subjective norms and perceived risks with value of mean 3.6983 and 2.6333. The mean for dependent variable which is online shopaholic behaviour is 4.3233.

SPEARMAN CORRELATION

Table 4.5: Spearman Correlation Coefficient of Variables

Spearman Correlation		Attitude	Subjective Norms	Perceived Risks	Perceived Benefits	Online Shopaholic Behaviour
Attitude	Coefficient Correlation	1	0.518**	-.019	.669**	.581**
	Sig. (2-tailed)		.000	0.766	.000	.000
	N	240	240	240	240	240
Subjective Norms	Coefficient Correlation	0.518**	1	.277**	.490**	.429**
	Sig. (2-tailed)	.000		.000	.000	.000

	Sig. (2-tailed)	.000	.000	.238		.000
	N	240	240	240	240	240
Online Shopaholic Behaviour	Coefficient Correlation	.581**	.429**	-.064	.662**	1
	Sig. (2-tailed)	.000	.000	.325	.000	
	N	240	240	240	240	240

** Correlation is significant at the 0.01 level (2-tailed)

Table 4.5 represents Spearman Correlation coefficient analysis. This assessment is to validate the relationship between online shopaholic behaviour and attitude. The result shows there is a positive relationship between online shopaholic behaviour and attitude, $r = 0.581$, $n = 240$, $p = 0.000$. Therefore hypothesis one is accepted. The analysis conclude that online shopaholic behaviour moderately influence attitude at fifty eight point one percent (58.1%).

This assessment is to validate the relationship between online shopaholic behaviour and subjective norms. The result shows that there is a positive relationship between online shopaholic behaviour and subjective norms, $r = 0.429$, $n = 240$, $p = 0.000$. The analysis concludes that online shopaholic behaviour moderately influences subjective norms at forty two point nine percent (42.9%).

Besides that, this assessment also is to validate the relationship between online shopaholic behaviour and perceived risks. The result shows there is a negative relationship between online shopaholic behaviour and perceived risks, $r = -0.064$, $n = 240$, $p = 0.325$. The analysis concludes that online shopaholic behaviour very low influence perceived risks at negative six point four percent (-0.64%).

This assessment is also to validate the relationship between online shopaholic behaviour and perceived benefits. The result shows there is a positive relationship between online shopaholic behaviour and perceived benefits, $r = 0.662$, $n = 240$, $p = 0.000$. The analysis conclude that online shopaholic behaviour highly influence perceived benefits at sixty six point two percent (66.2%).

5.0 RECOMMENDATION

The future researchers can explore more about the perceived risks and perceived benefits that are influencing them. Other than that, sample size has to be increased in further study because there are only 240 respondents in present research. The larger sample size of respondents can affect the future research to be more accurate to represent the feedback of all generation Z in Malaysia and other community.

At the same time, to get more accurate feedback, further researcher can distribute questionnaire to the community because this research has a large scope to be study more. It is possible that everyone will use this kind of method to purchase products or services in their

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

daily life not only for the generation Z. Another aspect that has an effect on the validity of this research is the respondents. The target respondents only focused experienced online shoppers and this in a sense limits the variety of responses that could have been generated because anyone who answered had knowledge about online purchasing at least.

6.0 CONCLUSION

This study focuses on factors affecting online shopaholic behaviour among Generation Z. At the end of this study, findings concluded that three hypotheses were accepted and one rejected. Independent variables which is attitude, subjective norms and perceived benefits shows significant relationship with online shopaholic behaviour among Generation Z. This study implies that generation Z as nowadays consumers who actually looking for easiest ways and services for them to do online shopping. At the same time, they also wanted the less risk services. It proves that consumers are highly influence to new technological platform. Especially generation Z, they are easily influenced to social media where encourage them to do online shopping to save their time and money as a youngsters.

Furthermore, there are some disadvantages of online shopping where it might affect customer's purchase intention which is delay in delivery. This is the most common issue that has been complaint by the online customers. Long duration and lack of proper inventory management will results delays in shipment. What makes customers frustrated and prevent them from online shopping is the delivery time. Customers selecting, buying and paying products not even take more than 15 minutes but to wait for the products arrive at doorstep, it might took 10-15days.

ACKNOWLEDGEMENTS

In performing this research, i had to take the help and guidelines of some respected, who deserve my greatest gratitude. The completion of this research gives me much pleasure. First of all i would like to thanked to my final year project supervisor, Puan Raja Rosnah Binti Raja Daud who continuously guided, advised and supervised me throughout my final year project. Moreover, I would like to express my sincere thanks to all my friend and lecturer who have always been helpful throughout this journey and my university time which have provided me the biggest motivation to go on and strive for excellence. Last but not least. My greatest appreciation to my parents who supported me mentally and financially so that I did not encounter many problems throughout my final year project. Finally thank you to everyone who had helped me in completing this research.

Abstract:

The development e-wallet technology in Malaysia cause the traders to start using it in their business as one of new method of payment. There are several factors that influence the use of e-wallet in business nowadays. This research purpose is to study on trader's intention to use e-wallet in their business, and to determine the factors of e-wallet usage among traders. For methodology, qualitative case study by an interview session with the traders are done to collect the data which is important to fulfil the requirements of the research objective. These findings show several factors from this qualitative study which is show some themes, namely convenience, security, performance expectations and adoption of e-wallet, to explain the factors of e-wallet usage among traders. In brief, this study will be provided rich information and contributed new knowledge that will benefit the future studies.

Keyword: Convenience, Security, Performance expectations, Adoption of e-wallet and Traders

1 INTRODUCTION

1.1 BACKGROUND OF STUDY

The world of Internet made life easy for people. Payments are rendered by means of mobile devices. One of the greatest innovations of the 21st century is electronic wallets (e- wallets) as an important part of the electronic payment system. The term "e-wallet" is a type of digital wallet that enables individuals to attach digital wallets to their debit or credit cards in order to make certain transactions (Digital Wallet ,2019).

An e-wallet is a type of prepaid account where any future online buying can be saved by the user. An e-wallet is safe with a password and a person can pay for grocery stores, online purchases and others. (Arslan & Fröjdh, 2019). There also has many applications such as Touch 'n Go e-wallet, Grab Pay, Boost App, Razer Pay, Maybank Pay and others. It is a fact that e-wallet transfers are more convenient and quicker than traditional banking networks because they save time and resources (Blockchains, 2018). Digital transaction by using e-wallet not only reduce the error of financial transaction process, it also encourages the benefits of a cashless economy, such as the simplicity of financial transfers, convenience and cost monitoring. (Andrew & Tan, 2020)So, e-wallet not only help customers to pay for what they

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

buy but also help them to check their transactions in their personal bank. Development of the cashless system in society as a consequence of customer behaviour, in which they favour technology that offers easy, simple and useful service.

1.2 RESEARCH PROBLEM

Nowadays, the usage of e-wallet has rapidly growth in Malaysia because it very convenience to use it because of some sort of problem regarding the cash payment. It is because they did not want to bring more cash in their wallet to avoid any crime happen to them. There are more comfortable to bring their smartphone and pay using e-wallet rather than bring more cash in their wallet because if they carry more cash, they probably been targeted by those who want to commit crime.

Traders also have to face many problems regarding of their safety of the money in their restaurants and also consumers complaint about an error in returning the balance. This problem could be more serious if the traders did not do anything about how to solve these problems. To avoid this problem from become more serious, the traders can use the e-wallet as their new way of payment in their business. *“Electronic payment (e-payment) which offers a more expedient and cost-effective means of moving funds over paper-based payments”* (Bank Negara, 2010). This policy aims to speed up adopting and inspiring the people with e-wallets in small enterprises and retail outlets to support Malaysia's use of digital payments.

The advanced of the Internet and the arrival of electronic commerce (e-commerce) also accelerated the digitization of payment fees systems by introducing a range of e-payment alternatives, including payment using credit and debit cards, electronic cash, mobile wallets and contactless payment methods. When carrying currency, the cost is often limited to the amount of cash held is reduced. The dilemma or inconvenience endured by consumers in the past use of capital relates to the invention of cashless payment method by e-wallet today.

1.3 RESEARCH OBJECTIVE

There are several factors that influence traders to use e-wallet in their business. So, the research objective of this study is:

‘To identify factors of e-wallet usage among traders’

2 LITERATURE REVIEW

2.1 PAST STUDIES ON E-WALLET

There are many researches that have been done by other researchers in the past. Research paper by Bezhovski (2016) studied that factors influencing the acceptance by consumers of the electronic payment system have demonstrated that the adoption of the system of electronic payment depends on different factors that will impact market demand and consumer ability to implement the new technologies to carry out transactions. So, this show

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

that e-wallet will be one of the convenience methods for both consumers and traders on doing the payment transactions.

The technological developments of fintech goods such as e-wallets, customers are moving from physical money to cashless payment. However, the growth of e-wallets in Malaysia has several realities which is effortless cash transactions accompanied by security and cost savings (Nizam, Hwang & Valaei, 2018). Malaysia has more than 42 e-wallets that have received official license from BNM (Bank Negara Malaysia). So, the development in technology has made e-wallet as a relevant option for traders to make it as their new way of payment.

The study of papers and publications from previous studies will be used as a reference for this research subject. In addition, related theoretical context would be further explored in order to outline a new philosophical framework and the formulation of the hypotheses to determine the link between the relevant determinants will be take place in the next portion.

2.2 REVIEW OF LITERATURE

2.2.1 Convenience

Convenience can be regarded as the ease and comfort of using something. As well as the achievement of a definite advantage by portability driven usage and immediate accessibility. (Sharman & Gutierrez, 2010). Convenience is one of the key factors that had been listed and proposed multiple variables that would the dependent variable can be affected either positively or negatively. Flexibility of the system is a key feature of user usability, as users can quickly adjust to the use of the payment system and incorporate it into the daily life of consumers. E - wallet system offers consumers the convenience to make payment without the limitation of location and time. It is an alternative method for convenient transaction as all payments can be done through a smartphone without other restrictions.

2.2.2 Security

E-wallet is an innovative technology for traders to use to reduce the danger that can affect both consumers and traders. Furthermore, in Batra and Kalra (2016) show that the factors e-wallet adoption was safe and stable, time-saving, easy to use, discounts available, cost monitoring and ease of access. Research found that security of the money exchange was the key concern of the respondents. In other words, if the e-wallet system is safer and more stable, it will promote more traders to adopt e-wallet as their new type of payment in their business.

2.2.3 Performance expectations

According to Teoh Teng Tenk et al. (2020), performance expectation in new technology generally used to measure the degree that consumers believe in a system such as a new mobile technology will bring benefits to their daily lives. They found that performance expectancy is the strongest variable in forecasting the intention to use in the original model. The impact of performance expectancy on behavioural intention is also proven within the mobile payment context (Thakur, 2013; Wang & Yi, 2012). E-wallet system offers consumers the convenience to make payment without the limitation of location and time. It is an alternative method for convenient transaction as all payments can be done through a smartphone without other restrictions.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

2.2.4 Adoption of e-wallet

According to Straub (2009), main goal of the acceptance theory is to research how consumers will make decisions and respond when they discover a new innovation and determine whether to consider it or deny it. E-wallet is an application that enables a person to make some e-commerce purchases by storing their credit card information. (Times, 2020) Payment by e-wallet is currently known to be one of the most popular transaction types, since an electronic transaction using a digital wallet has the benefit of convenience, flexibility and security (Lim, Ahmad, & Talib, 2019).

3 RESEARCH METHODOLOGY

This study highlighted the factors of e-wallet usage among traders in Taman Bendahara, Pengkalan, Chepa, Kelantan. A qualitative research methods are focused on the 'deeper' analysis of the phenomenon (Wycech, 2015). Qualitative case study research obtains answers in the interview and the researcher should not presume that the findings in advance. As a consequence, these methods allow the research to acquire new unique data and enables the analysis to look at the problem from another viewpoint (Wycech, 2015). For the data collection, researcher will interview some of the traders this area to collect some data for this study. The traders that been interviewed will be around five traders that already have their business around Taman Bendahara, Pengkalan Chepa. Researcher will use convenience sampling as the sampling technique of this research. Convenience sampling is a type of non-probability sampling that does not require random collection of participants. The opposite is probability sampling, where applicants are randomly chosen. The key aim of ease sampling is to obtain information from respondents that is readily available to the researcher. (Etikan, Musa, & Alkassim, 2016). This study was used the thematic analysis to explore the data that have been collected in the interview session with the traders. The data will be analyse using five steps to generate the sub- themes for each theme from the conceptual framework.

4 DATA ANALYSIS AND FINDINGS

4.1 DESCRIPTIVE ANALYSIS OF THE PARTICIPANTS

Interview sessions were conducted by the researcher. The participants had to be the traders that use e-wallet in their business to meet the requirements of the study.

Table 1: Profile of respondents

Participants	Number of participants	Code
Food and beverages	3	P1
Telecommunication	1	P2
Bookstores	1	P3

Based on the interview session with the traders, it shows that there are four types of factors that influence the traders to use e-wallet in their business which is convenience, security, performance expectations and adoption of e-wallet.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

4.2 Theme 1: Convenience

For this study, the participants agree that e-wallet are convenience to use for the traders and the customers. There are two categories of sub-theme that can be found in this analysis which is easy to use and new alternative.

4.2.1 Easy to use

The traders explained that e-wallet are easy to use for the them and the customers. It is because e-wallet are the new technology that have been develop to help improve the transactions in business. Most of the business are start to use e-wallet in their business because it easy for the customer to make payment in their store. They mentioned that:

“Our business fell very comfortable to use e-wallet because it can help us improve in our transactions. Not only that, if we hire new employees, they can learn it very quickly”

Participant 1 (P1)

“Yes, because customers nowadays are more convenience to use online payment rather than bring more cash in their wallet. Our business also is start using the e-wallet last year because I think it will help our business to have better transactions in the future”

Participant 2 (P1)

This sub-theme show that e-wallet are type of application that are easy to use for anyone because they only have to scan the bar code to pay the price. So, it will improve the transactions for the traders and for the customers.

4.2.1 New alternative

E-wallet are the new alternative for the traders and customers. It is because e-wallet are new type of technology that have been develop to improve the transactions in any business. E- wallet can help customers to pay more faster at any store that offer e-wallet one of their method of payment. Participants stated:

“Of course, because the usage of e-wallet in our business are still new and we glad to use e-wallet in our business”

Participant 1 (P1)

“Yes. I think e-wallet is a new alternative to replace old type of payment because I think e-wallet are faster in terms of doing accurate transaction rather than use cash”

Participant 2 (P1)

Based on the findings above, the reasons why traders started to choose e-wallet as their new type of payment are because of it very easy to use and e-wallet as a new alternative to improve the transactions between them and the customers. This result also state that traders are convenience to use e-wallet as their new type of payment in their business. So, the result of this study shows that one of the factors that influence traders to use e-wallet as their new type of payment are convenience because e-wallet offers many benefits to traders and customers.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

4.3 Theme 2: Security

Security is as the transaction security when it is using the internet to transfer the information or other things and in the perceived security, it includes the internet security, the perspective of infrastructure, the privacy, and security of the transaction in different distance. There are two categories of sub-theme that can be found in this analysis which is information security and safe transactions.

4.3.1 Information security

Information security is important because traders or customers that using e-wallet did not want their personal information leaked to others. Many e-wallet applications such as TnG e-wallet, Boost App and WechatPay provide best security to prevent the leaked of the personal data of the users. They mentioned that:

“I think e-wallet apps are providing the best security in order to prevent the personal data of the users to be leaked to other persons. For me, it is good to have better security in this apps to help people feel comfortable to use it”

Participant 1 (P1)

“For me it safe for everyone to use it because most of the apps has the best security in terms of protecting the personal data of the users”

Participant 2 (P2)

“In my opinion, mostly of the apps are upgrading their security by days so I sure that all of the information is safe from being hacked by someone”

Participant 3 (P1)

But there are one of the participants that not quite agree about security of e-wallet. The participants stated that:

“I not sure how secured that this apps will provide to prevent this thing happen because nowadays people are getting advanced in terms of technologies so I quite worried about it. But I sure that the personal data of the e-wallet users will safe if they can provide the best security to protect it.

Participant 4 (P3)

This sub-theme shows that most of the traders are agreed that the personal information is safe when use e-wallet. It is because there believe that e-wallet have the best security system to avoid the leaked of the personal data of the users. So, traders will use e-wallet as their new type of payment in their business because they believe e-wallet provide the best security to protect the personal data of its users.

4.3.2 Safe Transactions

This finding shows that mostly of the traders want to have safe transactions of using the e-wallet applications. They want every transaction are safe to prevent any problems while using e-wallet in their business. According to the traders:

“To prevent problem in transaction are our main objective because we want to have safe transactions in our business. Things like not give the customers wrong balance in payment

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

are one of our minor problems that we want to prevent in our restaurant. Using e-wallet are the effective ways to have a better transaction in the future”

Participant 1 (P1)

“Our restaurant wants to have safe transactions and better experience of payment for the customers”

Participant 2 (P1)

“Yes of course we want to have better transaction in our business because we want to prevent problem like shortage in terms of money. Using e-wallet also will make our business to have quick transactions with the customers”

Participant 3(P2)

Based on the interview session with the traders, the result show that mostly of them are agree that by using the e-wallet it can have quick and safe transaction in the future. It is because the security that been provide by e-wallet applications are secured to prevent the personal data of the users to be hacked by another person. In fact, both traders and customers can have quick transaction in payment by using the e-wallet applications.

4.3 Performance expectations

Performance expectation generally used to measure the degree that consumers believe in a system such as a new mobile technology will bring benefits to their daily lives. E-wallet system offers customers the convenience to make payment without the limitation of location and time. It is an alternative method for convenient transaction as all payments can be done through a smartphone without other restrictions. There are two categories of sub-theme that can be found in this analysis which is no limitations and flexible.

4.3.1 No limitations

For this study, participants stated that the use of e-wallet has no limitations and the customers can use it at anytime and anywhere. It is because the customers only have to scan at the merchant machine to pay the product. Participants stated:

“Basically, the customers can buy whatever they want in our store using e-wallet. They can pay the price only by scan their smartphone to the merchant machine as long as their balance in e-wallet account enough to pay the price of the products”

Participant 1 (P3)

“Yes, because customers believe that e-wallet can help them to pay the things that they want to buy by only scan it to the merchant machine without limit. I also very confident that e-wallet have many benefits for both sides”

Participant 2 (P1)

This sub-theme shows that e-wallet have no limit to use as long as the users of e-wallet still have enough balance in their e-wallet account. It will make the transactions to become more quicker because customers only have to scan the bar code at the merchant machine to pay the price.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

4.3.2 Flexible

E-wallet are flexible in term of doing quick transaction. Customers can only use their smartphone that have e-wallet applications to pay the products that they want by only scan it to the merchant machine at that store. According to the participants, e-wallet are flexible because there only have to let the customers to scan the bar code on the merchant machine to pay and they did not have to return the balance of the money because e-wallet already pay on exactly what are the price of the product. Participants mentioned that:

“To be honest, I prefer our customers to pay using e-wallet because it very convenience and flexible because we can do very quick transaction using it. They can use e-wallet at any time without worrying about not to have enough cash in their wallet. It easier using e-wallet rather than cash in business nowadays”

Participant 1 (P2)

“I agree with you because e-wallet are more flexible than using cash money because when you use physical money you have to return the balance but not for e-wallet. I believe that customers also believe that e-wallet are flexible and easy to use to make any transaction at our store”

Participant 2 (P1)

So, based on the data above traders and the customers believe that e-wallet are the new technology that bring many benefits in their daily life especially in term of payment. They believe e-wallet are the best solution to improve the transactions in term of payment because it very convenience for the traders and the customers. Researcher believe that based on the interview with the traders, many of them are more prefer their customers to use e-wallet payment because it very flexible to use it at any time without limitation.

4.4 Adoption of e-wallet

According to the participants, the reasons why they choose e-wallet in their business because of many of their customers are started to use e-wallet in their daily life. It was one of the reasons for the participants to started to provide the e-wallet payment in their business. Most of their customers are already use e-wallet to pay and the participants or traders started to adopt e-wallet in their business as one of the methods of payment in their business. There are one categories of sub-theme that can be found in this analysis which is user friendly.

4.4.1 User friendly

Based on the interview with the participants, they all stated that using e-wallet as their new type of payment is because it very user friendly to the customers. It is because e-wallet are suitable to be use at any age if they have e-wallet applications in their smartphone. E-wallet applications can be installed in android or iOS smartphone so customers can use it at any time at the store that offer payment using e-wallet. They mentioned that:

“I agree because customers nowadays are very comfortable to use e-wallet to make payment. One of the reasons because its user friendly and that why my business use e-wallet as one of the new payment methods for the customers”

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Participant 1 (P1)

“Benefits of using e-wallet in business are many because for me e-wallet are more friendly to the customers to make payment. It is because customers can pay directly without thinking about not having enough cash in their wallet.

Participant 2 (P1)

Based on the data that have analyse above, it can be conclude that traders are really aware of using e-wallet as new way type of payment because of the benefits from it. E-wallet are the new technology that help both traders and customers to have better experience in terms of payment and to have efficient transaction without any problem happen during that transaction. E-wallet also help traders to have proper financial system because e-wallet automatically record every transaction that happen during the business. So, based on the data, it can be concluded that e-wallet is the best type of payment in the business nowadays.

5 DISCUSSION AND CONCLUSION

The findings from this study show that there are several factors that influence the traders to use e-wallet in their business. Most of the traders agree that e-wallet provide good security in terms of protecting the personal data of the users from be leaked to others person. The all mentioned that e-wallet has the best security to protect the information of the users. Based on the past studies by Nizam, Hwang & Valaei, (2018), the growth of e-wallets in Malaysia has several realities which is effortless cash transactions accompanied by security and cost savings. So, its show that security is one of the factors that influence the traders to use e-wallet in their business.

Also, participant agree that transactions performed through e-wallet are safe for both traders and customers. Other reasons why participants use e-wallet in their business the adoption of e-wallet among customers. Research paper by Bezhovski (2016) studied that factors influencing the acceptance by consumers of the electronic payment system have demonstrated that the adoption of the system of electronic payment depends on different factors that will impact market demand and consumer ability to implement the new technologies to carry out transactions. So, participants or traders started to use e-wallet in their business to adapt the current technologies in their business. E-wallet are more user friendly and it very easy to use it so the business of the participants will improve especially in term of do the quick transactions.

On the other hand, in terms of flexibility e-wallet has prove that transactions between customers and the traders can be done any time as long as the customers had enough balance in the e-wallet account. There is no limit for the customers to use e-wallet as long as they have enough balance in the e-wallet account. E-wallet also are a new alternative in terms of do quick transaction. Flexibility of the system is a key feature of usability for traders, as customers can adapt to the use of the payment system easily and integrate it into the daily life of consumers (Arslan & Fröjdth, 2019). This statement is agreed by all the participants because the transaction can be done quicker than the cash payment. So, the participants started to use e-wallet in the business to improve the transaction and to add more type of payment in their business.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

According to Karim, Haque, Ulfy, Hossain, and Anis (2020), due to the advancement of financial technologies, there is a significant growth in cashless transactions. The technological developments of fintech goods such as e-wallets, customers are moving from physical money to cashless payment. So, this past study is related with this study because most of the customers are started to use cashless payment and traders also started to use e-wallet in the business as new type of payment to improve the transactions in the business.

For the conclusion, this study shows that convenience, security, performance expectations and adoption of e-wallet as the factor that influence the traders to use e-wallet in their business. This can be proved by the data that has been collected and analyse that show there are significant relationship of this factors and what influence the traders to use e-wallet in their business. Also, the past studies by other researchers also related with this study. The findings of this study are helpful for the traders because it shows that e-wallet will benefits their business in the future.

6 ACKNOWLEDGEMENTS

I like to thanks my respected and nice supervisor, Dr. Nurul Ashykin binti Abd Rahim, my parents, my friends and all who those had been involved in preparing this research directly and indirectly.

Abstract:

Small and Medium Enterprises (SMEs) do play a vital role in various economies across the world. In previous study discussed the factors affecting financial performance SMEs in Kenya. In this study, carried out to identify the factors affecting financial performance of small and medium enterprise (SMEs) in Kota Bharu, Kelantan. In this globalization era, financial performance becomes the popular topic over but it is still consider new to Malaysia. This study had examined four factors include technology cost, bank credit, employee cost and economic. The objectives of this study, to determine the relationship between dependent variable (financial performance) and independent variables (technology cost, bank credit, employee cost and economic). The main objective is to identify vital factor affecting financial performance of SMEs in Kota Bharu, Kelantan. The scope of this study will beneficial to the SMEs entrepreneur and also for upcoming entrepreneur to know the factors which affecting financial performance of SMEs. The differences between previous studies and this study is the the location and still new to Malaysian SMEs. Trade-Off Theory (TOT) were used to explain the independent variables and dependent variables. Researchers gathered data systematically to gain more in depth understanding about factors that affect the financial performance of SMEs. Quantitative data collection method and random sampling technique had been used. Total 66 valid responses of SMEs in Kota Bharu, Kelantan were tested using google form questionnaires and being analysed by using Pearson's Correlation Statistic Package for the Social Sciences (SPSS). The findings indicates that all the elements have significant relationship with (SMEs) intention. The implication and future direction of the study were discussed at the end of this paper. The result of this study offers a better direction towards financial performance, which lead to an increase the development of SMEs.

Keywords: Bank Credit, Economic, Employee Cost, Financial Performance, SMEs, Technology Cost

1 Introduction

SMEs definition cover all sector namely services, manufacturing, agriculture, construction and mining & quarrying. SMEs divide into three part which is micro, small, and medium. And then they do separate into two categories; manufacturing and services and other sectors. In micro enterprise, the sales turnover less than RM300, 000 or the employees less than 5 full time employees and it is same for both categories. In small enterprise, the sales turnover from RM300, 000 to RM 15 million or full time employees will be 5 to 75 for manufacturing category. By the way, in small enterprise under services and other sectors the sales turnover from RM300, 000 to RM 3 million or full time employees from 5 to 30. In medium enterprise, under manufacturing category the sales turnover from RM 15 million to RM50 million or full time employees from 75 to 200. Under services and other sectors sales

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

turnover from RM 3 million to RM 20 million or full time employees from 30 to 75 (SME Corp Malaysia, 2020).

1.1 Research Question

To examine the relationship between technology cost and financial performance of SMEs in Kota Bharu, Kelantan.

To identify the relationship between bank credit and financial performance of SMEs in Kota Bharu, Kelantan.

To determine the relationship between employee cost and financial performance of SMEs in Kota Bharu, Kelantan.

To examine the relationship between country's economic position and financial performance of SMEs in Kota Bharu, Kelantan.

1.2 Research Objectives

What is the relationship between technology cost and financial performance of SMEs in Kota Bharu, Kelantan?

What is the relationship between bank credit and financial performance of SMEs in Kota Bharu, Kelantan?

What is the relationship between employee cost and financial performance of SMEs in Kota Bharu, Kelantan?

What is the relationship between country's economic position and financial performance of SMEs in Kota Bharu, Kelantan?

2 Literature Review

2.1 Financial Performance

Entrepreneurs are backbone for each country's economy. In previous studies discussed, entrepreneurs help economic growth, provide opportunities for unemployment, and boost countries productivity (Alexander S. Kritikos, 2014). Beneficial impact on economic growth when the utilization of entrepreneurial opportunities (Pamela Mueller, 2007). The characteristic of entrepreneurs has a significant relationship to business success of SMEs in Bangladesh (MA Islam, ME Khan, AZM Obaidullah, SN Alam, 2011) Financial part is one of vital role in organization performance. According to Joseph Kwadwo Tuffour, Awurabena Asantewa Amoako, Ernestina Otuko Amartey (2020) around 35 percent of work is given by the sub-area and shows the significance of outfitting its possibilities in building up the Ghanaian economy. It has been set up that budgetary proficiency impacts whether little scope endeavours succeed.

2.2 Technology Cost

According Henderson and Venkatraman (1993), theory is that investment in computers and other forms of technology does not immediately boost profitability; instead, it is an important tool, but it has to be balanced with corporate considerations like business practises in order to be fully efficient. Based on Shin, N (2001) findings, the results indicate that technology is important for the business parity, not necessary for a comparative edge (i.e. improved profit). In this previous study Hu, Q (2005), technology advantage is a required but inadequate prerequisite for superior performance improvement. Based on Wang, Q., Lai, F., & Zhao, X (2008), higher technology advantage alone cannot guarantee improved financial results; only the complementary relationship between technology advantage and the participation of technology in policy planning can help companies achieve better financial performance.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Without proper coordination between technology plans and corporate strategies, the expense of advanced technology could not be offset by operational or competitive gains that may lead to a decline in the company's financial performance. According to Ombongi, P. N., & Long, W (2018), it is clear from the analysis that the technical element was concerned this growth in the SME sector not only decreases overall costs, but also contributes to efficiency in the activity of small and medium-sized enterprises.

2.3 Bank Credit

According to Investopedia, Alexandra Twin (2020), the term bank credit refers to the quantity of credit available to an enterprise or individual from a banking organization in term of loans. According to Akinyi, S. I (2014), bank funding in Nairobi County has also positive influence on the performance of SMEs in Nairobi County, as access to bank financing is an important ingredient in the creation and eventual growth and performance of SMEs. Based on Ombongi, P. N., & Long, W (2018), bank credit remains the biggest puzzle for many SMEs with little capacity to apply for bank credit financing. Analysis shows that bank credit has an effect on overall firm - level performance since own financing and profitability ratios weren't enough in terms of expansion to SMEs. Banks hold that lending to these SMEs remains low due to lack of certified demand, this has taken the funding deficit to the forefront; a chronic issue in many emerging foreign locations, along with Malaysia (Shamshubaridah Ramlee, Berma Berma, 2013). According to Abor, J (2007), the findings suggest that the capital structure, especially the long-term and total debt ratios, negatively affects the output of SMEs. By this studies, will find out the relationship between bank credit and financial performance.

2.4 Employee Cost

In this previous studies, it pointed out that small and medium-sized businesses generate jobs as well as lead to unemployment due to the uncertainty surrounding their activities, especially in developed countries, due to limited research capability and the potential to perform huge risks that require adequate financing (Katua, N. T. 2014). Based on Blasco, S., & Pertold-Gebicka, B. (2013), asserted the need for businesses to ensure that the workforce is well trained with the expertise and skills required to improve company efficiency and development. According to Ombongi, P. N., & Long, W (2018), the relationship between employee cost and financial performance negatively. Based on Berman, S. L., Wicks, A. C., Kotha, S., & Jones, T. M. (1999), the study also showed that the management of the partnership with key stakeholders, in particular employees, is related to financial performance. A variety of hypotheses and some scientific data indicate that how an organisation handles its employees can influence its financial performance (Delery, J. E., & Doty, D. H. (1996).

2.5 Economic

Small and medium enterprise (SMEs) a vital support in the development especially in economic of the country. Based on, Katua, N. T (2014) defined a direct link between SMEs and economic growth and created job opportunities for more than 50% of total employment in different economies. According to Ombongi, P. N., & Long, W (2018), economic one of factor that can enhance the financial performance of SMEs. Based on Narjoko, D., & Hill, H. (2007), theoretical and observational research shows that global economic crises have profound impacts on firms, but the consequences are inconsistent between firms. The socio-economic development of economies is highly contingent on the successful progress of the small and medium-sized enterprises sector in nations, as well as on the industrial improvement of countries (Donkor, J., Donkor, G. N. A., Kankam-Kwarteng, C., & Aidoo, E. (2018).

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

2.6 Hypotheses Statement

Hypothesis 1 (Technology Cost)

H1: There is relationship between technology cost and financial performance of SMEs.

Hypothesis 2 (Bank Credit)

H1: There is relationship between bank credit and financial performance of SMEs.

Hypothesis 3 (Employee Cost)

H1: There is relationship between employee cost and financial performance of SMEs.

Hypothesis 4 (Economic)

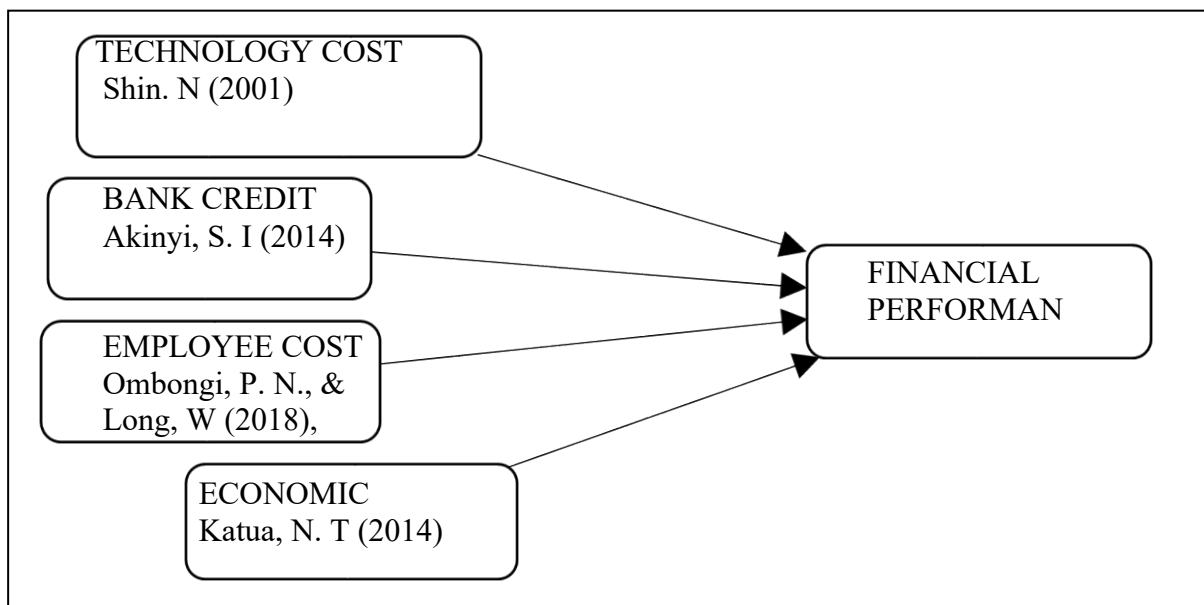

H1: There is relationship between country's economic position and financial performance of SMEs.

2.7 Research Framework

The goal of this research is to investigate the relationship between factors affecting financial performance of SMEs in Kelantan. The four factors which illustrated in the creation of conceptual framework that will affect financial performance of SMEs are technology cost, bank credit, employee cost and economic. Figure shows the establishment of conceptual framework for this research.

Table 4.1: Research Framework

Independent Variable Dependent Variable

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

3. Data Analysis and Findings

Demographic Profile of Respondents

From the table 5.1.1 shows the number of respondents on gender which are male and female. The number of male respondents is more than the female respondents. There are 53.0 percent (n=35) of respondents are male and another 47.0 percent (n=31) are female. Besides, table 5.1.1 shows the number of respondents based on age. The highest respondents is SME from 31 years old to 40 years old, 36.4 percent (n=24) of them had answered this survey while 7.6 percent (n=5) SME from 21 years old to 30 years old, 31.8 percent (n=21) SME from 41 years old to 50 years old, and 24.2 percent (n=16) SME from 50 years old and above that had participated in answering the questionnaire. Other hand, table 5.1.1 shows the number of respondents based on marital status. The highest respondents from Married, 78.8 percent (n=52) of them had answered this survey while 18.2 percent (n=12) from Single, and 3.0 percent (n=2) from Divorce that had participated in answering the questionnaire.

Hence, table 5.1.1 shows the number of respondents based on Category of Business. The highest respondents from Others, 39.4 percent (n=26) of them had answered this survey while 27.3 percent (n=18) from Retail Trade, 15.2 percent (n=10) from Manufacturing and 18.2 percent (n=12) from Printing that had participated in answering the questionnaire. Moreover, table 5.1.1 shows the number of respondents based on Duration of Business Operation. The highest respondents from 4-6 years, 45.5 percent (n=30) of them had answered this survey while 27.3 percent (n=18) from 1-3 years and 27.3 percent (n=18) from 7 years and above that had participated in answering the questionnaire. Last but not least, table 5.1.1 shows the number of respondents based on Number of Employees. The highest respondents from 1-5 employees, 42.4 percent (n=28) of them had answered this survey while 34.8 percent (n=23) from 6-10 employees and 22.7 percent (n=15) from 11 employees and above that had participated in answering the questionnaire.

Table 5.1.1: Demographic Profile of Respondents

Demographic Profile	Valid	Frequency	Percentage %
Gender	Male	35	53.0
	Female	31	47.0
Age	21 years old to 30 years old	21	31.8
	31 years old to 40 years old	24	36.4
	41 years old to 50 years old	5	7.6
	50 years old and above	16	24.2
Marital Status	Single	12	18.2
	Married	52	78.8
	Divorce	2	3.0
Category of Business	Retail Trade	18	27.3
	Manufacturing	10	15.2
	Printing	12	18.2
	Others	26	39.4
Duration of Business Operation	1-3 years	18	27.3
	4-6 years	30	45.5
	7 years and above	18	27.3

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Number of Employees	1-5 employees	28	42.4
	6-10 employees	23	34.8
	11 employees and above	15	22.7

3.2 Descriptive Analysis

There are 25 items are been tested and presented in Table 4.4. All the mean score of those 25 items are above 4.00. This is an indication that the majority of the respondents agree with the items' statements.

Table 5.2.1: Summary of the means of items according to variable (N=66)

VARIABLES	MEAN	STD. DEVIATION
FINANCIAL PERFORMANCE	4.1061	.96666
TECHNOLOGY COST	4.1061	.96666
BANK CREDIT	4.0545	.98202
EMPLOYEE COST	4.0455	1.02330
ECONOMIC	4.1424	.94772

3.2 Descriptive Analysis

Based on table 5.3.1, it shows that the Cronbach's Alpha value for financial performance (dependent variable) is 0.916 which considered as adequate. There are four main measures in independent variables. For technology cost, the Cronbach's Alpha value is 0.951 which considered as preferable. Next for bank credit, the value of Cronbach's Alpha is 0.942 indicates that it is preferable. For employee cost, the Cronbach's Alpha value is 0.965 and for economic, the Cronbach's Alpha value is 0.957 also considered as acceptable.

Table 5.3.1 Result of Reliability Test

VARIABLES	DIMENSIONS	CRONBACH'S ALPHA
DEPENDENT VARIABLES	FINANCIAL PERFORMANCE	0.916
INDEPENDENT VARIABLES	TECHNOLOGY COST	0.951
	BANK CREDIT	0.942
	EMPLOYEE COST	0.965
	ECONOMIC	0.957

3.3 Normality Test

According to Kolmogorov- Smirnova test and Shapiro- Wilk test, $p > 0.05$ is considered as normal while $p < 0.05$ is considered as abnormal. For significant value ($p=0.000$) of Kolmogorov- Smirnova test of all variable and significant value ($p=0.000$) of Shapiro- Wilk test for financial performance, technology cost, bank credit, employee cost and economic are considered as abnormal. It is considered as abnormal because the significant value is less than

BUSINESS COLLOQUIUM 2020/2021**

0.05.

Table 5.4.1 Result of Normality Test

	Kolmogorov-Smirnova			Shapiro-Wilk		
	Statistic	Df	Sig.	Statistic	df	Sig.
FINANCIAL PERFORMANCE	.201	66	.000	.848	66	.000
TECHNOLOGY COST	.201	66	.000	.848	66	.000
BANK CREDIT	.190	66	.000	.857	66	.000
EMPLOYEE COST	.188	66	.000	.845	66	.000
ECONOMIC	.198	66	.000	.834	66	.000

3.4 Multiple Linear Regressions Analysis

In this research, the researcher had implemented Multiple Linear Regression Analysis because the main objective in this study is to find the vital factor that affecting financial performance of SMEs. To find the relationship between the Financial Performance as the dependent variable and Technology Cost, Bank Credit, Employee Cost, and Economic as the independent variables. Besides that, this analysis will help the researcher to identify the most dominant factor that affecting financial performance of small and medium enterprises (SMEs) in Kota Bharu, Kelantan. Table below shows, the model summary for vital variables of this studies and model summary for excluded variables.

Table 5.5.1 Model Summary for Vital Variables

Model	Unstandardized Coefficients		Standardized Coefficients	Sig.	95.0% Confidence Interval for B	
	B	Std. Error	Beta		Lower Bound	Upper Bound
1 (Constant)	1.648	.321		5.139	.000	1.007 2.289
BANK_CREDIT	.620	.077	.712	8.039	.000	.466 .774

a. Dependent Variable: FINANCIAL_PERFORMANCE

Table 5.5.2 Model Summary for Excluded Variables

Model	Beta	InT	Sig.	Partial Correlation	Collinearity Statistics
					Tolerance
1 TECHNOLOGY_COST	-.171b	-.626	.533	-.079	.106
EMPLOYEE_COST	-.415b	-1.038	.303	-.131	.049
ECONOMIC	.091b	.312	.756	.040	.094

a. Dependent Variable: FINANCIAL_PERFORMANCE

BUSINESS COLLOQUIUM 2020/2021**

3.5 Hypothesis Testing

Based on the table below, it can be summarized as four independent variables where technology cost, bank credit, employee cost and economic has a significant impact on financial performance of SMEs in Kota Bharu, Kelantan.

Table 5.5.3 Summary of Person Correlation Analysis

Hypothesis	Result	Findings
H1: There is a relationship between technology cost and financial performance of SMEs in Kota Bharu, Kelantan.	r = 1.000	H1: Accepted
	p = 0.000	
	positive	
H2: There is relationship between bank credit and financial performance of SMEs in Kota Bharu, Kelantan.	r = 0.946	H1: Accepted
	p = 0.000	
	positive	
H3: There is relationship between employee cost and financial performance of SMEs in Kota Bharu, Kelantan.	r = 0.919	H1: Accepted
	p = 0.000	
	positive	
H4: There is relationship between country's economic position and financial performance of SMEs in Kota Bharu, Kelantan.	r = 0.914	H1: Accepted
	p = 0.000	
	positive	

4. Discussion and Recommendation

The study was conducted to identify the factors affecting financial performance SMEs in Kota Bharu, Kelantan. The focus point of this study is to identify the relationship between dependent variables (financial performance) and independent variables (technology cost, bank credit, employee cost, and economic) SMEs in Kota Bharu, Kelantan. At the same time, the main objective of this study to identify the vital factor that affecting financial performance in Kota Bharu, Kelantan. In this research, primary data was undertaken by the online questionnaires through Google Form to collect feedback from respondent and secondary data from the journal and article. The researcher was identified 66 responses to perform data collection by the online questionnaires. The collected data were analysis by using the SPSS version 26.0 software and the analysis was formed based on the research framework in this research. The analysis of data includes descriptive analysis, reliability analysis and Pearson Correlation Coefficient. The reliability test was conducted in this study to measure consistency, precision, repeatability and trustworthiness of this research. The Pearson Correlation also used in this research to denote relationship between two or more quantitative variable. Based on the result that researcher gained from chapter 4, it shows that there were similarities that occur between some previous study and current study which were supporting the hypothesis that has been stated in previous study.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Researcher selected the topic to be studied and to investigate the factors affecting financial performance of small and medium enterprises (SMES) in Kota Bharu, Kelantan. Researcher found that there were four hypothesis that had been implemented in this study. Hypothesis implemented by each factors which are technology cost, bank credit, employee cost and economic can related with dependent variable which is financial performance of SMEs in Kota Bharu, Kelantan. Based on findings, the independent variables which are technology cost, bank credit, employee cost and economic shows a significant effect on financial performance of SMEs in Kota Bharu, Kelantan. Therefore, it is automatically shows that the researcher achieved the research objectives of this study. To preventing the financial performance of SMEs, researcher could provide some suggestion that can help future research to achieve the research objectives. The studies result can be used as references to help upcoming researchers because the data collected are valid and had been analyzed.

