Preface

The 2020 Undergraduate Colloquium on Retailing with the theme “*3rd Multidisciplinary Research on The Entrepreneurship and Business Colloquium*” provides the platform for undergraduate students to engage, collaborate and disseminate ideas and research findings across a broad spectrum of audiences. Moreover, it gives the knowledge to undergraduate student towards high-impact of publication. Through this colloquium, it enables the final year students in encouraging their understanding of basic research on issues in current learning.

The objectives of The 2020 Undergraduate Colloquium on Retailing with the theme “*3rd Multidisciplinary Research On The Entrepreneurship and Business Colloquium*” (i) to exposure the final year student to article writing and colloquium presentation; and (ii) to enhance the understanding and enthusiasm of final year students about high impact studies and the documentation of their respective studies.

The editors would like to express their thanks to all participants and paper presenters from all over field and topic. Last but not least, thank you and congratulations to the organizing committee for their support and effort to make this successful seminar.

THE FACTORS THAT INFLUENCE CUSTOMER LOYALTY TOWARDS RETAIL STORE

Ahmad Zaim Mohd Alui and Tahirah Abdullah

Faculty of Entrepreneurship and Business,
Universiti Malaysia Kelantan,
Malaysia

Email: zaim.a17b1023@siswa.umk.edu.my; tahirah@umk.edu.my

Abstract:

This research is examining the factors that influences customer loyalty towards retail store. In addition, this study discussed about the cause that lead customer loyalty factors such as product, service, brand image. The factors are developed from justice theory. The quantitative methodology is adopted for this study and the result shows that all the variables are supported by the carried analysis.

Keyword: *Justice, product, service, brand image, customer loyalty.*

1. Introduction

Retail store is a place of business usually owned and operated by a retailer but sometimes owned and operated by a manufacturer or by someone other than a retailer in which merchandise is sold primarily to ultimate consumers. There are different types of retailers that specialise in various sales techniques and cater to different consumer types. They provide different services offering direct purchasing from a manufacturer or providing a wide range of merchandise. Others are based more on convenience. The purpose of this research proposal is to focus on customer loyalty towards retail stores and various aspects associated with it, such as the products, service, and brand image. In fact, loyal customers will repeat their purchasing behaviour which helps to increase sales revenue of business organisations. Therefore, customer's loyalty is the feedback of a successful retail marketing strategy in a competitive market that creates value for money for customers.

In Malaysia, traditional retail stores models have the retailer dictating to the customer how they can shop according to comfort and what service will be offered to meet their needs. Modern retail stores on the other hand is about listening to what customers want and developing services to meet their needs. Modern retail is attracting the upper and middle income shoppers but at present it is fast changing as improved consumer lifestyles, changing consumer's preferences and changing educational level of population. According to Olsen and Granzin (2013), grocery retail sectors were operated by many foreign business firms. Now, Malaysia is attracting other foreign names such as United Kingdom's Tesco, France's Carrefour, and Hong Kong which operates the Giant hypermarkets. Nowadays, retail sectors and grocery sectors are playing an important role in improving service quality and product assortment. Yuen and Chan (2013) posited that customers' demands in the grocery sectors are gradually increasing due to the development of customer service in parallel with product quality and diversity. This is similarly reflected in the retailing industry which plays a vital role to the tremendous growth of the

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

service sector. As such, it is necessary for the retailers to understand the customers' wants and needs to increase the level of their satisfaction and loyalty.

2. Literature Review

2.1 Customer Value and Distributive Justice

Organizations have been developing strategies to increase the perceived value delivered to the customers (Reichheld, 1996). While there are several different definitions of value; it has been suggested that the most important evaluation (Webster, 1994) is an overall assessment of worth (Zeithaml, 1988) or subjective value. Subjective value is based on the benefits that the customer receives in relation to their sacrifices. In CRM implementations that result in a modification of products or services delivered to the customer, the value perception is based on the benefits that they have received in light of possible changes in the pricing structure or perceived service quality.

2.2 Product Quality

A major proportion of consumers have strong feelings on superstores or hypermarkets with product brand equity for shopping of goods and services. Business firms had begun to develop the customers' loyalty by offering good quality products and services. The study Allaway et al. (2015) stated that product quality, service level and assortment were the basic requirements for achieving high levels of brand equity. He also mentioned that successful brand equity can successfully arouse commitment, shopping behaviour and the most interesting part is to develop familiarity with a person to person interactive communication. Aliawadi and Keller (2016) posited that successful retail branding influenced customers' perceptions and loyalty and even to the extent of choosing their favourite retailer stores frequently for shopping of goods. Brand equity creates customers' equity that emphasizes customers' satisfaction and loyalty. Customers' satisfaction and loyalty improves numerous opportunities for product brand equity and it helps to increase marketing tactics. According to Reichheld (2009), Zeithaml, Berry, and Parasuraman (2003) and Wright and Sparks (2013), they stated that loyal customers were willingly interested to purchase more products and pay the right prices of products and services. Bolten, Kennerknecht, and Spiller (2012) posited that the main determinants of customer satisfaction and loyalty are the service and product quality.

2.3 Service Quality

Service quality has different shades of meanings and various concepts in terms of different customers. The study by Lewis and Booms (2018), Gronoos (2019) and Su (2020), Service quality is defined as how well a consumer's needs are met and how well the service delivered meets the customer's expectations. Consumers' perceived values of services are heavily reliant on the customer expectations and outcomes of the evaluation processes. Service quality has a significant relationship with the customers' satisfaction which directly affects the customers' loyalty. Thus, the retail business firm should focus on these factors to increase the customers' relationship with satisfaction and loyalty in a competitive retail market globally. Service quality is the major tool for changing or developing the retail business paradigm. Customers' evaluations of the service quality are quite difficult to be developed in the retail marketing strategy. A business organization can gain profit and competitive advantages by applying an appropriate service quality. Service quality is capable of helping the business firms to realize

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

their envious position in the retail market place. If product prices and other costs are stable, the customers will invariably prefer the service quality as an extra attraction. So the following hypothesis is verified to test based on the above literature.

2.4 Brand Image Quality

Brand image represents an important aspect of marketing activities branding and market offering with varied definition and approaches to its conceptualisation Burleigh and Sidney, (1955) Dobni and Zinkhan, (1990) Martinez and Pina, (2003). A widely accepted view is that brand image represents customers' perceptions of a brand as reflected by the brand associations held in consumer memory Herzog, (1963) Keller, (1993) argued that these associations could originate from customer's direct experience or from information obtained on a market offering or due to the impact a pre-existing associations with an organisation had on consumer. Brand image is, therefore, the mental picture or perception of a brand or a branded product or service and includes symbolic meanings that consumers associate with the specific attributes of a product or service Dobni and Zinkhan, (1990) Padgett and Allen, (1997) Aperia and Back, (2004).

2.5 Customer Loyalty

Customers' loyalty means the customers are committed to buying goods or services at a particular retailer's locations. Retailers think that the customers' loyalty is secured by developing brand strategy and creating emotional attitudes towards the purchase behaviour of goods and services through loyalty programs. Customers have individual loyalty concept to specific product, stores and companies. Customers' loyalty is defined as customers are committed, either emotionally or sensibly, to repurchase the preferred goods and services in the particular retailer's market which is also considered as a firm's long term survival goal and objectives. It is not only the basis for developing business plan, but it also becomes sustainable in a competitive marketing strategy. Customer loyalty was held by the consumers who frequently did shopping of goods or services at particular outlets. Consumers' attributes on repeat purchase of goods are generated by the degree of enhancement of the service quality and store attributes in the retail business strategy. Customers' frequent buying intentions towards goods or services from the particular outlets are the key dimensions that produce customers' loyalty in the retail strategy. Reynolds and Arnold's (2008) posited that customers' loyalty was drive from shopping behaviours and loyalty attitudes which were recognized based on the service quality and product quality.

H1: There is a relationship between product quality and customer loyalty towards retail stores.

H2: There is a relationship between service quality and customer loyalty towards retail stores.

H3: There is a relationship between brand image and customer loyalty towards retail stores.

3 Research Methodology

This chapter explained regarding the method used by this research. This chapter will mention every component involved in conducting this research from research approach and design, population, population frame and sampling techniques used for the interview. Finally, this chapter provides a detail explanation of the selected mode of analysis used and data collection method. This study also highlighted the factors influences customer loyalty towards retail store. For the present analysis, thus, a quantitative approach was adopted. The student in Kampung Jias, Pasir Mas, Kelantan, was taken there.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

3.1 Research Design

According to Kerlinger (2012) research design is the plan, structure and strategy of investigation conceived so as to obtain answers to research questions and to control. There were completed schemes or program of the research. It includes the outline of what researcher will do from writing the hypothesis to the final analysis of data.

Research methodology was grounded on the summary of the systematic investigation, procedure, sample selection and analysis, which were conducted in the research. Since, the main purpose of this study is to investigate the factors that influence customer loyalty towards retail store in Malaysia country such as hypermarkets and so on, then, a self-administered questionnaire was developed to collect respondent's data from the Malaysian retail store consumers.

3.2 Data Collection Method

Data collection is the process of collecting and calculating information on variables of interest, in an established systematic fashion that enables one to answer stated research question, test hypotheses and evaluate outcomes (O' Neill, 2015). To execute this research, researchers will obtain the data through distributing questionnaires to target respondents because it is the main means to gather primary data and it enable researchers to reach large number of respondents and each questionnaire is collected back within 10 to 15 minutes. Before conducting a survey, permission from every type of retail stores visited around Kampung Jias, Pasir Mas, Kelantan must be made. Therefore, the permission for our research to be given out questionnaire has been granted. The respondents of the questionnaire are being chosen randomly by gender, religion and age. While the questionnaire being held, the researcher will ask respondents to send via WhatsApp or Facebook to ensure that the respondents answer their questionnaire properly because it is quite difficult to observe respondents face to face during this pandemic. Finally, after the survey being held, a data will be collected to be analysed to ensure the validity and reliability of this research.

4 Findings and Discussion

4.1 Demographic Profile of Respondents

The demographic profile is included gender, age, ethnicity, educational level, occupation, how frequent did respondents visit their retail store in a year. Frequency analysis was first run to measure respondents' demographic profile. The results of analysis were presented in Table 4.2. The total numbers of respondents are 108 who answered the survey questionnaires distributed. Based on the findings in Table 4.2, it shows that 53.7 percent of respondents are female while remaining 46.3 percent are male. Besides, 72.2 percent of respondents who participated in this research are Malay that makes up the majority of ethnicity for the survey. The rest are Chinese, Indian and others which are 15.7 percent, 10.2 and 1.9 percent respectively. For the occupation, respondents from students get the higher percentage, it is 48.1 percent.

Besides, 19.4 percent of respondents are qualified up to SPM, then. The larger proportions of the respondents are undergraduate degree with a percentage of 62 percent. The majority of frequent respondents visit retail store in a year is more than 15 times with 39.8 percent.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Table 4.2: Demographic Profile of Respondents in Main Survey

Profile	Category	Frequency	Percentage
Gender	Male	50	46.3
	Female	58	53.7
Age	17 - 20 years' old	10	9.3
	21 - 30 years' old	63	58.3
	31 – 40 years' old	29	26.9
	41 – 50 years' old	6	5.6
Ethnicity	Malay	78	72.2
	Chinese	17	15.7
	Indian	11	10.2
	Others	2	1.9
Education Level	High School	4	3.7
	SPM	21	19.4
	Diploma	15	13.9
	Degree	67	62
	Master	1	9
	Doctor of Philosophy	0	0
	Others	0	0
Occupation	Government sector	20	18.5
	Private sector	33	30.6
	Student	52	48.1
	Others	3	2.8
How frequent did you visit your favourite retail store in a year?	1 – 5 times	18	16.7
	6 - 10 times	20	18.5
	11 – 15 times	27	25
	More than 15 times	43	39.8

4.2 Reliability Test

The reliability test was performed using Cronbach's alpha analysis to measure the internal consistency of the item sets for the dependent and independent variables. The Alpha analysis of Cronbach makes it possible to determine if the set of the elements presents a high stability in the measurement of a variable.

Table 4.13 shows the results of the reliability analysis for the study variables. As illustrated above, Cronbach's alpha for customer loyalty towards retail store is 0.868 (dependent variable), product quality is 0.808, service quality is 0.861, and service quality is 0.861. the brand image is 0.886 (independent variables). Customer loyalty towards the retail store is the dependent variable in this study, since the calculated value of Cronbach's alpha is 0.868, the variable used was a good remarks and capable of measuring customer loyalty towards the store. In addition, three variables also obtained good remarks because the result of the score was higher than 0.80 whose product quality is 0.808, the service quality is 0.861 and the brand image quality is

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

0.886. In conclusion, Cronbach's alpha for the reliability coefficients of the dependent and independent variables in this study was approximately good.

Table 4.13: Results of Reliability Cronbach's Alpha for the Variables

	Variables	Cronbach's Alpha	Remarks	Number of Item
Independent Variables	Product Quality	0.808	Good	5
	Service Quality	0.861	Good	5
	Brand Image Quality	0.886	Good	5
Dependent Variable	Customer Loyalty Towards Retail Store	0.868	Good	5

4.3 Testing of Hypothesized Model

Based on Table 4.18, the hypothesis testing shows the significant relationships between the three attributes, namely, product, service, brand image towards customer loyalty that were tested using by Spearman correlation analysis. It showed that hypothesis for product, service, brand image and customer loyalty towards retail store are accepted as the significant values are less than 0.05 significant levels which is 0.000. Therefore, H1, H2, and H3 are accepted.

Table 4.18: Summary for Hypothesis Testing Based on Spearman Correlation's Results

	Hypothesis	Spearman Correlation's Results (Sig.)	
H1	There is a significant relationship between product quality and customer loyalty towards the retail store.	Sig. value=0.000 Coefficient Value=0.713 (High positive relationship)	Accepted
H2	There is a significant relationship between service quality and customer loyalty towards the retail store.	Sig. value=0.000 Coefficient Value=0.596 (Moderate positive relationship)	Accepted
H3	There is a significant relationship between brand quality and customer loyalty to the retail store	Sig. value=0.000 Coefficient Value=0.693 (Moderate positive relationship)	Accepted

5 Discussion and Conclusion

The findings showed that 3 hypotheses were supported. The relationship between product of use and customer loyalty towards retail store is the strongest relationship with value of coefficient is 0.713. Then follow with brand image quality with 0.693 and service quality 0.596. As a conclusion, the outcome of this research project indicated that product is the most important factor to influence customer loyalty towards retail store. Although product has the strongest influence on customer loyalty towards retail store, other factors such as service and brand image should not be underestimated. In addition, implication, limitation and

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

recommendations for future studies have been provided in this study as a guideline for retailers to develop innovative retail strategy and reference for future research to find out more coverage of retail store across the different retail segment, generation, culture and ethnic.

Abstract:

E-wallet also well-known as a noticeable increase of cashless transactions due to the development of financial technology. One of the best inventions of the 21st century is the electronic wallets (e-wallets) an integral part of electronic payment system. The term “e-wallet” is a form of digital wallet that allows an individual to link their debit or credit cards to digital wallet in order to make any transactions (Digital Wallet, 2019). Apart from the debit or credit cards electronic cards enable consumers to store their physical cards information and bank account number to perform certain action towards payment (Ray, 2017). The purpose of this study was to investigate the relationship between save money and factor use of E-wallet among students in University of Malaysia Kelantan City Campus. This study also aimed to investigate the relationship between discount and cashback and factor use of E-wallet among students in University of Malaysia Kelantan City Campus. Next this study aimed to investigate the relationship between safety and privacy and factor use of E-wallet among students in University of Malaysia Kelantan City Campus. In this study has three factors influencing use of E-wallet were state: Save Money, Discount and Cashback, and Safety and Privacy. This research discusses the relationship between the factors mentioned with use of E-wallet. This research use questionnaire as the survey to collect data from respondents. This research uses Statistical Package for Social Sciences (SPSS) to analysis the data. This research also have regression and correlation techniques to study the relationships between independent variables and dependent variables.

Keywords: *E-wallet, Digital Wallet, Payment Method, Discount, Mobile Payment*

1 Introduction

E-wallet is one of the technology apps and software. E-wallet is a device that has also been recognized as a digital wallet. E-wallet is a software application that uses electronic devices such as computers or mobile devices for online transactions. E-wallet is also a payable device without the use of cash or money. This helps the seller to collect the customer’s payment through the use of the unique two-dimensional quick-response code, also known as (QR) code that the seller generates. For example, Grab pay, Boost, Touch n Go e-wallet, Alipay, Favepay and so on. If the customer wants to use this method of payment, they will need to install the Mobile app to begin the payments and services (Kasthuri Subaramaniam, 2020).

Then, E-wallet well-known as a component of payment system. The word “payment system” is defined as a system that enables payment to be effects between a payers and a beneficiary, involving clearing, payment, or settlement services or all of them. A “payment system” as understood in India, can include the system enabling credit card operation, debit card operation,

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

smart card operation, money transfer operations or such similar operation (Jinimol.P, 2018). Next, E-wallet is a component of payment system. It is an electronic, internet- based payment system which stores financial value as well personal identity related information. More security measures to safeguard the identity related information will lead to use of e-wallet among many. Lack of awareness is also problem, which can be sort out only by giving proper information about e-wallets

The term “e-wallet” is a form of digital wallet that allows an individual to link their debit or credit cards to digital wallet in order to make any transactions (Digital Wallet, 2019). Apart from the debit or credit cards electronic cards enable consumers to store their physical cards information and bank account number to perform certain action towards payment (Ray, 2017). The mobile payments can be defined as “a type of payment transaction processing in which the payer uses mobile communication techniques in conjunction with mobile devices for initiation, authorization, or completion of payment” (Goetze and Pousttchi, 2010). When implemented on a mobile phone, the mobile payments can be combined with additional services, for example, public transport and event ticketing, loyalty programs, and so on. This is a way to develop a mobile wallet including all items that people usually hold in their physical wallets (Tatjana, 2014).

The increasing of customer’s needs in mobility when payment for transaction has created requirement for a new payment tool allowing the transactions more feasible and convenient (Ondrus & Pigneur, 2006). The current payment method gives consumers solvency that is beneficial in dealing with medium and large amount of money. It is inconvenient for customers in small denominations of coins or pennies when making micropayments (Gia-Shie Liu, 2016).

Mobile payment (M-payment) is defined as a transaction method which money is transferred from one person to another through a mobile device without intermediate. Mobile payment is a new payment method for purchases of products and services, which uses all kinds of mobile devices and wireless communication technologies which ia mobile telecommunication networks, Internet. In this new method, mobile devices can be used to make a varied type of small payments. These devices help users to connect to a server through which transactions are made and confirmed (Antovski & Gusev, 2003).

2 Literature Review

2.1 Save Money

E-wallets usually act like a debit card, which means the amount of money you have preloaded is determined by you. Reign in your spending by topping up your e-wallet with an amount limit based on your monthly budget. This is particularly great for discretionary spending such as shopping and eating out. If you’ve spent it all before the month ends, do not cave in by topping up with more cash. Instead, acknowledge that you’ve hit your budget limit and start reducing your indulgences.

H1: Save time of e-wallet will have positive influence on factors influencing to use E-wallet.

2.2 Discount and Cashback

Cashback is the amount of cashback payment not only by the cashback offer but also by the

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

amount a consumer spends which results in significant variation in the size of cashback payments related to the same offer. The variable Last Purchase Spend it captures the amount consumer I spent on the most recent purchase day, and therefore it controls for consumer-specific purchase trends. The variable Purchase Instance it the number of transactions consumer I made up to but not including day controls for past experience with the cashback company.

H2: Discount and cashback will have positive factors influencing on use of E-wallet.

2.3 Safety and Privacy

The study reported a moderate positive correlation between “security” and “intention to use” E-wallets. [LAI \(2016\)](#) argued that “intention to use” of e-Payment system was significantly influenced by “security,” design, “perceived usefulness” and “perceived ease of use.” He reported that “security” positively influences users’ “intention to use” the e-Payment system. [Kim et al. \(2010\)](#) found that “perceived security” has a positive impact on “perceived trust” and on the usage of e-Payment. They reported that “hedonic motivation, perceived security, general privacy, facilitating conditions, performance expectancy, perceived savings and social influence and price value in this order, influence the intention to adopt e-wallets.” They advocated to modify existing services to maintain the customers’ “privacy and security.”

H3: Safety and privacy will have positive influence on factors influencing to use e-wallet.

2.4 Conceptual Framework

Figure 1 show the theoretical framework on the factor influencing use E-wallet as a payment method among student in University of Malaysia Kelantan, City Campus. There is two type of variables. The first variable is independent variables, which consist of save money, discount and cashback, and safety and privacy. The second variable is dependent variable, which is use of E-wallet.

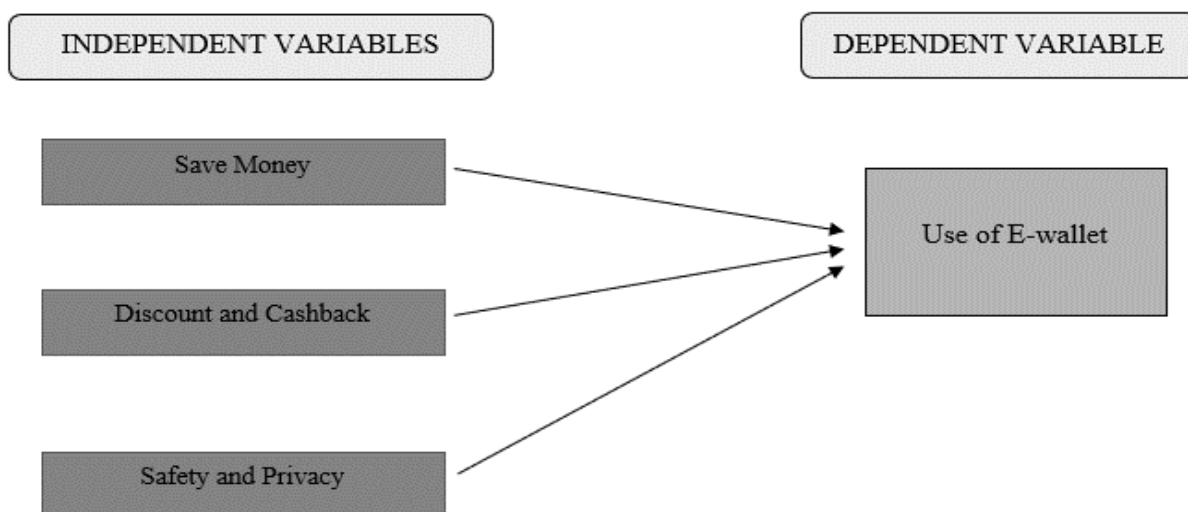

Figure 1: Conceptual Framework of Factor Influencing Use of E-Wallet As A Payment Method Among Students in University of Malaysia Kelantan

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

3. Research Methodology

3.1 Research Design

In this research, researchers chose the quantitative research approach. Quantitative research includes the collection of primary data which can ensure the validity of the study. Therefore, the study should collect information about the factor influencing by questionnaire. This study design used quantitative approaches to collect the necessary data. Questionnaires will be undertaken in order to collect data from selected groups of among student in the area University of Malaysia Kelantan City Campus.

3.2 Data Collection Methods

Data collection is a process of collecting information from all the relevant sources to find answers to the research problem, test the hypothesis and evaluate the outcomes. Data collection methods can be divided into two categories that is primary data and secondary data. Questionnaires is use particularly in case of big enquiries. It is being adopted by private individuals, research workers, private and public organizations, students and even by governments. In this method a questionnaire is sent (usually by post) to the persons concerned with a request to answer the questions and return the questionnaire. A questionnaire consists of several questions printed or typed in a definite order on a form or set of forms. The questionnaire is mailed to respondents who are expected to read and understand the questions and write down the reply in the space meant for the purpose in the questionnaire itself. The respondents must answer the questions on their own. This study will use the method of distributing questionnaires to respondents in the area of the study to gain data collection.

3.3 Study Population

Population is the large general group of many cases from which a researcher draws a sample for a study (Neumann and Robson, 2009; Engine, 1998). According to Mugenda (1999), the target population means the population to which a researcher wants to generalize the results of the study. The population was composed of students each year in University of Malaysia Kelantan City Campus. Krishnan, (2003) defined population as the target group to be studied place. It is the aggregate of all units pertaining to the study. The technique which was students in sampling. The target population of this study will be the students in University of Malaysia Kelantan City Campus consist of both gender from the age of 21 and above.

3.4 Sample Size

University of Malaysia Kelantan City Campus is the federal university and most famous area in Kelantan, Malaysia. University of Malaysia Kelantan Campus Kota the fastest growing university area of Kelantan state. University of Malaysia Kelantan Campus Kota has 3482 students from Faculty Entrepreneurship and Business and 2169 students from Faculty Hospitality, Tourism and Wellness. It is has 6000 students in University of Malaysia Kelantan City Campus. Many students in University of Malaysia Kelantan use the E-wallet nowadays. The population size of students use the E-wallet based on table (Krejcie & Morgan). Therefore, based on the table by (Krejcie & Morgan, 1970). For be respondents need to follow the table. University of Malaysia Kelantan that being domestic violence are targeted 362 respondents to answer questionnaire.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

3.5 Sampling Technique

Non-probability sampling was used as the sampling design in this study as the samples are collected in a method that does not offer equal opportunities for all people in the population for being selected. In the convenient sampling, respondents are randomly selected. The people who are easy to reach and provide the information will become the target respondents in the research.

3.6 Research Instrument Development

The method of data collection for this study is quantitative. Questionnaire will be used to collect the data. It consists of 5 sections: A) Demographic; B) Use of E-wallet; C) Save Money D) Discount and Cashback; E) Safety and Privacy.

3.7 Measurement of The Variables

This study will be using 5-Likert scale which consist of Scale: 1 Strongly Disagree, 2. Disagree, 3. Less Agree, 4. Agree, 5. Strongly Agree. Section B, Section C, Section D and Section E use the scale for answer.

4 Research Findings

4.1 Frequency Analysis

Table 1 shows the demographic of respondents was collect form survey and analysis by SPSS.

Table 1: Demographic respondent profile

Variables	Frequency	Percentage (%)
Gender		
Male	113	31.2
Female	249	68.8
Total	362	100
Age		
19-20 Years	105	29.0
21-22 Years	166	45.9
23 Years and above	91	25.1
Total	362	100
Races		
Malay	304	84.9
Chinese	33	9.1
Indian	14	3.9
Others	11	3.0
Total	362	100

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

Marital Status		
Single	347	95.9
Married	15	4.1
Total	362	100
Education		
STPM	37	10.2
Diploma	51	14.1
Bachelor	266	73.5
Others	8	2.2
Total	362	100

4.2 Reliability Analysis

Table 2 show the reliability analysis of Cronbach's Alpha. The Cronbach's Alpha for Use of E-wallet which is dependent variable is 0.890. Next is the Cronbach's Alpha for save money which is independent variable is 0.900. The Cronbach's Alpha for Discount and Cashback which is independent variable is 0.893. Lastly, the Cronbach's Alpha for Safety and Privacy is 0.929. The number item for all construct has five. All the construct has the good relationships.

Table 2: Reliability Test

VARIABLES	COEFFICIENT	NUMBER OF ITEM	RELATIONSHIP
Use of E-wallet (DV)	0.890	5	Good
Save Money (IV 1)	0.900	5	Good
Discount and Cashback (IV 2)	0.893	5	Good
Safety and Privacy (IV 3)	0.929	5	Good

4.3 Pearson's Correlation

Pearson's Correlation Analysis will examine that whether the independent variable, which is store image, satisfaction and consumer value is statistically significant with the technological innovation, the dependent variable. In this case, the researcher had used the Pearson Correlation Analysis (two-tailed test) to investigate the relationship between store image, satisfaction and consumer value with the use of technological innovation. The table below showed the interpretation of the strength of the coefficient with variables Guilford and Fruchter (1973).

Table 3 shows that there is a positive fair significant relationship between discount and cashback and use of E-wallet ($p > 0.05$, $r = 0.778$). Then, there is a positive good significant relationship between save money and use of E-wallet ($p > 0.05$, $r = 0.783$) and there is a positive perfect significant relationship between safety and privacy and use of E-wallet ($p > 0.05$, $r = 0.799$).

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Table 3: The correlation between independent and dependent variables

		Save Money	Discount and Cashback	Safety and Privacy	Use of E-wallet
Save Money	Pearson Correlation	1	.789**	.836**	.783**
	Sig. (2-tailed)		.000	.000	.000
	N	362	362	362	362
Discount and Cashback	Pearson Correlation	.789**	1	.826**	.778**
	Sig. (2-tailed)	.000		.000	.000
	N	362	362	362	362
Safety and Privacy	Pearson Correlation	.836**	.826**	1	.799**
	Sig. (2-tailed)	.000	.000		.000
	N	362	362	362	362
Use of E-wallet	Pearson Correlation	.783**	.778**	.799**	1
	Sig. (2-tailed)	.000	.000	.000	
	N	362	362	362	362

** . Correlation is significant at the 0.01 level (2-tailed).

4.4 Multiple Linear Regression Analysis

Multiple regression analysis was a statistical technique for estimating the variability of the dependent variable by regressing the independent variables against it (Sekaran & Bougie, 2016). Cooper and Schindler (2014) stated that multiple regression analysis was a statistical method used to construct a self-weighting estimation formula that predicts values for a dependent variable from the values of independent variables; monitors confounding variables to better assess the influence of other variables; tests and describes a causal hypothesis. The multiple regression result shown in Table 4:

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Table 4: Multiple regression between independent variables with use of E-wallet.

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.	95.0% Confidence Interval for B	
		B	Std. Error	Beta			Lower Bound	Upper Bound
1	(Constant)	1.633	.122		13.380	.000	1.393	1.874
	Safety and Privacy	.663	.026	.799	25.203	.000	.611	.715
2	(Constant)	1.520	.116		13.144	.000	1.292	1.747
	Safety and Privacy	.397	.045	.479	8.844	.000	.309	.486
	Save Money	.294	.041	.383	7.083	.000	.212	.376
3	(Constant)	1.207	.127		9.510	.000	.957	1.456
	Safety and Privacy	.269	.050	.324	5.389	.000	.171	.367
	Save Money	.224	.042	.292	5.294	.000	.141	.307
	Discount and Cashback	.262	.051	.279	5.193	.000	.163	.362

5 Discussion

Although this research has reached its aims, there is several research limitations were found in this study when conducting this study. This limitation is important and must give attention in order for the researchers to learn and gain knowledge. The first limitation is using only students in University of Malaysia Kelantan City Campus area as place of the survey of study. The researchers just focused at one university which is University of Malaysia Kelantan. However, the result at each state will not be the same and the researcher can evaluate based on the respondent of using E-wallet as a payment method. Each respondent's perception is not same because of the experience and their type of E-wallet as a payment method. Second, the limitation of study that the researchers had been facing during conducting this research is distributing the questionnaire to the right people at right time. This is because there was less commitment from the respondent as some-time they busy with their business.

This causes them to fill the answer without read the questions properly and understand it. Most of the questionnaire was answered by the students and not the owner although some students have less experience about this study. Researcher need to distribute the questionnaire and collect it on other day. So, it is difficult to find respondents that willing to answer the questionnaire as well as conducting the research in quantitative method.

Lastly, time constraint is one of the barriers in completing this research. Only 4 months are given to complete final year project 1 and 2. The time is very limited to conduct this research as this research needs more commitments to find research about E-wallet as a payment method.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

5.1 Hypothesis Testing

In discussion, will have more discussion on the hypothesis in this study. The hypothesis are based on the independents variables that is save money, discount and cashback, and safety and privacy. Firstly, hypothesis for independent variable of save money are stated as H1. Second, hypothesis for independent variable of discount and cashback are stated as H2. Lastly, hypothesis for independent variable of safety and privacy are stated as H3.

Table 5: Discussion of the Key Findings

Research Question	Hypotheses	Result	Initial Decision
What the relationship between save money and factor use of E-wallet among students in University of Malaysia Kelantan City Campus?	H1: There is a significant relationship between save money and the factors influencing use of E-wallet as a payment method among student in University of Malaysia Kelantan City Campus.	P-Value = 0.000 Sig. = 0.783	Hypothesis, H1 are accepted
What the relationship between discount and cashback and factor use of E-wallet among students in University of Malaysia Kelantan City Campus?	H2: There is a significant relationship between discount and cashback and the factors influencing use of E-wallet as a payment method among student in University of Malaysia Kelantan City Campus.	P-Value = 0.000 Sig. = 0.778	Hypothesis, H2 are accepted
What the relationship between safety and privacy and factor use of E-wallet among students in University of Malaysia Kelantan City Campus?	H3: There is a significant relationship between safety and privacy and the factors influencing use of E-wallet as a payment method among student in University of Malaysia Kelantan City Campus.	P-Value = 0.000 Sig. = 0.799	Hypothesis, H3 are accepted

6 Recommendations

After ending this study, the researchers have found out that there are some spaces for improving the quality of this study in the future. The study can be conducted using different independent variable such as discount and cashback to get better results on factors influencing use E-wallet as a payment method in University of Malaysia Kelantan City Campus. The researches just focus in certain students in University of Malaysia Kelantan City Campus. So, in the future the researcher can conduct the research at other place such as at University of Malaysia Kelantan Bachok and Jeli Campus. Besides that, researchers prescribed some strategies that the

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

government and its agencies responsible to using E-wallet as a payment method in the industries.

The government should play a leading role in educating E-wallet as a beginner on the incentives available to them and how to use the E-wallet when shopping with E-wallet. Such incentives will help them to improve their business besides contributes to national income. These incentives should be delivered through an establishment that really cares for the success and sustainability of E-wallet. Moreover, the primary data collected for the studies should compromise not only quantitative method but also the qualitative method such as interview. Qualitative data obtained from the interview session can generate high reliability as there are two-way communications between researchers and the respondents. This will make sure the respondents will clearly understand with the research and can give better commitment. Lastly, this study will give benefit to future researcher to conduct their study. This journal will be a reference and guideline to them to improve the benefit of E-wallet as a payment method in nowadays. This thesis can be displayed at the libraries and can be uploaded in website to the future researcher's reference. They will have proper guide when they understand about this case study and also the limitations.

7 Conclusion

In this chapter, the researchers make a conclusion of the study based on the research objectives which show in chapter 1. The implication of the study also discussed in this chapter which is about the impact of this research study. Besides, the researchers discussed the limitation of the study and make a several recommendations to improve the research. Based on the problem statement, the researcher investigates that the factor influencing use of E-wallet as a payment method among students in University of Malaysia Kelantan City Campus. It shows that payment method is one of the keys that factor influencing use E-wallet as a payment method. By this, the researcher can know the relationship between the use E-wallet and the factor influencing use E-wallet as a payment method.

The objective of this is to investigate the relationship between save money and factor use of E-wallet among students in University of Malaysia Kelantan City Campus. The result of the study has shown the use of E-wallet as a payment method in Kelantan. Furthermore, the factor influencing use of E-wallet as a payment method is classified accordingly. All the hypotheses are accepted where there are significant positive relationships between save money (IV1), discount and cashback (IV2) and safety and privacy (IV3).

For the finding, the researcher was found that the respondent was agreed that E-wallet is important as a payment method in nowadays. Save money can gain the competitive advantage for students to save money when shopping. Besides, save money is also important for the growth money and income nowadays. In addition, the finding shows that the save money is also one of the factors that influence use E-wallet as a payment method. Save money can increase the value for the payment method by online, or it can generate value to external customers, including supplier, end users or potential consumers. Besides, discount and cashback can increase the demand for user E-wallet in nowadays. It is can increasing the number of people who register the E-wallet as a payment method and minimize the cost and to generate more income for the firm. Besides, safety and privacy is also one of the key factors that influence to use E-wallet as a payment method. Customer data is important and must give full attention. Customer always hopes that their use E-wallet must be fulfilled. So, E-wallet

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

should take note about it to attract more customers by using the benefit of E-wallet. Customer taste and preference is not always the same. It will change according to the trend and environment. E-wallet should accept and adapt to the changes to attract more customers by fulfil their demands.

This will make sure the user E-wallet to them as customer with E-wallet as a payment method can fulfil customers demand on the time. In sum, all of the independent variable and dependent variable show a positive result, which is means that the result for research are acceptable, reliable, and significant, therefore, this research can be carrying out for the further research and learning.

A STUDY ON THE IMPACT OF COVID-19 TO THE BUSINESS PERFORMANCE OF SMALL AND MEDIUM- SIZED ENTERPRISES (SMEs) IN KEDAH

Anna Azieati Anuar and Siti Afiqah Zainuddin

Faculty of Entrepreneurship and Business,
Universiti Malaysia Kelantan,
Malaysia

Email: azieati.a17a00470@siswa.umk.edu.my; sitiafiqah@umk.edu.my

Abstract:

This research discusses the impact of Covid-19 to the business performance of SMEs in Kedah. Coronavirus is the latest disaster in the world that has impacted all aspects of the economy. Lockdown, containment, restricted travel order and social distances are among the pre-emptive efforts of governments to protect public health. Although acknowledging the importance of the national order in preventing the widespread spread of the virus, the authors argue that there are some undiscovered impacts of the control order policy on small and medium-sized enterprises in Malaysia. The predominant goal of this study is to investigate the In addition, this is comprehensive study in which 380 respondents from various genders, ages, and educational backgrounds were interviewed. The data obtained from the respondents was analysed using SPSS. The findings of this study have been proved by performing a reliable analysis, a descriptive analysis, and a Pearson correlation value for each variable we tested.

Keywords: *small and medium-sized enterprises, Covid-19*

1 Introduction

The goal of this study is to explore the effect of coronavirus disease 2019 (COVID-19) on the business performance of small and medium-sized enterprises in Kedah. Small and medium-sized enterprises (SMEs) are the main contributors to the Malaysian economy (Zalina et al., 2016) and this is one of the industries impacted by the 19th pandemic. There are 37092 SMEs registered by the Small and Medium Enterprise Corporation (SMECorp, 2019). Small and medium-sized enterprises are classified as enterprises with a turnover not exceeding RM50 million or an employment not exceeding 200 employees in the manufacturing sector. For services and other industries, small and medium-sized businesses have revenue turnover not exceeding RM20 million or jobs not exceeding 75 employees (SMECorp, 2019). With large numbers of small and medium-sized businesses on the market, any industry and economic downturn will eventually impact different sectors and national economic growth. Unfortunately, the spread of the Covid-19 coronavirus has underpinned downside possibilities for the global economy and human activities. China is the first country to record the spread of the virus, with more than 80,000 people infected, and the World Health Organization (WHO) declared Covid-19 a pandemic on 11 March 2020 (Congressional Research Service, 2020). The outbreak of the virus has spread rapidly and is expected to continue to spread to all parts of the world (Segal & Gerstel, 2020). However, states, companies and individuals do have a

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

considerable capacity to monitor the progression of the disease by certain particular acts (Craven et al., 2020; Smith-Bingham & Hariharan, 2020). Movement control order, lockdown, containment and social distance are among the government's measures to safeguard unparalleled public health and economic responses (Craven et al., 2020). The coronavirus may not totally swing back until the epidemic has relented (Craven et al., 2020). As such, Malaysia introduced the Movement Control Order (MCO) on March , 2020 to March 31, 2020 and later, on April 14, 2020, in accordance with the Infectious Diseases Prevention and Control Act 1988 and the Police Act 1967, to link the virus chain. The order included the closure of all government, private and commercial premises except those in critical services (water, electricity, energy, telecommunications, postal services, transport, irrigation, oil, gas, power, lubricants, broadcasting, finance, banking, health, pharmacy, fire, jail, port, airport, protection, defence, cleaning, retail and food supply) (The New Straits Times, 2020).

2 Research Objectives

The objective of this study is to investigate the impact of covid-19 on the business performance of small and medium enterprises (SMEs) in Kedah. The specific objectives for the proposed study are as follow:

- 2.1 To identify the relationship between the impact of covid-19 which is movement control order, social distancing, standard operating procedure and people reaction and emotion toward covid-19.
- 2.2 To identify the relationship between the impact of covid-19 which is movement control order, social distancing, standard operating procedure and the business performance of SMEs in Kedah.

3 Significance of Research

3.1 SMEs

By knowing the impact of Covid-19 on small and medium enterprises (SMEs), SMEs could use this finding from this research to enhance their knowledge. The study also helps SMEs to understand the point that they need to make a new strategy that can help them to grow up their business in these outbreaks. SMEs may connect with customers better and serve them on a higher level in new norms.

3.2 Future research

The outcome of this study will benefit future research in the covid-19. In that field, the research can be expanding to see the impact of covid-19 on SMEs. The researcher can suggest some recommendations for improvement in the future. This will help the new researcher to get knowledge, idea, and make it as a reference.

4 Literature Review

Dependent Variable

4.1 Business Performance of SMEs

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Business performance is an important aspect and it consists of three aspects which are income, supply chain and business operation. All of these three aspects are affected by this pandemic. First, income is the basis for the redistribution of tax obligations, the distribution of transfers and wider normative questions of inequality and justice. Yet we lack a common understanding of income, and a pure, rigorous concept of income is unlikely (Brooks, John R, 2018). The revenue impact can, depending on several factors, have positive or negative implications for a small business. In general, as wages are smaller, there is less spending and the impact on businesses is hurt. But that's not always the case. In addition, the most serious effects of COVID-19 are for the economy. Malaysia is doing the first step of the Movement Control Order during the first phase of COVID-19, and everything is stopping, including business and economic processes. Small and medium-sized businesses in Malaysia have a decent income and can also earn good revenue. But in this pandemic outbreak, small and medium-sized businesses are struggling to make profits, and their earnings are having an impact. Next the supply chain is an important activity in the market movement, since it is a network between a corporation and its suppliers to manufacture and deliver a particular commodity to the final purchaser (Will Kenton, 2020). The supply chain often reflects the steps that it takes to get the product or service from its original state to the consumer. Small and medium-sized companies (SMEs) have major impacts on the efficiency of the supply chain. They can take on the position of manufacturers, producers, distributors and customers. This paper contrasts large companies and small and medium-sized businesses in terms of strategic and organisational choices (Hong, P and Jeong, J, 2006). Ensuring supply chain management with the right resources and in a secure manner can offer multiple benefits to small and medium-sized businesses in any phase. In order to boost business and increase profitability. Small and medium-sized businesses, therefore, need to have a strong supply chain to ensure that they can meet their needs only in the time of their stock. Finally, market operations such as time of operation, flow of operation and SOP in business are necessary. In order to reduce the spread of covid-19, the government has instructed small and medium-sized enterprises to adopt the SOP. The goal of SOP is to reduce health risks to the public and business premises while avoiding burdening the country's health systems beyond reach. This SOP takes into account modern business and day-to-day standards.

Independent Variable

4.2 Movement Control Order

Movement Control Order is merely a temporary step to minimise the overload of Covid-19 cases in health facilities because it cannot prevent the spread of viruses (Dzulkefly, 2019) and caused a significant economic shock to small and medium-sized enterprises. During the lockdown time, all small and medium-sized companies need to close their operations during the first step of the Movement Control Order (MCO). After the first step of MCO, small and medium-sized businesses need to obey the government's orders to shorten their business hours, and now there are some places in the red zone that have to comply with the movement instructions and are unable to operate their business. Moreover, it also affects the supply chain performance because during the MCO, all cross-country movements are not permitted to dissolve the network between the company and its suppliers in order to manufacture and deliver a particular product to the final purchaser. All these things have impacted the profits of small and medium-sized businesses.

4.3 Social Distancing

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Social distance is to keep us in a secure space between ourselves and others. To practise social or physical distance, keep at least 6 feet (about 2 arms in length) away from other people who are not in your home, both indoor and outdoor. Any small and medium-sized business needs to minimise the tables or position them at least 1.5m between the tables so that the customer can sit at a comfortable distance. Employees or service personnel would also need to be qualified to serve table orders in the best way possible. So the number of customers coming to their outlet is going to decline before this pandemic.

4.4 Standard Operating Procedure

The Standard Operational Procedure (SOP) is a compilation of step-by-step instructions compiled by the company to help staff carry out complex routine operations. SOPs aim to achieve reliability, quality production and continuity of results, while at the same time reducing miscommunication and non-compliance with industry regulations. The goal of SOP is to reduce health risks to the public and business premises while avoiding burdening the country's health systems beyond reach. This SOP takes into account modern business and day-to-day standards. A list of standard operating procedures has been published to be followed by those residing in Malaysia who have been brought under the conditional movement control order (MCO).

4.5 Changes reaction and emotion of people toward covid-19.

Covid-19 also make people more emotional because we are facing our visible enemy so everybody will have their own stress and everyone want the best for their life but covid-19 make us to life in limitation so it will make people feel bad emotion. In service section, if we serve people with emotion, we cant give the best service to them and people don't attract to buy our product and we cant make sales and it will affect ourr business. Same goes with customer, some customer feel that they don't save to be in public area so they don't spend their money for something that they want but they maybe only will order their need using online seller. According to Mark Fisher, 2012 people buy using emotion. If people feel uncomfortable especially people who have anxiety they cannot feel comfort to shopping during this pandemic especially in shopping complex because they will feel very worry with their environment so it will effect the purchasing power.

4.7 Online Impulse Buying

(Beatty & Ferrell, 1998) provided a simpler classification that separates impulse purchases from unplanned purchases. Impulsive buys are "unexpected and prompt buys, with no pre-request proposed to buy a specific item classification or to finish a particular buy task", and a spontaneous update buy might be an "unavailable" update buy. As a result, impulse buying is a whimsy purchase that is almost unthinking. For example, shoppers see some sweets and decide to buy suddenly, while unplanned cautionary purchases are purchases because shoppers forget to list a piece of goods. For example, shoppers see sugar in the store and remember she bought them when they don't (Bellini et al., 2017). Past investigations have demonstrated that purchasers are impacted by others when they purchase items, which might be higher online than offline (Riegner, 2007). (Kollat & Willett, 1969), indicated to that when an individual attempts to purchase little things, for example, food, drinks, and different things, and winds up getting them with buying huge things like jewelry, watches, cell phones, and so forth, they are no plans. It indicates that the person made an impulsive or unannimity purchase during the

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

purchase process.

4.8 Variety of Selection

Variety of selection is an important reason for shoppers to shop online (Szymanski & Hise, 2000). A study by (Chang, 2011), shown that when things were arranged into more subcategories in the decision menu, clients comprehended that the page offered more kinds of things and experienced furthermore shopping euphoria, improving them toward online stores. (Mallapragada et al., 2016) also uncovered that online retailers with multiple product categories will in general carry more advantages to online buyers. There are numerous reasons why online customers esteem item classes. To start with, superior products can expand the odds of addressing their requirements, especially when it is highly unlikely that traditional retail channels will offer them. Second, a wide variety of search engines allow consumers to buy higher-quality goods (Bakos, 1997).

4.9 Price Attributes

Price attribute is an important variable in the process of consumer's purchase decision-making, which can easily affect consumer's purchasing behavior. According to a study by (Biswas & Blair, 1991), revealed price discounts can affect consumers' price perceptions and ultimately their willingness to shop. (Brynjolfsson & Smith, 2000), argue that online products and services cost 9 to 16 per cent less than similar products in traditional retail stores, contingent upon whether duties, delivery cost and shopping costs are included for the cost. (Reibstein, 2002), points out to that online shopper frequently look for price information from various retailers of a similar item to settle on the most ideal economic choices. Now and again, not exclusively do costs are brought down, yet exceptional proposals from online suppliers make web based business a productive alternative for customers. These unique offers may incorporate a "get one, get one", free pass for an event, discount coupons for future purchases, free gifts for 1st customers, holiday exchanges, etc. (Arora & Aggarwal, 2018).

4.10 Website Ease of Use

The website ease of use of a website is a view of the extent to which the site can be easily browsed. In an internet shopping climate, convenience is the client's inclination that it is nothing difficult to use the site for web based shopping (Awad & Ragowsky, 2008; Cho & Sagynov, 2015; Vijayasarathy, 2004). (Liu et al., 2013) define ease of use as "how easy it is to navigate through online shopping sites". In addition, ease of use is that clients can without much of a stretch peruse efficient sites, peruse and comprehend the data showed on sites (Loiacono et al., 2002). Ease of use additionally includes intuitiveness and traversability on a site, a quick and confided in inquiry framework, a deliberate showcase of refreshed and complete data on the site, and simple installment (Akram et al., 2017; Bilgihan & Bujisic, 2015; Verhagen & van Dolen, 2011). Many scholars point out that factors influence impulse buying: online users are more likely to participate when they are positively affected. In addition, online shoppers' positive feelings about emotions increase impulse buying and overspending (Akram et al., 2017).

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

4 Hypothesis Development

The hypothesis is a proposition to test or a tentative statement that two variables are causally related. In short, it is a clear statement of what is supposed to be investigated. It is a must to investigate the relationship which the researcher already analyze with reasonable reasons because the results that the researcher found out will give suggestions for problem-solving. It also can be used as formal procedures by statisticians or researchers to accept or reject a statistical hypothesis. In this research, the researcher has identified three hypotheses as stated below.

H1: There is a significant relationship between the impact of covid-19 which is movement control order, social distancing, standard operating procedure and people reaction and emotion toward covid-19.

H2: There is a significant relationship between the impact of covid-19 which is movement control order, social distancing, standard operating procedure and the business performance of SMEs in Kedah.

4.1 Research Framework

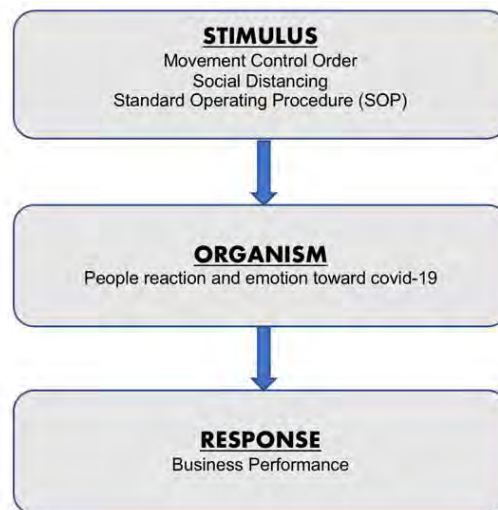

Figure 2.2: Research Framework

This research is aim to investigate the impact of covid-19 to the business performance of SMEs with the variables are shown in figure 2.2. In order to study on the impact of covid19 to the business performance of small and medium sized enterprises in Kedah, this study proposes stimulus, including movement control order, social distancing and standard operating procedure (SOP). The organism of this study is the people reaction and emotion toward covid-19 and lastly, the response of this study is the business performance of the SMEs in Kedah.

5 Methodology

5.1 Research Design

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Research design is the general approach to integrate the several factors of the research coherently and rationally, wherein, assuring you may efficiently cope with the studies' trouble. It develops the blueprint for the collection, measurement, and evaluation of statistics. A research design is the plan of research followed to fulfill the research objectives or test the hypotheses of a research. Research design creates solution to the research problem that researcher discussed earlier. This research study will use quantitative research method. Quantitative approach is selected for a larger target respondents' sample size and include of multiple type of measurement and analysis (Sekaran, 2012). According to Madrigal (2012), this method enable researcher to gather and analyses data collected and use for further hypothesis test in order to determine the relationship between dependent variable and independent variables. Cross-sectional design is also known as cross-sectional survey, because the descriptive information obtained is collected at a certain point in time or within a short time interval, so easy to implement, the object of study is better represented, a study can observe a variety of relevant possible factors and can collect data on all variables at the same time. This type of research is very low cost, so using cross-sectional design is the most appropriate research method for this study.