Moreover, improving the accuracy and reliability of the study result, the future researcher can expand the sample size which specifically more than 66 questionnaires. The current research, conducted at University Malaysia Kelantan, City Campus among final year students of Faculty of Entrepreneurship and Business which represent the whole population.

For the upcoming researchers who planned to use primary data, the researcher suggest that sending questionnaire to target respondent through online or internet will consume time and researcher have to wait for the reply or feedback from the respondents in the research survey. Moreover, to collect the data or information which needed to use in the research, the researcher has to adopt or use digital interview of face-to-face interview via online with the target respondent. Besides that, some questionnaire which send via e-mail would be refused by the target respondents due to lack of interest and participation to the questionnaire. Therefore, researcher suggested that upcoming researcher should provide questionnaire to the respondent directly. It will make sure that the survey and researcher may collect the feedback or data at the moment. This will ensure that the targeted respondent who participated the questionnaire will increase. The upcoming researcher can conduct their study in other locality or placement to obtain more accurate findings in research. By using different placement, this may help the future researcher to collect more in-depth information about financial performance in retail industry. Thus, conducting the research by using different placement may increase the accuracy of the study outcome. Furthermore, researcher ensure that the questionnaire which had been set should be concise and comprehensive that help targeted respondent easy to understand and help to fill up the questionnaire and the progression on the survey more efficient and smoother. Besides that, using multi-language in questionnaire make respondent more vulnerable to understand and to fill up the question. The researcher also recommend and encourage to take vital action to overcome the effect of financial performance. The organization management need to implement and recognize the effect and how to overcome. The researcher suggested that the organization be aware and solve the factors that affecting financial performance, so that the company easily to achieve their long and short term goals.

5. Conclusion

In short, this study focuses on factors affecting financial performance SMEs in Kota Bharu, Kelantan. At the end of this study, findings concluded that all hypothesis were accepted. Independent variables which are technology cost, bank credit, employee cost and economic shows significant effect on financial performance SMEs in Kota Bharu, Kelantan.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Acknowledgement

Firstly, I would like to say a big thank you by showing my appreciation and gratitude to my supervisor, Dr. Nur Ain Ayunni Binti Sabri for providing us useful comments through the learning process for this research and never fail to answer any of the questions and providing me some ideas related to my topic. Next, I would like to thank to my family for believing me and keep on encouraging me. Both of them had supported me a lot where they understand me and gives me permission to live in Kelantan during pandemic. They had motivated me a lot the moment I get stress due to this research.

Besides that, I would like to thank to my friends and colleagues as well because they helped me by clearing all my doubts. They had supported me in this research as well and give me some tips to do this research smoothly. They had been there for me through ups and downs throughout this research journey. Finally, I would thank to the god for giving me a good health and faith so that I can complete this research without any distraction. I would like to thank them who showing me a lot of value for guidance and advice. This research would not possibly done without support and helps from many people.

**FACTORS THAT INFLUENCING CONSUMER'S
PURCHASE INTENTION TOWARDS ORGANIC FOOD IN
IPOH, PERAK**

Shubashini D/O Visuvalingam and Nurul Azwa Binti Mohamed Khadri

Faculty of Entrepreneurship and Business,
University Malaysia Kelantan,
Malaysia.

Email: shubashini.a17a0651@siswa.umk.edu.my; azwa.mk@umk.edu.my

Abstract:

This research presents an improved approach to the Factors that Influence the Consumer's Purchase Intention towards Organic Food in Ipoh, Perak. Some factors can affect the consumers in Ipoh in taking decision and purchasing behaviour towards organic food. The dominant factors that affected the consumer's purchase intention towards organic food are health, environmental friendly, product quality and food safety. The important of this study is to identify the factors that affecting the consumer's purchasing intention towards organic food in Ipoh. This is a quantitative research conducted in Ipoh, Perak. By using SPSS version 23 to analyse the 150 sample of questionnaires from respondents, researcher found that the factors influence the consumer's purchase intention towards organic food in Ipoh was indicated in four main factors which is health, environmental friendly, product quality and food safety. The respondent varying from age, gender, race and preference of organic food. The limitations of this study and recommendations given in this research study will guide the future researchers to carry out the related researches more accurately.

Keywords: *Consumer's purchase intention towards organic food, environmental friendly, food safety, health, product quality*

1.0 Introduction

Organic foods refer to foods that are safe to be consumed, are of fine quality, are concerns about the environmental friendly, nutritious foods and are produced under the principle of sustainable development (Liu, 2003). Consumers in Malaysia start becoming health conscious consumers and aware on their foods in daily life. Consequently, the consumption of fresh vegetable and fruits is increasing rapidly. Beside, most of Malaysians are becoming well educated on the way their eating can influence health and tend to be highly consumed on organic fruits and vegetables. In Malaysia food industry, health consciousness and organic food become new important trend in past decades' year. Several studies agreed on the socio- demographic profile of organic food buyers. The proportion of people consuming organic food has been found to rise with an increase in income (Torjusen et al., 2001) and tend to be more highly educated than non-organic consumers (Lockie et al., 2002; Storstad and Bjorkhaug, 2003). One of the reasons for growing demand of organic foods is the increasing number of consumer concerns about the conventional food production (Van Loo, My Nguyen Hoang, Pieniak, & Verbeke, 2013). The organic food industry is relatively new in Malaysia and the government has recognised its potential to contribute to economic growth. Consumer's interest in organic food has increased due to local demand. Consumers worldwide are increasingly concerned about nutrition, health, and the

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

quality of their food. Major concerns have appeared because of recurrent food crises involving pesticide residues on fresh produce, food contamination by chemicals in dairy and seafood products, and the unregulated use of additives in processed foods.

2.0 Literature review

2.1 Environmental Friendly

The increase of the environmental consciousness has had a thoughtful effect on consumer behavior, with the green product market expanding at a remarkable rate (Bhaskaran, Polonsky, Cary & Fernandez, 2006). It can be found that there has been an increasing consumer demand for agricultural produce obtained by means of processes having less impact on the environment, especially for organic produce (Chinnici et al, 2002). Environmental and animal rights issues had a strong influence over attitudes and behaviour intention towards organic food (Honkanen, Verplanken & Olsen, 2006). Thus, environmental concern remains one of the reason of organic purchasing intention.

H₁ There is a significance relationship between environmental friendly and purchase intention towards organic food.

2.1 Health

The consumers purchase organic products because of a perception that such products are safer, healthier and more environmentally friendly than conventionally produced alternatives (Krissoff (1998). Health concern appears as the most important reason for purchasing and consuming organic food (Wandel and Bugge, (1997); Padel and Foster, 2005 and Michaelidou et al, 2008). Roitner-Schobesberger et al, (2008) also found that health consciousness was a main reason to purchase organic food in Thailand, particularly when consumers are concerned with residues from synthetic chemicals used in agriculture. Molyneaux (2007) supports the positive relationship between health consciousness and organic purchasing.

H₂ There is a positive affect between health and purchase intention towards organic food.

2.3 Food Safety

Food safety issues have driven consumers to seek for safety foods whose qualities and attributes are guaranteed (Lockie et al, 2004). Padel and Foster, (2005) food safety was highlighted as a motive for purchasing organic food. According to Williams and Hammitt (2001), consumers believe organically grown produce poses fewer risk to consumer than conventional products. Krystallis Fotopoulos & Zotos, (2006) also found that organic produce buyers are concerned about the safety of foods in that they are willing to sacrifice money in return. Thus, perceived safety of organic food products and its positive effect on behaviour

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

intention towards the organic food.

H₃ There is a significance relationship between safety and purchase intention towards organic food.

2.4 Product Quality

Perceived quality of organic food by consumers in becoming increasingly important to its rapid consumption (Magnusson et al, 2001; Padel et al, 2005). Consumers always purchase organic products because of a perception that these products have unique attributes compared to conventionally grown alternatives (Vindigni, Janssen & Jager, 2002).

H₄ There is a significance relationship between product quality and purchase intention towards organic food

3.0 Methodology

This research is to study the factors that influence the consumer's purchase intention towards organic food. The sampling method used for this study was stratified sampling. Stratified sampling was the most suitable for this study because the respondent is chosen by their age, gender and race. The respondent of this research were Ipoh people who preferred to purchase organic food. In this study, only 150 questionnaires have been used to analysis the data.

4.0 Findings

The summary of respondent's demographic profile is shown as table below:

Characteristics	Items	Frequency	Percentage
Gender	Male	76	50.7%
	Female	74	49.3%
Age	Below 20 years' old	19	12.7%
	21-30 years' old	32	21.3%
	31-40 years' old	31	20.7%
	41-50 years' old	41	27.3%
	51 and above	27	18.0%
Race	Malay	39	26.0%
	Chinese	48	32.0%
	Indian	45	30.0%
	Others	18	12.0%
Organic Food Preference	Yes	150	100%
	No	-	
Dominant Factors	Environmental Friendly	107	22.1%
	Health	140	28.9%
	Food Safety	124	25.6%
	Product Quality	113	23.3%

Table 4.0 Descriptive Profile of the Respondents.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

By using Cronbach's Alpha, reliability of variables was evaluated. In this calculation higher alpha values indicates higher reliability value; the quality of the research is high because the reliability value is higher. The result is shown in the table below.

Research Variable	Number of Measurements	Cronbach's Alpha
Environmental Friendly	4	0.875
Health	4	0.905
Food Safety	4	0.930
Product Quality	3	0.904
Consumer's Purchase Intention towards Organic Food	5	0.922

Table 4.1: Variable's Reliability and Validity Test

Table 4.1 shows that all the variable which are environmental friendly, health, food safety, product quality and consumer's purchase intention towards organic food are reliable and valid because the Cronbach's Alpha are more than 0.8 which demonstrate that the measurements are reliable.

Table below indicates that the results are moderate and small for environmental friendly, health, food safety and product quality. The results demonstrate that all the independent variables are having a positive relationship, but the effect is quite small and moderate where $p < 0.0005$ when $r = 0.452, 0.519, 0.477$ and 0.581 . The independent variables (Environmental Friendly, Health, Food Safety and Product Quality) are influencing the dependent variable (Consumer's Purchase Intention Towards Organic Food).

		Environment al friendly	Health	Food Safety	Product Quality	Purchase Intention of organic food
Environmental friendly	Pearson Correlation	1	.452**	.452**	.452**	.722**

N	150	150	150	150	150

**Correlation is significant at the 0.01 level (2-tailed).

Table 4.2: Pearson Correlation

5.0 Discussion and Conclusion

In conclusion, results show that health and product quality is more significant at $r = 0.519$ and 0.581 . This shows that consumers were more focusing in health and product quality factors to intent in purchasing organic foods. The consumers purchase organic products because of a perception that such products are safer, healthier and more environmentally friendly than conventionally produced alternatives (Krissoff (1998). Health concern appears as the most important reason for purchasing and consuming organic food (Wandel and Bugge, (1997); Padel and Foster, 2005 and Michaelidou et al, 2008). Perceived quality of organic food by consumers in becoming increasingly important to its rapid consumption (Magnusson et al, 2001; Padel et al, 2005). Consumers always purchase organic products because of a perception that these products have unique attributes compared to conventionally grown alternatives (Vindigni, Janssen & Jager, 2002). The limitation faced is pandemic which causes the researcher hard to collect data and can only focus at certain area of Ipoh. Next limitation faced by the researcher is uncooperative of respondents to participate in this research. Recommendation for future researcher are choose respondents from different state or even countries might have different perceptions about purchase intention of organic food. So, future research of similar topic can be done in different states or country. Overall, there is a significant relationship between dependent variable (Consumer's purchase intention towards organic food) and independent variables (Health, Food Safety, Environmental Friendly and Product Quality).

Acknowledgement

First and foremost, I have to thank the research supervisor, Miss Nurul Azwa Binti Mohamed Khadri. Without her assistance and dedicated involvement in every step throughout the process, this paper would have never been accomplished. I take this opportunity to express gratitude to all of the department faculty members for their help and support. I am also thanking my parent for the unceasing encouragement, support and attention. I am also would like to thank to University Malaysia Kelantan that provided me with the research grant to perform the research. Moreover, I would like to appreciate to all my friends for them continue support, hard work and assistance during this progress of research.

EFFECT OF COVID-19 TOWARDS RETAILER IN SABAH

Shuhairee Fuzainie bin Sudirman and Norfazlirda Binti Hairani

Faculty of Entrepreneurship and Business,
Universiti Malaysia Kelantan,
Malaysia

Email: shuhairee.a17a0652@siswa.umk.edu.my; fazlirda.h@umk.edu.my

Abstract:

The primary objective of this study is to identify what affected the retailer sales during the pandemic of Covid-19. Data were collected using an online form which is an online Google Form to approach and reach a wider number of respondents of local retailers in Sabah, Malaysia. This cross sectional study is using convenience sampling as 384 data collected in Sabah. The data will be analysed using Statistical Package for the Social Science (SPSS). SPSS statistical addresses the entire statistical analysis process such as data collection, data analysis and reporting for better decision making and performance. Multiple regression analysis will be used in this research to address the hypothesis. The study found that all independent variables were significant to the dependent variable and achieves the objectives.

Keywords: Demand, necessity goods, Pricing, Supply Chain, Retailer, Covid-19

1 INTRODUCTION

Known as the Covid-19 pandemic in Malaysia, the history of Coronavirus Disease 2019, the virus was reported entered Malaysia at the end of January 2020, when it was identified on the travellers from China arriving in Johor via Singapore on 25 January after the outbreak of Covid-19 in Hubei, China. Initially, registered cases remained relatively low and were mainly limited to imported cases, before localized clusters started to appear in March, the largest cluster at that time was related to a religious "Tabligh Jama'ah" gathering held in late February and early March in Sri Petaling, Kuala Lumpur, resulting in major spikes in local cases and exports of cases to neighbouring countries. Malaysia reported the largest cumulative number of confirmed Covid-19 infections in Southeast Asia within a few weeks, crossing the 2,000 active cases mark by the end of March from less than 30 cases at the start of the month.

The retail sector, RM107.5 billion in 2019, is projected to be set back by RM10.9 billion this year, mainly due to the Covid-19 pandemic, according to Retail Group Malaysia estimation. Current retail value sales reported declining growth in 2020 as opposed to the previous year. As this problem arises due to the Covid-19 pandemic that causes all countries to come under quarantine orders; Movement Control Order (MCO). They would have an important impact on their business for the retailer. They realize that the situation is changing every day and they know that they have little time to respond. Over the past few weeks, all consumers in the retail sector have complained about the effect this pandemic might have on their business.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Such research discussions indicate that in today's highly fluid social, economic, and healthy climate, there are few main areas where retail execs can concentrate their energy. There are also unknown long-term social, economic, and health effects of the Covid-19 virus.

This research study on Sabah customers and retailers and the effect of the pandemic on retailing activity. The global reaction to this virus has profoundly changed the situation for the retailers, whether this condition continues for weeks or months. It's time to confront reality and begin to adapt.

Owing to a variety of factors, the overall influence of retailing is great. An economic heavyweight in the retail market. Besides, it primarily serves final demand and thus has an important role in value chains, both as a household supplier and as an outlet for the upstream sectors. It is also complementary to operations in other hard-hit industries, such as the tourism industry. Moreover, the retail industry is quite labour intensive, so there are disproportionate job ramifications for any disturbances. The industry also depends on low salaries and part-time, calls, and gig employees who are not well protected by conventional social security initiatives, thus further reinforcing the social ramifications of the crisis in the sector.

Significant of the Study

The significance of the study, researchers want to improve and get more knowledge about how to manage the business during the pandemic toward the retailer. Through this research, the researcher highlights the importance of the demand for the product, product pricing, and supply chain management toward the retailer. They will know how to manage their own business during the pandemic. Good management of either company or business will stabilize the business. It will bring good to them to manage their business and also bring them into conversation with their customers.

2 LITERATURE REVIEW

2.1 Retailer

Retail is one of the world's oldest organizations and was practiced in ancient times. Traditional food and arms that continue the rise of consumers and hawkers are the beginning. The retailer remains, barter a day has been replaced by shift by money (Tiwari, 2009). A few decades ago, there were many shopping chains in several cities in the 16th and 17th centuries (Aydin, 2013). In the late 19th and early 20th centuries, however, the growth of retail development was accepted. Merchandise was initially dominated by supermarkets. Later, distributors specialized in the business started to gain traction. Competition has achieved great success in countries that have established retail and is once again beginning to concentrate on specialized stores. There have been several shops in recent years, selling every form of merchandise once again.

In the entire process of producing, transporting, and using products around the world, the retail industry has made remarkable adjustments. Today, the retail sector is used by most of the largest economies as their critical growth instrument (Sharma, 2008). Nevertheless, apart from this, retailers work in harsh and rapidly changing conditions, which offer risks and expectations. The industry, for instance, suffers from a constant surplus of capacity, resulting in fierce competition for consumer capital especially in difficult economic times. As with retail technology, customer demographics, habits, and buying behaviors shift quickly.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Retailers need to carefully select their target segment and position themselves strongly to be competitive (Kotler and Armstrong, 2012).

2.2 Necessity Goods

Complexity, filled with unique user interactions and guided by individually applicable historical trends, characterizes customer expectations of how products acquire status criteria by moving beyond the classification of products into luxury goods or need goods. It reflects on how customers perceive and narrate experiences in their lives that are emotionally charged, in which a specific product shifts over time to be considered a necessity. It demonstrates that familiarity, transformation in the form of redemption or contamination, reminders, incorporation, restoration, and compaction involve product requirements to become a needed product or luxury product. It is very useful for advertisers to consider the experience of needs to build successful marketing campaigns as well as public policymakers to ensure their people have access to the necessities of life (Jakob Braun, 2016)

Necessity goods are the product that people need to survive to continue their life. This good depends on some of the people in their lives need but a lot of common people need to eat and drinks every day need a shelter and clothes these are the common product that people are needs, but in some circumstances, necessity product can be changed such us when the disaster like a pandemic of Covid-19 happen the medical supply like hand sanitizer, gloves, medical masks, toilet tissue to prepared themselves for any possibility of out of stock in the future. (Sarah Whithen, 2020)

A broad variety of retail items bought by customers are protected by the consumer goods market, from staple products such as food and clothes to luxury goods such as jewellery and electronics. As a whole, food demand is unlikely to fluctuate, although some foods purchased by customers will dramatically shift consumers who are accustomed to purchasing more choices, such as cars and appliances, in various economic conditions. Employment, incomes, inflationary costs, interest rates, and customers are the economic variables that most consumers demand. (Maverick, 2020)

2.3 Demand

For customers involved in the procurement of products and services and the availability of prices for such goods or services, demand is an observed economic theory. The rise in the price of goods or services would be different in terms of all other variables, and so on. Consumer demand is the cumulative quantity purchased for a specific commodity by all the customers in the market. The full demand for all goods and services in the economy is a call for agreement. Various stock strategies for demand are often needed. Money to assess the number of demands people have for their goods and services is the most widely used sector. Demand is an economic endeavor, and the company can achieve little without it. (Caleb Silver, 2014)

Demand is linked closely to supply. Consumers are trying to get the lowest prices for products and services, and manufacturers are trying to increase profits. The supplier approach costs too much for the sum to be decreased, and the supplier does not sell the commodity required to make the profit available. The supplier approach costs too little, the lower the overall price could not bear the expense of the supplier or make a profit for the quantity increased. Certain factors that require demand for products or services, the availability of competitive goods, the availability of funding, the availability of perceived goods or services. (James Chen, 2014)

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

2.4 Pricing

Price is an important factor that plays an important role in the purchase by customers of products or services. Since low prices can be space for scepticism about prices and high prices will have the impact of providing low value for money to decide the correct price. The pricing strategy, in which the marketer initially sets a reasonably high initial price for a product or service, then reduces the price over time. This is a temporary version of the control of sales from price discrimination. This helps firms to rapidly recover their costs before competition reaches and decreases consumer prices. It has become a habit for managers to implement high prices and drop them over time in new and rising markets. (Gebhardt Gary, 2006)

Often, pricing schemes are referred to as a drop in the demand curve. At the beginning of the product life cycle, the goal of the price reduction strategy is to seize the market advantage to take advantage of the monopoly status or low price sensitivity of innovators. The organization charges the highest initial price that the consumer would pay for the product pricing plan. The business reduces the price when the first consumer demand is reached, to draw other segments that are more price responsive. (GJ Tellis, 2015)

2.5 Supply Chain

Supply Chain Management is a methodology for improving business processes, making them more durable, more agile and as a result, more competitive. The main function of the supply chain is to improve the product or service competitiveness (Machowiak W., 2012). Based on a systematic literature review, the various definitions of supply chain given by experts from beginning to end along with key classical definitions. The various dimensions of the supply chain are an inseparable part of this study. Supply chain and its dimensions and try to explain the supply chain from related fields such as Logistics Management, Value Chain Management, and Operations Management. There are a lot of various supply chain management theories. After completing a comprehensive literature review, this concludes with a conclusion and the scope of future work. The supply chain is related to the conversion of raw materials into finished goods and the timely delivery of products to end-users (Mabert and Venkataramanan, 1998). It describes the evolution of various supply chain definitions. Supply Chain Management studies relationships and relationships with each other between the various functions, processes, and limbs of the chain and analyse the effects of their interaction on value addition and profit maximization (Ballou, 2007). Next describes specific research questions such as understanding the supply chain and its dimensions, describing the supply chain from other relevant areas, and identifying the various contributions within supply chain theory.

2.6 Hypothesis Statement

Hypothesis 1: There is significant on retail demand during Covid-19.

Hypothesis 2: There is no significant on retail pricing during Covid-19.

Hypothesis 3: There is significant on the supply chain in retail during Covid-19.

2.7 Conceptual Framework

Below was the research model that has been stated in Figure 1, it was established based on the literature review above. This research model is to study the significant effect of the pandemic of Covid-19 toward retailers in Sabah.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

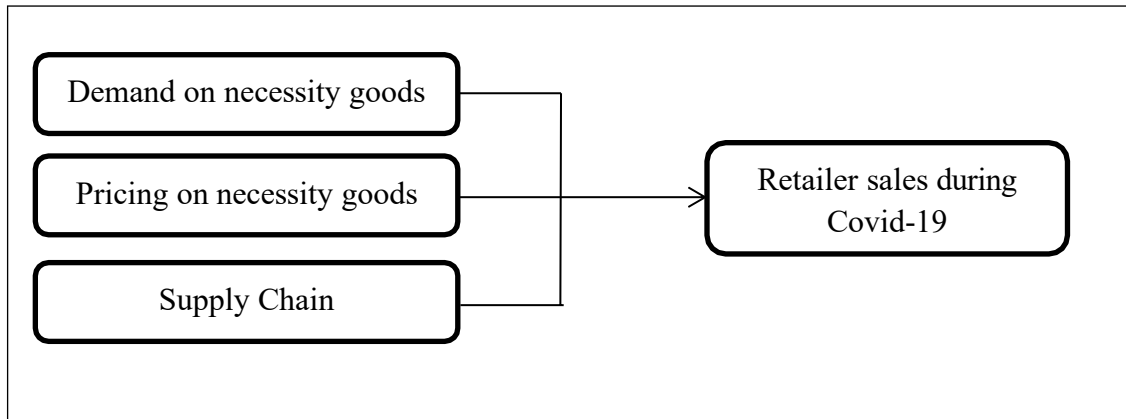

Figure 1: Research Model

3 METHODOLOGY

3.1 Research Design

The research design was a plan and structure of an investigation that helps the researcher to obtain an answer form from the research questions. A Google form questionnaire was used with quantitative research as the research instrument. For the result, the research design involved the method of data analysis consists of interrelated procedures that are carried out to summarize and evaluate the information or data. Furthermore, the researcher will analyse the data for this research using reliability statistics, descriptive statistics, and multiple regression analysis statistics to clarify the attributes of an effect of Covid-19 towards retailer that is, the demand of the necessary goods, and pricing on necessity goods and supply chain management. The research design was carried to get information concerning the current phenomenon to clarify what exists following the variables given to conduct in this study. The data collection method for each research variable focused on what affected the retailers which received proven data from the targeted respondents were asked in a questionnaire Google form.

3.2 Data Collection Method

The data is collected from a sample of respondents based on the questionnaire survey method. So, the data will be primarily because primary data is data that had not been published yet by anyone, so it is more reliable, objective, and authentic (Syed Muhammad Sajjad Kabir, 2016). The data is collected using an online form which is Google Form due to Covid-19 and to reach a wider number of respondents. The online form link will be spread through Instagram, Facebook, Twitter, WhatsApp, and Telegram. Then, the returned form will be filtered on which fits the best with criteria needed.

The question of the questionnaire survey was adapted and developed from a combination of a few previous studies. A 5-point Likert scale is used to determine the expression from respondents which are 1 = strongly disagree, 2 = disagree, 3 = neutral, 4 = agree and 5 = strongly agree. The questionnaire is written in 2 languages which are Bahasa Melayu and English.

3.3 Study Population

A study of population is a big collection of persons or objects that is the important focus of the studied investigation. The population is wide and can be defined to include all research and practice on, or affects, group of people or community. The target group is the entire retailer in Sabah. Besides, the respondent also consists of the age of the respondent, different

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

gender, type of business retail, and level of income. Based on the Malaysia population distribution, the total population in Sabah is around 3.91 million from the 33.1 million population of Malaysia updated 23 October 2020.

3.4 Sample Size

The sample size is a subset of the population. In this study, the targeted population is the individuals who step the retailer around Sabah between ages all that involves in retailing service, in Sabah. The sample is chosen among the respondents of the Retailer. This study uses a convenience sampling method as one of the non-probability samplings which is an attempt to obtain a sample convenient element because the samples are available at the right time and the right place.

Based on the Malaysia population distribution, the population in Sabah is around 3.91 million. According to the (Krejcie and Morgan, 2013), the respondent should be chosen from the population of 384 respondents.

3.5 Sampling Techniques

The procedure or techniques of selecting a subgroup from a population to participate in this research is the process of choosing several persons for the research in such an alternative that the individuals selected represent the large group from which they were chosen (Ogula, 2005). The area covered in the observation is the retailer in Sabah. This research used convenience sampling. According to (Sekaran & Bougie, 2011) this method is collecting data from a group of respondents who are conveniently accessible. The cost and time needed to carry out a convenience sample is small compared with the other techniques. This Google form is used to question the retailer to study the effect of the pandemic of Covid-19 towards the retailer. The questionnaire usually consists of several questions and answers from the respondent. In this research, the questionnaire will be distributed directly passing to the respondent.

3.6 Measurement of the Variables

The ratio scale is the highest level of measurement that allows the researcher to identify the objective, while at the same time ranking them and comparing their differences. This study uses the interval scale level of measurement where the number was used to answer the questions. For section B, section C, and section D, 5-point Likert Scale was used.

3.6 Procedure for Data Analysis

Data analysis plays a role in making decisions more scientific and helps to operate more effectively. Data analysis will be accompanied next to the data collection procedure. A processor's way of applying a systematic order or technique to describe, illustrate, condense, recap, and also evaluate the data can be stated by data analysis. After the data and information have been collected from the respondent, it will be analysed using Statistical Package for the Social Science (SPSS) software. This software can analyse data and connect the relationship between independent variables and the dependent variable, so the data can easily be read and get an accurate result. For the result, to interpret the data and information, it can be represented using tables and graphic presentations such as diagrams and charts. The method of data analysis consists of interrelated procedures that are carried out to summarize and evaluate the information or data. Therefore the researcher will analyse the data for this research using reliability statistics, descriptive statistics, and multiple regression analysis statistics.

4 FINDING

4.1 Demographic profile of Respondent

The respondent profile is summarized in Table 1 out of the 384 respondents, 195 were male and 189 were females. Most of them were in the 25 to 29 age category (n=134). Then, the business type of retail stated the highest number was 37.1% (n=142), most of the other types of retail business are dropshipper and agent. Majority level of income of the respondents is around RM1001 to RM2000 (n=225).

Table 1: Demographic profile

Characteristic	Item	Frequent	%
Gender	Male	195	50.8
	Female	189	49.2
Age Group	19 years old and under	16	4.2
	20-24 years old	125	32.6
	25-29 years old	134	34.9
	30-34 years old	71	18.5
	35-39 years old	18	4.7
	40 years old and above	20	5.2
Business type retail on	Department stores	40	10.4
	Supermarket	37	9.6
	Convenience stores	40	10.4
	Wet Market	125	32.6
	Other	142	37.0
Level of Income	RM1000 and under	129	33.6
	RM1001-RM2000	225	58.6
	RM2001-RM3000	26	6.8
	RM3001 and more	4	1.0

4.2 Reliability Analysis

Reliability analysis had been carried out for approximately 30 respondents to determine the consistency of independent variables such as demand, price and supply chain and dependent variables which are sales of the retailer. Total scale and subscale reliability analysis showed that the various measures had good internal consistency as expressed by alpha coefficient values. As Table 4.2 depicts, Cronbach's Alpha values of all the dimensions and the dependent variable were greater than 0.7.

Table 2: Realibility analysis

Variable	Cronbach's Alpha	N of items
Demand	.723	4
Price	.826	4
Supply Chain	.732	4
Sales	.732	5

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Descriptive Analysis

Table 3: Descriptive analysis for each variable

Variable	Mean	Std. Deviation
Demand	3.69	0.85
Price	3.54	0.79
Supply Chain	3.97	0.53
Sales	3.50	0.65

Regression Analysis

Table 4: Table of coefficients Analysis

Variable	Simple Linear Regression			Multiple Linear Regression		
	b	t-stat(95% CI)	p-value	b	t-stat(95% CI)	p-value
Demand	0.38	11.14(0.31, 0.45)	<0.001	0.321	8.64(0.25, 0.39)	<0.001
Pricing	0.31	7.84(0.23, 0.89)	<0.001			
Supply Chain	0.448	7.53(0.33, 0.57)	<0.001	0.223	3.68(0.10, 0.34)	<0.001

a. Dependent variable: Sales retailer

The table 4 above had shown the table of Coefficients Analysis that determines which independent variables were individually predictors of dependent variables. The independent variables included demand, pricing and supply chain had influenced the dependent variable which is sales retailer. According to the table above, the effects of Covid-19 for demand and supply chain variables were significant since their p-value was less than 0.05. According to the result shown in the table above, the demand is the strongest independent variable in measuring the sales retailer as its Beta value is the highest ranked value among all the independent variables which is 0.321. while the price variables were excluded.

5 DISCUSSION

5.1 Demand

The first purpose of this research project is to identify the Covid-19 that affected the demand sales of the retailer during the pandemic. The coefficient for demand toward retailers sales during Covid-19 is $b=0.38$, and the p-value is 0.000 which is (α root $p<0.001$) it shows that demand toward retailer sales during Covid-19 in Sabah has a significant relationship.

The purchase decision of the food hygiene product by (Tarek Fahmy, Armin Sohani, 2020) Although the effects of the pandemic can be measured and estimated economically and socially, it is not easy to predict changes in customer purchase behavior. As the demand for hygiene products increased and the supply decreased, some of the consumers were panicked. It has become interesting for researchers to explore the impact of the Covid-19 pandemic on brand preferences in the purchasing decisions for food and hygiene products. Many markets are currently in a position of uncertainty. Covid-19 had an economic and social impact on the world. Specifically, the economic impact has had an impact on demand. Retail consumption patterns have changed in the aftermath of the pandemic. The purchase of crisis goods, such as toilet paper and hand sanitizers, has increased (Nielsen and Svenska Dagbladet, 2020). Besides, Swedish supermarkets are facing problems with the maintenance of stocks. People are buying food at a record high, and many products, such as pasta and rice, are sold out, and

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

many shelves remain empty in supermarkets (Westerberg & Arvidson, 2020). Consequently, changes in the consumption demand and habits of products such as sanitizers, toilet paper, and food are currently occurring, possibly due to Covid-19. Also, with particular regard to personal hygiene and food products, other countries, besides Sweden, have faced the problem of empty shelves for personal hygiene and food products in supermarkets, since they are the main products that people buy and store in panic (Svenska Dagbladet, 2020). As a result, consumer behavior and, in particular, the purchase of personal hygiene and food products, is becoming an important and relevant area to focus on a better understanding of consumer behavior during a pandemic, both from an academic and a practical perspective. From an academic perspective, it is important to study the lack of empirical research on consumer behavior in the context of a crisis. Besides, the current literature on consumer behavior in a crisis context focuses on financial crisis or recession, thus enabling the field as a whole to be further developed by adding a lack of perspective to the non-financial crisis, and specifically to the pandemic. From a practical point of view, it is important to study as it will allow managers and supermarkets to understand how to operate during a pandemic and potentially turn it into an opportunity to capitalize on it. Moreover, given the important role of branding and brand perception in the decision-making process, the major changes in demand for this thesis will focus solely on food and personal hygiene products.

5.2 Price

The second purpose of this research project is to identify whether Covid-19 is affecting the price of the necessary product during the pandemic. The coefficient for price toward retailer sales during Covid-19 is $b=0.77$, with p-value 0.194 which is (α root $p>0.001$) it shows that price toward retailer sales during Covid-19 in Sabah does not have a significant relationship.

Based on the qualitative study of the impact of a pandemic on brand preference in food hygiene product purchasing decisions by (Tarek Fahmy, Armin Sohani, 2020) Starting with the role of price and how it impacts brand preference during the crisis, revenue was the main issue that emerged. Specifically, income was divided into two commonly occurring sub- themes of disposable income and financial uncertainty among respondents during the pandemic. Looking at disposable incomes, one common theme was the social impact of the pandemic. Respondents were found to have increased disposable income due to a pandemic affecting their social behavior. Also, financial uncertainty was a theme posed during the pandemic regarding the position of prices in brand preferences. Aspects such as employment, job security, and savings were frequently referred to and their effect on respondents' price sensitivity. As a result, the general feeling was that the pandemic did not directly affect their price sensitivity in the form of brand preferences for food and hygiene products, outside of a person who felt unsure about their future financial situation. Although the pandemic influenced the cost of some food and hygiene items they purchased, the price factor was not directly related. However, changes in demand and expectations about the quality of food and hygiene products have resulted from these changes.

5.3 Supply Chain

The third purpose of this research project is to identify the Covid-19 is affected by the supply during the pandemic. The coefficient for supply chain towards retailer sales during Covid-19 is $b=0.223$, with p-value 0.000 which is (α root $p>0.001$) it shows that supply chain toward retailer sales during Covid-19 in Sabah have a significant relationship.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Based on this research the third objective is to identify whether the supply chain was affected during the Pandemic Covid-19. At the end of this research, the researcher found that the supply chain is affected during the pandemic. During this pandemic, many retailers already prepared for supply chain activities to avoid any circumstances that might happen. Meanwhile, with the help of the term and regulation of this state, it makes the retailers easier to handle supply chain activities when the demand for the product is increasing. Based on the qualitative study of the impact of a pandemic on brand preference in food hygiene product purchasing decisions by (Tarek Fahmy, Armin Sohani, 2020). Moreover, the economic effect was not just on purchases. Supply chains have also been affected by closed borders and shifts in demand (Omni, 2020). In addition, with particular regard to personal hygiene and food products, other countries, besides Sweden, have also faced the problem of empty shelves for personal hygiene and food products in supermarkets, as they are the key products which people buy and store in panic (Svenska Dagbladet, 2020). As a consequence, consumer behavior and, in particular, the purchase of personal hygiene and food items, is becoming an important and significant field to concentrate on a better understanding of consumer behavior during a pandemic, both from an academic and a realistic viewpoint. From an academic perspective, it is important to study the lack of empirical studies on consumer behavior in the context of a crisis. In addition, the existing literature on consumer behavior in a crisis setting focuses on financial crisis or recession, thereby enabling the area as a whole to be further expanded by applying a lack of insight to the non-financial crisis, and specifically to the pandemic.

From a practical point of view, it is important to research how it would help managers and supermarkets to understand how to function during a pandemic and eventually turn it into an opportunity to capitalize on it. To begin with, the results suggested that interviewees who changed their preferred brands, changed them because they could not find preferred brands at the shop, due to the stock-out of these brands, and due to panic accumulating by other customers, As (Shou et al, 2011) clarified that panic accumulating could reduce the supply of certain items, which would subsequently trigger more problems as a highly unusual demand. Additionally, (Shou et al, 2011) highlight the complexity of the relationship between consumer panic buying and supply disruption, in which when customers learn that the supply of their goods is decreasing due to the reasons listed, they begin to purchase in large quantities to prevent potential shortages. Subsequently, creating additional problems as highly unusual demand could lead to stock-out, leading to more panic buying. Retailers can decide to restrict the supply, raise prices, or impose a buying quota for customers to avoid this behaviour. These activities could help reduce demand on the face of it, but it could also make consumers more nervous, leading to worse or more panic buying (Shou et al, 2011). It was also reported that clients begin substituting their missing favourite brands with other brands during supply shortage times (Tsao et al, 2019).

6 RECOMMENDATION

From the study, the researcher found that the demand and supply chain for the product is importance to the retailer's sales. But not only are the other independent variables, the price of the product also important. This research only wants to know the factors that have affected the Covid-19. During the multiple regression analysis, the demand and supply chain for the product is the only variable that affected due to Covid-19 pandemic, because during the pandemic people are panicked to buy the necessary product so that they demand the product to prepare during the pandemic, while the price was controlled by the government to take

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

advantage of the right of the customer and some of the retailers who could take advantage of it during the pandemic. Besides, the recommendation to retailers is about their service. The recommendation is that retailers need to upgrade their services. Such an improvement in cash on delivery as an example retailers need to seek feedback from the customer about their service so that they can easily understand the customer's demand and help them to understand what customers need, experience and pain points. It is therefore recommended that future researchers include more variables, such as price and merchandise selection, which also play an important role in creating discoveries in their investigation. Finally, future researchers can also use qualitative methods instead of questionnaires only when conducting a survey.

7 LIMITATION

There are several limitations to this study. First, the lack of peer-reviewed scientific articles on consumer buying behavior in a pandemic context has forced researchers to explore literature in an economic crisis context rather than in a real context. As a result, future researchers aiming to study the impact of the Covid-19 pandemic on retailers' sales during the pandemic should first explore literature in a pandemic context. Secondly, the demand for the product during the Covid-19 pandemic. Future researchers could also compare countries with the same levels of restrictions or different levels of restrictions as they would provide insights into how restrictions affect retailer sales, and can also look at the role of different cultures in retailer sales when faced with a pandemic. Third, all of the interviews were conducted online, which might have limited the researcher's ability to gather more insights from the respondent, although the respondent used a Google form questionnaire, thought that face-to-face interviews could have increased the reliability. Fourth, due to the limited timeframe of the researchers, only a quantitative method has been adopted, although quantitative studies help researchers to gain a deeper understanding of and explore the phenomenon by observing retail sales and understanding the context in which they live. However, the data is not generalized. As a result, the adoption of a mixed-method approach should be more successful as it allows for the generalization of findings while at the same time obtaining in-depth rich data.

8 CONCLUSION

This research was carried out with a view to the factor that affected retailer sales during the recent Covid-19 pandemic in Sabah. The factors that affected the demand for the sale of the product, the price of the sale of the product, and the supply chain. Also, this research was carried out by the researcher at all Sabah retailers. The research focuses on the design of the research, data collection methods, population study, sample size, sample techniques, development of the research instrument, variable measurement, and data analysis procedure. On the other hand, the data analysis of the researchers shows the results obtained throughout the survey questionnaire. Data analysis was collected from the survey to conduct a test of reliability, descriptive analysis, and multiple linear regressions. The researcher determined the significance of the research hypothesis in the study. As a result, from this chapter, we can conclude the significant between the independent variable and the dependent variable. And, lastly, from the entire chapter of this research, many things can be improved and can be a reference benefit for retail sales and future research. For retailers, the recommendations focus on their effect on sales during the Covid-19 pandemic. There is a suggestion for retailers to help them during the pandemic. But, at the end of the day, future researchers can try to use another way to get answers, such as quantitative methods.

**THE IMPACT OF DIGITAL SALES PROMOTION ON
ONLINE SHOPPING AMONG UNIVERSITY MALAYSIA
KELANTAN STUDENTS IN PENINGKALAN CHEPA**

Siti Aisyah Andan and Mahathir Muhamad

Faculty of Entrepreneurship and Business,
Universiti Malaysia Kelantan,
Malaysia

Email: aisyahandan97@gmail.com; mahathir.m@umk.edu.my

Abstract:

The purpose of this study is to investigate the impact of sales promotion and various digital sales promotion tools on the online shopping decision of University Malaysia Kelantan students. The research evaluates the impact of sales promotion tools mainly free sample, price discount and coupon. The dependent variable in this study is online shopping decision while there are three independent variable which is free sample, price discount and coupon. A total students were surveyed used questionnaire through google form is 346 people. The students from various characteristics and preference were answered the questionnaire given. This research can give online shopping retailers to managing their sales promotion. The result show that free sample, price discount and coupon are associated with the consumer preference. The result also show that the preference for sales promotion are dependent upon consumers's demographic profile.

Keywords: *online shopping decision, free sample, price discount, coupon, sales promotion, digital sales promotion tools.*

1 Introduction

Sales promotion is important in marketing programmes. Sales promotion is a marketing mix which is price, promotion, product and place. But for this study, the discussion only focused on sales promotion. Sales promotion refer activities but other than advertising and personal sales that stimulate consumer to purchase the product. Sales promotion also knows as competitive weapon in an organization for target audience to buy or endorse one brand over another. The objective of sales promotion in marketing is to

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

create brand awareness among customers. It short-term demand which is to attract loyal customer and encourage customers to make switching brand. The sales promotion is accomplished by educating and convincing consumers of an existing or new products in market. According to Perreault and McCarthy, further remarked that money spent on advertising and personal selling helps the firm more over the long-term and that sales promotion do not help develop close relationships with customers, instead, it erodes brand loyalty.

Sales promotion influence buying decisions of customers. Sales promotion is one those incentives which has influenced customer to make instant buying decision than to wait later (Kotler, 2003). The buying decision process comprises five stages which is recognition, identification of alternative, evaluation of alternative, purchase and post-purchase behaviour. Customer usually believe that during sales promotion, price of all the product will be more cheap than usual. This phenomenon shows that when customers see the word of sales promotion, some of them are easily to purchase it. This will inevitably lead to over-consumption and the buying of a product that is not necessary and useless. It is particularly effective in spurring product trial and unplanned purchases (Aderemi, 2003).

HYPOTHESIS STATEMENT

H₀: There is no significant relationship between free sample and online shopping decision towards student's preference.

H₁: There is significant relationship between free sample and online shopping decision towards student's preference.

H₀: There is no significant relationship between price discount and online shopping decision towards student's preference.

H₂: There is significant relationship between price discount and online shopping decision towards student's preference

H₀: There is no significant relationship between coupon and online shopping decision towards student's preference.

H₃: There is significant relationship between coupon and online shopping decision towards student's preference

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

FRAMEWORK

The conceptual framework is an analytical method with a variety of variations and contexts. It can be applied to various categories of work where an overall picture is required. It is used to make logical distinction and to organise ideas. Strong conceptual framework capture something concrete and do so in a way that is easy to remember and apply.

For this study, our dependent variable is online shopping decision. For independent variable, there are three variable that influence dependent variable (online shopping decision). First is free sample, price discount and coupon.

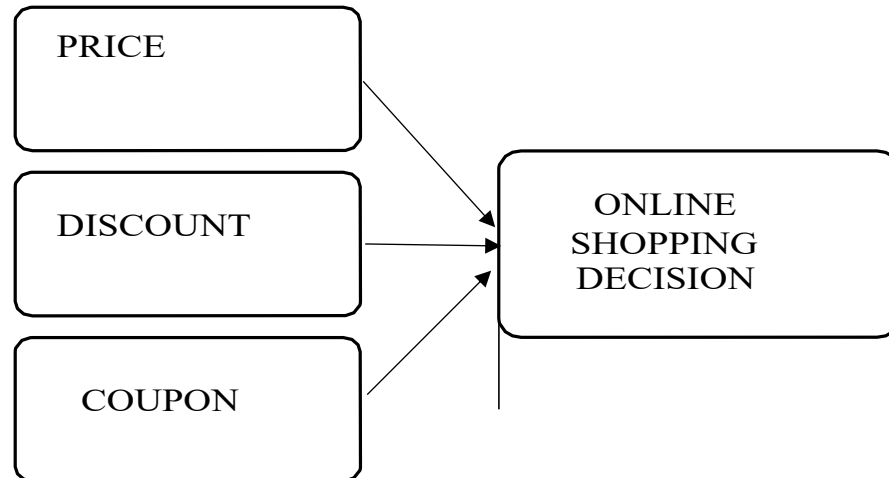

First independent variable is free sample. The distribution of free sample is a common and important promotional tool for many products (Schultz et al., 1998). By giving free sample to potential customers regardless they purchase something else. This approach exposes customers to product that they might not have considered before then encourage them to buy after used the sample. Free sample give chance for customers to try and use the product in small amount. According to Shimp (2003), free sample of product effect consumers buying behaviour.

Next, price discount can be defined as valuation approach where goods or products are offered in a good discounted buying price and it seems to be a reduced cost to the consumers (Fill, 2002). Consumers save more money during price discount because the product offer lower price compare to their normal price.

Coupon are defined as vouchers or certificates, which help consumers to price reduction on a specific product (Fill, 2002). Coupon have many benefits and trend towards the marketers in a way that they can boom the sales in a short time and they can stimulate customers to switch to other brands or products (Nudubisi & Tung 2005). Coupon is one of methods that use for customers to brand-switching. Actually coupon have increase brand-switching and influence purchasing among customers.

The figure below shows the relationship between dependent variable and independent variable. It show online shopping decision as it dependent variable. On the other hand, sales promotion tools is independent variable such as free sample, price discount and coupon.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

2 Research Method

This study use quantitative method. Quantitative methods emphasises quantitative calculation and statistical, mathematical or numerical analysis of data obtained by questionnaire or by manipulating pre-exisiting statistical data using computational techniques. Quantitative research focuses on collecting and generalising numerical data through groups of people or on describing a specific phenomenon. Besides that, there are two data collection which is primary data collection and secondary data collection. First is primary data collection is collection of raw material obtained at the sources. It is a method for collecting original data obtained by a researcher for a particular research purpose. Next is secondary data collection collected data by others. Secondary data can take a wide variety of forms, as guides to bodies.

There are 346 sample need in this study according to Krejcie&Morgan table. the population for this research are students from University Malaysia Kelantan in Pengkalan Chepa. The questionnaire will distribute randomly to those who might express their willingness in this survey to respond. The questionnaire will divide into two section section A and section B. Section A will include about demographics respondents such as gender, age, race status and others.

This research only used nominal scale and interval scale for measurement f the variables. Nominal scale only use in section A in questionnaire. A nominal variable is the types of variable used to mark. Closed-ended approach has been choose in this study. while interval scale been used in section B of questionnaire. Likert-scale is one of part interval scale and also use likert-scale five points evaluation (1) strongly disagree, (2) disagree, (3) neutral, (4) agree and (5) strongly agree.

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

1	2	3	4	5
Strongly disagree	Disagree	Neutral	Agree	Strongly agree

2.1 PROCEDURE FOR DATA ANALYSIS

Data analysis is a method used by researchers to simplify data to a narrative and view it to extract information. The method of data processing aims to minimise a vast amount of data into smaller pieces, which makes sense. The data collected by using online questionnaire to respondents. The set of information in this analysis will be measured and evaluated using statistical package for the social sciences (SPSS).

2.1.1 DESCRIPTIVE ANALYSIS

Descriptive analysis uses raw data and analyses the data to draw useful and understandable conclusions. In descriptive analysis, it basically explain what the data show descriptive analysis provides in numbers. The result of respondents will present into frequency distributions. Frequency distributions can be present in two ways, as a table or as a graph (bar chart, histogram and others graphs). Researcher easy to identify the information by using descriptive analysis in this study.

Variable	N	Mean	Standard Deviation
Online shopping decision	346	2.6582	1.13399
Free sample	346	2.6474	1.09575
Price discount	346	2.5282	1.18952
Coupon	346	2.6821	1.16505

Table 4.9 descriptive analysis for dependent variable and independent variable

This research had analysed the mean and standard deviation for section B in questionnaire included dependent variable (online shopping decision) and independent variable which is free sample, price discount and coupon.

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

Table 4.9 show the same number of respondent is 346 students. Mean for dependent variable which is online shopping decision is 2.6582. For independent variable, the highest mean is coupon which is 2.6821. Second highest of mean is free sample, 2.6474 while 2.5282 for price discount.

Standard deviation for dependent variable (online shopping decision) is 1.13399. Independent variable, the highest number is 1.18952 for price discount while 1.16505 represented coupon. Lastly is free sample with standard deviation 1.09575.

2.1.2 PEARSON CORRELATION ANALYSIS

Pearson correlation analysis is a method used to analyse the relationship between two quantitative. In this study, researcher used Pearson correlation analysis to analyse the relationship between dependent variable (online shopping) and independent variable (1) free sample, (2) price discount and (3) coupon. Besides that researcher also want to analyse relationship between independent variable. The result of Pearson correlation analysis will show in high correlation or weak correlation. If high correlation means that two variables have a close relationship with each other while weak correlation shows the opposite.

HYPOTHESIS 1: FREE SAMPLE

H₀: There is no significant relationship between free sample and online shopping towards student's preference.

H₁: There is significant relationship between free sample and online shopping towards student's preference.

		Online shopping decision	Free sample
Online shopping decision	Pearson Correlation	1	0.229

Free sample	Pearson Correlation	0.229	1
	Sig. (2-tailed)	0.000	
	N	346	346

Table 4.19 Pearson online shopping decision and free sample

The table show the Pearson’s Correlation coefficient, significant value and 346 number of respondents. The correlation coefficient for free sample and online shopping decision are 0.229 and this show the strength correlation between free sample and online shopping decision is weak positive correlation. Besides that p-value is 0.000 showing the significant value for the analysis it low than alpha root which is 0.01. Therefore, there is significant high positive correlation relationship between free sample and online shopping decision. According to the data, there is a positive relationship between free sample and online shopping decision towards student’s preference.

HYPOTHESIS 2: PRICE DISCOUNT

H₀: There is no significant relationship between price discount and online shopping towards student’s preference.

H₂: There is significant relationship between price discount and online shopping towards student’s preference

		Online shopping decision	Price discount
Online shopping decision	Pearson Correlation	1	0.461
	Sig. (2-tailed)		0.000
	N	346	346
Price discount	Pearson Correlation	0.461	1

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

	Sig. (2-tailed)	0.000	
	N	346	346

Table 4.20 Pearson between online shopping decision and price discount

The table show the Pearson’s Correlation coefficient, significant value and 346 number of respondents. The correlation coefficient for price discount and online shopping decision are 0.461 and this show the strength correlation between price discount and online shopping decision is strong positive relationship correlation. Besides that p-value is 0.000 showing the significant value for the analysis it low than alpha root which is 0.01. Therefore, there is significant high positive correlation relationship between price discount and online shopping decision. According to the data, there is a positive relationship between price discount and online shopping decision towards student’s preference.

HYPOTHESIS 3: COUPON

H₀: There is no significant relationship between coupon and online shopping towards student’s preference.

H₃: There is significant relationship between coupon and online shopping towards student’s preference

		Online shopping decision	Coupon
Online shopping decision	Pearson Correlation	1	0.357
	Sig. (2-tailed)		0.000
	N	346	346
Coupon	Pearson Correlation	0.357	1
	Sig. (2-tailed)	0.000	
	N	346	346

Table 4.21 Pearson Correlation between online shopping decision and coupon

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

The table show the Pearson's Correlation coefficient, significant value and 346 number of respondents. The correlation coefficient for coupon and online shopping decision are 0.356 and this show the strength correlation between coupon and online shopping decision is moderate positive correlation. Besides that p-value is 0.000 showing the significant value for the analysis it low than alpha root which is 0.01. Therefore, there is significant high positive correlation relationship between free sample and online shopping decision. According to the data, there is a positive relationship between coupon and online shopping decision towards student's preference.

2.1.3 RELIABILITY TEST

Reliability refers to the degree to which, if the measurements are replicated a number of times, a scale shows accurate outcomes. Reliability analysis is calculated by the proportion of systemic difference in a scale that can be accomplished by evaluating the relation between the scores collected from the various scale administrations. Thus, if the relation is strong in the measurement of reliability, the scale yields consistent. Cronbach Alpha is a reliability test conducted within SPSS in order to measure the internal consistency. If Cronbach Alpha >0.90, so it very high reliability.

ONLINE SHOPPING DECISION

Cronbach's Alpha	N
0.943	4

Table 4.14 Reliability test for online shopping decision

Consistent with the reliability evaluation in the table above. It is able to finish that the coefficient alpha for reliability if dependent variable for **Online Shopping Decision** is 0.943. This indicates the consistency and balance of 0.943 is **Excellent** based on the rules of thumb about Cronbach's alpha coefficient.

FREE SAMPLE

Cronbach's Alpha	N
0.871	4

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

--	--

Table 4.15 Reliability analysis for free sample

Consistent with the reliability evaluation in the table above. It is able to finish that the coefficient alpha for reliability if dependent variable for **Free Sample** is 0.871. This indicates the consistency and balance of 0.943 is **Good** based on the rules of thumb about Cronbach's alpha coefficient.

PRICE DISCOUNT

Cronbach's Alpha	N
0.941	4

Table 4.16 Reliability analysis for price discount

Consistent with the reliability evaluation in the table above. It is able to finish that the coefficient alpha for reliability if dependent variable for **Price Discount** is 0.941. This indicates the consistency and balance of 0.943 is **Excellent** based on the rules of thumb about Cronbach's alpha coefficient.

COUPON

Cronbach's Alpha	N
0.968	4

Table 4.17 Reliability analysis for coupon

Consistent with the reliability evaluation in the table above. It is able to finish that the coefficient alpha for reliability if dependent variable for **Coupon** is 0.968. This indicates the consistency and balance of 0.943 is **Excellent** based on the rules of thumb about Cronbach's alpha coefficient.

3 Figures and Tables

DEMOGRAPHIC PROFILE OF RESPONDENTS

This section discusses about demographic analysis of 346 students. This section presented the analysis about gender, age, race, year of study, marital status, how much respondent visit online shopping apps, online shopping apps prefer and product purchase category.

Gender	Frequency	Percent (%)
Female	201	58
Male	145	42
TOTAL	346	100

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

GENDER

Table 4.1 Demographic profile of gender

Based on Table 4.1, 346 respondents, there are 201 female respondent which is (58%) of population and the balance of the respondent are 145 male respondent which is (42%). The different between two genders are 56 students which is 16%

AGE

Age	Frequency	Percent (%)
18-20 years old	85	25
21-24 years old	185	53
25-28 years old	72	21
29 years old and above	4	1
TOTAL	346	100

Table 4.2 demographic profile of age

Based on table 4.2, there are 4 category of age listed in questionnaire. First category is 18-20 years old, there are 85 respondents that answer the questionnaire which is (25%). While there are 185 students that answer the questionnaire which is (53%) for 21-24 years old. Out of 346 respondents, there are 72 students which is (21%) for 25-28 years old. The balance of respondents are 29 years old and above students are 4 which is (1%).

RACE

Race	Frequency	Percent
Chinese	57	16
Indian	59	17
Malay	227	66
Others	3	1
TOTAL	346	100

Table 4.3 demographic profile of race

Based on table 4.3, there are 4 types of race which is Chinese, Indian, Malay and Others.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

There are 57 Chinese respondents which is (16%) while Indian respondents are 59 students which is (17%). The balance of respondents are established for Malay and Others which is 227 students (66%) and 3 students (1%) respectively.

YEAR OF STUDY

Years of study	Frequency	Percent (%)
Year 1	78	22
Year 2	91	26
Year 3	75	22
Year 4	102	30
TOTAL	346	100

Table 4.4 demographic profile of year of study

Based on table and chart 4.4, there are 4 types of year of study. First is 78 students from year 1 answer the questionnaire which is (22%). Next is 91 students from year 2 which is (26%) and Year 3 are 75 respondents (22%). The balance of respondent is 102 students from year 4 which is (30%).

MARITAL STATUS

Marital status	Frequency	Percent (%)
Married	6	2
Single	340	98
TOTAL	346	100

Table 4.5 demographic profile of marital status

Based on Table 4.5, out of 346 respondents, there are 340 single respondent which is (98%) of population and the balance of the respondent are 6 married respondent which is (2%). The different between both marital status are 334 students which is 96%

HOW MUCH RESPONDENTS VISIT ONLINE SHOPPING APPS MONTHLY

Times visit	Frequency	Percent (%)
1-10 times	185	53

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

11-20 times	86	25
21-30 times	47	14
30 and above	28	8
TOTAL	346	100

Table 4.6 demographic profile of times visit of online shopping

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

Based on table 4.6, there are 4 category of age listed in questionnaire. First category is 1-10 times, there are 185 respondents that answer the questionnaire which is (53%). While there are 86 students that answer the questionnaire which is (25%) for 11-20 times. Out of 346 respondents, there are 47 students which is (14%) for 21-30 times. The balance of respondents are 30 and above students are 28 which is (8%).

ONLINE SHOPPING APPS PREFERENCE

Online shopping apps	Frequency	Percent (%)
Shopee	180	52
Lazada	105	30
11st street	25	8
Others	36	10
TOTAL	346	100

Table 4.7 demographic profile of online shopping apps

Based on 4.7, there are 4 types of online shopping apps which is Shopee, Lazada, 11st street and others. There 218 students which is (63%) are more prefer Shopee as their online apps. Second is 140 respondents which is (41%) prefer Lazada online shopping apps. Then 74 respondents (21%) and 58 respondents (17%) are prefer 11st street and Others online shopping apps respectively.

PRODUCT PURCHASE CATEGORY

Product purchase category	Frequency	Percent (%)
Electronics	26	7
Clothing	163	47
Cosmetics and skincare	148	43
Others	9	3
TOTAL	346	100

Table 4.8 demographic profile of product purchase category

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Based on table and chart 4.8, there are 4 product purchase category which is electronic, clothing, cosmetics and skincare and others. First category is electronic, there are 26 respondents that answer the questionnaire which is (7%). While there are 163 students that answer the questionnaire which is (47%) for clothing. Out of 346 respondents, there are 148 students which is (43%) for cosmetics and skincare. The balance of respondents are others category students are 9 which is (3%)

4 Acknowledgements

First and foremost, praise and thanks to God, the Almighty, for His showers of blessings to successfully complete the research throughout my research work.

I would like to express my deep and sincere gratitude for guiding me to do my research and providing invaluable guidance throughout this study to my research supervisor, Encik Mahathir bin Muhamad. it was a great privilege and honour to work and study under his guidance. For what he has offered me, I am extremely grateful. I am extremely grateful to my parents for their love, their prayers, their care and their sacrifices for my future education and preparation. I am preparing this study at home due to the covid-19 pandemic, I would like to thankful for overcoming the patience given by my research supervisor and my parents in completing this work.

Finally, my thanks go to all the persons who have helped me directly or indirectly to complete the study work.

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021
THE EFFECT OF EXTERNAL ENVIRONMENT ON MARKETING
PERFORMANCE OF RETAIL STORES IN KOTA BHARU
KELANTAN**

Siti Nor Azlin Syafika Zulkipli and Mahathir Muhamad

Faculty of Entrepreneurship and Business,
Universiti Malaysia Kelantan,
Malaysia

Email: syafika.a17a0678@siswa.umk.edu.my, mahathir.m@umk.edu.my

Abstract:

This research analysed the effects of the external environment on marketing performance of retail stores in Kota Bharu Kelantan. A detailed literature review suggests the need for a better understanding of this area, which relates to the influence of the external environment on the marketing performance of Kota Bharu Kelantan retail stores. A total of 200 questionnaires were given to workers of retail stores in Kota Bharu Kelantan. The research investigated the effect of external environment on marketing performance of retail stores in Kota Bharu Kelantan. The independent variables used in this research are competition, economic and social factors whereas the dependent variable is the marketing performance of retail stores in Kota Bharu Kelantan. The purpose of this study is to achieve the objectives of the research. First of objectives of the research is to identify the competition effecting of external environment on marketing performance of retail stores in Kota Bharu Kelantan. Second objectives is to determine ways to overcome the issues economic effecting of external environment on marketing performance of retail stores in Kota Bharu Kelantan and third objectives to examine the variables social factor that can effecting of external environment on marketing performance of retail stores in Kota Bharu Kelantan. All the independent variables reflect a positive yet moderate correlation with significantly critical variables. Thus, there is a significant relationship between competition, economic and social factors towards the effecting of external environment on marketing performance of retail stores in Kota Bharu Kelantan.

Keywords: *competition, economic, social factor, marketing performance, retail*

1. Introduction

This chapter presented general information on the effects of the external environment on marketing performance of retail stores in Kota Bharu Kelantan. This chapter also discuss the problem statement , research question, research objectives, significance and scope of the study and definition of terms of variables. This research are focuses on the effects of the external environment on marketing performance of retail stores in Kota Bharu Kelantan. Some effect this study are competition, economic and social factor.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

There are three main objectives as follow:

- 1) To identify the relationship between the competition effecting of external environment on marketing performance of retail stores in Kota Bharu Kelantan.
- 2) To identify the relationship between the economic effecting of external environment on marketing performance of retail stores in Kota Bharu Kelantan.
- 3) To identify the relationship between the social factor effecting of external environment on marketing performance of retail stores in Kota Bharu Kelantan.

1.1 Significant of the study

1.1.1 External Environment

The external environment is a set of factors or situations that are outside the organisation but affect it to some extent. This definition typically refers to elements such as culture, economy, legislation and political system in industry that are related to dimensions that are out of control.

1.1.2 Marketing Performance

In the scope of retail competition, retailers alternate between the wholesale prices charged to the final consumers and retail contracts. Where market prices are conveniently set and distributors have access to the tools they need to hedge the prices of those networks, this can be accomplished.

1.1.3 Competition

This will increasing the number of retailer and entrepreneur in Malaysia in retail sector. This research also attempts to determine the ways to overcome the issues of influencing job performance among retail employees.

1.1.4 Social Factor

Social factors is another wide group of consumer behaviour consequences are represented. Specifically, these are the outcomes of individuals and communities who influence each other by culture and subculture, social status, comparison groups, and families.

2 Literature Review

2.1 Theory of Competition

Competition is the act or method of attempting to get or win something that someone else is either trying to get or win, the act or process of competing, such as a reward or a larger degree of achievement. Acts that are carried out by entities, corporations, competing against each other.

2.2 Theory of Economic

Economics is a social science in which the production, delivery and use of products and services are involved. It explores how citizens, corporations, states, and nations make decisions about how to distribute capital. Based on expectations that humans behave with rational behaviour, Economics focuses on the actions of humans, finding the most desirable degree of gain or utility. Studies on labour and trade are the building blocks of economics. As there are many potential human labour uses and many different means of obtaining capital, it is the duty of economics to decide which strategies achieve the best outcomes. In general, economics can be broken down into macroeconomics, which focuses on the

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

2.3 Theory of Social factor

Another major set of effects on consumer behavior are social factors. These are primarily the results of individuals and communities that affect each other by culture and subculture, social status, comparison groups, and families.

2.4 Research Hypothesis

H1 : There is a significant study on the relationship between the competition the effecting of external environment on marketing performance of retail stores in Kota Bharu Kelantan

H2 : There is a significant study on the relationship between the economic effecting of external environment on marketing performance of retail stores in Kota Bharu Kelantan

H3 : There is a significant study on the relationship between the social factors effecting of external environment on marketing performance of retail stores in Kota Bharu Kelantan

2.5 Research Framework

This model creates to find and search the significant among independent variable and dependent variable into this research. The entire variable that chooses in our research related and adapted to the study before. The research is design to confirm all the independent variables which is competition, economic and social factor.

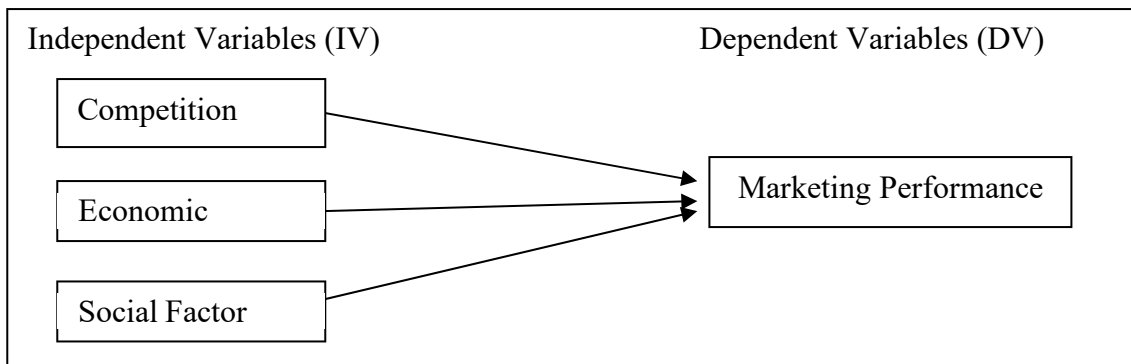

Figure 1: The Research Framework of the study

3 Methodology

The design of the study used in this study is to solve the problems identified. This chapter also discuss the process of the initial study from the beginning of the study process to the end of the study which is data analysis. In Malaysia, this thesis was published. The analysis technique is the most suitable way of conducting research and evaluating the appropriate procedure for solving the problem of testing (Sarah, 2015). In this chapter also we will explain the approach and procedures used in collecting the exact and applicable data. Any factor involved in the conduct of this population study, population sample size, and method of sampling used for the survey will be listed in this chapter. Finally, a through description of the preferred form of research used and the method of data collection will be given in this chapter.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

3.1 Research Design

The ways is researcher will doing a questionnaire in google form, then given to employees to answer the questions asked. It is a formal, objective, systematic process in which numerical data describes variables, examine relationships among variables and determine cause and effect interactions between variables (N,Burns, Grove, & Gray,2011). This study choose the cross-sectional design due to cost and time constraints.

3.2 Data Collection

The researcher obtained and analysed numerous forms of information, including the primary data and secondary data. In order to provide a potential answer to the study query, all methods of data collection are used. For this study, the researcher also has decide to use quantitative research which is using methods such as questionnaires in google form.

3.3 Sampling

Sample size is a term used for describing the number of subjects included in a sample size in market research. The sample size of this study is 200 respondent from the workers surrounding to be more researcher use place at Kota Bharu Kelantan city. They needed to answer all the question that ask in questionnaires of Google form.

The sampling technique that is applied in this study is simple random sampling method. Simple random is chosen because to make sure the equal of respondent will be choose and any sampling bias or unequal chance of selecting will be not an issue. According to Sekaran (2011) simple random is a probability sampling design in which every single element in the population has a known and equal chance of being selected as a subject.

3.4 Data Analysis

The total number of 200 respondents which is from workers of retail stores in Kota Bharu Kelantan were collected. The questionnaire that already collected which would be analysed and explained by using four types analysis which were Descriptive Analysis, Reliability Test, Spearman Correlation Analysis and Multiple Linear Regression Analysis. The data obtained was analysed by using Statistical Package for the Social Science (SPSS).

4 Findings

4.1 Descriptive Analysis

Table 1: The Demographic Characteristic of the Respondents

Demographic Characteristic	Category	Frequency	Percentage (%)
Gender	Male	117	58.5
	Female	83	41.5
Age	18-25 years old	96	48.0
	26-35 years old	91	45.5
	36 and above	13	6.5
Race	Malay	126	63.0
	Chinese	52	26.0

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

	Indian	21	10.5
	Other	1	0.5
Marital Status	Single	127	63.5
	Married	68	34.0
	Others	5	2.5
Academic Level	Pmr/ Pt3	17	8.5
	Spm	113	56.5
	Stpm / Stam	35	17.5
	Diploma	21	10.5
	Bachelor degree	11	5.5
	Master	3	1.5
Monthly Income	RM 1000 and below	50	25.0
	RM 1001-RM 2000	103	51.5
	RM 2001-RM 3000	39	19.5
	RM 3001 and above	8	4.0
Types of Retail stores	Department stores	58	29.0
	Specialty stores	66	33.0
	Supermarket	34	17.0
	Convenience stores	21	10.5
	Hypermarket or superstore	21	10.5

(Source: Developed for the Research)

Table 1 showed the overall descriptive statistics for respondents demographic which is gender, age, marital status, academic level, race, monthly income and types of retail stores. There are 200 respondents through Google form that are successfully collected to retail employees in Kelantan.

Table 2: The Descriptive Statistic of Independent Variables and Dependent Variables

Descriptive Statistics			
	N	Mean	Std. Deviation
IV1: Competition	200	4.4780	.54865
IV2: Economic	200	4.4630	.54894
IV3: Social Factor	200	4.4660	.54840
DV: Marketing performance	200	4.4810	.53014

(Source: Developed for the Research)

Table 2 showed mean and standard deviation for independent variables (competition, economic and social factor) and dependent variables (marketing performances). The mean value for dependent variables which is marketing performances

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

is (4.4810). Thus, for independent variables of competition (4.4780), economic (4.4630) and social factor (4.4660).

In addition, standard deviation indicates how close the data is to the mean. In the case, between all independent variables, competition (.54865), economic (.54894), social factor (.54840) and marketing performance (.53014).

4.2 Reliability Analysis

Cronbach's Alpha is used to determine stability and consistency of the items and if the variables are reliable in questionnaire. If the value of Cronbach's Alpha is 0.9 and above, it shows that the questionnaire is reliability. If the value is less than 0.60 so the strength of association considered as poor relationship. The result will be based on table 3 is Rules of Thumb about Cronbach's Alpha Coefficient Size to indicates the strength of association of the reliability analysis.

Table 3: Reliability Statistics of Independent Variables and Dependent Variables

Item	Cronbach's Alpha	Cronbach's Alpha Based On Standardized Items	N of Items
IV 1: Competition	.819	.819	5
IV 2: Economic	.846	.847	5
IV 3: Social Factor	.837	.836	5
DV: Marketing Performance	.806	.806	5

(Source: Developed for the Research)

Table 3 showed the reliability test result and its coefficient of Cronbach's alpha by each variables from 30 respondents of retail stores employees at Kelantan. Based on Cronbach's alpha coefficient test were conducted on all four variables. The table above shows result of Cronbach's alpha for competition is (0.819), economic (0.846), social factor (0.837) and marketing performances (0.806).

4.3 Multiple Linear Regression

The independent variable in this study, which are competition, economic and social factor were entered into same regression equation to predict either there was any significant relationship with the factors that influence marketing performances among retail employees in Kota Bharu Kelantan.

Table 4: Multiple Linear Regression

Model Summary ^b					
Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	Durbin-Watson
1	.906 ^a	.822	.819	.22568	1.984
a. Predictors: (Constant), competition, economic, social factor					
b. Dependent Variable: Marketing Performance					

(Source: Developed for the Research)

5 Discussion & Recommendation

The result for research question 1 is, “There is a significant study on the relationship between the competition the effecting of external environment on marketing performance of retail stores in Kota Bharu Kelantan”. From this result, it is proven that the H1 of the study is rejected while for H0 of the study is accepted. The main focus is to study is there is a significant study on the relationship between the competition the effecting of external environment on marketing performance of retail stores in Kota Bharu Kelantan.

The result for research question 2 is, “There is a significant study on the relationship between the economic the effecting of external environment on marketing performance of retail stores in Kota Bharu Kelantan”. From this result, it is proven that the H1 of the study is rejected while for H0 of the study is accepted. The main focus is to study is there is a significant study on the relationship between the economic the effecting of external environment on marketing performance of retail stores in Kota Bharu Kelantan

The positive of result for research question 3 is, “There is a significant study on the relationship between the social factor the effecting of external environment on marketing performance of retail stores in Kota Bharu Kelantan” in this study have shown a strong positive relationship was found. The result shows there is a significant study on the relationship between the social factor the effecting of external environment on marketing performance of retail stores in Kota Bharu Kelantan

For recommendation, the researcher have found out that there are some spaces for improve the quality of this study in the future. The study can be conducted using different independent variable to get better results on the relationship between competition, economic and social factors towards the effecting of external environment on marketing performance of retail stores in Kota Bharu Kelantan. In a certain place near Kota Bharu, the researcher literally focuses. The researcher will also perform study at another location in the future, such as Pasir Mas, Rantau Panjang, and other similar fields.

In addition, analysts prescribed several techniques for the growth of their sector by the government and its departments responsible for small enterprises. In educating small business beginners about the incentives open to them and how to navigate them, the government should play a leading role. Such benefits would allow them to develop their business besides adds to national income. These incentives should be delivered through an establishment that really cares for the success and sustainability of small business.

Next, method of interview or produce any open-ended questions for respondents instead of respondents answering online scaling questionnaire. Researchers can get a high response rate with the interview process, and ambiguities can be explained and incorrect responses can be followed up immediately. This approach will also minimise misunderstanding and yield improved research outcomes.

This thesis will allow prospective scholars to perform their studies. In order to strengthen their studies in small and medium businesses, this journal would be a guide and encouragement for them. This research can be viewed in libraries and can be uploaded to the reference of the potential investigator on the website.

Finally, this thesis will allow prospective investigators to perform their studies. In order to strengthen their studies in small and medium businesses, this journal would be a guide and encouragement for them. This research can be viewed in libraries and can be uploaded to the reference of the potential investigator on the website. When they know about this case study and even the limitations, they will have sufficient advice. When they know about this case study and even the limitations, they would have sufficient advice.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

6 Conclusion

The conclusion of this chapter, the researcher has to deliver the aim of this study regarding to the problem in this study. This study examines the relationship between competition, economic and social factors towards the effecting of external environment on marketing performance of retail stores in Kota Bharu Kelantan. Research framework is developed based on the literature that been viewed. The researcher planned to investigate the relationship of each element in the independent variables to the dependent variable.

There had 200 respondents who took part of this study through the online survey method. The data have been collected and analyse by SPSS software version 26 based on descriptive statistic, reliability analysis, Spearman correlation analysis and multiple linear regression analysis. From the result of the preliminary analysis, the overall variables were 0.96. Therefore, the result shown is reliable and it can be accepted in this study.

The research is to know the relationship between competition, economic and social factors towards the effecting of external environment on marketing performance of retail stores in Kota Bharu Kelantan. The result of the research objectives which is examine the relationship between relationship between competition, economic and social factors towards the effecting of external environment on marketing performance of retail stores in Kota Bharu Kelantan.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

7 Acknowledgements

Firstly, we are very grateful to Allah S.W.T for the opportunity to complete this research. With His blessing, I would be able to finish this research paper within the allocated time and stay in a good health during the time period in completing the study.

First of all, we would like to express our appreciation to our supervisor, Encik Mahathir bin Muhamad, Lecturer of Faculty of Entrepreneurship and Business, University Malaysia Kelantan. He continuously gave full support for us in this Final Year Research Project (FYP) with her knowledge, patience and motivation. Her advice gave us a direction in writing this final year research project all the time. The guidance from her, also helpful to us in improving our knowledge in making research.

After that, we would like to extend our gratitude to our friends, who always gave us a lot of support to complete our research project. The friends can share us with their different ideas and knowledge in writing this research project.

Last but not least, I feel thankful to my family. My parents always gave me a mental and physical support in writing this research project. Their supporting very helped me to release my stresses that gain from the processing of this research project.

Abstract:

Nowadays, technologies become increasing every days. It makes change the technology to become more effective and efficient. Technology becomes increasing, evolving and very prominent in our daily life especially in mobile technology. It can make it easier to deal with everyday life as consumer. As one of new technologies, QR code is widely utilized for creating an innovation marketing strategy in order to capture users to adopt in daily life. Quick response (QR) codes are two-dimensional and machine-readable matrix bar codes. The topics of this study, enhancing the shopping experience through QR code based on Malaysian users' perspective. The purpose of this study is to examine the impact of usefulness, acceptability and feasibility on perceived flow, the perceived flow influence customer satisfaction and purchase intention and the impact of customer satisfaction on purchase intention. Methodology of this study is based on data empirical such collected data by using questionnaire. The researcher used the probability sample for 387 respondents. This research used the different statistical data analysis method such descriptive analysis, reliability tests (Cronbach Alpha), normality test, correlation, and regression by using SPSS. The finding of this study that each independent variable such usefulness, acceptability and feasibility has positive impact on perceived flow, perceived flow has the positive influence customer satisfaction and purchase intention and customer satisfaction has positive impact on purchase intention.

Keywords: *QR codes, Usefulness, Acceptability, Feasibility, Perceived Flow, Customer Satisfaction, Purchase Intention.*

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

1 Introduction

Nowadays, technologies become increasing every days. It makes change the technology to become more effective and efficient. Technology becomes increasing, evolving and very prominent in our daily life especially in mobile technology. It can make it easier to deal with everyday life as consumer.

Today, the emergence of digital media technology for examples (applications, RFID tags, augmented reality, etc.) is leading to evolutions in lifestyles, networks and communication and market environments over the world. As one of new technologies, QR code is widely utilized for creating an innovation marketing strategy in order to capture users to adopt in daily life (Kim & Yoon, 2014).

Quick response (QR) codes are two-dimensional and machine-readable matrix bar codes originally developed and designed in 1994 by Denso Wave Incorporated for the purpose of accurate and fast inventory checks (Hossain, Zhou, & Rahman, 2018). QR code is Quick Response code is common in many parts of the world. Mobile tagging with QR codes has many functions in the business. Malaysia is also not left behind using mobile technology which is QR codes in business especially in retail industry. The integration of QR codes in the mobile marketing strategy has been increasing worldwide as a way to promote communication and interaction between the brands and the users (Santos, 2015). The use of QR code implies the creation and printing of a code that can be quickly read by the smartphone to provide additional useful information related to product, services, brand, payment or other objects that attract users to use the technology (Santos, 2015).

The Quick Response (QR) code has emerged as the next retail innovation that fulfils the users or consumers desire for smart, convenient and experiential shopping via mobile phone or smartphones (Ryu & Murdock, 2013). QR code is a two-dimensional matrix barcode developed by the Japanese company which is Denso Wave in 1994 (Ryu & Murdock, 2013). It can obtain a wide array of product content, such as URLs, message, images and video, payment and others (Pupa, 2012). It embeds text, advertisement, personal information, business card information or any type of digital information that can be thought of. Today, new mobile devices enable us to install the applications or software that can read QR code such as newspaper, magazines, product, advertisement, entertainment and others platforms (Demir, Kaynak, & Demir, 2015).

The trend of using QR code in mobile marketing communication has been perceptible for many years in Asia and Europe. The QR code has an excellent information capacity, high security and good security(Sun, Si, & Zhang, 2007). The QR code could be promoted by many companies such as retailers, as smart shopping tools that help consumer access product details or information, receive promotional offers, make online purchases and experience enhanced shopping experiences (Ozkaya, Ozkaya, Roxas, Bryant, & Whitson, 2015). It also has the positive impact to users while using the QR codes.

The objectives of this study:

1. How the QR codes which is usefulness, acceptability, feasibility impact perceived flow.
2. How the perceived flow can influences customer satisfaction and purchase intention of customer..
3. How the customer satisfaction can impact purchase intention of customer.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

1.1 Significant of the Study

1.1.1 Researcher

This study will be one of the references to the future researcher to do the research paper.

1.1.2 Malaysian Citizen And Community

This research will be the journal that Malaysian citizen and community to know the detail about QR codes and the positive impact while used the QR codes in their life and the awareness QR codes to the users. It also can attract the users to stay and continued using the technology (QR code) and attract the people who never tried this technology that give positive impact in daily life.

1.1.3 Technology Of QR Codes.

This study can help retailer, advertisers, marketers and others in the business to using the technology to attract the customers for using the QR code while shopping and it can give the good impact to both parties such sales and their customer satisfaction .

1.1.4 Government

This study also can be the reference to the government the effectiveness of the QR code while shopping.

2. Literature Review

2.1 Theory Stimulus-Organism-Response (S-O-R)

The theory that the researcher used in this study is Theory Stimulus-Organism-Response (S-O-R), (Del Rosario-Raymundo, 2017), (Hossain et al., 2018). The each stimulus are response and impact to organism. The theory also show the related organism has influences on each response.

Figure 2.2: Theory Stimulus-Organism-Response (S-O-R)

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

2.2 Research Hypotheses

There are hypothesis included in this research:

Hypotheses 1

- H1a: The usefulness of QR codes can impact the perceived flow.
- H1b: The acceptability of QR code can impact the perceived flow.
- H1c: The feasibility of QR code can impact the perceived flow.

Hypotheses 2

- H2a: Perceived flow influences customer satisfaction.
- H2b: Perceived flow influences purchase intention.

Hypotheses 3

- H3: Customer Satisfaction can impact on purchase intention.

2.3 Research Framework

Using QR codes are involving all different types of ages among people. It can impact by using QR codes. The researchers just focused on impact while using QR codes. It each impact such usefulness, acceptability and feasibility (independent variable) can impact the perceived flow (dependent variable). It perceived flow (independent variable) influence the customer satisfaction and purchase intention of customer (dependent variable). It customer satisfaction can impact on purchase intention. It can conclude the dependent variables for this study is usefulness, acceptability and feasibility. Intervening variable is perceived flow and customer satisfaction and the dependent variables is customer satisfaction and purchase intention of customer.

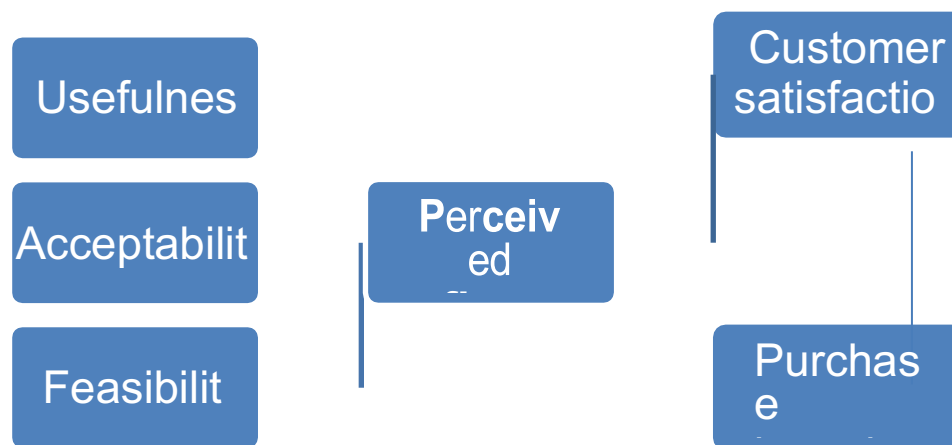

Figure 2.9: Conceptual frameworks.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

3.1 Methodology

The research design that been used in this research proposal was correlation research design. This design is used to measure the relationship between two variables. This study to determine the level of awareness among Malaysian regarding QR codes, the degree of QR codes usage, the reason why scanning QR codes and to determine that QR codes usage improves the shopping experiences. In this study, the researchers used this design to test the each impact such usefulness, acceptability and feasibility (independent variables) impact perceived flow. This study also to test the perceived flow (independent variable) can be influenced by customer satisfaction and purchase intention of customer. This research also to test the customer satisfaction impact purchase intention of customer.

3.2 Data Collection

To achieved the objectives of this study, the researcher use two kind of data which is primary data and secondary data. The primary data is based on the questionnaire that the researcher creates to collect the new data of respondent based on the Malaysian users in QR codes. Otherwise, the researcher also refers other journal, and article as the secondary data.

Data collection methods that the researchers used to collect the overall data from the consumers are using quantitative methods. In general, quantitative data collection methods such as questionnaires, surveys, and documents. The quantitative analysis is related to evaluate a numerical result in the study. To collect the data from the respondents the researchers used questionnaires randomly from the consumers. Researcher using the Google form as the quantitative methods to collect the data of the respondents in Malaysia.

3.3 Sampling Technique

The researchers were handling the probability technique because models were selected randomly. In this study, the researchers were used simple random sampling. The researcher was ensuring that all the individuals of the population are picking randomly. A researcher was select randomly based on the consumers by using smartphones which is using QR codes. Sampling techniques was being chosen because it can categorise as a newbies and still trying to adapt the new technologies and lifestyles in Malaysian. The sample of this study is 387 respondent were collected the data. The data that the researcher collected will used in Statistical Package for Social Science (SPSS) to insert and examined the data.

3.4 Sampling size

The sample size is the subset in the population. In this research of this study, the sample size that researchers choose in Malaysian. The numbers of questionnaires that the researchers provided are randomly for consumers to answers which is probability sample. Then the data that has been obtained from the questionnaires were used for the research purposes. The data were collected from the users QR codes in Malaysian. Sampling method the researcher used is Krejcie and Morgan sampling methods. It simplifies the process to collect the data from the sample size. The sample size that researcher is 387 respondents. The researcher used the quantitative method in this study which is questionnaire.

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

4. Findings

4.1 Descriptive Analysis

Table 1: Demographic characteristic of respondents

Demographics characteristic	Category	Frequency	Percentage (%)
Gender	Male	173	44.7
	Female	214	55.3
Age	18-22	91	23.5
	23-27	213	55.0
	28-32	35	9.0
	33-37	20	5.2
	38& above	28	7.2
Status	Single	283	73.1
	Married	97	25.1
	Others	7	1.8
Race	Malay	320	82.7
	Chinese	39	10.1
	Indian	23	5.9
	Others	5	1.3
Education level	SPM	78	20.2
	STPM/ Diploma	139	35.9
	Degree	166	42.9
	Others	4	1.0
Occupation	Student	173	44.7
	Employee	162	41.9
	Unemployed	9	2.3
	Self-employed	37	9.6
	Others	6	1.6
Know about Quick Respond (QR) Code	Yes	384	99.2
	No	3	0.8
Ever used QR code in daily life	Yes	374	96.6
	No	13	3.4

(Sources: Develop for the Research)

Table 1 show the overall of descriptive statistics which is demographic respondent that covering gender, age, status, race, education level, occupation, know about QR code and ever used from respondent in daily life. the total respondent for this research is 387 through questionnaire in Google form from Malaysian users of QR code. From the table show each demographic characteristic recorded the highest percent. The number of female is the highest with 55.3%, the age recorded the highest is 23 until 27 years old (55.0%), status single is the highest (73.1%), the majority race of respondent were Malay (82.7%), education level were dominant is degree (42.9%), occupation has highest which is student (44.7%).