5.2 Data Collection

Data collection is the process of collecting and gathering information about identified variables. All researchers collect data to understand and explore the answers to their questions. Key data will be collected in this research and will be further explained. Primary data and secondary data were utilized in this research as data collection method. The primary data of researcher use to collect the data is questionnaire and the source of secondary data that researchers use to collect data is the including books, journal, web, article and electronic library data set.

5.3 Sampling

Probability sampling is the sample techniques method that will be chosen in this research. In probability sampling, a random selection is used to select the sample so that each element in the population has a known chance of being selected. Simple random sampling is the most basic form of probability sampling. In a simple random sample, each member of the population has an equal known opportunity to become the body of the sample. This approach is used because researchers are required to collect data over exercise periods and there is no funding for the study. As a result, researchers will distribute online questionnaires through Google forms and publish them to certain groups or pages. This allows the person to fill out comments in their free time based on their volunteer attitude. By using this approach, consumers can easily provide their personal information and making the data collection process more efficient.

5.4 Population

The particular population elements concerning to the research group is named as target population. Usually to answer the questionnaire of population of study, it always in a big population that be target by researcher. The respondents will help the researcher to get the valid and data collected. The researchers choose to do a research about the impact of covid-19 to the business of SMEs in Kedah and it show that there are 37092 SMEs in Kedah.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

5.5 Sample Size

The sample is a subset of the population. The total number of objects in the sample is called the sample number and is expressed as "n". A sample was a subset of the population being studied that included the process of selecting a few samples. Larger the sample the more representative and more generalizable the results of the study were likely to be. This research is using sample size from Krejcie and Morgan's table. The total of sample size use is 380.

5.6 Research Instrument

The questionnaire planned in the study was bilingual, for example English and Malay. This is on the grounds that English is a worldwide language and can speak with respondents from everywhere the world, while Malaysia is the Malaysian language of the nation. Furthermore, the inquiries in this study questionnaire have been adapted and adjusted.

5.7 Data Analysis

Data analysis (the application of statistical and logical techniques in the system) can be used to describe and analyze the compression, generalization, and evaluation of data. The data for this research will be analyses using statistical software known as IBM. The Social Science Statistics Package (SPSS) software was used to analyze data collected from questionnaires. IBM was picked in light of its similarity with most other programming bundles and its ease of use utilized for information examination. SPSS is used to explain Descriptive Analysis, Pearson Correlation Analysis, and Multiple Regression analysis. By using this software will eliminate errors. Research can be carried out quickly and efficiently.

6 Data Analysis and Findings

The purpose of the study was to find out a study on the impact of covid-19 to the business performance of SMEs.

6.1 Demographic profiles of respondents

Table 2: Demographic profiles of respondents

GENDER						
		Frequency	Percent		Valid Percent	Cumulative Percent
Valid	Male	188	49.5		49.5	49.5
	Female	192	50.5		50.5	100.0
	Total	380	100.0		100.0	

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

AGE					
		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	20-30 years	108	28.4	14.9	14.9
	31-40 years	123	32.4	35.5	50.4
	41-50 years	117	30.8	37.1	87.5
	51 and above	32	8.4	12.5	100.0
	Total	380	100.0	100.0	

Note: *Multiple choice questions

EDUCATIONAL					
		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	SPM	54	14.2	14.2	14.2
	STPM	79	20.8	20.8	35.0
	Diploma	95	25.0	25.0	60.0
	Bachelor of Degree	105	27.6	27.6	87.6
	Master	35	9.2	9.2	96.8
	PHD	12	3.2	3.2	100.0
	Total	380	100.0	100.0	

Table 2 summarizes demographic information of the 380 respondents. Female respondents

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

were higher with 50.5% (n=192) respondents as compared to male with 49.5%. The respondents were allocated into four groups. Highest number of respondents were from group 31-40 years old with 32.4% (n=123) respondents. The lowest number of group age was 51 and above with 8.4%. The respondents were allocated into four groups. The highest number of respondents were from group 31-40 years old with 32.4% (n=123) respondents. The second highest group were from group 31-40 years old with 30.8% (n=117) respondents. Meanwhile, the respondents from young people of group 20-30 years old were 28.4% (n=108) respondents. Lastly, the lowest number of group age was 51 and above with 8.4% (n=32) respondents. The respondents were allocated into six groups. The highest number of respondents were Bachelor of Degree with 27.6% (n=105) respondents. Second highest were Diploma with 25% (n=95) respondents and next were STPM with 20.8% (n=79) respondents. The respondents of SPM with 14.2% (n=54) respondents. The second last is Master with 9.2% (n=35) respondents and the last one is PhD with 3.2% (n=12) respondents.

6.2 Descriptive Statistics

Table 3: Mean and Standard Deviation

		STIMULUS	ORGANISM	RESPONSE
N	Valid	380	380	380
	Missing	0	0	0
Mean		64.2158	22.2026	22.0158
Std. Deviation		5.96655	2.51402	2.45589

The Table 3 illustrates the descriptive statistics for the study on the impact of covid-19 to the business performance of SMEs in Kedah. Table 3 showed all the mean values range between 22.0158 to 64.2158 which the highest mean value show that the variable have high level of acceptance. This study adopted 5-point likert scale range from 1 (strongly disagree) to 5 (strongly agree).

6.3 Reliability Analysis

The general rule of thumb is that the Cronbach's Alpha which is >0.9 (excellent), >0.8 (good), >0.7 (acceptable), >0.6 (questionable), >0.5 (poor) and <0.5 (unacceptable). Table 4 shows the Cronbach's Alpha values of the questionnaire were above the acceptance level with the value range above than 0.70.

Table 4: Reliability Statistics

Variables	Number of Items	Cronbach's Alpha before item deletion item.
Stimulus	5	0.770

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Organism	5	0.749
Response	5	0.719

Based on the result from Table 4, the Cronbach's Alpha values of the questionnaire were above the acceptance level with the value range above than 0.70. George and Mallery (2003) provide the following rules of thumb which is >0.9 (excellent), >0.8 (good), >0.7 (acceptable), >0.6 (questionable), >0.5 (poor) and <0.5 (unacceptable). The first variable is stimulus found to be good reliable (5 items; $\alpha = 0.770$). The next variable is organism showed a good reliability (5 items; $\alpha = 0.749$) and the last variable that is response and it found to be also an acceptable reliability (5 items; $\alpha = 0.719$). The Cronbach's Alpha from every variable unchanged after the removal. Therefore, the data was considered suitable for further analysis.

6.4 Pearson Correlation

Pearson correlation analysis is utilized to decide the connection between at least two quantitative elements. This sort of assessment is an essential level, depending on the doubt of the direct connection between quantitative elements. The aftereffect of relationship investigation is a connection coefficient whose worth reaches from - 1 to +1. The connection coefficient +1 shows that two factors have great relationship in a positive direct way; a relationship coefficient of - 1 demonstrates that the two factors have a huge connection in a negative straight way, and a relationship coefficient of 0 shows that there is no direct connection between the two factors (Gogtay & Thatte, 2017).

Table 5: Pearson Correlation of IVs, MVs and DVs

		STIMULUS	ORGANISM	RESPONSE
STIMULUS	Pearson Correlation	0.015	0.015	0.068
	Sig. (2-tailed)		0.770	0.188
	N	380	380	380
ORGANISM	Pearson Correlation	0.015	1	0.052
	Sig. (2-tailed)	0.770		0.308
	N	380	380	380
RESPONSE	Pearson Correlation	0.068	0.052	1
	Sig. (2-tailed)	0.188	0.308	
	N	380	380	380

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Based on the Table 5, the pearson correlation values, r between stimulus and organism is 0.015. r between stimulus and response is 0.068. All the r value is range between 0.01 to 0.07 with indicate high positive relationship between variable. Besides, all the p -value for this relationship is 0.000 which is less than ($p < 0.01$) indicates a significant relationship between variable. Therefore all the hypotheses for this study is accepted.

7 Discussion and Recommendation

Based on the limitations of the study, some recommendations have been made for researchers who might carry out similar research in the future. This is align with the limitation that have been discussed in previous section. In the addition, there are some additional information that can be use by the future research to be conducted. Firstly, future research could extend the scope of the study on different type of industries such as manufacturing and services. The differences between industries by sector will give different views on their opinion. Thirdly, the number of sample size should be expended to emerge more accuracy outcome and data. Besides that, that is suggested to have more balance respondents among age ranges and occupations for the future studies and get more comprehensive findings as well by evenly giving out and collecting the data around the sampling location. Lastly, future research should investigate the influence of possible variables such as the education, income level, and age of SMEs owner. Analysing the difference between respondents' demographic profiles would give a better explanation of the trait of the target population more comprehensively towards SMEs.

8 Conclusion

The study examines the impact of covid-19 to the SME in Kedah. The result of this study shows that the literature is supported and the data collected are reliable. The impact from this study is SMEs need to face various changes and constraints to continue their business journey such as movement control order, social distancing and standard operating procedures that have been directed by the government to control this pendemic outbreak and there are positive relationship between the impact of covid-19 which is movement control order, social distancing, standard operating procedure (stimulus) and people reaction and emotion toward covid-19 (organism). There are positive relationship between the impact of covid-19 which is movement control order, social distancing, standard operating procedure (stimulus) and the business performance of SMEs in Kedah (response). Hence, the implications for the study shown that this research has impact of covid-19 to SME in Kedah. The impact from this study is SMEs in Kedah exposed towards people reaction and emotion toward covid-19 and the business performance of SMEs in Kedah and has positive impact on their business. For limitation of the study, although the hypothesis results show there is relationship tasted by the variables however the study have some limitations for the purpose of future research. This study was conducted face to face and limitation that appear here are applicable to time constraints because most of the respondents need help in understanding and interpreting the questions. This makes researchers must spend time to distribute the questionnaire within about two weeks for a total of 380 respondents. Last but not least, some recommendations have been made for researchers who might carry out similar research in the future. Future research could extend the scope of the study on different type of industries such as manufacturing and services. In addition, the number of sample size should be expended to emerge more accuracy outcome and data. Then, future research should investigate the influence of possible variables such as the education, income level, and age of SMEs owner.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

9 Acknowledgement

First of all, I would like to express my deepest appreciation and gratitude to several parties who help me to complete this research paper. This research had been done very well even though it had some limitations. Foremost, I would like to express my sincere gratitude to our supervisor, Dr. Siti Afiqah Binti Zainuddin, for the support, motivation, sharing of the knowledge, and guide me in completing this research. Her guidance helped me all the time of research and writing this report. I really appreciate his help from the early. On the other hand, I also would like to thank my friends who tried their best to give their support and information to me to complete this report and research. Last but not least, I would like to express our ultimate appreciation to those respondents who willing to help by spending their precious time to respond to the questionnaire of the research project. Besides that, I would like to thank our family members, friends, course mates and group mates for helping and supporting us till the research project end.

Universiti Malaysia Kelantan,
Malaysia

Email : divya.a17a0077@siswa.umki.edu; munirah@umk.edu.my

Abstract:

In this globalization era, technology in retail stores are really needed in order to develop their business also could become popular in Negeri Sembilan especially in whole Malaysia. This research study was carried out to explore factors that influencing impact of big data to retail stores in Seremban. Researchers had examined four factors include sales profit, buying pattern, operation and impact of big data. The Theory of Planned Behaviour (TPB) were used to explain the independent variables and dependent variables. Researchers gathered data systematically to gain more in depth understanding about big data technology. Quantitative data collection method and random sampling technique had been used. A total of 100 retailers in Seremban were tested using questionnaires and being analyzed by using Pearson's Correlation Statistic Package for the Social Sciences (SPSS). The result indicates that all the elements have significant relationship with Seremban area retailers. The implication and future direction of the study were discussed at the end of this paper.

Keywords: Sales profit, Buying pattern, Operation, Big Data

1 Introduction

Big data have been defined as three main characteristics that are called as 3Vs (Furht & Villanustre, 2016). Big data are defined as data that have ability to provide unlimited access to a range of database resources in order to support research activities in academia and industry for users from international and domestic to convert big data into big discoveries. The purpose of this research was to investigate the factors that influencing the positive or negative impact of big data to retail stores in Seremban. Big data is known as an abstract concept. Over the past 20 years, data has increased in a large scale in various fields. In 2011, the 'big' term begun to be spread to all over the world (Gandomi & Haider, 2015). Big companies in Malaysia should have made a huge investments in order to build a very strong platform for big data to deliver new business insights that have some goals such as reduce the storage and maintenance costs of the company. According to Hadoop (2010) big data are defined as datasets that cannot be recorded, handled and processed within an appropriate scope by general computers. Besides, big data is a technology that refers to a new generation of technology and architectures that are created in order to extract the value from a huge amount of wide variety of data economically. This process are carried out by enabling some capture with high speed, discovery and analysis. One of the common issue that can be seen by multiple big data applications in retail stores are the environment in marketing are showing tremendous changes in potential driving the

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

marketing opportunities and impact to the customer management domain (Svilar, Chakraborty, & Kanioura, 2013). According to the lifeline of the fashion retailers in Seremban, to discover and develop trends and historical sales alone have been the determinant of the popularity of trends in the past. But it is inadequate to look at historical sales, as customers increasingly expect and demand highly personalised shopping experiences. It is very difficult for fashion retailers in Seremban to determine which trends that are followed by the customers that leads them to buy outfits from the retail store. Through this implementation of big data, fashion line retailers could able to catch up with all the new trends by analysing what kind of outfits that consumers are buying from the statistics obtained. They can also keep updating their cloth stocks according to the trends easily. One of example according Alton (2018) which is Big Data analytics on previous seasons' buying behaviour could able to help to determine which fashion qualities or components shoppers can respond to in the future favourably. This fast fashion trend was initially supported by the first wave of Big Data analytics, which helped meet the demands in terms of enabling fashion companies to get the right pricing, stock, discounting, colours and sizing (Landon-Murray, 2016). The lack of a particular context and the large sample that is the scale of big data could provide new scientific opportunities in discovery, however, presents significant challenges in which high volume and dimensionality of data can produce noise accumulation, spurious correlations and incidental endogeneity were highlighted by (Fan, Lau, & Zhao, 2015) (Gandomi & Haider, 2015). The challenge of analysing big data has largely been addressed through the development of big data analytics (Kambatla, Kollias, Kumar, & Grama, 2014) and cloud computing (Assunção, Calheiros, Bianchi, Netto, & Buyya, 2015). Not only that, there will be an obstacles in order the way how to manage the complex data which are in high velocity, huge volume and from variety sources and how to process it in a mix of applications in a distributed environment (Khan et al., 2014). Those retailers need to be know how to clean those huge data sets and they need to decide which data that are reliable and also useful that became as one of the challenges in dealing with big data technologies. In addition, the main source of a very huge range of data experiments could be categorize into few types of information such as sequences of genetic and interactions of proteins or findings in the records of medical. According to this statement, all of the data that are gained need to be analysed according to the relevant data knowledge. This clearly shows that if a retailer are getting a huge amount of data, they need to have a space to store all those big data in order to analyse it, compare and also distribute it. This processes are not an easy task that can be done by those workers. Researchers had examined four factors include sales profit, buying pattern, operation and impact of big data. The Theory of Planned Behaviour (TPB) were used to explain the independent variables and dependent variables.

1.1 Research Question

- i. Does the sales profit influence big data to retail stores in Seremban?
- ii. Does the buying pattern influence big data to retail stores in Seremban?
- iii. Does the operations influence big data to retail stores in Seremban?

1.2 Research Objective

- i. To identify the relationship between sales profit and the impacts of big data to retail stores.
- ii. To understand what are the relationship between buying pattern and the impact of big data to retail stores.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

- iii. To investigate the relationship between operations and the impact of big data to retail stores.

2 Literature Review

The literature review of this study have to discuss the related theory and model. The definition of the sales profit, buying pattern, operation and big data will be define under this section. Besides, this study have to describe the research framework, which also served as the conceptual framework.

The Theory of Planned Behaviour (TPB) was prepared to manage the restrictions of the Theory of Reasoned Action (TRA) and carry out to anticipate the intention of individuals to participate in behaviour inside a specific venue, time and to describe all behaviour over which an individual has the ability to apply self-control. Moreover, Theory of Reasoned Action (TRA) was created to estimate and appreciate human behaviour including attitude (Olumide, 2016). This bring meaning that how much people see a specific behavioural positively which is attitude, or predicts that considerable other need them to take part in the behaviour which is subjective norm and trust that they are fit for completing the behaviour which is perceived behavioural control, serve as immediate determinants of the degree of their intention to perform the behaviour (Yakasai & Jusoh, 2015).

Theory of planned behaviour are used in this research because there is a research that need to know about the purchasing behaviour of the consumers in retail stores. This theory is one of the best theory as it understand consumers' mind-set that retailers can know. This theory are used because this theory is a social psychology theory that is well-established which also stating it is a specific salient beliefs influence of behavioural intentions and also behaviour of subsequent that are highlighted by (Ajzen, 2014). Many researchers that have done research regarding technology adopted and used this theory as their theoretical framework. This theory are used because it can determine what will be the relationship between, Perceived Behavioural Control and behaviour intention of consumers of the retail stores easier. In addition, there are few studies that are carried out by researcher (Wu & Chen, 2005) that stressing out that Perceived Behaviour Control under this theory could affect directly to the technology intention and (Hsu, Hsu, Wang, & Chang, 2016) stating that it can also affecting the continuance of usage intention.

First of all, this 'Big Data' term are used in most of the articles and reports that are mostly focused on Information Technology by researchers. This digital technology can spread easily to a very broad range of the data-reliant applications. This has made this digital technology to spread more into other disciplines which are including into sociology, medicine, biology, economics field, management and also science information. (Belhadi, Zkik, Cherrafi, & Sha'ri, 2019) stated that this Data Information Knowledge able to show an alternative way in order to view data in a structured way that can be very useful in a specific reasons. Last impact that most of the industries will be get because of the big data are which gives new bits of knowledge into environmental trends that could be used to improve effective capacities through supporting from corporate of decision-makers because they are being responsive and adaptive to the recent environmental trends (Erevelles, Fukawa, & Swayne, 2016). To be conclude, an organisations have to be more 'integrate, build and reconfigure' capability in order to meet the changes of the environmental into the highlights of big data technologies (Teece, 2009, p. 515).

Sales profit can be defined as a primary output that are concerned by retailers which also known

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

as profitability (Haessler, 2020). This financial benefits are classified into few issues which is in the cost reduction by limiting demand of energy, investments in technology and processes in the retail store (Ball, 2011). Financial issue in a retail store is the perception that some amount of cash may be lost or required to make a product work properly. Also, (Maignan & Lukas, 1997) viewed sales profit of retail stores as potential overall deficit of cash and includes consumers' feeling of uncertainty. Other than that, a business need to have some knowledge in big data in order to increase their sales in the retail stores. This is due to a new products and services in retail stores normally needs many types of knowledges such ad private knowledge might also need knowledge in big data types and variety of mixed knowledge in order to gain more information of the new products and services of retail stores. In addition, retail stores needs to have knowledge to transfer in the environment of big data technology so that they can increase their sales and profits of the stores (Verma & Singh, 2017). This shows when retailers could determine the perishability of the products and services and we are ready to allocate the best available spaces on the shelf for maximum profit through this big data technology in retail stores (Rautaray, Pandey, Chakraborty, & Barua).

Buying pattern which is the purchasing behaviour of customers is commonly define as a behaviour that is a noticeable response in a given circumstance as for a given target that retailers can observe. A buying behaviour or buying pattern may be characterized as a tendency to react in a positive or unfavourable way with respect to a given attitude objects (Cheung & To, 2019). Behaviour is a psychological and neutral condition of status, controlled through understanding, applying a directive impact upon the person's reaction to all items and circumstances with which it is connected. It is elusively hard trying to judge the psychological state of consumers while they are making purchases. Due to this hard task of making generalized conclusions there have been a number of studies that have come out hypothesizing different factors. Past research demonstrated that purchasing behaviour is also influence by demographics, channel information, and shopping orientation. However, there are many elements that are observable which can lend to having higher exchange rates and having a look into shopping behaviours. Seremban relatively low technology penetration that contributes to the continued rapid expansion of retail stores.

According to the research carried out from the previous studies reported, the main contribution of big data technology in retail stores are operations management. The existing prove are variety and it shows that big data is the accurate technology for operations in retail store. Therefore, this studies had reported successfully the implementation of big data technology followed by what technologies that were workers employed and their contributions to operations of retail stores. Not only that, big data is still considered shallow for those retailers that have their existing operations in retail stores are suggested by (Müller & Birkel, 2020). Further, this research indicates the conclusion of big data technology in retail stores, since it aims in providing proves in order to assist in a better understanding of framework that are applied and how big data impacted this retail stores operations. Operations of retail stores might mitigate the implementation of big data technology procedures be lack (Fettermann, Cavalcante, Almeida, & Tortorella, 2018).

2.1 Hypothesis Statement

H1: The sales profit had significant relationship with impact of big data towards retail stores in Seremban.

H2: The buying pattern had significant relationship with impact of big data towards retail stores in Seremban.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

H3: The operations had significant relationship with impact of big data towards retail stores in Seremban.

2.2 Conceptual Framework

The main reason of this research study is to determine the elements of the impact of big data to retail stores in Seremban. Nowadays, involving new advanced technology in retail industries that be faced by retailers that use technology in their retail store especially retailers that not skilled in technology. This section explains the proposed theoretical framework. In general, the main theories basically the theoretical framework consist of three impacts which is sales profit, buying pattern and operations. The research framework as illustrated has three key component which is serves as independent variables consist of sales profit, buying pattern and operations while impact of big data is the dependent variable.

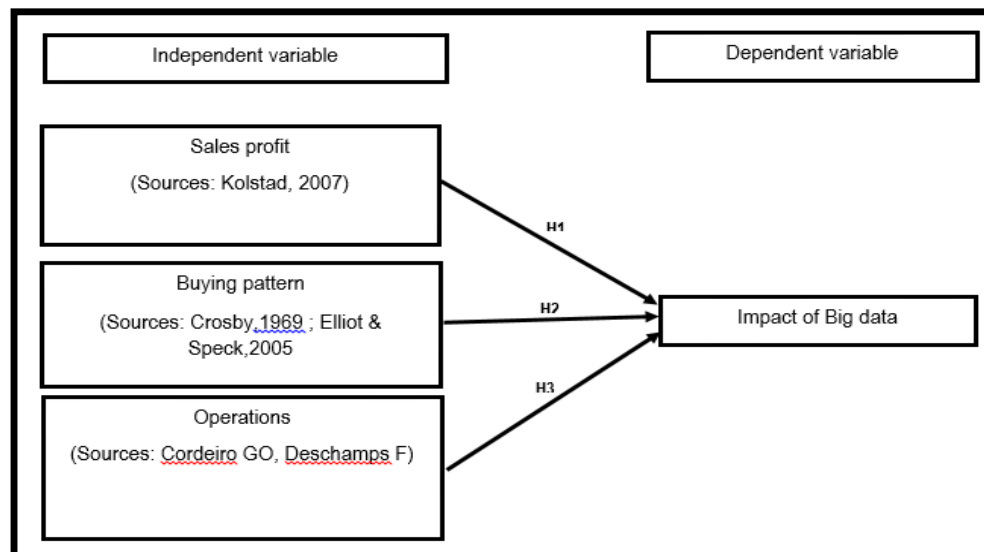

Figure 2.1 Conceptual Framework on factors that influencing the positive or negative impact of big data to retail stores in Seremban.

3 Research Methodology

3.1 Research Design

The research design was an exploratory research. There is important for researchers to meets objectives of study by select suitable design. The objective of this research is to examine the relationship of impact of big data to retail stores in Seremban retailers, the volume of the impact of big data and find out retailer's realization towards technology. Researchers collected information deliberately to earn more in depth knowledge about impact of big data. Quantitative Research Method is acquiring an evaluated and generalized result from the sample of population. Researchers distributed questionnaires to get feedback from respondents to assess the variables which is factors that influencing the positive or negative impact of big data and information gathered will be translated in diagrams and tables in the following chapter.

3.2 Data Collection Method

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

The questionnaire was used as the primary data collecting method to get more accurate result for the study. Moreover, this method is easy to handle since it will only take few minutes to answer the needed question and it will not burden the respondent much. There was 306 questionnaires were distributed to the retailers of retail stores in Seremban.

Survey questionnaires used as a measurement tool by the researchers to obtain data in this study. Questionnaire used to ask respondent to give their opinions by answering the questionnaires. Researchers had distributed 100 questionnaires to the respondents in order to help researchers to get results about the relationship between factors and impact of big data among retailers in Seremban. The questionnaires printed in English and Bahasa Malaysia language since these two languages are usually used by most of peoples.

The secondary data is including Internet sources. The previous journals, articles, case study and more valid information were collected from the Internet. The material was used to deliver the information during theory analysis and variables finding. The researcher collects the data from Google Scholar, My Athens and Research Gate and Pro Quest.

3.3 Study Population

For this research the population is the retailers from retail stores in Seremban which has many regions. This is because they have a strong establishment regarding big data and them currently in the highest stage in implementing new technology in their retail stores. Every region in Seremban, there are approximately 31,885 retailers according to current year so we will pick 100 people by random for retail stores. So that we can provides the result for the other people in different way.

3.5 Sample size

According Krejcie and Morgan (1970) have introduced a table for determine the sample size. They did this in response of an article called “Small Sample Technique” issued by the research division of the National Education Association (Hill, 1998). According to the enrolment of retailers in Seremban, Negeri Sembilan, there are 31,885 of retailers in current year. Referring to the table below, we took 100 retailers randomly as the total population of 31,885.

A sampling method is a technique that will take the sample of members in a population. Sampling methods can be divided as either probability or non-probability. Probability sampling is called as random sampling technique this is a sampling which allow each and every things for universe to have an equal chance of presence in the sample. Non-probability sampling is a sampling technique that won't offer a person for any feeling of probability that elements in the universe will have an opportunity to be incorporates into the examination sample (Etikan, Musa, & Alkassim, 2016).

Due to the huge number of population, there are total of 100 from 31,885 of retailers in Seremban as respondents, there were chosen randomly and taken to contribute their opinion in answered the questionnaire which has distributed by the researchers. Respondents' opinion will be collected and recorded through questionnaire as primary data to complete this research.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

4 Data Analysis And Findings

4.1 Preliminary Analysis

Table 4.1 Reliability Test for Pilot Test¹

Variables	Cronbach's Alpha	No. of Items	N (sample size)
Sales Profit	.936	4	10
Buying Pattern	.950	4	10
Operations	.954	5	10
Impact of Big Data	.983	5	10

Based on the table above, (Hair et.al, 2012) stated that Cronbach's Alpha coefficient according independent variables of the study, Sales Profit is 0.936 followed by Buying Pattern at 0.950 and Operations at 0.954. Cronbach's Alpha coefficient for my dependent variable which is for The Impact of Big Data at 0.983 classified as best reliability. To be conclude, the range of Cronbach's Alpha is between 0.936 and 0.983 for all constructs in this study. In a nutshell, all of the items in this study are understood by target respondents because of the value of Cronbach Alpha value for each construct must exceed 0.7 which reflects the target respondents understand the items of each variables (Hair et al, 2012). According to the results above, all variables are accepted and the highest coefficient value the Impact of Big Data while the lowest coefficient value is the Sales Profit.

4.2 Normality Test

Table 4.2 Normality Test for all variables²

	Tests of Normality					
	Kolmogorov-Smirnov ^a			Shapiro-Wilk		
	Statistic	df	Sig.	Statistic	Df	Sig.
Sales profit	.150	100	.000	.903	100	.000
Buying pattern	.157	100	.000	.908	100	.000
Operations	.140	100	.000	.916	100	.000
Impact of Big Data	.131	100	.000		100	.000

Table 4.2 shows the normality test for the all the variables. There are two types of tests were used to run this normality test which known as Kolmogorov-Smirnov and Shapiro-Wilk, with the significant value, p-value which is less than 0.05, indicates as normal data. A shown in the table above, the significant value, p-value is 0.000 for all the variables that have been stated, which is less than 0.05. Therefore, it indicates as a normal distribution.

¹ Data from SPSS version 26.0

² Data from SPSS version 26.0

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

4.3 Validity and Reliability Test

Table 4.3 Reliability Statistics³

Variables	Items	Cronbach's Alpha
Sales profit	4	.890
Buying pattern	4	.881
Operation	5	.891
Impact of Big Data	5	.914

Based on reliability analysis in Table 4.3, it can be concluded that the coefficient alpha for reliability of independent variable buying pattern is 0.881. This means the consistency and stability of 0.881 is very good. Hence, it indicated the test is very reliable in carry on the further analysis. The coefficient alpha for reliability of independent variable buying pattern is 0.891. This means the consistency and stability of 0.891 is very good. The coefficient alpha for reliability of independent variable buying pattern is 0.914. This means the consistency and stability of 0.914 is very good according to the rules of thumb about Cronbach's Alpha Coefficient (Hair et al., 2010). From this, it can be summarize that all items from independent variable are strong and stable result.

4.4 Demographic Profile of Respondents

Table 4.3 Numbers of respondents⁴

Demographic Profile	Valid	Frequency	Percentage %
Gender	Male	47	47.0
	Female	53	53.0
Age	18-20 years old	9	9.0
	21-30 years old	23	23.0
	31-40 years old	27	27.0
	41-50 years old	23	23.0
	51 years old and above	18	18.0
Race	Malay	32	3.0
	Chinese	26	26.0
	Indian	25	25.0
	Others	17	17.0
Distribution area in Seremban	Ampangan	11	11.0
	Labu	10	10.0
	Lenggeng	11	11.0
	Pantai	13	13.0
	Rantau	9	9.0
	Rasah	12	12.0
	Seremban	24	24.0

³ Data from SPSS version 26.0

⁴ Data from SPSS version 26.0

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

Setul

10

10.0

From the table 4.3, the female students are dominating from the retailers in Seremban. This statement is supported by data from the responses from the respondents, which defines 53.0 percentage of them are female. While the total respondents here are 100 retailers, the percentage of female retailers on the Seremban based on respondents' feedback is 53 female retailers. However, the male makes up 47.0 percentage of the Seremban retailers to answer this questionnaire which is to 47 retailers out of 100 samples feedback from the respondents.

The age groups of retailers that having retail stores in Seremban are categorized into five different age groups. The majority of the retailers' age is within range from 31 to 40 years old, with the domination of 27.0 percentage which is equivalent to 27 retailers. The second highest domination comes from age range of 21 to 30 years old with 23 retailers or similar to 23.0 percentage and 41 to 50 years old with also 23 retailers which is 23.0 percentage. The retailers' age group from 51 years old and above has been only ranked with 18 respondents or accounted for 18.0 percentage from 100 retailers collected for sampling. The lowest age range for retailers are from 18 to 20 years old which equals to 18.0 percentage from overall respondents in Seremban.

By looking at the retailers' that having retail store distribution table based on the race, the majority of the retailers are Malay. It is explained by the data above with highest respondents which is Malay retailers, 32.0 percentage from 100 retailers or consisted of 32 retailers. The second highest frequency for race will be Chinese, with 26 retailers (26.0 percentage). Then it followed by the Indian students which ranked as third with 25 responses or can accounted for 25.0 percentage. Retailers that having retail store from other races had been recorded as the least race as respondents. It is explained by the data above that only 17.0 percentage from 100 or consisted of 17 retailers has been responded to the questionnaire.

The majority of retail stores in Seremban are from Seremban. They compromise 24.0 percentage of the sample that has been taken from the survey. It means that 24 retailers are majority from Seremban area. The second highest frequency for the retail stores will be retailers who are at area Pantai with 13 retailers which are contributing to the total respondents with the percentage amount of 13.0 percentage. Then, retail stores in area Rasah in Seremban had ranked as third highest frequency as it made up to 12.0 percentage or equal to 12 retailers. Next, retailers who are at Rantau area have lower contribution which can be said as just 9.0 percentage or consisted of 9 retailers from the overall sampling of 100 respondents. Next, the second least retail stores area are at Setul and Labu which is only 10 retailers with 10.0 percentage. Those retailers, who are at Ampangan and Lenggeng area in Seremban, have recorded the least, which are only 11 retailers (11.0 percentage).

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

4.5 Descriptive Analysis

Table 4.4 Descriptive Statistics⁵

Descriptive Statistics		
	Mean	Std. Deviation
Sales profit	3.7150	1.12143
Buying pattern	3.7375	1.07154
Operations	3.7220	1.04674
Impact of Big Data	3.7780	1.08130

Table 4.4 shows the mean and the standard deviation of both dependent variable and independent variables. Mean for dependent variable which is the impact of big data of this research is 3.78. For independent variables, the highest mean is Buying Pattern which is 3.74, this shows that most of the retailers agreed that buying pattern are influenced by the big data and followed by the Operations which is 3.72. Sales Profit have the lowest mean as the independent variable which is 3.72, this shows that retailers less agree that sales profit can be influenced by big data in retail stores.

4.6 Hypotheses Testing

Table 4.5 Correlation Coefficient⁶

Hypothesis	Result	Findings
H1: The sales profit had significant relationship with impact of big data towards retail stores in Seremban.	r = 0.682** p = 0.000 strong positive	H1: Accepted
H2: The buying pattern had significant relationship with impact of big data towards retail stores in Seremban.	r = 0.755** p = 0.000 strong positive	H2: Accepted
H3: The operations had significant relationship with impact of big data towards retail stores in Seremban.	r = 0.746** p = 0.000 strong positive	H3: Accepted

Table 4.5 shows, that the significant value and the number of the respondents which are 100 retailers. There is 2-tailed significant between sales profit and impact of big data is 0.000 with p-value of $0.000 < 0.05$. Therefore, the p-value for sales profit is less than 0.05 level of significant which is provide enough to conclude that there are positive effect in sales profit that exist in population of Seremban retailers. The result of Pearson Correlation Coefficient shows is small but definite positive relationship between sales profit and impact of big data. The stronger sales profit gained the more impact of big data that will be given to retail stores in Seremban. The result explains that sales profit had significant relationship with impact of big data towards retailers that are having retail stores in Seremban.

⁵ Data from SPSS version 26.0

⁶ Data from SPSS version 26.0

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

The 2-tailed significant between buying pattern and impact of big data is 0.000 with p-value of $0.000 < 0.05$. Therefore, the p-value for buying pattern is less than 0.05 level of significant which is provide enough to conclude that there are positive effect in buying pattern that exist in population of Seremban retailers. The result of Pearson Correlation Coefficient shows is small but definite positive relationship between buying pattern and impact of big data. The stronger buying pattern have the more impact of big data that will be given to retail stores in Seremban. The result explains that buying pattern had significant relationship with impact of big data towards retailers that are having retail stores in Seremban.

There is 2-tailed significant between operation and impact of big data is 0.000 with p-value of $0.000 < 0.05$. Therefore, the p-value for operation is less than 0.05 level of significant which is provide enough to conclude that there are positive effect in operation that exist in population of Seremban retailers. The result of Pearson Correlation Coefficient shows is small but definite positive relationship between operation and impact of big data. The stronger operation have the more impact of big data that will be given to retail stores in Seremban. The result explains that operation had significant relationship with impact of big data towards retailers that are having retail stores in Seremban.

5 Discussion And Conclusion

5.1 Key Findings

The highest Cronbach's Alpha value among all variables is impact of big data with 0.914 which is the consistency and stability is equal to internal consistency of excellent. Meanwhile, the lowest Cronbach's Alpha value is buying pattern with 0.881 which is the consistency and stability is equal to internal consistency of acceptable. All the variables can considered as acceptable because all the variables score more than 0.7.

According to descriptive analysis, major respondents are female with 53.0 percentage compare to male with 47.0 percentage in this survey. Besides that, the majority respondents are from the age group of between 31 to 40 years old with 27.0 percentage while the respondents with age group between 18 to 20 years old are the minority. Apart from that, in this survey Malay respondents are the majority with 32.0 percentage. In term of category of areas in Seremban, Seremban are the highest with 24.0 percentage while Rantau are the lowest with 9.0 percentage.

Based on result of Pearson Correlation Analysis, there is a relationship among three independent variables which is sales profit, buying pattern and operation with the dependent variable the impact of big data. Buying pattern has high correlation relationship with impact of big data which is 0.755. Besides that, operation has high correlation relationship with impact of big data which is 0.746. Meanwhile, sales profit has moderate correlation relationship with impact of big data which is 0.682.

5.2 Discussion

There is a moderate correlation relationship between sales profit and impact of big data. In the result, the p value is 0.000, which is lower than 0.01 ($p < 0.01$). It can be concluded that, sales profit has playing role towards the impact of big data to retail stores in Seremban. Therefore, this hypothesis are also supported by (Verma & Singh, 2017) that stated a retail store need to have big data technology so that they would able to increase their sales and profits of the store.

There is a moderate correlation relationship between sales profit and impact of big data. In the

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

result, the p value is 0.000, which is lower than 0.01 ($p < 0.01$). It can be concluded that, sales profit has playing role towards the impact of big data to retail stores in Seremban. Therefore, this hypothesis are also supported by (Cheung & To, 2019) that buying pattern could be observed with the technology penetration in retail stores.

There is a moderate correlation relationship between operation and impact of big data. In the result, the p value is 0.000, which is lower than 0.01 ($p < 0.01$). It can be concluded that, operation has playing role towards the impact of big data to retail stores in Seremban. Therefore, this hypothesis are also supported by (Müller & Birkel, 2020) explained that big data are needed in retail stores that are with existing operations otherwise the store will be considered having shallow management.

5.3 Implications of the Study

In this study, the hypothesis help the researcher to gain more specific evidence of some specific area regarding their retail process in the retail industries. From, this research, researcher also could able to adjust the quota that they preferred to have all the data statistics. This research could bring benefits to retail stores because those retail stores could get to access profits and loss information of their goods and services easily and also could keep the data for stores' references in retail market.

Other than that, retailers will be able to get a detailed information about their sales and the profits in order to identify what are the goods and services that would giving them the best sales and which are not giving them profits through this research. The hypothesis in this research also very helpful to for retailers for them to get to know about their sales statistics of the goods and services. Not only that this research could make retailers to analyse on a database system that allows retailer in designing and implementing their Business Process Management (BPM) to maximize their profits in the store.

For government, the efficiency of retail stores' technology will help in increase of the Gross Domestic Product (GDP) in Malaysia. This is because retailers are able to manage a large volume of data in the market. This could be very helpful in retail stores to analyse the data that they obtain specifically in retail stores for them to improve the economy.

5.4 Limitations of the Study

This study only conducted on a small size of population who are retailers that are having retail stores in Seremban area only. The study should involve many participants to get accurate results. But due to the time limit, researcher have no unlimited time to research and collect such a large data, so this studies only able to conduct by the small population. Since the respondents are focus on number of retailers, to catch retailers' time are one of the limitations. This is because most of retailers doesn't have much time to answers researcher's questions or give their opinions about this study. This questionnaire on this the research have been used were closed ended question with the Likert scale such as scale 1 until scale 5 which made the retailers to choose answer randomly. However, it common to have some respondents who just answer the questionnaire without read and understand the questions very well. This can affect the data that we need to calculate and this can also affect the variables and retailers that tick the lowest scale also can make the result getting worse which made the researcher hard to find actual result.

5.5 Recommendations

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

The researcher recommend for retail stores to get and upgrade more advanced technology system in their business because the technology would affect the entire business improve their business strategies and making much easier. retail stores needs to have knowledge to transfer in the environment of big data technology so that they can increase their sales and profits of the stores (Verma & Singh, 2017). The researcher recommend to get more used to advance technology and get more knowledge about current high technology system. Operations of retail stores might mitigate the implementation of big data technology procedures be lack (Fettermann et al., 2018).

6 Conclusion

In literature review, the factors that contribute the impact of big data to retail stores in Seremban were sales profit, buying pattern and operation. These three factors is a most important elements that closely relevant to the impact of big data to retail store to get new technology. Hence, a framework was created to show the factors that influencing impact of big data to retail store in Seremban. The factors that influencing were the independent variables in this research, which involved of sales profit, buying pattern and meanwhile the dependent variable for this research is impact of big data.

In the findings, researcher explore more about the Big Data, the definition of every independent variables and dependent variables. It has a positive relationship between independent variables and dependent variable. Based on the framework, researcher can make a few hypothesis about relationship between independent variables and dependent variable.

Few methods were used in this survey in order to analyse the result of data that surveyed. Researcher used descriptive analysis, reliability test, normality test and correlation analysis method based on Pearson's Correlation Coefficient to analyse the data collected. By using simple random technique, process of data collection were carried out by selecting random retailers in Seremban as respondents.

The result of the reliability and validity are found to be moderate and acceptable. The result from SPSS software indicates the relationship between independent variables and dependent variable. Based on the results, all factors are shown as factors that influence the impact of big data with the most significant factors which is sales profit, buying pattern and operation.

THE IMPACT OF VISUAL MERCHANDISING ON CONSUMER IMPULSE BUYING BEHAVIOUR AMONG SEREMBAN AREA CONSUMERS

Durga Dewi Udhiavell and Yusrinadini Zahirah Md. Isa@Yusuff

Faculty of Entrepreneurship and Business,
Universiti Malaysia Kelantan,
Malaysia

Email: durga.a17a0078@siswa.umk.edu.my ; yusrinadini@umk.edu.my

Abstract:

The purpose of this study is to define which visual merchandising influence consumer impulse buying behaviour among Seremban area consumers. The total number of respondents that involve in this study is 384 respondents. This study uses quantitative which questionnaire in a form of Google Form distributed to the respondents. And the data collected will through the test in Software Package for Social Sciences (SPSS). Three visual merchandising be as the independent variables which is window display, floor merchandising and shop brand names in this study. The results and finding show that convenience was the highest level of positive significant relationship between consumer impulse buying behaviour that be as dependent variable.

Keywords: *Visual merchandising, Impulse buying, Window display, Floor merchandising, Shop brand names.*

1 Introduction

Visual merchandising is one of those profiting techniques that is considered as one of the determinants of achievement for a retail location. In visual merchandising the management ensures that both the inside and outside of their store is sufficiently engaging to pull in the shoppers. Both the inside and outside regard to majorly affect buyers purchasing conduct and is observed to stimulate and want to buy among them. This technique also helps in the selling of the right kind of the product to the right kind of consumers by developing products accordingly (Wanninayake & Randiwela, 2007). Visual merchandising ranges from window display to floor merchandising along with shop brand name. Presentation of goods is often the most crucial factor in decision making. Four dimensions of store atmosphere i.e. visual (sight), aural (sound), olfactory (smell) and tactile (touch) are significant in consumer's choice of products (McGoldrick, 2002).

The visual merchandising is a marketing based phrasing which speaks to the most significant marketing tools and furthermore speaks to the most immediate mean of an expose an item. Visual merchandising isn't just about what is expressed before however it additionally incorporates the layout of stores which includes racking style, sections, environment the store have and the brands accessible. It is visual item identification, brand idea and the means for building up connection between a consumer and the item to produce deals. Among the many marketing strategies visual merchandising is the one which builds up an immediate association

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

and closer correspondence with a purchaser. The primary reason behind conducting this research is to analyze the impact of visual merchandising on consumer impulse buying behavior. Window display, floor merchandising and shop brand name are some elements of visual merchandising whose role in gaining consumer's impulse buying would be specifically discussed in this research.

1.1 Research Objectives

The main objective of this research process is to reveal what visual merchandising elements makes the highest impact on consumer impulse buying behavior. The various objectives of this problem are as follow:

- To discover the relationship between window display and consumer impulse buying behavior among Seremban area consumer.
- To study the relationship between floor merchandising and consumer impulse buying behavior among Seremban area consumer.
- To examine the relationship of shop brand name and consumer impulse buying behavior among Seremban area consumer.

1.2 Significance Study

The use of visual merchandise consistently improves the picture and offer of a retail outlet. However, there are only few researches done in this aspect. This research attempts to identify the impact of preferred visual merchandise and consumer buying behavior. With expanding rivalry, retailers are endeavoring to make their store appealing to their objective market. The product offered by retailers are discovered to be comparable. As the merchandise offered can't be separated, the retailers attempt to separate and deal with the opposition by visual merchandise. However, there are only few researches done in this aspect. Along these lines, this study will give data on why visual merchandising should be considered as a significant part of a key advertising plan on the side of income increment and making positive store/company image. This study will likewise give comprehension to retailers about best sorts of visual marketing methods that may impact customers' impulse buying behaviors.

2 Literature Review

Visual merchandising is a tool used by companies or shopkeepers to attract the customers for unplanned buying. In this the marketers and the shopkeepers arrange their shops or carryout promotional activities which attract the attention of shoppers by just having a look at the shop, their promotions, sign boards, atmosphere inside, shelf arrangements, section divisions, cleanliness and other factors which influence impulse or unplanned buying.

As stated by (HUBRECHTS & KOKTÜRK, 2012) motivators for impulse purchases are classified into two categories: internal motivators and external motivators. Internal motivators include hedonic needs, autistic stimuli, social status and subjective well-being. External motivators include visual stimuli, shopping format discounts, display, ambient factors and perceived crowding. They found that store layout, promotional signage, in-store display and product shelf

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

presentation had a strong positive impact on the customer's impulse purchase behavior.

(Husnain & Akhtar, 2016) investigated the paper titled "Impact of branding on impulse buying behavior". The objectives of the study are to detect the impact of branding on impulse buying in FMCG area Pakistan. A survey has been utilized to learn around 180 understudies occupied with buying. Convenience testing has-been utilized to gather the information. The research finds that branding has significant impact on impulse buying behavior of consumers.

(Minal, Sanjay, & Urvashi, 2012) investigated a paper named "Effect of Emerging Trends in Retail Sector on Impulse Buying Behavior". The fundamental point of this paper was to know the impact of later patterns in retail without much forethought buy i.e. the effect of window show limited time signage and floor stock. For this examination they gathered information from 200 respondents, Durg, Chattisgarh. The information investigation apparatuses like ANNOVA has been utilized. They anticipated that there is a positive connection between drive purchasing and window display, special signage and floor merchandising.

(Sujata, 2012) have shown impulse buying as a predecessor to impulse buying. He has taken window display, forum display, floor merchandising as independent variable. He has taken example involving both male and females old enough 18-45 and applied Pearson connection. His concludes by tolerating a strong correlation between window display, impulse buying and forum display. Low correlation is found between impulse buying and floor merchandising.

(PEREIRA et al., 2010) have considered the effect of visual merchandising on fashion stores in shopping centers. His reliant variable was visual merchandising and free factor was shopping store window as per sex. Elements esteemed by buyer on going into a store characteristic that impact on buy choices as indicated by sex. He used sample of 334 respondents and applied mean standard deviation as a factual device. His discoveries are that critical contrasts in the mall window show impacts over purchaser purchasing conduct as indicated by sex and minimal huge contrasts in the components esteemed by shoppers on going into a mall as per sexual orientation.

(N. P. Mehta & Chugan, 2013) directed an investigation on impulse buying behavior with a paper named, " impact of visual merchandise on impulse buying behavior. The fundamental reason for study is to discover the effect of visual merchandise without really thinking acquisition of customers in focal shopping center of Ahmadabad and India. They utilized factual bundle SPSS to examine information assembled from 73 respondents the outcome expressed that components of visual merchandise influence impulse buying behavior of shoppers in Ahmadabad.

2.1 Hypothesis

- H1: There is a positive relationship between window display and consumer impulse buying behavior.
- H2: There is a positive relationship between floor merchandising and consumer impulse buying behavior.
- H3: There is a positive relationship between shop brand names and consumer impulse buying behavior.

2.2 Conceptual Framework

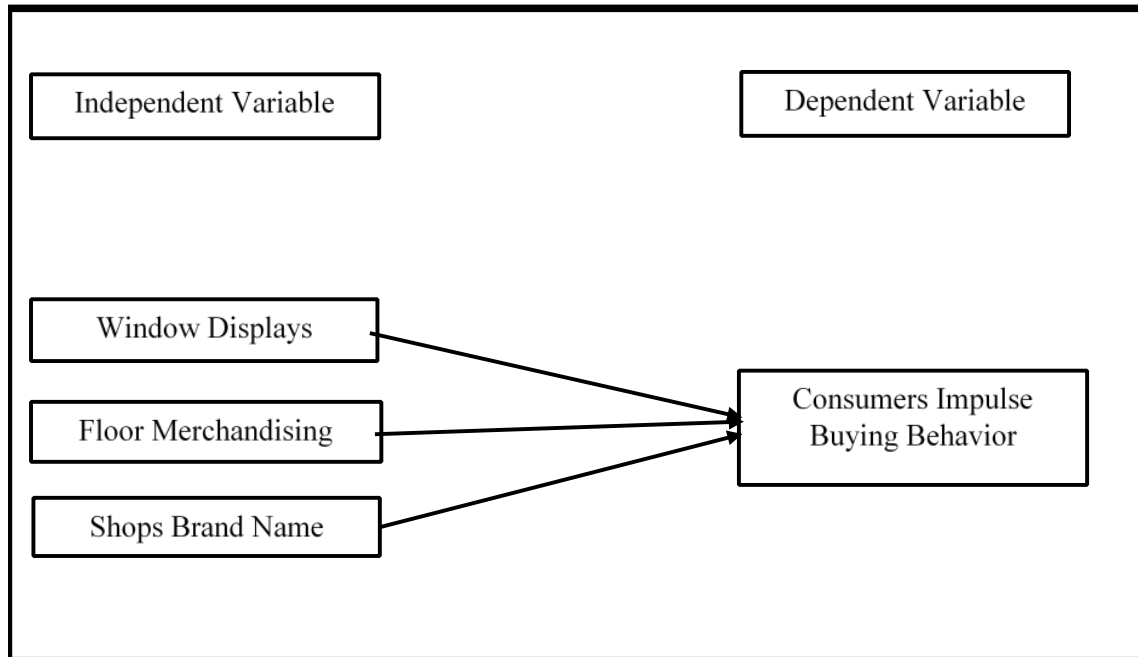

Figure 1: The Relationship of Independent Variable and Dependent Variable

3 Research Method

3.1 Method of Data Collection

This study used quantitative methods which questionnaire in order to study about the impact of visual merchandising on consumer impulse buying behaviour among Seremban area consumers. These data will be gathered from survey questionnaires. For the purpose of this research project, a quantitative research approach will be applied so that large amounts of data can be obtained within a short period of time.

3.2 Sample Size & Sampling Technique

384 respondents were selected as sample size for this research. The questionnaire included close ended questions and instrument was distributed randomly. The ethical use of respondents' data and information was also ensured. The sampling technique used for the research was non-probability and the respondents were chosen on the basis of convenience. The respondents were general consumers at different retail markets.

3.3 Instrument of Data Collection

In order to gather data for this research the instrument of questionnaire was used. The

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

questionnaire has been developed using Likert scale of 1 to 5 starting from strongly disagree (1) to strongly Agree (5). The target population for this survey was general consumers.

4 Analysis And Result

4.1 Descriptive Analysis

20 items had tested the descriptive analysis according to their variable and listed on the summary of the mean and standard deviation of computed items in Table 1, 2, 3 and 4.