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Table 2: The Descriptive Statistics

Section	Valid	N	Mean	SD
	Independent Variable			
B	Usefulness	387	4.3682	0.56998
C	Acceptability	387	4.3829	0.57135
D	Feasibility	387	4.3747	0.57932
	Intervening variable			
E	Perceived flow	387	4.3006	0.63578
F	Customer satisfaction	387	4.3480	0.61179
	Dependent variable			
F	Customer satisfaction	387	4.3480	0.61179
G	Purchase intention	387	4.3859	0.60496

(Sources: Develop for the Research)

The overall mean for usefulness is 4.3682 (SD=0.56998), mean for acceptability is 4.3829 (SD=0.57135) and mean for feasibility is 4.3747 (SD=0.57932). While, perceived flow recorded overall mean is 4.3006 with standard deviation 0.63578. Customer satisfaction recorded overall mean is 4.3480 (SD=0.61179) and purchase intention of customer overall mean is 4.3859 with standard deviation 0.60496.

4.2 Reliability Analysis

The more reliable a set of scale is or scale items, the more confident we have score obtained from the administration of the scale that researcher test is essentially the same score that would be obtained if the test is repeated. Reliability raises the questions of whether each scale is measuring a single idea. It is a measurement of the internal consistency of a test of scale items. The content validity was obtained by obtaining from the questionnaire that already done by the previous researcher in the journal. Furthermore, content validity was strengthened through an extensive literature search. Observations made were corrected and noted. The reliability of instruments was measured using Cronbach's Alpha. The reliability involved 387 respondents of Malaysian users in shopping experience via QR code. Reliability test, the test of data is variable alpha value or Cronbach's Alpha must more than 0.7.

Table 3: The Reliability Analysis

Questionnaire	Number of items	Cronbach's Alpha
Independent Variable		
Usefulness	4	0.903
Acceptability	5	0.936
Feasibility	4	0.924
Intervening variable		
Perceived flow	3	0.840
Customer satisfaction	3	0.932
Dependent variable		
Customer satisfaction	3	0.932
Purchase intention	3	0.924

(Sources: Develop for the Research)

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

The reliability analysis in table 3, the coefficient Cronbach's Alpha that been obtained in actual reliability test for independent variable which is usefulness (0.903), acceptability (0.932), feasibility (0.924). intervening variable for perceived flow (0.840) and customer satisfaction (0.932). dependent variable for customer satisfaction (0.932) and purchase intention (0.924). the all result are display from the table.

4.3 Spearman's rho Correlation Coefficient Analysis

Table 4: The Spearman's rho Correlation Result

			USE	ACC	FEA	PF	CS	PIOC
Spearman's rho	USE	Correlation Coefficient	1.000	0.864**	0.864**	0.753**	0.771**	0.759**
		Sig.(1-tailed)	.	0.000	0.000	0.000	0.000	0.000
		N	387	387	387	387	387	387
	ACC	Correlation Coefficient	0.864**	1.000	0.871**	0.769**	0.797**	0.785**
		Sig.(1-tailed)	0.000	.	0.000	0.000	0.000	0.000
		N	387	387	387	387	387	387
	FEA	Correlation Coefficient	0.864**	0.871**	1.000	0.790**	0.834**	0.788**
		Sig.(1-tailed)	0.000	0.000	.	0.000	0.000	0.000
		N	387	387	387	387	387	387
	PF	Correlation Coefficient	0.753**	0.769**	0.790**	1.000	0.820**	0.797**
		Sig.(1-tailed)	0.000	0.000	0.000	.	0.000	0.000
		N	387	387	387	387	387	387
	CS	Correlation Coefficient	0.771**	0.797**	0.834**	0.820**	1.000	0.832**
		Sig.(1-tailed)	0.000	0.000	0.000	0.000	.	0.000
		N	387	387	387	387	387	387
	PIOC	Correlation Coefficient	0.759**	0.785**	0.788**	0.797**	0.832**	1.000
		Sig.(1-tailed)	0.000	0.000	0.000	0.000	0.000	.
		N	387	387	387	387	387	387

** Correlation is significant at the 0.01 level (1-tailed).

(Sources: Develop for the Research)

The table show that, the usefulness has a high positive correlation with perceived flow. The value that obtained is $r = 0.753$ and the result show that it was significant under significant level $p < 0.05$ which was $p = 0.000$. It shows that 75.3% usefulness of QR codes impact on perceived flow. This means the relationship is strong and significant between these two variables. Hence, hypothesis 1 (H1a) is accepted. While, acceptability has a high positive correlation with perceived flow. The value that obtained is $r = 0.797$ and the result show that it was significant under significant level $p < 0.05$ which was $p = 0.000$. It shows that 79.7% perceived flow influences purchase intention of customer. This means the relationship is strong and significant between these two variables. Hence, hypothesis 2(H2b) is accepted.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Next, the feasibility has a high positive correlation with perceived flow. The value that obtained is $r = 0.790$ and the result show that it was significant under significant level $p < 0.05$ which was $p = 0.000$. It shows that 79% feasibility of QR codes impact on perceived flow. This means the relationship is strong and significant between these two variables. Therefore, it can conclude that usefulness give impact on perceived flow. Hence, hypothesis 1(H1c) is accepted.

The acceptability has a high positive correlation with perceived flow. The value that obtained is $r = 0.820$ and the result show that it was significant under significant level $p < 0.05$ which was $p = 0.000$. It shows that 82% perceived flow influences customer satisfaction. This means the relationship is strong and significant between these two variables. The acceptability has a high positive correlation with perceived flow. The value that obtained is $r = 0.797$ and the result show that it was significant under significant level $p < 0.05$ which was $p = 0.000$. It shows that 79.7% perceived flow influences purchase intention of customer. This means the relationship is strong and significant between these two variables. Hence, hypothesis 2 (H2a) and (H2b) are accepted.

The customer satisfaction has a high positive correlation with purchase intention. The value that obtained is $r = 0.832$ and the result show that it was significant under significant level $p < 0.05$ which was $p = 0.000$. It shows that 83.2% customer satisfaction impact of purchase intention on customer. This means the relationship is strong and significant between these two variables. Therefore, it can conclude that usefulness give impact on perceived flow. Hence, hypothesis 3 (H3) is accepted.

5.0 Discussion and Summary

The title of this study is enhancing the shopping experience through QR code based on Malaysian users' perspectives. The overall conclusion of the study based on chapter 4 through SPSS has same results in this study. This can be concluding each independent variable impact and influence the dependent variables. It shows that has the positive influence and positive impact.

Furthermore, all the research questions and the research objectives in this study were achieved throughout this study based on the Malaysian users' perspectives in shopping experience through QR codes. This study also support the all hypotheses are accepted for each variable. This study used the spearman correlation. It proven based on the value of r is below than $0.05 (< 0.05)$. For hypotheses 1a show that the usefulness has a high positive correlation with perceived flow. The value that obtained is $r = 0.753$, hypothesis 1 (H1a) is accepted. Hypotheses 1b show that the acceptability has a high positive correlation with perceived flow. The value that obtained is $r = 0.797$, hypothesis 2(H2b) is accepted. that the feasibility has a high positive correlation with perceived flow. The value that obtained is $r = 0.790$, hypothesis 1(H1c) is accepted. While hypotheses 2 show 2a that the perceived flow has a high positive correlation with customer satisfaction. The value that obtained is $r = 0.820$ and 2b show that the perceived flow has a high positive correlation with perceived flow. The value that obtained is $r = 0.797$. both hypotheses 2a and 2b is accepted. Hypotheses 3 show that the customer satisfaction has a high positive correlation with purchase intention. The value that obtained is $r = 0.832$. Hence, hypothesis 3 (H3) is accepted.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

This study also has the implications and the limitations of the study. The implications of the study such based on the online shopping, online marketing, marketing based on online platform such applications and the customer behaviour based on the group s and retailing such online retail store. The advertising are very helpful the marketers and advertisers in marketing. It can influences purchase intention and customer satisfaction. This research has the limitation of the study. This study need to be highlighted for future researchers as limitations. It can be used this study to refer. The limitation for this research has limited information to refer to base on the population of the study. Otherwise, it can't compute the all of sample data to conclude the overall populations that more specific group such as students, employee, company, the place and others. The researcher also has the several recommendations for future research. It is hoped that recommendations given could help other research such as using this research as a moderating research. Other that, for future research the researcher can used the QR codes more specific such as group, product, company as others. There are several recommendations in this study that the researcher would identify to future research. The suggestion for future research is the researcher can do the research based on qualitative methods because lack of information to prefer this research. It can be used as a moderating research for the future. Last but not lease, the suggestion for the future research is can use the QR codes more specific such as group, product, and company as others. For future, the researcher can do the research about the encourage adoption of QR codes among users in Malaysia.

**FACTOR INFLUENCE THE INTENTION TO USE FOOD
ORDERING AND DELIVERY APP AMONG UNIVERSITY
MALAYSIA KELANTAN (UMK) STUDENTS**

Teo Kai Jing and Mohammad Bin Ismail

Faculty of Entrepreneurship and Business,
Universiti Malaysia Kelantan,
Malaysia

Email: tkjing.a17a0737@siswa.umk.edu.my; mohammad.i@umk.edu.my

Abstract:

This research examines the influence intention to use food ordering and delivery for students in their lifestyle or during the hostel what application to use for ordering food. Food ordering and delivery is an important app in our lifestyle that will help us to solve the dietary problem. In this investigate that I want to conclude the factor influence the intention to use food ordering and delivery between the attitudes, subjective norm, perceive behaviour control, trust and convenience relationship. This result of the study to demonstrate the theory of planned behaviour model (TPB) which is an attitude, subjective norm and perceive behaviour control. Questionnaire were distributed to collect is analysed by using IBM SPSS 24.0 versions based on descriptive statistics, reliability analysis, normality test and Pearson correlation coefficient. Future researchers are recommended to find the different scholar to continue to study the challenge with a similar topic. Through this study, it will understand the factor that influence the intention to use food ordering and delivery app.

Keywords: *Attitude, Convenience, Subjective Norm, Trust and Food Delivery*

1.0 Introduction

The Internet has become an integral part of the daily lives of many countries and has important changed different field of people's lives, it also includes the way how they shop. In ecommerce environments, the time of the delivery service plays an important role in satisfying and retaining customers. According to the mobile app download statistics show that over the user of smartphones has 2.7 billion in the worlds and they spend around 90% time on apps in 2020. The mobile food ordering has become fashionable in recent that the owner of food and beverage service operators have look for new channel to bring their products to consumers. Food ordering and delivery application is increasingly downloaded and used by a class of people having smart phones. The frequency of usage and the determinants which engage people to use this app has not been assessed. An order is typically made either through a restaurant or grocer's phone or website, or through a food ordering company. The delivery fee is depending on company that the customer can choose to pay online or in person. A delivery fees is often charged with what the customer has bought. Sometimes no delivery fees are charged depending upon the situation. Food is a basic need for every person. Food industry has also evolved in e-commerce technology. It is more interesting to understanding the influencing factors which leads to intension to order food using App like Grab Food, Food Panda, Dah Makan and others. Online food ordering is the process of ordering food from a website or other application to

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

choose their favourite food or want to eat. The products will directly delivery to home and ready-to-eat food. Nowadays, consumers are busy in work, study and lifestyle and they didn't have any time to cook therefore they use the easy way to take their food and they can use the time to eat and do their work. In this year the consumer are frequently intentions to use online food ordering and delivery app because of Coronavirus (Covid-19) pandemic.

1.2 Research Objectives

1. To investigate the factor influence of individual's attitude on intention use Food Ordering and Delivery.
2. To examine the influence of subjective norm on intention use Food Ordering and Delivery.
3. To study the influence of perceive behavioural control on intention use Food Ordering and Delivery.
4. To examine the influence of trust on intention use Food Ordering and Delivery.
5. To examine the influence of convenience on intention use Food Ordering and Delivery.

2.0 Literature review

Review of the literature on the factor affects the consumer 's intention to use the food ordering and delivery app among UMK students in Malaysia. Studies are the attitude of internet users to the adoption of a web environment for food ordering. The past studies, articles and related journal will be used to find out what factor influence intention use food ordering and delivery app among University Malayasia Kelantan Students. Attitude, subjective norm, perceive behavior control, trust and convenience that are considering the factor contributing to purchase food through online among a group of students and friends. Theory of planned behavior (TPB) is think that the role and social impact of the individual. It is one of the most widely accepted in the interpretation of technical adoption behavior. Theory of Planned Behavior (TPB) is proposed by the polish social psychologist names Icek Ajzen (1991) and it is a theory that improves on the theory of Reasoned Action (TRA). The aim of TRA is intention of behavior by subjective norm or attitude that force individual to take specific actions. To achieve the behavior target that one of the factors over an individual to control is perceived behavior control by Ajzen (1988). In TPB have three independents decide or determine of intention to action or behavior such as attitude, perceive behavior control and subjective norm. Assume that intention is the motivation factors that capture the behavior.

2.1 Dependent Variable:

2.1.1 Intention to use

Intention of customer in choosing a product or service is important information that the marketers need to know because it is highly associated with customer retention. According to Azjen (1991), intention is one of the major driving forces of behavior.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

2.2 Independent variable:

2.2.1 Attitude

According to Ajzen and Fishbein (1980) attitude is the behavior intention that influence one someone in the TPB model. Based on the previous research the attitude to be an assessment that consumer exploit when using the food delivery apps.

2.2.2 Subjective Norm

Subjective norm is defined as the social pressure that the person or individual perceive some issues that important influence on the intention of behavior (Ajzen; Fishbein 1980). According to Ajzen (1991), the influences of social such as their families or friends become the main impact that affected an individual's career choice.

2.2.3 Perceive Behaviour Control

According to Ajzen found that people's behavior is not absolutely voluntary however is under control. Budic (2016) defined the perceived behavioral control as the individual mindset for download the app and use to order. Although use the food delivery app is easily for everyone that they just click an order and the apps also provide an excellent usage experience for the consumer.

2.2.4 Trust

Trust is an important reason that can improve the relationship with buyer and seller; the intention to online purchase in e-commerce (Jarvenpaa et al., 1998; Zhou et al., 2007; Naveed and Eddaoudi 2009; Yulihastri et al. 2011; Swidi et al., 2012). Trust can be defined as the characteristic that the consumer will belief and confidence to give the consumer choose purchase online.

2.2.5 Convenience

Convenience is very important for the consumer to do any thing and purchase easily. Based on the previous research Azitul, Jamaludin, Albattat, Ahmad also stated quality attributes represent convenience be related with food delivery apps that think the consumer can easily to ordering purchase among young generation.

2.3 Hypothesis Statement

These following hypothesis are generated by resercher and were tested in this study.

H1: Attitude will be the factor influence consumer intention to use food ordering and delivery among UMK students.

H2: Subjective norm will be the factor influence consumer intention to use food ordering and delivery among UMK students.

H3: Perceive behavior control will be the factor influence consumer intention to use food ordering and delivery among UMK students.

H4: Trust will be the factor influence consumer intention to use food ordering and delivery app among UMK students.

H5: Convenience will be the factor influence consumer intention to use food ordering and delivery among UMK students.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

2.4 Theoretical Framework

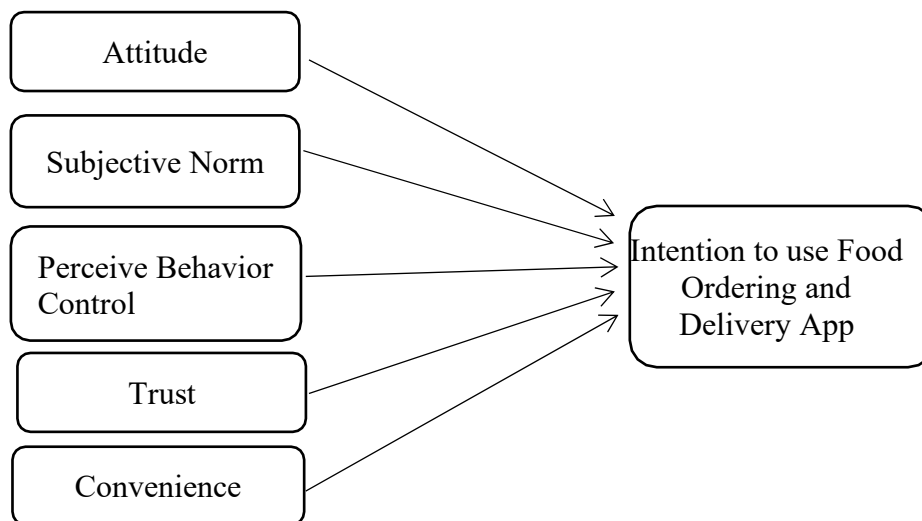

Figure 1: Theoretical Framework of factor influence the intention to use food ordering and delivery app among UMK students

3.0 Methodology

The methodology of research consists of the procedure and action taken in the collection and processing of data related to this study. In the research design the researcher choose quantitative methods. For the data collection, the research use the primary data which is use the questionnaire methods to collects data. The secondary data gathered were from internet, journal, databases and other which had been adopted and adapted in this research.

The purpose of this study intends to examine the factor influence intention use the food ordering and delivery app among University Malaysia Kelantan students. The population of this study in UMK is around 5631 students in session 2020/2021 from the first year until fourth year. Therefore, for the sample size will chosen around 360 respondents. In this research using the probability sampling which is simple random sampling to collect the data.

The questionnaire in this research divided into three sections which is section A, Band C. For the section A is demographic profile of the respondents that are related some personal information such as gender, age, religion, academic of the year and others. In section B is the dependent variable and section C is independent variable such as attitude, subjective norm, perceived behavioural control, trust and convenience.

In the section A are using the multiple choice thus section B and C were examined based on the statement on a 5- point scale. The scales ranged are from 1 until 5 which is 1= Strongly Disagree, 2= Disagree, 3= Neutral, 4= Agree and 5= Strongly Agree. Lastly, the procedure of data analysis is use descriptive analysis, frequency analysis, reliability test and Pearson correlation coefficient.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

4.0 Data Analysis and Findings

The researcher collected the demographic characteristic of the respondents by distribute the questionnaire which is involve students in University Malaysia Kelantan City Campus which consists the demographic profile of respondents such as gender, age, race, faculty, year of study, monthly usage application and usage application. From the sample collected the female respondents were higher than male. The female respondents are 65.6% (n=236) and the male respondents are 34.4% (n=124).

Next is the age of respondents. The respondents were allocated into three groups. The highest numbers of respondents were from the age of around 21-23 years old with 84.4% (n=304). The second highest are 18-20 years old with 9.2% (n=33). Lastly, the lowest number of group age was 24-26 years old with 6.4% (n=24) respondents.

There are four races from respondents. 51.4% (n=185) was Chinese respondents are the most and the next was Malay respondents with 39.4% (n=142). The India respondents was 8.1% (n=29) and the other respondents just only 1.1% (n=4). For the faculty of the respondents, the first higher was the FKP respondents with 80.8% (n=291). The FHPK respondents is the second high in the study with 17.5% (n=63). For the FPV respondents was the least with 1.7% (n=6).

Besides, the year of the respondents the 4th Year's respondents was the higher than 3rd Year. The year fourth students were 57.5% (n=207) and the third year students was 26.9% (n=97). Meanwhile the second year students was 9.4% (n=34) and first year students was 6.1% (n=22). The respondents are use the most monthly application in 1-2 times with 52.2% (n=188). Moreover, 3-4 times usage the application in monthly was 25.8% (n=93) respondents. The third higher of usage the application in monthly was 0 times with 13.3% (n=48) respondents. For the 5-6 times of usage the application was 6.7% (n=24) respondents. The monthly of usage application in 7-8 times was 0.6% (n=2) respondents and use the application more than 9 times was 1.4% (n=5) respondents.

Lastly for the application of Food Panda was the most usage in 61.9% (n=223). Grab Food was 28.9% (n=104) which in the second most used application. The third most use application was Halo in 4.4% (n=16) respondents. The respondents also use the other of application to ordering and delivery which was 3.3% (n=12). For the application Dah Makan was 1.4 % (n=5) respondents only.

4.1 Descriptive Analysis

The descriptive analysis tested according their variable and listed out the summary of the mean and standard deviation.

Table 1: Summary of the mean and standard deviation for all variable

Variables	Mean	Standard deviation
Intention to use	3.97	0.682
Attitude	4.24	0.556
Subjective norm	4.04	0.626
Perceive behavioral control	4.07	0.629
Trust	4.09	0.609
Convenience	4.19	0.577

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

In this study that the summary of the mean and standard deviation for all variable. The intention to use in dependent variable of mean was 3.97 and standard deviation was 0.682. for the independent variable the first is attitude of mean show 4.24 and standard deviation is 0.556. The second is subjective norm show the mean shown 4.04 and the standard deviation was 0.626. The perceive behavioral control of mean is 4.07 and standard deviation is 0.629. For the fourth is trust show the mean is 4.09 and standard deviation was 0.629. therefore, the last one was convenience of mean is 4.19 and standard deviation was 0.557.

4.2 Reliability Analysis

Table 2: Reliability Analysis

Variable	Number of item	Cronbach's Alpha
Intention to use	5	0.826
Attitude	5	0.822
Subjective Norm	5	0.777
Perceive Behavior Control	5	0.814
Trust	5	0.828
Convenience	5	0.800

The first dependent variable is intention to use found to be good level (5 items; $\alpha=0.829$). Next is the first independent variable which is attitude showed a good reliability (5 items; $\alpha=0.822$). The second independent variable is subjective norm which is show an acceptable reliability (5 item; $\alpha=0.777$). The third independent variable is perceived behavior control which is show a good reliability (5 items; $\alpha=0.814$). The fourth independent variable is trust which is show a good reliability (5 items; $\alpha=0.828$) and the last independent variable is convenience which found to be an good reliability (5 items; $\alpha=0.800$).

4.3 Normality Test

Table 3: Normality Test for all Variables

	Kolmogorov-Smirnov ^a			Shapiro-Wilk		
	Statistic	df	Sig.	Statistic	df	Sig.
Intention to use	.118	360	.000	.958	360	.000
Attitude	.097	360	.000	.945	360	.000
Subjective Norm	.090	360	.000	.961	360	.000
Perceive Behavior Control	.096	360	.000	.955	360	.000
Trust	.086	360	.000	.959	360	.000
Convenience	.104	360	.000	.949	360	.000

a. Lilliefors Significance Correction

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Table 4.16 is show that the normality tests for dependent variable and independent variable. Kolmogrov-Smirnov and Shapiro-Wilk are the type of to use to run the normality test. As these two types of tests with the significant value, p-value which is less than 0.05 which indicate normal data. Therefore, on the table above show the dependent and independent variable which the significant value is 0.000, which is less than 0.05. As a result, show that it is a normal distribution.

5.0 Key Findings

Table 4: Summary of hypothesis result

Research question	Hypothesis result	Finding
a) Is there a significant relationship between attitude and intention to use food ordering and delivery among UMK students?	R= 0.715	There are positive relationship between attitude and intention to use food ordering and delivery among UMK students.
b) Is there a significant relationship between subjective norm and intention to use food ordering and delivery among UMK students?	R=0.723	There are positive relationship between subjective norm and intention to use food ordering and delivery among UMK students.
c) Is there a significant relationship between perceive behavior control and intention to use food ordering and delivery among UMK students?	R=0.728	There are positive relationship between perceive behavior control and intention to use food ordering and delivery among UMK students.
d) Is there a significant relationship between trust and intention to use food ordering and delivery among UMK students?	R=0.725	There are positive relationship between trust and intention to use food ordering and delivery among UMK students.
e) Is there significant relationship between convenience and intention to use food ordering and delivery among UMK students?	R=0.640	There are positive relationship between convenience and intention to use food ordering and delivery among UMK students.

5.1 Discussion

The study was conducted to identify the relationship of attitude, subjective norm, perceive behavior control, trust and convenience between intention to use the food ordering and delivery. In this research, the primary data was collected questionnaire through Google form from the respondents and secondary from article and journal.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

5.1.1 The relationship between attitude and intention to use the food ordering and delivery among UMK students.

Based on the table 4 that the researcher identify there is significant relationship between attitude and intention to use food ordering and delivery among UMK students. According to the result of Pearson Correlation Coefficient, the researcher accepts the significant relationship between attitude and intention use food ordering and delivery because the result shows that 0.715 with significant value p, 0.05.

Attitude plays a significant role in evaluating the intention use the food ordering and delivery. This is because the attitude that will influence the person who didn't have time to cook and the consumer's attitude play an important recommend the services for the other person.

5.1.2 The relationship between subjective norm and intention to use the food ordering and delivery among UMK students.

Based on the table 4 that the researcher identify there is significant relationship between subjective norm and intention to use food ordering and delivery among UMK students. According to the result of Pearson Correlation Coefficient, the researcher accepts the significant relationship between subjective norm and intention use food ordering and delivery because the result shows that 0.723 with significant value p, 0.05.

Subjective norm also plays a significant role in evaluating the intention use the food ordering and delivery. This is because the consumer will introduce the comment that close with them made about food delivery apps.

5.1.3 The relationship between perceive behavioral control and intention to use food ordering and delivery among UMK students.

Based on the table 4 that the researcher identifies there is significant relationship between perceive behavioral control and intention to use food ordering and delivery among UMK students. According to the result of Pearson Correlation Coefficient, the researcher accepts the significant relationship between perceive behavioral control and intention use food ordering and delivery because the result shows that 0.728 with significant value p, 0.05.

Perceived behavioral control also play a significant role in evaluating the intention use the food ordering and delivery. Perceive bahavioral controls that affects the people are influence by the knowledge to use the food delivery app.

5.1.4 The relationship between trust and intention to use food ordering and delivery among UMK students.

Based on the table 4 that the researcher identifies there is significant relationship between trust and intention to use food ordering and delivery among UMK students. According to the result of Pearson Correlation Coefficient, the researcher accepts the significant relationship between trust and intention use food ordering and delivery because the result shows that 0.725 with significant value p, 0.05.

5.1.5 The relationship between convenience and intention to use food ordering and delivery among UMK students.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Based on the table 4 that the researcher identifies there is significant relationship between convenience and intention to use food ordering and delivery among UMK students. According to the result of Pearson Correlation Coefficient, the researcher accepts the significant relationship between convenience and intention use food ordering and delivery because the result shows that 0.640 with significant value $p, 0.05$.

Convenience also plays a significant role in evaluating the intention use the food ordering and delivery. The convenience gives the customer could get more easily price between different restaurant that they can choose from food delivery app. The customer could purchase and save their time and money

6.0 Recommendation

Based on the limitation of the research, some of the recommendation that need to discuss for researcher who would carry out the similar topic of the research. Firstly, future researcher could conduct the research in different area or big city area that often uses food ordering and delivery in Malaysia. The future researcher can search out more information or knowledge to identify the respondents is efficiency on uses food ordering and delivery in Malaysia. The future researcher can know the influence of respondents that want to use delivery and the convenient for them.

Furthermore, the second recommendation of the research is the researcher can more expand the sample size and population that to get more exact of the study. The study just focuses on UMK students. The future researcher could conduct in different university, place and age of the respondent to solve more information from that. In addition, the researcher also can take the longer time to collect the data accurate which more understanding the respondent that adopt food ordering and delivery in their lifestyle.

Lastly, the future researcher can interview compare to questionnaire which is more recommended action for survey that can more understanding the user to know they which the favourite type of application to order their food through online. The researcher also can easily show the guidance to the user which the person has difficult to answer the questionnaire. This action will more effective in doing the research and collect the data.

7.0 Conclusion

As a conclusion in this study, we can identify the study the factor influence the intention to use food ordering and delivery app among University Malaysia Kelantan students. The result of this study show that the literature is supported and the data collected are reliable. This is proven by all independent variable which is include attitude, subjective norm, perceive behavior control, trust and convenience are supporting the dependent variable is intention to use. According to the result is shown that the attitude had positive influence the intention to use food ordering and delivery. The result indicates the respondents feel that using the food ordering and delivery app is a good idea in their lifestyle.

Next, in the result of subjective norm also had positive influence the intention to use food ordering and delivery. The respondents always use the delivery because of promotion code and the influence of advertising on social media or television that can affect the people to use and purchase on it easily. On the other hand, the result of perceived behavior control also has the

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

resources, knowledge and ability to use the app that the people also feel the app is under their control. Hence, the trust on the result also positive with the people feel trust on using the app and the information on the site is true for them. The last independent variable which is convenience that show the result is effectiveness that feel use the delivery application give the people is convenience and no need to cook when busy to do something.

Although in the study of hypothesis result is relationship between independent and dependent variable however the study have some limitation on that. Therefore, the recommendation for the future researcher can find out more reliable information and result of the study on the similar topic. Future researcher can do some action to collect data more effective. After do this research, the owner will more know that their customer trend to buy with them because of convenience, perceive risk and trust on the food ordering and delivery. Lastly, the researcher had anticipated the purpose of the findings of the research to give knowledge and experience for university students to know the food ordering and delivery app in their lifestyle.

8.0 Acknowledge

I would like to take this opportunity to express my appreciation to all people who have contributed their time and efforts that helped me in this research study. First of all, I would like to thank you University Malaysia Kelantan for the opportunity to work on this research.

Second, I would like appreciate to my supervisor, Prof Madya Dr Mohammad Bin Ismail. For guidance me to complete this research today. He always kindness and generous when I face some problem in this research and he will give the guidance for me. Without his guidance and support, I would not have complete it within this time.

Lastly, I would like to grateful towards my family, coursemate and friends for their understanding and assistance during my writing. Thank you all for helping me.

Malaysia

Email: ilman.a17b084@siswa.umk.edu.my; mahathir.m@umk.edu.my

Abstract:

This research aims to identify the causation of online game addiction among university student. This study tested three hypotheses, namely (1) Relationship between psychological factor and online game addiction, (2) Relationship between technological factor and online game addiction, (3) Relationship between media factor and online game addiction. This study obtained a sample of university students, using a questionnaire survey was conducted on 105 samples. The factors are developed from justice theory. The quantitative methodology is adopted for this study and the result shows that all the variables are supported by the carried out the analysis.

Keyword: *Justice, psychological factor, technological factor, media factor*

1 Introduction

1.1 Background of Study

Nowadays, the majority of people use technology. When technology advances, it grows by simply clicking to make things simpler for individuals. Even the Internet is very open for individuals. The Internet is the largest medium we use to connect around the world today. Playing online games is one of these things. It is a type of indoor gaming that is normally used on a computer or mobile device. Offline games are commonly played in single games, whereas online games require the internet to link players around the world or communicate. The online gaming that the Internet offers. As a result, online games are extremely popular for individuals, especially students, because they can easily access the internet and are downloaded free of charge (Lowa State University, 2011).

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

1.2 Problem Statement

Online games are meant to draw students for hours on end. When they play sports, most students experience a sense of strength and accomplishment. They have little financial freedom in the modern world and are trapped in the uncomfortable void between infancy and adulthood. Playing an online game offers an escape from life for them.

Online games offer a sense of excitement to sedentary students. When they are facing a new challenge in a game, some students get an addictive adrenaline rush. Most games often have different levels of ability that work to draw the gamer in. The gamer earns a reward and feels a sense of satisfaction with each new level reached. Games such as massive online role- playing multiplayer games (MMORPG) are highly addictive. In order to progress, these types of games force the player to perform tasks, and sometimes players must work together in an online forum as teams. The more time students spend in front of a computer or mobile screen, the less time they have to deal with their assignments or socialize with peers. They are more sedentary as well, which can lead to health issues.

When a student starts playing the game online more often and longer, it can have some lasting impact on their lives. Students have spotted failure in education achievement and relationship due to their online game addiction.

1.3 Objective

This research is carried out with the primary goals of understanding the causation of online game addiction among university student. This research specifically aims to; (1) To investigate the relationship between the psychological factor and online game addiction among university student. (2) To identify the technology variables that lead to addiction to online game among university student. (3) To analyzing whether media factors can trigger online gaming addiction among university student.

1.4 Scope of Study

Online game addiction research is still a fairly recent condition. There are not many researchers doing this study about how to formulate any preventions, especially for students. Since excessive online game addiction is the problem, it can have a serious unforeseen effect on both the gamer and the people around them. Moreover, this research focus on the causation of online game addiction among university students.

This study will offer solutions to the problem and thus help to find ways to eventually avoid and prevent it from being addictive. Moreover, with the information collected, some students could find solutions for online gaming addiction to improve their academic performance.

2 Literature Review

2.1 Psychological Factor

This research focuses on researching the potential causation of online game addiction among university students. Unlike drug abuse, the biological aspect of video game addiction is unknown. Study shows that gambling raises dopamine, but there is more to addiction than brain chemistry (Rooij, 2010). The addict is suffering from a psychological aspect of the addiction. Online gaming helps a person to escape the real world and shift the sense of self-esteem (Rooij, 2010). An addiction to an online game is not so far removed from opioid addiction. Virtual life becomes more enticing than real life. Compared to the risks of a drug overdose, too much gaming may seem relatively harmless, but experts warn video game addiction can destroy lives. Students who play four to five hours per day have no time for socializing, doing assignments, or playing sports leaving little time for normal social development. According to Lan Ying Huang 2010, players of online games can also see the games as a source of diversion and filling time by playing the online game features. It seems that students who play games to get away from their lives or pretend to be other individuals are most at risk of being part of a vicious circle. These players escape their issues by playing games, which in turn interfere with their lives because they're too busy playing games.

2.2 Technological Factor

According to Simon Hill, developers and publishers have been ensuring the most of their attempts to increase the reception of online gamers. People keep track of the latest version of the game to enable them follow the pattern. Online game incentive schemes, such as achieving a high level in the game, gaining new weapons, can also inspire players to play online (Choi, Lee, Choi, & Kim, 2007). According to Choi, Lee, Choi, & Kim, the aspect that affects addiction is the role of satisfying interdependence. This happens because online players are drawn to the task and incentive of the game. There are a number of challenges and prizes from various types of games. The rise in this addiction is due to technology. Technologies have continued to innovate over time. Addictions to electronic devices such as online game have been referred to as 'technological addictions' (Griffiths, 1995, 1996).

2.3 Media Factor

The role of the media in promoting the games also contributes to why such games would be more popular in the addicted games. Unintentional advertisement processing, unconscious learning states, and retentive exposure effects in advertisement and marketing literature remain intensely debated topics (Mick, 2003). In their immediate surroundings, people often do not consciously include or process any of the commercials (Bauer and Stephen Greyser 1968; Webb and Ray 1979). According to Wood. R. T. A 2008, media hype regarding video game addiction

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

may encourage some of the concerned relatives to define totally natural actions as problematic. The fundamental consideration is that the influence of in-game ads relies on the respective method of processing, which is in turn influenced by factors dependent on stimuli and person thresholds (Mau. G and Silberer. G, 2013).

2.5 Hypothesis Development

There are three hypothesis conducted for this study, which are:

H1: To investigate the relationship between the psychological factor and online game addiction among university student.

H2: To identify the technology variables that lead to addiction to online game among university student.

H3: To analyzing whether media factors can trigger online gaming addiction among university student.

2.6 Conceptual Network

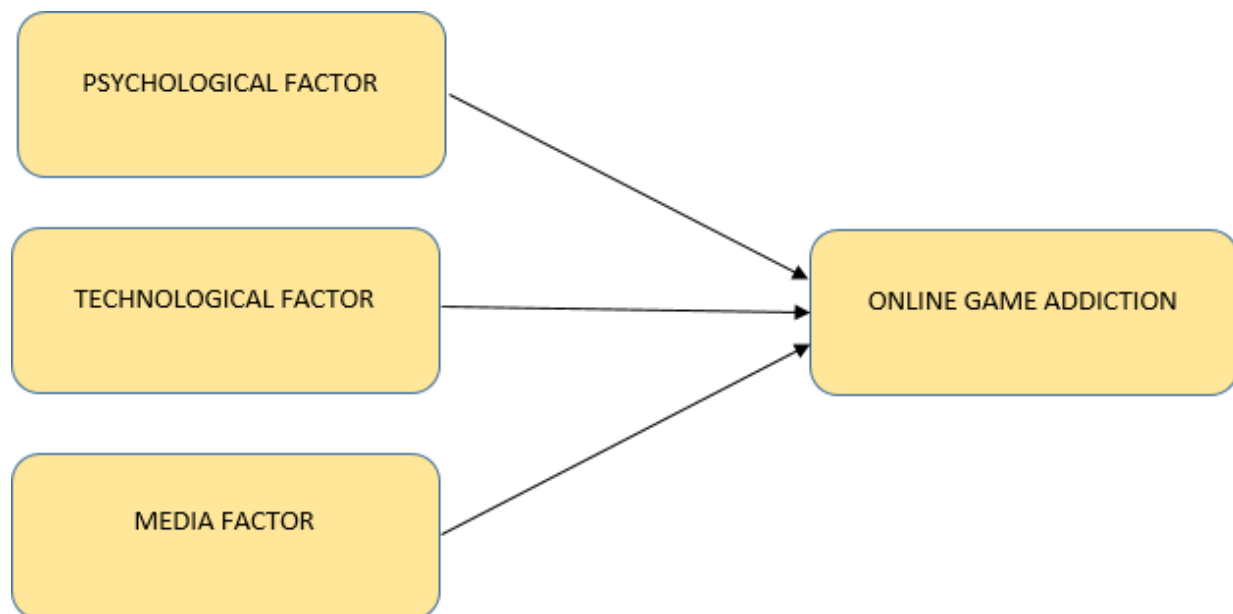

Figure 2.1 Conceptual Framework

3 Methodology

3.1 Research Design

The purpose of the research design is to provide an appropriate framework for the study. The choice to be made regarding the research approach is a very important decision in the research design process, since it determines how the relevant information for the study will be obtained. In order to provide a solution, research can be described as a systematic and organized effort to investigate a particular problem (Sekaran; 2000; Burn, 1994).

According to Smith et al., (1979), quantitative research employs the traditional, positivist, experimental, or empiricist method to enquire into an identified problem. Quantitative is based on the analysis of a theory, measured by numbers and analyzed using statistical techniques, and emphasizes objectivity and reproducibility in particular (Smith et al., 1979). A structure questionnaire was designed to obtain the data on the causation of online game addiction among university students. The data were then being analyzed to discover the relationship.

3.2 Data Collection

Data collection is a process of gathering information from all relevant sources to find answers to the research problem, to test the hypothesis and to evaluate the results. Methods for data collection can be split into two categories: primary data and secondary data.

3.2.1 Primary Data

In this study, data collection is through primary data collection method which is a common online survey questionnaire. An online questionnaire is used to gather information from university students. Next, the SPSS and Smart PLS is used as a tool to identify and examine information on the basis of a questionnaire.

3.2.2 Secondary Data

Secondary data is the data that has already been collected and made readily available for researchers to use for their own research through primary sources. It is a form of information that has already been gathered in the past.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

3.3 Sample Size

Sample size in any statistical context is a count of individual samples or findings. The size of the sample is an essential aspect of any scientific analysis in which the aim is to draw inferences from the sample. In this research, the population from which the samples were derived conducted on the university students. The most appropriate sample size for this research is 105. There means that 105 university students were used to answer questionnaires. Hence, the questionnaires were distributed randomly for those people that can express their willingness to respond to this survey.

3.4 Sampling Techniques

Sampling technique as a method used by a researcher to determine how to choose or identify the individual survey units that would be used as study respondents. The convenience sampling will be the selection of the sample in this study. Convenience sampling is a form of non- probability sampling technique in which samples are chosen for the target population due to their convenient usability and accessibility to the researcher. Elements are picked for the survey depending on the convenience of the researcher in convenience sampling (Black, 2011). Researchers are easier to identify the respondents among the population by selecting convenience sampling, since the respondents select based on their availability and willingness. In fact, the convenience sampling method would effectively minimize the time and expense of this research.

4 Data Analysis

4.1 Data Analysis

The SPSS and Smart PLS application was used in this chapter to evaluate the data obtained from respondents and the effects of statistical analysis. The result included demographic section such as gender, marital, age, ethnicity, type of university, education level and preferred online game, dependent variable which is online game addiction. The researcher distributed questionnaires through Google form for respondents to answer. There is a three-part data analysis used: descriptive statistics followed by Cronbach's Alpha and Frequencies Statistic. Multiple Linear Regression (MLR) is to test the strength of variables between the dependent variable and independent variables.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

4.2 Findings

The reliability test was carried out on the independent variables to check the measurement instrument's internal consistency. The Cronbach's Alpha for all variables scales was in the range of 0.7 to 0.91. They were well above the minimum acceptable reliability of 0.6 as suggested by (Hulin, Netemeyer, & Cudeck, 2001). The result for the first independent variable which is psychological factor has value of 0.853. This means that the result of Cronbach's Alpha is acceptable. Next, the result of Cronbach's Alpha for technological factor has value of 0.843 which is acceptable. Moreover, the result for media factor has value of 0.917. This means that the result of Cronbach's Alpha is excellent. Thus, the actual reliability test was obtained for this study is reliable.

Table 4.1 The Result of Actual Reliability Test for Each Section of Questionnaire.

Variable	Number of Items	Cronbach's Alpha	Strength of Association
Online game addiction	5	0.752	Good
Psychological factor	5	0.853	Acceptable
Technological factor	5	0.843	Acceptable
Media factor	5	0.917	Excellent

Partial Least Square (PLS) Algorithm and Bootstrapping used in this study describe the relationship between the independent variables and dependent variable by using the term of beta coefficient and p-value. The result indicated that psychological factor value ($\beta= 0.614$, t-value= 6.628, p-value= 0.000), technological factor value ($\beta= 0.436$, t-value=2.515, p-value= 0.012), and media factor value ($\beta= 0.318$, t-value=1.854, p-value= 0.064).

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Table 4.2 Beta Coefficient, T-value and P-value among Independent Variables

	Beta Coefficient	T Statistics	P-Value	Significant
Psychological Factor	0.614	6.628	0.000	Significant
Technological Factor	0.436	2.515	0.012	Significant
Media Factor	-0.259	1.854	0.064	Not Significant

Discussion and Discussion

This paper conducted a questionnaire survey on studying the causation of online game addiction among university student. According to the research result, psychological factor, technological and media factor have a remarkable impact on university student. This study's significant contribution was to investigate the psychological factor, technological factor and media factor that influence to online game addiction. However, this study proposed a substantial relationship between the independent variable and the dependent variable. Therefore, the objectives of this study have been achieving.

Acknowledgement

I would like to express my appreciation and my thanks to the authors and acknowledge the support and guidance received from Sir Mahathir Muhamad, Faculty of Entrepreneurship and Business, University Malaysia Kelantan research. His knowledge, information, and experienced shared on the learning process very valuable. He is also very understanding of each of the difficulties to finish this assignment.

FACTORS THAT INFLUENCE THE INTENTION OF THE CUSTOMERS TO USE E-HAILING SERVICES

Wan Alia Nabila and Mohammad Ismail

Faculty of Entrepreneurship and Business,
Universiti Malaysia Kelantan,
Malaysia

Email: nabila.a17a0755@siswa.umk.edu.my; mohammad.i@umk.edu.my

Abstract:

Nowadays, using E-hailing services become a trend to university students. Students tend to use E-hailing services due to the benefits that have when using the Ehailing services. E-hailing services are useful especially for those who do not have their own vehicles. In this era of globalization, people prefer to be one of the Ehailing drivers. Therefore, this analysis is to study the factors that influence the intention of customers to use E-hailing services among university students. The analysis is to examine the relationship between perceived price, perceived convenience and perceived safety and security with the intention of customers to use E-hailing services among FKP students at UMK. From the findings, the research design of the study is quantitative study while for data collection is by online questionnaire. Population of the study is for 3482 students from FKP but only 136 questionnaires were distributed and valid for coding, analyzing and to test hypotheses. The collected data were then analyzed using SPSS version 25.0 and this study can be used in the future in this field. From the findings also, there are 47 male students and 89 females students that participate to answer the questionnaire. Majority of the respondents are still single while only 9 of the respondents have been married.

Keywords: *E-hailing service, perceived convenience, perceived price, safety and security, university students*

1 Introduction

Since the transition to a global integrated network to share and distribute data, the internet has become a valuable marketing tool to serve as a platform for domestic and foreign transactions. It also becomes a platform for those who want to use online applications. Throughout 2018, global transportation market size has been forecasted to grow by 19.8%, however, the transportation industry was worth 75 billion in 2017 (Research, 2019). Progressed improvement in Global Positioning System (GPS) innovation has effects affected metropolitan development and robotized transport organizations (Mason, 2001). One of those innovative advancements in the on-going past is the improvement of e-hailing down applications in the taxi market. According to (Arumugama, Ismailb, & Joehareec) Malaysia's E-hailing administration is controlled under the Ministry of Transport Malaysia (MoT). Both specialist services must enlist with the Land Transport Commission (SPAD), the Companies Commission of Malaysia (SSM), or the Cooperative Commission of Malaysia (SKM) to apply for e-hailing permitting.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

E-hailing is an online transportation administration that has arisen as the vehicle area's traveler, requiring correspondence between specialist providers and users. Anyway, as users have more information and decision in this period to pick any customers, the specialist organization needs to fulfil and offer better support to its huge number of clients, especially for e-hailing administration. For the specialist organization of e-hailing to hold upper hands, keeping up consumer loyalty is significant. One of the standards of co-making of significant worth is organization customer's connection.

Subsequently, the technique of significant worth co-creation was utilized to enhance purchaser commitment as buyers are associated with making encounters and incorporating quality-in-setting that can improve the organization's effectiveness (Idros, Mohamed, & Jenal, 2018). (Khalaf Ahmad, 2011) it guaranteed that a framework should be all around planned and makes it simple for customers to use as it is critical to impact consumer fulfilment. At present, e-hailing permits travelers to rate their experience on a size of 1 to 5 stars to screen customers' loyalty for the driver as it were (Idros et al., 2018)

In the overall vehicle industry, E-hailing with different names, otherwise called ride-booking and ridesharing, was notable and was presently getting famous in Malaysia. E-hailing administrations were viewed as the securing of on-request vehicles that depend on organization reliance and the Internet use of a specific computerized application. E-Hailing was defined as the use of a private car to transport a paying passenger, enabled by the use of technology and apps (Juma, 2016).

There were various types of e-hailing which was grabbing, maxim, mycar and others. E-hailing services is vital to everyone due to it may help others to use the services to go anywhere at any time. So it is easy for others who does not have car or motorcycle license to drive. While, as software programmed licensed by TNC, an E-Hail Application can be portrayed occupant on a cell phone or smartphone (Transportation Network Companies) and coordinated with the TPEP (Taxi Passenger Enhancement Program). Such a solicitation should be joined by the ID of the places of both the driver and the traveler, the quest for accessible cabs in the region, the capacity of the traveler to book a taxi and the driver to acknowledge such demands and the capacity of the traveler to pay for the administration utilizing the E-hail application.

The purpose of this research is to know more about the factors influencing the intention of customers to use e-hailing services, especially among students. E-hailing services have been raise expanding as more passengers register for the services. The number of operators and the increased coverage of the areas served by taxi operators have also increased (Juma, 2016). In recent months, in terms of users, drivers, and geographical areas covered, these services have expanded rapidly. In their present state, these services look exactly to taxis, which have generated a lot of political confusion and tension about strain about 'reasonableness' in administrative treatment among cabs and ride sourcing organization (Rayle, 2014). In most areas, the inevitable populace development has prompted the requirement for endeavours to improve the simplicity of development of individuals and vehicles, to limit self-driving and to support the utilization of public vehicle (Veloso, 2011).

The tendency to use e-hailing services has increased, as they allow users to control their reservations in advance by pre-booking, changing and cancelling applications at lower costs. E-hailing services enable passengers to book private cars via application and take

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

advantage of surge pricing during the high demand to arrive within the specific time at the location of the request of passengers (Homniem & Papat, 2020). Although e-hailing services become increasingly common in Malaysia, the generation X usage rate of e-hailing services is relatively low. Generation X is more educated and has a higher disposable income compared with the baby boomer generation (Chin, Leng, Peter, & Yacob, 2019). E-hailing services become one of the favoured public transportation modes, door-to-door service, security features, and vehicle choices due to its 24-hour availability. In conclusion, the purpose of this study was to evaluate the competition brought about by the selection of different E-Hailing Apps and the distinctive characteristics that separate the applications and their degree of separation utilization starting with one then onto the next administrator. In 2017, the market revenue for the e-hailing is 53 billion that reported by (McKinsey, 2017). Users can use smartphones, laptops or tablets to conduct e-commerce operations as long as wireless internet access is available. With more than 90% of the market share, Asia is the largest e-hailing industry in the world.

Generally, the intention was an indicator to denote the factors that influence a desired behaviour (T. Teo & Zhou, 2014). It also shows how much effort a person can make to conduct an action. Basically, having a specific intention can improve the level of concentration and motivation. However, there is little understanding of the factors that influence the intention of the customers to use e-hailing services and the relationship between perceived safety and security and factors that influence the intention of the customer to use e-hailing services. Many conceptual models of entrepreneurial intentions exist. All of them are generally derived from the theory of planned behavior in (Ajzen, 1991). The intention of using e-hailing services depends on the understanding of the intention of the person and the probability of behaviors and tendencies associated with it.

2 LITERATURE REVIEW

2.1 Attitudes

Attitude is defined as the affective assessment of a given assignment (Fishbein, 1980). In other words, the attitude towards the use of technology relates to the degree to which a person wants to use technology or dislikes it. Intention is an indicator to define the variables influencing an action that is desired. It also shows how much effort a person must make to carry out a behavior (Fishbein, 1980). In the TRA and TPB, the attitude-intention relationship was highlighted, suggesting that the attitude of a person is an evaluative predisposition to the behavior as a result of its definitive personal effects. Thus, the following hypothesis was proposed:

H1: There is a significant relationship between attitude and the intention of the customers to use e-hailing services

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

2.2 Perceived Safety and Security

Perceived safety and security is the main predictor of the experience of passengers in deciding on the use of public transport services, which is very sensitive and vital to the personal safety and security of passengers. The perceived safety and security issues are about the drivers, the privacy of passengers, the state of the car, as well as insurance coverage for premiums when using the service. Include when requesting the service, the details given in advance, such as the location of the driver, phone number, plate number, and the approximate fare in advance (B.-C. Teo, Mustaffa, & Rozi, 2018). Recent studies have shown that perceived safety and security has an effect on attitudes and intention to use technology because perceived safety and security directly affects attitudes. It is supposed to have an indirect impact on the intention to use technology.

H2: There is a significant relationship between perceived safety and security and the intention of the customers to use e-hailing services

2.3 Perceived Price

The perceived price can be described as the perception of a person's price in relation to the price at which the passenger charged for using the service charged after completion of the service. During high demand era, the surge pricing by e-hailing service has occurred, resulting in a different charge for fare and driver management particularly during prime time (Mohamad, 2016). Recent studies have shown that perceived price has an effect on attitudes and intention to use technology because perceived price directly affects attitudes. It is supposed to have an indirect impact on the intention to use technology.

H3: There is a significant relationship between perceived price and the intention of the customers to use e-hailing services

2.4 Perceived Convenience

Perceived convenience can be defined as an alternative to standard modes of transport that are similar to general public transport, but have better features that are more convenient for passengers with accessibility to certain fares and multiple payment methods available as alternatives depend on the convenience of customers (B.-C. Teo et al., 2018). Recent studies have shown that perceived convenience has an effect on attitudes and the intention to use technology because perceived convenience directly affects attitudes. It is supposed to have an indirect impact on the intention to use technology.

H4: There is a significant relationship between perceived convenience and the intention of the customers to use e-hailing services

2.5 Perceived Ease of Use

Perceived ease of use refers to how the individual thinks they can use the system to make purchases, and it can be easily accomplished, and a system does not cause users to have trouble and problems. Passengers feel that because of its comfort, fast, and trouble-free way the public transport service can be lightened to use and happy to use (Gumilar, W.D., Oliver, Gunawan, Sfenrianto1, 2019). Recent studies have shown that

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

perceived usefulness has an effect on attitudes and the intention to use technology because perceived usefulness directly affects attitudes. It is supposed to have an indirect impact on the intention to use technology.

H5: There is a significant relationship between perceived ease of use and the intention of the customers to use e-hailing services

2.6 Conceptual Framework

By referring to the literature review, a research framework has been conducted to connection between factors that influence the intention of the customer to use e-hailing services. The independent variables that been proposed consist of four factors which is perceived safety and security, perceived price and perceived convenience. Meanwhile, the dependent variable is intention to use e-hailing services.

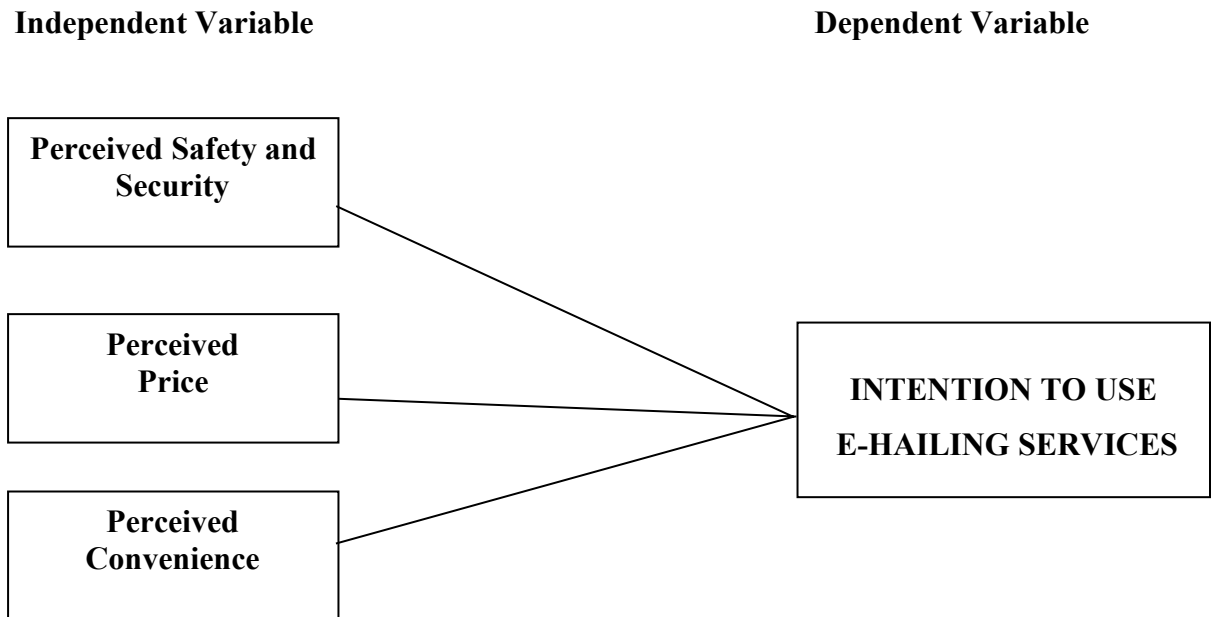

Figure 2.6.1: Factors That Influence the Intention of the Customers to Use E-Hailing Services among University Students

3 Methodology

3.1 Research Design

The purpose of this study is examining factors that influence the intention of the customer to use e-hailing services among university students. The correlational research design is carry out that it seeks to determine the relationship between the intention to use and factors that influence the intention of the customer to use e-hailing services among university students. In this study, online questionnaires are used as a method for data collection. Besides that, this study also conducted using the descriptive design.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

3.2 Data Collection Methods

Data collection method of the research is quantitative analysis. Quantitative analysis refers to the measurement of a numerical result. A typical case is a survey that asks questions to gather answers that shed light on patterns, preferences, behavior and so on. Each respondent was asked to answer the questionnaires by online. The researcher makes a survey of the respondents' survey forms. The complete forms are accepted for the data analysis process, incomplete questionnaires are replaced with new questionnaires. The researcher ask question to the respondent which is university students that has the intention to use e-hailing services. Besides that, the researchers also acquire the data from secondary data which is from books, journal, and articles.

3.3 Populations

Population of the study involved university students which is FKP students in UMK that have intention to use e-hailing services. To carry out this study, the researcher takes female and male respondent in UMK under FKP to answer the online questionnaire. According to Universiti Malaysia Kelantan Pengkalan Chepa, the total of FKP students is 3482. According to (Cohen 1992) 136 respondents need to answer the questionnaire.

3.4 Sampling

Sampling technique that used is convenience sampling technique. A convenience sample is simply one where the units chosen for inclusion in the sample are the most easily accessible. Sampling technique is FKP students who has been experienced and has intention to use e-hailing services. FKP students are participate and 136 respondents answering the questionnaire. It passed randomly to FKP students.

3.5 Data Analysis

In this report, primary data collection is used directly and precisely to gather information and feedback from the respondent who uses the E-hailing services. Besides that, in this research, the Statistical Package for the Social Sciences (SPSS) will be used. The data that we collected will enter into SPSS which helps to provide material for analysis. The techniques were used to analyse the information gathered by descriptive analysis, normality analysis and correlation analysis.

4 Data Analysis and Findings

4.1 Demographic Profile

In this section, researcher were analysed the demographic characteristic of the respondent. This section of Part A in the questionnaire generates information on demographic profile respondents such as gender, course, race, marriage status and understanding about E-hailing. The purpose of the collection of demographic data is to identify the background of respondent that have been used E-hailing services. There are 136 respondents.

In this result, the number of male respondents is the lowest which is 34.6% while the number of female respondents is the highest with 65.4%. Meanwhile, for the course SAR has the highest respondent with 55.1% and the lowest one is SAB which is 7.4%. Besides, in this result show that, Melayu is the highest races that answer the questionnaire with 84.6% follow by others race which is 2.2%. In terms of marital

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

status, only 6.6% were married and the rest 93.4% are single. It shows most of the respondent which is single marital status was comprised the majority group of the study. Lastly, in term of understanding about E-hailing services show that 97.8% is understand while the rest are not understand about E-hailing services.

4.2 Descriptive Analysis

Table 4.2.1: Descriptive analysis for intention to use e-hailing services

Descriptive Statistics		
	Mean	Std. Deviation
Intention to use E-hailing	4.3382	.66572
Perceived Safety and Security	4.3382	.65584
Perceived Price	4.3787	.56025
Perceived Convenience	4.4301	.59837

Table 4.2.1 shows the result of all dependent variable and independent variables include intention to use e-hailing, perceived safety and security, perceived price and perceived convenience. The highest mean is perceived convenience with 4.43 whereas the lowest mean is intention to use e-hailing and perceived safety and security with 4.34 each. Moreover, the highest standard deviation is intention to use e-hailing with 0.67 while perceived price has the lowest standard deviation which is 0.56. Thus, E-hailing need focus more to the highest value variables in order to influencing consumers have intention to use E-hailing services.

4.3 Reliability Analysis

Table 4.3.1: Reliability Analysis for All Variables

Variables	Number of Items	Crombach's Alpha	Strength of Association
Intention to use e-hailing	6	0.895	Good
Perceived safety and security	4	0.884	Good
Perceived price	4	0.811	Good
Perceived convenience	4	0.861	Good
All	18	0.926	Excellent

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

From the table 4.3.1 is show overall reliability analysis. The Cronbach Alpha for intention to use e-hailing is 0.895 with the strength of association is good. For the perceived safety and security, the Cronbach Alpha is 0.884 while perceived price is 0.811 and for the perceived convenience is 0.861. From the all variables the strength of association is excellent.

44 Normality Test

Table 4.4.1: Normality Test

Kolmogorov-Smirnov ^a			Shapiro-Wilk			
Statistic		Df	Sig.	Statistic	df	Sig.
Intention to use e-hailing	.160	136	.000	.853	136	.000
Perceived safety and security	.171	136	.000	.849	136	.000
Perceived price	.159	136	.000	.890	136	.000
Perceived convenience	.194	136	.000	.810	136	.000

a. Lilliefors Significance Correction

The result that shown in table normality tests that using SPSS was abnormal data. The value of 0.000 in Shapiro-Wilk's test and Kolmogorov-Smirnov's test that shown mean it was less than 0.05. It means that the data was counted as abnormality data. Table 4.6.1 show that the significant of intention to use e-hailing was 0.025, significant for perceived safety and security was 0.016 and significant for perceived price was 0.014. That is mean intention to use e-hailing, perceived safety and security and perceived price. Significant for perceived of convenience was 0.056 that means it was normal data.

45 Hypothesis Testing

Table 4.5.1 Hypothesis Testing

Variables	Pearson Correlation	Sig. (2-tailed)
Perceived Safety and Security	0.803**	.000
Perceived Price	0.792**	.000
Perceived Convenience	0.586**	.000

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

The table 4.5.1 shows the result of Pearson correlation or hypothesis testing of the research. The highest r value is perceived safety and security with 0.803 while the lowest is perceived convenience with 0.586 r value. Moreover, perceived price also shows a high r value with 0.792. However, the p-value is significant for all variables with the value of 0.000. That's mean all independent variable has a significant relationship between dependent variable in this study.

5 Discussion and Conclusion

5.1 Overall Conclusion

In a nutshell, this research concludes that all of the independent variables which are perceived safety and security, perceived price and perceived convenience have positive related towards factors that influence the customers intention to use e-hailing services among FKP students in UMK. However, based on our research the result show that the perceive convenience became the most influence factor that influencing the customers intention to use e-hailing services among FKP students in UMK. Most of students of UMK preferred to a convenience in using e-hailing services. This is because students care more about the convenience rather than price and safety and security. Thus, it is important to e-hailing drivers to make sure that they provide clearly and accurately site to influence customers intention to use e-hailing services among FKP students in UMK.

5.2 Recommendation

The first recommendation is more determinant factors should be used by the future researcher beside perceived safety and security, perceived price and perceived convenience. There are others determinant factor that can influence customers' intention to use e-hailing services such as trust, privacy and information. Future researcher are suggested to use other related research when continuing this research as this research are done in such limited time and this research are not able to provide full understanding towards bigger scope of study. Next, researcher can provide some goodies to attract the co-operation of respondents. As we know, people like the appreciation. This is to appreciate the respondent because they spent their time for complete the questionnaires. Lastly, future researchers should find more respondent by choosing wide 53 population compared to this study that focus on FKP students in UMK which the wider population will give more relevant results.

5.3 Implications

This study basically is to understand the factors that influence the intention of the customers to use e-hailing services. From the factor were given in this study may help e-hailing driver to penetrate the intention of the drivers in planning a strategy to attract customers to use e-hailing services. Moreover, as new e-hailing drivers, they can refer to this study for the knowledge to know the factor that influence the customer intention to use e-hailing services to know their target market. This can help the e-hailing drivers to focus on what they need to do to attract and gaining customer interest in their business.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

6 Acknowledgements

First and foremost, I would like to convey our deepest gratitude to our supervisor, Prof. Madya Dr. Mohammad Bin Ismail for his excellent guidance for our research project. He has spent lots of effort and valuable time in guiding us to complete this research project. Furthermore, I would like give thanks to University Malaysia Kelantan for giving me opportunity to conduct our research in order to fulfil subject requirement for Bachelor of Entrepreneurship (Retailing). Throughout this research project, I gain a lot of information and it gives extra knowledge to me whether by books, source of internet or lecturers. Even though these research outcomes may not be the best among student nevertheless, I strongly believe that my research will give benefits for another researcher, academician or retailer for their future references. This research project may give clear understanding in different perspective for them. Last but not least, I would like to confess my deepest appreciation to my beloved friends who assist me to completing this research.

INTENTION TO PURCHASE HALAL PRODUCT AMONG MUSLIMS CONSUMER IN KOTA BHARU

Wan Anis Zahirah Binti Wan Mohamad Zaki and Nur Ain Ayunni
Binti Sabri

Faculty of Entrepreneurship and Business,
Universiti Malaysia Kelantan,
Malaysia

Email: zahirah.a17a0823@siswa.umk.edu.my; ayunni.s@umk.edu.my

Abstract:

The purpose of this study is to explore the relationship between Halal awareness, religious belief, Halal certification and intention to purchase Halal product among Muslims consumer. The convenience sampling approach was used and 400 respondents were evaluated. The data collected is analysed by using Statistical Packages for Social Science Version 26 (SPSS Version 26) software based on descriptive statistic, reliability analysis, and correlation analysis. As for the result, all of the independent variables (Halal awareness, religious belief, Halal certification) had significant relationships towards dependent variable (intention to purchase Halal product) among Muslims consumer in Kota Bharu, Kelantan.

***Keywords:** Halal awareness, religious belief, Halal certification, intention to purchase Halal product, Muslims consumer.*

1 Introduction

Today, the halal logo is no longer just a commodity. It's just a religious matter. It's turning into a global icon. In the category of industry and business, quality improvement and lifestyle preference. Halal is an "allowable" Arabic word. It is more commonly referred to as lawful under Islamic law in English. It applies to everything that is permitted under Islam in the Arabic language. Typically, it is used to define something a Muslim may indulge in, such as eating, drinking or using. Haram, which is Arabic as forbidden or banned, is contrary to Halal. Islamic concepts linked to human interactions with Allah are Halal and Haram. God permits Halal to do, use, or drink. It means that the halal substance will be eaten by God and that it does not affect torture or sin. AlQur'an requires not only halal but also cleanliness in terms of food (Tayyib). Halal products are also shariah-conforming, that is to say they are not dangerous or are not meant for harmful reasons and are not subject to use of haram (prohibited) ingredients, labour or environment use. All consumer goods such as toiletries, pharmacy, etc. can be included in halal cosmetics, and so forth. It also comprises a wide variety of subsectors in the industry with religious, political and financial components.

Muslim customers, who have to fulfil Shariah requirements, are very close to every other market group, who demand safe, good quality goods. Not only do Muslims guarantee what is eaten or worked according to Islamic laws but also the Halal certificate or emblem encourages farmers to adhere with the Halal requirements. Halal certification will also

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

play an important part in ensuring that customers have the requisite halal product requirements.

One Hadith told us, "Whoever lives on halal food has a smooth spirit, has no challenge to his prayers, his faith shines. And if you eat syubhat (ambiguous, halal or haram) forbidden food, your religion is cryptic, your heart is ambiguous. He who eats haram, his heart has gone, his religion is frail, and his faith decreases and Allah closes his prayers and his worship is low. This hadith explains very specifically the joy of the people who eat Halal food all the time in their lives, so that they can follow the order of Allah, so that His piety for Allah will be strong and His prayers will be offered to Him.

In order for businesses to concentrate more on Halal in the global market beyond content (allowable ingredients), farms and spoons, as the population of Muslims is growing by approximately 35% over the next 20 years, from 1,6 billion in 2010 upto 2,1 billion by 2015 and 2.2 billion by 2030. Thus, it enables academics and advertisers to broaden this commodity to multiple markets by exploring its attributes. The signs and symptoms of Halal such as brand names Halal, Halal labels, Halal icons and Halal certifications, etc. are the main factors in making items of Halal available on the markets.

Various studies have been carried out in Muslims consumer to analyse the influence of intention to purchase Halal product among Muslims consumer, with varying results. This research is also discussed in the literature review. The findings of several papers on the intention to purchase Halal product among Muslims consumer are summarised in this literature review report such as Halal Awareness, religious belief and Halal Certifications.

1.1 Research Objectives

1. To identify the relationship between halal awareness and intention to purchase halal product among Muslim's consumer.
2. To identify the relationship between religious belief and intention to purchase halal product among Muslim's consumer.
3. To observe the relationship between halal certification and intention to purchase halal product among Muslim's consumer.

1.2 Research Significant

1.2.1 Retailers

Basically, by depending on the results of this report is to ensure that it suits the needs of Muslims consumer, retailers or retail industry also can get some advantages which can help them to offer the suitable products to consumer according on their age, religion and also gender. Retailers also can know Muslims consumer's perceptions about the product and how much they aware and their knowledge about Halal products. So, in this case it proofs that this research can help retailers or retail industry to offer the products to consumer.

1.2.2 Researcher

Since researcher is currently doing this study, for sure researcher can get input too from this study. One of them is, researcher also can be a consumer that need to purchase the products moreover researcher is Muslim. In this case, researcher will be more aware about Halal products. It is also because of religious beliefs that researcher holds which is in Islam concept, Muslim people cannot eat, wear or more precisely buy the products which has illegal ingredients. Researcher also can get a lot of knowledge in Halal industry.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

1.2.3 Muslims Consumer

Moving on to the next point, this study is purpose to get to know what is intention to purchase Halal product among Muslims consumer through Halal awareness, religious beliefs and also Halal certification. There is significant value for the Muslims consumer that can make they aware about purchasing Halal product. This thing really important to consumer especially Muslim consumer who are really about Halal or Haram concept.

2 Literature Review

2.1 Independent Variable

2.1.1 Halal Awareness

Halal awareness is the ability of a Muslim to understand what a Halal product actually is. This includes their awareness on how products are being stored, sanitary practices, and transferred in the distribution system. For instance, how well a Muslim is able to separate Halal from non-Halal product during shipment and storage to prevent contamination of these products (Ab TalibMS, 2012). Halal is defined as anything that is allowed or acceptable to Muslims (Eliasi and Dwyer, 2002; Berry and Donna, 2000; Berry, 2008). Islamic food products can be separated into nine categories between Halal and Haram. Makrooh and Mashbooh fall in between these categories (Eliasi and Dwyer, 2002). This is very essential for the Muslim customers to know the product categories that they buy and use (Shaari and Arifin, 2009). Regardless of the extensively offered Halal food products, and frequent research information on Halal food market, there is an absence of theory-driven research on Halal food purchasing (Alam and Sayuti, 2011). Moreover, consumers are not exposed adequately to Halal certification and Halal brands (Rajagopal et al., 2011). At the same time, there has been a lack of unpretentious knowledge on the connection between Halal concept such as Halal consciousness and Halal accreditation with purchase intention in the context of purchasing Halal products (Aziz and Chok, 2013). According to previous studies (Bang et al., 2000) knowledge has an influence on intention, as increasing knowledge is likely to influence the intention. Similarly, the knowledge in the direction of the influence of marketing-related concept such as advertising and branding with Halal purchase intention is almost unavailable (Aziz and Chok, 2013). Although vendors are beginning to achieve an understanding on the significance of Halal accreditation and Halal awareness, still very little is known about Halal components and other determinants that have an impact on purchase intention. The manifestation of publicized Halal food meaningfully impacts consumer knowledge of Halal principles (Rezai et al., 2012). Consequently, Halal awareness has a substantial influence on explaining the intention to purchase Halal products (Aziz and Chok, 2013). Previous studies (Bonne et al., 2009) involved habit as an independent construct in Halal meat purchase intention while considering Halal awareness as part of an overall habit. In the UAE, the awareness of youngsters concerning fundamental Halal principles and Halal accreditations is tremendously low (Rajagopal et al., 2011), and this paradigm needs to be confirmed in other parts of the world, especially in the Muslim countries (Hayat M Awan, 2015).

2.1.2 Religious Beliefs

Religiosity is the extent to which people are committed to their religion, reflecting their attitude and behaviour in either obeying or violating the religion's rules and regulations

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

(Z. Zakaria, 2017). Therefore, religious perception becomes an important aspect that affects consumption actions (Essoo and Dibb, 2004). More religious consumer will buy more Halal meals as nearest as possible to the religious perception and prevent themselves from getting involved in activities that are against the religious guidelines (Schneider et al., 2011; Masnono, 2005). Therefore, the religious belief of customers has become a very important part in marketing, particularly in advertisements (Froehle, 1994). Religiosities also have a strong effect on consumer actions and behaviour to buy Halal foods (Weaver and Agle, 2002). Individual's level of religiosity positively affects attitude towards the Halal products (Mukhtar and Butt, 2012).

2.1.3 Halal Certification

In a Muslim majority nation such as Malaysia, the principle of halal is a gateway to consumption. Muslim consumers are now facing a wide variety of goods and services which are quite questionable. Halal certification and logo were indirectly forced by manufacturers and advertisers to warn and persuade their target customers that their goods comply with Halal and Shariah. In general, in Malaysia, Muslim consumers seek authentic Halal Certification issued by the Islamic Development Ministry (JAKIM) in Malaysia, under the jurisdiction of the Prime Minister 's ministry (Abdul Raufu Ambali, 2014). The implementation of Halal Logo and Certification (JAKIM) has led to a greater understanding among Muslims of the value of consuming imported goods or participating in services that obey Islamic guidelines and principles. In Malaysia, Muslims consume food, beverages and manufactured goods by looking at the halal logo approved by the government agency. The Halal logo itself is considered to be a significant source or consideration because food or beverages can be trusted in terms of halal, protection and hygiene. Halal logo is therefore a signal for which food outlets are permitted to be the patronage of Muslims in the country. Labelling is also relevant as a source of knowledge about healthy and hygienic food and diet-related drinks and health. For instant, fruit, vegetables and starchy staples must have complete nutrition labelling and marketing practises that are conducive to healthier food choices (Ahmad Naquiuddin Bakar, 2014).

2.2 Independent Variable

2.2.1 Intention to Purchase Halal Product

The intention is one of the main factors that brings person's behaviour in purchasing a Halal product and how they aware with it especially Muslim people. Intention is the best predictor of behaviour, meaning that if you want to know what someone will do, the best way is to know the intention of the person. The purchase intention a consumer is regarded a subjective propensity towards a product and can be an important index for predicting buying behaviour. However, one can make judgments based on completely different reasons, not always based on intention. In this study, Armitage and Conner stated that intention is recognize as the motivation for individuals to engage in a certain behaviour. Purchase intention can affect the buying decision of customers in the future (Khairi Mohamed Omar, 2012). Moreover, based on various previous theories, purchase intention can be considered as the predictor of future purchase decisions. Furthermore, according to the TPB model, behavioural intention is an immediate antecedent of behaviour. Thus, Behavioural intention is defined as the individual's subjective probability that he or she will engage in that behaviour (Khairi Mohamed Omar, 2012).

2.3 Research Hypothesis

H1: There is a significant relationship between halal awareness with intention to

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

purchase halal product among Muslims consumer.

H2: There is a significant relationship between religious beliefs with intention to purchase halal product among Muslims consumer.

H3: There is a significant relationship between halal certification with intention to purchase halal product among Muslims consumer.

2.4 Conceptual Framework

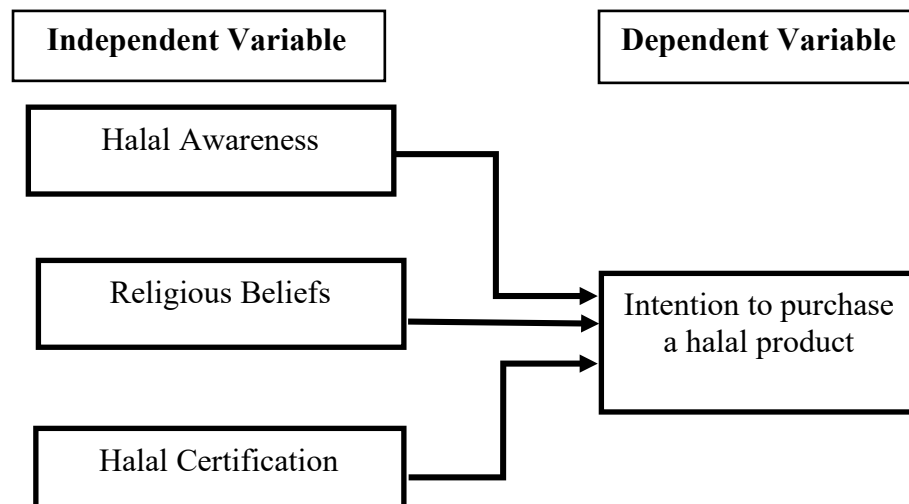

Figure 2.1: The Study Framework

Figure 2.1 shows the conceptual framework that has two variables which are dependent variable namely, intention to purchase a halal product. Dependent variable is the variable that being measured or tested in this study. The next variable is independent variable namely Halal awareness, religious beliefs and Halal certification. An independent variable is a variable believed to affect the dependent variably. By this mean, intention to purchase a halal product among Muslims consumer based on their Halal awareness, religious beliefs and Halal certification.

3 Methodology

3.1 Research Design

This study aims to investigate the relationship between Halal awareness, religious belief and Halal certification towards intention to purchase Halal product. In this research, quantitative type of research has been used for the data collection purpose. Based on Veal (2006), quantitative approach involves statistical analysis. This research is prescriptive in nature, attempting to identify the relationship between Halal awareness, religious beliefs and Halal certification with intention to purchase Halal product among Muslims consumer in Kota Bharu, Kelantan. This area is selecting due to the differences in population of residents and consumers. Residents in this area are mixing community, Malays, Chinese, Indians, and Siamese. Respondent will be selecting among Muslims consumers in Kota Bharu, Kelantan.

3.2 Data Collection

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Data collection define as the process of gathering and measuring information on variables of interest, in an established systematic fashion that enables one to answer question, stated research questions, test hypothesis and evaluate outcomes. The procedure to collect data involves quantitative and qualitative data collection. In this study of halal awareness, religious beliefs and halal certification among Muslims consumer in Kota Bharu, Kelantan. Researcher choose *quantitative method* as a collection of data. Researcher also using primary and secondary data as the method to collect the data.

3.3 Target of Population

Population is an important task for the researchers to carefully select and define before collecting data. Besides, the population also refers to the entire group of people or element sharing some common set of characteristics or interest which the researchers wish to investigate Davis (2005). There are at least 608 600 people at Kota Bharu, Kelantan provided by Department of Statistics Malaysia 2019. In this study, researcher's respondent is among Muslims consumer in Kota Bharu and researcher assume the total is around 564 300 Muslims people.

3.4 Sample Size

The study will be conduct at Kota Bharu, Kelantan. Researcher is focusing for Muslims consumer that have intention to purchase halal product in Kota Bharu. Researcher's respondents involving in variety industry such as food and beverages, cosmetics and others. The sampling is not probability they will make the choice to choose to collect all the data of the study data. Researchers using Kercie & Morgan Table as guidance in determine sample size. According to that table, if the population of study is greater than 100,000 the sample size must at least 384.

3.5 Sampling

In this research, a non-probability sampling will be employed. A non-probability sampling represents a group of sampling techniques that help researcher to select units from a population that are interest in studying. This study will conduct by using convenience sampling as sampling method to collect the data. It is often applied to population study topics which are readily available to the researcher. (Etikan the Ilker, 2015). In this case, each consumer is chosen entirely by chance and each member of the population has an equal chance, or probability, of being selected. One way of obtaining a random sample is to give each individual in a population a number, and then use a table of random numbers to decide which individuals to include.

3.6 Data Analysis

Data processing is a technique of collecting analysis, storage and production of data. The data will analyse and transfer into the statistical packaging for the Social Science Software (SPSS) in latest version 26.0. The descriptive statistics analysis is conducted as to obtain some general observations about the respondent's background. On the other hand, correlation analysis is performed in order to predict the relationship between independent variables (HALAL awareness, religious belief and HALAL certification) and dependent variable (intention to purchase Halal product).

BUSINESS COLLOQUIUM 2020/2021**

4 Data Analysis and Findings

4.1 Demographic Profile

This section discusses the demographic analysis of 400 Muslims consumer respondents, who had intention to purchase Halal products. This section presented the findings about age, gender, race, status and education level. Next, the demographic profiles of respondents were recorded, analysed and simplified as shown in Table 4.1.

No.	Category	Details	Frequency	Percentage (%)
1.	Age	20-25	153	38.3
		26-30	48	12
		31-35	32	8
		36-40	37	9.3
		41-45	53	13.3
		45-50	40	10
		50 an above	37	9.3
2.	Gender	Male	240	60
		Female	160	40
3.	Race	Malay	382	95.5
		Chinese	10	2.5
		Indian	8	2.0
4.	Status	Single	198	49.5
		Married	195	48.8
		Widower/widow	7	1.8
5.	Education Level	UPSR	6	1.5
		PMR	4	1
		SPM	89	22.3

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

MATRICULATION/STPM	46	11.5
DIPLOMA LEVEL	126	31.5
UNDERGRADUATE	87	21.8
POSTGRADUATE	42	10.5

Table 4.1 Demographic Profile

4.2 Descriptive Analysis

This study has analysed the mean and standard deviation for section B, and C of the questionnaires.

Variables	N	Mean	Standard Deviation
Halal Awareness	400	4.7590	0.30880
Religious Beliefs	400	4.7395	0.32389
Halal Certification	400	4.7485	0.31828
Intention to Purchase Halal Product	400	4.7490	0.32351

Table 4.2 Descriptive Statistics

Table above showed the number of respondents, mean and standard deviation of independent variables and dependent variables. For the independent variables, the highest mean was Halal Awareness which is 4.7590 and followed by Halal certification which was 4.7485 and Religious beliefs was 4.7395. The mean for dependent variable which is intention to purchase halal product is 4.7490.

4.3 Reliability Analysis

Validity is about the interpretability, utility and accuracy meanwhile reliability is about the stability, consistency and precision. The reliability of the data is test by the Statistical Package Social Science (SPSS) software and for the internal consistency the Cronbach's alpha.

Table 4.3 Independent and Dependent Reliability Test

Variables	Total Items	Cronbach's Alpha
All variable analysis	20	0.942
Halal Awareness	5	0.759
Religious Beliefs	5	0.783
Halal Certification	5	0.780

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

Intention to Purchase Halal 5 0.798

Products

Table 4.3 shows the Cronbach's Alpha Coefficient value of independent variable and dependent variable of reliability coefficient of this study. All the questions are adopted from the previous study and the entire question has used Likert-Scale. The Cronbach's Alpha for all variables is 0.942. The result shown is an excellent result and the reliability is acceptable. For the independent variable which is Halal awareness, religious belief and Halal certification, the Cronbach's Alpha value are 0.759, 0.783, and 0.780 respectively. All value in independent variable is the good value and the reliability are acceptable. Moving on to the dependent variable, the value of Cronbach's Alpha for intention to purchase Halal product are in a good value which is 0.798. Thus, the result shows the reliability of dependent variable is acceptable.

4.4 Pearson Correlation Analysis

Pearson Correlation Coefficient used to determine strength of linear relationship between independent variables and dependent variables of the study. Basically, it used to determine the strength of the relationships between the Halal awareness, religious beliefs and Halal certification with intention to purchase Halal products.

Correlation			
		IV1	DV
IV1	Pearson Correlation	1	.853**
	Sig. (2-tailed)		.000
	N	400	400
DV	Pearson Correlation	.853**	1
	Sig. (2-tailed)	.000	
	N	400	400

**** . Correlation is significant at the 0.01 level (2-tailed).**

Table 4.4 Correlation Data for Halal Awareness

According to the table above, Halal awareness has been regarded as to have a positive high relationship with intention to purchase Halal product among Muslims consumer in Kota Bharu which their r value is at 0.853.

Correlation			
		IV2	DV
IV2	Pearson Correlation	1	.874**
	Sig. (2-tailed)		.000
	N	400	400

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

DV	Pearson Correlation	.874**	1
	Sig. (2-tailed)	.000	
	N	400	400

****.** Correlation is significant at the 0.01 level (2-tailed).

Table 4.5 Correlation Data for Religious Belief

Table 4.5 shows the correlation data for religious belief which is second independent variable. According to the table, religious belief has a positive high relationship with intention to purchase Halal product among Muslims consumer in Kota Bharu. The value of r is at 0.874. The correlation is significant at the 0.01 level in 2 tailed.

Correlation			
		IV3	DV
IV3	Pearson Correlation	1	.878**
	Sig. (2-tailed)		.000
	N	400	400
DV	Pearson Correlation	.878**	1
	Sig. (2-tailed)	.000	
	N	400	400

****.** Correlation is significant at the 0.01 level (2-tailed).

Table 4.6 Correlation Data for Halal Certification

According to the table above, role of Halal certification has been regarded as to have a positive high relationship with intention to purchase Halal product among Muslims consumer in Kota Bharu which their r value is at 0.878.

4.5 Hypothesis

Hypothesis	Statement	Result
Halal Awareness (IV1)	There is a relationship between Halal awareness towards intention to purchase Halal product among Muslims consumer in Kota Bharu.	Accepted
Religious Belief (IV2)	There is a relationship between religious belief towards the intention to purchase Halal product among Muslims consumer in Kota Bharu.	Accepted

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Halal Certification (IV3)	There is a relationship between Halal certification towards intention to purchase Halal product among Muslims consumer in Kota Bharu.	Accepted
----------------------------------	---	----------

Table 4.7 Hypothesis for All variables

5 Discussion and Conclusion

5.1 Implication of the Study

This research has contributed beneficial to the society in Kota Bharu, Kelantan in terms of awareness and knowledge regarding with the purchase intention to buy Halal product. As Muslims, we should not only focus on getting the certificate at the first place, but the ingredients which use in making the products is also important. That is why, the society need to understand that Halal is not just about the foods, but the other products also need from Halal ingredients. The implication of this study will be discussed in detail below.

5.1.1 Implication for Retailers

Basically, by depending on the results of this report is to ensure that it suits the needs of Muslims consumer, retailers or retail industry also can get some advantages which can help them to offer the suitable products to consumer according on their age, religion and also gender. Retailers also can know Muslims consumer's perceptions about the product and how much they aware and their knowledge about Halal products. So, in this case it proofs that this research can help retailers or retail industry to offer the products to consumer.

5.1.2 Implication for Researcher

Since researcher is currently doing this study, for sure researcher can get input too from this study. One of them is, researcher also can be a consumer that need to purchase the products moreover researcher is Muslim. In this case, researcher will be more aware about Halal products. It is also because of religious beliefs that researcher holds which is in Islam concept, Muslim people cannot eat, wear or more precisely buy the products which has illegal ingredients. Researcher also can get a lot of knowledge in Halal industry.

5.1.3 Implication for Society

Moving on to the next point, this study is purpose to get to know what is intention to purchase Halal product among Muslims consumer through Halal awareness, religious beliefs and also Halal certification. There is significant value for the Muslims consumer that can make they aware about purchasing Halal product. This thing really important to consumer especially Muslim consumer who are really about Halal or Haram concept.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

5.2 Recommendation

5.2.1 Future Research

These future researchers can study about entrepreneur's intention towards selling Halal product based on Halal awareness, religious belief and also Halal certification. This suggested might be able to generate different outcome compared to present study.

5.2.2 Expand Sample Size

This study covered 400 respondents Muslims consumer in Kota Bharu, Kelantan. For the future studies, researchers can expand the number of sample size to increase the accuracy and reliability of data and the problem such as bias data can be divided.

5.2.3 Simplified the Question in Questionnaire

The questionnaire for the present study had included demographic questions, questions for independent variable and dependent variable. The questions should be simpler and easier to understand by the respondents. The respondents will definitely answer the future simpler question more accurate.

5.2.4 Different Population

For the future study, researchers can try to get from the different population such as not only in Kota Bharu, researchers can pick the population in the Malaysia or in East Cost Malaysia which is Kelantan, Pahang and Terengganu. In this case, researchers can get more respondents and also can study in more depth about this Halal awareness.