4.1.1 Dependent variable: Consumer impulse buying behaviour

Table 1: Consumer impulse buying behaviour

Description	Mean	Std. Deviation
I shop based on my mood.	4.24	.780
I plan my purchase before shopping for it.	4.25	.752
When I see a good deal, I tend to buy more than that I intended to buy.	4.12	.867
I have difficulty controlling my urge to buy when I see a good offer.	4.16	.907
After I make an impulse purchase I feel regret.	4.01	1.092

4.1.2 Independent variable: Window display

Table 2: Window display

Description	Mean	Std. Deviation
I tend to enter the store when I am attracted by an eye-catching window display.	4.35	.680
I feel compelled to enter the store when I see an interesting window display.	4.16	.877
I tend to choose which store to shop in depending on eye-catching window display	4.23	.760
I tend to look at the display of products only at eye level.	4.16	.783
Window displays help to show variety of products in the store.	4.31	.655

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

4.1.3 Independent variable: Floor merchandising

Table 3: Floor merchandising

Description	Mean	Std. Deviation
I choose to shop in store with good layout, moving/browsing space and ambiance.	4.31	.631
I am more inclined for product purchase when I see a pleasant counter display.	4.26	.689
I buy products based only after looking around completely.	4.34	.652
A good space and proper layout inside the store make a comfortable environment to purchase.	4.33	.631
Store communications elements like tent cards, banner, floor vinyl, graphics enhance merchandise display affect customer purchase decision.	4.31	.679

4.1.4 Independent variable: Shop brand names

Table 4: Shop brand names

Description	Mean	Std. Deviation
Shop brand name influence on purchasing decision.	4.25	.761
Branded products are better than unbranded products.	4.17	.811
Brand name and image attract me to purchase.	4.18	.824
Brand often dominates my thoughts.	4.13	.893
Brand is very important to define my choice of purchase.	4.16	.854

4.1.5 Reliability Analysis

Table 5: Result Test of Reliability Coefficient Alpha for the Independent and Dependent Variable

Variables	Number of items	Cronbach's Alpha
Consumer impulse buying behavior.	5	0.809

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Window display	5	0.845
Floor merchandising	5	0.794
Shop brand names	5	0.910

The Cronbach's Alpha is designed to measure a "goodness" reliability criterion in each group item and internal consistency. De Vaus, (2002) suggests that in order to measure the reliability of the scale, whether the internal consistency is unacceptable, poor, questionable, acceptable, good and excellent, the Alpha value of Cronbach should be between $0.5 > \alpha$ and $\alpha < 0.9$. Table 5 summarizes the findings of the reliability test of each variable in this study. According to table 5, the range of Cronbach's Alpha is from 0.794 to 0.910 which indicates that each item for each variable as acceptable, good and excellent based on rule of thumb of Cronbach's Alpha Coefficient. According to the rule of thumb of Cronbach's Alpha coefficient, all the items of each variables represents as good as it exceeded 0.6. Hence, the reliability shows that all the items from each variable are easily understood by the respondents. This questionnaire is also accepted for data collection in this study.

4.1.6 Hypothesis Testing

Hypothesis to Address Research Question 1:

H0: There is no significant relationship between window display and consumer impulse buying behavior among Seremban area consumers.

H1: There is significant relationship between window display and consumer impulse buying behaviour among Seremban area consumers.

Table 6: The relationship between window display and consumer impulse buying behaviour among Seremban area consumer.

		Consumer impulse buying behavior	Window display
Consumer impulse buying behavior	Pearson Correlation	1	.644**
	Sig. (2-tailed)		.000
	N	384	384
Window display	Pearson Correlation	.644**	1
	Sig. (2-tailed)	.000	
	N	384	384

**Correlation is significant at the 0.01 level (2-tailed).

Table 6 above shows the relationship between window display and consumer impulse buying behaviour among Seremban area consumers. According to the result of The Pearson Correlation, this research is accepting H1 and rejected H0 because with the result 0.644 with significant value $p < 0.05$, it proved that there is a significant relationship exists between window display and consumer impulse buying behaviour among Seremban area consumers. From the result, H0 is rejected because the p-value is 0.00 which is the value is less than 0.05 and it shows there is no significant relationship that exists between both independent and dependent variables. Other than that, H1 shows the level of correlation between window display and consumer impulse buying behaviour is strong positive linear correlation.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Hypothesis to Address Research Question 2:

H0: There is no significant relationship between floor merchandising and consumer impulse buying behaviour among Seremban area consumer.

H2: There is significant relationship between floor merchandising and consumer impulse buying behavior among Seremban area consumer.

Table 7: The relationship between floor merchandising and consumer impulse buying behaviour among Seremban area consumer.

		Consumer impulse buying behavior	Floor merchandising
Consumer impulse buying behavior	Pearson Correlation	1	.505**
	Sig. (2-tailed)		.000
	N	384	384
Floor merchandising	Pearson Correlation	.505**	1
	Sig. (2-tailed)	.000	
	N	384	384

**Correlation is significant at the 0.01 level (2-tailed)

Table 7 shows there is relationship between floor merchandising and consumer impulse buying behaviour among Seremban area consumers. According to the result of The Pearson Correlation, this research is accepting H2 because with the result 0.505 with significant value $p < 0.05$, it means that there is a significant relationship exists between floor merchandising and consumer impulse buying behaviour among Seremban area consumers. From the result, H0 is rejected because the p-value is 0.00 which is less than 0.05 and that's means there is no significant relationship that exists between both independent and dependent variables. From the result also prove that the level of correlation between consumer impulse buying behaviour and floor merchandising for H2 is strong positive linear correlation.

Hypothesis to Address Research Question 3:

H0: There is no significant relationship between shop brand names and consumer impulse buying behaviour among Seremban area consumers

H3: There is significant relationship between shop brand names and consumer impulse buying behavior among Seremban area consumers.

Table 8: The relationship between shop brand names and consumer impulse buying behaviour among Seremban area consumers

		Consumer impulse buying behavior	Shop brand names
Consumer impulse buying behavior	Pearson Correlation	1	.675**
	Sig. (2-tailed)		.000
	N	384	384

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

Shop brand names	Pearson Correlation	.675**	1
	Sig. (2-tailed)	.000	
	N	384	384

**. Correlation is significant at the 0.01 level (2-tailed).

Table 8 shows there is relationship between shop brand names and consumer impulse buying behavior among Seremban area consumers. According to the result of The Pearson Correlation, this research is accepting H3 because with the result 0.675 with significant value $p < 0.05$, it means that there is a significant relationship exists between shop brand names and consumer impulse buying behavior among Seremban area consumers. From the result, H0 is rejected because the p-value is 0.00 which is less than 0.05 and that's means there is no significant relationship that exists between both independent and dependent variables. From the result also prove that the level of correlation between consumer impulse buying behavior and shop brand names for H3 is strong positive linear correlation.

5 Discussion & Recommendation

The study was conducted to identify which visual merchandising giving most impact on consumer impulse buying behaviour among Seremban area consumers. In this research, primary data was undertaken by the online questionnaires through Goggle Form to collect feedback from respondent and secondary data from the journal and article.

The dependent variable in this study was important to identify the consumer impulse buying behavior. Whereas, a set of independent variables which window display, floor merchandising and shop brand names was used. The researcher was identified 384 responses to perform data collection by the online questionnaires.

The analysis of data includes descriptive analysis, reliability analysis and Pearson Correlation Coefficient. The reliability test was conducted in this study to measure consistency, precision, repeatability and trustworthiness of this research. The Pearson Correlation also used in this research to denote relationship between two or more quantitative variables. Based on the result that researcher gained from chapter 4, the impact of visual merchandising (window display, floor merchandising, shop brand names) between consumer impulse buying behavior among consumers of Seremban area It shows that there were similarities that occur between previous study and current study which were supporting the hypothesis that has been stated in previous study.

This research has three objectives which are to discover the relationship between window display and consumer impulse buying, to study the relationship between floor merchandising and consumer impulse buying and to examine the relationship of shop brand names and consumer impulse buying among Seremban area consumers.

The future researcher can manage to conduct the research in different area of Malaysia to enrich the local context. Different state of Malaysia will have different impact in the visual merchandising. Future researcher can find out more information about the impact of visual merchandising on consumer impulse buying behaviour. Future researcher can know which visual merchandising influence consumer impulse buying behaviour.

Next, the future researcher is recommended to expand the sample size and the population in order to get more accurate and diverse outcome of the study. The study was conducted only at

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Seremban area. It is recommended that future researchers perform similar research in different areas, states or even in Malaysia as it will lead to a different outcome. In addition, in order to improve the quality of the data obtained, the number of respondents can be expanded for future studies. To get an accurate result from larger amount of responses, future researchers must take a longer duration for data collection and analysis.

Furthermore, future researcher should consider to use qualitative method for research. Future researcher may gain deeper understanding about the impact of visual merchandising on consumer impulse buying behaviour. Interview with the respondents enables researcher to know how the respondents think of visual merchandising. Therefore, using qualitative method may get different perspectives of the visual merchandising.

6 Conclusion

This study focuses on the impact of visual merchandising on consumer impulse buying behavior among Seremban area consumer. Organizations can use the outcome of this study to determine the effectiveness and impact of visual merchandising on consumer impulse buying behavior. This is because it will help retailers to make a strategic plan in order to use the visual merchandising techniques because it plays a very critical role to directly influence customer impulse buying. Many firms/retailers feel visual merchandising as highest unnecessary cost and retailers feel it as an unnecessary burden but visual merchandising has lot of advantages over than its cost. So retailers and firms needs to realize the long term strategy of visual merchandising.

The minimum requirement for reliability analysis has been met from the study of the overall variable since the value of the Cronbach's Alpha coefficients is above 0.6. The independent variables identified as the window display, floor merchandising and shop brand names indicate the significant relationship to the dependent variable known as the consumer impulse buying behavior. Based on the hypothesis result, all the H0 have been rejected while H1, H2, and H3 have been accepted in this study. Most notably, this study has established that Seremban area consumer's impulse buying behavior are influenced by window display, floor merchandising and shop brand names. Finally, this research was successfully completed.

7 Acknowledgment

I would like to take this opportunity to express my appreciation to all the people who have contributed their time and efforts that greatly helped me in this research study and made the research process easier to achieve. First of all, I would like to express my gratitude towards University Malaysia Kelantan for the opportunity to work on this research.

Secondly, I would like to say thank you to my supervisor, Dr.Yusrinadini Zahirah Binti MD Isa @ Yusuff. For guidance to complete this research study. She is always generous throughout the whole process of completing this project. Without her guidance and support, I would not have completed it within the time frame. Nevertheless, I grateful towards my family, and friend for their understanding and assistance during the writing phase.

Lastly, I would like to thank to the management of University Malaysia Kelantan because willing to give the cooperation with me which provides a way to access the material for writing the research project such as online library.

Universiti Malaysia Kelantan,
Malaysia

Email : emily.a17a0081@siswa.umk.edu.my ; tahirah@umk.edu.my

Abstract:

Service quality typically applies to a customer's assessment of service standards as it relates to the performance of the company. This study examined the relationship between service quality (tangibility, reliability, responsiveness, assurance and empathy) on customer satisfaction in Sibu, Sarawak. The data were collected from 384 respondents who really visit supermarkets in Sibu, Sarawak through questionnaire distribution. The collected data were analyzed through Statistical Package for Social Sciences (SPSS) Version 26 and the results of data were analysed using descriptive analysis, reliability analysis, Spearman correlation, and multiple regression. The results showed that tangibility, reliability, responsiveness, assurance, and empathy had a significant relationship to customer satisfaction in Sibu's supermarkets. In this study, assurance is the most influential dimension of service quality towards customer satisfaction. The findings of study should assist all supermarkets in Sibu, Sarawak to enhance their service quality and improve their customer satisfaction.

Keywords: Assurance, Customer Satisfaction, Empathy, Reliability, Responsiveness, Service Quality, Tangibility.

1 Introduction

1.1 Background of Study

Service quality was among the most significant competitive reasons in today's market environment. Therefore, the service quality will bring the different industries a great opportunity for organisations to generate competitive differentiation. The service quality reflects the core of the economy today, not just in developed countries, as well as in developing countries in the global (Mmutle, 2017). However, issues such as poor conditions of jobs, poor work standards and inefficient structures and procedures in place negatively affect the service quality by public organizations (Hennayake, 2017). In addition, due to unsatisfactory goods and poor service quality in different industries, Malaysian customers had to suffer a big loss of ever more than RM360 million (Malay Mail, 2019). The e-commerce (online buying) sector reported the highest number of complaints, followed by retail and telecommunications and mobile networks.

Supermarket is one of the retail service sectors. Nowadays, the supermarket performs a critical role in Malaysia's economy. Good service quality contributes to more customer satisfaction, sales and improved business performance (Sirohi & Kumar, 2018). Service quality is generally

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

specified as customer evaluation. Consequently, Supermarkets should enhance the quality of service in order to satisfy their customers with the services provided.

Customer satisfaction emerges which means that it determines the customer's expectation as to how goods and services are provided by businesses (Khadka & Maharjan, 2017). When the customer satisfaction is high in the business, the business will get high profit because the customer revisit and repurchase in this business. Hence, supermarkets can boost their profit quickly and efficiently by increasing customer satisfaction.

A successful service provider is providing consumers outstanding quality service. If the service quality is not good enough, the service provider is likely to deceive its customers and also lower their satisfaction. The service quality serves as a defining factor of customer satisfaction. Customer satisfaction and the service quality are related. The better the quality of the service, the customer satisfaction will be greater.

1.2 Research Objectives

1. What is the relationship between tangibility and customer satisfaction in Sibu's supermarkets?
2. What is the relationship between reliability and customer satisfaction in Sibu's supermarkets?
3. What is the relationship between responsiveness and customer satisfaction in Sibu's supermarkets?
4. What is the relationship between assurance and customer satisfaction in Sibu's supermarkets?
5. What is the relationship between empathy and customer satisfaction in Sibu's supermarkets?
6. What is the most influential dimension of service quality towards customer satisfaction in Sibu's supermarkets?

1.3 Significance of Study

This study primarily focuses on the relationship between service quality of supermarkets and customer satisfaction in Sibu, Sarawak. The findings of this study may help the management of supermarkets in Sibu to know the customer's opinion on the level of service quality. The result of this study would probably give references to the management of Sibu's supermarket to enhance their service quality to satisfy their customer. Service quality is an important factor contributing to customer satisfaction and thus service providers should boost their overall quality of service from each aspect which is used in this study.

It also brings priority to future researchers and other students who are involved in conducting research in this field. It helps those who are interested to lead the discovery in the related field to explore the relations between each aspect in detail at a later stage in the study. It also provides statistical and sentence support for further research from each aspect.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

2 Literature Review

2.1 Independent Variables

2.1.1 Tangibility

It relates to anything that is tangible and influences the quality of service to the customers. It is a company's ability to display its presence to other individuals in tangible bodies, such as infrastructures available, equipment, and the physical appearance of the company (Andrianto & Santoso, 2019). Tangibility will influence customers because failure in providing tangible things will make customers feel the company did not pay attention to the company image. Physical appearance will influence customers whether proper or improper service is provided by the company. Organizations spontaneously arrange physical items and combine them to deliver services to their customers who after its utilize access it (Othman, Harun, Rashid, & Ali, 2019).

2.1.2 Reliability

It relates to the willingness to fulfill the promise of service accurately and regularly (Felix, 2017). It involves right service and accurate record and prompt response to customers. Precise information involves precise product prices, and also right and reliable product information (Beneke, Hayworth, Hobson, & Mia, 2012). Reliability is a result evaluated when the customer evaluates the service after the service has been experienced. Reliability is the ability to assess the customer experience and as an aspect of the supplier's accreditation (Sakarji et al., 2020).

2.1.3 Responsiveness

It relates to the company's ability to serve customers and give quick service (Andrianto & Santoso, 2019). This dimension focuses attention and focus and pace in interacting with inquiries, questions, complaints and concerns from the customer. Responsivity is interacted to customers as long as they have to ask for help, responses to questions or attention to issues (Linh & Anh, 2018). It also relates to the capacity for employees to build customised solutions (Penceliah, Noel, & Adat, 2015).

2.1.4 Assurance

Assurance is the understanding and friendliness of staff and their ability to build faith and trust. It also defines the capacity of the company to foster trust in the eyes of the customer through the friendliness and understanding of the workforce in operation (Haming, Murdifin, Syaiful, & Putra, 2019). This dimension concerns how professional and courteous workers are to encourage confidence and trust from their users (Auka, Bosire, & Matern, 2013). If customers did not feel assured by the service provider, it meant that the company betrayed customer trust to them. Customers based their evaluation of a service provider 's ability on how effective or confident the necessary services were to be delivered (Sakarji et al., 2020).

2.1.5 Empathy

Empathy involves the willingness of the service provider to provide each customer with caring and personalised attention (Parasuraman et al., 1988). The key factors included in the measurement of empathy were individual attention, convenient working hours, awareness of the employees when an issue arises and the knowledge that employees have of the needs of the

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

customers (Auka et al., 2013). Customers want to feel valued and essential to businesses that give them access service (Hennayake, 2017).

2.2 Dependent Variable

2.2.1 Customer Satisfaction

The customer concept is the person or business that purchases the items or service from a corporation (Hamzah et al., 2017). Satisfaction can influence the company whether customers would repurchase, buying more goods, positive word of mouth and the willingness of the consumer to spend more for the specific brand (Hanif, Hafeez, & Riaz, 2010). Satisfaction is an expression to identify a feeling for an individual for something. Customer satisfaction with a company's goods and services is recognised as the most significant factor contributing to competition and growth.

In the corporate sector, customer satisfaction is critical because it will not have a market without loyal and satisfied customers. The more to concentrate on customer satisfaction and retention, the more long-term business to have (Mohsan, Nawaz, Khan, Shaukat, & Aslam, 2011). Customer satisfaction tests how well a customer's needs have been met for a product or service offered by a business. According to Beneke et al. (2012). high ratings for customer satisfaction are commonly assumed to be the main predictor of the financial performance of a company. As criteria for identifying product or service performance, many companies use customer satisfaction and even refer customer satisfaction ratings to management and employee pay ratings. The service quality is an essential tool to evaluate customer satisfaction and a criterion for maintaining satisfactory customer relations.

2.3 Research Hypothesis

- H1: There is a significant relationship between tangibility and customer satisfaction in Sibü's supermarkets
- H2: There is a significant relationship between reliability and customer satisfaction in Sibü's supermarkets.
- H3: There is a significant relationship between responsiveness and customer satisfaction in Sibü's supermarkets
- H4: There is a significant relationship between assurance and customer satisfaction in Sibü's supermarkets
- H5: There is a significant relationship between empathy and customer satisfaction in Sibü's supermarkets

2.4 Theoretical Framework

The conceptual framework shows the relationship between independent variable and dependent variables. There are five independent variables selected which are tangibility, reliability, responsiveness, assurance and empathy. The dependent variable is customer satisfaction.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

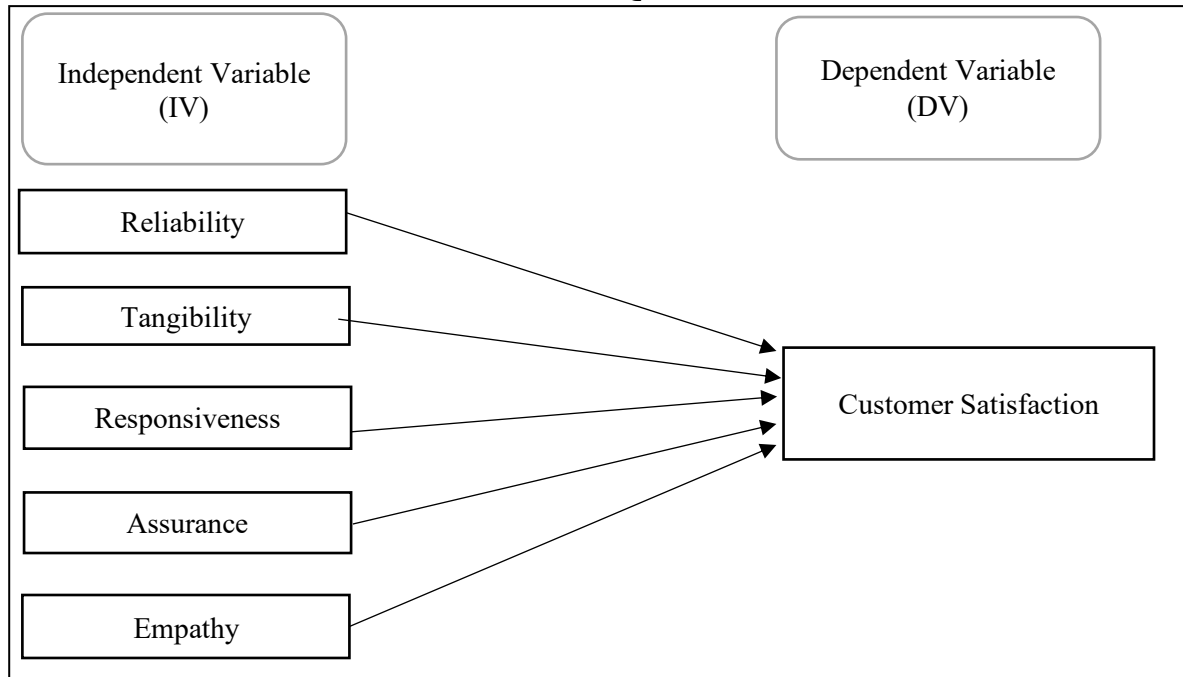

Figure 2.1 Conceptual Framework of Research

3 Methodology

3.1 Research Design

The research design that the researcher selected is descriptive research which used a quantitative research method in this study. In quantitative research method, the researcher uses standardised questionnaires to obtain data. Descriptive study in this research can be categorized as cross-sectional. Cross-sectional is the data only collected just once.

3.2 Data Collection Methods

This study will be conducted on a quantitative research method. Both the primary data and secondary data will be used in this study. Primary data is data that was collected by first hand by researcher for the purpose of this study. The researcher uses primary data in this study because it can get the latest information from the respondents. The secondary sources of data usually collected from journals articles, official websites, newspapers and others. The researcher uses secondary data which is existing data in this study because it will be conducted such as in literature reviews to explain definition and other information.

3.3 Study Population

The study will proceed in the Sibul which is a town in the central zone in Sarawak. The population for this study includes the customers who really visit the supermarkets in Sibul. Hence, the population of this study is the total number of residents in Sibul. Based on the statistics from the websites, the population of Sibul is approximately 198,239 (World Population Review, 2020).

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

3.4 Sample Size

All the respondents are the people who visit supermarkets at least one time in their life. The total number of residents in Sibul is the population in this study. A sample size will be carried out from the population in Sibul based on Krejcie and Morgan (1970) table, therefore the researcher decides the sample size that is 384 respondents.

Note: N is Population Size; S is Sample Size *Source: Krejcie & Morgan, 1970*

3.5 Sampling Techniques

Present study decided to select convenience sampling in non-probability sampling. A convenience sample comprising 384 respondents who convenient access was selected. In this case, the survey questionnaire will be distributed by using non probability sampling method who have fulfilled the functional requirements of convenience sampling.

3.6 Research Instrument Development

The questionnaire was categorized into 3 sections. Section A is about personal information. Section B is the questions that related with the independent variables, which included tangibility, reliability, responsiveness, assurance and empathy of Sibul's supermarkets. Section C is related to the dependent variable which is Sibul's supermarkets customer satisfaction.

Table 3.2: Sources of Questionnaire

Items	Adopted Sources
Tangibility	(Goranczewski & Puciato, 2011; Kitapci et al., 2013; Slack, Singh, & Sharma, 2020)
Reliability	Goranczewski & Puciato, 2011; Loke et al., 2011)
Responsiveness	(Goranczewski & Puciato, 2011; Kitapci et

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

	al., 2013; Eshetie, Seyoum, & Ali, 2016)
Assurance	(Goranczewski & Puciato, 2011; Slack, Singh, & Sharma, 2020; Handrinos et al.,)
Empathy	(Goranczewski & Puciato, 2011; Loke et al., 2011)
Customer Satisfaction	(Kitapci et al., 2013; Slack, Singh, & Sharma, 2020; Peng & Moghavvemi, 2015)

3.7 Measurement of the Variables

Nominal scale, ordinal scale and interval scale will be implemented in the questionnaire. In addition, the researcher will use a 5 point likert scale of scaling technique at section B and section C in the questionnaire.

3.8 Procedure for Data Analysis

Before doing data analysis, present study will design questionnaire and distribute to respondents to fill. After all data collected from the respondents, the researcher would transfer all data collected into SPSS. In this study, the researcher used Statistical Package for Social Sciences (SPSS) 26 in order to make the data analysis which included descriptive analysis, reliability test, Pearson's correlation analysis and multiple regression Analysis.

4 Data Analysis and Findings

4.1 Demographic Profile of Respondents

The personal information includes gender, age, race, education level, occupation and frequency of the respondents visiting Sibü's supermarkets in a month.

For gender, the majority of the respondents are female. It can be explained that about 222 (57.8%) respondents who participated in this study were female, meanwhile 162 (42.2%) were male. Therefore, the most active participant in this study was female rather than the male. It means that females visit supermarkets more than male.

For age, it states that the age of participants consists of people around below 20 until above 50. The majority of the respondents are from age 31-40. The percentage about 2.9%, which was 11 respondents of age below than 20, 26.0% or 100 respondents of age 21 to 30, 32.3% or 124 respondents from age 31 to 40, 28.1% or 108 respondents from age 41 to 50, and age 50 to above was about 10.7% which was 41 respondents. The most participated respondents were in age between 31 to 40 because they could give their time to answer questionnaire.

For race, it states the races of participants consists of races which are Malay, Chinese, Indian and Bumiputera Sarawak. The majority of the respondents are Chinese which represent 168 respondents (43.8 %). Meanwhile Malay respondents represent 75 out of 384 respondents. The number of Bumiputera Sarawak respondents show an impressive feedback which are 139 respondents or 36.2%. 2 Indian respondents also contribute into this study. It could indicate that the most respondents that participated in this study were Chinese which are more often went to supermarkets.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

For education, the majority of respondents are having SPM level as their highest education. For no education level, it was about 1 respondent with 0.3%, PMR about 9 respondents with 2.3%, SPM level about 124 respondents with 32.3%, STPM/A level about 61 respondents with 15.9% and Diploma level about 64 respondents with 16.7%, Bachelor Degree about 114 respondents with 29.7% and last Master Degree about 11 respondents with 2.9%. It could indicate that the most respondents that participated in this study had at least SPM level as their education.

For occupation, it provides selection for the respondents to choose their occupation which related to government sector, private sector, student and others. The majority of respondents are from the private sector. Government sector was about 121 respondents with 31.5%, private sector about 184 respondents with 47.9%, students about 59 respondents with 15.4 % and others about 20 respondents with 5.2%. It could be concluded that the respondents from the private sector participated the most in this study and the least participated were involved in others.

For frequent visit Sibul's supermarkets in a month, the selection of the question was 1 to 5 times, 6 to 10 times, 11 to 15 times and more than 15 times. The majority of respondents visited supermarkets in a month were 1 to 5 times. The respondents that using the Sibul's supermarkets for 1 to 5 times in a month was about 216 with 56.3%, 6 to 10 times was about 126 respondents with 32.8%, 11 to 15 times was about 26 respondents with 6.8% and more than 15 times was about 16 respondents with 4.2%. This could conclude that the most participating respondents in this study were the respondents that visit Sibul's supermarkets in 1 to 5 times a month.

Table 4. 1 Personal information of Respondents

	Frequency	Percentage (%)
Gender:		
Male	162	42.2
Female	222	57.8
Age:		
20 years old and below	11	2.9
21-30 years old	100	26.0
31-40 years old	124	32.3
41-50 years old	108	28.1

**How frequent did you visit
Sibu’s supermarkets in a
month?**

1-5 times	216	56.3
6-10 times	126	32.8
11-15 times	26	6.8
More than 15 times	16	4.2

4.2 Descriptive Analysis

Based on the result, customer satisfaction (DV) obtained the highest mean with 4.24, whereas tangibility (IV1) recorded the lowest mean with 4.10.

Table 4.2: Summary of the Means and Standard Deviation of Computed Items according to Variable

Variables	Mean	Std. Deviation
Tangibility (IV1)	4.10	.846
Reliability(IV2)	4.14	.742
Responsiveness (IV3)	4.16	.702
Assurance(IV4)	4.21	.679
Empathy (IV5)	4.11	.745
Customer Satisfaction (DV)	4.24	.674

4.3 Reliability Analysis

Reliability analysis played a vital role in the process of analysing the data. Reliability test was a technique for checking a scale’s internal regularity. Reliability test was also concerned about repeatability with obtaining the same result.

Based on the table 4.3, the highest Cronbach’s Alpha is Tangibility. It indicated the consistency and reliability of this items. The second highest of Cronbach’s Alpha was customer satisfaction which was 0.923 and followed by 0.922 which was belong to reliability. Cronbach’s Alpha of empathy was 0.906 which was higher than assurance which was 0.905. Lastly, the lowest Cronbach’s Alpha belongs to responsiveness which was 0.903. The overall result on above was shown to be good consistency and reliability for all of the independent variables and dependent variables as all of the Cronbach’s Alpha results were above 0.7.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Table 4.3: Reliability Statistics Results

Variables	Number of Items	Cronbach's Alpha Value
IV 1- Tangibility	5	.941
IV 2- Reliability	5	.922
IV 3- Responsiveness	5	.903
IV 4- Assurance	5	.905
IV 5- Empathy	5	.906
DV- Customer satisfaction	5	.923

4.4 Normality test

According to Kolmogorov-Smirnova test and Shapiro-Wilk test, normal is $p > 0.05$ while $p < 0.05$ is abnormal. For sig. value ($p = .000$) of Kolmogorov-Smirnova test and Shapiro-Wilk test of all variable are considered as abnormal. Thus, the distribution was abnormal and the researchers were suggested to use Spearman correlation analysis.

Table 4.4: Normality Test Results

	Kolmogorov-Smirnova			Shapiro-Wilk		
	Statistic	df	Sig.	Statistic	Df	Sig.
Customer satisfaction	.145	384	.000	.886	384	.000
tangibility	.170	384	.000	.869	384	.000
reliability	.157	384	.000	.910	384	.000
responsiveness	.129	384	.000	.914	384	.000
assurance	.126	384	.000	.912	384	.000
empathy	.130	384	.000	.918	384	.000

4.5 Spearman Correlation Analysis

This study has applied the Spearman correlation coefficient analysis as the guide in measuring the strength of the linear relationship between all of the independent variables which are tangibility (IV1), reliability (IV2), responsiveness (IV3), assurance (IV4), and empathy (IV5) with the dependent variable, which is customer satisfaction (DV). The result in this study shown that all of the independent variable had a strong relationship with dependent variables. The correlation between assurance (IV4) and customer satisfaction (DV) which was 0.866 is the most positive and strong relationship compared to other independent variables that has been tested during this study.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Table 4.5: Spearman Correlations

Correlations		DV	IV1	IV2	IV3	IV4	IV5

	N	384	384	384	384	384	384

** . Correlation is significant at the 0.01 level (2-tailed).

4.6 Multiple Linear Regression Analysis

A metric of dependent variable that is affected by one or more independent variables can be measured by using regression analysis. Thus, in order to achieve the research objective, multiple regression analysis is used to measure the relationship between five dimensions of service quality towards customer satisfaction at SibU's supermarkets.

Assurance is the most influential for customer satisfaction compared to other four independent variables, which are reliability, responsiveness, assurance and empathy. This is because its unstandardized coefficient beta is the highest, which is 0.507. Hence, the main predictor of customer satisfaction is assurance. This was followed by empathy, tangibility, reliability and responsiveness, which are 0.234, 0.194, 0.130 and -0.172 respectively.

Table 4.6: Coefficient Table of Independent Variables towards the Customer Satisfaction in SibU's supermarkets

		Coefficients ^a				
Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	.525	.088		5.998	.000
	Tangibility	.194	.035	.244	5.491	.000
	Reliability	.130	.053	.143	2.446	.015
	Responsiveness	-.172	.060	-.179	-2.862	.004
	Assurance	.507	.054	.511	9.455	.000
	Empathy	.234	.046	.258	5.047	.000

BUSINESS COLLOQUIUM 2020/2021**

a. Dependent Variable: (Customer Satisfaction) DV

5 Discussion and Recommendations

5.1 Discussion

The relationship between tangibility of SibU’s supermarkets and customer satisfaction was determined in Hypothesis 1. Based on the results of Spearman Correlation Coefficient, it showed that p-value of tangibility is 0.000. It means that there is a significant relationship between tangibility and customer satisfaction in SibU’s supermarkets ($r = 0.838, p < 0.05$). Hence, hypothesis 1 is accepted.

The relationship between reliability of SibU’s supermarkets and customer satisfaction was determined in Hypothesis 2. Based on the results of Spearman Correlation Coefficient, it showed that p-value of reliability is 0.000. It means that there is a significant relationship between reliability and customer satisfaction in SibU’s supermarkets ($r = 0.843, p < 0.05$). Hence, hypothesis 2 is accepted.

The relationship between responsiveness of SibU’s supermarkets and customer satisfaction was determined in Hypothesis 3. Based on the results of Spearman Correlation Coefficient, it showed that p-value of responsiveness is 0.000. It means that there is a significant relationship between responsiveness and customer satisfaction in SibU’s supermarkets ($r = 0.829, p < 0.05$). Hence, hypothesis 3 is accepted.

The relationship between assurance of SibU’s supermarkets and customer satisfaction was determined in Hypothesis 4. Based on the results of Spearman Correlation Coefficient, it showed that p-value of assurance is 0.000. It means that there is a significant relationship between responsiveness and customer satisfaction in SibU’s supermarkets ($r = 0.866, p < 0.05$). Hence, hypothesis 4 is accepted.

The relationship between empathy of SibU’s supermarkets and customer satisfaction was determined in Hypothesis 5. Based on the results of Spearman Correlation Coefficient, it showed that p-value of assurance is 0.000. It means that there is a significant relationship between responsiveness and customer satisfaction in SibU’s supermarkets ($r = 0.851, p < 0.05$). Hence, hypothesis 5 is accepted.

Table 5.1: Summary of Hypotheses Testing

Hypotheses	Data Analysis Method	Results
H1: There is a significant relationship between tangibility and customer satisfaction in SibU’s supermarkets	Spearman Correlation Coefficient	Accepted ($p = 0.000, r = 0.838$) $p < 0.05$
H2: There is a significant relationship between reliability and customer satisfaction in SibU’s	Spearman Correlation	Accepted ($p = 0.000, r =$

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

supermarkets	Coefficient	0.843) p < 0.05
H3: There is a significant relationship between responsiveness and customer satisfaction in Sibü's supermarkets	Spearman Correlation Coefficient	Accepted (p = 0.000, r = 0.829) p < 0.05
H4: There is a significant relationship between assurance and customer satisfaction in Sibü's supermarkets	Spearman Correlation Coefficient	Accepted (p = 0.000, r = 0.866) p < 0.05
H5: There is a significant relationship between empathy and customer satisfaction in Sibü's supermarkets	Spearman Correlation Coefficient	Accepted (p = 0.000, r = 0.851) p < 0.05

5.2 Recommendations

The future researchers are suggested to increase the sample size so that more people can involve in this study. This is because there are only 384 respondents in the present study. When there are more respondents involved in this study, the more the result can represent the opinion of the people. Hence, the future researchers are recommended to conduct similar research in other places and enlarge the sample size to generate more information from a different and larger population.

Second recommendation that suggested by the researcher of this study is the future researchers can add on other factors that might be influenced on customer satisfaction. The other factors might be also important to involved in the research in order to examine the level of customer satisfaction who visited the supermarkets. Hence, the future researchers who want to carry out the same field can add other factors not only service quality so that it can ensure different factors are also important to customer satisfaction.

Lastly, future research also recommended conducting mixed collection method. This is because in quantitative method, the questions were already fixed. Through qualitative research, researcher can get more perspective and more detail information about what they really felt at supermarkets from the respondents.

6 Conclusion

The main objective of this study is to investigate the relationship between service quality of supermarkets and customer satisfaction in Sibü, Sarawak. The finding showed that each

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

dimension of service quality which is reliability, tangibility, empathy, assurance and responsiveness had a significant relationship with the customer satisfaction in Sibul's supermarkets. The most important is assurance plays a vital role in influencing service quality of supermarkets towards customer satisfaction in Sibul, Sarawak. While responsiveness was the least significant dimension of service quality that caused to give an influence towards the supermarkets customer satisfaction. Hence, the findings of the study will be helpful to all supermarkets in Sibul, Sarawak to enhance their service quality and improve their customer satisfaction.

7 Acknowledgment

I would like to take this chance to record my deepest thanks for those who supported me in this research. The research would not be done without their great encouragement and supportive contributions.

Firstly, I would like to thank my supervisor Dr. Tahirah Binti Abdullah for her guidance and supervision of this research and correcting mistakes and guiding me.

I indebted to all of them, who did their best to bring their suggestions to us. Furthermore, I would like to express our gratitude towards my parents and members of my families for their understanding while in completion of this research.

Finally, I would like to thank the people who directly or indirectly helped me do the research. Thank you.

Abstract:

The purpose of this research is to examine the factors that influence consumer purchasing decisions during Covid-19 in the most affected areas in Malaysia. Since the outbreak of the Covid-19 virus worldwide, consumer spending behavior has changed dramatically. This is because consumers should limit their shopping activities because they want to reduce expenses in preparation for future crises. Many are impressed with the changes that are taking place, especially in business or commerce. Therefore, this research aims to examine the relationship between consumer purchasing decisions with four main factors namely product, price, location or channel, and promotion. This study collected data using a questionnaire distributed and conducted on 384 respondents with a population scope that includes all residents in the area affected by the Covid-19 epidemic. Pearson correlation coefficient analysis and regression analysis were used to test the relationship between these four factors and consumer purchasing decisions. Based on the results of the study, there is a significant relationship between product, price, location or channel, and promotion. Finally, the results of this study can increase the knowledge of the community, government, traders, and other researchers to better understand consumer purchasing decisions, especially in the event of a crisis in the future.

Keywords: Covid-19, Place, Price, Product, Promotion.

1 Introduction

On March 11, 2020, the Covid-19 pandemic has spread worldwide in more than 114 countries before the WHO being formally declared as an outbreak ⁷(Anjorin, 2020). The virus surging dramatically since March 2020 across the world involved many regions and countries. As social distancing becomes the new normal by cause of the Covid-19 pandemic, consumer habits are acclimated in real-time to the new environment and circumstances ⁸(Tam, 2020). Dinozo (2020) found that shopping behaviour is beginning to evolve during the Covid-19 pandemic outbreak.⁹ They will likely be purchasing a low price product and decided on expensive

⁷ Anjorin, A. (2020). The coronavirus disease 2019 (COVID-19) pandemic: A review and an update on cases in Africa. *Asian Pacific Journal of Tropical Medicine*, 13(5), 199. <http://doi.org/10.4103/1995-7645.281612>

⁸ Tam, B. (2020, April 27). *How COVID-19 Will Change Consumer Behaviour + Purchase Patterns*. Hill+Knowlton Strategies. <https://www.hkstrategies.com/how-covid-19-will-change-consumer-behavior-purchase-patterns/>

⁹ Dinozo, C. (2020, April 12). *Survey: How is COVID-19 Changing Consumer & eCommerce Trends?* Yotpo. <https://www.yotpo.com/blog/survey-how-is-covid-19-changing-consumer-ecommerce-trends/>

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

products. They will make a purchase only to fulfil their basic needs and will decrease their intentions to buy products that not fulfil their needs. In Malaysia, consumers prefer to spend more money on a product that lasting for a long time. They also prefer to purchase essentials items rather than luxury items. This change in buying behaviour shows that Malaysians are adapting to the new living situations. (Kong, 2020).¹⁰

The research objective was to identify the relationship between factors affecting consumer buying decisions during Covid-19 at most affected area in Malaysia. So, consumers need to know more about their purchasing habits and the factors that influence their buying decisions such as price, product, place, and promotion during this pandemic outbreak. This research will be explored and focusing more on consumer buying decisions during the outbreak of the Covid-19 pandemic. This research focuses only on four factors that influenced consumer buying decisions in Malaysia. This research will explain in detail whether factors such as product, place, price, and promotion are influenced by the consumer buying decisions especially during Movement Control Order (MCO) or Conditional Movement Control Order (CMCO). During MCO or CMCO, the government has allowed only certain economic sectors can be operated with government permission. So, it gives a great impact on buying decisions because consumer buying patterns have changed significantly by this situation.

2 Literature Review

2.1 Underpinning Theory

The underpinning model of the study is known as Hawkins Stern's Impulse Buying Theory (1962). Stern (1962) introduced the concept of a suggestion impulse purchase as the purchase of a new product on the basis of self-suggestion but without any prior experience. Stern (1962) defined impulse buying behaviour by classifying it as planned, unplanned, or impulse, also suggested that some product-related factors might predict impulse buying.¹¹ Factors that stimulate consumers have six components included marketing stimuli (4Ps) need or motivation and so on. In this study, the researcher focuses on the external factor that influencing consumer buying decisions which is marketing stimuli. Marketing stimuli consist of four components which include product, price, place, and promotion (Kotler et al., 2008).¹² This stimulus represents external circumstances that help create consumer choice. Figure 2.1 given below to illustrate Hawkins Stern's Impulse Buying Behaviour.

¹⁰ Kong, S. (2020, April 25). *Covid-19 changes consumer buying behaviours*. Borneo Post Online. <https://www.theborneopost.com/2020/04/26/covid-19-changes-consumer-buying-behaviours/>

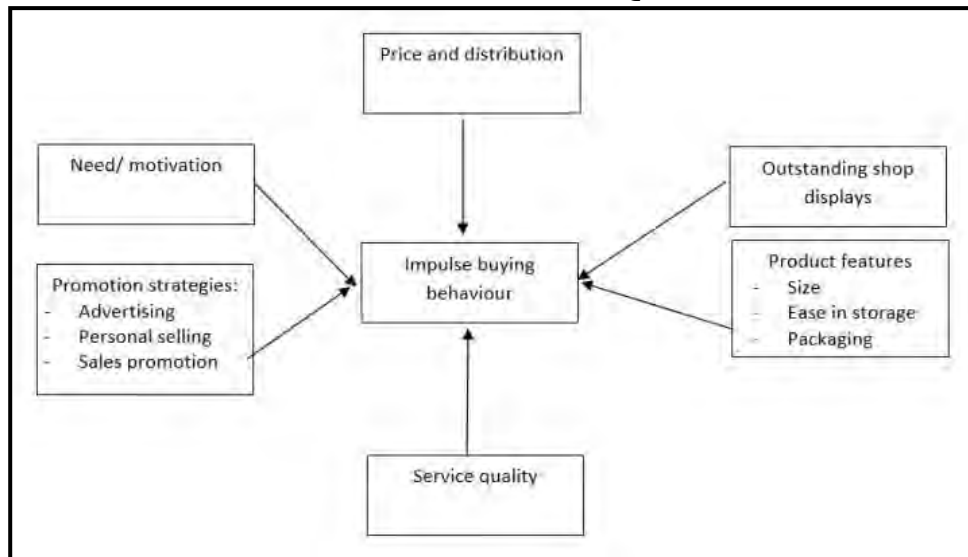

Figure 2.1: Hawkins Stern's Impulse Buying Behaviour¹³

(Source: Stern, 1962, p59)

Marketing stimuli also refers to the marketing mix or the 4P's presented by the marketer. According to the theory, the buyer's decisions influenced by marketing activities. Marketers can influence consumers by marketing stimuli in order to meet the specific needs of customers and yield profits. 4P's of marketing stimuli stands for product, price, place, or distribution, and promotion are the factors coordinate by a marketer that influence people's consumption choices¹⁴(Gbadamosi, 2016). Marketing stimuli or external stimuli described as shopping and marketing environment. The buyer's decision is considered an output phase that explains consumer behavior during the purchase or post-purchase evaluation experience. In this study, the researcher used marketing stimuli as a factor affecting consumer buying decisions because there are many previous researchers who used it.

2.2 Previous Studies

Based on the previous study, consumers frequently display consistent decision-making styles to direct their decision-making when they shop¹⁵(Durvasula et al., 1993). Besides that, consumers commonly demonstrate different shopping patterns. This is because consumers have different needs and want including their habits, personalities, attitudes, and economic situations. For example, some consumers preferred branded products or high-quality products for themselves but some consumers preferred affordable products. For these reasons, many factors such as brand, quality, price, habit, recreation, confusion, impulse, and fashion combine

to determine an Individual's unique shopping habits ¹⁶(Sproles & Kendall, 1986). Malaysian's buying behavior gave changed during the Covid-19 pandemic outbreak ¹⁷(Leong, 2020).

2.3 Conceptual Framework

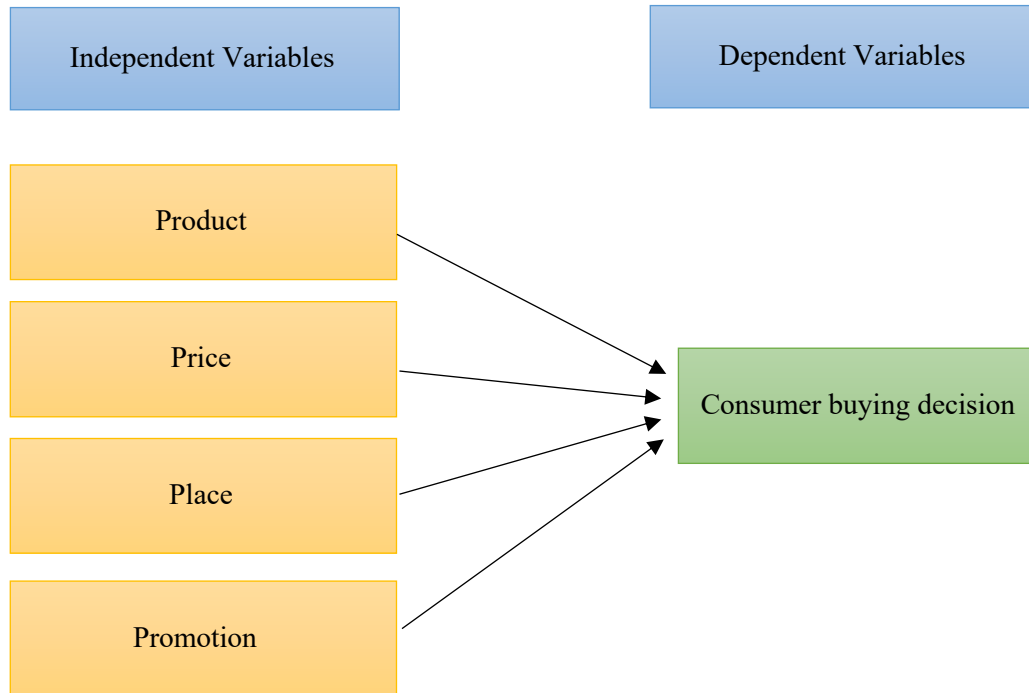

Figure 2.2: Theoretical framework of the factors affecting on consumer buying decision during Covid-19 at most affected area in Malaysia

2.3.1 *The relationship between product and consumer buying decision*

Product factors greatly influence consumer decisions when buying goods. Consumers tend to determine the type of product, product quality, and product functionality they like before making a purchase. This is because consumers will choose products that can meet their needs and wants. Consumers are more interested in product features that are attractive and beneficial to them. For example, consumers who like to drink coffee will buy coffee that has a good taste and aroma and has a large quantity.

2.3.2 *The relationship between price and consumer buying decision*

The price factor greatly influences the consumer's decision to buy a product. Price perception explains information about a product and gives deep meaning to the consumer ¹⁸(Kotler and Keller, 2016). Consumers will make purchases based on product prices because they want to make purchases that benefit them. For example, consumers will not buy a product whose price is not worth the quality of the product. Therefore, they will make expenses that will give benefit to them. Price is an important element to a product because it gives value to them.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

2.3.3 *The relationship between place and consumer buying decision*

Place refers to the process and methods used to bring the product or service to the consumer¹⁹(Luenendonk, 2019). The place factor also influences consumer buying decisions because consumers should decide concerning the place of purchasing before making a purchase. For example, busy business users prefer to place orders online for food delivery because they do not have enough time to stop by the restaurant. Correct placement is a vital activity that is focused on reaching the right target audience at the right time²⁰(Luenendonk, 2019).

2.3.4 *The relationship between promotion and consumer buying decision*

The promotion factor also greatly influences the consumer's decision to buy a product. Promotion refers to the marketing communication used to make the offer known to potential customers and persuade them to investigate it further²¹(Blythe & Jim, 2009). According to Wikipedia (2020), in marketing, promotion refers to any type of marketing communication used to inform or persuade target audiences of the relative merits of a product, service, brand, or issue.²² It helps marketers to create a distinctive place in customers' mind.

3 Research Methods

3.1 Data Collection Methods

The researcher used primary and secondary data collection methods. The researcher used quantitative data collection methods for this study. The researcher chooses this method because it is easy to make comparisons of findings and they can be applied within a shorter duration of time. So basically, the questionnaire would be distributed to the respondents to test the dependent variable and independent variables. The research is conducted by the researchers by distributing the questionnaire to respondents in the most affected areas of Covid-19 in Malaysia such as Kuala Lumpur, Selangor, Negeri Sembilan, and Kedah. For secondary data collection methods, the researcher used it because it is helpful to save time for collecting data because this type of data has been collected by a previous researcher. A common source for this type of data includes books, journals, internet searches, and so on.

3.2 Sample size

According to Fraenkel and Wallen (1993), a sample can be defined as the group where the information can be obtained.²³ The sample of this research was the population of the most affected area of Covid-19 in Malaysia. Each member of the sample is known as the subject²⁴(Kumar et al., 2013). So respondents in the most affected area of Covid-19 would become the sample size in this research when the population number is 11.63 million people. Considering the formula used by Krejcie & Morgan (1970) in determining the sample size of the research, the suitable sample size for this research is 384.²⁵ However, in terms of the low return rate of a questionnaire distributed, we would distribute four hundred copies of the questionnaire to ensure the data collection was sufficient.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

3.3 Sampling technique

The sampling techniques used by the researcher is probability sampling methods were chosen from the respondents in the most affected areas of Covid-19 in Malaysia such as Kuala Lumpur, Selangor, Negeri Sembilan, and Kedah. In this sampling plan, a simple random sample is used which is each individual is chosen randomly and entirely by chance, such that each individual has the same probability of being chosen at any stage during the sampling process ²⁶(Wikipedia Foundation, 2020). Sampling is an alternative used by the researcher to know and get the conclusion of the factors affecting pandemic on consumer buying decision during Covid-19 at the most affected area in Malaysia. An individual will be chosen entirely by chance and each member of the population has an equal chance, or probability, of being selected as a sample.

3.4 Research Instrument Development

The research instrument used by the researchers in this study is a structured questionnaire. Researchers have used questionnaires as the main source of data collection in conducting the entire research study. Questionnaire validation is one type of source of obtaining and collecting data in each research proposal ²⁷(Richards and Schmidt, 2013). The researchers used questionnaires because the distance and number of respondents were large, simple, efficient, and could spend less time compared to interviews and observations. The questionnaire would be divided into few parts which were Section A, B, and C. Basically, Section A would be the part of the demographic of respondents in terms of age, gender, race, mutual status, and so on. For Section B and Section C, questions would focus on the independent variables and dependent variables. Independent variables were product, price, place, and promotion. For the dependent variable which was the consumer buying decision.