5 Conclusion

The aim of this study was to investigate the relationship between independent variable and dependent variable. In this study, there are independent variable namely Halal Awareness, religious belief and Halal certification which was include examining the relationship with intention to purchase Halal product. As mentioned in chapter 3, 384 respondents were chosen from Kota Bharu, Kelantan to analyse their factors that brings intention to purchase Halal product by distribute questionnaire in Google form platform. Furthermore, in Chapter 4, there are analyses about the finding from the questionnaire. Pilot Test, Reliability Test, Descriptive analysis and Pearson Correlation were used to interpret the result. The final results reveal that Halal awareness, religious belief and Halal certification has a significance relationship between intention to purchase Halal product. Lastly, in Chapter 5, the study presents the summarizations of the result based

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

on data analysis. In overall, all hypotheses were accepted. Apart from that, the implication of study and some of recommendation for further studies were also include.

Acknowledgement

First and foremost, praise and thanks to God, the Almighty, for His showers of blessings during my research study to bring the research to a successful end. I would like to express the deepest appreciation gratitude to my research supervisor, Dr Nur Ain Ayunni Bin Sabri, Center for Market Statistics, University of Malaysia Kelantan, for providing us an opportunity to carry out research and providing invaluable guidance during this research. I was profoundly influenced by her vision, honesty and inspiration. She has taught me the methods to carry out the research and to present the research work as simply as possible. It has been a great pleasure and honors to work and research under her guidance. I am deeply grateful for what she has given me. I would also like to thank her for her friendship, sympathy and a wonderful sense of humor. I extend my heartfelt thanks to her husband and family for their acceptance and understanding in the discussion I had with her on study and thesis preparation.

I am extremely grateful to my parents for their love, prayers, caring, and sacrifices for trying to educate and preparing me for my future. I also appreciate to my brother and younger brother for their support and valuable prayers. I would like to thank my friends and research colleagues, Syahirah Wahida, Nur Ain, Muhd Danial, Muhd Rifdi and Nurul Hasimah, for their continuous support. I would also like to thank the management of the University of Malaysia Kelantan for their help in enabling me to do this work in the library and get a lot of information via the internet network that has been given to students. Finally, my special thanks go to all the people who have supported me to complete the research work directly or indirectly.

RESEARCH ON THE FACTORS THAT INFLUENCE INTERNET ENTREPRENEURSHIPS INTENTION WITHIN UMK CITY CAMPUS STUDENTS

Wan Az-Zahra Binti Wan Abdullah and Yusrinadini Zahirah Binti Md. Isa@Yusuff

Faculty of Entrepreneurship and Business,
Universiti Malaysia Kelantan,
Malaysia

Email: azzahra.a17b1019@siswa.umk.edu.my ; yusrinadini@umk.edu.my

Abstract:

This research is examined the factors that influence internet entrepreneurship intention within UMK City Campus students. In today business environment, as indicates to competitive advantages the internet and technology are important to curb the strategies in commercializing business activities also organization development. People use the internet as a mainstream necessity into their life today but in a different version of the technology. Today locus, traditional entrepreneurs must mash-up with modern digital technology. Internet revolution opens the new era for business to develop and have filled the holes with random numbers of new entrepreneur that has young flourishing mind also could lead to taking control in dispute economy. The convenience of internet network became a trend that lead to influence the intention of entrepreneurial among UMK City Campus students. Also the advance of internet increases the intention of student's awareness in internet entrepreneurship. This analysis was therefore to establish relationship between the factors influence of ICT adoption, entrepreneurship education and family background towards the internet entrepreneurship intention within students of UMK City Campus Malaysia. Resource-based view theory has been used in this research. There are 741 students from fourth year are given questionnaire through e-survey (google form) by applying a convenience sampling, use valid for coding, analysing and testing the hypothesis. The results for the UMK City Campus are presented in this report. The report suggests improving internet entrepreneurial intention among UMK City Campus students by stimulating entrepreneurship education at universities also ICT adoption guide the students that considering specific offers and activities for the different groups of entrepreneurial students as well as for students who have not considered becoming a founder yet.

Keywords: *internet entrepreneurship intention, e-business, ICT adoption, entrepreneurship education, family background.*

1.0 Introduction

In today business environment, as indicates to competitive advantages the internet and technology are important to curb the strategies in commercializing business activities also organization development. Revolution of the internet has an impact not only on business but also on the economic section and growth of human society. Digital technology industry well-known call as a new economy where the data gather and the process by software. Generally, digital technology builds with the internet that applied in a different version of devices what

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

people frequently use such as digital television, mobile phones, household appliances and "smart" electronics, as for today events it becomes more mainstream use. It improves major factors like a time consuming and upgrade the living standard of people holistically.

As a developing country, according to Annual Report RMK 10, 2011-2015, through the Economic Planning Unit 2010, Malaysia have growth as a knowledge-based economy technology to be in the same line as other countries that have technology development and large-scale of the economy. This partnership with internet shows results of thousands information by the business through networks that will receive a huge amount of mind baffling of new data directly from consumers who become customers to the products. The business usually will receive information and analysis through customers by internet transaction from customers about their behaviour tracking, situational awareness of the products and sensor- driven decision analytics during their purchases. Besides, from the internet, the business will automatic and can directly control the process of optimization, resource optimization and can have independent systems. Nevertheless, in the age of internet today, if the business can predict and meet consumer needs will tremendously make the business become a more pleasurable experience to any consumers and like to continue to do the business in future. The prediction will move the business into infinity and vigorous circumstances of massive data as they have this ability power to evaluate the wars, current natural disasters, climate changes, geopolitics, advance telecommunications and other variables demand. In a business cycle, the ability to predict is apart from a strategy.

Entrepreneurs also booster the use of the internet as it increasingly high roles in searching job or business, whether used for gathering information, medium communication for interaction or as a session for relaxation that leads to technology innovation. Internet is a network tool it helps entrepreneur whether students, individual, small business or corporate company to sell products and services directly to customers on their smart devices without waste any extra of minutes. Today locus, traditional entrepreneurs must mash-up with modern digital technology. This was caused by the pandemic of COVID-19 that hit and paralyzes every stage of their business. Digital technology could assemble all manner of virtual resources that enable direct link from all groups of the consumer in the same network. Meanwhile, according to recent research, about 65% of primary school at an average are children will have a job in sectors may not yet exist according to new prediction follow through these days event. More to be the point, entrepreneurship has legally accepted in the community as they steadily adapt and define as an alteration that meets the demands between new technologies and the internet to become more necessity of the future.

2.0 PROBLEMS

a. Unemployment among fresh graduate keep raise and difficult to find job

Unemployment affected Malaysia in the early year 1980's to 2010 from the past research (Mariana Mohamed Osmana, Syahriah Bachoka, Siti Aisyah Muslima, Nurul Izzati M Bakri, 2014). During the development process through programmed called Economic Transformation Programme (ETP). the rising population of unemployment in graduate students become critical scenario to Malaysia because of lack vacancies offered, the huge influx of foreign worker, mismatch skills and job selection, spatial job location offered, high demand on semi-skilled workers and others reason lead to this situation (Mariana Mohamed Osmana, Syahriah Bachoka, Siti Aisyah Muslima, Nurul Izzati M Bakri, 2014). Malaysia is one of the regional economies with a double-digit incidence of youth unemployment despite a low overall unemployment rate of about 10.7% from 21.6 was Indonesia. According to previous research

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

by Nasrudin (2004), unemployment can be attributed to eleven factors, which are capital-intensive economies, a rapid increase in graduate workforce, a lack of partnership between educational institutions and industry, a lack of training for job readiness, a rapid increase in the population rate and a rapid decrease in the rate of jobs.

b. Lack of skills and outside of their expertise when they required to perform some task

According to Ministry of Higher Education during years 2012, in their report they reveal some evidence the lack of skills in students today which are the weak English ability 55.8%, unpleasant character, attitude or personality 37.4%, unrealistic wages 33%, abilities that do not match 30.2%, inability to solve problems 25.9% and lack of profound knowledge of skills 23.8% are the dominant problems reported among them (Lee Lai Fong, Gurnam Kaur Sidhu, and Chan Yuen Fook, 2013). New students must face daunting and demanding careers in the workplace because many employers often want to find seasoned talents as benchmarks for their role in the business. Because of struggling in today's situation and following the current government structure, a business itself could not afford to accept any new graduates to undergo an apprenticeship. The lack of skills today existed on graduate students because they did not prepare to entitle this job market. This action is often seen as a step in the right direction, but the fact seems to be that universities do not have the expertise to use them to get the business industry off its feet. Furthermore, another research carried out by Monster.com in Malaysia has shown that more than a third of the fresh students of Malaysia have left their first job in less than one year (Azahar, 2017). Lastly, most students have a lack of basic knowledge and skills job they demanded, lack of communication skills and language skills; and lack of general information.

a. Struggle and frustrating from long wait of job vacancies in the middle of sputtering economy

Everyone from students to retirees, a sputtering economy implies miserable financial, psychological, and physical health implications. Not only exactly does that mean a few years of high unemployment or a couple of years of living in the apartment buildings of their parents. This meant a complete decade of lost wages and even more house environment with low economic status is often linked with stress. This is what struggle and frustration mean living as a graduate student without no work but must pay huge bills. In general, though, getting in the job at a government or private sectors, they will receive minimum or starting amount of fixed income in every month without considering another option like being an entrepreneur that need many sacrifices in term of wages and remuneration. Graduated from any universities is no longer guarantees for the job secure because the number of job seekers is higher than job vacancies.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

3.0 LITERATURE REVIEW

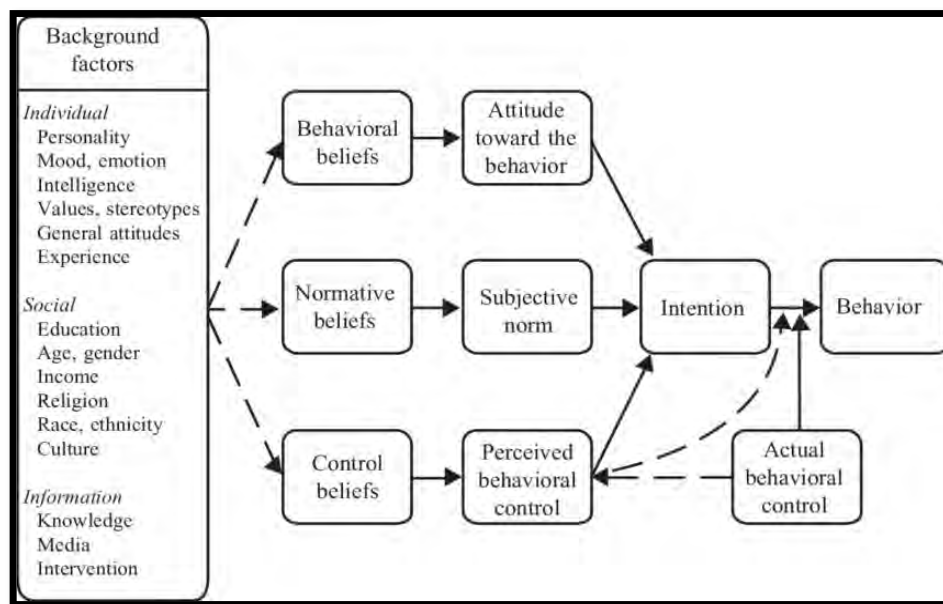

Figure 3.0 shows an important theoretical perspective and it considers as the resource combination of organization (Prahalad & Hamel, 1997). This theory presents the use of organization resources to obtain a competitive advantage and achieve high performance in market (Wernerfelt, 1984; Barney, 1991; Peteraf, 1993).

In this paper, we enlarge the Ajzen (1991) theory of planned behaviour TBP, as an intention model in order to accurately measure and help to keep the ways of this study on student’s internet entrepreneurship intentions. The internet entrepreneurship is sub-seed of digital entrepreneurship where all physical assets has become digitized (Esmaeeli, 2011 and Hull et al. 2007. So internet entrepreneurs imply activities that associated with digital goods or services or all the activities with be conduct in digital. The adoption of technology defined through TAM Theory that has broadly expand into another theory which is TPB by Ajzen in 1993 where behaviour of entrepreneur is unpredictable according to psychological nature that be measure by entrepreneurial intention base on behavioural beliefs, normative beliefs and control beliefs can affect the most intentions. In this theory, there three selection factors indicate to TPB which are ICT adoption under behavioural beliefs, family background called under normative beliefs and entrepreneurship education is under control beliefs. The TPB by Ajzen is useful in explaining any type of behaviours in the wide range. Besides, Ajzen TPB said the strong factors of behaviour is individual’s intention here refers to the entrepreneur scope, where this intention create by motivation that push them to react on some certain of behaviour. The TPB model in some literature is support by EI, it shows the link between EI, intention and behaviour (Krueger et al., 2000; Guerrero et al., 2009; and Gelderen et al., 2008). Moreover it influences on data whereby it found about 0.53% the overall data correlation in meta-analysis between intention and behaviour (Sheeran, 2002).

a. The Internet Entrepreneurships Intention Create by ICT Adoption

Students can’t be separate from technology and internet, because they are the generation that generate of tech savvy that create new foam of opportunities to develop in internet entrepreneurs and open the new advance business that emerge with technology through talent, cash venture and instantaneous decision-making skills (Byers, 1983). ICT adoption in

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

internet entrepreneurship make students pursuit straightforward and can utilize the existing technology as much as possible to venture also integrate with social welfare and prosperity. Moreover the incentive from ICT adoption can increase the attractiveness of internet entrepreneurs these related with credit profile, government programs, loans, the information and communication, also influence the sensitized about entrepreneurship among students (Sabri et al., 2008). What's more, the growth of internet user in students who live in rural areas will lead by ICT development, plus help the intention to be internet entrepreneurship evermore (Arunachalam, 2004). ICT itself is built in the foam of software and hardware through technology whereby it allowed the flow of communications and information transfer that capture by electronic process (Parliamentary Office of Science & Technology, 2006). The technology evolution from ICT development is consider as a new section for online resource to advance the effective performance of the business by sharing electronic data transfer. The electronic data transfer use in internet entrepreneurship business regard to ICT adoption will receive an improvement and progressive in output, social environment, effective government service and economic conditions (Crandall, Lehr, & Litan, 2007; Gillet, Lehr, & Sirbu, 2006 and LaRose et al., 2008). On top of that, the utilize of ICT adoption on internet entrepreneurs can mould the creativity of local entrepreneurship business not only just for students by selling the products or services, brand name and can construct the local setting. It also allowed the business to have permit for expansion, change whole of the business looked, help the business to enter in new market and design a new branch for new customers.

H1 = There is a significant relationship between internet entrepreneurship intention and ICT adoption among students

b. The Internet Entrepreneurships Intention Create by Entrepreneurships Education

Some study agrees that in shaping and curb the internet entrepreneurial behaviour support them through education which allow them to help to merge with economic growth plus prepare them in a healthy business environment (White R.E., Thornhill S. and Hampson E., 2007). Moreover according to previous research also agreed entrepreneurship educational provide necessary knowledge about internet entrepreneurship with good and efficient technique of knowledge to practical use (Mumtaz et al., 2012 and Turker & Selcuk, 2009). Hence to enhance the internet entrepreneurial confident, every universities need to provide and encourage entrepreneurship curricula program that give more advance skills to students. the level of self-confident surely influence by internet entrepreneurial education and the intention as it able to high believe in their self and confident to be able manage their own business more manageable and achieve the success in the future Boyd and Vozikis (1994); Peterman and Kennedy, 2003; Izquierdo and Buelens (2008) and Drost Ellen (2010). The entrepreneurs education help students to become internet entrepreneur as it influences by knowledge that they learn also it become career choices (Peterman and Kennedy, 2003). Therefore entrepreneurs education through proper and an adequate information will boost up the internet entrepreneurial intention also gain interest towards internet entrepreneurship career decision (Gelard & Saleh, 2010). Students were prepared by entrepreneurship knowledge and experiences can recognize opportunities by their self-independencies it could bring sustainable development in the future as they can avoid any personal threat, natural hazards and benevolence. It can gain more of their motivation through complex opportunities and help economic not to fall on inflation. There are major different between students that receive higher motivation in entrepreneurship education than students without the entrepreneurship education (Solesvik, 2013). Besides motivation that create by entrepreneurship education is linked between the attitude and

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

intention. This has proved by past researcher where entrepreneurship education and behaviour of student's has significant positive relationship that obtain the increasing student's mindset as it could expose them into real-worlds skills and knowledge (Tam, 2009 and Dell 2008). Hence, entrepreneurship education can't be separate with economic environment as it interrelated with each other to develop economic scale and shows positive relationship. Moreover, this relationship keeps minimize the perception on situation like barriers ahead and risk of internet entrepreneurship example human investment, financial capital, determining of opportunity, material gaining and technology adoption. Plus in advance, it increases their entrepreneurial knowledge as it become a base or foundation when they want to start new business in handling the management process (Clouse, 1990; Ahmed et al., 2010 and Zhou et al., 2012).

H2 = There is a significant relationship between internet entrepreneurship intention and entrepreneurship education among students

c. The Internet Entrepreneurships Intention influence by Family Background

Family background is the last independent variable relations that need to put on test conducting on this research. Family support is important encouragement to internet entrepreneurships intention as they are nearest members, spouses, relatives and associated with entrepreneur's development as they want to start-ups the venture (Davidson & Honig, 2003 and Baughn et al., 2006). Also in this scenario, the emphasis is on colleagues and significant others (as mentors) who may encourage or disapprove of the concept of entrepreneurial action taken by students. The family, friends or others are the most relational support who powerfully influence the approval and support the involvement of entrepreneurial activities (Türker and Selçuk, 2009). As we know, family background can consist environment of internet entrepreneurship intention be more favourable, and students might want to engage more in entrepreneurship activities, this is what we called triggered effect. Their roles are prominently influenced to students in making the decisions and becoming internet entrepreneur (Nanda and Sorensen, 2009). They are the one who willing to give information, supervision, figure of good example and supportive roles (Postigo et al. 2006). A good figure is a set of examples that will lead students to be more confident and inclined to become an internet entrepreneur, hence inspired them to be more successful motivated in this career. The family background impact was also a crucial factor that offered a history of knowledge and inspiration for students to pursue entrepreneurial practises (Bagheri and Pihie, 2010). Research findings have also revealed that student with a family who became an entrepreneur are often more likely to exhibit entrepreneurial intention (Krueger, 1993) (Krueger, 1993). Studies have also revealed that people having a parent who is an entrepreneur are more likely to express entrepreneurial intention (Krueger, 1993). A parent who aware of this situation will facilitate tangible support like supplies and equipment that can help their entrepreneurial activities. Additionally, member of the family who has awareness and innovations especially parents, may not have the most up-to-date information to promote the invention processes of internet entrepreneurs.

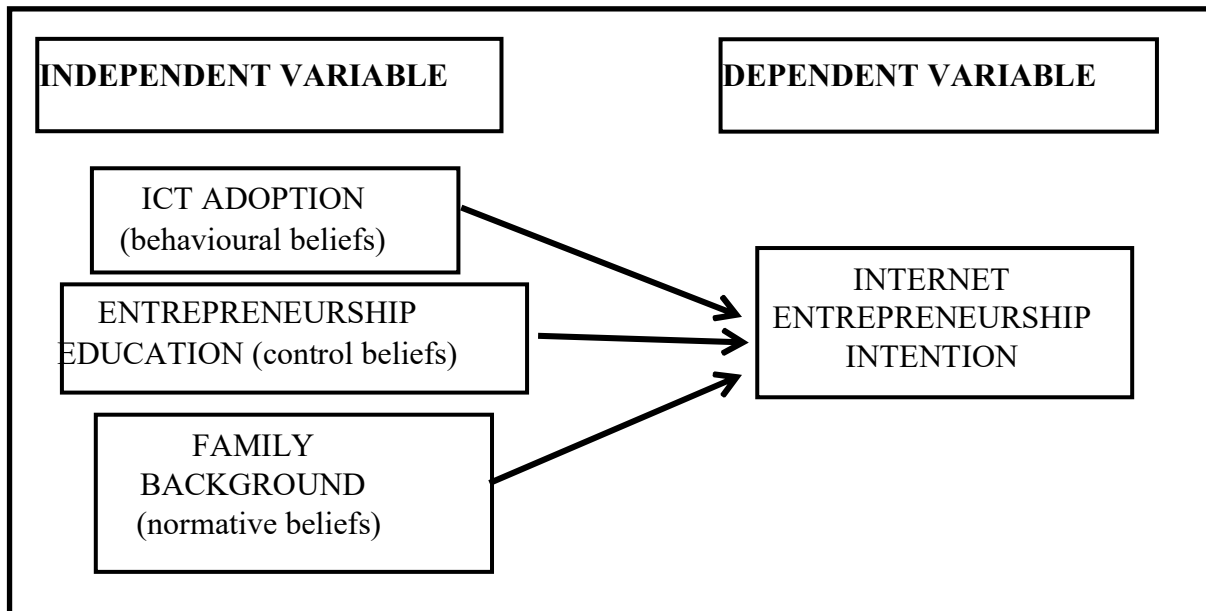

H3 = There is a significant relationship between internet entrepreneurship intention and family background among students

d. PROPOSED CONCEPTUAL FRAMEWORK

The purpose of this research is to examine the relationship between the factors influence and the internet entrepreneurship intention within UMK City Campus students. It is illustrated by three factors which are ICT adoption, entrepreneurship education and family background. Figure 3.0.1 shows the establishment of conceptual framework for this research.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

The model used as follow:

4.0 RESEARCH METHODS

In this research, a quantitative research method has been applied. The researchers apply a case study and survey in this research study. A case study is implemented in this research study as it assists researchers to understand and define the detail description of a phenomenon in depth within its perspective (Yin, 2003). Meanwhile, forwarded the survey link about 741 questionnaires, but received and only selected 266 questionnaires are collected from the target respondents which is UMK City Campus students to participant in the survey. Respondents selected in the research study indicated that the information received is from knowledgeable Purposive sampling techniques are applied for selecting the convenience sampling since it is enables researches to obtain complete questionnaires quickly and economically whereby respondents are randomly selected for the ease of researcher. Likert scale is applied in the research. Section A has five questions which are intended with an arrangement of nominal scale and ordinal scale. The nominal scale is applied to identify the respondents' wide-ranging info which is gender, age, courses, places, hours and network. The 5-point Likert scale in section B allows respondents to indicate their consent or disagreement with the statement of the problem. The scope ranges from "very disagree", "disagree", "somewhat agree", "agree", to "strongly agree". There are several types of analytical techniques that are used to check the accuracy of the data collected throughout the research such as descriptive analysis, normality analysis, pilot test and Spearman's Rho correlation coefficient analysis.

5.0 ANALYSIS AND DISCUSSION

a. Demographic Profile of Respondents

The demographic of the respondent is collected and recorded in the table 5.0.1. The demographic includes with gender, age, courses, internet access, internet network, spending hours and internet entrepreneurship. Based on the result, there is 36.8% of 98 male respondent and 63.2% of 168 female respondent in the data. It concludes that the total of female respondents is more than the total of male respondents. The result explained by the fact that the participation of the study is characterized by a female dominated the survey questions. As for the age majority is in the age

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

range of 24 - 25 years who agreed to participate in the studies which is 33.2% of the respondents. Majority of the respondents is Malay students hold with the number 207 with the percentage is 77.8. There are very high number according to courses in UMK City Campus about 82 respondent and the percentage is 30.8 more than other courses fill in the survey. As for internet access among of them answer both at home and outside home as its complementary items for today necessary use, so 204 respondents follow by 76.7%. Moreover, majority for internet network they use oftenly is both wi-fi and mobile cellular data with 173 numbers answer them with the percentage is 65.0%. there are 186 respondents with 69.9% answer more than 4 hours they spent on the internet to streaming. Lastly as for do they want to be internet entrepreneurship, about 123 respond to maybe answer followed with the percentage is 46.2%.

Table 5.0.1: Respondent's Demographic

Variables	Frequency (n= 266)	Percentage (%)
GENDER		
Male	98	36.8
Female	168	63.2
AGE		
20-21 years	80	30.1
22-23 years	80	30.1
24-25 years	83	33.2
26 years and above	23	8.6
RACE		
Bumiputera Sarawak	1	0.4
Chinese	31	11.7
Iban	1	0.4

b. Descriptive Analysis

Table 5.0.1 Descriptive Statistics

Item	N	Mean	Std. Deviation
DV1: Internet Entrepreneurship Intention	266	4.2723	.71056
IV1: ICT Adoption	266	4.32	.592
IV2: Entrepreneurship Education	266	4.29	.604
IV3: Family Background	266	4.14	.743

The table shows the descriptive statistics of Dependent Variables (DV) is Internet Entrepreneurship Intention, while Independents Variables are ICT adoption (IV1), entrepreneurship education (IV2) and family background (IV3). In this research, the ICT adoption has the highest mean which is 4.32. Then, second follows are entrepreneurship education which is the mean 4.29, the third place ranked by internet entrepreneurship intention with the mean is 4.2723 and lastly will be family background with the mean is 4.14 respectively. However, the factor influence on family background has the lowest mean which is 4.14. The result shows that majority of the respondents agreed that ICT adoption is most important factors influence the intention on them, want to be an internet entrepreneurship. Undoubtedly, it is strategy for internet entrepreneur for growth in business when adopt to ICT which can offer best prospects to overcome the challenging part on entrepreneurial activities (Hollifield & Donnermeyer, 2003). Absolutely the adoption from ICT development could eliminate any barriers or problem arise that replace with generate income, increase productivity, become the best network of communications, prepare job-field and can delivered the task easily (Ghazy et al., 2008 and Rahman et al., 2005).

c. Spearman's Rho Correlation Coefficient

Table 5.0.3: Summary of Spearman's Rho Correlation Analysis

		IV1	IV2	IV3	DV
Spearman's rho	IV1	Correlation Coefficient	1.000	.798**	.690**
		Sig. (2-tailed)	.	.000	.000
		N	266	266	266
	IV2	Correlation Coefficient	.798**	1.000	.754**
		Sig. (2-tailed)	.000	.	.000
		N	266	266	266

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

	IV3	Correlation Coefficient	.690**	.754**	1.000	.840**
		Sig. (2-tailed)	.000	.000	.	.000
		N	266	266	266	266
	DV	Correlation Coefficient	.672**	.729**	.840**	1.000
		Sig. (2-tailed)	.000	.000	.000	.
		N	266	266	266	266

***. Correlation is significant at the 0.01 level (2-tailed).*

By using the Spearman's Rho Correlation Coefficient table, the study can determine the relationship between the dependent variable and the independent variables. Based on the literature review and the current studies, the hypotheses can be formulated as the awareness of ICT adoption, entrepreneurship education and family background have a significant positive relationship towards the factors influence internet entrepreneurship intention. Table 5.0.3 shows the results of Spearman's Rho correlation coefficient analysis. The objective of Spearman's Rho correlation coefficient is to define strength of association between independent and dependent variables. On the other hand, to define significant, p-value must be higher than >0.05 . Based on the results, the four independent variables (ICT adoption, entrepreneurship education and family background) have a positive relationship towards the factors influence internet entrepreneurship intention. Based on table it shows that all the variables have substantial significant positive correlation with internet entrepreneurship intention which is factor IV1 ($r = 1.000$), IV2 ($r = 0.798$) and IV3 ($r = 0.690$). According to the rules of thumbs, this indicates that there is a very strong relationship between the ICT adoption towards the internet entrepreneurship intention within UMK City Campus students.

d. Hypotheses Testing

Table 5.0.4 Summary of Hypothesis Testing

	Hypothesis	Significant Value	Magnitude Relationship	Supported or Rejected
H1	There is significant relationship between ICT adoption and internet entrepreneurship intention	1.000	Substantial	Accept H1 hypothesis supported
H2	There is significant relationship between entrepreneurship education and entrepreneurship intention	0.798	Substantial	Accept H2 hypothesis supported
H3	There is significant relationship between family background and internet entrepreneurship intention	0.690	Substantial	Accept H3 hypothesis supported

Source: Develop for The Research

Table 5.0.4 shows the summary of hypothesis testing. To conclude, there are relationship between all independent variables (ICT adoption, entrepreneurship education and family background) against dependent variable (internet entrepreneurship intention). All these

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

hypotheses to address research question one, two and three. The proposed theoretical framework is accepted.

H1 = There is a significant relationship between internet entrepreneurship intention and ICT adoption among students.

Based on the table, the value of correlation is 1.000 able to prove that there is a positive relationship between internet entrepreneurship intention and ICT adoption among students. This show how internet, social media platform and ICT adoption really important to engaged together which it help students to have better communication and can smoothly conduct the business (Cooke and Buckley, 2008; Datis, 2014; Liu and Ying, 2010 and Edosomwan et al., 2011). The power of ICT adoption and development to internet entrepreneur intention as it can operate the business through website or social media tools and can spread the message more evenly also can test their new markets (Nasir et al., 2017).

H2 = There is a significant relationship between internet entrepreneurship intention and entrepreneurship education among students.

According to our study result, the hypothesis H2 is accepted with the correlation is 0.798. There is a positive relationship between internet entrepreneurship intention and entrepreneurship education among students. Conversely, students who didn't seem engage in entrepreneurship education have a poor internet entrepreneurial intention, which decreases their interest in internet entrepreneurship. It has been proven by researcher in USA, entrepreneurship education enhances the economic growth as new companies and new ventures extremely expand their business globally (Drost, 2010). Hence, entrepreneurship education can't be separate with economic environment as it interrelated with each other to develop economic scale and shows positive relationship.

H3 = There is a significant relationship between internet entrepreneurship intention and family background among students.

The table above indicate the value of the correlation is 0.690 able to prove that there is a positive relationship between internet entrepreneurship intention and family background among students. From parents' interactive communication with their children have influences the perspective of normative view. That being said, entrepreneurial independence promotes the creation of entrepreneurial interest in the family's position (Bahheri and Pihie, 2010). Research findings have also revealed that student with a family who became an internet entrepreneur are often more likely to exhibit internet entrepreneurial intention (Krueger, 1993) (Krueger, 1993).

6.0 CONCLUSIONS AND RECOMMENDATIONS

a. For Universities

The finding that the students from the business background showing higher internet entrepreneurial intention where there is a growing concern base on their entrepreneur knowledge. There will be broad the research and development also can eventually market those products. Those who have attended courses training have indicated significantly higher internet entrepreneurial intention that will reveal the entrepreneurship attituded or behaviour as university compulsory the subject in the curricula. The university should take the approach this course oh higher level of education but also on schools. The programme or course maybe can focus more on how to help them in manage the consumption, or how to maintain compulsory savings or help them find the way to become more knowledgeable in internet entrepreneurship. So, it can help students to make better in decision making in future.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

b. To Students

For students, they need self-initiative to provoke the internet entrepreneurial intention base on the knowledge, take experience base on people around them and facilities around them. This will improve or increase their awareness towards internet entrepreneurial intention because from this research findings, it can say the entrepreneurial level among them is moderate but the effect of lack self-initiative. This finding can be improved by demographic question, about do they want to internet entrepreneur, the higher scale that they rate is maybe. So, in order to increase the internet entrepreneurial intention level, the students should join more and can be done through seminars and training courses tailored towards this issue. The results also show that many of the young undergraduate have incredible potential and very innovative, but they need more special entrepreneurial training in order to transform from neutral potentials to internet entrepreneurial leaders and creators of enterprises.

c. Future Research

It would be more useful for those with stronger studies in the future. These were recommended that the constraint issue findings of the study be solved in continued study. First, the research should be extended broadly by the study. The analysis findings will become more and stronger as the scale of the study is extended. Therefore, a society including teachers, lecturers and students will benefit considerably. In addition, the questionnaire should be delivered directly to the respondent by hand although today scenario we are not supposed to have direct contact because of pandemic Covid-19. But for this research, this will ensure the respondent can react naturally or the respondent can ask the researcher if he or she struggles to understand the questions he or she has asked. In addition, study could be offered a chance to enhance the research by giving the interview subject their own interpretation and input. For potential scientists it is recommended that the research is carried out in various fields or in considerable distances, such as different educational level, or includes a diversified colleges or universities. In turn, the prospective researcher can also concentrate on other variables and attempt to discourage common variables from being included.

7.0 ACKNOWLEDGEMENTS

This work is supported by Faculty of Entrepreneurship and Business, University Malaysia Kelantan. The completion of this research would not complete without assistance and participation of so many people whose names that cannot be enumerated. The researchers are very much thankful to who provided detail guidance, expertise and valuable advice in the process of writing this *DR YUSRINADINI ZAHIRAH BINTI MD ISA@YUSUFF* research. She inspired and motivated us to work hardest to complete the analysis. Researchers wish to express sincere thanks and gratitude to all those interviewed who, despite their busy schedule, were able to participate. We are thanked as well as honoured for their contributions to this study. The researchers were also thankful for their contributions and sacrifices to the families and friends. Despite everyone this study will not be successful.

FACTORS OF SATISFACTION TOWARD ONLINE FOOD DELIVERY APPS AMONG GENERATION Y IN KUALA LUMPUR

Wong Kar Wei and Mahathir Muhamad

Faculty of Entrepreneurship and Business,
Universiti Malaysia Kelantan,
Malaysia

Email: wkwei.a17a0779@siswa.umk.edu.my; mahathir.m@umk.edu.my

Abstract:

With the emergence of various food delivery service providers through the internet and mobile applications, online food delivery services are becoming more advanced in Malaysia. Rapid growth of internet service has provided customers a lot of benefits. Therefore, this research project establishes a valid measure on factors of satisfaction toward Online Food Delivery Apps among Generation Y in Kuala Lumpur. The major aim of this research project is to identify the factors influencing Generation Y satisfactions towards Online Food Delivery Apps. In addition, it investigates the relationships between the independent variables (service quality, food quality and trust) and dependent variable (Online Food Delivery Apps toward Generation Y satisfaction). Primary data were collected through survey questionnaire with 384 respondents who have experience in Ordering Food Online and their age are from 24 – 39 years old who live in Kuala Lumpur. The data were analysed by Statistical Package for Social Sciences (SPSS) version 25. Data analysis was done for reliability analysis, descriptive analysis, , normality test, Pearson correlation analysis and hypothesis testing. The result showed that there have significant relationships between factors (service quality, food quality and trust) and Online Food Delivery Apps toward Generation Y satisfaction. Lastly, this research had brought significant contributions to the university/academic, researcher and government. At the end of project, the limitations and several recommendations will be addressed and presented in this study.

Keyword: Online Food Delivery Apps; Satisfaction; Generation Y; Kuala Lumpur

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

1. Introduction

1.1 Background of the Study

Digital information technology and their offspring, such as computers, the internet, smart phones, tablets, mobile applications, have fundamentally changed daily lives of people (He, Han, Cheng, Fan, & Dong, 2019). The advent of Information Technology has paved ways to procure quality food with much ease. Due to the paucity of time professionals across all spectrum of occupations prefer to fetch food online as it saves a lot of resources especially time. Intrinsically ordering food through online food apps has become an innate human tendency (Hamid, Sood, & Seth, 2020).

With the emergence of various food delivery service providers through the internet and mobile applications, online food delivery services are becoming more advanced. Due to busy schedules or heavy traffic jams, individuals do not have time to go out to buy food. With the help of Go- Jek's, Go-Food and other food delivery service, individuals can now conveniently order food via their smartphone, food delivery companies will deliver food directly to the place of order. Therefore, this is considered a trend that will continue for some time (Prabowo & Nugroho, 2019).

There are a lot of online food delivery apps in Malaysia. The three top online food delivery apps in Malaysia are Grabfood, Bungkusit, and Foodpanda (XphX, 2020). For reasons such as visible price menu, complete service details, real-time delivery tracking, push notifications, multiple payment options, GPS search of nearby restaurants, better interface, and discounts and deals offered, online food delivery applications have become popular (Reddy & Aradhya, 2020).

Besides that, Online Food Delivery Application provides a complete food ordering and delivery solution system. It offers a single window for ordering from a wide variety of café and restaurants and has its unique fleet of delivery personnel to pick up and deliver food to the customer (CHETAN PANSE, SHARMA, & DORJI, 2019).

Based on the newspaper article, Pew Research Centre decided a year ago that the last birth year for generation Y is 1996. Generation Y is born between 1981 -1996, and their age is from 23-38 years old in the years 2019. They also can be referred to as Millennials, and anyone born after 1997 belongs to a new generation (Michael Dimock, 2019). According to San, Omar, and Thurasamy (2015), Generation Y is a group of consumers who are always involved in Online Shopping.

While online shopping has given society many benefits, there are also some negative concerns regarding online shopping (UKEssays, 2018). The number of individuals who want to order the delivery of food is increasing. At present, 47% of the market for food orders is offline, while 53% is online. But as the industry of food delivery apps grows, food delivery companies face significant challenges (Julia Matyunina, 2020). Therefore, this complete framework is needed to understand the factors of satisfaction toward online food delivery apps among Generation Y in Kuala Lumpur.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

1.2 Research Objectives

The objectives of the study as following:

- (1) To determine the relationship between service quality and Generation Y satisfaction toward Online Food Delivery Apps.
- (2) To determine the relationship between food quality and Generation Y satisfaction toward Online Food Delivery Apps.
- (3) To determine the relationship between trust and Generation Y satisfaction toward Online Food Delivery Apps.

2. LITERATURE REVIEW

2.1 Generation Y Satisfaction toward Online Food Delivery Apps

Consumption habits and people's purchasing food behaviour have changed significantly in a study conducted by K Group in Finland in 2017. To make any food choices, customers want more accurate information and expect more varied foods than before. It has happened because the internet's ability to search for data and compare goods enables consumers to be smarter, thirstier (for information), have a more varied choice, and prefer to get something quickly when buying food. Consumers now tend to shop on e-commerce platforms because they can easily shop without time constraints in their homes. The use of the internet from year to year also encourages e-commerce penetration, which continues to penetrate various sectors. (Prabowo & Nugroho, 2019).

Due to the increase in the number of working populations and tight working hours of work-life culture in metro cities, the changing presence of urban customers has triggered the emergence of online food delivery services (Saad, 2020). Businesses today recognise that to be competitively viable, they must satisfy consumers and deliver quality services. For several years, service firms have measured customer satisfaction and quality of service to gauge how well they meet customer needs (Dabholkar, 1995).

Consumer satisfaction measures how the organisation has fulfilled customer needs for the product or service delivered. Customer satisfaction is an abstract concept and involves factors such as service quality, food quality and trust. Businesses often use customer satisfaction surveys to measure customer satisfaction. Companies that use customer satisfaction to measure the success of a marketing strategy or marketing plan (Lee & Eun-Ju, 2005).

The concept of online food delivery system is the delivery of food at the doorstep of the consumer. It is the process by which the customer's order food online from their favourite food stores or restaurants using the mobile app or through websites providing the feature of zero mobility to customers while having the favourite food at his doorstep (Hamid et al., 2020).

Moreover, customers always take advantage of selecting the food of their choice from the massive food options and virtual menu. The digital revolution is reshaping everything; in order to order food online, you only need a smartphone and internet access. The few reasons behind the growing

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

popularity of ordering food through online apps are the quality, quantity, discount, food customization, on-time food deliveries of various parameters. Seeking comfort is the priority of every customer (Hamid et al., 2020).

Online food ordering through the web or mobile applications connects the eater and restaurants. The websites and applications are tailored to meet the needs of eaters and provide them with a better service. This model is a massive success because of the simplicity of the customer's choice to conveniently choose food from the menu, the convenience of placing an order with the service provider and the convenience of paying through multiple channels (Reddy & Aradhya, 2020).

2.2 Service Quality

With the presence of food delivery services to provide the customer with ease in getting the food products. In this case, with quality service delivery between good food, the quality of service can be one measure of success in ensuring consumer satisfaction, so it can increase customer satisfaction that impacts increasing customer loyalty (Ilham, 2018).

Service quality refers to the customer's opinion on a product's quality and is similar to attitude (Haghighi, Dorosti, Rahnama, & Hoseinpour, 2012). (Zeithaml, Berry, & Parasuraman, 1988) state that to measure service quality, a multi-item scale called SERVQUAL was developed, which shows that the service quality perceived by customers comes from the comparison of customer expectations and their perception of delivery performance. (Jamal & Anastasiadou, 2009) demonstrate that service quality is “ magnitude and direction of the discrepancy between perception and expectations of the consumers ”.

Lastly, service quality plays an essential role in customer satisfaction because it is the customers who are the patrons of the goods or services. Consequently, effective methods for evaluating the service standard are invaluable to companies who earn their profits or part of it from the delivery service. (Zulkarnain, Ahasanul, & Selim, 2015).

2.3 Food Quality

Quality food can be defined as well-presented, fresh, and delicious food. (Ha & Jang, 2012). From their research, (Namkung & Jang, 2008) identify the presentation and taste of food as the most critical factors in food quality , whereas (Ha & Jang, 2012) identify food variety as the most important contributor. According to (Sahari, Basir, & Jangga, 2012), restaurants can also address additional considerations such as cost, presentation, taste, portioning, and value for money while addressing food quality issues.

Understanding the perceptions and representations of food quality by consumers is essential. This is because consumers will concentrate their purchasing decisions on these beliefs (Van Rijswijk & Frewer, 2008). According to (Al-Tit, 2015), there have five aspects of food quality: The food is fresh, the food is delicious, the food is nutritious, a selection of menu items is available, and the food's scent is appealing.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Moreover, food quality variables have typically been a fundamental part of the overall experience of the restaurant. The description of food quality concept is evaluating the quality of food before and after purchase. Food quality can be defined based on this understanding as an essential feature that affects customer experience in buying food. (Sjahroeddin, 2018).

Food quality is related to food performance that meets the needs of customers in restaurants (Ha & Jang, 2012). According to (Namkung & Jang, 2008), detailed indicators such as the menu, freshness and health, the way the food is displayed and the food temperature used to assess the quality of the food. The food quality was identified as part of the menu, the size of food, the presentation and other measures in restaurants. Therefore these indicators, as well as the delivery time, delivery package, and so on will indicate the online food quality in this study from the views of the delivers (Namkung & Jang, 2008).

2.4 Trust

A shopper would not purchase anything from an online or physical store without trust. (Mayer, Davis, & Schoorman, 1995). Trust is described as the willingness of customers to accept vulnerability in an online transaction based on their positive expectations of future behaviour in the online store. (Kimery & McCord, 2002). This implies that trust is the willingness of a customer who wants to shop online. In online shopping, consumers rely on and behave on the seller, rendering the customer vulnerable to the seller.

Furthermore, customers are more willing to purchase via online when they trust the seller: they believe that the seller is credible, reliable, and trustworthy. When customers carry out the transaction through the Internet, such as internet banking and direct debit by using credit card or debit card, they had trusted these payment systems are secured. They believe that the sellers and the payment system protect their personal information and credit information. All these three perspectives of trust are essential. When one of these does not obtain by the customer, the trustworthiness will not exist, and customers will not purchase online. Therefore, trust is the critical barrier for the customer involved in online purchase.

Trust is fundamental just in unsafe circumstances, and to trust implies to go out on a limb and abandon oneself helpless against the activities of those one trusts (Yao-Hua Tan, 2000). The past research also has shown that apparent trust assumes an essential part in E-Commerce because of the insignificant eye to eye cooperation amongst retailers and shoppers in the web-based setting (Liat & Wuan, 2014). Trust refers to the observation of shoppers to the conduct of online retailer because of their capacity, generosity and trustworthiness (D Harrison McKnight, 2001). Most customers agree that large organisations are more trustworthy in the e-commerce situation and affect their loyalty and purchasing intention through e-commerce (Koufaris & Hampton-Sosa, 2004). Online purchasing expectations of consumers may increase when buyers think that their private information is being secured and guaranteed. (Chiu, Lin, & Tang, 2005).

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

2.5 Research Hypothesis

The research hypothesis was formulated to identify the factors influencing the participation of service providers in Shared Economy regarding the previous literature.