3.5 Measurements of the Variables

Understanding the level of measurement of variables used in research is important because the level of measurement determines the types of statistical analyses that can be conducted. In this study, the researchers had chosen respondents at the most affected area of Covid-19 in Malaysia as the respondents. All the respondents were individual and the entire questionnaire was given individually. The Likert scale had been applied in the research study due to the ease of analysis which was a 5-point Likert scale that typically based on strongly agree, agree, neutral, disagree, and strongly disagree type of rage. The researcher chooses the 5-point Likert scale because there are many researchers who used this type of Likert scale.

Table 3.1: Likert Scale Value

Options	Degree
Strongly disagree	1
Disagree	2
Neutral	3
Agree	4
Strongly agree	5

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

3.6 Procedure for Data Analysis

The researcher used quantitative data analysis because it involves critical analysis and interpretation of figures and numbers. The researcher used Statistical Package for the Social Science (Version 21.0 SPSS) as a device for analyzing and interpreting the data. This software could do manipulation and analyze sophisticated information with a very easy method ²⁸(Foley, 2020). For the reliability test, the researcher used Cronbach's alpha coefficient for estimating the consistency and stability of the result obtained. The researcher chooses Cronbach's alpha coefficient because it can be used or retest and if the result shows the same or almost the same it means it stands for very reliable.

Table 3.2 Cronbach's Alpha Coefficient

Alpha Coefficient Range	Strength of Association
<0.60	Poor
0.60 to < 0.70	Moderate
0.70 to < 0.80	Good
0.80 to < 0.90	Very Good
>0.90	Excellent

The researchers had used Pearson's correlation coefficients in order to analyzed, collected, and identified the collection of data analysis. Pearson's correlation coefficient was used to see the strength of the linear relationship between the independent and dependent variables. The researchers would get the positive and negative correlation coefficient and it was always between the ranges of scale for -1.00 to +1.00. It was considered a perfect positive correlation if the correlation shown was +1.00 and perfect negative correlation if it showed -1.00 while there would be no relationship if it showed 0.00 which as neutral.

Table 3.3 Pearson's Correlation Coefficient

Size of Coefficient	Strength
0.90 – 1.00 (-0.90 to -1.00)	Very high positive / Negative correlation
0.70 – 0.90 (-0.70 to -0.90)	High positive / Negative correlation
0.50 – 0.70 (-0.50 to -0.70)	Moderate positive / Negative correlation

²⁸ Foley, B. (2020, October 12). *What is SPSS and How Does it Benefit Survey Data Analysis?* Alchemer. <https://www.alchemer.com/resources/blog/what-is-spss/>.

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

0.30 – 0.50 (-0.30 to -0.50)	Low positive / Negative correlation
0.00 – 0.30 (0.00 to -0.30)	Negligible positive / Negative correlation

4 Data Analysis

4.1 Demographic Profile of Respondents

4.1.1 Age of the respondents

Table 4.1 showed that the majority of the respondent's average age between 20 to 29 years old which was 166 respondents (42.00%). Then, followed by the respondent's ages between 30 to 39 years old which was 92 respondents (25.10%). For the respondent's age below 20 years old, it recorded 72 respondents (18.80%) and the minority of the respondent's age was 40 years old and above which was 54 respondents (14.10%).

Table 4.1 Age of the respondents

Age (years old)	Frequencies	Percentage (%)
Below 20	72	18.80
20-29	166	42.00
30-39	92	25.10
40 and above	54	14.10
Total	384	100.00

4.1.2 Gender of the respondents

From Table 4.2, it showed that the majority of the respondent's gender that participate in the survey question was females which were 224 respondents (58.30%). The remaining belongs to males which were 160 respondents (41.70%).

Table 4.2 Gender of the respondents

Gender	Frequencies	Percentage (%)
Female	224	58.30
Male	160	41.70
Total	384	100.00

4.1.3 Race of the respondents

From Table 4.3, it showed that the majority of the respondent's race was Malay which was 312 respondents (81.30%). Then, followed by Chinese respondents that participate in the survey question which was 44 respondents (42.00%). For the remaining respondents, Indian belongs to the minority of the respondents which was 28 respondents (25.10%). For other races, there was zero number of respondents.

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

Table 4.3 Race of the respondents

Race	Frequencies	Percentage (%)
Malay	312	18.80
Chinese	44	42.00
Indian	28	25.10
Others	0	0.00
Total	384	100.00

4.1.4 Mutual status of the respondents

Table 4.4 showed that the most number of respondent's mutual status was single which was 198 respondents (51.60%) and the least number of respondent's mutual status was married which was 186 respondents (48.40%). There is no respondent choose others option on the questionnaire.

Table 4.4 Mutual status of the respondents

Mutual status	Frequencies	Percentage (%)
Single	198	51.60
Married	186	48.40
Others	0	0.00
Total	384	100.00

4.1.5 Occupation of the respondents

From Table 4.5, it showed that the most number of respondent's occupation was students which were 151 respondents (38.30%). Then, followed by self-employed which was 95 respondents (24.70%). The number of respondent's occupations from the private sector belongs to third place which was 59 respondents (15.40%). Respondents from the government sector belong to fourth place which was 45 respondents (11.70%) and the number of unemployed respondents belongs to fifth place which was 34 respondents (8.90%).

Table 4.5 Occupation of the respondents

Race	Frequencies	Percentage (%)
-------------	--------------------	-----------------------

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

Student	151	38.30
Government	45	11.70
Private	59	15.40
Self-employed	95	24.70
Unemployed	34	8.90
Total	384	100.00

4.2 Descriptive Analysis

4.2.1 Descriptive statistics for product

Table 4.6 as below showed the descriptive statistics for the product. The result showed most respondents that participated in the survey question were only buy products when they feel it necessary needed and once they find a product they like, they buy it regularly especially during Covid-19 (4.56). Next, followed by the respondents make a special effort to choose the very best quality products especially during Covid-19 (4.53). The least respondents prefer buying the best-selling products especially during Covid-19 (4.45).

Table 4.6 Descriptive statistics for product

Statements	Mean
1. I only buy products when I feel its necessary needed especially during Covid-19	4.56
2. I prefer buying the best-selling products especially during Covid-19	4.45
3. Once I find a product I like, I buy it regularly especially during Covid-19	4.56
4. I make a special effort to choose the very best quality products especially during Covid-19	4.53

4.2.2 Descriptive statistics for price

Table 4.7 below showed the descriptive statistics for price. From the result, it showed the majority of respondents that participated in survey question affected by low prices of product because it increases their willingness to buy them especially during Covid-19 (4.57). Next, followed by the respondents who prefer to buy their needs during sales seasons and will compare item prices between different stores especially during Covid-19 (4.50). The minority respondents always drive a bargain when buying a product especially during Covid-19 (4.45).

Table 4.7 Descriptive statistics for price

Statements	Mean
1. Low prices of products increase my willingness to buy them especially during Covid-19	4.57

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

2. I prefer to buy my needs during sales seasons especially during Covid-19	4.50
3. I always drive a bargain when buying a product especially during Covid-19	4.45
4. I compare item prices between different stores especially during Covid-19	4.50

4.2.3 Descriptive statistics for place

Table 4.8 showed the descriptive statistics for the place. From the result, it showed the majority respondents that participated in survey question prefer store location is not far away from their house and they preferred store locations are easy to access since it is located in malls and big streets especially during Covid-19 (4.56). Next, followed by the respondents that usually look for an online item especially during Covid-19 (4.33). The minority respondents will look for it on online platforms if the goods aren't available in stores especially during Covid-19 (4.32).

Table 4.8 Descriptive statistics for place

Statements	Mean
1. I prefer store location is not far away from my house especially during Covid-19	4.56
2. I prefer store locations are easy to access since it is located in malls and big streets especially during Covid-19	4.56
3. I usually look for an online item especially during Covid-19	4.33
4. If the goods isn't available in stores, I look for it on online platforms especially during Covid-19	4.32

4.2.4 Descriptive statistics for promotion

Table 4.9 showed descriptive statistics for promotion. From the result, it showed most respondents that participated in the survey question preferred the store gives information when they have a promotion especially during Covid-19 (4.50). Secondly, the respondents preferred the store to give some coupons to be changed with merchandise especially during Covid-19 (4.44). Thirdly, respondents do not buy unnecessary items unless it's on discount especially during Covid-19 (4.43). The least respondents will look forward to receiving free samples when they did grocery shopping especially during Covid-19 (4.34).

Table 4.9 Descriptive statistics for promotion

Statements	Mean
1. I don't buy unnecessary items unless it's on discount, especially during Covid-19	4.43
2. I prefer the store gives information when they have a promotion, especially during Covid-19	4.50
3. I prefer the store to give some coupons to be changed with merchandise	4.44

BUSINESS COLLOQUIUM 2020/2021**

especially during Covid-19	
4. I look forward to receiving free samples when I do grocery shopping especially during Covid-19	4.34

4.2.5 Descriptive statistics for consumer buying decisions

Table 4.10 showed descriptive statistics for a consumer buying decision. The result showed most respondents that participated in the survey question were purchased items that are readily available especially during Covid-19 (4.49). Secondly, the respondents used the prices to determine which products to purchase especially during Covid-19 (4.46). The least respondents purchased items because of the advertisement run in the media especially during Covid-19 and the packaging of the products influences their decision to purchase (4.41).

Table 4.10 Descriptive statistics for consumer buying decisions

Statements	Mean
1. I purchase items because of the advertisement run in the media especially during Covid-19	4.41
2. I purchase items that are readily available especially during Covid-19	4.49
3. I used the prices to determine which products to purchase especially during Covid-19	4.46
4. The packaging of the products influences my decision to purchase	4.41

4.2.6 Descriptive statistics for product, price, place, promotion and consumer buying decisions

Table 4.11 as below showed the average mean for all independent variables includes the product, price, place, promotion, and dependent variables which were consumer buying decisions. Product recorded the highest level of mean that indicated 4.53 followed by the level of the mean for the price which was 4.51. The level of the mean for the place was 4.44 while the lowest level of mean was 4.43. Then, the level of the mean for consumer buying decisions was 4.44. However, all these five variables indicated that they gained a high level of means score.

Table 4.11 Descriptive statistics for product, price, place, promotion and consumer buying decisions

Measures	Total Means
Product	4.53
Price	4.51
Place	4.44
Promotion	4.43
Consumer buying decisions	4.44

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

4.3 Validity and Reliability Test

4.3.1 The Cronbach's Alpha

Table 4.12 showed Cronbach's alpha values for the variables that were used in the measurement instrument. Four questions were used to measure the product by using a 5-point Likert scale. The Cronbach's Alpha result for this independent variable was 0.865 which was a very good level that indicates an acceptable level of reliability. It considered a good strength of association and thus the items coefficient for the product was reliable. This is because α of 0.800 shows a very good acceptable level of reliability.

Next, four questions were used to measure price by using a 5-point Likert scale. The Cronbach's Alpha result for this independent variable was 0.852 which was a very good level that indicates an acceptable level of reliability. It considered a good strength of association and thus the items coefficient for the price was reliable. Besides that, four questions were used to measure place by using a 5-point Likert scale. The Cronbach's Alpha result for this independent variable was 0.812 which was a very good level that indicates an acceptable level of reliability. It considered a good strength of association and thus the items coefficient for the place was reliable. This is because α of 0.800 shows a very good acceptable level of reliability.

Four questions were used to measure promotion by using a 5-point Likert scale. The Cronbach's Alpha result for this independent variable was 0.883 which was a very good level that indicates an acceptable level of reliability. It considered a good strength of association and thus the items coefficient for promotion was reliable. Lastly, four questions were used to measure consumer buying decisions by using a 5-point Likert scale. The Cronbach's Alpha result for this dependent variable was 0.861 which was a very good level that indicates an acceptable level of reliability. It considered a good strength of association and thus the items coefficient for consumer buying decisions was reliable. This is because α of 0.800 shows a very good acceptable level of reliability.

Table 4.12 The Cronbach's Alpha result

Reliability Statistic			
Variables	No. of Items	Cronbach's Alpha	Cronbach's Alpha Based on Standardized Items
Product	4	0.865	0.869
Price	4	0.852	0.857
Place	4	0.812	0.820
Promotion	4	0.883	0.888
Consumer buying decisions	4	0.861	0.863

4.4 Normality Test

Kolmogorov-Smirnov test and Shapiro-Wilk test was used to test examines if scores are likely to follow some distribution in some population. A variable is not normally distributed if "Sig." more than 0.05.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

From Table 4.13, statistics of the product for both Kolmogorov-Smirnov and Shapiro-Wilk test were 0.269 and 0.816 respectively. Product variables for both tests were normally distributed because Sig. is 0.000 which is not more than 0.005. Next, statistics of the price for both tests were 0.256 and 0.815 respectively. Price variables for both tests were normally distributed because Sig. is 0.000 which is not more than 0.005. The third variable which is the place recorded statistics for both tests were 0.210 and 0.852 respectively. Place variable for both tests was normally distributed because Sig. is 0.00.

Besides that, statistics of promotion for both Kolmogorov-Smirnov and Shapiro-Wilk were 0.209 and 0.832 respectively. Promotion variables were normally distributed for both tests. This is because Sig. is 0.000 which is not more than 0.005. Lastly, statistics of the consumer buying decisions for both tests were 0.224 and 0.845 respectively. This variable was normally distributed because Sig. is 0.000.

Table 4.13: Test of normality

Variables	Kolmogorov-Smirnov ^a			Shapiro-Wilk		
	Statistic	df	Sig.	Statistic	Df	Sig.
Product	0.269	403	0.000	0.816	403	0.000
Price	0.256	403	0.000	0.815	403	0.000
Place	0.210	403	0.000	0.852	403	0.000
Promotion	0.209	403	0.000	0.832	403	0.000
Consumer buying decisions	0.224	403	0.000	0.845	403	0.000

4.5 Hypothesis Testing

4.5.1 *The relationship between product and consumer buying decision*

From Table 4.14, it demonstrates the relationship between product and consumer buying decision. Null hypothesis was rejected after Pearson Correlation testing was conducted. It means that this study accepted alternate hypothesis (H_1). From the result of the significant value $p < 0.01$, this indicated that there was a positively relationship between product and consumer buying decision. Based on the Figure of 4.1: Guilford's Rule of Thumb, the positive value of Pearson Correlation 0.575 indicated that the moderate correlation or substantial of relationship between product and consumer buying decision.

H1: There is a significant relationship between product and consumer buying decision.

4.5.2 *The relationship between price and consumer buying decision*

From Table 4.14, it demonstrates the relationship between price and consumer buying decision. Null hypothesis was rejected after Pearson Correlation testing was conducted. It means that this study accepted alternate hypothesis (H_2). From the result of the significant value $p < 0.01$, this indicated that there was a positively relationship between price and consumer buying decision. Based on the Figure of 4.1: Guilford's Rule of Thumb, the positive value of Pearson

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Correlation 0.586 indicated that the moderate correlation or substantial of relationship between price and consumer buying decision

H2: There is a significant relationship between price and consumer buying decision.

4.5.3 *The relationship between place and consumer buying decision*

From Table 4.14, it demonstrates the relationship between price and consumer buying decision. Null hypothesis was rejected after Pearson Correlation testing was conducted. It means that this study accepted alternate hypothesis (H₃). From the result of the significant value $p < 0.01$, this indicated that there was a positively relationship between place and consumer buying decision. Based on the Figure of 4.1: Guilford's Rule of Thumb, the positive value of Pearson Correlation 0.563 indicated that the moderate correlation or substantial of relationship between place and consumer buying decision

H3: There is a significant relationship between place and consumer buying decision.

4.5.4 *The relationship between promotion and consumer buying decision*

From Table 4.14, it demonstrates the relationship between price and consumer buying decision. Null hypothesis was rejected after Pearson Correlation testing was conducted. It means that this study accepted alternate hypothesis (H₄). From the result of the significant value $p < 0.01$, this indicated that there was a positively relationship between promotion and consumer buying decision. Based on the Figure of 4.1: Guilford's Rule of Thumb, the positive value of Pearson Correlation 0.647 indicated that the moderate correlation or substantial of relationship between promotion and consumer buying decision

H4: There is a significant relationship between promotion and consumer buying decision.

Table 4.14: Pearson Correlation for product, price, place, promotion and consumer buying decision

Correlations						
		Product	Price	Place	Promotion	Consumer buying decision

(Source: Guildford Rule of Thumb, 1973, p24)

Table 4.15: Summary of Hypothesis Testing

Hypothesis	Statement	Result
1	There is significant relationship between product and consumer buying decision	Supported
2	There is significant relationship between price and consumer buying decision	Supported
3	There is significant relationship between place and consumer buying decision	Supported
4	There is significant relationship between promotion and consumer buying decision	Supported

4.6 Regression Analysis

Based on Table 4.16, the value of R² of multiple linear regressions for consumer buying decision at the most affected area of Covid-19 in Malaysia was 0.524. This indicated that the

²⁹ Guilford, J. P. (1973). *Fundamental statistics in psychology and education*. New York, NY: McGraw-Hill

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

independent variables comprised of product, price, place and promotion explained most of the variation in the consumer buying decision.

Table 4.16: Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	0.724 ^a	0.524	0.520	0.30178
a. Predictors: (Constant), Promotion, Place, Product, Price				
b. Dependent Variable: Consumer buying decision				

Table 4.17 showed that the unstandardized beta value for promotion was 0.307, $p < 0.05$ which was the largest among the four independent variables. Thus, 30.7% of promotion was the most dominant factor affecting consumer buying decisions. The place was also a significant predictor that consumer buying decisions with unstandardized beta values of 0.183 and followed by product with unstandardized beta values of 0.182. It showed that 18.3% of places and 18.2% of products contributed to a consumer buying decision. Lastly, the unstandardized beta value for the price was 0.159, $p < 0.05$ which was the smallest among the four independent variables that contributed 15.9%.

Table 4.17 Coefficient

	Unstandardized Coefficients		Standardize d Coefficients	t	Sig.	95.0% Confidence Interval for B	
	B	Std. Error	Beta			Lower Bound	Upper Bound

a. Dependent Variable: Consumer buying decision							

5 Discussion and conclusion

5.1 Key Findings

From this study, there were four factors affecting consumer buying decisions during Covid-19 in the most affected area in Malaysia. The four factors which refer to 4Ps included product, price, place, and promotion. Quantitative techniques were used to obtain the best result of the findings in this study. This technique required the researcher to distribute questionnaires for

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

consumers in the most affected area of Covid-19 in Malaysia to involve in this study. The questionnaire will be conducted for data collection. The questionnaire must be reliable before the researcher started to distribute it. So, it is really important to ensure the questioners did not have any errors or problems.

Researchers create questionnaires from Google form because it is such an easy way to create a survey and collected data. The researcher started to distribute the survey questions at an online platform such as Whatsapp, Telegram, E-mail, and also media social. It is an easy method to interact with people especially during Covid-19. Besides that, the researcher also used the coefficient alpha to test the reliability and used the Pearson correlation coefficient to analyze the hypothesis test of the relationship between each independent variable and the dependent variable. For demographic data, respondents involved in this study were 384 respondents. The results for age category, the most respondent's average age between 20 to 29 years old and the last respondent's age between 40 years old and above. For the gender category, the female percentage was higher than the male.

Most of the respondent's race was Malay, followed by Chinese and Indian. Next, the most number of respondent's mutual status was single and the least number of respondent's mutual status was married. For occupation, the most number of respondent's occupation was students and the number of unemployed respondents belongs to the last place. The study implied and tested four variables identifying the factors affecting consumer buying decision which were a product, price, place, and promotion. Based on the data analysis, the results were supported all of the underlying hypotheses (H1, H2, H3, and H4). Regression analysis was conducted to see if every independent variable affects the dependent variable. The result showed that all independent variables could be the factors that influence consumer buying decisions. The promotion was the most dominant factor that affecting consumer buying decision followed by place, product, and price.

5.2 Discussion

5.2.1 The relationship between product and consumer buying decision.

H1: There is a significant relationship between product and consumer buying decision

From the result of analysis in Chapter 4, the mean score for the question "I only buy products when I feel its necessary needed especially during Covid-19 and Once I find a product I like, I buy it regularly especially during Covid-19 " was the highest while other questions also in good terms. The reliability test for the product was a very good level which indicates an acceptable level of reliability. It considered a good strength of association and thus the items coefficient for the product was reliable. This means that the overall question for these variables in the questionnaires could be accepted in this study. As for the coefficient correlation, it showed there was a significant relationship between product and consumer buying decision. The regression analysis also showed that the product was one of the factors affecting consumer buying decisions. Therefore, the product had become the most factor affecting consumer buying decision. The consumer always cultivates impressions towards the product that they like. So, the product becomes a great influence on the buying decision. The product can attract consumer attention by making a stand-out product.

5.2.2 The relationship between price and consumer buying decision

H2: There is a significant relationship between price and consumer buying decision

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

From the result of analysis in Chapter 4, the mean score for the question “Low prices of products increase my willingness to buy them especially during Covid-19” was the highest among other questions but the rest of the questions also in good terms. The reliability test for the price was also a very good level that indicates an acceptable level of reliability. It considered a good strength of association and thus the items coefficient for the product was reliable. This means that the overall question for these variables in the questionnaires could be accepted in this study. As for the coefficient correlation, it showed there was a significant relationship between price and consumer buying decisions. The regression analysis also showed that price was one of the factors affecting consumer buying decisions. Therefore, pricing is really important for consumer buying decisions. The affordable price will attract consumers to buy products from retailers. Price relates to the quality of the product because if the price of the product is high, the consumer assumes that the quality of the product was also high.

5.2.3 The relationship between place and consumer buying decision

H3: There is a significant relationship between place and consumer buying decision

From the result of the analysis in Chapter 4, the mean score for the question “.I prefer store location is not far away from my house especially during Covid-19 and I prefer store locations are easy to access since it is located in malls and big streets especially during Covid-19” was the highest among other questions but the rest of the questions also in good terms. The reliability test for the place was a very good level that indicates an acceptable level of reliability. It considered a good strength of association and thus the items coefficient for the product was reliable. This means that the overall question for these variables in the questionnaires could be accepted in this study. As for the coefficient correlation, it showed there was a substantial relationship between place and consumer buying decision. The regression analysis also showed that the place was one of the factors affecting consumer buying decisions. Therefore, place or channel also has an important role in consumer buying decisions. This is because the retailer must decide about the distribution of their product for the consumer to reach them easily.

5.2.4 The relationship between promotion and consumer buying decision

H3: There is a significant relationship between place and consumer buying decision

From the result of analysis in Chapter 4, the mean score for the question “I prefer the store gives information when they have a promotion, especially during Covid-19” was the highest among other questions but the rest of the questions also in good terms. The reliability test for promotion also was a very good level that indicates an acceptable level of reliability. It considered a good strength of association and thus the items coefficient for the product was reliable. This means that the overall question for these variables in the questionnaires could be accepted in this study. As for the coefficient correlation, it showed there was a substantial relationship between promotion and consumer buying decisions. The regression analysis also showed that promotion was one of the factors affecting consumer buying decisions. Therefore, promotion really important strategies to use for introducing products or services to the customer. Promotion can influence and encourage the customer to buy products. The retailer can persuade the customer by doing marketing activities like sale promotion and so on.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

6 Conclusion and Future Research

There were several recommendations or suggestions for future research. Future researchers who wanted to research in this field can test more factors besides the factors that had been outlined in this research. The current study, as mentioned earlier, is focused on the four factors only which were a product, price, place, and promotion. So, the future researcher can choose other variables and expand the result of the analysis. The future researcher can analyse using similar types of analysis methods. Expanding about other aspects that influence consumer buying decisions can be a good opportunity to discover new results that still relevant in the future. Since the data of this research was only collected during Covid-19 at the most affected area in Malaysia, the finding of this research could not be generalized to all situations or events. Therefore, for future researchers who make similar studies, they could research by increasing the range of respondents that are not involved in critical situations or crises, so that the results could be more valuable and increased generalizability.

In conclusion, this study was conducted to have a better understanding of the factors affecting consumer buying decisions during Covid-19 in the most affected area in Malaysia by analysing variables such as product, price, place, and promotion. Besides that, this research had fulfilled all of its objectives which were to examine the relationship between all of the independent variables with the dependable variable. As to provide the answer for research objectives, this research computes the hypotheses as explained in Chapter 4: Data Analysis. The data were tested by using a reliability test to analyse the reliability of the item and the Pearson coefficient correlation was tested to determine the relationship between independent variables and dependent variables. In conclusion, all variables showed a positive relationship with a highly significant result. Therefore, all the objectives were successfully achieved in this study.

7 Acknowledgements

First and foremost, praise and grateful, this research project has been done. Researchers want to thank University Malaysia Kelantan (UMK) for giving us this opportunity to involve in this research project. This project would not possibly done without support and helps from many people. Then, researchers would like to take this golden opportunity to extend our gratitude towards our supervisor who is Dr. Wan Farha Binti Wan Zulkiffli for valuable guidance and advices. Researchers would like to thanks for his guidance, taught and in helping us to start, collect data, process and analyse the result. Without his effort and guidance our study will not be completed. Researchers really feel thanks for his tremendous support and help. Last but not least, an appreciation also to our family members for their understanding, endless patient and encouragement when it was at most required. Researchers also would like to thank our respondents for their cooperation. Thank you.

THE FACTORS THAT AFFECTING THE CLOSING DOWN OF
POPULAR FASHION BRAND OUTLET IN MALAYSIA**

Ezatul Hanani Zawawi and Tahirah Abdullah

Faculty of Entrepreneurship and Business,
Universiti Malaysia Kelantan,
Malaysia

Email: hanani.a17b0090@siswa.umk.edu.my ; tahirah.a@umk.edu.my

Abstract:

This research is examining the factors that influencing the closing down of popular fashion brand outlet in Malaysia. In addition, this study discussed about the cause that lead the closing down on factors such as pandemic COVID-19, online competition, too many store and retail victims. The factors are developed from business failure theory. The quantitative methodology is adopted for this study and the result shows that all the variables are supported by the carried analysis.

Keywords: *business failure, COVID-19, closing down, fast fashion, online competition, pandemic, retail victim, too many store.*

1 Introduction

The term product life cycle refers to the length of time a product is introduced to consumers into the market until it is removed from the shelves. The life cycle of a product is divided into four stages, which are introduction, growth, maturity, and decline. These stages is used by management and by marketing professionals as a measurement tool in deciding an appropriate time to launch an advertisement, reduction of prices, expanding to new markets, or redesign packaging. The process of strategizing ways to continuously support and maintain a product is called product life cycle management. Most of the popular fashion brand are included in the declining stage (Levvit, 2014). Running a business is a dynamic process in which they should be fine-tuning and adapting to the financial environment, customer needs and market trends to be able to stand the test of time and be profitable. The product or service, can always be improved or revised and new markets to discover. Every stage of a business brings new or pre-existing challenges.

According to The New York Times (2020) more and more branded companies will close down their stores because of the “the unprecedented and ever-changing nature of the situation” and “the need for social distancing”. most of the company able to withstand the costs of a temporary shutdown announced their plans quickly. Leading the charge outside the fashion industry was Apple, which was one of the first and most influential companies to announce closures most of its stores outside mainland China, Hong Kong and Taiwan are closed until March 27.

The closing down of popular fashion brand is a shocking news to retail industry. The number of store which decide to close down some of their branch are getting higher and most of them are the most popular clothing brand around the globe. Their label can be seeing everywhere. People are proudly wear the brand on the street or make it as a prop in social media platform. Therefore, four factors which are the covid-19 pandemic, online competition, too many store and retail victim are taken out as the independent variables that lead to the closing down of the

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

popular fashion brand outlet. The study is design to prove the relationship between independent variables with dependent variable. In order to explore the factors that influencing the closing down of the popular fashion brand globally, data will be collect and measure to determine which factor have the strong relationship.

2 Literature Review

Business Failure Theory

According to Ucbasaran, business failure (BF) is a constant in today’s business world, being considered an essential and significant part of new business ventures. (Walsh and Cunningham,2016). Business failure (BF) is a not a simple concept to define. (Chen and Williams, 1999) do not feel the need to define the concept, while others (e.g.,Dimitras, Zanakis and Zopounidis, 1996; Everett and Watson, 1998; Bell and Taylor, 2011), present a wide array of definitions in order to be as comprehensive as possible.Business failure (BF) occurs over several distinct phases, usually contiguous to a significant event that is considered the tipping point of ‘failure’. The process includes the analysis of the conditions and series of events that lead to BF. It also considers the post-failure situation, focusing on the consequences of going through such a stressful situation.

Figure 1 explained Business failure may stem from the mismatch between the organization and its business environment (Drazin & Van de Ven,1985;Sabherwal, Hirschheim,&Goles, 2001), that is internal and external misfits. Internal misfit stems from mismatch between the firm’s resources, structure, practices, and strategy, whereas external misfit refers to the mismatch between the firm specific factors, and the home, host, or global environment (Gammeltoft, Filatotchev &Hobdari, 2012). This suggests that, overtime, a chain of events can turn a firm’s competitive advantage into liabilities and a source of errors and failure. As Thompson (1967, p.234) recognized decades ago, alignment is “a moving target”. This requires continuous upgrading and updating of resources and capabilities in a timely manner to avert environmental shift, rendering the current strategy obsolete

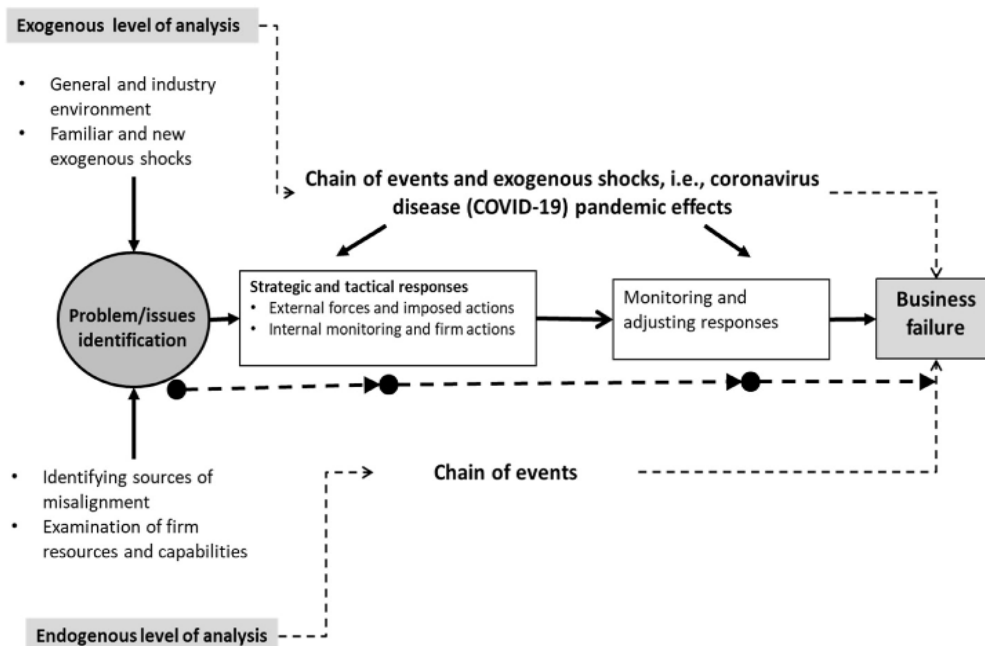

Figure 1

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Based on the model in figure 1, it is crucial for researcher to understand the problem or issues identification that leading to business failure. According to this research there are four factors which is the independent variables that influence the closing down of famous fashion brand outlet globally including Malaysia. There are, the pandemic Covid – 19, the online competition, too many store open rapidly and last but not least the retail victim.

The model in figure 2 using pandemic Covid-19 effect as the example and based on my study, it is also relatable with other three factors as well. The processes shown in the model will provide a deeper insight into how a business loss can result from the independent variable used in this analysis. The exogenous degree of analysis is explored with respect to the general and industrial environment included in the retail victim's research and also addresses the familiar and exogenous shocks associated with the Covid-19 pandemic and online competition .For this kind of research, apart from the exogenous level of analysis, this model also discusses the endogenous level of analysis. The identification of sources of misalignment and the examination of firm resources and capabilities are part of this. Too many stores and retail victims are therefore the best examples of an endogenous level of analysis. Last but not least, the researcher can identify issues based on the chain of event and can relate the process in between that led to business failure. Thus, in aligning with the discussion above, the following propositions are suggested:

H1: There is a significant relationship between Covid-19 and the closing down of popular fashion brand outlet.

H2: There is a significant relationship between online competition and the closing down of popular fashion brand outlet.

H3: There is a significant relationship between too many store and the closing down of popular fashion brand outlet.

H4: There is a significant relationship between retail victim and the closing down of popular fashion brand outlet.

2.1 Popular fashion brand

According to the editorial policy of Fashion Theory: The Journal of Dress, Body & Culture, fashion is defined as "the cultural construction of the embodied identity." As such, it encompasses all forms of self-fashioning, including street styles, as well as so-called high fashion created by designers and couturiers. Fashion also alludes to the way in which things are made to fashion something is to make it in a particular form. Most commonly, fashion is defined as the prevailing style of dress or behavior at any given time, with the strong implication that fashion is characterized by change (Valerie Steele,2012)

2.2 Covid-19

According to the Organization for Economic Co-operation and Development (2020), the COVID-19 pandemic is regarded as one of the largest concurrent public health and economic crises in modern times, culminating in sharp decline in consumption and consumer confidence. Indeed, the COVID-19 pandemic has been recognized as a major exogenous shock that has altered the competitive land-scape for both small and large firms (Wenzel et al., 2020). In many instances, it has led to a collapse in demand, and disruption of supply of many products. In respond to the crisis, governments around the globe have embraced border closures, instituted social distancing measures, and issued directives and guidelines to small and large businesses.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

According to openaccessgovernment.org (2020), The fashion industry has been negatively affected by the COVID-19 outbreak on every level from retailers to supply chains to vendors. High-street stores have been massively affected by store closures, H&M has recently announced it will be closing around 70% of its stores worldwide. However online fast fashion brands have not felt the sting, in fact, things are quite the opposite.

According to Joseph Amankwah-Amoah, Zaheer Khan and Geoffrey Wood (2020), around the world, many SMEs in 2020 have faced increased exposure stemming from the ongoing epidemic outbreak. According to the European Investment Bank (2020), the pandemic has created a demand and supply shock leading to such businesses being unable to raise revenue and pay rent, SMEs are the backbone of the European economy, accounting for around two-thirds of overall employment and over 55% of the value added in the non-financial business sector (European Investment Bank,2020). This is partly due to the containment measures introduced by governments around Europe and beyond that placed a limit on travel and thus halted or curtailed demand in several sectors such as air transport, tourism, and automotive, and of course the direct effects of the pandemic (Dunn, 2020). The sudden “environmental shock” triggered by COVID-19 has exponentially depleted firms’ financial resources and increased insolvencies, creating financial distress in organizations and weakening the financial position of many large and small businesses, and thereby forcing many to seek government support in the form of subsidies, tax relief, and other financial and non-financial support (Cook & Barrett, 2020). To a large extent, many sectors have been forced to “compete on sanitation” in marking their premises and settings to minimize potential for viral transmission.

2.3 Online competition

Today, shopping through the Internet has ended up being one of the most quickly developing methods of purchasing, with expanding deals development rates outperforming the conventional apparel retail settings (Geissler, 2001). A report of the Direct Marketing Association (1990-1992) investigated that clothing is the most bought items on the planet somewhere in the range of 1988 and 1991. The deals of clothing multiple times expanded somewhere in the range of 1982 and 1987 (Jones and Jones, 2006). Because of developing utilization of web and its commitment in business and shopping, enormous number of deals in a wide range of items saw during a decade ago. Internet shopping and online business has given more occasions to brokers and organizations to spread their business over the world (Rosen, Jaffe and Perez-Lopez, 1997).

Online shopping not only affected consumer perceptions and their shopping attitudes, but also influenced the industries and business sectors (Jones & Jones, 2006). However, one of the most purchased shopping items on the internet is the clothing product, seemingly enjoying magnificent rewards, including improvements in its range of practices. It is obvious that online shopping is effective in preventing real estate costs and retaining low inventories for industries and the clothing business. Clothing companies today find it easier to target future internet and retail customers and now seem to follow a variety of online marketer-built shopping strategies to retain a consumer base from which the maximum number of customers can be drawn (Geissler, 2001).

2.4 Too many stores

Franchise systems constitute one form of entrepreneurial ventures that have contributed significantly to economic development results in the United States and other countries. Franchising has also been seen as an alternative to individual self-employment decisions to

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

start an independent small business (Kaufmann,1999 and Williams, 1998). Central to these new venture alternative decisions is the likelihood of success or failure. Industry category turnover rates are impacted by franchisor, franchisee, and competitive influences. Various other factors influence industry category turnover rates. fluctuating business cycles, industry life cycles, and other environmental factors can affect a unit's profitability and its chance of survival or failure. In Malaysia itself, we can see how many fashion brand outlets are open at different location due to many developers build an exclusive mall in the region for the sake of domestic and international tourist attraction, the only different about the outlet is, the location which the service and product still the same almost at every location. Thus, most of the sale are not going well and the outlet need to end its operation at a very early period.

2.5 Retail victim

According to Dugyur Turker and Ceren Altuntas, the author for Sustainable supply chain management in the fast fashion industry: An analysis of corporate reports, quick fashion is characterised by the transformation of trendy fashion. Design of articles that can be purchased by the masses (Sull & Turconi, 2008). The goal of this industry is to draw customers to stores in order to raise the frequency as often as possible. They're buying trendy models (Barnes & Lea-Greenwood, 2006). This is done by low cost and low cost clothing that stays on the shelf for a shorter period of time than that traditional clothing sector (Bhardwaj & Fairhurst, 2010). This leads to shorter business cycles, more seasons and more organizational purchasing criteria, such as extremely versatile manufacturing and design capacities, blending up-to - date raw clothing materials and resources at very short lead times (Barnes & Lea-Greenwood, 2006). Therefore, with a fast fashion trend seem nowhere to stop, the retailers need to keep up with all the trend in very short period and it can lead to negative impact. In depth, this trend is not being welcomed within the retail sector, as it presents major challenges to operations and the environment, the quick fashion trend is changing the way companies and customers perceive clothing according to the article the impact of fast fashion on the retail industry by buxtonco.com. The retail victim over fashion industry are facing by the designer and retailers all over the world including Malaysia. The fast fashion trend also seems to be huge in Malaysia plus in Malaysia, we have so many festive seasons to celebrate and it is important to keep it with trend and dress well for each of the festival. In addition, Malaysian are very interested with fashion movement from overseas, thus the situation that happening in overseas are more likely the same with Malaysia.

3 Research Methodology

This study highlighted the factors influencing the closing down of popular fashion brand outlet in Malaysia. Therefore, a quantitative methodology was adopted for the present study. The sample are withdrawn from student in Universiti Malaysia Kelantan. To collect the data for this study, a convenience sampling technique was used. Convenience sampling involves selecting sample elements that are most readily available to participate in the present study and can provide the information requires (Heir, 2011). Besides that, this study also utilized questionnaires as a survey to the targeted respondents. In overall, the number of respondent who participated in this study was 246 students. This data was analysed using Statistical Packages for the Social Sciences (SPSS).

BUSINESS COLLOQUIUM 2020/2021**

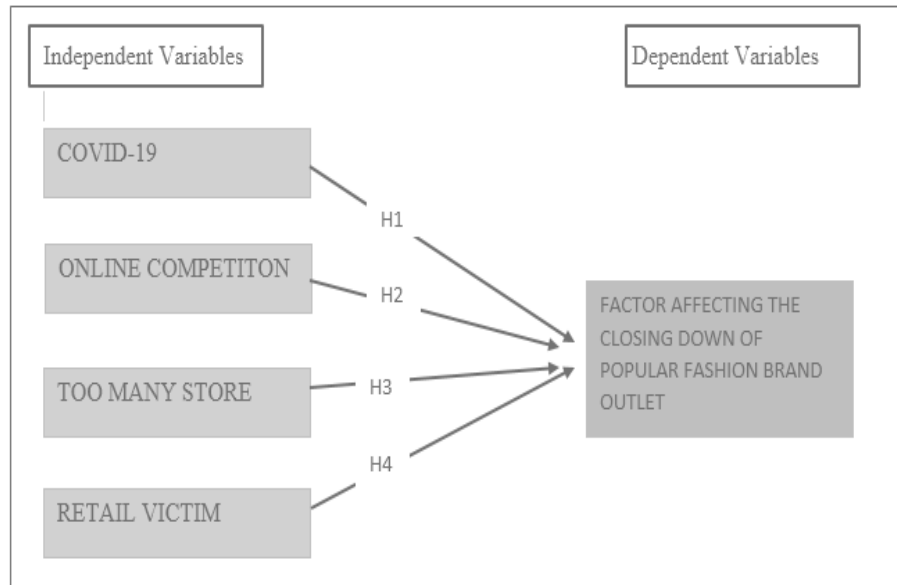

Figure 2

4 Finding and Discussion

Demographic Profiles of Respondent

The demographic information is included age, gender, ethnicity, nationality and fashion trend. The demographic information will showing the frequency and percentage of UMK's. Table 1 will summarised the respondent profile. There were 31.7% for male and 68.3 % for female. Most of the respondents were in the aged category of between 19-23 year old, followed by the respondent in the aged category of between 24-28 year old and lastly from respondent aged between 29-33 year old. Among the 246 respondent, there were 52.8% respondents are Malay, 24.0 respondents are Chinese and 23.2 respondent are Indian. Next, 100% of respondents are Malaysian. For the fashion style, 11.4% respondent choose sporty, 13.0% of respondents choose bohemian, for grunge, 18.7% respondents, 2.4 % respondent choose preppy, for streetwear, 20.7% respondent choose that style and 3.7% choose classic. Most of the respondents choose casual which is equal to 30.1%.

Table 1

	UMK'S RESPONDENT	
	FREQUENCY	%
Gender		
Male	78	31.7
Female	168	68.3
Age		
19 - 23	125	50.8
24 - 28	81	32.9
29 - 33	40	16.3
Ethnicity		
Malay	130	52.8
Chinese	59	24.0

Classic	74	30.1

4.1 Reliability Analysis

Reliability analysis for the independent variable of pandemic Covid-19 and dependent variable using the method of Cronbach's Alpha analysis. The total of 5 items were used to test the reliabilities of the data. The value of Cronbach's Alpha was 0.701. the value means that the questionnaire is valid because its showing an acceptable of association. Reliability analysis for the independent variable of pandemic retail victim and dependent variable using the method of Cronbach's Alpha analysis. The total of 5 items were used to test the reliabilities of the data. The value of Cronbach's Alpha was 0.900. The value means that the questionnaire is valid because its showing an excellent of association.

4.2 Correlation analysis

According to the result shown in the table 3, factor of too many store had the lowest ranked Beta value among the independent variable which was .005. Meanwhile, pandemic COVID-19 was ranked at third where the beta value was .011, followed by retail victim, raked at second where Beta values was .035. The online competition was ranked at first where the Beta value .195 which mean the online competition had the strongest positive effect on the closing down of the popular fashion brand outlet. It is also can be said that it was the most important independent variable in measuring the factors that effecting the closing down of popular fashion brand outlet in Malaysia.

Table 3

Coefficients^a						
Factors		Unstandardized Coefficients		Standardize d Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	1.394	.147		9.454	.000
	covid_19	.011	.018	.039	.630	.530
	online_competiti on	.195	.075	.163	2.592	.010
	many_stores	.005	.035	.010	.140	.889
	retail_victim	.035	.014	.182	2.600	.010

a. Dependent Variable: DV

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

4.3 Testing of Hypothesized Model

Table 4

No of Hypothesis	Statement of hypothesis	Result
H1	There is a positive relationship between Pandemic Covid-19 and the factors effecting the closing down of popular fashion brand outlet	Supported
H2	There is a positive relationship between online competition and the factors effecting the closing down of popular fashion brand outlet	Supported
H3	There is a positive relationship between too many stores and the factors effecting the closing down of popular fashion brand outlet	Supported
H4	There is a positive relationship between retail victim and the factors effecting the closing down of popular fashion brand outlet	Supported

5 Discussion and Conclusion

The findings showed all 4 hypotheses were supported. The relationship between Pandemic COVID-19 and dependent variable showed the strongest relationship ($\beta=.264$), retail victim ($\beta=.161$), online competition ($\beta=.163$) and lastly too many store ($\beta=.040$). Each hypothesis was analysed based on the regression results and confirmed or denied. Four of the predictors were significant. This research has shown an increased explanatory of the factors that effecting the closing down of popular fashion brand outlet compared to previous research. It also provides guideline for future research to concentrate on the strengths and terminate the weaknesses. As with any studies, there are some drawback in this research such as sample chosen was limited to university student with higher education background. Thus, future study is suggested to select working adults and other variable that related to the factors that affecting the closing down of popular fashion brand outlet in Malaysia or globally.

Abstract:

This thesis is investigating the Influencing factors of H&M store image in Aeon Mall Kota Bharu.. The purpose of this study is to determine the Influencing factors of H&M store image in Aeon Mall Kota Bharu. The Data is collected by means of questionnaires obtained from 379 respondents in Kota Bharu. Non-probability sampling which is a Convenience Sampling method has been implemented in this study in order to allow researchers to collect the respondents quickly and efficiently, as the target respondent's population is large. This study used Descriptive Analysis and Pearson's Correlation Coefficient Analysis. From the result, all the Independent Variables are significant with the Dependent Variable with the value of ($p < 0.05$) and the most dominant variable of the study is store atmosphere with the value of ($r = 0.239$). Factors of affect the store image will be the store atmosphere, merchandise quality and customer service while the most effective factor is store atmosphere.

Keywords: *Factors, Store Atmosphere, Merchandise Quality, Customer Service, Store Image*

1 Introduction

Today, fashion is the most significant part of our lifestyle. The definition of fashion varies from that of each person. For too many citizens, fashion is the latest trend in apparel, accoutrements, shoes, but for many of us, it might be the current foods, lifestyle, and so forth. The style gives another good perception throughout a moment that we are wearing the latest trends (josbd, 2017).

In previous studies, the store image consists of eight different dimensions of the retail marketing mix: venue, product, store environment, customer service, price, advertisement, sales staff, and sales reward programs Lindquist(1974). Then, store the identity as the reputation for the company and the aspect that influences an initial purchasing customer's initial decisions North El (2003). According, to (Berman and Evans,2007), a store's image is described as how customers and others view a retailer. In this research study, the researcher had conducted a research in examining and identifying the relationship between the store atmosphere, the merchandise quality, and the customer service that effect on store image. The results of this study shows the importance of factor that influencing the store image.

2 Literature Review

2.1 Theoretical Model

This article proposes two theoretical models showing the mechanism whereby store image helps increase the equity of a specific type of distributor brand (the store brand). The approach used in this analysis is based, on the one hand, on defining brand equity through its components, using the model in (Aaker, 1991), and on the other, on including (social and strategic) corporate dimensions in measuring store image.

The theoretical models presented in the past research have been developed under the research objectives and the aforementioned conceptual framework and with the literature on the relationships under study. The first of the proposed models relate store image to each of the components of store brand equity to determine, which are the main components through which store image contributes to increasing store brand equity.

The second model centers on store image, relating its different dimensions to the store brand equity. This allows us to identify the most relevant dimensions of store image in terms of impact on store brand equity. Note that price perception has also been included as an antecedent of equity in the proposed models, although this variable does not fall within the objectives of the research. The researcher seeks to avoid the problem that would be caused by an error in the specification of the model, such as want avoid the possibility that an omission of price, a key antecedent of store brand equity, might distort the measure of the relationship between store image and store brand equity (Hair et al., 1998).

2.2 Previous Study

Store Image

The store's image is made up of a series of purchase intentions attached to the store throughout the customer's mind. According to (Beristain and Zorrilla, 2011), company collaborations are associated together by recognizing the features for retailers and consumers' presumed benefits. Then, the dimension of store image depends on variables: the quality and range of the products sold, the price of the goods, the physical facilities of the shop, and the services provided by the sales staff (Beristain and Zorrilla, 2011). Thus, value services performance helps to preserve brand reputation and customer loyalty and is very critical for profitability (Torres et al. 2001). Customer satisfaction represents consumer judgments about the overall superiority and excellence of brands. The dominant goods or solutions offered by the company or brands can, in the main, depend on the consumer's level of satisfaction that can lead to the recurring buying behaviour of satisfied customers. (Das, 2014). When determining the nature of the product or store, consumers consider some factors and characteristics. Also, (Mendez, 2008) the information inputs used in the evaluation refer to situational and personal variables. All these attributes, together, lead to the concept of perceived or subjective quality, which is related to the ability to control the wishes of the consumer.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

2.3 Store Atmosphere

Customer experience greatly affected by the atmosphere of the store. "Atmospherics" is a term used to describe the art of constructing a store in such a way as to enhance the sensory feeling of the consumer. Atmospherics optimizes the spatial aesthetic characteristics of the store and is a subtle and quiet background language that affects customers (Kotler, 1973–1974). This aesthetic context affects the emotions of the customers and can lead them to assess the products differently. Koo (2003) suggested that customers with a positive experience would be highly satisfied, which in turn, would induce them to increasingly frequent the store, thus boosting store sales. Several researchers who examined store atmosphere indicated that the ambiance and design of the store are critical factors that influence customer preference, service, and product quality, price perception, and cost of the shopping experience (Baker et al., 2002; Thang & Tan, 2003).

H₁: There is a relationship between store atmosphere and store image.

2.4 Merchandise Quality

(Zeithaml, 1988) stated that quality is an intrinsic and extrinsic attribute added to a brand or product centered on the consumer's experience. Intrinsic value includes the product's success and durability, while extrinsic value includes brand name and product warranties. Then, (Verbeke, 2000) argued the brand name is a key quality criterion, and brands of the worlds leading include the notion of high quality. Consumers use inherent consistency in valuing international brands as better quality goods.

For an established strong brand, a perceived quality further increases its popularity; meanwhile, perceived quality reduces its chances of success for a low or new brand, (Aaker, 2000). (Laroche and Tffoli, 1999) have found that price and consistency are key factors influencing purchasing decisions. They made it clear that the price of popular brands is associated with quality. Typically customers who perceive quality and price favorably believe that high prices are of high quality, whereas low prices are of low quality.

H₂: There is a relationship between merchandise quality and store image.

2.5 Customer Service

(Newman and Patel, 2004), a significant brand criterion is the service element, which integrates the relationship between a company's staff and its customers. Members of the sales team communicate with customers directly. They concluded that consumers judge the service provided good service, allowing customers to share their positive experience with others through word-of-mouth marketing and increasing consumer loyalty to the store. This variable may also be the first experiences of all the H&M outlets also include the retailers. Customer service is the relationship between the company's vendors and that retailer's buyer or customer. The service delivered by sales workers directly affects the desired store of target customers; in particular, the organization involved in the distribution of services (Teller, Kotzab and Grant, 2006). The positive service rendered by the worker improves the store image, according to (Miranda et al. 2005). Good service will persuade customers to be loyal to a shop.

H₃: There is a relationship between customer service and store image.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

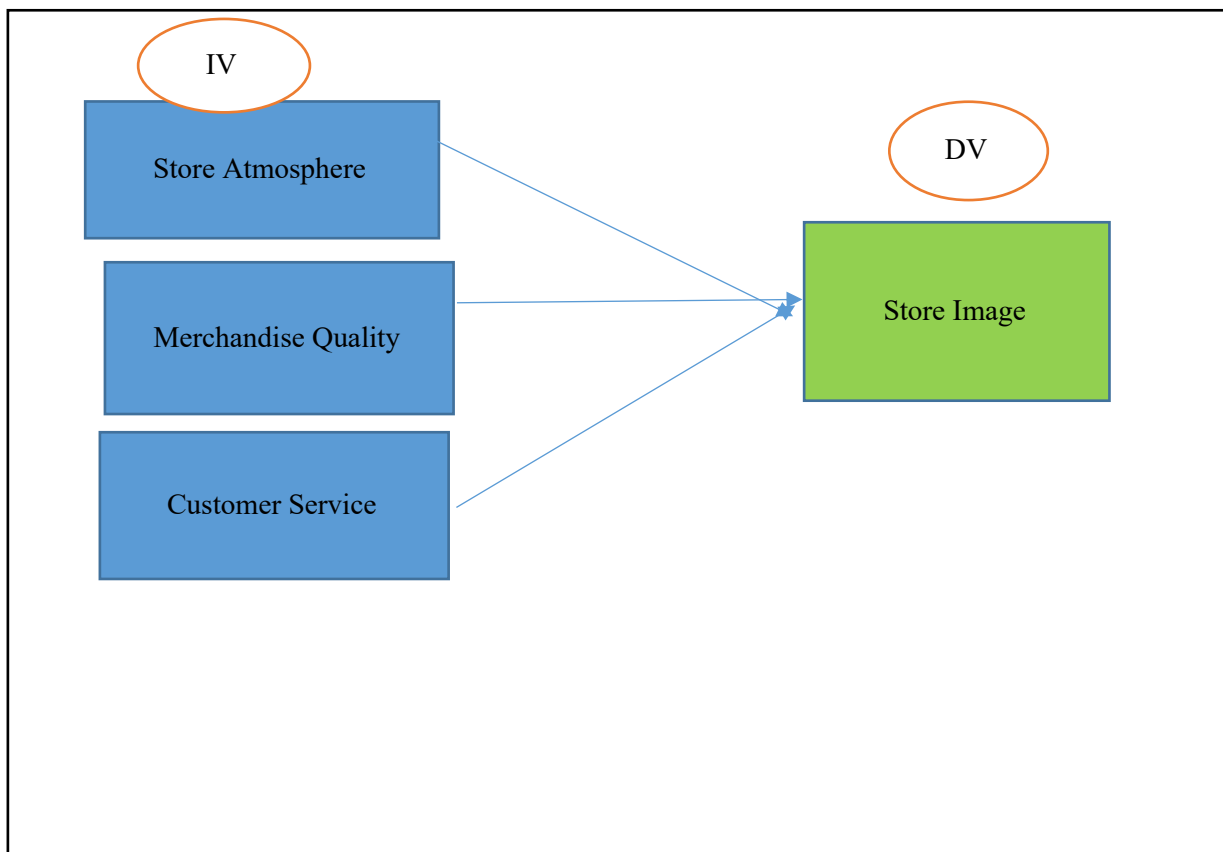

2.6 Dominant Factor

Ghosh (1994), store image is composed of eight different elements of the retail marketing mix: location, merchandise, store atmosphere, customer service, price, advertising, personal selling, and sales incentive programs. Consequently, for each retail store, a distinct image may exist within consumers' minds. Others have defined store image as the "summation of all attributes of a store as perceived by the shoppers through their experience with that store" (Omar, 1999). In particular, store image represents an important component in consumers' store patronage (Darden and Erden, 1983) and store choice decisions.

H₄: There is a direct effect of factors (store atmosphere, merchandise quality, and customer service) and H&M store image.

2.7 Conceptual Framework

The research model has been stated in Figure 2.1, it was developed based on the literature review above. This research model is to study the significant factor that influences the H&M store image.

3 Research Methodology

3.1 Data Collection and Sample Selection

In this research design, Quantitative research had been implemented which involves primary data gathering by collecting quantifiable data and carrying out statistical analytical or computational techniques of the 379 respondents in Kota Bharu via google form. Quantitative

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

analysis produces data by means of large-scale quantitative research using techniques such as questionnaires while for the Descriptive Analysis, this analysis had been used in this research to collect the sample size of the research and measure with simple graphic analysis such as for the demographic section of this research questionnaire (Library, 2020).

The sampling selection that had been used in this research is the methodology of Non-Probability Sampling Techniques. In Non-Probability Sampling, the extent of bias in selecting the sample of respondents is not known. In this research, Convenience Sampling had been implemented in order to collect the data of the population of 7997 000 million The Department of Statistics (1949), which consists of 34.3 thousand citizens into 379 respondents as the sample size³⁰. The researcher tends to select any available respondents information quickly and efficiently without any obstacles. Hence, the researcher had then shared the questionnaire through online (Google Form) to all the respondents by approaching the respondents at the shopping malls, distributed on social media platform and requesting the respondents to answer the questionnaires. Thus, the reason this sampling had been implemented in this research is because it is quick and easy for picking up the available respondents in Kota Bharu in order to collect the information (Gravetter, Wallnau, Forzano, & Witnauer, 2020).

3.2 Measurement and Scales

In this research study, the researcher had used two versions for the questionnaire in this analysis that is scaled response and close-ended questions. The questionnaires contained English and Malay languages to utilize in the paper-based form questionnaire. These questionnaires were divided into three which are Section A, Section B and Section C. Nominal and Ordinal scales are used for all the three sections of questionnaire of this study. Besides that, the researcher had implemented the Likert Scale scores for the questionnaire such as Scale 1 to Scale 6. The Likert scale would encourage respondents to quickly pick and address the problem without wasting more time answering the study questionnaires.

3.3 Data Analysis Method

The answered questionnaire be collected from the respondents and be converted into numerical form to key in the Statistics Package for the Social Sciences (SPSS) version 26.0. From the SPSS all the data will be derived. Pilot Study, which is the Reliability Analysis, Descriptive Analysis, Cronbach Correlation Analysis and Pearson's Correlation Coefficient Analysis, were used to test the research objectives and hypothesis.

4 Data Analysis

4.1 Descriptive Analysis

The study was conducted to determine the Influencing factors of store image that affect the store image of H&M in Aeon Mall Kota Bharu. In this case, primary data was undertaken which is a set of questionnaires used to get feedback from respondents. According to (Krejcie & Morgan, 1970), based on the table rule of thumb that was developed, the number of the sample is 379 respondents were selected and for independent variable was developed.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Table 4.1: Descriptive Analysis of Independent and Dependent Variable

Descriptive Statistics			
	N	Mean	Std. Deviation
Store Atmosphere	379	4.9135	.77467
Merchandise Quality	379	4.6053	.82268
Customer Service	379	4.6987	.92036
Store Image	379	5.0572	.94091
Valid N (listwise)	379		

Source: SPSS Data Analysis

Table 4.1 shows the mean and standard deviation of independent variables on respondents selected. The table shows independent variables of store atmosphere has the highest mean value which is 4.9135 and for standard deviation is 0.77467. That was meant the respondent tended to agree with the statement that store atmosphere provides more information which can influence store image at H&M. The respondent tended to agree with store atmosphere. Next, customer service shows the value of mean is 4.6987 and the value of standard deviation is 0.92036. The respondent tended to agree with the statement of customer service based on their knowledge about that. Then, merchandise quality shows the lowest value of mean is 4.6053 with 0.82268 of standard deviation. The respondent tended to agree with the statement of merchandise quality based on their experience about that.

4.2 Reliability Analysis

Result of Reliability Cronbach's Alpha for Variable

Table 4.2: Result of Reliability Cronbach's Alpha for Variable

Source: SPSS Data Analysis

Variable	No. of Cases	No. of Item	Reliability Cronbach's Alpha
Store Atmosphere	379	5	0.890
Merchandise Quality	379	5	0.788
Customer Service	379	5	0.868
Store Image	379	3	0.769

Based on table 4.2 above, shows the value of the reliability test for the dependent variable and

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

each of the independent variables. Based on the result of the analysis, the highest reliability analysis value is from the independent variable is store atmosphere with a value of 0.890 and that was good. It shows that the store atmosphere was effective and gave a positive effect to the store image.

Besides, the second-highest value from the table of reliability test is from an independent variable is customer service which is 0.868 and it was good. It has a good strength of association, which means the customer service gave a positive effect to this study.

Then, the third-highest value from the table of reliability test is also from an independent variable is merchandise quality which is 0.788 and it was acceptable. It means that merchandise quality was also gave a positive effect in influencing the store image of H&M.

Lastly, the lowest value between all of the variables is the dependent variable is store image with the value 0.769. That shows the store image was acceptable. It means that the store image given a positive effect on this study.

4.3 Pearson's Correlation Coefficient Analysis

Table 4.3: Result for Correlation of Store Image

Correlations					
		Store Atmosphere	Merchandise Quality	Customer Service	Store Image
Store Atmosphere	Pearson Correlation	1	.216**	.149**	.239**
	Sig. (2-tailed)		.000	.004	.000
	N	379	379	379	379
Merchandise Quality	Pearson Correlation	.216**	1	.519**	-.033
	Sig. (2-tailed)	.000		.000	.522
	N	379	379	379	379
Customer Service	Pearson Correlation	.149**	.519**	1	.038
	Sig. (2-tailed)	.004	.000		.462
	N	379	379	379	379
Store Image	Pearson Correlation	.239**	-.033	.038	1
	Sig. (2-tailed)	.000	.522	.462	
	N	379	379	379	379

** . Correlation is significant at the 0.01 level (2-tailed).

Source: SPSS Data Analysis

Table 4.3 shows that the value of Pearson's Correlation (r) is 0.239, which indicates a weak positive linear correlation. Therefore, it concluded that store atmosphere give a good impact on the store image of H&M. Hence, H_1 is accepted.

Result for merchandise quality is -0.033 that indicates a weak negative correlation. Therefore, it concluded that merchandise quality give a good impact on the store image of H&M. Hence, H_2 is accepted

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Then, customer service is 0.038, which indicates a weak positive linear correlation. Therefore, it can be concluded that customer service give a good impact on the store image of H&M. Hence, H_3 is accepted.

The value of store atmosphere is 0.239 a higher value compared with another factor, which is value -0.33 and 0.038. Therefore, can concluded that store atmosphere give a good impact on the store image of H&M. Hence, H_4 is accepted.

5 Discussions and Recommendations

5.1 Discussion

H1: There is A Relationship Between Store Atmosphere and Store Image

It can be seen from Pearson's Correlation Coefficient Analysis that there is a significant result between the store atmosphere and store image. It is indicated that the store atmosphere gives a positive effect store image of H&M. It is a significant p-value which is ($p = 0.239 > 0.00$) that shows there is a weak positive linear correlation between two variables. Hence, it can be concluded that store image gives a positive effect to the store image.

H2: There is A Relationship Between Merchandise Quality and Store Image

It can be seen from Pearson's Correlation Coefficient Analysis that there is a significant result between the merchandise quality and store image. It is indicated that the merchandise quality a good effect on the store image of H&M. It is a significant p-value which is ($p = -0.033 < 0.00$) that shows there is a weak negative linear correlation between the two variables. Hence, it can be concluded that merchandise quality can influence store image.

H3: There is A Relationship Between Customer Service and Store Image

It can be seen from Pearson's Correlation Coefficient Analysis that there is a significant result between customer service and store image. It is indicated that the customer service gives a positive effect store image of H&M. It is a significant p-value which is ($p = 0.038 > 0.00$) that shows there is a weak positive linear correlation between two variables. Hence, it can be concluded that customer service gives a positive effect on the store image.

H4: There is A Direct Effect of Factors (Store Atmosphere, Merchandise Quality, And Customer Service) And H&M Store Image

It can be seen from Pearson's Correlation Coefficient Analysis that there is a significant result between the store atmosphere and store image. It is indicated that the store atmosphere gives a positive effect store image of H&M. It is a significant p-value which is ($p = 0.239 > 0.00$) that shows there is a weak positive linear correlation between two variables. Hence, it can be concluded that store atmosphere gives a direct effect to store image compare with two other factors.

5.2 Recommendation

The first recommendation is the researcher can carry out this study of factors that influencing store image at another state and outlet such as H&M Kuala Lumpur outlets because it had many

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

group people in that state. The researchers also could increase the amount of the respondents and also perhaps add more independent variables. This research limits the number of respondents where the questionnaires were distributed only for a group of people at Kota Bharu. The researcher could expand the target respondents to another state so that the research can be done evenly throughout the whole of Malaysia. This is to have a larger scope so that the research is more reliable.

The second recommendation is the researcher should be continuing to analyze and conducting more research related to this aspect of the study. Researchers should produce better research and upgrade the version of this research with a more updated citation by scholars to make it relevant to the current issue. As for the students at the degree level, I suggest that they use this research as their reference of study. Whether it this research for research purposes or merely for notes in a lecture class, this research will be a benefit to the students to develop more understandings regarding the issue.

Lastly, for the apparel sector. I suggest this research can be used as a boost and provide for the manager of store or entrepreneur in upgrading strategies for the store image has been explained in detail.

6 Conclusion

In a conclusion, this research has been carried out to examine the factor influencing of H&M store image. Besides, this study helps other researchers to do the research about the store image and can be used as one of their references. The result that has been obtained in chapter 4 through Statistical Package for the Social Sciences (SPSS), version 26.0 was discussed further and at the same time conclusion were made based on the results. As a result, it can be concluded that there is a significant relationship between the store atmosphere, merchandise quality, and customer service with store image. Their store atmosphere gives a direct effect on the store image of H&M at Aeon Mall, Kota Bharu outlet. Thus, it is hoped that all the information provided throughout this research will help the other parties to do the next research.

7 Acknowledgements

First and foremost, I am grateful and would like to show my gratitude to our supervisor, for her excellent guidance, and patience to provide me with valuable knowledge and guiding us from the beginning till end. Next, I would like to appreciate the supports from all parties including our family members, friends, and all my fellow group members. Without their mental and financial support, this research may be harder for me to complete it. Last but not least, I would like to thank the respondents, who were willing to sacrifice their precious time to answer the questionnaires. Their sincerity provided me with detailed insight and paved the way for us to conduct all forms of data analysis and research findings smoothly.

BUSINESS COLLOQUIUM 2020/2021**

**THE FACTORS THAT INFLUENCING CUSTOMER
SATISFACTION TOWARDS ONLINE BUYING DURING
MOVEMENT CONTROL ORDER (MCO) IN KUALA
TERENGGANU**

Fatin Nurfazliza Jaamin and Nadia Hanum Amiruddin

Faculty of Entrepreneurship and Business,
Universiti Malaysia Kelantan,
Malaysia

Email: fazliza.a17a0104@siswa.umk.edu.my ; nhanum@umk.edu.my

Abstract:

Online buying is a common thing in Malaysia. People nowadays who work hard tends to buy something through internet because of the convenience, affordable and save their time. Especially during COVID-19 outbreak, the restriction movement makes people more choosing buying goods and products they needed through online. This paper aimed to study the factors influencing customer satisfaction on online buying during Movement Control Orders (MCO). The study discussed about the product quality, customer trust and price fairness during MCO. Three main factors that used in this study to analyses customer satisfaction are product quality, customer trust and price fairness. The online buyer that currently living in Kuala Terengganu is selected as the subject of the analysis.

Keywords: *Product Quality, Customer Trust, Price Fairness, Customer Satisfaction, Movement Control Order, Online Buying and Kuala Terengganu.*

1 Introduction

During the Industrial Revolution 4.0 era, the increasingly hectic lifestyle made the internet an effective social necessity. Many people connect with the Internet in today's everyday life as a way of coping not only with employment and school, but also with industry and commercial partnerships. Although they are low in risk and less time intensive, online commercial and business systems have become a common option among the public. Customer satisfaction has been the of the most critical priorities that every firm pursuing a long-term partnership with the customer finds to be a top priority. A few of the key factors determining customer satisfaction is the customer's view of service efficiency. Customer satisfaction is defined as the product of a comparison of the perceptions of the customer and his or her actual performance of the quality of the service. Perceived service efficiency is one of the antecedents of this conceptualization of total customer satisfaction³¹. Previous studies have shown evidence to support this association between consumer loyalty and quality of service (Ngo & Nguyen, 2016).

Next, in this study also related about the implementation of Movement Control Order (MCO) due to COVID-19 outbreak has also led to an increase in online activity including buying and

³¹ . Ngo, V. M., & Nguyen, H. H. (2016). The relationship between service quality, customer satisfaction and customer loyalty: An investigation in Vietnamese retail banking sector. *Journal of Competitiveness*.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

selling of goods. According to Isa and Latiff (2018), as a consequence of the implementation, most traders start expanding their marketing strategy by selling their goods online.³² Moreover, the online medium has also made consumers feel more comfortable to make purchases because it enables them to access different services easily and efficiently.

According to Isa (2020), the results of her study indicate that Shopee, Lazada and Food Panda were the top three shopping websites visited by customers, selling general everyday necessities wanted by customers. The results also revealed that the elements of the comfortable website that relate to the appealing interface, the polite user, the choice of native language, the amount of information posted and the upgrading of the product descriptions were the factors that lead to the attractiveness of customers to be interested in online shopping.³³

Therefore, with the expectation of online shopping industry especially through e-commerce platform are in rapid speed in increasing usage in Malaysia, the researcher is investigating the influencing of these three factors which are product quality, customer trust and price fairness of customer satisfaction on online buying for further understanding the customers need and expectation.

Recognizing customer satisfaction with Internet shopping is especially important as a high degree of satisfaction is correlated with a variety of main outcomes such as repeat purchase and positive word-of-mouth.³⁴ In the current analysis, the measurements discussed will significantly assist researchers in determining how consumers are happy with shopping on the Internet (Cheung & Lee, 2005). Customer satisfaction is dependent variables where being tested and measured in this study.

Product quality related problem somehow affect the preference of consumer either they will buy the product through online or not. Online customer satisfaction has gained significant interest in recent years, partially because it acts as a way to achieve competitive advantage. If a customer is happy with a single internet store, they are more likely to buy there again ³⁵ (Lin, Wu, & Chang, 2011).

Next, trust is characterized as one party's trust in the reliability and honesty of an exchange partner. That is the party's assumption that the other party has the skills to do a task, while the latter applies to the one party's belief that the other party has intentions that are helpful to the goal as new circumstances emerge without a promise³⁶ (Dang, Pham, & Wang, 2019). Customer satisfaction may be defined as the expectations of customers that manufacturers are trustworthy and reliable in delivering on their commitments.

After that, price discrimination helps companies to separate consumers in regard to their ability to pay by setting varying rates on the same good or service. Multi-channel retailers can distinguish prices by means of different instruments, such as product price differential, such as base price, without discounts and fees or price promotions. In addition, they have to determine whether to charge delivery charges electronically and if so, understand the interplay between

³² Isa, K., & Latiff, A. A. (2018). Internet Browsing Trends among Malaysians during Movement Control Order (MCO) Period

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

lower online rates and shipping charges on price differentiation. According to Bertrandie and Zielke (2019), price unfairness may be described as the price determination as unacceptable, unreasonable or unjustifiable. Consumers interpret market injustice when presented with differing pricing for the same commodity.³⁷

In online buying, the selection of marketing outlets is growing with the passing of time, as is the sophistication of the buying behaviour of customers. Pappas (2016) stated that when purchasing goods, shoppers prefer to migrate between e-channels largely due to the dramatically improved financial, protection and efficiency threats that the Internet poses relative to offline shopping.³⁸ During the pandemic, peoples tend to purchase product through online rather than go to the store.

The main problem in satisfaction of customer is the standard of customer ratings for good and services. The customer rates it in terms of whether the product or service can fulfil requirement of customer or the product performance can fulfil the expectations of customers. If one aspect of products and services do not satisfy customer, thus they cannot be satisfied with the overall performance of the online buying.

The objectives of this research will be to determine the influencing customer satisfaction on online buying during MCO in Kuala Terengganu. In order to achieve the aim of the study, the succeeding supporting objectives are established:

- 1) To investigate the relationship between product quality and customer satisfaction on online buying during MCO.
- 2) To define the consumer trust and customer satisfaction on online buying.
- 3) To determine the product price and customer satisfaction on online buying during MCO.
- 4) To find the strongest factors that affect customer satisfaction on online buying during MCO

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

2 Research Methodology

2.1 Underpinning Theory

2.1.1 Theory of Consumer Satisfaction With Internet Shopping

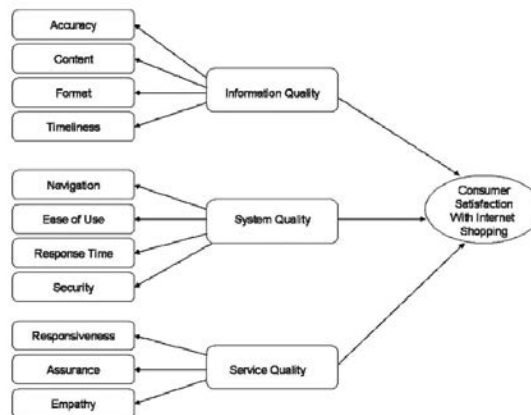

Figure 2.1: Research Framework of Consumer Satisfaction with Internet Shopping

This report combines end-user computer literature with literature on service efficiency and proposes a methodology for the study of customer interaction with internet shopping. For information quality, high information content has long been established in relation to device use, customer retention and net benefits.³⁹ He urged that the quality of web content should decide whether potential customers would be drawn to or pushed away from the website (Cheung & Lee, 2005). It can be related to the price influencing customer satisfaction with the information quality. Next, system quality relates to customer trust which can affecting the customer satisfaction. And the last one is service quality where relate to the product quality for this study.

The researcher uses this theory to study the customer satisfaction on online buying during MCO. The researcher uses this principle to analyze consumer loyalty during MCO for online shopping. It is especially important to consider customer satisfaction with internet shopping since a high degree of satisfaction is correlated with many main findings. For example, repeat buying, good word-of-mouth, and so on. The aspects discussed in the current study will significantly aid researchers to explain how customers create satisfaction with Internet shopping. This paradigm basically attempts to clarify three fundamental questions like what determines user satisfaction with internet shopping, how it is produced, and what characteristics are relatively relevant to its creation.

³⁹ Cheung, C., & Lee, M. (2005). *Consumer satisfaction with internet shopping: A research framework and propositions for future research* (Vol. 113).

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

2.2 Conceptual Framework

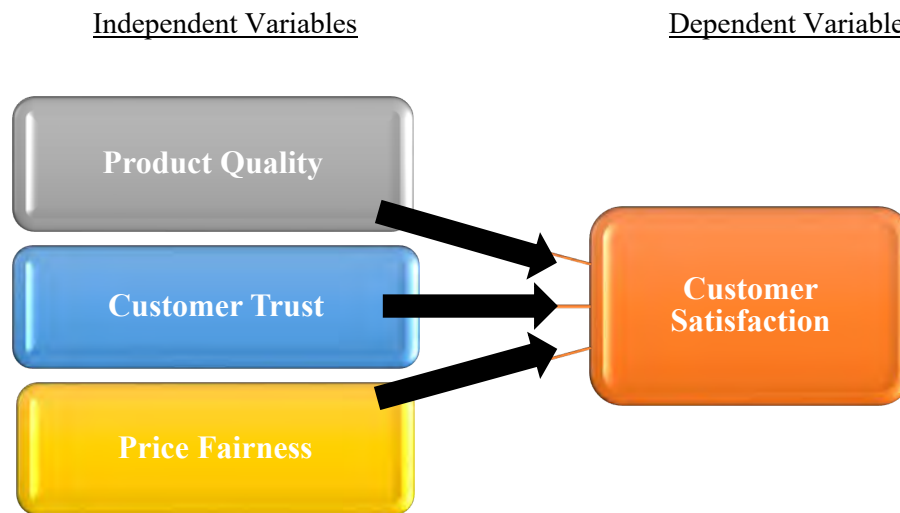

Figure 2.2: Conceptual Framework of the Study

There are three hypotheses to assume that there is relationship of each influential factors that effect customer satisfaction on online buying during MCO to associate in the Figure 2.2.

Hypothesis 1: There is a relationship between product quality and customer satisfaction during MCO.

Hypothesis 2: There is a relationship between customer trust and customer satisfaction during MCO.

Hypothesis 3: There is a relationship between price fairness and customer satisfaction during MCO.

2.3 Data Collection Methods

This study uses descriptive research which will be taken to investigate the factors influencing customer satisfaction on online buying during MCO with the independent variables which are product quality, customer trust and price fairness. Descriptive assisted with reliability and correlation in order to accomplish research objectives. Moreover, it also consists of a research framework design and plan of action for the research.

The research uses quantitative approach. A quantitative method and its explanations can be defined in the positivist model. In line with the issue of big populations and data processing, this approach focuses on new data collection, but lacks the emotions and thoughts of a person or the environmental context ⁴⁰(Rahi, 2017). Primary data is data originated for the first time by the researcher through direct efforts and experience, specifically for the purpose of addressing their research problem. Also known as the first hand or raw data. Primary data collection is quite expensive, as the research is conducted by the organization or agency itself, which requires resources like investment and manpower.

The objective of this research design is maintaining validity of this study, where research need to collect information about the customer satisfaction on online buying during MCO. Thus, a collection of constructed questionnaires distributed to the respondents to collect data directly

⁴⁰ Rahi, S. (2017). Research design and methods: A systematic review of research paradigms, sampling issues and instruments development. *International Journal of Economics & Management Sciences*, 6(2), 1-5

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

from different internet users who brought products via the internet, in which the questionnaire helps the research to obtain accurate and reliable information, even though it is a main method of collecting data used for this quantitative approach. This study will use primary data collection method for quantitative research. Quantitative data collection methods are based in mathematical calculations in various formats.

2.4 Sample Size, Sampling Techniques and Measurement of the Variables

Table 3.1: The Table of Statistical Power Analysis for Multiple Regression Models

Exhibit 1.7 Sample Size Recommendation a in PLS-SEM for a Statistical Power of 80%												
Maximum Number of Arrows Pointing at a Construct	Significance Level											
	1%				5%				10%			
	Minimum R ²				Minimum R ²				Minimum R ²			
	0.10	0.25	0.50	0.75	0.10	0.25	0.50	0.75	0.10	0.25	0.50	0.75
2	158	75	47	38	110	52	33	26	88	41	26	21

10	256	123	79	64	189	91	59	48	156	76	49	41

Source: Cohen, J. A power primer. *Psychological Bulletin*, 112, 155–159.

As for this research, the researcher uses the sample size provided by Cohen 1992. The sample size presents the table of statistical power analysis for multiple regression models. The sample size refers the number of independent variables to take the number of respondents. Based on the table, the maximum arrows pointing at a construct in framework of this study is 3 factors which are product quality, customer trust and price fairness pointed to dependent variable which is customer satisfaction. Hence, on the basis of this sample, the analysis needs a minimum number of 124 surveys to obtain a statistical power of 80 percent for the identification of R² values of at least 0.10 with a 5 percent error probability.

In this study, the researcher will be using non probability sampling is often associated with case study research design and qualitative research. Sampling of convenience chooses participants so they are most conveniently and widely accessible. Generally, convenience sampling among students tends to be a favorite sampling method, since it is inexpensive and simple to choose from compared to other sampling techniques. Convenience sampling also tends to overcome many of the research-related pitfalls. For instance, using friends or family as part of the sample is easier than contacting random individuals⁴¹ (Taherdoost, 2016). Convenience sampling also can help the researcher easy to collect the data. Before proceeding the survey, questionnaire begins by asking whether respondents have ever made a purchase online.

For the question survey, the researcher used Likert scales. The 5 points were usually used in the scale of calculation to assess whether respondents agree or disagree on the questions

⁴¹ Taherdoost, H. (2016). Sampling Methods in Research Methodology; How to Choose a Sampling Technique for Research. *International Journal of Academic Research in Management (IJARM)*.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

considered. The scale used with 5 points, however is insufficient to evaluate the characteristics of the purpose of the respondent, especially when the researchers decide to attempt a statistical inference parametric test.⁴² The influence of parametric strategies is weakened by 5 points of Likert scales representing 5 options (Awang, Afthanorhan, & Mamat, 2016).

After that, data collection is the process of collecting and evaluating information in a defined systematic manner on targeted variables, which enables one to answer research questions, test hypotheses, and analyze the findings. For data management and interpretation, the Statistical Package for Social Sciences (SPSS) will be used in this research. It is powerful software that makes statistical analysis of the most frequently used forms simpler. The researcher uses this technique in this study.

This section explains the methodology used in this research includes research design, data collection methods, study population, sample size, sampling technique, research instrument development, measurement of the variables and procedure of data analysis. The respondents of this study are all gender which age range is 18 years old and above up to 45 years old. The data and constructs used in this study meet the requirements of research methodology.

3 Analysis and Discussion

3.1 Demographic Profiles of Respondents

Table 3.1: Gender

		Gender			Cumulative
		Frequency	Percent	Valid Percent	Percent
Valid	Female	98	79.0	79.0	79.0
	Male	26	21.0	21.0	100.0
	Total	124	100.0	100.0	

Table 3.2: Age

		Age			
		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	less than 18 years old	8	6.5	6.5	6.5
	19 – 24 years old	76	61.3	61.3	67.7
	25 – 29 years old	27	21.8	21.8	89.5
	30 – 34 years old	4	3.2	3.2	92.7
	35 – 39 years old	5	4.0	4.0	96.8
	40 – 44 years old	3	2.4	2.4	99.2
	more than 45 years old	1	0.8	0.8	100.0
	Total	124	100.0	100.0	

Table 3.3 : Status

Status

BUSINESS COLLOQUIUM 2020/2021**

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Single	103	83.1	83.1	83.1
	Married	21	16.9	16.9	100.0
	Total	124	100.0	100.0	

Table 3.4: Ethnicity

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Malay	103	83.1	83.1	83.1
	Chinese	12	9.7	9.7	92.7
	Indian	3	2.4	2.4	95.2
	Others	6	4.8	4.8	100.0
	Total	124	100.0	100.0	

Table 3.5: Education Level

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	SPM	9	7.3	7.3	7.3
	Matriculation / STPM	30	24.2	24.2	31.5
	Diploma	1	.8	.8	32.3
	Degree	77	62.1	62.1	94.4
	Master	2	1.6	1.6	96.0
	6	4	3.2	3.2	99.2
	PhD	1	.8	.8	100.0
	Total	124	100.0	100.0	

Table 3.6: Monthly Income

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Less than RM 1000	67	54.0	54.0	54.0
	RM 1001 – RM 3000	27	21.8	21.8	75.8
	RM 3001 – RM 5000	22	17.7	17.7	93.5
	More than RM 5000	8	6.5	6.5	100.0
	Total	124	100.0	100.0	

For the present study, the analysis shows that the table 3.1 shown the demographic respondents about gender of the respondents. The highest score for the data of gender for female with the score 79.0% follow by the lowest data of gender are gender male which is 21.0%. Based on the

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

survey, majority of the respondents is 19 years old to 24 years old, which are 76 respondents (61.3%). Besides that, respondents in the range of 45 years old and above is the minority in the survey with only one respondent from 124 respondents (0.8%). Based on the Table 3.3, the table shown the demographic respondents about status of the respondents. There are 103 respondents out of 124 respondents are single. The percentage of single respondents are 83.1%. For the married respondents, there are 21 male respondents out of total 124 respondents. The percentage for male respondents are 16.9%. Next, the highest score for the race data is Malay with the score 83.1% and the lowest score for the race data is Indian which is 2.4%. After that, there are 9 respondents that were level SPM. The percentage of level SPM respondents are 7.3%. Next, in the results stated that there are 77 respondents are degree level. The percentage of the respondents that are degree level are 62.1%. For the Diploma and other education level, both are only one respondent and the percentage is 0.8%, which are the lowest score from the total 7 classes. For the results of matriculation and STPM level are 30 respondents from 124 respondents with 24.2%. Besides that, based on the data, there are 2 respondents and 4 respondents out of 400 total respondents are from master degree and PhD. The both percentages are 1.6% and 3.2%. Based on Table 3.6 shown that the data analysis for the demographic respondents for Monthly Income. Based on the results, the percentage of the respondents who have their monthly income below than RM1,000 are 54% which is the highest score for this data analysis. There are 8 respondents which is 6.5% of the total respondents who have their monthly income more than RM 5,000. This class also recorded the lowest score for this question.

3.2 Descriptive Analysis

3.2.1 Dependent Variable and Independent Variable

Table 3.7 Descriptive Statistics (Develop for the Research)

Variables	N	Minimum	Maximum	Mean	Std. Deviation
Product quality (IV)	124	3.20	5.00	4.5032	0.45082
Customer trust (IV)	124	3.00	5.00	4.2887	0.43602
Price fairness (IV)	124	2.80	5.00	4.2500	0.51427
Customer satisfaction (DV)	124	3.00	5.00	4.4581	0.52870
Valid N (listwise)	124				

Based on the summary, the highest mean value was from product quality which was 4.5032 where respondents agreed more on this variable while the lowest mean value is on price fairness which is 4.2500 where shows the respondents agree lower for that variable in this analysis. The data set from 124 respondents with the standard deviation which lower than 1, shows the values were more reliable.

3.3 Validity And Reliability Test

In this research, the researcher had used Cronbach's Alpha to test the reliability of the data, or whether the data fits the common measurement for internal consistency⁴³. Internal consistency reliability can be defined as a test for respondents' responses whether is consistency at all sections (Sekaran & Bougie, 2009). Cronbach's Alpha can be defined as the statistics or tool in measuring the consistency of respondents' responses from a set of questions that had been

⁴³ Sekaran, U., & Bougie, R. (2009). Research Methods for Business: A Skill Building Approach (5th Edition). *International Journal of Information Technology and Management - IJITM*.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

designed together to measure the ultimate aim for the research⁴⁴ (Gliem & Gliem, 2003).

Table 3.8: Cronbach's Alpha Reliability Test Result (Develop from the Research)

Variables	Cronbach's Alpha Value	No. of item	Strength
Product quality (IV)	0.668	5	Moderate
Customer trust (IV)	0.588	5	Poor
Price fairness (IV)	0.779	5	Good
Customer satisfaction (DV)	0.819	5	Very Good

Table 3.8 above shows the results of the reliability test through the value of Cronbach's Alpha Coefficient for dependent and independent variables in this study based on our survey of 124 respondents in the area of Kuala Terengganu. According to Table 4.1, the strength of the association value of Cronbach's Alpha coefficient of more than 0.70 is good for the reliability test. In measuring the customer satisfaction on online buying during MCO in Kuala Terengganu, five questions were used and the Cronbach's Alpha result for this section's questions was 0.819 which resulted as very good. Thus, the coefficient obtained for these questions in the product quality variable was very good. After that, to measure the product quality that influenced the customer satisfaction on online buying during MCO in Kuala Terengganu, the five questions were also used and the value for the Cronbach's Alpha result for this section's question was 0.668 which is moderate. Thus, the coefficient obtained for this question in the order processing variable was moderate. Next, to measure the customer trust that influenced the customer satisfaction on online buying during MCO, there were five questions were used and the Cronbach's Alpha result for this section question was 0.588 which a bit low resulted as poor. Therefore, the coefficient obtained for the questions in the customer trust variable was poor. Lastly, in measuring the price fairness variable which influenced the customer satisfaction on online buying during MCO in Kuala Terengganu, there were five questions were used and the Cronbach's Alpha result for this section question was 0.779 which also resulted as good. Therefore, the coefficient obtained for the questions in the price fairness variable was good.

3.4 Hypotheses Testing

3.4.1 Pearson's Correlation Analysis

In this part, the Pearson's Correlation Analysis will examine that whether the independent variable, which is product quality, customer trust and price fairness are statistically significant with the customer satisfaction on online buying, the dependent variable. In this case, the researcher had used the Pearson Correlation Analysis (two-tailed test) to investigate the relationship of the factors that influencing customer satisfaction on online buying during MCO in Kuala Terengganu. The table below showed the interpretation of the strength of the coefficient with variables.

Table 3.9: Rule of Thumb of Correlation and Coefficient

⁴⁴ Gliem, J. A., & Gliem, R. R. (2003). *Calculating, interpreting, and reporting Cronbach's alpha reliability coefficient for Likert-type scales.*

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Coefficient (r)	Strength
0.91 – 1.00	Very high relationship
0.71 – 0.90	High relationship
0.41 – 0.70	Moderate relationship
0.21 – 0.40	Slightly weak but definite relationship
0.01 – 0.40	Weak almost negligible relationship

Source: Guilford and Fruchter (1973)

Table 3.10: Pearson’s Correlation Analysis (Develop from the Research)

Variables		Product quality	Customer trust	Price fairness	Customer satisfaction
Product quality	Pearson Correlation	1	0.516**	0.372**	0.602**
	Sig. (2-tailed)		0.000	0.000	0.000
	N	124	124	124	124
Customer trust	Pearson Correlation	0.516**	1	0.594**	0.597**
	Sig. (2-tailed)	0.000		0.000	0.000
	N	124	124	124	124
Price fairness	Pearson Correlation	0.372**	0.594**	1	0.622**
	Sig. (2-tailed)	0.000	0.000		0.000
	N	124	124	124	124
Customer satisfaction	Pearson Correlation	0.602**	0.597**	0.622**	1
	Sig. (2-tailed)	0.000	0.000	0.000	
	N	124	124	124	124

** . Correlation is significant at the 0.01 level (2-tailed).

According to Table 3.10, correlation is significant at 0.01 level, which means there are less than one in a hundred chances to be wrong when it comes to test the hypothesis. Price fairness achieved the highest correlation at 0.622, followed by product quality at 0.602 and lastly customer trust at 0.597.

3.4.2 Hypothesis 1: Product Quality

H1: There is a significant relationship between product quality and customer satisfaction during MCO.

As shown in the Table 4.15, the hypothesis is accepted because there is a significant, moderate and positive correlation between Product Quality and Customer Satisfaction as the p-value is 0.00 and less than 0.01. Therefore, there is a connection between security and customer satisfaction as the correlation coefficient is 0.602. It can be concluded that customer satisfaction is influenced by product quality. Therefore, there is a connection among product quality and customer satisfaction.

3.4.3 Hypothesis 2: Customer Trust

H2: There is a significant relationship between customer trust and customer satisfaction during MCO.

As shown in the Table 4.15, the hypothesis is accepted because there is a significant, moderate and positive correlation between Customer Trust and Customer Satisfaction as the p-value is

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

0.00 and less than 0.01. Therefore, there is a connection between customer trust and customer satisfaction as the correlation coefficient is 0.597. It can be concluded that customer satisfaction is influenced by customer trust. Therefore, there is a connection among customer trust and customer satisfaction.

3.4.4 Hypothesis 3: Price Fairness

H3: There is a significant relationship between price fairness and customer satisfaction during MCO.

As shown in the Table 4.15, the hypothesis is accepted because there is a significant, moderate and positive correlation between Price Fairness and Customer Satisfaction as the p-value is 0.00 and less than 0.01. Therefore, there is a connection between price fairness and customer satisfaction as the correlation coefficient is 0.602. It can be concluded that customer satisfaction is influenced by price fairness. Therefore, there is a connection among price fairness and customer satisfaction.

This chapter has discussed on the reliability, frequency distribution, regression and correlation of the instruments used in order to complete this research. This chapter also has examined the hypothesis that were developed in this study. The results showed all independent variables (product quality, customer trust and price fairness) have positive relationships with dependent variable (customer satisfaction on online buying during MCO in Kuala Terengganu). The most important factor that influence the customer satisfaction on online buying during MCO is price fairness.

5 Conclusion and Future Research

5.1 Recommendations/ Suggestion for Future Research

The result of this study highlighted about the factors that influenced customer satisfaction on online buying during MCO. This study only focused on people in Kuala Terengganu. As a recommendation, there are few future opportunities for future research. Firstly, the future studies need to get extend their sample size to get better result for this study because this study only focusing on people in Kuala Terengganu area. For example, in order to get more result, they can add their sample size by enlarging it. Therefore, future researcher could extend the study population by targeting people in the state of Terengganu. In addition, from that, the research could be expanding if the study also conducted in the industrial sector either in government or private sector. The knowledge, experience and expectation towards customer satisfaction could be varied from different group of population. Thus, a more accurate research could be conducted when studying different groups of respondents. The larger population can help to generalize the result to a wider scope and helps the results to be more exact. Lastly, the future researcher should do more methodology work to make independent variable more acceptable and getting the outcome to be more precise. Therefore, the future researcher can explore others independent variable or adding other variables in this study to know the level of satisfaction of customers. As for benefit to others marketers, the future research about the product quality should be done and studied detail and widely so the online marketers could understand the online food ordering concepts in order to boosts their sales by knowing what factors that influence customer satisfactions towards online food ordering among student.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

5.2 Overall Conclusion of the Study

In conclusion, the research objectives had been achieved and the research question has successfully answered. This research concludes that the independent variables Product Quality, Customer Trust and Price Fairness that influence the satisfaction of the customer towards online buying during MCO in Kuala Terengganu. And, the major factor that most influence customer satisfaction has been identified which is price fairness with the highest results shown as the correlation coefficient is 0.602. Highest compared to other independent variables analysed to be the factor influences customer's satisfaction of online buying during MCO in Kuala Terengganu. Customer satisfaction is a domain element in determining the sustainability of such business. Customer satisfaction would also lead to future repeats on purchase which refers to loyalties and prolongs revenues. Hence, it is crucial in ensuring that every need of the customers is fulfil to achieve total satisfaction on each penny spent on the products purchased. This research has beneficially highlighted the results on every element that is counted in as well as pointing out the major item that needs to be taken into improvements. This research would also help peoples, as a user, in analysing the product quality itself that is offered, the best services that they can get throughout every feature offered in the services either the trust on the seller and the extent to which the price fairness features owned by the platform. However, there are still some parts to be improve in this research. Therefore, the researcher must continuously conduct the future research that will be added to the new dimensions of customer satisfaction on online buying.

6 Acknowledgement

This research project was successfully done. I would like to express great gratitude to those individuals who have guided, assisted and helped me in completing this research. My deep gratitude first goes to University Malaysia Kelantan (UMK) for giving me this opportunity to do this research. Through this research, I have gained a lot of experience, knowledge and expose to situation, which cannot be found in books, and certainly going to benefit us in the future especially through online distance learning. The appreciation also extends to my supervisor, Madam Nadia Hanum Binti Amiruddin who guides me to complete the proposal by sacrificing her time through the entire project. Her patient and advices ensure this research can proceed very well. Finally, I acknowledge my family members, colleagues and course mates for encouraging and loving me before this research project finishes.

**THE IMPACT OF DIGITAL MARKETING IN RETAIL
INDUSTRY IN MALAYSIA**

Fatin Sheba Nurhuda Zulkifli and Yusrinadini Zahirah Md. Isa@Yusuff

Faculty of Entrepreneurship and Business,
Universiti Malaysia Kelantan,
Malaysia

Email: fatin.a17b0969@siswa.umk.edu.my; yusrinadini@umk.edu.my

Abstract:

Digital marketing is transforming the way retail industry to interact with their clients and build connections. Potential customers are at the edge of deciding how they want to engage with retail industry. The means of establishing and sustaining connections with consumers, as well as achieving goals, have increased because of these developments. This encouraged retail industry to digitally communicate with customers, figure out which digital marketing campaigns are going to get a positive response, and use digital technology to attract over customers. For the conclusion, the main purpose of this research is to know the impact of the digital marketing in retail industry in Malaysia

Keywords: *Digital Marketing, Retail Industry, Technology Factor, Consumer Factor, Job Opportunity.*

1 Introduction

Digital marketing is the mean of the marketing element that incorporates digital technologies such as desktop computers, personal computer, laptop, tablet, mobile phones and other digital media and platforms to advertise merchandise and services on the internet and online. Its creation in the 1990s and 2000s changed the way brands and retailers use marketing technology.

Digital marketing is not just a marketing contact channel that is faster or newest. It's a modern brand engagement strategy. As the focus of digital marketing shifts towards a customer-driven world, in order to strengthen customer interactions and achieve goals, customers have taken charge of the way retail businesses can interact with them.

1.1 Research Objectives

The objectives of this research are:

- i. To study the impact of digital marketing in retail industry in Malaysia between the technologies that we have in Malaysia.
- ii. To discover the impact of digital marketing in retail industry in Malaysia between the consumer psychology in Malaysia.
- iii. To identify the impact of digital marketing in retail industry in Malaysia between the job opportunity in Malaysia.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

2 Literature Review

The introduction of digital marketing has drastically transformed and improved the way businesses interact with their targeted customers in the retail sector. Today, in the modern world, digital marketing is used to define, predict and meet consumer desires profitably and effectively (Chaffey & Smith, 2017). Even though it is a requirement to effectively interact in today's dynamic marketing communication environment to apply an integrated marketing communication (IMC) basis for the implementation and execution of a content marketing strategy. This is achieved through a systematic process that starts with extensive target audience analysis, the correct selection of (digital) communication platforms for marketing and successful customer messaging (Key & Czaplewski, 2017)

2.1 Variable

2.1.1 Technology

The technology and factors that contributed were described in a comprehensive literature review. Required marketing instruments that are used in. So, a method variety is created, including such quality or digital marketing. The technological environment also consists of innovation, research and development in technology, technological alternatives and technological barriers to smooth operation. By using focusing on digital transformation can bring a new feel to business procedures of that business such as an adoption of technology that may using smartphone. Besides, it can reduce the cost of labour or staff issues if they might make mistakes during taking the commands from customers. Therefore, technology will give the best opinion to the digital marketing in retail industry. So, it may make a consideration in using the technology that have in Malaysia.

2.1.2 Consumer

Consumer buying behavior has been identified as purchase intention from its beginning developmental stages, suggesting an emphasis on contact through retailers and manufacturers at the end of the investment period. Retailers should recognize its developing stage of consumer preferences in the advertisements. Noteworthy, businesses use advertisement to develop trust for consumers and develop good connections among customers in hopes to obtain loyalty from consumers in effect (Keefe, 2004)

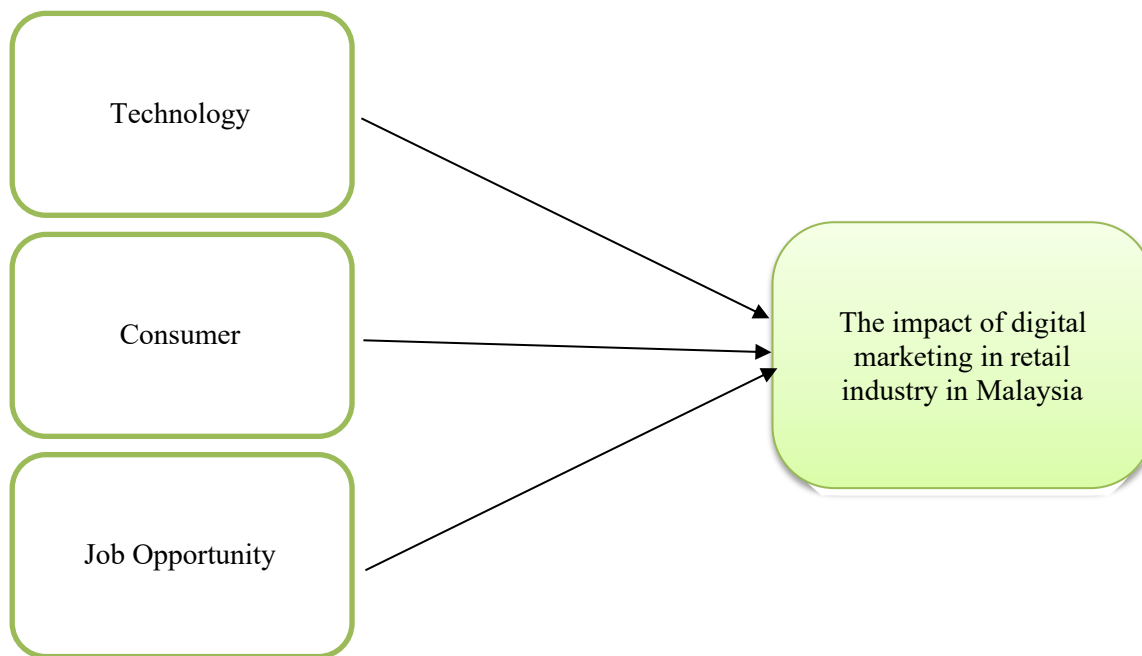

2.1.3 Job Opportunity

The positive benefits of using digital marketing are that mostly Malaysians will have so many job opportunities and people can work from home without having to go out. The Government of Malaysia also urges people not to go outside as before the COVID 19 pandemic. So, people must obey what the government is asking for. Therefore, so many individuals can lose their jobs. But it can offer people always have a job to do with digital marketing and can boost the country's greater economic growth.

For certain individuals who make a side income for their needs, it may even be a side work. So, it was a smart way to use digital marketing to get more money. People will want this job because it can still make them do their job as normal without anything having to alter.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

2.2 Conceptual Framework

Independent Variable

Dependent Variable

3 Research Methodology

Research methodology is important in gathering data on financial planning amongst respondents, as seen in the preceding paragraph, and this chapter is committed to reflections on sampling techniques. The methodology that has been used in data analysis procedure would be the purpose of the data analysis. Analysis techniques include data collection materials such as questionnaires, interviews or observations, as well as sampling methods and statistical techniques for organizing and analyzing unstructured data. Certain techniques have been used to ensure the study's precision and effectiveness. The methodology of science should be focused on empirical procedures to minimize research inequality.

In order to include objectivity, reliability, and clarity, the research methodology in this study is focused on quantitative analysis. It has become important to select this approach as it uses statistics and it is possible to statistically evaluate these numbers. This approach is all about gathering and running accurate documentation that can be verified without problems. This methodology would have the correct findings and thus have stronger conclusions, but it also has its problems, like different testing techniques. (Burns & Burns, 2008) (Matthews & Ross, 2014)

3.1 Research Design

The research design, study population, sample, and data resources and processing and presentation are included in chapter third. According to (Sutrisna, 2009), the overall techniques used to achieve research goals and objectives are research methods. The key factors to consider are results, research philosophy, and research decisions. The outcomes of research will be

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

affected by the establishment of the philosophy of science. Study and data analysis informed by the research role and research results include data.

In this study, it is possible to use each number one and secondary studies. Primary research is a good way to locate direct information about the subject matter of a study and can be assumed to be accurate since the answers can be obtained from the intended target institution. It offers new statistics and is collected in order to obtain the expectations and goals of the subject matter of the studies. Secondary research is also considered useful because it gives a deeper knowledge of what is already known about the subject and enables the issue to be discussed more thoroughly (Walliman, 2017).