H₁: There is a significant relationship between service quality and generation Y satisfaction towards Online Food Delivery Apps.

H₂: There is a significant relationship between food quality and generation Y satisfaction towards Online Food Delivery Apps.

H₃: There is a significant relationship between trust and generation Y satisfaction towards Online Food Delivery Apps.

3. METHODOLOGY

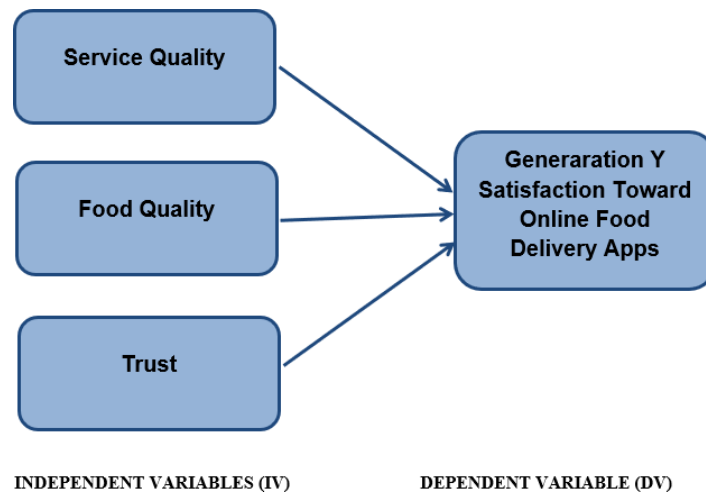

Figure 1: Conceptual Framework

This study uses both types of data collection method which are primary and secondary data. This study used survey questionnaire as the primary data source by using questionnaire, while in the secondary data collection is from journals, scholarly journals, magazines, museums, company's report, internet and electronic database. A purposive sample size of 384 of Generation Y from Kuala Lumpur were selected as respondents of this study. The target respondents of this study are Generation Y from age 24-39 years who lived in Kuala Lumpur and the questionnaire were only distributed among this specific group of people. According to Department of Statistic (2020), the total population of Generation Y in Kuala Lumpur is 405,000. The selection of the sample in this study will be purposive sampling. Based on Tongco (2007), purposive sampling is the most effective sampling technique that we use when we want to get targets sample quickly with select

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

the respondents to have the same characteristics. After the data collection process was done, SPSS software is used to conduct the analysis. SPSS is a predictive software to enable accurate analysis of result for better decision making and problem solving in academic research. In carrying out this research, there are a few types of analysis methods that will be used, which are descriptive analysis, pilot test and reliability analysis, and Pearson Correlation analysis.

4. FINDINGS

4.1 Reliability, Mean and Standard Deviation

Table 1: Reliability, Mean and Standard Deviation

Variables	Cronbach's Alpha	N	MEAN	SD
Generation Y Satisfaction toward Online Food Delivery Apps	0.885	384	4.0193	0.581
Service Quality	0.833	384	3.9062	0.6792
Food Quality	0.755	384	3.5062	0.6561
Trust	0.846	384	3.6370	0.5714

Based on Table 1, Reliability Test among the variables has been measured by Cronbach's Alpha are more than 0.7 therefore all the variable was well-established with good level of reliability. Moreover, table 1 also shows the mean and standard deviation for Generation Y Satisfaction toward Online Food Delivery Apps, Service Quality, Food Quality and Trust.

The findings reflect that the factor of Service Quality on Generation Y Satisfaction toward Online Food Delivery Apps in Kuala Lumpur is highest compared to Food Quality and Trust. This is because the values of the mean of Service Quality was scored 4.00 and above while Food Quality and Trust is below 4.00. From above results, it concludes that Service Quality is the worthiest elements which influence Generation Y Satisfaction toward Online Food Delivery Apps and Food Quality has the least contribution to satisfy Generation Y.

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

4.2 Correlations

Table 2: Pearson Correlation Coefficient

Correlations

		Generation Y Satisfaction toward Online Food Delivery Apps	Service Quality	Food Quality	Trust
Generation Y Satisfaction toward Online Food Delivery Apps	Pearson Correlation	1	.660**	.677**	.567**
	Sig. (2-tailed)		.000	.000	.000
	N	384	384	384	384
Service Quality	Pearson Correlation	.660**	1	.597**	.639**
	Sig. (2-tailed)	.000		.000	.000
	N	384	384	384	384
Food Quality	Pearson Correlation	.677**	.597**	1	.753**
	Sig. (2-tailed)	.000	.000		.000
	N	384	384	384	384
Trust	Pearson Correlation	.567**	.639**	.753**	1
	Sig. (2-tailed)	.000	.000	.000	
	N	384	384	384	384

** . Correlation is significant at the 0.01 level (2-tailed).

Hypothesis 1: There is a significant relationship between Generation Y Satisfaction toward Online Food Delivery Apps and Service Quality. The r value of Service Quality was 0.660. Besides that, the P value which is 0.000 showing the significant value for the analysis where it is lower than the alpha root which is 0.01. Therefore, the result showed that there is a moderate positive relationship between Generation Y Satisfaction toward Online Food Delivery Apps and Service Quality.

Hypothesis 2: There is a significant relationship between Generation Y Satisfaction toward Online Food Delivery Apps and Food Quality. The r value of Food Quality was 0.677. Besides that, the P value which is 0.000 showing the significant value for the analysis where it is lower than the alpha root which is 0.01. Therefore, the result showed that there is a moderate positive relationship between Generation Y Satisfaction toward Online Food Delivery Apps and Food Quality.

Hypothesis 3: There is a significant relationship between Generation Y Satisfaction toward Online Food Delivery Apps and Trust. The r value of Trust was 0.567. Thus, the P value which is 0.000 showing the significant value for the analysis where it is lower than the alpha root which is 0.01. Therefore, the result showed that there is a moderate positive relationship between Generation Y Satisfaction toward Online Food Delivery Apps and Trust.

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

5. DISCUSSION

5.1 Key Findings

This study was conducted to find out about the Factors of Satisfaction toward Online Food Delivery Apps among Generation Y in Kuala Lumpur. In this research, primary data was taken by a set of questionnaires that was used and been distributed to get feedback from the respondent. The sample of respondent are 384 that have been selected.

The main objectives of this study were to determine the relationship between the dependent variable which was the Generation Y Satisfaction toward Online Food Delivery Apps and the independent variables which were Service Quality, Food Quality and Trust.

Therefore, the reliability was carried out using Google Form towards 384 of respondents. It was tested by Cronbach's Alpha Coefficient. The value of Cronbach's Alpha Coefficient for the independent variables for Service Quality is 0.885. Then, the value of Cronbach's Alpha Coefficient for Food Quality is 0.833. Finally, the value of Cronbach's Alpha Coefficient for Trust is 0.755. Both of variables which is Service Quality and Food Quality indicated the acceptable and good result respectively. Moreover, all the variables had satisfied the requirement of reliability because all the value of the variables was greater than 0.7.

The results showed in Table 4.20 that there is positive relationship between independent variables and dependent variable. Among the factors that listed out, the findings show that Generation Y Satisfaction toward Online Food Delivery Apps is having the highest moderate positive relationship with Food Quality (value of coefficient is 0.677). Hence, it shows that most of the respondents were agree with the statement descriptions of food quality. According to Atiyah (2016), all of the organization that provide online food delivery service always thrive to satisfy all of their customer of level of services and quality of food.

Researcher had performed the Pearson Correlation Coefficient to measure of the strength of a linear association between two variables as to meet the objective of the study. Table 5.1 showed the overview of the Pearson Correlation Coefficient, the strength between the service quality, food quality and trust were positive and no linear relationship.

5.2 Discussion

Table 3: Summary of Pearson's Correlation Coefficient

Hypothesis	Significant	Conclusion	Correlation, r
1	0.000	Moderate	0.660
2	0.000	Highest Moderate	0.677
3	0.000	Lowest Moderate	0.567

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

5.2.1 Discussion of Hypothesis 1

H1 : There is a positive relationship between service quality and Generation Y satisfaction toward Online Food Delivery Apps.

In this study, the first research objective is to determine the relationship between Service Quality and Generation Y Satisfaction toward Online Food Delivery Apps. According to the results of Pearson Correlation Coefficient, Service Quality has moderate positive relationship after food quality where the value of $r = 0.660$ and P value is less than 0.01. The respondents were all agreed that they are satisfied toward the service if the food delivery is on time. Customer is able to track their food preparation and delivery in real time. Atiyah (2016) concluded that the companies need to highlight on important ways to determine the relationship between customer satisfaction and quality of the service. Reliable delivery must be a priority and is crucial to the success of every online food delivery service.

5.2.2 Discussion of Hypothesis 2

H2 : There is a positive relationship between food quality and Generation Y satisfaction toward Online Food Delivery Apps.

Besides, the second hypothesis is to determine relationship between Food Quality and Generation Y Satisfaction toward Online Food Delivery Apps. Based on the result in previous chapter, Pearson correlation analysis between Food Quality and Generation Y Satisfaction toward Online Food Delivery Apps has highest moderate positive relationship among those three factors where the value of $r = 0.677$ and P value is less than 0.01. The respondent was mostly agreed with the proper packaging and good condition of foods delivered is utmost important to them. Food presentation and taste are the significant factors in food quality. Based on (Kedah et al., 2015), condition of food delivered which are fresh, well-cooked and well-presented are important food characteristics for the customers to be satisfied and reorder.

5.2.3 Discussion of Hypothesis 3

H3 : There is a positive relationship between trust and Generation Y satisfaction toward Online Food Delivery Apps.

Finally, the third hypothesis is to determine relationship between Trust and Generation Y Satisfaction toward Online Food Delivery Apps. Based on the result in previous chapter, Pearson correlation analysis between Trust and Generation Y Satisfaction toward Online Food Delivery Apps have lowest moderate positive relationship compared than other factors where the value of $r = 0.567$ and P value is less than 0.01. Al Karim (2013) said that the main concerning issues related to online shopping are online payment systems, delivery system faults and personal privacy information. The respondents were standing neutral with statement of "I am comfortable to provide my financial details during ordering food online". Most of the respondent feeling unsafe to provide financial details when using credit card or other online transfer methods. Most common risk is card fraud. If the card details are discovered or revealed, respondent may find fraudulent purchases appearing on their statement. This is a huge security risk for respondent.

6 RECOMMENDATION

Based on the study, I find that the scope of the study is appropriate to my research title. This research may contribute not exclusively to a superior comprehension of what and how firmly the components engaged with online buy choices yet in addition this examination gives a diagram of the client's fulfilment with this innovation.

In any case, online food delivery companies should remember that shopper fulfilment may change now and again particularly in the online commercial centre so online food providers need to examine buyer conduct after some time and tailor items and administrations to address clients' issues. However, I can recommend the future research of some things as a continuation of my research.

Firstly, my survey respondents only involve the Generation Y in Kuala Lumpur. As I am aware that Kuala Lumpur is a city and they mostly go directly to the restaurant to buy food and the frequency for ordering food online is less. I propose for future research to compare Online Food Delivery Apps patterns by location, respondents' income and their frequency of buying online shopping in a month. By knowing the frequency of users to Online Food Delivery Apps, I can compare whether the respondents have the satisfaction of buying in the restaurant or ordering food online.

Besides that, the scope of the study is involving the Generation Y; it can be expanded to other generations as well to get the perfect result on Online Food Delivery Apps. This can be made a comparison of which among the Generation Y and the older generation is more often in ordering food online.

Another recommendation including advertise the online food providers on a daily paper article or newspaper to attract more consumer to try this Online Food Delivery Apps. A positive press about Online Food Delivery Apps should be put on the news to enhance more consumers.

Moreover, future researches can also be carried out to find out factors of Online Food Delivery Apps satisfactions among university students in Malaysia compare on factors of Online Food Delivery Apps satisfactions among the Generation Y in Kuala Lumpur.

Lastly, for future research, the questionnaire form needs to be improved to facilitate respondents to respond to the questionnaire provided by the researcher. Changing questions to be more easily understood by respondents as well as reducing the number of questions to be given to respondents. Respondents are quite lazy to answer the questionnaire when looking at the questions given quite a lot. Other way will attract respondents to answer the questionnaire given when questions are easy to understand, and the amount of question is less.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

7 CONCLUSION

This study is focus on the factors of satisfaction toward Online Food Delivery Apps among Generation Y in Kuala Lumpur. From the analysis of the entire variables, it has been satisfied the minimum requirement of reliability since all the Cronbach's Alpha coefficients shows greater than 0.7 which is all the independent variable (service quality, food quality and trust) had the significant relationship to the dependent variable (Generation Y Satisfaction toward Online Food Delivery Apps).

In this study, I examine several factors that influence the satisfaction of the Generation Y for online food delivery apps. Among the factors of satisfaction of the Generation Y for online food delivery apps are service quality, food quality and trust. Based on the results obtained in this study, the satisfaction of the Generation Y is based on the service quality available in this online business. Most respondents agree that the service quality factor is the highest factor to influence the satisfaction of the Generation Y to buy food online. In this case, it can be concluded that the Generation Y is more concerned with service quality compared to other factors.

Food Quality is the second factor that affects the Generation Y satisfaction for online food delivery apps. Based on the study, food quality is also an important element in the satisfaction of the for Generation Y online food delivery apps. Although trust factors are at the lowest stages of our study results, but this factor is valid as an important factor in our study.

This study can help many users to understand all the advantages of online food delivery apps offered besides to see that there are other options that can be done ordering food online instead of going to a restaurant. This study can also become a beginner to use Online Food Delivery Apps more widely, not just involving the Generation Y. So, through this study I can conclude that there is a positive and significant relationship between satisfactions based on online food delivery apps factors. And that the outcome of the study may be confidently improving the general knowledge and awareness of Online Food Delivery Apps and may be a prospect for the future.

8 ACKNOWLEDGEMENT

This research was supported by University Malaysia Kelantan. I would like to take this opportunity to thank God as finally I was able to finish interpretations and conclusions of this paper in the time frame which is given. Besides that, I would like to take this chance to express my deep and sincere gratitude to our supervisor, Encik Mahathir Bin Muhamad for his kind encouragement and time while this task was in process. He had given us appropriate example and knowledge in order to make me understand more about this task. I would also like to show my gratitude to all respondents that involve in this research project for willingness to spend their time and effort in participating in the questionnaire survey.

Universiti Malaysia Kelantan,
Malaysia

Email : emily.a17a0081@siswa.umk.edu.my; tahirah@umk.edu.my

Abstract:

Service quality typically applies to a customer's assessment of service standards as it relates to the performance of the company. This study examined the relationship between service quality (tangibility, reliability, responsiveness, assurance and empathy) of supermarkets on customer satisfaction in Sibul, Sarawak. The data were collected from 384 respondents who really visit supermarkets in Sibul, Sarawak through questionnaire distribution. The collected data were analyzed through Statistical Package for Social Sciences (SPSS) Version 26 and the results of data were analysed using descriptive analysis, reliability analysis, Spearman correlation, and multiple regression. The results showed that tangibility, reliability, responsiveness, assurance, and empathy had a significant relationship to customer satisfaction in Sibul's supermarkets. In this study, assurance is the most influential dimension of service quality towards customer satisfaction. The findings of study should assist all supermarkets in Sibul, Sarawak to enhance their service quality and improve their customer satisfaction.

Keywords: Assurance, Customer Satisfaction, Empathy, Reliability, Responsiveness, Service Quality, Tangibility.

1 Introduction

1 1.1 Background of Study

Service quality was among the most significant competitive reasons in today's market environment. Therefore, the service quality will bring the different industries a great opportunity for organisations to generate competitive differentiation. The service quality reflects the core of the economy today, not just in developed countries, as well as in developing countries in the global (Mmutle, 2017). However, issues such as poor conditions of jobs, poor work standards and inefficient structures and procedures in place negatively affect the service quality by public organizations (Hennayake, 2017). In addition, due to unsatisfactory goods and poor service quality in different industries, Malaysian customers had to suffer a big loss of ever more than RM360 million (Malay Mail, 2019). The e-commerce (online buying) sector reported the highest number of complaints, followed by retail and telecommunications and mobile networks.

Supermarket is one of the retail service sectors. Nowadays, the supermarket performs a critical role in Malaysia's economy. Good service quality contributes to more customer satisfaction, sales and

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

improved business performance (Sirohi & Kumar, 2018). Service quality is generally specified as customer evaluation. Consequently, Supermarkets should enhance the quality of service in order to satisfy their customers with the services provided.

Customer satisfaction emerges which means that it determines the customer's expectation as to how goods and services are provided by businesses (Khadka & Maharjan, 2017). When the customer satisfaction is high in the business, the business will get high profit because the customer revisit and repurchase in this business. Hence, supermarkets can boost their profit quickly and efficiently by increasing customer satisfaction.

A successful service provider is providing consumers outstanding quality service. If the service quality is not good enough, the service provider is likely to deceive its customers and also lower their satisfaction. The service quality serves as a defining factor of customer satisfaction. Customer satisfaction and the service quality are related. The better the quality of the service, the customer satisfaction will be greater.

1.2 Research Objectives

1. To determine the relationship between tangibility and customer satisfaction in Sibu's supermarkets
2. To determine the relationship between reliability and customer satisfaction in Sibu's supermarkets
3. To determine the relationship between responsiveness and customer satisfaction in Sibu's supermarkets
4. To determine the relationship between assurance and customer satisfaction in Sibu's supermarkets.
5. To determine the relationship between empathy and customer satisfaction in Sibu's supermarkets
6. To determine the most influential dimension of service quality towards customer satisfaction in Sibu's supermarkets

1.3 Significance of Study

This study primarily focuses on the relationship between service quality of supermarkets and customer satisfaction in Sibu, Sarawak. The findings of this study may help the management of supermarkets in Sibu to know the customer's opinion on the level of service quality. The result of this study would probably give references to the management of Sibu's supermarket to enhance their service quality to satisfy their customer. Service quality is an important factor contributing to customer satisfaction and thus service providers should boost their overall quality of service from each aspect which is used in this study.

It also brings priority to future researchers and other students who are involved in conducting research in this field. It helps those who are interested to lead the discovery in the related field to explore the relations between each aspect in detail at a later stage in the study. It also provides statistical and sentence support for further research from each aspect.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

2 Literature Review

2.1 Independent Variables

2.1.1 Tangibility

It relates to anything that is tangible and influences the quality of service to the customers. It is a company's ability to display its presence to other individuals in tangible bodies, such as infrastructures available, equipment, and the physical appearance of the company (Andrianto & Santoso, 2019). Tangibility will influence customers because failure in providing tangible things will make customers feel the company did not pay attention to the company image. Physical appearance will influence customers whether proper or improper service is provided by the company. Organizations spontaneously arrange physical items and combine them to deliver services to their customers who after its utilize access it (Othman, Harun, Rashid, & Ali, 2019).

2.1.2 Reliability

It relates to the willingness to fulfill the promise of service accurately and regularly (Felix, 2017). It involves right service and accurate record and prompt response to customers. Precise information involves precise product prices, and also right and reliable product information (Beneke, Hayworth, Hobson, & Mia, 2012). Reliability is a result evaluated when the customer evaluates the service after the service has been experienced. Reliability is the ability to assess the customer experience and as an aspect of the supplier's accreditation (Sakarji et al., 2020).

2.1.3 Responsiveness

It relates to the company's ability to serve customers and give quick service (Andrianto & Santoso, 2019). This dimension focuses attention and focus and pace in interacting with inquiries, questions, complaints and concerns from the customer. Responsivity is interacted to customers as long as they have to ask for help, responses to questions or attention to issues (Linh & Anh, 2018). It also relates to the capacity for employees to build customised solutions (Penceliah, Noel, & Adat, 2015).

2.1.4 Assurance

Assurance is the understanding and friendliness of staff and their ability to build faith and trust. It also defines the capacity of the company to foster trust in the eyes of the customer through the friendliness and understanding of the workforce in operation (Haming, Murdifin, Syaiful, & Putra, 2019). This dimension concerns how professional and courteous workers are to encourage confidence and trust from their users (Auka, Bosire, & Matern, 2013). If customers did not feel assured by the service provider, it meant that the company betrayed customer trust to them. Customers based their evaluation of a service provider 's ability on how effective or confident the necessary services were to be delivered (Sakarji et al., 2020).

2.1.5 Empathy

Empathy involves the willingness of the service provider to provide each customer with caring and personalised attention (Parasuraman et al., 1988). The key factors included in the measurement of empathy were individual attention, convenient working hours, awareness of the employees when an issue arises and the knowledge that employees have of the needs of the customers (Auka et al., 2013). Customers want to feel valued and essential to businesses that give them access service (Hennayake,

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

2017).

2.2 Dependent Variable

2.2.1 Customer Satisfaction

The customer concept is the person or business that purchases the items or service from a corporation (Hamzah et al., 2017). Satisfaction can influence the company whether customers would repurchase, buying more goods, positive word of mouth and the willingness of the consumer to spend more for the specific brand (Hanif, Hafeez, & Riaz, 2010). Satisfaction is an expression to identify a feeling for an individual for something. Customer satisfaction with a company's goods and services is recognised as the most significant factor contributing to competition and growth.

In the corporate sector, customer satisfaction is critical because it will not have a market without loyal and satisfied customers. The more to concentrate on customer satisfaction and retention, the more long-term business to have (Mohsan, Nawaz, Khan, Shaukat, & Aslam, 2011). Customer satisfaction tests how well a customer's needs have been met for a product or service offered by a business. According to Beneke et al. (2012). high ratings for customer satisfaction are commonly assumed to be the main predictor of the financial performance of a company. As criteria for identifying product or service performance, many companies use customer satisfaction and even refer customer satisfaction ratings to management and employee pay ratings. The service quality is an essential tool to evaluate customer satisfaction and a criterion for maintaining satisfactory customer relations.

2.3 Research Hypothesis

H1: There is a significant relationship between tangibility and customer satisfaction in Sibu's supermarkets

H2: There is a significant relationship between reliability and customer satisfaction in Sibu's supermarkets.

H3: There is a significant relationship between responsiveness and customer satisfaction in Sibu's supermarkets

H4: There is a significant relationship between assurance and customer satisfaction in Sibu's supermarkets

H5: There is a significant relationship between empathy and customer satisfaction in Sibu's supermarkets

2.4 Conceptual Framework

The conceptual framework shows the relationship between independent variable and dependent variables. There are five independent variables selected which are tangibility, reliability, responsiveness, assurance and empathy. The dependent variable is customer satisfaction.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

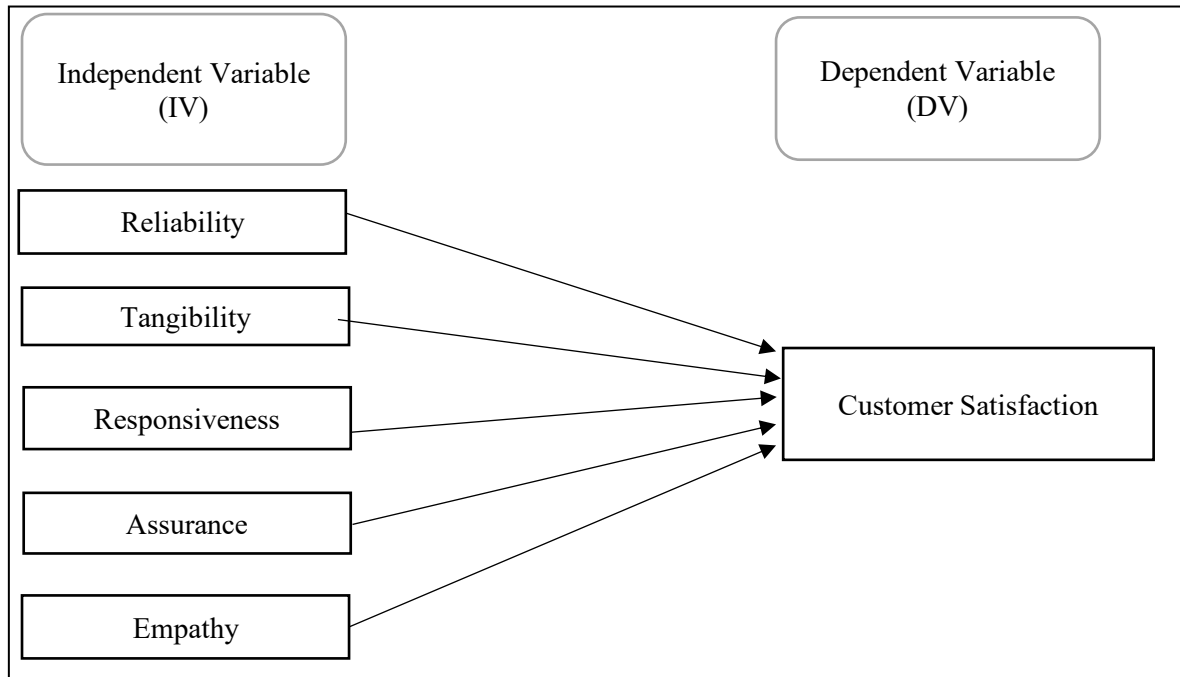

Figure 2.1 Conceptual Framework of Research

3 Methodology

3.1 Research Design

The research design that the researcher selected is descriptive research which used a quantitative research method in this study. In quantitative research method, the researcher uses standardised questionnaires to obtain data. Descriptive study in this research can be categorized as cross-sectional. Cross-sectional is the data only collected just once.

3.2 Data Collection Methods

This study will be conducted on a quantitative research method. Both the primary data and secondary data will be used in this study. Primary data is data that was collected by first hand by researcher for the purpose of this study. The researcher uses primary data in this study because it can get the latest information from the respondents. The secondary sources of data usually collected from journals articles, official websites, newspapers and others. The researcher uses secondary data which is existing data in this study because it will be conducted such as in literature reviews to explain definition and other information.

3.3 Study Population

The study will proceed in the Sibul which is a town in the central zone in Sarawak. The population for this study includes the customers who really visit the supermarkets in Sibul. Hence, the population of this study is the total number of residents in Sibul. Based on the statistics from the websites, the population of Sibul is approximately 198,239 (World Population Review, 2020).

3.4 Sample Size

All the respondents are the people who visit supermarkets at least one time in their life. The total number

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

of residents in Sibul is the population in this study. A sample size will be carried out from the population in Sibul based on Krejcie and Morgan (1970) table, therefore the researcher decides the sample size that is 384 respondents.

Table 3.1: Table for Determining Sample Size of a Known Population

Note: N is Population Size; S is Sample Size *Source: Krejcie & Morgan, 1970*

Sources: Krejcie and Morgan (1970)

3.5 Sampling Techniques

Present study decided to select convenience sampling in non-probability sampling. A convenience sample comprising 384 respondents who convenient access was selected. In this case, the survey questionnaire will be distributed by using non probability sampling method who have fulfilled the functional requirements of convenience sampling.

3.6 Research Instrument Development

The questionnaire was categorized into 3 sections. Section A is about personal information. Section B is the questions that related with the independent variables, which included tangibility, reliability, responsiveness, assurance and empathy of Sibul's supermarkets. Section C is related to the dependent variable which is Sibul's supermarkets customer satisfaction.

Table 3.2: Sources of Questionnaire

Items	Adopted Sources
Tangibility	(Goranczewski & Puciato, 2011; Kitapci et al., 2013; Slack, Singh, & Sharma, 2020)
Reliability	Goranczewski & Puciato, 2011; Loke et al., 2011)
Responsiveness	(Goranczewski & Puciato, 2011; Kitapci et al., 2013; Eshetie, Seyoum, & Ali, 2016)
Assurance	(Goranczewski & Puciato, 2011; Slack, Singh, & Sharma, 2020; Handrinos et al.,)

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Empathy	(Goranczewski & Puciato, 2011; Loke et al., 2011)
Customer Satisfaction	(Kitapci et al., 2013; Slack, Singh, & Sharma, 2020; Peng & Moghavvemi, 2015)

3.7 Measurement of the Variables

Nominal scale, ordinal scale and interval scale will be implemented in the questionnaire. In addition, the researcher will use a 5 point likert scale of scaling technique at section B and section C in the questionnaire.

3.8 Procedure for Data Analysis

Before doing data analysis, present study will design questionnaire and distribute to respondents to fill. After all data collected from the respondents, the researcher would transfer all data collected into SPSS. In this study, the researcher used Statistical Package for Social Sciences (SPSS) 26 in order to make the data analysis which included descriptive analysis, reliability test, Spearman correlation analysis and multiple regression Analysis.

4 Data Analysis and Findings

4.1 Demographic Profile of Respondents

The personal information includes gender, age, race, education level, occupation and frequency of the respondents visiting Sibul's supermarkets in a month.

For gender, the majority of the respondents are female. It can be explained that about 222 (57.8%) respondents who participated in this study were female, meanwhile 162 (42.2%) were male. Therefore, the most active participant in this study was female rather than the male. It means that females visit supermarkets more than male.

For age, it states that the age of participants consists of people around below 20 until above 50. The majority of the respondents are from age 31-40. The percentage about 2.9%, which was 11 respondents of age below than 20, 26.0% or 100 respondents of age 21 to 30, 32.3% or 124 respondents from age 31 to 40, 28.1% or 108 respondents from age 41 to 50, and age 50 to above was about 10.7% which was 41 respondents. The most participated respondents were in age between 31 to 40 because they could give their time to answer questionnaire.

For race, it states the races of participants consists of races which are Malay, Chinese, Indian and Bumiputera Sarawak. The majority of the respondents are Chinese which represent 168 respondents (43.8 %). Meanwhile Malay respondents represent 75 out of 384 respondents. The number of Bumiputera Sarawak respondents show an impressive feedback which are 139 respondents or 36.2%. 2 Indian respondents also contribute into this study. It could indicate that the most respondents that participated in this study were Chinese which are more often went to supermarkets.

For education, the majority of respondents are having SPM level as their highest education. For no education level, it was about 1 respondent with 0.3%, PMR about 9 respondents with 2.3%, SPM level about 124 respondents with 32.3%, STPM/A level about 61 respondents with 15.9% and Diploma level

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

about 64 respondents with 16.7%, Bachelor Degree about 114 respondents with 29.7% and last Master Degree about 11 respondents with 2.9%. It could indicate that the most respondents that participated in this study had at least SPM level as their education.

For occupation, it provides selection for the respondents to choose their occupation which related to government sector, private sector, student and others. The majority of respondents are from the private sector. Government sector was about 121 respondents with 31.5%, private sector about 184 respondents with 47.9%, students about 59 respondents with 15.4 % and others about 20 respondents with 5.2%. It could be concluded that the respondents from the private sector participated the most in this study and the least participated were involved in others.

For frequent visit SibU's supermarkets in a month, the selection of the question was 1 to 5 times, 6 to 10 times, 11 to 15 times and more than 15 times. The majority of respondents visited supermarkets in a month were 1 to 5 times. The respondents that using the SibU's supermarkets for 1 to 5 times in a month was about 216 with 56.3%, 6 to 10 times was about 126 respondents with 32.8%, 11 to 15 times was about 26 respondents with 6.8% and more than 15 times was about 16 respondents with 4.2%. This could conclude that the most participating respondents in this study were the respondents that visit SibU's supermarkets in 1 to 5 times a month.

Table 4. 1 Personal information of Respondents

	Frequency	Percentage (%)
Gender:		
Male	162	42.2
Female	222	57.8
Age:		
20 years old and below	11	2.9
21-30 years old	100	26.0
31-40 years old	124	32.3
41-50 years old	108	28.1
51 years old and above	41	10.7
Race		
Malay	75	19.5
Chinese	168	43.8
Indian	2	0.5
Bumiputera Sarawak	139	36.2
Education		
No Education	1	0.3
PMR	9	2.3
SPM	124	32.3
STPM/ A-Level	61	15.9
Diploma	64	16.7
Bachelor Degree	114	29.7
Master Degree	11	2.9
Occupation		
Government sector	121	31.5
Private sector	184	47.9
Student	59	15.4
others	20	5.2
How frequent did you visit		

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Sibu's supermarkets in a month?		
1-5 times	216	56.3
6-10 times	126	32.8
11-15 times	26	6.8
More than 15 times	16	4.2

4.2 Descriptive Analysis

Based on the result, customer satisfaction (DV) obtained the highest mean with 4.24, whereas tangibility (IV1) recorded the lowest mean with 4.10.

Table 4.2: Summary of the Means and Standard Deviation of Computed Items according to Variable

Variables	Mean	Std. Deviation
Tangibility (IV1)	4.10	.846
Reliability(IV2)	4.14	.742
Responsiveness (IV3)	4.16	.702
Assurance(IV4)	4.21	.679
Empathy (IV5)	4.11	.745
Customer Satisfaction (DV)	4.24	.674

4.3 Reliability Analysis

Reliability analysis played a vital role in the process of analysing the data. Reliability test was a technique for checking a scale's internal regularity. Reliability test was also concerned about repeatability with obtaining the same result.

Based on the table 4.3, the highest Cronbach's Alpha is Tangibility. It indicated the consistency and reliability of this items. The second highest of Cronbach's Alpha was customer satisfaction which was 0.923. 0.922 which was part of reliability. Cronbach's Alpha of empathy was 0.906 which was higher than assurance which was 0.905. Lastly, the lowest Cronbach's Alpha belongs to responsiveness be part of 0.903. The overall result on above was shown to be good consistency and reliability for all of the independent variables and dependent variables as all of the Cronbach's Alpha results were above 0.7.

Table 4.3: Reliability Statistics Results

Variables	Number of Items	Cronbach's Alpha Value
IV 1- Tangibility	5	.941
IV 2- Reliability	5	.922
IV 3- Responsiveness	5	.903
IV 4- Assurance	5	.905
IV 5- Empathy	5	.906
DV- Customer satisfaction	5	.923

4.4 Normality test

According to Kolmogorov-Smirnova test and Shapiro-Wilk test, normal is $p > 0.05$ while $p < 0.05$ is

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

abnormal. For sig. value(p=.000) of Kolmogorov-Smirnova test and Shapiro-Wilk test of all variable are considered as abnormal. Thus, the distribution was abnormal. The researcher will use Spearman correlation analysis in this study.

Table 4.4: Normality Test Results

	Kolmogorov-Smirnova			Shapiro-Wilk		
	Statistic	Df	Sig.	Statistic	Df	Sig.
Customer satisfaction	.145	384	.000	.886	384	.000
Tangibility	.170	384	.000	.869	384	.000
Reliability	.157	384	.000	.910	384	.000
responsiveness	.129	384	.000	.914	384	.000
Assurance	.126	384	.000	.912	384	.000
Empathy	.130	384	.000	.918	384	.000

4.5 Spearman Correlation Analysis

This study has using the Spearman correlation coefficient analysis as the guide in measuring the strength of the linear relationship between all of the independent variables which are tangibility (IV1), reliability (IV2), responsiveness (IV3), assurance (IV4), and empathy (IV5) with the dependent variable, which is customer satisfaction (DV). The result in this study showed five independent variable had a strong relationship with dependent variable. The correlation between assurance (IV4) and customer satisfaction (DV) which was 0.866 is the most positive and strong relationship compared to other independent variables which has been tested in this study.

Table 4.5: Spearman Correlations

Correlations		DV	IV1	IV2	IV3	IV4	IV5	
Spearman's rho	DV	Correlation Coefficient	1.000	.838**	.843**	.829**	.866**	.851**

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

**. Correlation is significant at the 0.01 level (2-tailed).

4.6 Multiple Linear Regression Analysis

A metric of dependent variable that is affected by one or more independent variables can be measured by using regression analysis. Thus, in order to achieve the research objective, multiple regression analysis is used to measure the relationship between five dimensions of service quality towards customer satisfaction at SibU's supermarkets.

Assurance is the most influential for customer satisfaction compared to other four independent variables, which are reliability, responsiveness, tangibility and empathy. This is because its unstandardized coefficient beta is the highest, which is 0.507. Hence, the main predictor of customer satisfaction is assurance. Other independent variables consist of empathy, tangibility, reliability and responsiveness, which are 0.234, 0.194, 0.130 and -0.172 respectively.

Table 4.6: Coefficient Table of Independent Variables towards the Customer Satisfaction in SibU's supermarkets

		Coefficients ^a				
		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
Model		B	Std. Error	Beta		
1	(Constant)	.525	.088		5.998	.000
	Tangibility	.194	.035	.244	5.491	.000
	Reliability	.130	.053	.143	2.446	.015
	Responsiveness	-.172	.060	-.179	-2.862	.004
	Assurance	.507	.054	.511	9.455	.000
	Empathy	.234	.046	.258	5.047	.000

a. Dependent Variable: (Customer Satisfaction) DV

5 Discussion and Recommendations

5.1 Discussion

The relationship between tangibility of SibU's supermarkets and customer satisfaction was determined in Hypothesis 1. Based on the results of Spearman Correlation Coefficient, it showed that p-value of tangibility is 0.000. It means that there is a significant relationship between tangibility and customer satisfaction in SibU's supermarkets ($r = 0.838$, $p < 0.05$). Hence, hypothesis 1 is accepted.

The relationship between reliability of SibU's supermarkets and customer satisfaction was determined in Hypothesis 2. Based on the results of Spearman Correlation Coefficient, it showed that p-value of reliability is 0.000. It means that there is a significant relationship between reliability and customer satisfaction in SibU's supermarkets ($r = 0.843$, $p < 0.05$). Hence, hypothesis 2 is accepted.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

The relationship between responsiveness of Sibü's supermarkets and customer satisfaction was determined in Hypothesis 3. Based on the results of Spearman Correlation Coefficient, it showed that p-value of responsiveness is 0.000. It means that there is a significant relationship between responsiveness and customer satisfaction in Sibü's supermarkets ($r = 0.829$, $p < 0.05$). Hence, hypothesis 3 is accepted.

The relationship between assurance of Sibü's supermarkets and customer satisfaction was determined in Hypothesis 4. Based on the results of Spearman Correlation Coefficient, it showed that p-value of assurance is 0.000. It means that there is a significant relationship between assurance and customer satisfaction in Sibü's supermarkets ($r = 0.866$, $p < 0.05$). Hence, hypothesis 4 is accepted.

The relationship between empathy of Sibü's supermarkets and customer satisfaction was determined in Hypothesis 5. Based on the results of Spearman Correlation Coefficient, it showed that p-value of empathy is 0.000. It means that there is a significant relationship between empathy and customer satisfaction in Sibü's supermarkets ($r = 0.851$, $p < 0.05$). Hence, hypothesis 5 is accepted.

Table 5.1: Summary of Hypothesis Testing

Hypothesis	Data Analysis Method	Results
H1: There is a significant relationship between tangibility and customer satisfaction in Sibü's supermarkets	Spearman Correlation Coefficient	Accepted ($p = 0.000$, $r = 0.838$) $p < 0.05$
H2: There is a significant relationship between reliability and customer satisfaction in Sibü's supermarkets	Spearman Correlation Coefficient	Accepted ($p = 0.000$, $r = 0.843$) $p < 0.05$
H3: There is a significant relationship between responsiveness and customer satisfaction in Sibü's supermarkets	Spearman Correlation Coefficient	Accepted ($p = 0.000$, $r = 0.829$) $p < 0.05$
H4: There is a significant relationship between assurance and customer satisfaction in Sibü's supermarkets	Spearman Correlation Coefficient	Accepted ($p = 0.000$, $r = 0.866$) $p < 0.05$
H5: There is a significant relationship between empathy and customer satisfaction in Sibü's supermarkets	Spearman Correlation Coefficient	Accepted ($p = 0.000$, $r = 0.851$) $p < 0.05$

5.2 Recommendations

The future researchers are suggested to increase the sample size so that more people can involve in this study. This is because there are only 384 respondents in the present study. When there are more respondents involved in this study, the more the result can represent the opinion of the people. Hence,

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

the future researchers are recommended to conduct similar research in other places and enlarge the sample size to generate more information from a different and larger population.

Second recommendation that suggested by the researcher of this study is the future researchers can add on other factors that might be influenced on customer satisfaction. The other factors might be also important to involved in the research in order to examine the level of customer satisfaction who visited the supermarkets. Hence, the future researchers who want to carry out the same field can add other factors not only service quality so that it can ensure different factors are also important to customer satisfaction.

Lastly, future research also recommended conducting mixed collection method. This is because in quantitative method, the questions were already fixed. Through qualitative research, researcher can get more perspective and more detail information about what they really felt at supermarkets from the respondents.

6 Conclusion

The main objective of this study is to investigate the relationship between service quality of supermarkets and customer satisfaction in Sibul, Sarawak. The finding showed that each dimension of service quality which is reliability, tangibility, empathy, assurance and responsiveness had a significant relationship with the customer satisfaction in Sibul's supermarkets. The most important is assurance plays a vital role in influencing service quality of supermarkets towards customer satisfaction in Sibul, Sarawak. While responsiveness was the least significant dimension of service quality that caused to give an influence towards the supermarkets customer satisfaction. Hence, the findings of the study will be helpful to all supermarkets in Sibul, Sarawak to enhance their service quality and improve their customer satisfaction.

7 Acknowledgment

I would like to take this chance to record my deepest thanks for those who supported me in this research. The research would not be done without their great encouragement and supportive contributions.

Firstly, I would like to thank my supervisor Dr. Tahirah Binti Abdullah for her guidance and supervision of this research and correcting mistakes and guiding me.

I indebted to all of them, who did their best to bring their suggestions to us. Furthermore, I would like to express our gratitude towards my parents and members of my families for their understanding while in completion of this research.

Finally, I would like to thank the people who directly or indirectly helped me do the research. Thank you.

FACTORS INFLUENCING THE USE OF E-WALLET AS A PAYMENT METHOD AMONG STUDENT IN UNIVERSITY OF MALAYSIA KELANTAN CITY CAMPUS

Amira Khalisha Arshad and Nurul Izyan Mat Daud

Faculty of Entrepreneurship and Business,
Universiti Malaysia Kelantan,
Malaysia

Email: khalisha.a17a0037@siswa.umk.edu.my, izyan.md@umk.edu.my

Abstract:

E-wallet also well-known as a noticeable increase of cashless transactions due to the development of financial technology. One of the best inventions of the 21st century is the electronic wallets (e-wallets) an integral part of electronic payment system. The term “e-wallet” is a form of digital wallet that allows an individual to link their debit or credit cards to digital wallet in order to make any transactions (Digital Wallet, 2019). Apart from the debit or credit cards electronic cards enable consumers to store their physical cards information and bank account number to perform certain action towards payment (Ray, 2017). The purpose of this study was to investigate the relationship between save money and factor use of E-wallet among students in University of Malaysia Kelantan City Campus. This study also aimed to investigate the relationship between discount and cashback and factor use of E-wallet among students in University of Malaysia Kelantan City Campus. Next this study aimed to investigate the relationship between safety and privacy and factor use of E-wallet among students in University of Malaysia Kelantan City Campus. In this study has three factors influencing use of E-wallet were state: Save Money, Discount and Cashback, and Safety and Privacy. This research discusses the relationship between the factors mentioned with use of E-wallet. This research use questionnaire as the survey to collect data from respondents. This research uses Statistical Package for Social Sciences (SPSS) to analysis the data. This research also have regression and correlation techniques to study the relationships between independent variables and dependent variables.

Keywords: *E-wallet, Digital Wallet, Payment Method, Discount, Mobile Payment*

1 Introduction

E-wallet is one of the technology apps and software. E-wallet is a device that has also been recognized as a digital wallet. E-wallet is a software application that uses electronic devices such as computers or mobile devices for online transactions. E-wallet is also a payable device without the use of cash or money. This helps the seller to collect the customer’s payment through the use of the unique two-dimensional quick-response code, also known as (QR) code that the seller generates. For example, Grab pay, Boost, Touch n Go e-wallet, Alipay, Fave-pay and so on. If the customer wants to use this method of payment, they will need to install the Mobile app to begin the payments and services (Kasthuri Subaramaniam, 2020).