3.2 Population

The population covers all groups of people, events or objects with common factors whereas the target population is related to the population in which the research wants the results to be transmitted to the absolute population of the study (Mugenda & Mugenda) The population is a unit of education and subjects that are currently being measured (Cooper & Schindler, 2006). A target population is characterized as the totality of cases that agree to a few specifications. (Churchill & Iacobucci, 2005). It consists of all objects of interest in an investigation (Evans, 2007). The population of this study is estimated at one hundred and ten thousand. A body of trends is a master list of all sample units within a population (Tustin, 2005)

Year	Number ('000)			Annual population growth rate (%)		
	Total	Citizens	Non-Citizens	Total	Citizens	Non-Citizens
2010	28,588.6	26,264.1	2,324.5	1.8	1.6	4.0
2011	29,062.0	26,616.9	2,445.1	1.6	1.3	5.1
2012	29,510.0	26,961.7	2,548.3	1.5	1.3	4.1
2013	30,213.7	27,325.6	2,888.0	2.4	1.3	12.5
2014	30,708.5	27,696.2	3,012.3	1.6	1.3	4.2
2015	31,186.1	28,060.0	3,126.1	1.5	1.3	3.0
2016	31,633.5	28,403.5	3,230.0	1.4	1.2	3.3
2017	32,022.6	28,735.1	3,287.5	1.2	1.2	1.8
2018	32,382.3	29,059.6	3,322.7	1.1	1.1	1.1
2019	32,523.0	29,382.7	3,140.4	0.4	1.1	(5.6)
2020*	32,657.3	29,696.9	2,960.4	0.4	1.1	(5.9)

* Estimates

Table 3.1 Total population and annual population growth rate, Malaysia 2010-2020

3.3 Procedure for Data Analysis

Data analysis is the procedure of analysing information to determine each portion of the data presented using logical and analytical inference. Using the Statistical Package for Social Sciences (SPSS) 23, the evidence reported in this research will be analysed and examined. The analysis data collection in this study involved the descriptive analysis, frequency analysis, reliability analysis, normality test and Pearson's correlation.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

4 Data Analysis and Findings

The study of data that requires descriptive analysis. Also, describe the demographic data from respondents, reliability analysis centered on the importance of Cronbach's Alpha, correlation study consisting of the Pearson correlation.

By emphasizing on the probability of statistics, I analyzed each demographic profile information. In order to determine whether the data collected are compatible using the Cronbach of alpha technique, I analyzed the reliability analysis. That will further evaluate and figure out, correlation analysis and regression analysis will be used.

4.1 Preliminary Analysis

4.1.2 Pilot Test

A pilot test can be described as the preparation for a greater and project will mainly from a small research. By doing a questionnaire, this research would conduct the entire testing, but the result from this pilot test was poor estimation since they had no statistical basis and only based on a limited number of studies.

Without gathering information for data sets, the trial research is to research the reasonableness and feasibility of the study. The aim of the analysis is to determine the reliability of the questionnaire and recommend that it be revised as necessary, while this research is to ensure that respondents understand the questions and the meaning of each questionnaire.

Before the actual survey began implemented to measure the questionnaire's viability, a pilot test was conducted. The pilot test has been used to ensure that the survey did not contain any mistakes or flaws. The sample size with this research was 269. The responses to the questionnaire would cause the 20 respondents to be chosen at random. The analysis on the quality of the data on how to construct the questionnaire was collected after the collection of 20 sets of questionnaires was completed. If the survey contains errors or malfunctions, it is necessary to reconstruct it immediately.

4.2 Demographic

269 people are the overall number of respondents participating in the research. As per the descriptive statistical analysis were used to examine the demographic component, the distributions of respondents in terms of their context and preferences and showed the frequency and percentage for each segment of the respondents' demographic profile.

4.3 Descriptive Analysis

The descriptive research is used to identify the statistics of the population which is the percentages of respondents. Until performing the statistical examination, researchers would be able to analyze the data using descriptive analysis. Statistical analysis and processing of the findings can also be carried out thereafter. Furthermore, to calculate and describe the descriptive summary statistics, the mean, standard deviation, and percentage were used.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

4.4 Reliability test

4.4.1 Technology Factor

Table 4.1 :Reliability Statistics

Cronbach's Alpha	N of Items
.696	5

The reliability assessment in the table above is consistent. If the independent variable (IV) for the technology component is 0.696, the coefficient alpha for reliability can be inferred. This means that the accuracy and balance of 0.696 based on the thumb rules on the Cronbach of alpha coefficient is acceptable.

4.4.2 Consumer Factor

Table 4.2: Reliability Statistics

Cronbach's Alpha	N of Items
.802	5

The reliability assessment in the table above is consistent. If the independent variable (IV) for the consumer factor is 0.802, the coefficient alpha for reliability can be inferred. This means that the accuracy and balance of 0.802 based on the thumb rules on the Cronbach of alpha coefficient is good.

4.4.3 Job Opportunity

Table 4.3:Reliability Statistics

Cronbach's Alpha	N of Items
.769	4

The reliability assessment in the table above is consistent. If the independent variable (IV) for the job opportunity is 0.96, the coefficient alpha for reliability can be inferred. This means that the accuracy and balance of 0.96 based on the thumb rules on the Cronbach of alpha coefficient is acceptable.

5 Discussion and Conclusion

For the conclusion, the main purpose of this research is to know the impact of the digital marketing in retail industry in Malaysia. Following are the part that have in this research, in Chapter 1, the research context, problem statement, study importance and study scope were highlighted. In addition, the first part of Chapter 2 defined all the conceptions of dependent variable and independent variables in order to explain the problem and to evaluate the relationship between these variables. The main aim of Chapter 3 is to expand on research methodological details such as pilot analysis, research design, estimation of research and approach to science. However, Chapter 4 is important for researchers to review the reliability test for all these variables and to ensure that there is a connection between the dependent

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

variable and the independent variable in the linearity test. Finally, the content of Chapter 5 was on general findings, implications of the study, shortcomings of the study, and recommendations for future research.

The most important research indicates that the more technologically sophisticated a retail department store becomes, the more marketing strategies can be created. It can be observed that modern digital marketing technologies expand the reach of marketers during a consumer journey in a powerful way. Tech devices such as signposts, therefore, enable customers to be detected from the very beginning of a shopping trip and communicate with them during the entire shopping journey.

6 Acknowledgement

Firstly, I would like to express the deepest appreciation gratitude for giving me the opportunity to do research and provide invaluable guidance during this research to my research supervisor Dr Yusrinadini Zahirah binti Md Isa@ Yusuff. I was influenced overpoweringly by her dynamism, vision, honesty and inspiration. She taught me the methods for conducting the analysis and presenting the test work as simply as possible. Working and learning under her guidance was a great pleasure and honor. For what she has given me, I am extremely grateful. In addition, I am incredibly truly grateful for my parents because of their devotion, their prayers, their care and their sacrifices in order to educate and prepare me for my future. To complete this research work, I am grateful for their love, understanding, prayers and continuing support. I would like to say thanks to my friends during my research work for their sincere support.

Finally, thanks to all the individuals who helped me to directly or indirectly complete the research work.

**ONLINE PURCHASING INTENTION ON COSMETIC
PRODUCT AMONG YOUNG WOMEN**

Hanis Radhiah Chik and Nadia Hanum Amiruddin

Faculty of Entrepreneurship and Business,
Universiti Malaysia Kelantan,
Malaysia

[Email: hanis.a17a0115@siswa.umk.edu.my](mailto:hanis.a17a0115@siswa.umk.edu.my) ; nhanum@umk.edu.my

Abstract:

This study examines online purchasing intention on cosmetics among young women in Malaysia. Cosmetics is one of the top important needs for women in Malaysia because it will make them more confident and attractive. By pandemic Covid-19, many consumers were purchasing cosmetics online and there are many factors that influenced them to buy it. The aim of this research is to investigate factors influencing consumer purchase intention on cosmetics. Based on this study, there are four factors that influence online purchasing intention among young women which is product quality, brand image, promotion and electronic word-of-mouth. In this research, the researcher used an online questionnaire to get the data about factors influencing online purchasing intention on cosmetics. The total number of respondents was 137 respondents who had been distributed with questionnaires. The limitation of this research is only focused on young women that have intention and have experience purchasing cosmetics online. The data were analyzed and interpreted using SPSS software which involved reliability analysis, descriptive analysis, normality test and correlation analysis. After analysing the data, the finding reveals that the factors influencing are correlated with online purchasing intention on cosmetics.

Keywords: *Online Purchasing Intention, Product Quality, Brand Image, Promotion, Electronic word-of-mouth.*

1 Introduction

In both advanced and developing nations, the cosmetic industry is rapidly developing. In Asia, the cosmetic market is becoming visible to be the fastest-growing-market. It is because people have more choice to spend their money on cosmetic products as long as the product will make them perform beauty and confidence. Cosmetics is one of the top important needs for most women, especially young people. Nowadays, the desire for beauty is constantly evolving as one of the basic needs of human beings. By using the cosmetic products, women will feel more attractive and positive images on their appearance. People are already aware of cosmetic products because when they hear about that, they tend to consider women. According to Hidayah (2019), cosmetic products not only refer to lipstick, face powder, mascara but it also includes other personal care products such as shampoo, fragrance, body soap and dental care products.

This study aims to investigate whether the factors regarding online purchasing intention on cosmetics will attract young women. According to Haque et al. (2015), purchasing intention is a precedent that promotes and drives the purchase by the consumer of products or services. The intention will arise after the person feels they need the product to solve their problems. Purchasing intention is the possibility that consumers in a certain purchasing situation choose

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

a certain brand or product category. It also can be defined as a process in which young women have information and awareness about the products. So, it will enhance them to have the intention to buy cosmetic products by choosing a certain brand. The consumer purchase intention can be influenced by many factors which depend on product quality, brand image, promotion, and e-WOM.

1.1 Research Objective

The objective for this research is:

- i. To determine the relationship between product quality and the online purchase intention of cosmetic products among young women.
- ii. To determine the relationship between brand image and the online purchase intention of cosmetic products among young women.
- iii. To determine the relationship between promotion and the online purchase intention of cosmetic products among young women
- iv. To determine the relationship between e-WOM and the online purchase intention of cosmetic products among young women.

1.2 Significant of the Study

Consumer

This study would expose the determinants of consumer purchase intention towards cosmetic products in Malaysia. This research will provide some information to the consumers that have the intention to purchase cosmetic products online. By this research, consumers can know what kind of factor they need to implement to purchase cosmetics online. Besides that, it will give more information to consumers that can help them to make the right decision when buying cosmetic products online.

Retailer

This research will help the retailers to understand the cognition of the customers better. The retailers can know what kind of factors that consumers recognize to purchase online. Besides that, the online retailer can improve the weakness possessed by the company. They also can improve the knowledge of the products, feedback, and any information at e-commerce. It will help to convince customers to make purchases of cosmetic products online. As mentioned in this research, product quality, brand image, promotions, and e-WOM are important in order to influence consumers to buy our products. So the retailers could identify the strategy to market the products by e-commerce.

2 Literature Review

Perception of research on the relationship between product quality, brand image, promotion and electronic word-of-mouth (e-WOM) in order to know the factors that influence online purchasing intention on cosmetics among young women.

2.1 Dependent Variable

2.1.1 Online Purchasing Intention

Consumer purchase intention according to Haque et al. (2015) concludes that purchase intention is a precedent that encourages and drives the purchasing of goods or services by customers to buy the product through the internet. According to Lu, Chang, and Chang (2014), online buying intention is the ability and willingness of customers to purchase a product at a particular time and specific situation through an online transaction network. People will use any social media to purchase products that they want. Besides that, they are also willing to search for any trusted seller to buy the products online.

2.2 Independent Variable

2.2.1 Product Quality

Product quality is the capability of the product to perform its purpose correctly, including the efficiency and precision of the product. According to previous research, it revealed an important moderate relationship between perceived quality and emotional value to purchase intention, Asshidin, Abidin, and Borhan (2016). The high quality of the products will make consumers have the intention to purchase cosmetics online. It is because they already know from other feedback that the products will give more benefit to them. Thus, Priyanga and Krishnaveni (2016) noted that it is due to the quality of the beauty care products, the customer becomes brand loyal. High-quality of products cosmetics help create and retain the trust of targeted consumers and convince them to purchase the product.

2.2.2 Brand Image

The brand of the product is regarded as a name and a symbol of an undertaking. Brands play an important role in the creation of a positive image among consumers. According to a previous study, Khan, Ghauri, and Majeed (2012), as a customer's ability to spend a significant amount on their preferred brand over its alternatives, notes brand loyalty. Besides that, according to Mohammadzadeh (2015), a brand image is the expectation of customers regarding products or the overall views that are created in their minds about products. That means when consumers are aware of cosmetic brands, the cosmetic product will be considered on their purchase list. It can be concluded there is a positive relationship between brand image and online purchasing intention in cosmetic products. Brand image is also important for businesses, they aim to enhance marketing activity and communicate with strategies to position and sustain a positive brand. If consumers have a positive image towards brands, the brand is more influential relative to other brands.

2.2.3 Promotion

According to Xinhe (2019), sales promotion is a short-term demand derivation strategy and also a special marketing offer that provides more profits than what customers get from a product's sales position and also has a sharper impact on sales. Sales promotion online can influence consumers to purchase because the price of the products might be lower than usual.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Besides, price promotion or price discount make consumers buy unplanned when the price suddenly low than before. The research found that there is a positive relationship between promotion and online purchasing intention on cosmetics among young women in Malaysia. In the same previous article, Xinhe (2019)the researchers also mentioned that price promotions are popular strategies to attract customers and increase business profits. This strategy is often used in the short term and intended to promote and facilitate further purchases of individual goods by consumers. Consumers are more attracted to promotions by buying 1 free 1, coupon or gift. Not all people think that sales promotion can cause consumers to pay attention to the promotion compared to products and services.

2.2.4 Electronic word-of-mouth

Electronic word of mouth (E-WOM) is a message about the product or service of the organization or about the organization itself through the internet. According to Du, Ruan, Gu, Bitzer, and Mueck (2016), the information delivered by the internet can be positive, negative, or complete. Previous studies have shown that the key factors that could affect e-WOM are trustworthiness, expertise, informative influence, and high fashion participation. The finding of the study will benefit the businesses that use social media to market their goods by targeting factors that have a major effect on their purchasing intention, Saleem and Ellahi (2017). Based on the 2017 Local Consumer Review Survey, the findings revealed that 97 percent of customers read online reviews for local businesses, while 54 percent of customers were affected by valence review, 46 percent of customers were affected by quantity review, and 38 percent of customers were affected by timeliness review, Local (2017). Many research has found that online reviews have a big impact on the intention of online buying on social media and website shopping.

2.3 Research Hypothesis

From the research, the researcher have studied factors influencing online purchasing intention on cosmetic products among youth women, there are four hypotheses that can be concluded from the previous study.

- i. There is a significant relationship between product quality and online purchasing intention among young women.
- ii. There is a significant relationship between brand image and online purchasing intention among young women.
- iii. There is a significant relationship between promotion and online purchasing intention among young women
- iv. There is a significant relationship between e-WOM and online purchasing intention among young women.

2.4 Conceptual Framework

A research framework has been conducted to a connection between the factor influence which is product quality, brand image, promotion and e-WOM with online purchasing intentions on cosmetics products.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Independent variable

Dependent Variable

FIGURE 1: Conceptual Framework for factors influencing online purchasing intention on cosmetics among youth women in Malaysia.

3 Methodology

3.1 Research Design

The correlational research design is carried out in that seeks to determine the relationship between purchase intention and factors influencing online purchase intention among young women in Malaysia. In this study, online questionnaires will be used as a method for data collection. Besides that, this study was also conducted using the descriptive design.

3.2 Data Collection Method

The data collection method of the research is by primary data and secondary data. A typical case is a survey that asks questions to gather answers that shed light on patterns, preferences, behaviour, and so on. Each respondent was asked to answer the questionnaires online. The researcher also acquires the data from secondary data which is from books, journals, and articles. Secondary data is knowledge gained and is information commonly accessible in derivative or electronic form.

3.3 Population

The population of the study involved young women who have the intention to purchase cosmetic products online. To carry out this study, the researcher will take a female respondents ages from 18-34 in Malaysia to answer the online questionnaire. According to webpage Insights (2018), Social networks and influencers also play an important role in product research and evaluation, particularly among people between the ages of 18 and 34. They found that 49 per cent of facial skin care shoppers aged 18–34 and 53 per cent of make-up shoppers in the same age bracket are likely to make a purchase on the basis of a social media message.

3.4 Sampling

The respondent to the questionnaire will be chosen convenience and judgmental from the population of young women in Malaysia. The sampling technique of the research is a convenience sample. A convenience sample is the people who happen to be most available to the researcher are simply included in a convenience sample.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

3.5 Data Analysis

In this report, primary data collection is used directly and precisely to gather information and feedback from the respondent who uses the online platform to purchase cosmetic products. Besides that, in this research, the Statistical Package for the Social Sciences (SPSS) will be used. The data that we collected will enter into SPSS which helps to provide material for analysis. The techniques were used to analyze the information gathered by descriptive analysis, normality analysis and correlation analysis.

4 Data Analysis and Findings

4.1 Demographic Profile

Respondents	Frequency	Percentage
Age		
18-23 years old	54	39.4%
24-29 years old	51	37.2%
30-34 years old	32	23.4%
Marital Status		
Single	90	65.7%
Married	47	34.3%
Monthly Income		
Less than RM1,000	61	44.5%
RM1,001-RM3,000	35	25.5%
RM3,001-RM4,000	28	20.4%
More than RM4,001	13	9.5%
Occupation		
Student	53	38.7%
Private Sector	35	25.5%
Self Employed	37	27.0%
Public Sector	12	8.8%
Monthly Expenditure on Cosmetics		
RM0-RM100	60	43.8%
RM101-RM200	46	33.6%
RM201-RM300	23	16.8%
RM500 and above	8	5.8%

Out of 137 respondents, the highest number of age is 18-23 years old which is 39.4% and the lowest percentage is 23.4% were 30-34 years old. Meanwhile, in terms of marital status, only 34.3% were married and the rest 65.7% are single. It shows most of the respondents which is single marital status comprised the majority group of the study. In terms of monthly income, the result shows that the highest income level of the respondent is from income level less than RM1000 were 44.5% and the lowest is 9.5% have monthly income more than RM4001. Out of 137 respondents, 38.7% were students and it is the highest of the respondents. Besides that, and 8.8% from the public sector which is the lowest. Lastly, in terms of monthly spending on cosmetics is the result shows that the highest money spend of respondents 43.8% was RM0-RM100, the second highest money were spend is 33.6% was RM101-RM200 and 16.8% were spend the money is RM201-RM300. Nevertheless, only 5.8% of respondents spent money for the amount RM500 and above.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

4.2 Descriptive Analysis

Table 4.1: Descriptive Analysis on Online Purchasing Intention on Cosmetics

Descriptive Statistics		
	Mean	Std. Deviation
Online Purchasing Intention	4.3504	.88842
Product Quality	4.5314	.73662
Brand Image	4.3839	.86910
Promotion	4.3080	.86399
E-Wom	4.4277	.80629

Table 1 shows the result of all dependent variables and independent variables including online purchasing intention, product quality, brand image, promotion and e Wom. The highest mean is product quality with 4.53 whereas the lowest mean is promotion with 4.31. Moreover, the highest standard deviation is online purchasing intention with 0.89 while product quality has the lowest standard deviation which is 0.74. Thus, online retailers need to focus more on the highest value variables in order to influence consumers' intention to purchase cosmetics online.

4.3 Reliability Analysis

Table 4.2: Actual Reliability Analysis

Variable	Number of Item	Cronbach's Alpha	Strength of Association
Online Purchasing Intention	5	0.932	Excellent
Product Quality	5	0.904	Excellent
Brand Image	5	0.942	Excellent
Promotion	5	0.925	Excellent
E-Wom	5	0.948	Excellent
All	25	0.982	Excellent

Table 4.2 shows Cronbach's Alpha of both dependent and independent variables. The Cronbach's Alpha for both independent and dependent variables shows 0.982 which is considered as excellent, which means that this variable is reliable. The result shows a high positive relationship. Besides that, cronbach's alpha for e-Wom shows the highest value which is 0.948 and the lowest value is product quality with 0.902. For other variables which are online purchasing intention, brand image and promotion, the value of cronbach's alpha is 0.932, 0.942 and 0.925. That means all the variables in this research are reliable.

4.4 Normality Test

Table 4.3 Shapiro-Wilk of Normality

Tests of Normality						
	Kolmogorov-Smirnov ^a			Shapiro-Wilk		
	Statistic	df	Sig.	Statistic	Df	Sig.
Product Quality	.262	137	.509	.635	137	.609
Brand Image	.239	137	.196	.720	137	.742
Promotion	.212	137	.149	.789	137	.899
e-Wom	.239	137	.222	.718	137	.688

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

a. Lilliefors Significance Correction

The result that was shown in the normality test using SPSS was normal data. The value of significance in Shapiro-Wilk's test and Kolmogorov-Smirnov's test that shown in the table is more than 0.05. Table 4.6.1 shows that the significance of product quality is .609 and brand image is .742. Besides that, the other two variables also shown the significant is more than 0.05 which is promotion for .899 and e-Wom for .688. It means the data was counted as normally data.

4.5 Hypothesis Testing

Table 4.4 Pearson Correlation Coefficient

Variables	Pearson Correlation	Sig. (2-tailed)
Product Quality	0.817**	.000
Brand Image	0.871**	.000
Promotion	0.856**	.000
E-Wom	0.878**	.000

The table 4.4 shows the result of Pearson correlation or hypothesis testing of the research. The highest r value is electronic word-of-mouth (e-wom) with 0.878 while the lowest is product quality with 0.817 r value. Moreover, brand image and promotion also shows a high r value with 0.871 and 0.856. However, the p-value is significant for all variables with the value of 0.000. That means all independent variables have a significant relationship between dependent variables in this study.

5 Discussion and Conclusion

5.1 Overall Conclusion

As a conclusion, based on the findings of this research, all independent variables have a significant relationship towards the factors that influence online purchasing intention on cosmetics among young women. It also shows the sources from literature supported and all the data are reliable. The researcher concludes that all the independent variables have a great factors to influence young women have intention to purchase cosmetics online. It means all variables play an important role when consumers make decisions to purchase cosmetics online. Moreover, the finding of Pearson's Correlation Analysis shows that there was a positive and significant relationship between product quality, brand image, promotion, electronic word-of-mouth and factors online purchasing intention on cosmetics among young women. Thus, the result of P-value to all independent variables is less than 0.05 and the hypothesis result show a high figure between 0.878 to 0.817.

As the respondents were young women and the data collected on this research, it is shown when they have engaged online shopping on cosmetics they mostly choose based on product quality. This is because consumers are more concerned about the quality of the product when buying cosmetics especially online. Apart from that, through this research the researcher discovered that online purchasing intention on cosmetics was impacted by brand image factors. This is because the result shows that there is a positive relationship. When buying products online, the customers will have intention to purchase the product that they already have a good expectation on the brand image. Besides that, promotion is also another factor that can

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

influence young customers to have online purchasing intentions. When they are already aware about the quality and brand image of the products, they can simply purchase cosmetics when the company offers a promotion. Electronic word-of-mouth (e-WOM) also can be factors that young women attract to have online purchasing intentions. Electronic word-of-mouth is the feedback of the customers by social media such as Instagram, Whatsapp and so on. It can be the respondent asked their friend preferences about the certain products before making the decision to purchase it.

5.2 Recommendation

Researcher may recommend and suggest some of the opinions to further research with all alternative hypothesis supported. During this pandemic Covid-19, all businesses were transformed to online business. So, this research can give an idea to retailers or founders of cosmetics to develop their business by knowing factors that make consumers attracted to purchase cosmetics online, especially young women. Retailers can improve their online business strategies to attract more customers and be a trusted seller. Moreover, further research is recommended to use other many methods to collect data from respondents. The researcher was using an online questionnaire method to collect data from respondents in this study. Thus, the other method recommended is interviews and observation or called a qualitative method. Different methods used to implement the study will increase the accurateness of the final result.

5.3 Implication

By conducting this research which is online purchasing intention on cosmetics, the researcher can be defined that several factors can influence young women to make purchases on cosmetics online. The implication of the study is young women that have intention purchase cosmetics online will more understand about the factors that affect them to purchase online. It also makes them be aware of the factors to make online purchasing in the future. Besides that, it also can give additional knowledge to young women considering that cosmetics are very important to them nowadays. Retailers can get the information from this research in order to improve their business online. It is because the data that researcher got is from consumers so that it will be a good idea to them in order to fulfill customer's wants.

6 Acknowledgement

First and foremost, I would like to convey our deepest gratitude to my supervisor, Puan Nadia Hanum binti Amiruddin for her excellent guidance for our research project. She has spent lots of effort and valuable time in guiding us to complete this research project. Furthermore, I would like to give thanks to University Malaysia Kelantan for giving me the opportunity to conduct our research in order to fulfil the subject requirement for Bachelor of Entrepreneurship (Retailing).

Throughout this research project, I gain a lot of information and it gives extra knowledge to myself whether by books, source of the internet or lecturers. Even though these research outcomes may not be the best among students nevertheless, I strongly believe that my research will give benefits for another researcher, academician or retailer for their future references. This research project may give clear understanding in different perspectives for them. Last but not least, I would like to confess my deepest appreciation to my beloved friends who assist me in completing this research.

Abstract:

The aim of this research was a study of corporate image, customer satisfaction and brand loyalty in Guardian, Cameron Highlands, Pahang. Retail store is located all around the world. In Malaysia economy, retail is one of the most active sub-sectors and second largest contributor to national GDP. As the market become more aggressive, it is important to have a good brand loyalty to maintaining existing customers. Therefore, a study of corporate image and customer satisfaction towards brand loyalty was determined. The independent variable in this study was corporate image and customer satisfaction while dependent variables was brand loyalty. A quantitative method was used and 380 respondents were being evaluated in this study. Questionnaire were distributed through Google Form that used to collect primary data and all the information that wanted in this study. All the collected data was analyzed used SPSS version 26. Descriptive analysis, Pearson Coefficient Correlation and multiple regression analysis was being analyzed through SPSS. As a result, all of the independent variables which are corporate image and customer satisfaction have a significant relationship between dependent variables which is brand loyalty in Guardian Cameron Highlands, Pahang. After done with this study, it will be have a better understanding of the two criteria that will affect the brand loyalty in Guardian.

Keywords: Brand Loyalty, Cameron Highlands, Corporate Image, Customer Satisfaction, Guardian.

1 Introduction

Nowadays, retail shop can be seen at anywhere. There are a lot of retail shop all around the world. In the year of 1990s and 2000s, with new shopping streets and centres joining the market, the retail industry entered a more vibrant revolution. This has become a new system as chain stores merge with franchising, hypermarkets and malls, with the rise of organized retailers that prepare, structured corporate structure management that tracks everything. (Ene & Özkaya, 2014). The retailer shall take the largest single slice of the cost of distribution. That is 53% of the estimated total of \$170 billion in retail sales thereafter. This is the most conservative guess when it comes to distributing goods and services to the public (Lebow, 1955).

In the Malaysian economy, Retail is one of the most active sub-sectors and the second largest

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

contributor to national GDP, contributing RM31,081 million in the year 2000.(Mui, Badarulzaman, & Ahmad, 2003). There are many retail outlets, ranging from department stores, supermarkets, mini markets, specialty stores, convenience stores, pharmacies, direct sales, wet market stalls to pavement stores and petrol. This variety of retail stores reflects the changing needs and the desire of consumers to have a good quality of products and services. (Mui et al., 2003).

Guardian Malaysia has start the business since 1967 until now that selling health and beauty products. They're just selling pharmaceutical and quality personal care products when they start. Then, by having the concept of providing specialized health and beauty products in a professional environment, popularity has increased and Guardian has begun to expand its store. Guardian start their business at The Weld, Kuala Lumpur and now they have more than 440 stores and have average 33million of customers in a month that visit Guardian(Guardian, n.d.).

Now that the market is becoming more aggressive and competitive, many organizations realize that the importance of remaining existing customers and some retailers have come out with a number of activities to build long-term relationships with their customers. (Abdullah et al., 2012). All of these developments and in the competitive retail sector, brand loyalty needs to be established in order to create a sustainable competitive edge, which will keep current customers in the retail store. (Ene & Özkaya, 2014). Businesses point out that maintaining existing customers is more profitable when compared to finding and gaining new customers.

By creating brand loyalty, there are some elements that will affect the brand loyalty which are corporate image and customer satisfaction. This will decide customer want to enter the shop or no. Businesses points out that maintaining existing customers is more profitable than finding and gaining new customers (Zhang, Zhuang, Yang, & Zhang, 2017).

A study of corporate image, customer satisfaction and brand loyalty in Guardian, Cameron Highlands, Pahang will be investigate and determine in this study. This study will find out the views of customer that visit Guardian store.

1.1 Research Objectives

1. To determine the relationship between corporate image and brand loyalty in Guardian.
2. To determine the relationship between customer satisfaction and brand loyalty in Guardian.

1.2 Significance of the Study

1.2.1 Government

Retail sectors are being apart of big income for Malaysia. By doing this study, government will get to know on how to improve the retail sectors by providing a good environment or places to retail sectors run their business. Government also can give some financial aid for retail store to improve the quality of retail store to make sure they have enough money to improve their retail store.

1.2.2 Guardian Malaysia

This research will focus on corporate image, customer satisfaction and brand loyalty. This will help Guardian to know more about their customer's needs and wants. They can improve their store to serve their customers in a better service and products. This will give a benefits to Guardian to increase their brand loyalty of company.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

1.2.3 Customers

Customer can get to know more about the retail store that they always visit. They can know how the retailer serve them and they can know more about the retail store. When customer know more about the retail store, they will stick to a brand to buy the product more often.

1.2.4 Researcher

This research will help the other researcher to use as a reference in future when doing a similar research. Researchers believe that this research will give other researcher a good reference on this study and they can explore more about this study in other ways.

2 Literature Review

2.1 Underpinning Theory

Brand Loyalty

Brand loyalty defined as consumer willing to pay with a higher price for a certain brand for a product and they will suggest the product to others as well. Customer will always stick on the brand and will not change their product brand to the other brand (Saif, Ahmed, Shareef, & Khalid, 2018). When there is having a brand loyalty from customers, company will no need to advertise more on their products because customers themselves will promote the product that sell by that company to the other people. This will help to attract more customers to visit the company and buy their products and services (Ingemansson, Nilsson, & Vllasalija, 2015).

Other than that, loyalty is related with different factors and one of the main factor is the experience of using the product and service. A good experience will let the customers satisfy and want to continue to shop in the store (Salim Khraim, 2011). Brand loyalty is recognize as a min construct in market and the researcher agree that brand loyalty produce company benefits which are reduce the marketing cost, bring profit to a company and increase their market share. Therefore, researcher determine brand loyalty as customer's unconditional loyalty and have a big relationship with a brand, which is they will not easy to be affect by others (Maheshwari, Lodorfos, & Jacobsen, 2014).

2.2 Previous Studies

2.2.1 Corporate Image

Corporate image is a valuable and a things that is hard to be simulate by others. This can help a company to gain a good financial performance (Ene & Özkaya, 2014). As an employer, employee, consumers, suppliers, community and corporate citizen, corporate image has include the information and inference about the company. An organization's corporate image will affects stockholders' behavior, the reason for the company to maintain and develop their image are:

- i. Enhance the corporate competitive advantage to bring to a higher profit in company.
- ii. Create a good identity of employees thereby guiding to their satisfaction.
- iii. Influence financial institution and investor.
- iv. Promoting a good relationship with government and various interest group.

Therefore, when a company want to have a good corporate image, a company need to know the expectations and needs of various interest groups especially customers. This is important because the needs and expectation will be different (Adeniji, Osibanjo, Abiodun, & Oni-Ojo, 2014).

Based on previous study, the researcher explored the relationship between corporate image and customer brand loyalty. The result shown that when the corporate image in one company is high, the loyalty of customers towards their product also will be high. The researcher has

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

identified the relationship of corporate image and brand loyalty is positive (Lee, 2019).

In the other research, the researcher found out that corporate image has support their hypothesis which is brand loyalty is positively influence by corporate image. This can be see that by having a good corporate image in a company could increase their brand loyalty (Ashraf, Ilyas, Imtiaz, & Ahmad, 2018).

2.2.2 Customer Satisfaction

Customer satisfaction is a perception and evaluation from a consumer based on total purchase and experience in one store. A good service and product information will give a good satisfaction to consumers. To have a good customer satisfaction, companies need to have a good sell ideas and methods after refer to the needs and wants from their customers. Company can find out what is the needs and wants of their consumer in that location and sell more on the products that always need by consumer at the place (Konečnik Ruzzier et al., 2014).

Other than that, customer satisfaction is mean an individual's feeling of the performance of products or services provide by the seller either it is reach to his or her expectation. Customer satisfaction will be hard to measure because that is difficult to know human feelings on that time. Therefore, there will be some ways to measure customer satisfaction which are:

- i. Company doing a survey to know the level of satisfaction.
- ii. Doing a page or provide paper for customers to left their feeling when visit the store.
- iii. Direct ask the feeling from customers.

By doing these, company can easily know the satisfaction of consumers towards their company services and products (Eriksson, 2009).

In the other studies, researcher found out that customer satisfaction is the key factor that will improve the intention of repurchase and brand loyalty. By producing a good customer satisfaction, company should considerate their customer is satisfy to their services and products is good enough (Ji & He, 2013).

On the other hand, after the researcher done with the results, there is a positive relationship between customer satisfaction and brand loyalty. Researcher found out that customer satisfaction will helps more for a company to build brand loyalty. Therefore, company always need to make sure the customer satisfaction is good (Ahmed, Rizwan, Ahmad, & Haq, 2014).

2.2.3 Brand Loyalty

The study show there is 5% increase of customers purchase for products can increase company profits up to 25%. Therefore, to determine customer loyalty and satisfaction levels on products, company have to observe and know customers' needs and wants. When there is customer do not satisfy with the company, they will not loyal to the brand again (Ene & Özkaya, 2014).

The other study researcher found out that a loyal customer will less sensitive to the price. Even when the price of products is increase, customer will still buying the products in same brand and the quantity of buying the products will not decrease (Mao, 2010).

2.3 Hypothesis Statement

H₁: There is a significant relationship between corporate image and brand loyalty.

H₂: There is a significant relationship between customer satisfaction and brand loyalty.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

2.4 Conceptual Framework

Figure 1: The Conceptual Framework of Study

3 Methodology

3.1 Research Design

In this study, researcher will use cross-sectional study design. Cross-sectional study involves looking at data from a population at one specific point in time. In the other word, cross-sectional is the data only collected just once. The reason for researcher choose to use cross-sectional study is because this method can use to make reasoning about possible relationships or preliminary data to support further study. It can also let researcher to look at numerous characteristics in one time (Cherry, 2019). A quantitative method will be use in this research. A questionnaire will be distribute in google form at one time to respondent to fill up the survey.

3.2 Data Collection Method

The method used for this study is quantitative research method. A survey is being conduct to collect all the data required. A primary data will be use in this study. Primary data source is an original data source which is the data collect in a first hand from researcher. The data generated from the survey is categorise as primary source for this study. The questionnaire will be distributed to respondent in google form at Cameron Highlands.

3.3 Study Population

By referring to district council in Cameron Highlands, the latest population in Cameron Highlands is 35,075 people (MDCH, 2020). The population usually has varying characteristics and it is also known as the theoretical population. The population to be chosen because there will be people in Cameron Highlands will visit Guardian.

3.4 Sample Size

This research will be conduct by taking data from respondents who are able to fill up the questionnaire in google form at Cameron Highlands area. All the respondents are the customer that are visit Guardian before. The population is taken from the data from district council in Cameron Highlands. A sample size will be carry out from population based on Krejcie and

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Morgan (1970) table, therefore the researcher will take the sample size that is 380 peoples.

3.5 Sampling Technique

In this research, researcher will use non- probability sampling. Non-probability sampling is a sampling technique which is the researcher select sample base on the subjective judgement rather than random selection. In non-probability sampling, it is not all members of population will participate in the study. Under non-probability sampling, researcher will use convenience sampling. Convenience sampling is researcher will send the Google form to respondent to fill up the questionnaire when they are available.

3.6 Research Instrument Development

Researcher will use questionnaire in google form to gather all the information that will be need in this research. This is a systematic structure form with a set of question will be design to get answer from respondents for the purpose of collecting data. The sample of questionnaire will be use from a population of people in Cameron Highlands. The respondents will be ask for structure or closed question which is the guidance of answering those question will be provide in the questionnaire. The questionnaire method will use to collect the data in this study.

Researcher will use two format in the questionnaire which are multiple choice and Likert scale. In multiple choice format, there is only section A that is using this format which is respondent will choose to fill up their demographic profile.

On the other hand, Likert scale will be use in part B, C and D. Part B is about corporate image, part C will be customer satisfaction and part D is about brand loyalty. There will be 5 scales to measure the level of agreement about the question provided in the questionnaire. Respondent will be ask to choose one of the scales that they feel is suit for them. The point of Likert scale is 1- strongly disagree, 2- disagree, 3- neutral, 4- agree and 5- strongly agree. Below will provide the table of Likert scale.

Table 1 Likert Scale Table

Strongly Disagree	Disagree	Neutral	Agree	Strongly Agree
1	2	3	4	5

3.7 Measurement of the Variables

In this study, researcher will use face validity to test the validity of instruments. Validity is a test is valid if it measure what it claims to measure (McLeod, 2013). For face validity, the draft of questionnaire will be submit to lecture before give to the respondent to answer.

Next, researcher will use reliability. According to Colin Phelan and Julie Wren, 2005, Reliability is the degree to which and assessment tool produces stable and consistent results. This will be used because our questionnaire having ranging stage which is from agree to disagree. This was a test on the consistency of raw data collected and if there was transparency in how the data made up. When the reliability coefficient close to value 1, the reliability measures will be better.

3.8 Procedure for Data Analysis

In this study, researcher will publish the questionnaire in google form to people in Cameron Highlands. Researcher will randomly send the questionnaire to respondent for them to answer

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

when they are available. Before that, researcher will do the Pilot Test by using 30 respondents to test the reliability of the questionnaire. This is to make sure the questionnaire is reliable before distribute the questionnaire.

Statistical Package for the Social Sciences (SPSS) will be use in this research. After collect all the data, data will enter into SPSS that can help to provide material for analysis. Descriptive statistic will used in this research since there are some empirical researchers that using this research design.

Cronbach's alpha will used to measure the reliability of questionnaire. Normally, the ranging for Cronbach's alpha from 0 to 1. According to the table can clearly see that the value nearer to one is excellent ("Cronbach's Alpha," 2020). Below will provide the table of Cronbach's Alpha table.

Table 2 Cronbach's Alpha Table

Cronbach's alpha	Internal consistency
$0.9 \leq \alpha$	Excellent
$0.8 \leq \alpha < 0.9$	Good
$0.7 \leq \alpha < 0.8$	Acceptable
$0.6 \leq \alpha < 0.7$	Questionable
$0.5 \leq \alpha < 0.6$	Poor
$\alpha < 0.5$	Unacceptable

Other than that, Pearson's correlation coefficient will used to test the hypothesis. The positive value means that there is a positive relationship between the variables on the other hand, the negative value means that there is a negative relationship between the variables.

4 Data Analysis and Findings

4.1 Preliminary Analysis

Preliminary analysis also call as reliability analysis. This is to test either the questionnaire is suitable to distribute for respondent or no. Therefore, pilot study was conducted by distribute the questionnaire to 30 respondents. The most common measure that used in internal consistency measure is Cronbach Alpha Coefficient. There are no exactly rules appear for internal consistencies, but the most agree on a minimum internal consistency coefficient is 0.70 (Taherdoost, 2018). The outcome of the pilot test is shown below:

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

Table 3 Pilot Test

Variables	N Terms	Cronbach Alpha	Strength
Corporate Image (IV 1)	13	0.839	Good
Customer Satisfaction(IV2)	5	0.846	Good
Brand Loyalty(DV)	4	0.740	Acceptable

Based on Table 4.1, the dependent variable which is brand loyalty shows a value of 0.740 with acceptable strength. Independent one is corporate image has the value of 0.839 which is a good strength. The second independent variable is customer satisfaction which shows the value of 0.846 with good strength. Therefore, all the variables are reliable and can be used for the research.

4.2 Demographic Profile of Respondents

Based on the findings that has been carried out, this section will provide the information of gender, race, age, marital status and occupation. From the collected data, there are 47% respondent is male with the amount of 177 respondents. Female respondent is 53% with the amount of 203 respondents.

Next in term of race, there are 33% respondent is Malay with the number of 126 respondents. While Chinese is 39% with the number of 148 respondent and Indian have 28% with the number of 106 respondent. While in age group, there is 26% of respondent with the amount of 97 respondents is 20 years old to 29 years old. 30 years old to 39 years old is 28% with the amount of 107 respondents out of 380 respondents. For 40 years old to 49 years old is 26% with the amount of 99 respondents and for 50 years old and above is 20% with the amount of 77 respondents.

Moreover, for marital status there is 42% with the amount of 159 respondents is single. While 58% with the amount of 221 respondents was married. In occupation, there is 27% of respondent with the amount of 101 respondents is a businessman. Private sector employee is 30% with the amount of 114 respondents out of 380 respondents. For government sector employee is 25% with the amount of 97 respondents and for student is 18% with the amount of 68 respondents.

4.3 Descriptive Analysis

Table 4 Descriptive Statistics on Variables

No	Variables	N	Mean	Standard Deviation	Ranking
1	Brand Loyalty (DV)	380	4.2559	0.72720	3
2	Corporate Image (IV1)	380	4.2715	0.56646	2
3	Customer Satisfaction (IV2)	380	4.2932	0.61215	1

Table 4.2 shows the descriptive statistics of brand loyalty, corporate image and customer satisfaction. Customer satisfaction has the highest mean which is 0.61215. Second is corporate image which is 4.2715 and follow by brand loyalty which is 4.2559. Therefore, from the table can clearly see that there are majority of respondents agree that customer satisfaction is important.

Other than that, table 4.2 also shows the standard deviation for three variables. In this situation,

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

brand loyalty is the highest standard deviation among three variables which is 0.72720. Second is follow by customer satisfaction which is 0.61215 and the last is corporate image which is 0.56646.

4.4 Pearson Correlation Analysis

Table 5 Pearson Correlation Analysis

Variable	Mean(SD)	Corporate Image	Customer Satisfaction	Brand Loyalty
Corporate Image	4.27(0.57)	1	0.879	0.801
Customer Satisfaction	4.29(0.61)	0.879	1	0.816
Brand Loyalty	4.26(0.73)	0.801	0.816	1

*p-value<0.05, Pearson Correlation analysis applied

Based on table 4.3, the correlation of every independent variable which are corporate image and customer satisfaction is significant at 0.01 levels, two tailed towards brand loyalty. Furthermore, the result shows that there are positive perfect significant relationship in all independent variables with brand loyalty. The value between corporate image and brand loyalty is 0.801 and customer satisfaction is 0.816. As a result, customer satisfaction shown a strongest positive relationship with brand loyalty ($r=0.816$) and follow by corporate image ($r=0.801$). Other than that, the correlation between independent variable (customer satisfaction) and dependent variable (brand loyalty) is positively related with $r=0.816$ at 0.01 levels.

4.5 Multiple Linear Regression Analysis

4.5.1 Simple Linear Regression

Table 6 Simple Linear Regression Table

Variable	Simple Linear Regression		
	β	t-stat (95% confidence interval)	p - value
Corporate Image	1.03	25.97(0.95, 1.11)	<0.001
Customer Satisfaction	0.97	27.43(0.90,1.04)	<0.001

* Normality assumption was fulfilled/met

4.5.2 Multiple Linear Regression

Table 7 Multiple Linear Regression Table

Variable	Multiple Linear Regression		
	β	t-stat (95% confidence interval)	p - value
Corporate Image	0.47	6.16 (0.32, 0.62)	<0.001
Customer Satisfaction	0.59	8.28 (0.45, 0.73)	<0.001

* Normality assumption was fulfilled/met

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

4.5.3 Checking the Normality Assumption for Multiple Linear Regression

Figure 2 Unstandardized Residual

Figure 4.8 is the histogram of unstandardized residual of a study of corporate image, customer satisfaction and brand loyalty of Guardian, Cameron Highlands, Pahang.

Based on the figure above, there is a normal bell shape distribution of the unstandardized residual of a study of corporate image, customer satisfaction and brand loyalty of Guardian, Cameron Highlands, Pahang.

4.5.4 Interpretation, Tabulation and Conclusion

Variable	Simple Linear Regression			Multiple Linear Regression		
	β	t-stat (95% confidence interval)	p - value	β	t-stat (95% confidence interval)	p - value
Corporate Image	1.03	25.97(0.95, 1.11)	<0.001	0.47	6.16 (0.32, 0.62)	<0.001
Customer Satisfaction	0.97	27.43(0.90,1.04)	<0.001	0.59	8.28 (0.45, 0.73)	<0.001

* Normality assumption was fulfilled/met

There is a significant effect of corporate image and customer satisfaction ($p < 0.05$). In every unit increase of corporate image, brand loyalty will be increase by $0.47(\beta)$. Other than that, every unit increase of customer satisfaction, brand loyalty will be increase by $0.59(\beta)$.

5 Discussion and Conclusion

5.1 Key Findings

Based on this study, there are two independent variables which are corporate image and customer satisfaction and dependent variable is brand loyalty. By getting the result in this

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

study, researcher use quantitative method by distribute questionnaire to respondent for collect data. After done with the pilot test that the questionnaire is reliable, researcher start to collect data by distribute questionnaire in Google Form randomly to 380 respondents in Cameron Highlands, Pahang.

First, based on demographic data, the total sample size for this study was 380 respondents and female respondents is more than male respondent with the amount of 203 female respondents out from 380 respondents. While in race group, Chinese was the majority race, minority respondents was Indian with 106 respondents and last follow by Malay. For age group, 30 years old to 39 years old was majority age and minority respondents were from 50 years old and above. There are also 221 respondent are married out of 380 respondents and most of their occupation is private sector employee that have the amount of 114 respondents out of 380.

Furthermore, this study has provide two independent variables and one dependent variable. Based on the data analysis that done in chapter 4, the result shows that there are positive perfect significant relationship in all independent variables with brand loyalty. This is mean by H_1 and H_2 are supported.

Descriptive analysis has given the researcher an idea of the distribution of the data, and this can help researcher to identify the associations among the variables. Pearson's Correlation Coefficients are used in this study to measure how strong the relationship between two variables.

5.2 Discussion

5.2.1 Relationship between Corporate Image and Brand Loyalty

H_1 : There is a significant relationship between corporate image and brand loyalty.

Based in this study, there was a significant relationship between corporate image and brand loyalty in Guardian Cameron Highlands, Pahang at a strong positive level ($r=0.801$, $N=380$, $p<0.01$). This can be see the first hypothesis statement is accepted. From the analysis data in Chapter 4, the data shows that the reliability score was consistency and good. This is means by the all the questions for this variable can be accept in this study. Then, in every unit increase of corporate image, brand loyalty will be increase by $0.47(\beta)$.

5.2.2 Relationship between Customer Satisfaction and Brand Loyalty

H_2 : There is a significant relationship between customer satisfaction and brand loyalty.

Based in this study, there was a significant relationship between customer satisfaction and brand loyalty in Guardian Cameron Highlands, Pahang at a strong positive level ($r=0,816$, $N=380$, $p<0.01$). Therefore, second hypothesis statement is accepted in this study. From the analysis data in Chapter 4, the data shows that the reliability score was consistency and good. This can be mean that the overall question for this variables in the questionnaire can be accept in this study. Other than that, every unit increase of customer satisfaction, brand loyalty will be increase by $0.59(\beta)$. Therefore, researcher found out that customer satisfaction is the most important criteria that have a stronger relationship with brand loyalty compare to corporate image.

5.3 Recommendation/ Suggestion for Future Research

This study can be used by many parties such as organization, society and business because this proved that how the residents in Cameron Highlands were being affected the brand loyalty by corporate image and customer satisfaction in this research. Therefore, there are some

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

suggestion for future research.

First of all, researcher would like to suggest the sample size may be more to highlight the study of brand loyalty in Guardian. This is because the data of this study is only focus on residents in Cameron Highlands, Pahang. This data will be very limit because Guardian will not get the data for whole Malaysia. Therefore, for the researcher that want to conduct this field of study can increase the range of respondents to whole Malaysia.

Other than that, the two criteria which are corporate image and customer satisfaction were not the only factors that influence the brand loyalty in Guardian in Cameron Highlands, Pahang. Therefore, researcher who will conduct this field of study, the other researcher need to test more criteria other than these two in this study. This will help the other researcher to get more information after this.

Lastly, researcher would like to suggest to future researcher that can do this field of study by doing qualitative method also. This is because in this study only using quantitative method. This has made the result cannot get the most accurate because there are some respondent will not give full commitment in answering questionnaire. Therefore, by doing quantitative method can get the answer by asking question to respondent directly and can get the answer on the spot.

5.4 Overall Conclusion of the Study

This study was conducted to know more about the study of corporate image, customer satisfaction and brand loyalty in Guardian, Cameron Highlands, Pahang by explain the criteria of corporate image and customer satisfaction. In this research has go through all the objectives and examine the relationship between all the independents variables and dependent variables. By getting the results in this study, this research has analyse the assumptions and discuss in Chapter 4. The research data was test by using reliability test and Pearson Coefficient Correlation to test the relationship between all the independent variables and dependent variable. In overall, all of the variables has shown a positive correlation with the significant results. Therefore, all the objectives were successfully achieved in this study.

6 Acknowledgement

Firstly, this study experiment was completed with praise and humility. The researchers would like to thank University Malaysia Kelantan (UMK) for the opportunity to engage in this research project. Without funding and assistance from several individuals, this project will not likely be completed. Researchers would like to use this golden opportunity to demonstrate our appreciation to the individuals who have been influential in the successful execution of this mission.

Apart from that, researcher would like to take this golden opportunity to expand the appreciation of the researcher to Madam Mardhiah binti Kamaruddin, the supervisor, for useful guidance and advice. Researcher would like to thank her for her support, teaching and encouraging every researcher to start, gather knowledge, process and evaluate the outcome. Our analysis is not going to be done without her effort and direction. Researcher also admire her immense help and assistance.

Finally, researchers would like to convey their appreciation to family members for their understanding, countless patients, and support when it was needed at most. The researcher

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

would also like to thank all the participants for their support. Thank you.

Abstract:

It is well-known that traditional (offline) marketing strategies are already widely used by the companies around the world and there are almost no new options for fostering competition. And here comes online marketing with almost unlimited possibilities and options. Therefore, businesses must learn how to use social media in a way that is consistent with their business plan (Mangold and Faulds 2009). This paper focuses on the effectiveness of online marketing on Facebook and Instagram platform including research of the state of the art through analysis of the data provided by numerous surveys. It also contains brief description of the online marketing itself, basic strategies on the internet nowadays. The literature review covered the trust, perceived value and purchase intention in conceptual framework. I presented three research hypothesis to test the independent variable toward dependent variable. At the same time researcher provided questionnaire in order to measure student innovative behaviour. 300 respondents will be collected among UMK students. Trust, perceived value and purchase intention will be a factor that influence the effectiveness of online marketing on Facebook and Instagram among UMK students in making decisions to buy.

Keywords: *social media, online marketing, trust, perceived value, purchase intention*

1 Introduction

Online Marketing is the process of creating, conveying the value of a product or service and making it relevant to customers so that they may consider to buy products or services when they saw the brand products online. A new world where there are increasingly connected users, according to research & research, in 2012, there were 17.5 million active internet users in Malaysia. The top activities performed by online users are preparing product notification or advertisements, reading or sending emails, using search engines to find items and of course interacting with the community with shared interests on social networks such as Facebook and Instagram. This is a great opportunity for companies to reach a technologically savvy audience that continues to interact with the world wide web for a variety of interests.

Facebook and Instagram are one of the increasingly used social media platforms. These social marketing and communication online channels are important for businesses, organizations and institutions, including those in politics. Both platforms have opened the door for businesses to communicate with millions of people about products and services and have opened new

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

marketing opportunities in the market. This can only be done if managers are fully aware of the use of communication strategies to engage customers and improve their experience (Mangold, 2009).

Online marketing can also be crowded and competitive. While opportunities to provide good goods and services in local and far-flung markets, competition can be significant. Companies that invest in online marketing may find that visitors' attention is difficult to capture due to the number of businesses that also market their products and services online. Marketers must develop a balance of developing unique value propositions (UVP) and brand voices as they test and build marketing campaigns across multiple channels. This research aims to study about exploring the effectiveness of online social marketing on Instagram and Facebook among UMK Kota Campus students. We want to determine what are the highest factors UMK students is influenced online marketing on Instagram and Facebook. The study will focus on trust, perceived value and purchase intention.

1.1 Objective

There are three research objectives of this study:

To identify the relationship between trust and online marketing Facebook and Instagram among UMK students.

To identify the relationship between perceived value and online marketing on Facebook and Instagram among UMK students.

To identify the relationship between purchase intention and online marketing on Facebook and Instagram among UMK students.

2. Literature review

The chapter presents the research framework of the study, followed by the discussion of multiple concepts that serve as the backbone on the study on conceptually, theoretically and empirically way. It's also presents the literature reviews of the effectiveness of online marketing on Facebook and Instagram among UMK Kampus Kota students. Some prior research conducted on the concept and the issue raised is also discussed in this research. Lastly, this research concludes the discussion by proposing the relationship among the variables used in the research framework. This section ends with hypotheses development.

Nowadays, the concept of internet marketing has evolved and brings more opportunities for companies to reach out to their customers. In the past, the internet was only used as a tool to contact customers, which was part of direct marketing. Nowadays, the internet especially websites have become a popular medium for any company to introduce their products and services. The Internet is considered an independent and effective marketing tool. Over the past eight years, from 2000 to 2008, the number of Internet users has increased 4-fold from about 361 million to more than 1, 46 billion (internetworldstats, 2008) where, Asia, the continent with the largest population accounts for 39.5% of World Internet Users.

As we all know, online marketing is a hot topic in every business sector, and is gradually playing a very important role in multi-channel marketing strategies. It uses the internet to deliver promotional marketing messages to consumers. These include email marketing, search engine marketing, social media marketing, many types of display ads, and mobile advertising.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Online marketing is now seen by many practitioners as a new arena for market communication and at the top of the list of users of various media are Facebook, Blog, Twitter, YouTube and LinkedIn (Steltzner, 2009). Kaplan and Haenlein (2010) define social media as a group of internet-based applications that build on the ideology and technology of Web 2.0, which facilitates the creation and exchange of user-generated content. It consists of different Internet applications such as blogs, social networking sites, content communities, collaboration projects, virtual gaming worlds and social worlds. Russell S. Winer (2009) points out that many companies today use some or all of the new media to develop targeted campaigns that reach specific segments and engage their customers to a much greater extent than traditional media. There are several social media platforms that are the concern of users at the moment. The time spent on a particular social media platform depends on the demographic group. Ebrand (2015) reports that the most popular social media platforms among young people are YouTube, Facebook, WhatsApp and Instagram. Comparing the most popular social media sites of people aged 13 to 17 and 18 to 29 years, it can be seen that nowadays young people prefer various messaging applications such as WhatsApp, Messenger, Kik messenger and Snapchat than Pinterest, Twitter or LinkedIn. However, there is no significant difference in the time spent on social media between these age groups. (Ebrand 2015; Goldman 2013, 45).

2.1 Underpinning theory

According to Pseudo-theories, social media landscape is fast changing due to the low cost of innovation in the era of open-source movement. The disconnect of academia from the industry and the slow process of formal publishing cycle poses a challenge for researchers in academic institutions. Many social media and online marketing agencies actually are more innovative and ahead of the curve of social media for marketing purposes. This section views two frameworks trying to make sense of social media landscape. Carlene Li and Jeremiah Owyang from Altimeter Group are the major contributors to the social graphics framework (JOwyang 2010).

They argued that instead of studying the demographic, geographic, or psychographic profiles of your customers, businesses also need to develop social strategy termed social graphics. Marketers and managers needs to ask the following questions: which websites are my customers on? What are my customers' social behaviours online? What social information or people do my customers rely on? What is my customers' social influence? The answers to these questions could separate your customers into layers of engagements from curating, producing, commenting, sharing, to watching. The businesses then need to separate their customers into these layers and provide tools and platforms to facilitate their social interaction.

Today, as technology has improved and with the advent of faster and better internet services, the number of users online has boomed. Due to rise in all such technologies like faster internet which is easily available and cheap, access to this fast internet on our LTE enabled handsets has not just only affected our lives but has opened new ways for marketers to sell and promote their products amongst their target audience. Brands and businesses are making sure to make the most of this social media boom is the core of it.

2.2 Hypothesis

A variable in research refers only to a person, place, thing, or phenomenon that we try to

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

measure in a certain way. An independent variable causes a change in the dependent variable and it is not possible for the dependent variable to cause a change in the independent variable. Independent Variables are variables that come first and then the dependent variables. This is because; independent variables form and affect dependent variables. This research is about the effectiveness of online marketing through Facebook and Instagram. Therefore, this independent variable is a factor that causes the Facebook and Instagram platforms to be the focus in terms of trust, perceived value and purchase intention. In this study, these changes affect the public especially students who easily influence marketing on Facebook and Instagram. This is how independent variables correlate with dependent variables.

H1: There is a significant relationship between trust and the effectiveness of online marketing

H2: There is a significant relationship between perceived value and effectiveness of online marketing

H3: There is a significant relationship between purchase intention and the effectiveness of online marketing

3 Methodology

Sample size is actually a count of selected elements such as individual or object chosen for observations in any statistical setting, such as scientific experiment or a public opinion survey. More ever, according to Jon Zamboni (2010), sample size measures the number of individual samples measured or observations used in a survey or experiment. Then, to determine the sample size needed for an experiment or survey, researches take a number of desired factors into account. Therefore, from this study, the total population of UMK Kampus Kota students is 3482 students. The number of respondents selected is 300 based on courses and semesters. Whereas, gender according to the ratio as a whole. In order for the research to conclude this study will be represented by the sample selected in this study while generalisation of the sample statistics to the population. This study used a random sampling technique to ensure that all sample categories were represented.

In this study, researchers prefer using the Likert scale method. The Likert scale method uses a fixed-range reaction format and is designed to measure attitudes or opinions (Bowling 2005). The Likert-scale will be used in Section B and Section C which is consisting of questionnaires for the dependent variable and independent variables. Three factors that have influenced effectiveness of online marketing on Facebook and Instagram, which are trust, perceived value and purchase intention are measured using the scales used in the questionnaire was based on a 5 Likert-scale with (1= strongly disagree, 2= disagree, 3= Neither Agree nor Disagree, 4= Agree, 5= Strongly Agree) for each question for the variable part. Therefore, the quantitative research method will generate statistics through the use of large-scale survey research, and this research will use methods such as questionnaires. In this study, the data were collected through structured data created from Google Form. According to Mirreile Djenno, Glenda M.Insua, Annie Pho (2015), Google Form provides an easy and inexpensive way to incorporate both active learning and collecting data.

4 Findings/Results and Discussion

4.1 Reliability test

Reliability analysis were performed in order to determine whether these sets of items have strong of stability in measuring variables. Based on table 1, all the variables are met the

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

minimum accepted reliability as suggested by (Canvas, 2001). The result showed the Cronbach' Alpha practises ranges between 0.859 till 0.942. According to Hair, 2015 suggested that Cronbach's Alpha value that above 0.60 or greater can be accepted in research.

Table 4.1.1: Reliability test of the independent variable and dependent variables

Variables	Cronbach's Alpha	N of item
Online marketing	0.859	5
Trust	0.942	5
Perceived value	0.899	5
Purchase intention	0.940	5

4.2 Hypothesis testing

4.2.1 Hypothesis 1 – Trust

H_0 = There is no significant relationship between trust and the effectiveness of online marketing on Facebook and Instagram

H_1 = There is a significant relationship between trust and the effectiveness of online marketing on Facebook and Instagram

Reject H_0 if $p < 0.01$

Table 4.2.1: Relationship between the effectiveness of online marketing on Facebook and Instagram and trust

Variable	Mean(SD)	Online Marketing	Trust
Online Marketing	4.20 (0.53)	1	0.435**
Trust	4.09 (0.54)	0.435**	1

*p-value < 0.05, Spearman's rho Correlation Analysis applied

Based on the table 4.2.1, the correlation between self-efficacy with innovative behaviour showed r-value = 0.435** and p-value = 0.273 ($p > 0.05$). There is weak relationship between trust and online marketing.

4.2.2 Hypothesis 2 – Perceived Value

H_0 = There is no significant relationship between perceived value and the effectiveness of online marketing on Facebook and Instagram

H_1 = There is a significant relationship between perceived value and the effectiveness of online marketing on Facebook and Instagram

Reject H_0 if $p < 0.01$

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Table 4.2.2: Relationship between perceived value and effectiveness of online marketing on Facebook and Instagram

Variable	Mean(SD)	Online Marketing	Perceived Value
Online Marketing	4.20 (0.53)	1	0.583**
Perceived Value	4.20 (0.77)	0.583**	1

*p-value<0.05, Spearman's rho Correlation Analysis applied

Based on the table 4.2.2, the correlation between perceived value and effectiveness of online marketing showed r-value = 0.583** and p-value = 0.108 ($p > 0.05$). There has no or negligible relationship between perceived value and effectiveness of online marketing. No reject H_0 because p-value = 0.108 are bigger than 0.05.

4.2.3 Hypothesis 3 – Purchase Intention

H_0 = There is no significant relationship between purchase intention and the effectiveness of online marketing on Facebook and Instagram

H_1 = There is a significant relationship between purchase intention and the effectiveness of online marketing on Facebook and Instagram

Reject H_0 if $p < 0.01$

Table 4.2.3: Relationship between purchase intention and the effectiveness of the online marketing

Variable	Mean(SD)	Online Marketing	Purchase Intention
Online Marketing	4.20 (0.53)	1	0.566**
Purchase intention	4.13 (0.75)	0.566**	1

*p-value<0.05, Spearman's rho Correlation Analysis applied

Based on table 4.2.3, the correlation between purchase intention and effectiveness of online marketing showed r-value 0.566**, where p-value 0.756 ($p > 0.05$). Hence, it indicates that the value of the result is significant. There is a very strong relationship between purchase intention and effectiveness of online marketing. No reject H_0 because p-value = 0.566 are bigger than 0.05.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Based on the findings result, there are several opportunities for future studies emerged. First, for future research the number of respondents should be more and if possible, including all the online shopping platform in Malaysia from various backgrounds. This research is limited to respondents UMK students only. Malaysian nowadays are interested in buying online products and people who shop online are increasing day by day as consumers are becoming more and more technically literate with more use of gadgets and devices.

Second, this research also can be used for a future study purpose. The research findings are valuable for the next research regarding to this topic. In the future, this research data can be used as a reference by the future researcher. This is because those independent variables had already been tested to be continued with more factors as variables in this research topic.

Last but not least, those factors that have been used in this study which are trust, perceived value and purchase intention are not only the factors that develop the dependent variable which is effectiveness of online marketing on Facebook and Instagram among UMK students in making decisions to buy. Thus, future researchers who want to continue conducting future research in this topic should come out with other factors that have not been tested yet in previous research.

After this research was completed, all of the independent variables were proven to be the factors that influence effectiveness of online marketing on Facebook and Instagram among UMK students in making decisions to buy. The three independent variables which are trust, perceived value and purchase intention showed significant relationship with the dependent variables. Although there are only limited related past research about this study, this is just a beginning for future researchers to get a better understanding regarding this study. This research also can give encouragement to the future researcher in exploring deeper about this topic and finding more relevant independent variables for the study.

6 Acknowledgements

This research project was successfully done with assistance and co-operation of variety authorities. I wish to express my ultimate appreciation to those people who guided, helped and supported me in completing this research. First off all, I would like to thank University Malaysia Kelantan (UMK) for giving me the opportunity to involve in the research. Throughout this research, I gain a lot of experience, knowledge and exposure to a situation which cannot be found in the textbook and certainly going to benefit me in the future.

Secondly, I would like to thank my supervisor, Encik Md Zaki bin Muhamad Hasan, who had led me by sacrificing his time to guide me throughout the whole project. His patient and advices ensure this thesis proceeds well. I thoroughly appreciate what he had done to assist me. Thirdly, I would also like to express my gratitude to my examiner Encik Mahathir bin Muhamad for coordinating and provide me with the relevant information regarding our research project.

Last but not least, we would like to express my ultimate appreciation to those respondents who willing to help by spending their precious time to respond to the questionnaire of the research project. Besides that, I would like to thank my family members, friends, course mates and group supervisor mates for helping and supporting me till the research project end.

Abstract:

Finance is a term for the matters that relating to the money and investment management, development, and the research. In particular, it manages the inquiries of how and why an individual, organization or government obtains the cash that require and how they spend or invest that money. Finance is intended to help the individuals to save, manage, and collect the funds. So, this study is to investigate the factors that influences financial challenges towards academic performance among Faculty of Entrepreneurship and Business students in University Malaysia Kelantan. A conceptual framework comprising of different variables like financial knowledge, family income, rising cost of education were studied which it influences the academic performance. This study was conducted by using a quantitative research approach and the total number of 140 respondents participated in the study. The data that collected were analyze by using the Statistical Package for the Social Science (SPSS). Thus, the data collected through the online questionnaire survey uses different method of data analyses such as descriptive, reliability and normality analysis were carried out from the study. The findings reveal that all the H0 have been rejected while the H1, H2 and H3 have been accepted in this study. It could be concluded from the results that there is significant relationship between the independent variables and dependent variable.

Keywords: *Financial Knowledge, Family Income, Rising Cost of Education, Academic Performance, Finance*

1 Introduction

First and foremost, finance is a term for the matters that relating to the money and investment management, development, and the research. In particular, it manages the inquiries of how and why an individual, organization or government obtains the cash that require and how they spend or invest that money. Finance is intended to help the individuals to save, manage, and collect the funds. The objective of the finance needs to be enunciated and embraced. It should be studied in their business education by the students for their knowledge.

Besides, the studies that related to the finance had been done by the previous researchers. For example, according to Daud, Mat Norwani, and Yusof (2018), higher education students need more funds to cover the cost of studying and working in universities as the cost of higher education is rising in both public and private educational institutions. There could be students

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

who struggling with the financial issues in their daily lives as a result of limited financial resources and rising cost of education where this might can affect their academic performance.

In addition, higher education institutions can usually be divided into public and private universities which are the undergraduate, postgraduate and diploma programmes that are offered by the universities in Malaysia. Thus, public universities are those who completely regulates and funded by the federal government and indirectly by the public sector as well as stated by Arokiasamy, Ismail, Ahmad, and OTHMAN (2009).

Moreover, in order to support the position of tertiary education, there are growing number of universities have been set up in Malaysia as one aspect of an ideal educational goal that continues to aim for the quality teaching in the different sectors of the development to prepare for the human capital needs of the country. While this goal needs to be in line with Malaysia's current growth. Meanwhile, the tertiary education should also be able to continue contributing to Malaysia's development continues by Arokiasamy et al. (2009).

Furthermore, in the 21st century, with the rapid growth of socio-economic shifts, the higher education faces some serious obstacles in its administration such as in their systems, curriculum, emphasize of project, external partnerships, research and finance. Although these obstacles can be seen as the both risks and possibilities which are diagnosing on what is happening in contemporary higher education that can provide the foundation for the future design as mentioned by Shin and Harman (2009). Undoubtedly, education is the greatest weapon for an individual where they invented for their own development. Therefore, all communities have one form of education or another, but it differs in its use. It is also considered to be the only way in Malaysia to get to the top, and so where the failure can brings the person an untold misery and anger as indicate by Ayodele and Adebisi (2013).

1.2 Research Question

Is there any relationship between the financial knowledge and the academic performance among the FEB students in UMK, City Campus?

Is there any relationship between the family income and the academic performance among the FEB students in UMK, City Campus?

Is there any relationship between the rising cost of the education and the academic performance among the FEB students in UMK, City Campus?

1.3 Research Objective

To identify the relationship between the financial knowledge and the academic performance among the FEB students in UMK, City Campus.

To identify the relationship between the family income and the academic performance among the FEB students in UMK, City Campus.

To examine the relationship between the rising cost of the education and the academic performance among the FEB students in UMK, City Campus.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

2 LITERATURE REVIEW

There are three independent variables that will be determine by definition under this research which are financial knowledge, family income and rising cost of education.

2.1 FINANCIAL KNOWLEDGE

According to Setiawan (2020), financial knowledge is a fundamental knowledge of finance that encompasses a variety of areas including numeracy, compound interest, inflation and diversification of risks. For individuals and nations, an awareness of financial knowledge is important. Besides, in the terms of the understanding of financial concepts and risks that would provide the skills and encouragement to make a successful financial decisions the financial awareness was described.

2.2 Family Income

Family is the first atmosphere of any individual human being. "A child becomes a good reader when people at home read to him and read often." When family members communicate with him, a child learns to speak. However, the fact that the family has a higher income would not necessarily mean that a better study atmosphere will be provided to the student, but at least it means that it has the conditions to do so and to improve the student's academic performance. Thus, in this part, the family wealth is attributable to the income inequalities and the achievement gaps as stated by Okioga (2013).

2.3 Rising Cost Of Education

Rising cost of education refers to a general and increase in the education that rise high in prices. In recent years, they know that the price tag of higher education for students has really been "rising up like a spaceship." It is true that the cost of higher education has risen steadily as part of the general inflationary trend. Based on the Thackrey (1971), the study had revealed that the price paid for higher education to students and their families has risen much faster than the increase in higher education. Thus, to increase the cost of the higher education, students and their families had been forced to pay a higher rate of education costs.

2.4 Research Hypothesis

In this study the hypothesis are as below:

Hypothesis 1:

There is positive significant relationship between the financial knowledge and the academic performance among the FEB students in UMK, City Campus.

Hypothesis 2:

There is positive significant relationship between the family income and the academic performance among the FEB students in UMK, City Campus.

Hypothesis 3:

There is positive significant relationship between the rising cost of education and the academic performance among the FEB students in UMK, City Campus.

2.5 Conceptual Framework

A propose conceptual framework is going to build on the basis of the literature review below to determine the relationship between the factors that influences the financial challenges towards academic performance among FEB students in UMK City Campus. The independent variables for this study are the financial knowledge, family income and rising cost of education. Meanwhile, the dependent variable of this study is the academic performance.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

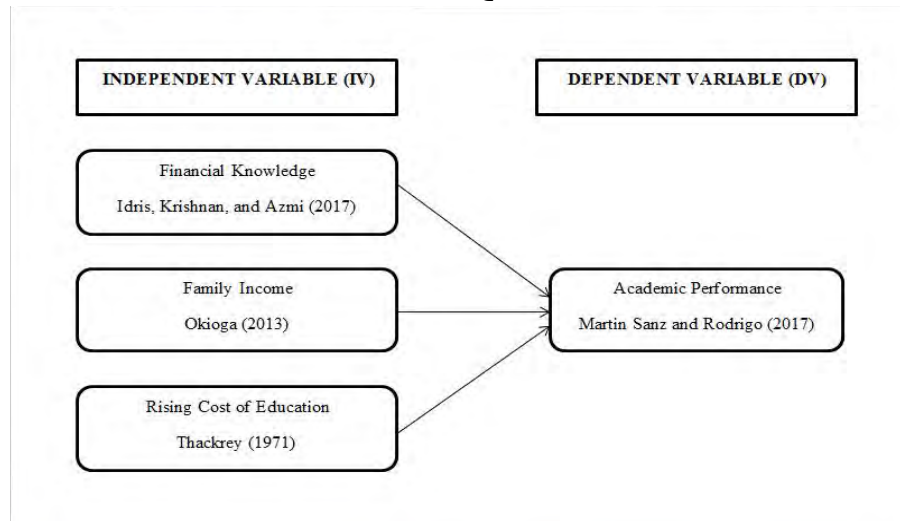

Figure 2.1: Conceptual Framework on the factors that influences financial challenges towards academic performance among FEB students in UMK City Campus.

Based on the figure 2.1 above, it is the conceptual framework that creates by the researcher on the factors that influences financial challenges towards academic performance among FEB students in UMK City Campus to conduct the study using the independent variables such as the financial knowledge (Idris et al., 2017), family income (Okioga, 2013) and the rising cost of education (Thackrey, 1971) along with the dependent variable such as academic performance (Martin Sanz & Rodrigo, 2017). Moreover, figure above had stated the previous researchers under all the variables. It strongly shows that all the variables have the supporting journals from the previous studies to conduct this research in further.

3 Methodology

3.1 Research Design

A research design is basically the plan for a study that provides the specification of procedures to be follows by the researchers in order to accomplish their research objectives or test the hypotheses that formulated for their studies. For the purpose of this research project, quantitative research approach will be applied so that large amounts of data can be obtained within a short period of time. Therefore, exploratory research is adopted to find out the relationship between the factors that influences financial challenges towards academic performance among Faculty of Entrepreneurship and Business in University Malaysia Kelantan. Therefore, the researcher has to collect more information that relates to these objectives to gain more knowledge. Subsequently, the statistical analysis of the data is based on the formulated hypotheses which provide evidence for arriving at the conclusion.

3.2 Data Collection Methods

Data collection method can be divided into two categories which are known as primary data collection methods and secondary data collection methods. In this study, both of the primary and secondary data collection methods had been used for the study. Besides, the quantitative data collecting method are cheaper to apply compares to the qualitative data collecting methods that can be implemented during a shorter period of time. In addition, it is easy to compare the results due to a high level of standardization of quantitative methods approach. In this research, the researcher uses the quantitative data collection method.

Secondary data is a form of data that has already been published in books, newspapers, magazines, journals and web portals. There are ample of sources that provide an abundance of data about this field

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

of research in business studies, almost regardless of the existence of the field of research. Besides, the implementation of the appropriate set of criteria to classify the secondary data that to be uses in the study therefore plays an important role in the accuracy and reliability of the test results. For secondary data collection method, the researcher collected the data and the previous study from journal using google scholar.

3.3 Sample Size

A sample size is a component of the population that selected for an experiment or survey. A significant aspect of any analytical analysis in which the aim is to draw the conclusions from a survey about a consumer segment is the sample size. Based on the data, the information that collected from the Faculty of Entrepreneurship and Business, there are total of 3482 of undergraduate entrepreneurship students in UMK City Campus. The researcher has used the G*Power Sample Size to determine the total number of respondents that needs for the research. The sample size showed a total of 140 respondents were taken to collect the data through the google form as online survey.

4 Data Analysis And Findings

4.1 Demographic Profile of Respondents

In this study, there were seven questions asked under the demographic section such as gender, age, marital status, race, religion, year of study and programme of the FEB students in UMK, City Campus. The total amount of the questionnaire that was distributed through the google form to the respondents is 140 sample sizes which are 36 male (25.7%) and 104 female (74.3%) that involved in fill up the questionnaire.

The age was split into three groups from the questionnaire that distributed to the respondents through the Google form, which were 18-21 years old, 22-25 years old and 26-30 years old. In addition, the majority of respondents aged 22-25 years, with the highest frequency around 114 respondents and the highest percentage around (81.4%), were within the category. The second highest frequency comes from the 18-21 years age group, led by 19 respondents with a percentage of around (13.6%). Meanwhile, the lowest frequency comes from the age range of 26-30 years old that followed by the 7 respondents with the lowest percentage around (5%) out of the total respondents of 140 that the researcher collected for the sampling.

The marital status was divided into 3 groups that were single, married and others. According to the survey, there were no respondents that stated as others. Thus, the figure shows that the single status has the highest frequency that involved in this questionnaire around 135 respondents with the highest percentage of (96.4%). Besides, the lowest frequency that involved in this questionnaire were from 5 respondents with the percentage of (3.6%).

The respondents by race were divided into 4 categories which were Malay, Indian, Chinese and Others. According to the survey, the majority of the respondents that were involved in this questionnaire are from Indian which is 62 respondents with the highest percentage of (44.3%) followed by Malay with the second highest frequency which is 50 respondents with the percentage of (35.7%). Meanwhile, the involvement of the Chinese is 24 respondents with the third highest percentage of (17.1%). Last but not least, there were 2 Telugu respondents with the percentage of (1.4%), 1 Siamese respondent with the percentage of (0.7%) and 1 Orang Asli respondent with the percentage of (0.7%) for the others.

The religion of the respondents from this questionnaire was divided into 4 categories which were Muslim, Hinduism, Buddhism and Christian. According to the survey, the majority of respondents that participated in this questionnaire were from Hinduism, with 61 respondents with the highest percentage of (43.6%), followed by Muslims with 50 respondents with the second highest percentage of (35.7%). Meanwhile for the Buddhism, there were 21 respondents that involved in this questionnaire with the third highest percentage of (15%) followed by Christian, there were 8 respondents with the percentage of (5.7%).

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

The programme from this questionnaire was divided into 5 categories which were SAR (Retailing), SAL (Logistic), SAK (Commerce), SAB (Islamic Banking) and SAE (Entrepreneurship) from the Faculty of Entrepreneurship and Business in Universiti Malaysia Kelantan, City Campus. Therefore, the majority of the respondents by programme were involved by the SAR with the highest frequency around 59 respondents with the highest percentage of (42.1%) out of 140 respondents. The second highest frequency was from the SAL programme which is 32 respondents with the percentage of (22.9%) followed by the third highest frequency among the other programme was from the SAK programme which is 23 respondents with the percentage of (16.4%). Lastly, the lowest frequency was from the SAE programme which is 12 respondents with the percentage of (8.6%) followed by the SAB programme which is 14 respondents with the percentage of (10%).

4.2 Descriptive Analysis

4.2.1 Independent Variables and Dependent Variable

Descriptive Statistics					
	N	Minimum	Maximum	Mean	Std. Deviation
Academic Performance (DV)	140	8.00	25.00	18.7429	4.33054
Financial Knowledge (IV 1)	140	13.00	25.00	20.8143	3.45284
Family Income (IV 2)	140	9.00	25.00	18.9857	4.24262
Rising Cost of Education (IV 3)	140	15.00	25.00	21.3143	3.14879
Valid N (listwise)	140				

The Mean and the Standard Deviation for both dependent variable and the independent variables is shown by the Table 4.9 above. The Mean for the dependent variable of this research is 18.7429. For the independent variables, the highest mean is Rising Cost of Education (IV 3) which is 21.3143 and followed by the Financial Knowledge (IV 1) which is 20.8143. The Family Income (IV 2) has the lowest mean of the independent variables which is 18.9857

4.3 Validity and Reliability Test

The data that collected from the survey were used to evaluate the reliability for both independent and dependent variables in the reliability analysis. Cronbach's Alpha is a research method for evaluating and estimating the accuracy of the questionnaire given. The Cronbach's Alpha can be value from 0 to 1. In general, a score of more than 0.7 is considered to be acceptable and below 0.5 is unacceptable. Table 4.14 below shows the common acceptable thumb for explaining the internal consistency reliability.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Table 4.15: Result Test of Reliability Coefficient Alpha for the Independent and Dependent Variables

Variables	Cronbach's Alpha	Number of Items
Financial Knowledge	0.840	5
Family Income	0.762	5
Rising Cost of Education	0.793	5
Academic Performance	0.748	5
Total	0.888	20

The Table 4.15 above summarizes the findings of the reliability test of each variable in this study. The Cronbach's Alpha was designed to measure a "goodness" reliability criterion in each group item and internal consistency. Next, Vaus (2002) suggested that in order to measure the reliability of the scale to ensure whether the internal consistency is unacceptable, poor, questionable, acceptable, good and excellent. The Alpha value of Cronbach should be between $0.5 > \alpha$ and $\alpha 0.9$. According to the table 4.15, the range of Cronbach's Alpha is from 0.748 to 0.840 which indicates that each item for each variable as acceptable based on the rule of thumb of Cronbach's Alpha Coefficient. Next, according to the rule of thumb Cronbach's Alpha of Coefficient, all the items of each variable that represents as acceptable as it had exceeded 0.7. Hence, the reliability analysis showed that the all items from each variable were clear and easily understood by the respondents.

4.4 Normality Test

Table 4.16: Normality Test for All Variables

Tests of Normality						
	Kolmogorov-Smirnov ^a			Shapiro-Wilk		
	Statistic	df	Sig.	Statistic	df	Sig.
Financial Knowledge	.137	140	.000	.920	140	.000
Family Income	.094	140	.004	.952	140	.000
Rising Cost of Education	.158	140	.000	.904	140	.000
Academic Performance	.099	140	.002	.947	140	.000
a. Lilliefors Significance Correction						

The Table 4.16 above shows the normality test for all the variables. There are two types of tests were used to run this normality test which known as Kolmogorov-Smirnov^a and Shapiro-Wilk. As shown in the table above, the Kolmogorov-Smirnov^a with the significant value showed the p-value for all the variables indicates as not a normal data which is less than 0.05.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Besides, the Shapiro-Wilk with the significant value showed the p-value is 0.000 for all the variables that have been stated above which is less than 0.05. Therefore, the normality test for all the variables had indicated as not a normal distribution.

4.5 Hypothesis Testing

Summary of Pearson Correlation Coefficient Analysis

Hypothesis	Correlation Value	Significant Value (2-tailed)	Conclusion
H1	0.395	0.00	Accepted
H2	0.584	0.00	Accepted
H3	0.331	0.00	Accepted

According to the result of The Pearson Correlation Coefficient, this research is accepting the H1 and rejected the H0 because with the result of 0.395 with the significant value $p < 0.05$, it proved that there is significant relationship between the financial knowledge and the academic performance among the FEB students in UMK, City Campus. Other than that, H1 shows the level of correlation between the academic performance and financial knowledge is weak positive linear correlation.

In addition, this research is accepting the H2 and rejected H0 because with the result of 0.584 with the significant value $p < 0.05$, it means that there is significant relationship between the family income and the academic performance among the FEB students in UMK, City Campus. Other than that, H2 shows the level of correlation between the academic performance and family income is strong positive linear correlation.

Nevertheless, this research is accepting the H3 and rejected the H0 because with the result 0.331 with the significant value $p < 0.05$, it means that there is significant relationship between the rising cost of education and the academic performance among the FEB students in UMK, City Campus. From the result also prove that the level of correlation between the academic performance and rising cost of education for H3 is weak positive linear correlation.

5 Discussion And Conclusion

5.1 Introduction

The overview of the results and the discussions of the research findings are outlined in this chapter. Based on the results and recommendations, the chapter also presents the conclusions of the report. The objective of the study were to develop the relationship between the Financial Knowledge, Family Income, Rising Cost of Education and Academic Performance among Faculty of Entrepreneurship and Business (FEB) students in Universiti Malaysia Kelantan (UMK), City Campus. Besides, the implication of the study, limitation of the study and the recommendations and suggestion for the future research study also included in this chapter.

5.2 Key Findings

This study was conducted by the researcher to identify the factors that influences financial challenges towards academic performance among FEB students in UMK, City Campus. In this research, primary data was collected from the respondents by the researcher through the google form by created the online questionnaires and the secondary data from the journal and article. According to the G*Power Sample

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Size, the sample size that the researcher was needed in this study were around 140 respondents. Based on the survey, the data that were collected through the google form showed 104 female and 36 male respondents. This finding presented that the students in UMK, City Campus are more dominant by the female students compared to male students.

Besides, the reliability test was conducted in this study to measure consistency, precision, repeatability and trustworthiness of this research. The Pearson Correlation Coefficient also used in this research to denote the relationship between two or more quantitative variables. Based on the findings from the previous chapter 4, it shows that there were similarities that occur between the previous study and current study.

5.3 Recommendations/ Suggestion for Future Research

The first recommendations as the current researcher are focusing on the students from FEB in UMK Campus City. So, for the future research, the researcher can conduct a research that includes all the three campuses faculties in Bachok and Jeli. Thus, by including the other campus and faculty, the researcher can increase the number of the sample size since the population involve are the highest. The current research involves 140 respondents of sample size because the population of FEB student are 3482, the sample size for the future research could be large up than the current respondents. This is because, the larger the sample size of population, the more accurate the data can be.

Second recommendation for future research is suggesting to use different research method by using a qualitative approach. This is because, the qualitative approach serve with supporting word or action that handling insight into the factors that influences financial challenges towards academic performance among FEB students in UMK, City Campus. Moreover, the primary data that collected for the research should compromise not only quantitative method but also the qualitative method such as interview. Qualitative data obtain from interview session can generate high reliability since there are two way communication between the researchers and respondents. This can make sure the respondents will clearly understand regarding the research in further.

Next recommendation for future research is to identify the other challenges that the students might face during the period of their studies apart from the financial challenges. This is because, I believe the more expand the scope of the study, the more the future researcher can identify the other challenges that the students are facing apart in their academic performance. Through this, the researcher can obtain a new scope of research.

5.4 Overall Conclusion of the Study

The FEB students have a bit of a reputation when it comes to financial resources, including the variables that influences the financial challenges towards academic performance in UMK, City Campus. Thus, the student's financial knowledge, family income and the rising cost of education are all affected by an expansive list of variables. Students with different parental backgrounds begin their financial journeys from widely differing starting points.

The minimum requirement of the reliability analysis has been fulfilled from the analysis of the entire variables since the value of the Cronbach Alpha coefficients is above 0.7. The independent variables such as financial knowledge, family income and rising cost of education showed the significant relationship to the dependent variable where it known as academic performance.

Based on the findings of the hypothesis, all the H0 were rejected while the H1, H2 and H3 were successfully accepted in this study. Therefore, the researcher is able to know the relationship between all the independent and dependent variables among the FEB students in UMK, City

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Campus. Overall, all the factors indicates that there is a relationship between the financial challenges towards academic performance among FEB students in UMK, City Campus.

6 Acknowledgement

First and foremost, praises and thanks to the God, the Almighty, for the showers of blessings throughout my research process to complete the research proposal successfully.

Next, I would like to my deep and sincere gratitude to my research supervisor, Dr Nur Ain Ayunni Binti Sabri for giving me the opportunity to do the research and providing the invaluable guidance throughout the research. Without her assistance and dedicated involvement in every step throughout the process, this paper would have never been accomplished. I would like to thank you very much for your support and understanding throughout the research. It was a great privilege and honor to work and study under her guidance.

Besides that, I am highly indebted to Universiti Malaysia Kelantan for providing the great facilities and platform to search for related resources to complete my research and I would like to take this opportunity to thank the Faculty of Entrepreneurship and Business in providing the latest format and information regarding this research.

Most importantly, none of this could have happened without the support, sacrifices, love and care of my family in completing the research project with the constant motivation. Besides, I would like to take this opportunity to express my appreciation to all my friends, seniors and to the people whoever that have contributed their time and efforts that greatly had helped me in this research study to complete within the time frame.

Abstract:

Fashion companies locally whom have not utilized or budgeted social media platform to advertise their apparel turns in raising a question whether this method is a feasible one to increase the purchase intention. Next, there's abundant advantage in the event that including customer in product improvement which customer-brand relationship can be cemented by proactively including customers in product or service innovation, however there are scarce literature available on the effectiveness of this method to increase purchase intent among youths in Malaysia. It is believed that sales promotion has a positive influence on the purchase intention. These marketing strategies are incorporated by global fashion apparel industries and local fashion apparel industries, however, there is a need to shed light if this methods are effective in generating or increasing purchase intention among youths. Thus, this study aims to highlight the purchase intention towards fashion apparel among youths in Malaysia. A total of 384 respondents whom are youths in Malaysia were collected via a google form questionnaire which has utilised the purposive sampling and snowball sampling. The data was analysed and tested via descriptive analysis, Multiple Regression and Simple Linear Regression by using IBM SPSS statistics. The main findings have confirmed that social media marketing, sales promotion, fashion involvement, and international brand are significant and positively related to the purchase intention of youths towards fashion apparel among youths in Malaysia. Results also shows that the most influential factor on purchase intention towards fashion apparel among youths in Malaysia is social media marketing

Keywords: *Fashion, Apparel, Youths, Social Media Marketing, Sales Promotion, Fashion Involvement, International Brand.*

1 Introduction

Fashion Apparel

Apparel refers to what you wear in where it can be portrayed as clothes or attire. Whereas, fashion is known as a drift where it often changes according to (Barnard, 2002), it is possible to change the consumer's desire or choice to fashion and it will change from one time to another time. Thus, fashion apparel is best used to portray clothes or other items that shift to drift or slant clothes, clothing products or attires. Other than that, shoes, shoe care products, leather pieces such as calfskin sacks and handbags can be referred to as fashion apparel. In addition, footwear, outdoor and sports clothing and open air and sports shoes were also included (Statista Showcase Estimate,n.d). As in other words, apparel is wore to ensure, create recognition and boost the outward appearance of one, thereby present to the world outside, leading to the introduction of images (Faust & Carrier, 2009). Clothing and fashionable clothing are generally expended products that reflect the personality and character of the person wearing it (Dodd,

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Clarke, Noble, Houston, et al., 2000).

Fashion Apparel Globally

Fashion apparel plays an imperative part, agreeing to the (Trade of Fashion and McKinsey & Company, 2016), because it is one of the most businesses driving the worldwide economy. In economic and social terms, fashion apparel contributes, because it offers work openings and financial development for nations. Companies and markets (2015), one of the world's biggest advertise inquire about database, assessed that with roughly \$1.2 trillion in income, the worldwide apparel industry is ceaselessly appearing promising growth (Bhardwaj, Fairhust, et al., 2010). Around 60-75 million workers within the apparel, material, sportswear, and clothing businesses around the world support this industry. The worldwide apparel industry has been rising at a 4.78 percent annually pace since 2011, agreeing to Showcase Line, a commerce insights firm. The division, presently evaluated at nearly \$1.4 trillion in 2017 income, appears no sign of slowing as the showcase is anticipated to involvement 5.91 percent yearly development for the another three year. By 2020, the clothing industry's advertise esteem is anticipated to hit a mind boggling \$1.65 trillion in income around the world in US dollars (Gereffi, Memedovic, et al., 2003).

Youth Involvement in Fashion Apparel in Malaysia

Changes within the structure of Malaysian society have enormously expanded the utilization control of the youth advertise and in Malaysia this showcase comprises of college and university students. Students are profitable fragment and this bunch makes up approximately a strong 30 percent of the population in Malaysia (Insights Malaysia, 2011) and investing on clothing in Malaysia had appeared an increment of 25% over the past 2 years (Insights Malaysia, 2011). Zafar, Ghingold and Dahari (2005) evaluated that college students in Malaysia spend more than 10 percent of their month to month wage on clothing. Changing way of life, financial advancement and rising salary makes the youth showcase and alluring advertise for design retailers.

2 Literature Review

Theory of Planned Behavior (TPB)

The underpinning theory that will be utilized in this study is the Theory of Planned Behavior (TPB). The Theory of Planned Behavior (TPB) maybe a broadly inquired about model for predicting behavioral intentions by social psychologists (Ajzen, 2011) (Solomon, 2018). TPB proposes that beliefs and their comparing attitudes, subjective norms, and perceived behavioral control impact eagerly, which drive genuine behavior (Ajzen & Fishbein, 2005). Numerous, studies have inspected this well run process of shopper behavior in different social and situational settings (Ajzen, 2011). In any case, it is occasional that studies explore and emphasize the antecedents and triggers that shape and set up consumer's attitude, subjective norms and perceived behavioral control (Chaudhuri, 2006) (Solomon, 2018). Ideas are adopted from the model because this conceptual framework is seen as a base model. The variables that are focused in this study are (1) Social Media Marketing, (2) Sales promotion, (3) Fashion Involvement, and (4) International Brand .

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Figure 2.1: Theory of Planned Behaviour (TPB) (Ajzen, 1991).

Purchase Intention

Purchase intention is kind of decision -making that thinks about the reason to buy a specific brand by customer (Shah, 2012). Purchase intention could be in situation where buyer will likely to purchase the specific product in a definite state (Egorova, Grudieva, Morinez, Kube, et al., 2007). In the meantime the customer's buying choice is complicated, which requires a good connection with both internal and external inspirations in the buying process (Gogoi, 2013). In accordance with (Assael, 2004), when the consumer have the intention to repurchase it also can be known as the intention to purchase.

The relationship between Social Media Marketing and Purchase Intention

Social Media Marketing is often used to recognize online customer behaviour. Social media advertising is now taking over the news media, TV advertisement, and radio since it is a campaign promoting the present day. People want to connect through social networking networks these days to share the information they know. Customers are preferred via Facebook, Instagram and others to look for web journal comments, ratings and follow their friends (Ahmad, Ashiq & Salman, 2010).

In the previous studies by (Bamini KPD Balakrishnan, Mohd Irwan Dahnil, Wong Jiunn Yi, 2014) they have stated that the purchase intention of generation Y has been impacted positively through Social Media Marketing. The result below shows the positive impact of Social Media Marketing on purchase intentions is 3.2422. This result from the findings showed that shows that generation Y have optimistic perceptions, but are almost neutral in that social media advertising and marketing will generate purchasing behavior.

H1: Social media marketing has significant influence towards purchase intention of fashion apparel among youth's in Malaysia.

The relationship between Sales Promotion and Purchase Intention

Sales promotion is described as a major aspect of marketing communication activities and also a special offer within a particular time span (Alvarez & Casielles, 2005). Some studies have

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

presented sales promotion as either an offer or a reward that allows manufacturers and distributors to achieve the desired sales result (Gilbert & Jackaria, 2002). Sales promotion may also be attributed to any incentive that suppliers or sellers use to cause exchange with other retailers or channel members, or to buy brands with consumers, other than to enable the sales force to actively promote the product (Shimp, 2003).

A study by (Weng, J.T, Run, et al., 2013) (Weng, 2013) stated that sales promotion strategies perform a more influential role in impacting customer loyalty and behavioural intent rather than on the basis of personal value for all forms of consumer goods researched. There were few internal reasons or factors causes such findings as from the customer's point of view. Factors such as consumer product features, the collectivist essence of Malaysian buyers, the preference given for tangibility-based sales promotion strategies and the preference offered for monetary- based sales promotion advantages.

H2: Sales promotion has significant influence towards purchase intention of fashion apparel among youths in Malaysia.

The relationship between Fashion Involvement and Purchase Intention

Customers or consumer's interest in the fashion apparel can be defined as fashion involvement (O'cass & Choy, 2008). According to (Kim, 2005), The participation of customers in such goods will inspire consumers to obtain more knowledge and may influence their selection. Fashion involvement appears primarily to buy impulsive products by shopping (Jones, Reynolds, Weun & Beatty et al., 2003) (Seo, et al., 2001) as it merges close connections and relationships with the type of products.

Previous research by (Prof, M. D, 2014) resulted with regard to fashion involvement. Important predictive relationships with impulse purchases have also been found, indicating that buyers with high fashion participation are more likely to participate in fashion-oriented impulse purchases. (Park, et al., 2006) study of university students further lend motivation to revealed that the students with great and high fashion involvement were mostly likes to experience great and positive outcome during shopping. This means a positive relationship between fashion involvement and impulsive purchasing behavior.

H3: Fashion involvement has significant influence towards purchase intention of fashion apparel among youths in Malaysia.

The relationship between International brand and Purchase Intention

International brand could be described as an important role playing choice in customers routine. The feeling of connecting among other nations would be born in these brands (Holt, Quelch, et al., 2004). International brands are also identified, controlled and perceived internally from the point of view of an organisation seeking to harmonise its portfolio across markets (Schuiling & Kapferer, 2003).

In the prior research by (Kiong, T.P, Yin-Fah, B.C, et al., 2013) found out that the strongest variable or predictor towards international brand preference is country-of-origin. If the country-of-origin is not suitable, then the consumers will not look further to another cause or factor. Furthermore, this study's findings showed that quality is also considered as one of the significant impact on consumer preferences towards an

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

international brand of product with $\beta=0.253$. As a reason, quality is the value of the good, which gives customers more satisfaction.

H4: International brand does affect the purchase intention of fashion apparel among youths in Malaysia.

Proposed Conceptual Framework

The available review on theories and literature's, there are many factors that may influence the purchase intentions towards fashion apparel among youth's in Malaysia which vary in various circumstances. Hence, in this study it has decided to use four predictors to determine the purchase intention towards fashion apparel among youth's in Malaysia and researcher also determines to know whether international brand affects the purchase intention towards fashion apparel among youth's in Malaysia. Therefore, researcher decided to combine these variables into a single proposed research framework.

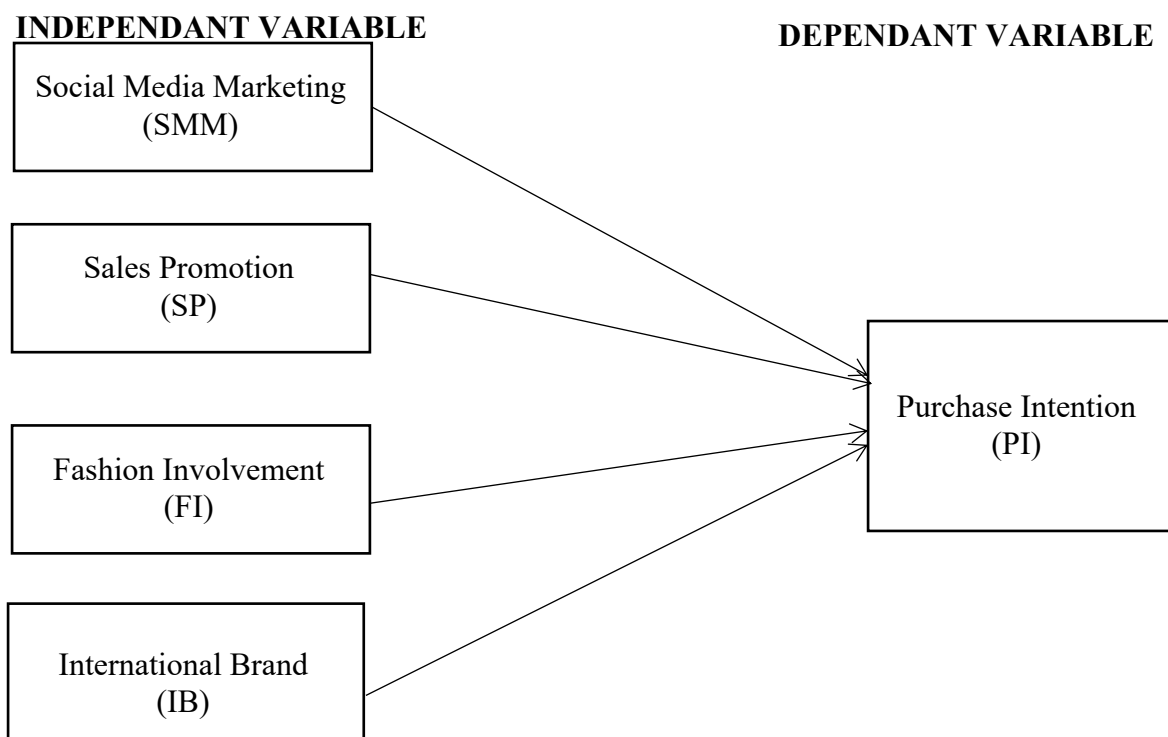

Figure 2.2: Proposed Research Framework

3 Research Method

In this research, quantitative research method has been applied. The cross-sectional is defined as numerical description of demographic trends, attitudes or choices. It includes the use of questionnaires or structured interviews by examining the sample of the population. According (Campbell, Machin, Walters, 2007), cross-sectional study describes as a group of subjects at one particular point in time. The questionnaire will be distributed by the researcher to the respondent. Questionnaire used in this study is develop by (F Coster, V.Hwang, J Svensson,

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

2015) and (Lam, Lee, S.L, Ong, J.J et al., 2017) and is used as alternative to collect primary data. For the primary data, questionnaire will be distributed through social media platform which is Facebook, Instagram and Whatsapp since it can't be distributed face to face due to the Covid situation. Questionnaire will be send to qualified respondents separately within the age 15 to 30 years old. Such targeted samples are directed at individuals who are far more conscious of fashion trends and their presence and others who plan to buy some fashion clothes in the future. In this study, youths in Malaysia were the target demographic and no particular locations were set up to perform the survey. Purposive sampling involves a researcher's conscious choice on the basis of the characteristics shown by the subject. Respondents are to be selected according to predetermined criteria that are relevant to the research objectives. Inclusion criteria includes respondents aged between 15 to 30 years old and does respondents buys or own any fashion apparel. For this sampling technique, the help of any theory is not necessary and the researcher chooses the type of data needed and the individual's ability to provide data (Dornyei, 2007). On the basis of the study findings, the online survey is distributed to qualified respondents via social media channels such as Facebook, Instagram and Whatsapp. In this way, snowball sampling is implemented in order to select and philtre the study participants. Snowball sampling refers to a qualified respondent who invites other qualified respondents similar to them to meet the target survey criteria (Berg, 2006). The survey will be shared with their close relations, such as colleagues, relatives and friends, by the selected respondents who are eligible to answer the survey. There are several types of analytical techniques that are used to check the accuracy of the data collected throughout the research such as descriptive analysis, Spearman Correlation coefficient analysis, Multiple Regression Analysis and Simple Linear Regression

4 Analysis And Discussion

4.1 Descriptive Analysis

Table 4.1: Demographic Background

Variable	Frequency	Percentage	Variable	Frequency	Percentage
<u>Gender</u>			<u>Highest Academic Qualification</u>		
Female	220	62.1	SPM	47	13.3
Male	134	37.9	STPM	64	18.1
			Foundation	6	1.7
<u>Age</u>			Diploma	20	5.6
15-18	39	11.0	Degree	214	60.5
19-22	100	28.2	Others	3	0.8
23-26	149	42.1			
27-30	66	18.6	<u>Personal Monthly Income</u>		
			0-999	242	68.4
<u>Marital Status</u>			1000-1999	27	7.6

Indian	136	38.4	Unemployed	9	2.5
Others	2	0.6			
			<u>State</u>		
			Negeri Sembilan	98	27.7
			Malacca	9	2.5

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

	Kedah	2	0.6
	Terengganu	11	3.1
	Penang	19	5.4
	Johor	42	11.9
	Selangor	111	31.4
	Pahang	33	9.3
	Perak	29	8.2

According to the table above, there are 134 male respondents and 220 female respondents to be tested in this study. Female whom have participated 62.1% while male whom participated are 37.9% of the sample.

The respondents age between 23 to 26 years old have participated for the highest proportion among 354 respondents which is 42.1% or 149 respondents. 39 respondents or 11.0% are at the age group 15 to 18 years old. The 19 to 22 age group in this study are 100 respondents or 28.2% while in age group between 27 to 30 years old has 66 respondents or 18.6%.

According to the table above, respondents who are single participated the highest percentage that is 88.4% or 313 respondents out of 354 respondents. Next, it is followed by married respondents which made up to 11.6% or 14 respondents among 354 respondents.

The table above stated that Indians have contributed the highest proportion among 354 respondents which is 136 respondents or 38.4%. Next, it follows by 34.7% or 123 Chinese respondents and 26.3% or 93 Malay respondents. Lastly, the lowest percentage is respondents which came from different races, which are 2 respondents or 0.6%.

According to the table above, most of the respondents participated are degree holder which consists of 214 respondents or 60.5% among 354 respondents and it follows by STPM holders which consists of 64 respondents or 18.1%. There are 47 respondents or 13.3% are SPM holders and 20 diploma holders or 5.6%. Lastly, there are 6 respondents or 1.7% are foundation holders and there are 3 respondents or 0.8% comes from other education level.