Then, E-wallet well-known as a component of payment system. The word “payment system” is defined as a system that enables payment to be effects between a payers and a beneficiary, involving clearing, payment, or settlement services or all of them. A “payment system” as understood in India, can include the system enabling credit card operation, debit card operation,

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

smart card operation, money transfer operations or such similar operation (Jinimol.P, 2018). Next, E-wallet is a component of payment system. It is an electronic, internet- based payment system which stores financial value as well personal identity related information. More security measures to safeguard the identity related information will lead to use of e-wallet among many. Lack of awareness is also problem, which can be sort out only by giving proper information about e-wallets

The term “e-wallet” is a form of digital wallet that allows an individual to link their debit or credit cards to digital wallet in order to make any transactions (Digital Wallet, 2019). Apart from the debit or credit cards electronic cards enable consumers to store their physical cards information and bank account number to perform certain action towards payment (Ray, 2017). The mobile payments can be defined as “a type of payment transaction processing in which the payer uses mobile communication techniques in conjunction with mobile devices for initiation, authorization, or completion of payment” (Goeke and Pousttchi, 2010). When implemented on a mobile phone, the mobile payments can be combined with additional services, for example, public transport and event ticketing, loyalty programs, and so on. This is a way to develop a mobile wallet including all items that people usually hold in their physical wallets (Tatjana, 2014).

The increasing of customer’s needs in mobility when payment for transaction has created requirement for a new payment tool allowing the transactions more feasible and convenient (Ondrus & Pigneur, 2006). The current payment method gives consumers solvency that is beneficial in dealing with medium and large amount of money. It is inconvenient for customers in small denominations of coins or pennies when making micropayments (Gia-Shie Liu, 2016). Mobile payment (M-payment) is defined as a transaction method which money is transferred from one person to another through a mobile device without intermediate. Mobile payment is a new payment method for purchases of products and services, which uses all kinds of mobile devices and wireless communication technologies which ia mobile telecommunication networks, Internet. In this new method, mobile devices can be used to make a varied type of small payments. These devices help users to connect to a server through which transactions are made and confirmed (Antovski & Gusev, 2003).

2 Literature Review

2.1 Save Money

E-wallets usually act like a debit card, which means the amount of money you have preloaded is determined by you. Reign in your spending by topping up your e-wallet with an amount limit based on your monthly budget. This is particularly great for discretionary spending such as shopping and eating out. If you’ve spent it all before the month ends, do not cave in by topping up with more cash. Instead, acknowledge that you’ve hit your budget limit and start reducing your indulgences.

H1: Save time of e-wallet will have positive influence on factors influencing to use E-wallet.

2.2 Discount and Cashback

Cashback is the amount of cashback payment not only by the cashback offer but also by the amount a consumer spends which results in significant variation in the size of cashback payments related to the same offer. The variable Last Purchase Spend it captures the amount consumer I spent on the most recent purchase day, and therefore it controls for consumer-specific purchase trends. The variable Purchase Instance it the number of transactions consumer I made up to but not including day controls for past experience with the cashback

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

company.

H2: Discount and cashback will have positive factors influencing on use of E-wallet.

2.3 Safety and Privacy

The study reported a moderate positive correlation between “security” and “intention to use” E-wallets. [LAI \(2016\)](#) argued that “intention to use” of e-Payment system was significantly influenced by “security,” design, “perceived usefulness” and “perceived ease of use.” He reported that “security” positively influences users’ “intention to use” the e-Payment system. [Kim et al. \(2010\)](#) found that “perceived security” has a positive impact on “perceived trust” and on the usage of e-Payment. They reported that “hedonic motivation, perceived security, general privacy, facilitating conditions, performance expectancy, perceived savings and social influence and price value in this order, influence the intention to adopt e-wallets.” They advocated to modify existing services to maintain the customers’ “privacy and security.”

H3: Safety and privacy will have positive influence on factors influencing to use e-wallet.

2.4 Conceptual Framework

Figure 1 show the theoretical framework on the factor influencing use E-wallet as a payment method among student in University of Malaysia Kelantan, City Campus. There is two type of variables. The first variable is independent variables, which consist of save money, discount and cashback, and safety and privacy. The second variable is dependent variable, which is use of E-wallet.

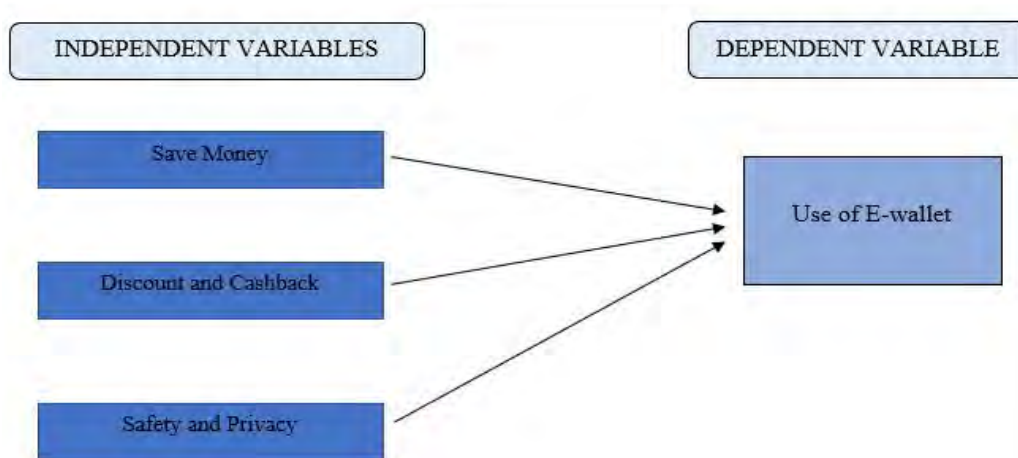

Figure 1: Conceptual Framework of Factor Influencing Use of E-Wallet As A Payment Method Among Students in University of Malaysia Kelantan

3 Research Methodology

3.1 Research Design

In this research, researchers chose the quantitative research approach. Quantitative research includes the collection of primary data which can ensure the validity of the study. Therefore, the study should collect information about the factor influencing by questionnaire. This study design used quantitative approaches to collect the necessary data. Questionnaires will be

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

undertaken in order to collect data from selected groups of among student in the area University of Malaysia Kelantan City Campus.

3.2 Data Collection Methods

Data collection is a process of collecting information from all the relevant sources to find answers to the research problem, test the hypothesis and evaluate the outcomes. Data collection methods can be divided into two categories that is primary data and secondary data. Questionnaires is use particularly in case of big enquiries. It is being adopted by private individuals, research workers, private and public organizations, students and even by governments. In this method a questionnaire is sent (usually by post) to the persons concerned with a request to answer the questions and return the questionnaire. A questionnaire consists of several questions printed or typed in a definite order on a form or set of forms. The questionnaire is mailed to respondents who are expected to read and understand the questions and write down the reply in the space meant for the purpose in the questionnaire itself. The respondents must answer the questions on their own. This study will use the method of distributing questionnaires to respondents in the area of the study to gain data collection.

3.3 Study Population

Population is the large general group of many cases from which a researcher draws a sample for a study (Neumann and Robson, 2009; Engine, 1998). According to Mugenda (1999), the target population means the population to which a researcher wants to generalize the results of the study. The population was composed of students each year in University of Malaysia Kelantan City Campus. Krishnan, (2003) defined population as the target group to be studied place. It is the aggregate of all units pertaining to the study. The technique which was students in sampling. The target population of this study will be the students in University of Malaysia Kelantan City Campus consist of both gender from the age of 21 and above.

3.4 Sample Size

University of Malaysia Kelantan City Campus is the federal university and most famous area in Kelantan, Malaysia. University of Malaysia Kelantan Campus Kota the fastest growing university area of Kelantan state. University of Malaysia Kelantan Campus Kota has 3482 students from Faculty Entrepreneurship and Business and 2169 students from Faculty Hospitality, Tourism and Wellness. It is has 6000 students in University of Malaysia Kelantan City Campus. Many students in University of Malaysia Kelantan use the E-wallet nowadays. The population size of students use the E-wallet based on table (Krejcie & Morgan). Therefore, based on the table by (Krejcie & Morgan, 1970). For be respondents need to follow the table. University of Malaysia Kelantan that being domestic violence are targeted 362 respondents to answer questionnaire.

3.5 Sampling Technique

Non-probability sampling was used as the sampling design in this study as the samples are collected in a method that does not offer equal opportunities for all people in the population for being selected. In the convenient sampling, respondents are randomly selected. The people who are easy to reach and provide the information will become the target respondents in the research.

3.6 Research Instrument Development

The method of data collection for this study is quantitative. Questionnaire will be used to collect the data. It consists of 5 sections: A) Demographic; B) Use of E-wallet; C) Save Money D) Discount and Cashback; E) Safety and Privacy.

3.7 Measurement of The Variables

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

This study will be using 5-Likert scale which consist of Scale: 1 Strongly Disagree, 2. Disagree, 3. Less Agree, 4. Agree, 5. Strongly Agree. Section B, Section C, Section D and Section E use the scale for answer.

4 Research Findings

4.1 Frequency Analysis

Table 1 shows the demographic of respondents was collect form survey and analysis by SPSS.

Table 1: Demographic respondent profile

Variables	Frequency	Percentage%
Gender		
Male	113	31.2
Female	249	68.8
Total	362	100
Age		
19-20 Years	105	29.0
21-22 Years	166	45.9
23 Years and above	91	25.1
Total	362	100
Races		
Malay	304	84.9
Chinese	33	9.1
Indian	14	3.9
Others	11	3.0
Total	362	100
Marital Status		
Single	347	95.9
Married	15	4.1
Total	362	100
Education		
STPM	37	10.2
Diploma	51	14.1
Bachelor	266	73.5
Others	8	2.2
Total	362	100

4.2 Reliability Analysis

Table 2 show the reliability analysis of Cronbach's Alpha. The Cronbach's Alpha for

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Use of E-wallet which is dependent variable is 0.890. Next is the Cronbach's Alpha for save money which is independent variable is 0.900. The Cronbach's Alpha for Discount and Cashback which is independent variable is 0.893. Lastly, the Cronbach's Alpha for Safety and Privacy is 0.929. The number item for all construct has five. All the construct has the good relationships.

Table 2: Reliability Test

VARIABLES	COEFFICIENT	NUMBER OF ITEM	RELATIONSHIP
Use of E-wallet (DV)	0.890	5	Good
Save Money (IV 1)	0.900	5	Good
Discount and Cashback (IV 2)	0.893	5	Good
Safety and Privacy (IV 3)	0.929	5	Good

4.3 Pearson's Correlation

Pearson's Correlation Analysis will examine that whether the independent variable, which is store image, satisfaction and consumer value is statistically significant with the technological innovation, the dependent variable. In this case, the researcher had used the Pearson Correlation Analysis (two-tailed test) to investigate the relationship between store image, satisfaction and consumer value with the use of technological innovation. The table below showed the interpretation of the strength of the coefficient with variables Guilford and Fruchter (1973).

Table 3 shows that there is a positive fair significant relationship between discount and cashback and use of E-wallet ($p > 0.05$, $r = 0.778$). Then, there is a positive good significant relationship between save money and use of E-wallet ($p > 0.05$, $r = 0.783$) and there is a positive perfect significant relationship between safety and privacy and use of E-wallet ($p > 0.05$, $r = 0.799$).

Table 3: The correlation between independent and dependent variables

		Save Money	Discount and Cashback	Safety and Privacy	Use of E-wallet
Save Money	Pearson Correlation	1	.789 ^{**}	.836 ^{**}	.783 ^{**}
	Sig. (2-tailed)		.000	.000	.000
	N	362	362	362	362
Discount and Cashback	Pearson Correlation	.789 ^{**}	1	.826 ^{**}	.778 ^{**}
	Sig. (2-tailed)	.000		.000	.000
	N	362	362	362	362

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

Safety and Privacy	Pearson Correlation	.836**	.826**	1	.799**
	Sig. (2-tailed)	.000	.000		.000
	N	362	362	362	362
Use of E-wallet	Pearson Correlation	.783**	.778**	.799**	1
	Sig. (2-tailed)	.000	.000	.000	
	N	362	362	362	362

** . Correlation is significant at the 0.01 level (2-tailed).

4.4 Multiple Linear Regression Analysis

Multiple regression analysis was a statistical technique for estimating the variability of the dependent variable by regressing the independent variables against it (Sekaran & Bougie, 2016). Cooper and Schindler (2014) stated that multiple regression analysis was a statistical method used to construct a self-weighting estimation formula that predicts values for a dependent variable from the values of independent variables; monitors confounding variables to better assess the influence of other variables; tests and describes a causal hypothesis. The multiple regression result shown in Table 4:

Table 4: Multiple regression between independent variables with use of E-wallet.

Model	Unstandardized Coefficients	Standardized Coefficients	t	Sig.	95.0% Confidence Interval for B	
					B	Std. Error
1 (Constant)	1.633	.122	13.380	.000	1.393	1.874

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

	Safety and Privacy	.663	.026	.799	25.203	.000	.611	.715

	Discount and Cashback	.262	.051	.279	5.193	.000	.163	.362

5 Discussion

Although this research has reached its aims, there is several research limitations were found in this study when conducting this study. This limitation is important and must give attention in order for the researchers to learn and gain knowledge. The first limitation is using only students in University of Malaysia Kelantan City Campus area as place of the survey of study. The researchers just focused at one university which is University of Malaysia Kelantan. However, the result at each state will not be the same and the researcher can evaluate based on the respondent of using E-wallet as a payment method. Each respondent's perception is not same because of the experience and their type of E-wallet as a payment method. Second, the limitation of study that the researchers had been facing during conducting this research is distributing the questionnaire to the right people at right time. This is because there was less commitment from the respondent as some-time they busy with their business.

This causes them to fill the answer without read the questions properly and understand it. Most of the questionnaire was answered by the students and not the owner although some students have less experience about this study. Researcher need to distribute the questionnaire and collect it on other day. So, it is difficult to find respondents that willing to answer the questionnaire as well as conducting the research in quantitative method.

Lastly, time constraint is one of the barriers in completing this research. Only 4 months are given to complete final year project 1 and 2. The time is very limited to conduct this research as this research needs more commitments to find research about E-wallet as a payment method.

5.1 Hypothesis Testing

In discussion, will have more discussion on the hypothesis in this study. The hypothesis are based on the independents variables that is save money, discount and cashback, and safety and privacy. Firstly, hypothesis for independent variable of save money are stated as H1. Second, hypothesis for independent variable of discount and cashback are stated as H2. Lastly,

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

hypothesis for independent variable of safety and privacy are stated as H3.

Table 5: Discussion of the Key Findings

Research Question	Hypotheses	Result	Initial Decision
What the relationship between save money and factor use of E-wallet among students in University of Malaysia Kelantan City Campus?	H1: There is a significant relationship between save money and the factors influencing use of E-wallet as a payment method among student in University of Malaysia Kelantan City Campus.	P-Value = 0.000 Sig. = 0.783	Hypothesis, H1 are accepted
What the relationship between discount and cashback and factor use of E-wallet among students in University of Malaysia Kelantan City Campus?	H2: There is a significant relationship between discount and cashback and the factors influencing use of E-wallet as a payment method among student in University of Malaysia Kelantan City Campus.	P-Value = 0.000 Sig. = 0.778	Hypothesis, H2 are accepted
What the relationship between safety and privacy and factor use of E-wallet among students in University of Malaysia Kelantan City Campus?	H3: There is a significant relationship between safety and privacy and the factors influencing use of E-wallet as a payment method among student in University of Malaysia Kelantan City Campus.	P-Value = 0.000 Sig. = 0.799	Hypothesis, H3 are accepted

6 Recommendations

After ending this study, the researchers have found out that there are some spaces for improving the quality of this study in the future. The study can be conducted using different independent variable such as discount and cashback to get better results on factors influencing use E-wallet as a payment method in University of Malaysia Kelantan City Campus. The researches just focus in certain students in University of Malaysia Kelantan City Campus. So, in the future the researcher can conduct the research at other place such as at University of Malaysia Kelantan Bachok and Jeli Campus. Besides that, researchers prescribed some strategies that the government and its agencies responsible to using E-wallet as a payment method in the industries.

The government should play a leading role in educating E-wallet as a beginner on the incentives available to them and how to use the E-wallet when shopping with E-wallet. Such incentives will help them to improve their business besides contributes to national income. These incentives should be delivered through an establishment that really cares for the success

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

and sustainability of E-wallet. Moreover, the primary data collected for the studies should compromise not only quantitative method but also the qualitative method such as interview. Qualitative data obtained from the interview session can generate high reliability as there are two-way communications between researchers and the respondents. This will make sure the respondents will clearly understand with the research and can give better commitment. Lastly, this study will give benefit to future researcher to conduct their study. This journal will be a reference and guideline to them to improve the benefit of E-wallet as a payment method in nowadays. This thesis can be displayed at the libraries and can be uploaded in website to the future researcher's reference. They will have proper guide when they understand about this case study and also the limitations.

7 Conclusion

In this chapter, the researchers make a conclusion of the study based on the research objectives which show in chapter 1. The implication of the study also discussed in this chapter which is about the impact of this research study. Besides, the researchers discussed the limitation of the study and make a several recommendations to improve the research. Based on the problem statement, the researcher investigates that the factor influencing use of E-wallet as a payment method among students in University of Malaysia Kelantan City Campus. It shows that payment method is one of the keys that factor influencing use E-wallet as a payment method. By this, the researcher can know the relationship between the use E-wallet and the factor influencing use E-wallet as a payment method.

The objective of this is to investigate the relationship between save money and factor use of E-wallet among students in University of Malaysia Kelantan City Campus. The result of the study has shown the use of E-wallet as a payment method in Kelantan. Furthermore, the factor influencing use of E-wallet as a payment method is classified accordingly. All the hypotheses are accepted where there are significant positive relationships between save money (IV1), discount and cashback (IV2) and safety and privacy (IV3).

For the finding, the researcher was found that the respondent was agreed that E-wallet is important as a payment method in nowadays. Save money can gain the competitive advantage for students to save money when shopping. Besides, save money is also important for the growth money and income nowadays. In addition, the finding shows that the save money is also one of the factors that influence use E-wallet as a payment method. Save money can increase the value for the payment method by online, or it can generate value to external customers, including supplier, end users or potential consumers. Besides, discount and cashback can increase the demand for user E-wallet in nowadays. It is can increasing the number of people who register the E-wallet as a payment method and minimize the cost and to generate more income for the firm. Besides, safety and privacy is also one of the key factors that influence to use E-wallet as a payment method. Customer data is important and must give full attention. Customer always hopes that their use E-wallet must be fulfilled. So, E-wallet should take note about it to attract more customers by using the benefit of E-wallet. Customer taste and preference is not always the same. It will change according to the trend and environment. E-wallet should accept and adapt to the changes to attract more customers by fulfil their demands.

This will make sure the user E-wallet to them as customer with E-wallet as a payment method can fulfil customers demand on the time. In sum, all of the independent variable and dependent variable show a positive result, which is means that the result for research are acceptable, reliable, and significant, therefore, this research can be carrying out for the further research and

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

learning.

Acknowledgements

It is a great pleasure for me to undertake this project. I feel high doing the Final Year Research Project entitled **“Factors Influencing the Use of E-wallet as a Payment Method among student in University of Malaysia Kelantan City Campus”**

First of all, I would like to express our deepest gratitude to our research project supervisor, Dr. Nurul Izyan Binti Mat Daud, for her valuable supports and efforts in helping and guiding me in the completion of this research. I appreciate her dedication and the faith that she gave for me especially when I was facing difficulties during the entire process. I’m having extremely grateful to her for becoming our supervisor.

Furthermore, I would like to thanks the second examiner, Puan Nik Noorhazila Binti Nik Mud. She has given us valuable recommendations and suggestions that helped us in making better improvements in this research project.

Besides, I’m thankful for the infrastructures and facilities provided by the University of Malaysia Kelantan (UMK). Without those faculties, I’m unable to obtain the sufficient data, journal articles, and information required in conducting this research.

Last but not least, the credit also gave to my friends, course mates, and parents, Hj Arshad Bin Zainal Abidin and Hjh Masmerah Binti Abd Samat whose always support and motivate me throughout this Final Year Research Project. Their dedications are gratefully acknowledged, together with the sincere apologies to those we have inadvertently failed to mention here.

THE USE OF TECHNOLOGICAL INNOVATION ON RETAILING STORE EFFECT ON CONSUMERS PURCHASING

Nurul Husna binti Zainal and Nurul Izyan binti Mat Daud

Faculty of Entrepreneurship and Business,

Universiti Malaysia Kelantan,

Malaysia

Email : husna.a17a0578@siswa.umk.edu.my, izyan.md@umk.edu.my

Abstract:

Technological innovation will have a significant impact on retail. The use of a large number of benefits enjoyed by retailers using technologies such as cost reduction, increased consumer satisfaction, flexible job introduction and finally in the field of market dominance and increased company competitiveness (Gil et al., 2014). The retail industry is one of the sectors connected to the revolution because of continuous technological advances (Priporas et al., 2017). Although retailers traditionally lack modern ability and typically adapt to innovation, products and services are available and increasing rapidly to support consumers and retailers with technology and creative systems and digital sales (Pantano, 2014). The aim of this paper is to deepen the study of retail technology innovation and explore the direct effect of innovation in the areas of level of satisfaction, image storage and consumer value to stimulate corporate economic efficiency (Townsend, 2010). There are several other key issues identified related to store image, satisfaction and consumer value that will use of technological innovation in the retailing.

Keywords: *Consumer Value, Retailing, Satisfaction, Store Image, Technological Innovation*

1 INTRODUCTION

Innovation is usually linked with technology-based change. Innovation not only pose challenges for retailing but also creates new effective solutions to improve consumer experience and retail management (Imtiaz, Eissa.A & Mosab, 2019). The level of innovation that may occur vary between firms operating in the same industry in terms of the nature and volume of successful innovations (Cao, 2014). Moreover, by providing new instruments to add value to the consumer experience, the rapid development of information and communication technology has fundamentally changed business conditions (Thiesse et al., 2009). In this study, technological innovation will have a significant impact on retail. The use of a large number of benefits enjoyed by retailers using technologies such as cost reduction, increased consumer satisfaction, flexible job introduction and finally in the field of market dominance and increased company competitiveness (Gil et al., 2014).

As Cyber Monday statistics show, smartphone use, in particular is driving retail e-Commerce sales with the rapid growth of technology. The mobile share of e-Commerce retail sales reached \$ 1.4 trillion in 2017, which is 58.9 percent of the total. It is expected to hit \$ 3.5 trillion by 2021, which will account for 72.9 percent of all retail e-commerce revenue. Outstanding growth in the e-Commerce retail sector, widespread use of information

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

technology, increase mobile internet connection, and increased investment will increase market share. The aim of this paper is to deepen the study of retail technology innovation and explore the direct effect of innovation in the areas of level of satisfaction, image storage and consumer value to stimulate corporate economic efficiency (Townsend, 2010). The objectives of this study are to :

1. To determine the relationship between store image on technological innovation.
2. To determine the relationship between satisfaction on technological innovation.
3. To determine the relationship between consumer value on technological innovation.

2 LITERATURE REVIEW

2.1 STORE IMAGE

Store image management is a key strategic tool to achieve competitive advantage (Delgado et al., 2014). According to Kumar et al., 2014, this concept gets a lot of attention from academics and the world today and is associated with consumer perceptions of the business world (Morschett et al., 2005). The study began in the 1950s, and the literature is very extensive. A large number of authors use Martineau's classic conceptualization concept (1956) as a basis for which he describes the picture or "the way the mind of the buyer envisions the store partly through the quality of its function and partly through its psychological attributes".

Therefore, the image of the store represent the identify or personality of a store because it is a mixture of values and expectations centred on customers' tangible and intangible elements associated with the business (Ailawadi and Keller, 2000; Hartman and Spiro, 2005). According to Shen, 2010, a number of variables or attributes have been recognized as contributors to image formation and, in particular, atmosphere, product display, service, pricing facilities and more. Based on (Beristain and Zorrilla, 2011; Delgado et al., 2014; Gil et al., 2017) as a result of this different approach, various attributes have been considered as part of the sales point image, although most studies retain accessibility-related attributes, space organization, comfort and convenience as key technology components to enhance their store image.

H1 : Store image have a positive effect on technological innovation in retailing.

2.2 SATISFACTION

For retail managers, satisfaction is the key goal and a definition that is of great interest in market research (Coil et al., 2007). From a specific or cumulative approach (Boulding et al., 1993) and a cognitive or affective approach (Oliver, 1997), satisfaction has been defined in the literature. An approach shared by several writers is an analysis of satisfaction with a concrete encounter (Spreng et al., 1996; Giese and Cote, 2000). However, fulfillment refers to a collection of cumulative interactions in the retail sense (Jones and Suh, 2000; Sivadas and Baker-Prewitt, 2000). A decision on a pleasurable level of consumption-related fulfillment is happiness from a cognitive perspective (Oliver, 1997). Store satisfaction in this line refers to a subjective judgement that meets or exceeds expectations in the store (Helesen et al., 2010),

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

and the principle of expectation dis-confirmation is most widely accepted in the literature. The affective viewpoint notes that a summary of emotional responses of varying severity is happiness (Giese and Cote, 2000). Therefore, we consider customer satisfaction with the technology to be a cumulative evaluation, affective and cognitive.

H2 : Satisfaction have a positive effect on technological innovation in retailing.

2.3 CONSUMER VALUE

Values are also easily equated with satisfaction even though the contract is different. This is because value takes sacrifices in exchange into account, while satisfaction is not (Grace and O’Cass, 2005) and this is because value occurs at different stages of the purchase process, while satisfaction is post-purchase (Oliver,1997). Research on value has traditionally focused on technology and little on the retail context, focusing on a variety of perspectives, such as the value of in-store experience (Terblanche and Boshoff, 2004) the value of the shopping process (Mathwick et al., 2002) or the value of general shopping experience (Babin et al., 1994). A study by Sharma et al., 2012, presents empiric retail studies that traditionally focus on more beneficial aspects of the shopping process, but more recent literature shows that consumers have motivations that go beyond buying a product.

H3 : Consumer value have a positive effect on technological innovation in retailing.

2.4 THE USE OF TECHNOLOGICAL INNOVATION

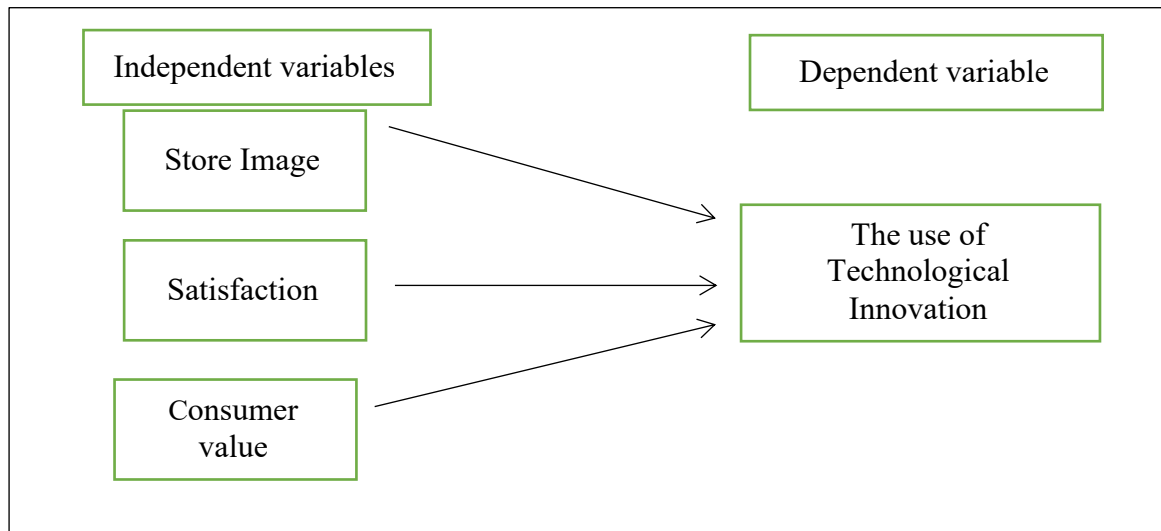

Technological innovation provides opportunities for entrepreneurs to find new organizations and create a competitive position as a source of employee advantage. The impact of innovation may not be so obvious that it is too late for providers who use older knowledge to compete with new competitors. Thus, the underlying technology and technological innovations can have a profound effect on the dynamics and evolution of organizational population competition. Ecological research linking the technological cycle with population dynamics, albeit limited in scope, provide strong support for this assertion (Baum, 1996).

New technologies can increase efficiency, build on existing knowledge and strengthen the position of incumbents or destroy competencies, making existing knowledge obsolete and making it possible for newcomers to become superior competitors in terms of technology. Technology advances return to additional enhancements to dominant technologies. While the universality of this technological cycle is debated, it has proven to illuminate various industries.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

2.5 CONCEPTUAL FRAMEWORK

A theoretical framework has been developed and present in Figure 2.1. It used to examine the relationship among three variables such as:

3.1 RESEARCH DESIGN

Research design is an important element in methodology. This is "a study design to provide a specification of the procedure that must be followed by the researcher to achieve the objectives of the study or test the hypotheses formed for the study" (McDaniel & Gates, 1999). Study design can ensure that the evidence generated from the data can answer research questions confidently and convincingly (Lewis, 2015). The target respondents for this research are residents in Parit Buntar, Perak. Researchers use independent variables and dependent variables to construct questions. This study uses descriptive research analysis to identify the role of technological innovation on store image, satisfaction and consumer value in retailing among resident Parit Buntar, Perak.

3.2 DATA COLLECTION METHOD

Data collection is a process of collecting information from all the relevant sources to find answers to the research problem, test the hypothesis and evaluate the outcomes. Data collection methods can be divided into two categories that is primary data and secondary data.

3.3 STUDY POPULATION

Population refers to the whole group of people, events or interesting things that the researcher wants to investigate (Kumar, Abdul Talib & Ramayah, 2013). The target population of this research is in Parit Buntar, Perak. But considering the cost and time limit, this study focuses on residents in Parit Buntar. The total population in Parit Buntar, Perak is 97,975 (Portal Rasmi Majlis Daerah Kerian, 2017). The reason for choosing this target population area is less time consuming to get more accurate results and achieve high data collection speed. The target population for the research is the customer from in Parit Buntar, Perak. The number of the of respondent that will be fill out the online questionnaire is 382 respondents (Krijcie & Morgan,1970).

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

3.4 SAMPLE SIZE

The sample size is a subgroup of the population, by examining the sample, the researcher should be able to draw conclusions from the general to the interested population” (Sekaran & Bougie, 2013). Sample sizes were selected based on sample size calculations using Krejcie and Morgan sample size determination tables. They have simplified the process of determining the sample size for a limited population developed in 1970. It is the number of respondents chosen from population by researchers. The number of populations in Parit Buntar, Perak was 97,975. Due to the sample size of a known population of Krejcie and Morgan (1970), there will be 382 will be chosen as the respondents. Study will be used a convenience sampling.

3.5 SAMPLING TECHNIQUES

Sampling technique is the process of selecting a sufficient number of elements from the population. Sampling design for this study is a non-probability sampling. Non-probability sampling is a sampling technique in which the researcher decides in sample based on subjective judgment of the researchers rather than random selection. Convenience sampling is chosen in conducting the sampling method as it’s allows researchers to identify respondent. It is also referred to the researching subjects of the population that are easily accessible to the researcher (Etikan et al., 2016). Convenience sampling is affordable, easy and the subjects are readily available.

3.6 RESEARCH INSTRUMENT DEVELOPMENT

The survey questionnaire was used as a measurement tool by the researchers to obtain data in this study. Questionnaires were used to ask respondents to give their opinions by answering the questionnaire. Questionnaires printed in bilingual. Nominal scales will be used for Sections A, B, C, D and E in the questionnaire for this study. This questionnaire was made with simple and standard words for respondents who easily understand the questions in the questionnaire. Moreover, this question is made based on the objectives and questions of this study. Questionnaire made as a closed question, which is a Likert type scale. Respondents can choose the answer that is closest to their point of view.

3.7 MEASUREMENT OF THE VARIABLES

The questionnaire will be used as an instrument in this study. The measured scale used by the researcher is the Likert scale. A Likert scale will be used to measured targeted respondents responses based on the use of technological innovation on retailing store effect on consumers purchasing.

3.8 PROCEDURE FOR DATA ANALYSIS

Once the information was collected from the respondents, the researcher began to collect and analyze the questionnaire. Respondents' feedback was converted to numerical values before entering the data in the spreadsheet. The Statistics Package for Social Sciences (SPSS) is selected and applied to collect and analyze the information collected. SPSS Statistics is a software package used for interactive statistical analysis, or batch. The statistical analysis for the study included the descriptive analysis, reliability analysis, Pearson correlation analysis and multiple analysis. Result of analysis came out and the discussion, conclusion also can be proceed.

3.8.1 DESCRIPTIVE ANALYSIS

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Descriptive statistics help researchers to simplify large amounts of data in a sensible way. Each descriptive statistics reduces lots of data into a simple summary. For instance, consider a simple number used to summarize the use of technological innovation on retailing store effect on consumers purchasing based on store image, satisfaction and consumer value.

3.8.2 RELIABILITY ANALYSIS

Reliability analysis is a way of estimating the quality of the measurement procedure used to collect data in a research. Reliability is concerned with consistency or how far the questions used in a survey which is the same kind of information each time respondent has been asked. Reliability is concerned with consistency or how far to the questions used in survey which is the same kind of information each time respondent has been asked.

3.8.3 PEARSON CORRELATION ANALYSIS

Pearson correlation analysis is used when it believed there is a linear relationship in data. In this study, Pearson correlation analysis was used to determine the relationship between store image, satisfaction and consumer value.

3.8.4 MULTIPLE REGRESSION ANALYSIS

Multiple regression was computed to ascertain the best linear combination of store image, satisfaction and consumer value in the use of technological innovation on retailing store.

4 RESEARCH FINDING

In this chapter shows that data questionnaires in SPSS.

4.1 DEMOGRAPHIC

Table 1: Demographic respondent profile

Variables	Frequency	Percentage%
Gender		
Male	127	33.2
Female	255	66.8
Total	382	100
Age		
15-25	186	48.7
26-35	97	25.4
36-45	71	18.6
45 >	28	7.3
Total	382	100

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

Education		
STPM	51	13.4
Matriculation	22	5.8
Diploma	80	20.9
Degree	122	31.9
Others	107	28.0
Total	382	100
Occupation		
Student	159	41.6
Unemployed	33	8.6
Employee	155	40.6
Housewife	35	9.2
Total	382	100
Retail Store		
Food	153	40.1
Household goods	82	21.5
Electronic goods	77	20.2
Textile	70	18.3
TOTAL	382	100

Table 1 shows that respondent of demographic profile. First, based on the sample obtained by the questionnaire distribution, the total sample have been collected reached a total of 382. From the sample collected, the respondents were majority female respondent which has dominated a total of 255 in total, and the rest were male respondent. 66.8% of the respondents were female and only 33.2% were male. For age, the population of Parit Buntar in the age range of 15 to 25 years is the majority in this study. Next, based on the data collected, the highest academic qualification which was Degree and Matriculation has recorded as the least number between STPM, Diploma, and others. After that, the highest occupation which was students and unemployed has recorded as the least number between employee and housewife. Last but not least, the highest retail store which was foods and textile has recorded as the least number between household goods and electronic goods.

4.2 RELIABILITY

Table 2 : The Actual Result of Reliability

Variable	Cronbach's Alpha	N of item	Result
<u>Dependent variable</u>			
Technological Innovation	0.904	5	Excellent
<u>Independent variable</u>			
Store image	0.740	5	Good
Satisfaction	0.748	5	Good
Consumer value	0.906	5	Excellent

Table 2 showed the Cronbach's Alpha for technological innovation was 0.904 and it indicated as a "excellent" result because it closed to 1.0. Besides that, consumer value obtained

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

a “excellent” result in the reliability test, which was 0.906 respectively. The Cronbach’s Alpha for store image and satisfaction was 0.740 and 0.748 respectively, there was considered as “good” reliability. Generally, the items will be acceptable when the result of Cronbach’s Alpha was more than 0.70. Based on this statement, all of the items in this research can be accepted and there was positively correlated with each other.

4.3 PEARSON CORRELATION

Table 3 : The correlation between independent and dependent variables

		Technological innovation	Store image	satisfaction	Consumer value
Technological innovation	Pearson Correlation	1	.418**	.521**	.876**
	Sig. (2-tailed)		.000	.000	.000
	N	361	361	361	361
Store image	Pearson Correlation	.418**	1	.518**	.343**
	Sig. (2-tailed)	.000		.000	.000
	N	382	382	382	382
Satisfaction	Pearson Correlation	.521**	.518**	1	.494**
	Sig. (2-tailed)	.000	.000		.000
	N	361	361	361	361
Consumer value	Pearson Correlation	.876**	.343**	.494**	1
	Sig. (2-tailed)	.000	.000	.000	
	N	361	361	361	361

** . Correlation is significant at the 0.01 level (2-tailed).

*p-value <0.05

Table 3 shows that there is a positive fair significant relationship between store image and technological innovation ($p < 0.05$, $r = 0.418$). Next, there is a positive good significant relationship between satisfaction and technological innovation ($p < 0.05$, $r = 0.521$) and there is a positive perfect significant relationship between consumer value and technological innovation ($p < 0.05$, $r = 0.876$).

4.4 MULTIPLE LINEAR REGRESSION ANALYSIS

Table 4 : Table of Coefficients Analysis

Coefficients ^a						
		Unstandardized Coefficients		Standardized Coefficients	t	Sig.

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

Store image	0.181	0.049	0.107	3.715	0.000
Satisfaction	0.109	0.050	0.068	2.177	0.030
Consumer value	0.822	0.029	0.806	28.431	0.000

a. Dependent Variable: Technological innovation

Table 4 showed the table of coefficient analysis. There is a significant effect of store image toward technological innovation (<0.05). In every unit increase of store image, technological innovation will increase by 0.18. Next, there is a significant effect of satisfaction toward technological innovation (<0.05). In every unit increase of satisfaction, technological innovation will increase by 0.11. Last but not least, there is a significant effect of consumer value toward technological innovation (<0.05). In every unit increase of consumer value, technological innovation will increase by 0.82.

5 DISCUSSION

In this research, the researcher had managed to collect data using the research instrument (online questionnaire) and after analyzing the data using IBM SPSS Statistics version 23, the result for the tests was obtained.

The first objective of this study is to determine the relationship between store image and technological innovation among the residents of Parit Buntar, Perak. The strength of the correlation between store image to technological innovation is a moderate positive correlation. Based on Gil et al., 2017, found that various attributes have been considered as part of the selling point picture, although most studies maintain attributes related to accessibilities, space organization, comfort and convenience as key technology components to enhance store image. This study has a positive effect on the store image

The second objective is to determine the satisfaction of the relationship between satisfaction and technological innovation among the people of Parit Buntar. The strength of the correlation between satisfaction with technological innovation is a simple positive correlation. Store satisfaction refers to subjective assessment that meets or exceeds store expectations (Helesen et al., 2010). Therefore, satisfaction with technology is considered a cumulative, effective and cognitive assessment. This study has a positive effect on satisfaction.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

The last objective is to determine the relationship between consumer value and technological innovation among the people of Parit Buntar. The strength of the correlation between satisfaction with technological innovation is high positive correlation. Research on value has traditionally focused on technology with a focus on various perspectives, such as the value of in-store experience (Terblanche and Boshoff, 2004). This study has a positive impact on consumer value.

There is a significant effect of store image toward technological innovation (<0.05). In every unit increase of store image, technological innovation will increase by 0.18. Next, there is a significant effect of satisfaction toward technological innovation (<0.05). In every unit increase of satisfaction, technological innovation will increase by 0.11. Last but not least, there is a significant effect of consumer value toward technological innovation (<0.05). In every unit increase of consumer value, technological innovation will increase by 0.82.

5.6 HYPOTHESES TESTING

Table 5 : Hypotheses testing

Hypotheses	Objective	Result
H1 : Store image have a positive impact on technological innovation in retailing.	the p-value for store image had indicated 0.000, which $p < 0.01$, meaning that there is significant relationship between store image and technological innovation.	Accepted
H2 : Satisfaction have a positive impact on technological innovation in retailing.	the p-value for satisfaction had indicated 0.03, which $p < 0.01$, meaning that there is significant relationship between satisfaction and technological innovation.	Accepted
H3 : Consumer value have a positive impact on technological innovation in retailing.	the p-value for consumer value had indicated 0.000, which $p < 0.01$, meaning that there is significant relationship between consumer value and technological innovation.	Accepted

Based on the table 5, it can be concluded that the store image, satisfaction and consumer value have a significant relationship between the use of technological innovation in retailing.

6.0 RECOMMENDATION

This study focuses on the use of technological innovation on retailing store effect on consumers purchasing toward resident Parit Buntar, Perak. Clear research should be out in the Parit Buntar, Perak area as it has been shown that there is no wide-range research done in Parit

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Buntar. Future studies in other universities and elsewhere can use the proposed model. For future studies, the number of respondents should be increased and distributed elsewhere not only in Parit Buntar but also in each district in Perak to get a clearer study on the factor of the use of technological innovation on retailing store effect on consumers purchasing. This study can also be useful for future researchers as they can utilize it as a source of perspective and rules in leading comparative research, as they can direct exploration of research the factors that successfully influence the use of technological innovation on retailing store effect on consumers purchasing.

7.0 CONCLUSION

In conclusion, the results of this study have contributed useful information on the use of technological innovation on retailing store effect on consumers purchasing and success factors to future researchers as a reference for their study. In addition, this study provides an understanding of the use of technological innovation in retail stores effect on consumers purchasing. Retail stores can improve a business to increase its effectiveness in the use of technology. This study involved the resident of Parit Buntar. A total of 382 respondents to complete this study. The results for correlation is that there is a positive fair significant relationship between store image and technological innovation ($p < 0.05$, $r = 0.418$). Next, there is a positive good significant relationship between satisfaction and technological innovation ($p < 0.05$, $r = 0.521$) and there is a positive perfect significant relationship between consumer value and technological innovation ($p < 0.05$, $r = 0.876$). Finally. This study is expected to obtain good feedback from relevant businesses in improving the use of technological in business. Although there are some limitations to this study, its is hoped that the first step taken in studying the use of technological innovation on retailing store effect on consumers purchasing is important for further justification.

ACKNOWLEDGEMENT

The success and the final outcome of this assignment required a lot of guidance and assistance from people that I truly appreciated and are extremely privileged to have along the completion of this assignment. Everything I have done just because of the endless supervision, help and encouragement I will never forget during this semester. Here, I would like to thank the supervisor for the Retail Research Project, DR. NURUL IZYAN BINTI MAT DAUD for the guidance and help given to me. Although there are flawless and mistakes that I have made throughout the completion of this research study. Not forgetting also many thanks to the family who helped a lot to provide complete facilities to me while completing this project due to the pandemic problems that hit the country that caused me to stay at home to complete this final project. I would like also to thank the friends behind me for their encouragement in completing this project. Therefore, without them the process of completing a task would probably be quite challenging.