Most of the respondents have a low monthly income (below RM1,000) which has 242 respondents or 68.4% followed by monthly income in the range RM2,000 to RM2,999 which has 56 respondents or 15.8%. There are 29 respondents or 8.2% in the range of RM3,000 and above monthly income. Lastly, 27 respondents or 7.6% personal monthly income level at range RM1,000 to RM1,999.

According to the table above, 243 respondents or 68.6% are students out of 354 respondents. Next, respondents who are employed consists of 102 respondents or 28.8% and there are only 9 respondents or 2.5% are unemployed.

Respondents from the state of Selangor contributed the highest to answer the survey which is 111 respondents or 31.4% followed by respondents from the state of Negeri Sembilan which is 98 respondents or 27.7%. Next, 42 respondents or 11.9% are from the state Johor and 33 respondents or 9.3% are from the state Pahang. 29 respondents or 8.2% are from Perak contribute to answer this survey and 19 respondents or 5.4% are from the state of Penang. Lastly, least amount of respondents who answered this survey was from Terengganu which is 11 respondents or 3.11%, Malacca consists of 9 respondents or 2.5% and Kedah which is 2 respondents or 0.6%.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

4.2 Reliability Analysis

4.2.1 Pilot Reliability Test

Table 4.2: Pilot Reliability Test

Variable	Cronbach's Alpha	Cronbach's Alpha Based on Standardized Items	No. of Items
Social Media Marketing	.827	.822	7
Sales Promotion	.763	.782	6
Fashion Involvement	.748	.809	6
International Brand	.940	.941	7
Purchase Intention	.763	.766	3

*N= 30

During the initial stage of testing the Cronbach's Alpha of the purchase intention questionnaire consisting five items, the reliability value obtained was ($\alpha=0.604$). Hence, to achieve higher Cronbach's Alpha value, and item total statistics was run in which the outcome of Cronbach Alpha value if item deleted increased to ($\alpha=0.763$), after removing item 4 and item 5.

Table above shows the purchase intention is adequate with ($\alpha=0.763$) alpha values. The Cronbach's Alpha value for independent variables for this study, social media marketing is ($\alpha=0.827$), sales promotion is ($\alpha=0.763$), fashion involvement is ($\alpha=0.748$) and international brand is 0.940. This table concludes independent variables alpha value are larger than ($\alpha=0.7$), so this is reliable and consistent.

4.2.2 Actual Data Reliability Test

Table 4.3: Actual Data Reliability Test

Variable	Cronbach's Alpha	Cronbach's Alpha Based on Standardized Items	No. of Items
Social Media Marketing	.887	.888	7
Sales Promotion	.901	.902	6
Fashion Involvement	.830	.843	6
International Brand	.953	.953	7
Purchase Intention	.839	.840	3

*N=354

The satisfactory level of reliability with coefficient alpha exceeding the cutoff value of ($\alpha=0.70$) (Hair et al., 2014). The results in the table above shows that all the independent variable which is (social media marketing, sales promotion, fashion involvement, international brand) and dependent variable which is (purchase intention) have an excellent reliability where it is above the cutoffs value which is in between ($\alpha=0.8$ to 0.90) respectively.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

4.3 Correlation Analysis

4.3.1 Normality Test for Correlation Analysis

Table 4.4: Normality Test for Correlation Analysis

Variable	Kolmogorov-Smirnov			Shapiro-Wilk		
	Statistics	df	Sig.	Statistics	df	Sig.
SMM	0.195	354	0.000	0.817	354	0.000
SP	0.204	354	0.000	0.798	354	0.000
FI	0.199	354	0.000	0.813	354	0.000
PI	0.217	354	0.000	0.764	354	0.000

Note: SMM: Social Media Marketing

SP: Sales Promotion

FI: Fashion Involvement

PI: Purchase Intention

According to Kolmogorov-Smirnov test and Shapiro-Wilk test, if ($p > 0.05$), thus it is considered as a normal result, while if the ($p < 0.05$), thus it is considered as an abnormal result. For a significant value, the p-value should be ($p = 0.000$) of Kolmogorov-Smirnov which is test for all the independent variable and dependent variable. While, for Shapiro-Wilk test all the significant value is ($p = 0.000$), which is less than 0.05 thus in the both test of this study all the independent variables and dependent variable are abnormal for the correlation analysis. Thus, Spearman Correlation Analysis should be implemented in order to identify the relationship of two variables of this study.

As result from normality test concluded that the data was not normally distributed, Spearman correlation analysis was used to measure the direction and strength of the relationship between the variables. The results is shown in the Table 4.4

Table 4.5: Result of Spearman Correlation Analysis

Variable	Mean(SD)	SMM	SP	FI	IB	PI
SMM	4.33(0.69)	1	0.457	0.502	0.394	0.514*
SP	4.30(0.71)	0.457	1	0.446	0.337	0.375*
FI	4.37(0.61)	0.502	0.446	1	0.376	0.470*
PI	4.44(0.72)	0.514	0.375	0.470	0.277	1

***p-value < 0.05, spearman correlation analysis applied**

Note: SMM: Social Media Marketing

SP: Sales Promotion

FI: Fashion Involvement

PI: Purchase Intention

When the range is below 0.2 it means there is no relationship, when the range is between 0.2 to 0.4 that is known low degree of relationship. Next, range between 0.4 to 0.6 is known as moderate relationship and 0.7 to 0.8 means there is high correlation. Based on the table above, there is a positive strong significant relationship between social media marketing and purchase intention ($p < 0.05$, $r = 0.514$). Social media marketing and purchase intention has the most

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

significant correlation as it has the highest correlation among other variables showed by the results. It is proven to have significant influence towards the purchase intention yet confirm the findings from (Bamini KPD Balakrishnan, Mohd Irwan Dahnil, Wong Jiunn Yi, 2014). The result shows how significant data and opinions sharing between customers on social media contributes while these causal interactions among users with others appear to create higher purchase intention.

Next, there is a positive moderate significant relationship between sales promotion and purchase intention ($p < 0.05$, $r = 0.375$). Sales promotion and purchase intention has a positive yet significant influence while the youths are inclined and attracted towards sales promotion. According to (Weng, J.T, Run, et al., 2013) stated that sales promotion strategies has a positive correlation towards purchase intention. The purchase intention of customers tends to be influenced by the sales promotion in spite of the fact that they have no prior intention to buy the particular products (Akhtar, et al., 2014). The statement has been proved by other researchers who expressed that sales promotion has significantly influenced the preplanned purchase of the customers and gaining more purchase intention among customers (DeVecchio, Henard & Freling, 2006) (Dib & Alnazer 2013).

Whereas, there is positive moderate significant relationship between fashion involvement and purchase intention ($p < 0.05$, $r = 0.470$). Fashion involvement is the second most significant correlation according to the results. Therefore, fashion involvement was proven to be inevitable towards the purchase intention as (O'Cass, 2000) expressed, personal characteristics of the customer which reflects about an individual's subjective knowledge on fashion was closely related to fashion involvement, resulting in helping them to develop their intentions to adopt new fashion. An individual would continue to trial and adoption once he or she perceived fashion positively.

4.4 Regression

4.4.1 Normality Test for Multiple Linear Regression Analysis

Figure 2: Normality test of Unstandardized Residual of

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**
Multiple Linear Regression

Based on Figure 2 it is shown that there is a normal shape distribution of the unstandardized residual of the Multiple Linear Regression. Thus, this study can be proceeded further in order to analyse the Multiple Linear Regression to test the dominant variable of this study.

4.4.2 Multiple Linear Regression Analysis

Table 4.6: Multiple Linear Regression Analysis

Variable	Simple Linear Regression			Multiple Linear Regression		
	β	t-stat(95%CI)	p-value	β	t-stat(95%CI)	p-value
SMM	0.69	16.44(0.61,0.77)	<0.001	0.37	6.11(0.25,0.47)	<0.001
SP	0.61	13.96(0.52,0.69)	<0.001	0.23	4.35(0.13,0.33)	<0.001
FI	0.74	14.96(0.64,0.83)	<0.001	0.27	4.01(0.14,0.40)	<0.001

***Normality assumption was fulfilled**

Note: SMM: Social Media Marketing

SP: Sales Promotion

FI: Fashion Involvement

There is a significant effect of social media marketing, sales promotion, and fashion involvement towards purchase intention ($p < 0.05$). In every unit increase of social media marketing, purchase intention will increase by 0.37. Whereas, in every unit increase of sales promotion, purchase intention will increase by 0.23. Next, in every unit increase of fashion involvement, purchase intention will increase by 0.27. The degree of impact of these independent variable on purchase intention could be depicted through the following multiple regression equation:

$$PI = 0.37 * SMM + 0.23 * SP + 0.27 * FI$$

The equation above shows that the most influential factor on purchase intention towards fashion apparel among youths in Malaysia is social media marketing with a standardized β coefficient of 0.37.

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

4.4.3 *Normality Test for Simple Linear Regression Analysis*

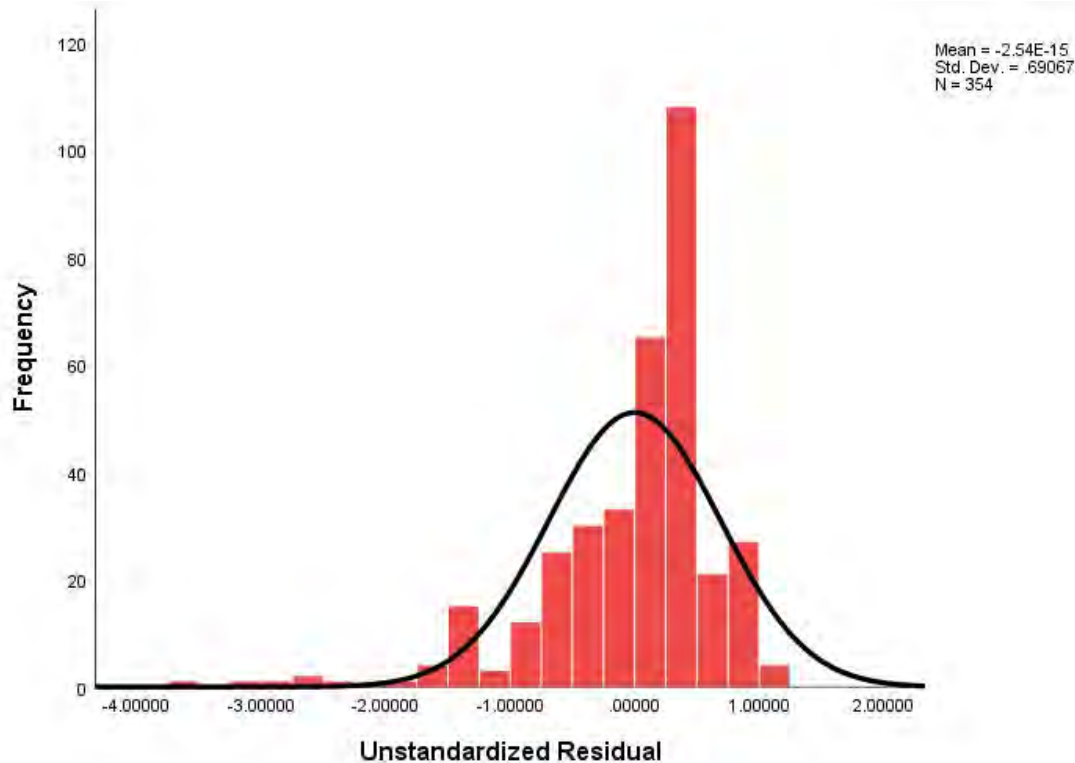

Figure 3: Normality test of Unstandardized Residual of Simple Linear Regression

Based on Figure 3 it is shown that there is a normal shape distribution of the unstandardized residual of the Simple Linear Regression. Thus, this study can be proceeded further in order to analyse the Simple Linear Regression to test whether international brand does affect the purchase intention towards fashion apparel among youths in Malaysia.

4.4.4 *Simple Linear Regression Analysis*

Table 4.7: Simple Linear Regression Analysis

Variable	Simple Linear Regression		
	β	t-stat(95%CI)	p-value
IB	0.17	5.50(0.11,0.24)	<0.001

***Normality assumption was fulfilled**

Note: IB: International Brand

There is a significant effect of international brand towards purchase intention towards fashion apparel among youths in Malaysia ($p < 0.05$). In every unit of increase of international brand, purchase intention will increase by 0.17. This concludes that international brand does affects the purchase intention towards fashion apparel among youths in Malaysia. According to the analysis results, it is proven that international brand does affect the purchase intention of fashion apparel among youths in Malaysia. Hence, it is proven to inevitable towards the purchase intention as stated by (Kiong, T.P, Yin-Fah, Gharleghi, et al., 2013), quality is also

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

considered as one of the significant impact on consumer preferences towards an international brand of product and quality is the value of the good, which gives customers more satisfaction to purchase the products.

Table 4.8: Summary for Hypotheses Testing

Hypotheses	Spearman Correlation	Results
H1= Social media marketing has significant influence towards purchase intention of fashion apparel among youth's in Malaysia.	$r=0.514, p<0.05$	Supported
H2= Sales promotion has significant influence towards purchase intention of fashion apparel among youths in Malaysia.	$r=0.375, p<0.05$	Supported
H3= Fashion involvement has significant influence towards purchase intention of fashion apparel among youths in Malaysia.	$r=0.470, p<0.05$	Supported
Hypotheses	Simple Linear Regression	Results
H4= International brand does affect the purchase intention of fashion apparel among youths in Malaysia.	$\beta=0.17, p<0.05$	Supported

5 Conclusion And Future Research

Firstly, for the future research it is suggested that to provide more detailed fashion studies information in Malaysia it is vital for the future studies to investigate more on the internal and external variables in order to have more comprehensive data. In addition, besides the variables that have been suggested in this study, future researchers should expand the research framework for development by adding other independent variables in influencing the purchase intention. For example, for future research the display of store can be applied in to the variables. Fashion involved is bigger in context so future researcher might explore even more in advance and narrow down to fast fashion, green fashion and much more. From the proposed framework, additional factors can be expanded to prompt the actual selection of fashion attire.

Secondly, future researcher in every other location can carry out fashion related studies as the consumer behavior, background, culture, preference and others are different. The constructions of questions needs to be informative, straight-forward and easy to understand to overcome the unclear comprehensions of respondents. In addition, it would be way better to provide face-to-face interviews with respondents in which the researcher would give guidance to respondents

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

to participate within the study to prompt accurate data collection. Besides, will have a clear view and understanding on the respondents background as they can filter respondents who don't meet the criteria to participate in this study. However, it is suggested that future researcher before giving out the survey to concentrate and filter the age range of respondents. This will ensure and resolve the unreliable information gotten from out-of-target respondents. It could moreover fasten the time of information collection however accomplish more detailed results.

Overall, this study has successfully achieve the research objectives which have been set earlier in the beginning of this study which is to identify whether social media marketing, sales promotion, and fashion involvement are significant relationship of purchase intention towards fashion apparel among youth in Malaysia, to identify the most influence factors of purchase intention towards fashion apparel among youth in Malaysia and to examine if international brand affects the purchase intention towards fashion apparel among youth in Malaysia. All the four independent variables have been proved to have significant impact towards the dependant variable which is purchase intention. Social media marketing have strongest impact towards the purchase intention. This study is useful for businesses, marketer, and future researcher in multiple perspectives.

6 Acknowledgements

Throughout the research process, we have meet people who have contributed their efforts, time and commitment that greatly assisted the research. Therefore, I would like to grab this opportunity to express our deeply appreciation to all of them. First and foremost, I would like to show my gratitude and special thanks to my respective supervisor, Cik Nurul Azwa binti Mohamed Khadri. She showed her generous support, coaching and companionship during our research. She played an important role in our research by valuable our research both practically and theoretically. Moreover, I thank to University Malaysia Kelantan (UMK) for giving a great opportunity to me for conducting this research. Also, I express our deepest thank to the respondents who spent their valuable time to contribute in the questionnaire section. Without their effort, I would have never been collected accurate data to further my research. Last but not least, a sincere thank among the group members as it is a precious opportunity to work together. Throughout the research process, we have learn, grow up and gained knowledge together within this period.

Abstract

Social commerce is a subset of electronic commerce that involves social media, online media that supports social interaction, and user contributions to assist online buying and selling of products and services. Social commerce is a subset of electronic commerce that supports social interaction between seller and buyer. This has led to the decision to choose the consumer satisfaction to repurchase intention in social commerce as the main topic for this thesis. To fulfil the consumer satisfaction is vital and want to maintain consumer loyalty had to face major challenge. Consumer satisfaction to repurchase intention is a crucial element of long-term profitability and competitive advantage. The purpose of this research to measure the factor that affect consumer satisfaction to repurchase intention in social commerce Malaysia among UMK students. The respondents of this research were students who studying in University Malaysia Kelantan, campus Kota, by using questionnaire. It was discovered the perceived usefulness of product which were included quality, suitable of use, and product characteristics which were the major factor affecting the consumer satisfaction to repurchase intention in social commerce Malaysia. The findings show that quality, suitable of use, and product characteristics have significant influenced on consumer satisfaction to repurchase intention in social commerce.

Keywords: *Consumer Satisfaction, Repurchase Intention, Social Commerce, Quality, Suitable of Use, Product Characteristics*

1 Introduction

1.1 Research Background

The quantity of netizen, as known as internet user, which included the mobile phone user and social media user, they have increased every year. In Malaysia with year 2020, in the light of the Global Digital Report 2020, the total number of those internet users is 26.69 million, and it was increased 3.6% every year. On the other hand, the total amount of social media users is 26 million, and it was increase 4.1% every year. Furthermore, the total amount of mobile phone users is 40.69 million, which is up 0.4% year-on-year (Kemp, 2020).

According to Smart Insights, with the continuous development of social media, the number and scope of platforms to connect with people will also continue to expand. Consumers will be expected to view and purchase items in the space where they spend their time. In addition, companies that want to stand out in social commerce are seeking to use new and existing relationships with influencers to enhance their brand's influence, relevance and affinity (Llewellyn, 2019).

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Other than that, the grow in social commerce is partly caused by young consumers, especially the Generation Z and Millennials. It's because they always looking for new and convenient ways to online purchase. In the line with e Marketer, it stated there were more than 55% of the Generation Z internet users in United State spend most of the time on online shopping due to inspired by social media browsing (Kats, 2019).

Lastly, with the continuous development of social media, social commerce is also forced to grow in order to provide consumers with more choices and methods to browse and purchase in different social channels. According to (Llewellyn, 2019), more and more consumers frequently use multiple channels when making online purchases. Therefore, social channels should be used in conjunction with other commercial channels and complement them to provide a consistent consumer experience at every stage of the buying process.

1.2 Research Objectives

1. To investigate the effect of quality of a product towards the consumer satisfaction to repurchase intention in social commerce Malaysia among UMK students.
2. To study the effect of suitable of use by a product towards the consumer satisfaction to repurchase intention in social commerce Malaysia among UMK students.
3. To examine the effect of product characteristics towards the consumer satisfaction to repurchase intention in social commerce Malaysia among UMK students.

2 Literature Review

2.1 Social Commerce

The term "social commerce" is a new derivative model of e-commerce. Which means that it uses the communication channels of social networking sites to assist the purchase and sale of goods through social interaction and user-generated content. Social commerce is a subset of e-commerce that supports social interaction between buyers and sellers (Mohd et al., 2013). It is assisting the user contributions in the online buying and selling of products and services.

Besides that, David Beisel proposed the concept of social commerce to represent the advertising content generated by users on e-commerce sites (Beisel, 2013), and by Steve Rubel to includes collaborative e-commerce tools that allow shoppers to "get advice from trusted individuals, find goods and services, and then buy". It has been found that social networks that spread this recommendation can increase customers' trust in one retailer, not another (S. Guo, Wang, & Leskovec, 2011).

Social commerce is a constantly evolving field in the field of online marketing, which is closely integrated with the growth of social media and online shopping. Blogs related to fashion and shopping use social commerce and media to attract shoppers to buy linked products online. For example, many popular fashion blogs have Instagram accounts, allowing followers to like, share and comment on the products offered. Labelled items are often directly linked to the shopping cart or check-out counter of the store (DOLLARHIDE, 2020).

2.2 Consumer Satisfaction

(Kotler, 2000) believes that consumer satisfaction "refers to a person's state of feeling of pleasure or disappointment formed by comparing the perceivable effects of a product with expectations." It is also believed that when the actual consumption effect of the product meets the consumer's expectation, it will lead to satisfaction, if not will make the consumer

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

dissatisfied. From the above definition, satisfaction is a function of the difference between perceived effect and expected value. If the effect is lower than the expectation, the consumer will be dissatisfied; if the perceivable effect matches the expectation, the consumer is satisfied; if the perceivable effect is more than the expectation, the consumer will be highly satisfied.

Generally, consumer satisfaction is the direct and comprehensive evaluation of the products and services provided by the company and employees, and approval of the company, products, services and employees. Consumers based on their value judgments to evaluate products and services. Therefore, Philip Kotler believes that "satisfaction is the level of a person's feeling state, which comes from the comparison of the product's expected performance or output with people's expectations." From the perspective of a business, the customer service goal is not just to satisfy customers. In marketing management, it is only the first step. Between companies and consumers, in the process of establishing long-term partnerships, companies give consumers with "customer value" that exceeds their expectations, so that consumers can be in high satisfaction in every purchase process and after-purchase experience. Every time satisfaction will enhance consumers' trust in the company, so that the company can obtain long-term benefits and development.

2.3 Repurchase Intention

Repurchase refers to the actual behaviour of consumers buying the same product or service in multiple times (Ibzan, Balarabe, & Jakada, 2016). According to (Ibzan et al., 2016), consumers repeatedly purchase similar products from similar sellers, and most purchases represent a series of events rather than a single isolated event. Meanwhile, according to Cambridge English Dictionary, intention refers to a thing intended; an aim or plan. In the other hand, the other common term for repurchase is retention (Hennig-Thurau, 2004), which is considered one of the most important variables in relationship marketing (Fullerton, 2005).

Therefore, repurchase intention refers to someone who was willing to buy again from the same company based on their previous purchase experience (Hellier et al., 2003). The customer loyalty and repeat purchase rate are the competitive advantage of online business (Tsai & Huang, 2007). By this, consumer satisfaction and repurchase intentions are one of the most studied concepts in academia, and they are also one of the most important concepts in practice today.

2.4 Quality

The first factor is product quality. Nowadays, people will concern about the product that offered by the retailers. Product quality refers to the collection of product features and characteristics that help meet specific requirements (Pass, 2005). Some consumers consider quality as their primary consideration when shopping online. Although online shopping cannot make consumers directly touch or feel the quality of the product, the reviews on the website can indicate the quality of the product to some extent. As we know, a good comment for a product will affect the confidence of consumers, thus the sales of the product will also increase. In addition, studies like (Alam & Yasin, 2010) and (X. Guo, Ling, & Liu, 2012) have found product quality to be an important factor influencing e-satisfaction.

2.5 Suitability of Use

Every product or service that consumers buy has its purpose. For example, the purpose of an oven is to bake raw food, but not all ovens have the same functions and advantages. Benefits are the reasons that consumers buy products or services (FastTrac, 2007). For example, the

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

benefits of certain ovens to buyers include practicality, ease of use, or affordable prices. It is important to remember that consumers buy products and services because they want to solve problems or satisfy needs. Therefore, the product and service offerings in social commerce Malaysia must provide solutions and meet their needs, thus increase the consumer satisfaction to repurchase intention. Then, the benefits are ultimately more important to the consumers in social commerce, it is imperative that retailers to understand the benefits product's benefits provided, emphasize these benefits in sales efforts, and renew products when consumers want new or additional benefits.

2.6 Product Characteristics

According to (Team, 2018), product characteristics refers to characterize the meaning of the completed project. Product characteristics are attributes that can be added to the project definition to extend each product description. Examples of characteristics are size, colour, quality, shape and weight. For example, normally, ladies customers were more satisfied by buying a clothes which incorporate with elegant, luxury, fancy colour, and etc. In the other hand, from the analysis of (Wang, Lu, & Tan, 2018), the survey showed that the type, colour, the drainage method, display and loading type, frequency conversion, capacity of the product have a statistically significant impact on satisfaction. Therefore, clearly defining consumer product characteristics for each product is the key to success in the market. Retailers must understand their products as much as possible from different angles. So that it can be affect to the consumer satisfaction thus to cause the consumers to repurchase in social commerce.

2.7 Research Hypothesis

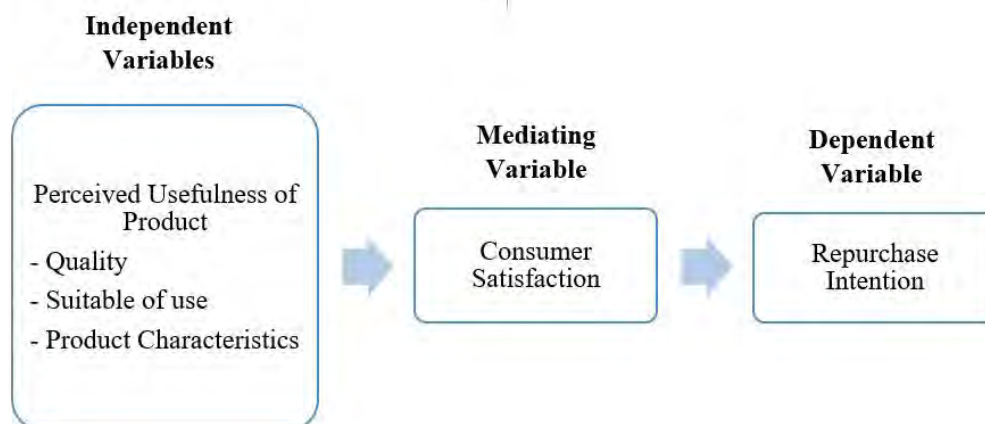

A series of testable hypotheses were developed from the proposed research model, as shown below:

Hypothesis 1: There is a significant positive relationship between product quality and consumer satisfaction to repurchase intention.

Hypothesis 2: There is a significant positive relationship between suitable of use and consumer satisfaction to repurchase intention.

Hypothesis 3: There is a significant positive relationship between product characteristics and consumer satisfaction to repurchase intention.

3 Methodology

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Figure 3.1 Research Conceptual Framework

This study using quantitative research methodology. It could gain deep understanding on the factors that affects consumer satisfaction to repurchase intention in social commerce Malaysia among UMK students and to establish the factors of customer satisfaction from the perspective of UMK students. In addition, this method was focusing on collecting data. In this study, questionnaires by using the Google form was conducted to recruit the respondents which were the UMK students. The questionnaire consists of three sections, which are namely section A, section B, and section C.

The target population of this study were the students who study in University Malaysia Kelantan, which was the campus located in Kota Bharu. There was total 5631 students in UMK campus Kota, which were 3482 students in Faculty of Entrepreneurship and Business (FKP), and 2149 students in Faculty of Hospitality, Tourism and Wellness (FHPK). Then, a total of 300 students from different program in UMK campus Kota have been conducted. The sample were selected from every program and semester according to the proportion.

In this study the chosen sampling technique is Judgmental Sampling. Judgemental sampling is a selection process where the auditor decides which items should be audited (Jokovich, 2013). After the data collection process was done, SPSS software is used to conduct the analysis. SPSS is a predictive software to enable accurate analysis of result for better decision making and problem solving in academic research.

4 Findings

4.1 Reliability, Mean and Standard Deviation

Table 4.1 Reliability, Mean and Standard Deviation

Questionnaire	Number of Items	Cronbach's Alpha	Mean	S.D
Dependent Variable				
Consumer Satisfaction to Repurchase Intention	4	0.817	4.0300	0.68392
Independent Variable				
Quality	5	0.846	4.5073	0.49810
Suitable of Use	5	0.826	4.3087	0.55475
Product Characteristics	5	0.817	4.1987	0.62222

No of respondent (N) = 300

Construct's reliability has been measured by Cronbach's alpha, above Table 4.1 shows the reliability of all construct is more than 81% which is more than acceptable. Table 1 also shows the mean and standard deviation for consumer satisfaction to repurchase intention, quality, suitable of use, and product characteristics. Mean of all above variables was more than the scale of 4.0 mostly which lies between agree and strongly agree responses.

4.2 Correlation

Table 4.2 Pearson Correlations

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

		CSTRI	Q	SOF	PC
CSTRI	Pearson Correlation	1	.408**	.546**	.511**
	Sig (2-tailed)		.000	.000	.000
	N	300	300	300	300
Q	Pearson Correlation		1	.723**	.452**
	Sig (2-tailed)			.000	.000
	N		300	300	300
SOF	Pearson Correlation			1	.626**
	Sig (2-tailed)				.000
	N			300	300
PC	Pearson Correlation				1
	Sig (2-tailed)				
	N				300

**Correlation is significant at the 0.01 level (2-tailed).

Hypothesis 1: There is a significant relationship between quality and consumer satisfaction to repurchase intention. The results showed that a significant positive correlation coefficient between quality and consumer satisfaction to repurchase intention ($r = .408, p < .01$). The result demonstrated that the strength of association between quality and consumer satisfaction to repurchase intention was moderate.

Hypothesis 2: There is a significant relationship between suitable of use and consumer satisfaction to repurchase intention. A significant positive correlation coefficient showed between suitable of use and consumer satisfaction to repurchase intention with the value of .546 ($p < .01$). The strength of relationship between suitable of use and consumer satisfaction to repurchase intention was moderate.

Hypothesis 3: There is a significant relationship between product characteristics and consumer satisfaction to repurchase intention. The final findings indicated that there is a significant positive correlation coefficient between product characteristics and consumer satisfaction to repurchase intention ($r = .511, p < .01$). The correlation coefficient gained shows a moderate relationship.

5 Discussion

The purpose of this study is to measure the factor affect consumer satisfaction to repurchase intention in social commerce Malaysia among UMK students. There were three independent variables (quality, suitable of use, product characteristics) that can affect consumer satisfaction to repurchase intention in social commerce Malaysia. The researcher has chosen students who study in University Malaysia Kelantan campus Kota as respondent for this study. Respondent has been chosen from Year 1 to Year 4 and have shown data in the descriptive analysis that include gender, year of study, marital status, ethic, monthly income, and experience purchase in social commerce.

Based on 300 respondents of UMK students, the Cronbach's Alpha for reliability analysis shows all variables consistency and stability are good which is quality is 0.846, followed by 0.826 that represent for suitable of use and product characteristics is 0.817. Next, dependent variables (consumer satisfaction to repurchase intention) is 0.817 are recorded.

Based on result generate, for Pearson analysis quality from UMK students has a significant

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

impact on consumer satisfaction to repurchase intention in social commerce. The significant level of customer satisfaction is at 0.000 which lower than alpha value 0.01. Besides, β -value is which express that the relationship between quality and consumer satisfaction to repurchase intention are positive.

According to the finding, suitable of use has a significant impact on the consumer satisfaction to repurchase intention in social commerce among UMK students. The significant level of suitable of use is at 0.000 which lower than alpha value 0.01. Besides, β -value is which express that the relationship between suitable of use with consumer satisfaction to repurchase intention are positive.

Furthermore, the study reveals that product characteristics also has a significant impact on consumer satisfaction to repurchase intention in social commerce among UMK students. The significant level of product characteristics is at 0.000 which lower than alpha value 0.01. Besides, β -value is which express that the relationship between product characteristics with consumer satisfaction to repurchase intention are positive. From the results, researcher can describe that all independent variables have significant relationship with dependent variable.

6 Recommendation

Researcher hereby propose some recommendation and alternative to beat those restrictions. Since this study had only focused on students who study in University Malaysia campus Kota, Kelantan, it is recommended that further studies can be carried out to other generation and place in Malaysia, not only focused in Kota Bharu, Kelantan. Secondly, researcher suggests that one-to-one communication can abstain from misconception of the respondents while noting the survey. Next recommendation, in further studies also can concentrate on particular retailers, so it can help retailers to improve their product with features, thereby retailers are able to full fill consumers' needs and wants.

7 Conclusion

This study was focus on the factors affect the consumer satisfaction to repurchase intention in social commerce Malaysia among UMK students. From the analysis of the entire variable, it has been satisfied the minimum requirement of reliability since all the Cronbach's Alpha coefficients shows greater than 0.8 which is all the independent variable (quality, suitable of use, product characteristics) had the significant relationship to the dependent variable (consumer satisfaction to repurchase intention). Regarding the result of analysis performed in order to determine whether or not quality, suitable of use, and product characteristics has an impact on consumer satisfaction to repurchase intention, it was found out that all independent variables has significant relationship with consumer satisfaction to repurchase intention in this study. Based on the relationship, UMK students will repurchase in social commerce if those factor meets their needs and wants. The most important part, retailers can acknowledge these factors before produce a product in the future to increase the consumer satisfaction, thereby increase the repurchase intention between young consumer. The results show factors that affect consumer satisfaction to repurchase intention were really play important role among UMK students. This research had been complete successfully.

8 Acknowledgement

This research was supported by Universiti Malaysia Kelantan. I would like to express our

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

deepest gratitude to Sir Md Zaki Bin Muhamad Hasan for his guidance and mentorship throughout this dissertation. It is a life-long honour to be his students and he helped me a lot whenever I came across difficulties in this research study. His tolerance and expertise also helped and supported me all the way through proposing initial ideas to the completion of this research study. I would like to thank everyone who are involved in this research directly or indirectly that may have helped me a lot in finalizing this project within the limited time frame. So, with a lot of guidance and assistance from many people, I extremely fortune to have this all along the completion of assignment work.

Abstract:

Retail has emerged as one of the fastest- growing that considered as one of the most important players in the business industry. In nowadays a new of retail landscape has changing from traditional store format to the modern retail store format. It has given new experience to buyers who are familiarize to the traditional retail format. The purpose of this study is to identify the factor that influence consumer behaviour in choosing the retail store format among FKP student at UMK City Campus. This study is help the researcher to understand the factor that influence consumer in choosing the retail store format. This study analysed between three factor which is store image, store atmosphere and product variety that influenced the consumer behaviour in choosing the retail store format. This research was performed by distributed the questionnaire by using the Google form to FKP student by using the simple random sampling techniques. Then, the respond measured by using a descriptive analysis to know the mean and standard deviation. Spearman Correlation was applied to know the relationship between the independent variable and dependent variable. The result show that, there was a fair positive relationship between store image and consumer behaviour (p -value < 0.05 , $r= 0.46$), positive relationship between store atmosphere and consumer behaviour (p -value < 0.05 , $r=0.62$), and a positive relationship between product variety and consumer behaviour (p -value < 0.05 , $r=0.72$). It is important for all retailer either they managed their business in traditional or modern retail store that need know the factor that influence the consumer behaviour in choosing their retail store. It is because all these factor give a positive impact to their business where can increase the revenue for the business and the future to expand more their business.

Keywords: *Store image, Store Atmosphere, Product Variety, Consumer Behaviour, Traditional Retail Store, Modern Retail Store.*

1 Introduction

This study is to investigate the customer behaviour in choosing the retail store format. Retail is the sale of the good or the services from individual to the end of user or known as the consumer. Retailer is being a part of an integrated system that called as supply chain which is purchasing the good in the large of quantities from wholesale or directly from the manufacturer. In nowadays the retailing business in Malaysia has grown rapidly along with the new era of the development of social economic condition of the community. Retail is one of the most popular sector that can generate income compared to other sector. So the marketer has their own strategies to influences the consumer to choose their store by offering them with the variety of the product in different ways, at a several of location and services.

Retail has emerged as one of the fastest- growing industries and can compete with the other

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

sector such as tourism, hospitality and many more. It can be considered as one of the most important players in the business industry nowadays especially in Malaysia. In nowadays a new of retail landscape has been taking place to the traditional format that change to the modern retail format. It has given new experience to buyers who are familiarize to the traditional retail format. In Malaysia, there are a lot of choices that can make by a consumer in choosing the retail store format to meet their need and want. As we can see there is many retail stores open around the City or the village like mushrooms after the rain. In 2018, the number of establishment for the wholesale & retail trade sector is recorded 469,024 that compared to 370,725 establishments in 2013 with an annual growth rate of 4.8 per cent. Determining the factor that influence the consumer behaviour in choosing between traditional and modern retail store is important for the business owner in Malaysia because of it will help to boost more sale and attract more people to visit their store. There is three factor that influence the consumer behaviour which is store image, store atmosphere and product variety. In the next section of literature review all the factor are be discussed in detail.

1.1 Research Questions

The problem that is addressed in the study is to know the factor that influences the consumer behaviour in choosing between traditional and modern store retailing among FKP students at UMK City Campus.

What is the relationship between store image and consumer behaviour in choosing the retail store format among FKP student at UMK City Campus.

What is the relationship between store atmosphere and consumer behaviour in choosing the retail store format among FKP student at UMK City Campus.

What is the relationship between product variety and consumer behaviour in choosing the retail store format among FKP student at UMK City Campus.

1.2 Research Objectives

This study aims to determine the factor that influences consumer behaviour in choosing the retail store format. The specific objective of this paper is shown below.

- To examine the relationship between store image and consumer behaviour in choosing retail store format among FKP student at UMK City Campus.
- To examine the relationship between product variety and consumer behaviour in choosing retail store format among FKP student at UMK City Campus.
- To examine the relationship between store atmosphere and consumer behaviour in choosing retail store format among FKP student at UMK City Campus.

1.3 Significant of the study

The priority of Malaysian consumer behaviour towards making a good decision in choosing retail store format is very important for this study. This research will provide a better understanding of the factors that influence consumer behaviour in making the right choice according to their suitability. Therefore, the result can give some important information to a few groups which include the business owner, consumer, and future research.

2 Literature Review

According to Jinfeng and Zhilong (2009) the retail sector has been a a powerful switch over the last decades with the rapid growthof supermarket as a dominant form of organized retailing The phenomenon of modern retail store are emerged throughout Asia, South Africa, Eastern Europe and the Middle East. Meanwhile food retailing still dominated by the traditional format

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

to run the food store. It is been a trend in expansion of the modern retail store as hypermarket and also a supermarket. They are becoming the most popular store because of they has providing more convenience facilities to the consumer compared to the traditional store. Traditional retail store that also known as mom and pop store still dominate much of the region modern retail format and operated in urban areas of the most Asian countries like village and the small town.

Regarding to the department of statistic Malaysia shown that the retail sector is grown rapidly with the number of establishments for Wholesale & retail trade sector in Malaysia are recorded 469,024 in 2018 as compared to 370,725 establishments in 2013 with an annual growth of 4.8 per cent. Total of establishment of Small & Medium Enterprises (SMEs) has increase to 98.5 per cent compared to 98.9 per cent in 2013. Meanwhile, total sales value of goods & services increased to RM1, 270.8 billion as compared to RM841.6 billion in 2013 with an annual growth of 9.4 per cent. In other word, the retail business has high potential because of it is very well be seen through a hearty development of retail sector, with normal yearly development pace to compete resources and commitment expanded over the time of 2013 to 2018.

Store Image

The concept of the store image, considered as the way consumers see the store in his minds based on tangible or intangible attributes. Store image can be define as the different store attributed or characteristic that focus on the marketing activities of a store to influence customer perceptions of the store choice, Jinfeng and Zhilong (2009). Regarding to Grewal et. al., (2004), store image has built up as a combine evaluation regarding the store and the brand that influenced customer's store choice.

Jantan and Kamaruddin (1999) evaluated significant store image features which are important in departmental store choice behaviour of Malaysian shoppers. There are seven store image features in store choice behaviour and the most significant one was location after which it was service, merchandise, promotion and advertising. According Steenkamp and Wedel (1991) store image as one of the retailer's most valuable asset because it is one of the strategic tool in the highly competitive retailing environment.

Store Atmosphere

Store atmosphere plays a vital role in the consumer's experience. It is involve to a conscious designing of space to affect customer's sensory experience. According to Ryu & Jang (2007) and Ryu & Han (2009) store atmosphere have a tremendous effect on customer behaviour in choosing the store which reflects the quality that giving to the customer. For examples it provide an attractive decor or design, music, lighting, colour to attract the customer. Other than that, making some of investing in the operation of physical environment also important because it will directly increase sales and purchase intention dramatically.

Product variety

According to Fisher et al. (1999) product variety referrer in two of dimension which is the rate at which the firm replaces existing products with new products and the breadth of the products that a firm offers at a given time. Martin (1999) also mention that there are two types of variety which is generational variety that refer to the variety across the future generation of the product and spatial variety that indicates the variety that a company offers the marketplace at a point in time.

Ulrich and Randall (2001) has mention that product variety as the number of different versions of a product offered by a firm at a single point in time. Regarding to Ho and Tang (1998) consumers are the ultimate source for demand for product variety, as each individual has preference for different product variants. Retailers try to satisfy these demands by offering a

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

wide range of products. Multi product firms offer a variety of choices in a single product category to capture the surplus of consumers who may have heterogeneous quality valuations, tastes or budget constraints, Hui, (2003).

2.1 Research Hypothesis

This study is expected to have three independent variable which are store image, store atmosphere and product variety. Meanwhile, consumer behaviour in choosing the retail store format (traditional/modern) is a dependent variable

Store image

H0: There is no significant relationship between store image and consumer behaviour in choosing the retail store format.

H1: There is a positive significant relationship between store image and consumer behaviour in choosing the retail store format.

Store atmosphere

H0: There is no significant relationship between store atmosphere and consumer behaviour in choosing the retail store format.

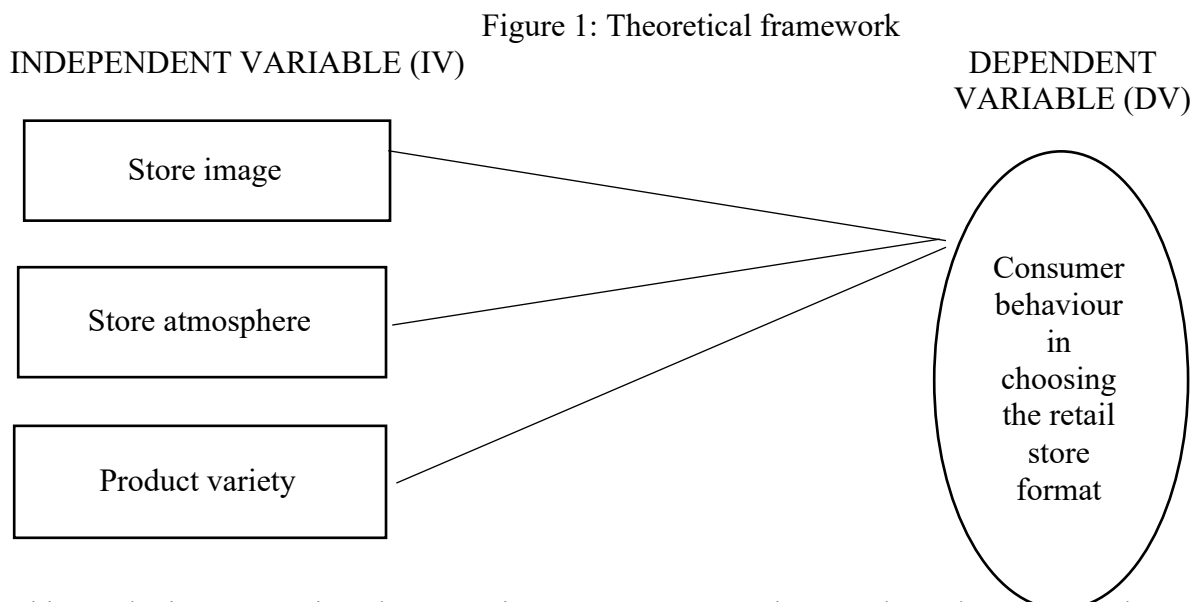

H1: There is a positive significant relationship between store atmosphere and consumer behaviour in choosing the retail store format.

Product variety

H0: There is no significant relationship between product variety and consumer behaviour in choosing the retail store format.

H1: There is a positive significant relationship between product variety and consumer behaviour in choosing the retail store format.

2.2 Conceptual Framework

This study is to examine the store image, store atmosphere and product variety have a relationship between consumer behaviour in choosing the retail format among FKP student at UMK City Campus.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

3 Research Methodology

3.1 Research design

This study used quantitative method with using a set of questions that will be formed in the questionnaire survey. A survey of the questionnaire will be presented to the respondents using the Google form.

3.2 Data collection method

This study used the data collection technique questionnaire method. Researcher choose the quantitative method of the data collection depend on the area of researcher and the nature of research aims and objective. This will be done to collect appropriate and relevant data to meet this study's research goal. These data collection will conducted through the Google form and spread it to FKP student as the respondent through the whatsapp group and telegram channel. A simple random sample is a subset of a statistical population in which each member of the subset has an equal probability of being chosen. A simple random sample is meant to be an unbiased representation of a group. In this research, a simple random sampling would be selected of 303 FKP undergraduate student being chosen out of a hat from total of student in UMK which is 3482 of FKP student from a different course and year of their study.

3.3 Measurement development

All measurement for each variable are based on existing measurement develop by previous studies. The respondent will ask to mark the number 1 to 5 for the each statement that will give by the researcher. The researcher will used 5 point likert scale that design to examined how strongly subject agree and disagree with the statement on five point likert scale. The questionnaire that provided to the respondent have two language which is in English and Malay version.

3.4 Sample size

This study has to conduct at least 300 respondents among FKP students. According to Salman (2015), Mansor et al. (2015) and Abduh & Isma (2017), the futures researches are suggested to enlarge the sample size to get more reliable and effective result. In their studies, they have used 200 respondents to run the test but still become a limitation in their studies. Therefore, in this research, 303 respondent would be distributed for a more reliable result throughout the targeted state that choose among FKP student.

3.5 Data analysis

This study use the Statistical Package for the social Sciences (SPSS) with the version of 24 to analyse the data. There were data type of analysis were used for the data demographic profile of the respondent, frequency analysis, reliability analysis and spearman correlation.

4 Finding

4.1 Demographic Profile of the Respondent.

A set of demographic profile which is including to the gender, age, ethnic group and many more of analysis have been examined and presented in table 1. The questionnaire was distributed by using the Google form.

Table 1 shows the socio demographic profile of the respondent. The result show the percentage for the gender with male respondent having (39.6%) and female respondent having (60.4%).

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

The majority of the respondents are from the age group of 23-24 years old years (74.9%) and 21-22 years old (19.5%), (3.6%) percent were from the 25 years old group and minimal respondents fell within the range of 20 years and below (2.0%) percent. From the ethnic groups, the Malay occupied the highest percentage (80.5%), followed by Chinese (12.2%) and Indian (7.3%). The majority of the respondents are from the retail (SAR) student which is (30.0%), followed by Islamic Banking (SAB) student with the percentage (24.8%), ecommerce (SAK) student (20.5%), logistic (SAL) student (19.5%) and the lowest respondent is an entrepreneurship (SAE) student which is (5.3%). Other than that, the majority of the respondent is from the fourth year student which is achieved to (71.9%).

In term of retail store format choice, most of the respondent are make a choice to enjoy in a both format which is (traditional and modern retail store) with the percentage (48.2%), followed by modern retail store (45.2%) and the remaining is enjoy purchase at traditional retail store (6.6%). Besides that, the majority of respondent are like to visit the retail store in a twice in a month which is (64.7%), followed by 3 and above in a month that they like to visit the retail store (32.3%) and it minor of the respondent are like to visit the retail store in once a month (3.0%).

The majority of the respondent were giving the reason in choice of the retail format where they were looking for the product variety with the percentage (43.6%), followed by store image (33.7%) and lastly with store atmosphere (22.4%)

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

Table 1

Demographic		frequency (N)	Percentage
Gender	Male	120	39.6%
	Female	183	60.4%
Age	20 years old and below	6	2.0%
	21-22 years old	59	19.5%
	23-24 years old	227	74.9%
	25 years old and above	11	3.6%
Course	SAR	91	30.0%
	SAB	75	24.8%
	SAK	62	20.5%
	SAL	59	19.5%
	SAE	16	5.3%
Year of study	Year 1	8	2.6%
	Year 2	21	6.9%
	Year 3	56	18.5%
	Year 4	218	71.8%
Race	Malay	244	80.5%
	Chinese	37	12.2%
	Indian	22	7.3%
Retail format	Traditional store	20	6.6%
	Modern store	137	45.2%
	Both	146	48.2%
Time visit store	once a month	9	3.0%
	Twice a month	196	64.7%
	3 and above	98	32.3%
Reason choice of store	store image	102	33.7%
	store atmosphere	68	22.4%
	product variety	132	43.6%

4.2 Spearman Correlation Analysis

Spearman correlation analysis is applied to describe a strength of the relationship between the independent variable and the dependent variable. Table 2 show the spearman correlation analysis for the factor that influences the consumer behaviour in choosing the retail store format.

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

Table 2: Result of Spearman Correlation Analysis

Variable	Mean (SD)	Store image	Store atmosphere	Consumer behaviour
Store image	4.59(0.40)	1	0.70	0.46*
Store atmosphere	4.30(0.52)	0.70	1	0.62*
Product variety	4.13(0.60)	0.61	0.75	0.72*
Consumer behaviour	4.10(0.65)	0.46	0.62	1

*Correlation is significant at the p-value <0.05 level .spearman correlation analysis applied

From the table 2 show that the outcome result from Spearman Correlation which was run to determine the relationship between the store image, store atmosphere , product variety and the consumer behaviour in choosing the retail format.

There is a positive fair correlation between store image and consumer behaviour in choosing the retail format ($p < 0.05$, $r = 0.464$). So that the H_0 will be rejected.

There is a positive perfect correlation relationship between store atmosphere and consumer behaviour in choosing the retail format ($p < 0.05$, $r = 0.622$). So that, the H_0 will be rejected.

There is a positive perfect correlation relationship between product variety and consumer behaviour in choosing the retail format ($p < 0.05$, $r = 0.718$). So that, the H_0 will be rejected.

4.3 Hypothesis testing

The hypothesis of the relationship between store image, store atmosphere, product variety and consumer behaviour are accepted by using the spearman correlation ($p < 0.05$).

5 Finding & Discussion

Store Image

Based on the study the result of reliability analysis show that the store image has the reliable Cronbach Alpha which is 0.78. Other than that, the result of Spearman Correlation in table 4.2 also show that store image and consumer behaviour in choosing the retail store format among FKP student at UMK City Campus has the fair positive correlation relationship between as the spearman correlation value r that obtained in this test is $r = 0.46$. Both variable show that a positive correlation coefficient value which indicate sign of the relationship between them. It also shown that the store image statistically as the significant obtained is 0.00 where $p < 0.05$.

Store Atmosphere

The result of reliability analysis show that the store atmosphere has the reliable Cronbach Alpha which is 0.85. Other than that, the result of Spearman Correlation in table 4.2 also show that store image and consumer behaviour in choosing the retail store format among FKP student at UMK City Campus has the perfect positive correlation relationship between as the spearman correlation value r that obtained in this test is $r = 0.62$. Both variable show that a positive correlation coefficient value which indicate sign of the relationship between them. It also shown that the store atmosphere statistically as the significant obtained is 0.00 where $p < 0.05$.

Product variety

The result of reliability analysis show that the product variety has the reliable Cronbach Alpha which is 0.84. Other than that, the result of Spearman Correlation in table 4.2 also show that

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

store image and consumer behaviour in choosing the retail store format among FKP student at UMK City Campus has the perfect positive correlation relationship between as the spearman correlation value r that obtained in this test is $r = 0.72$. Both variable show that a positive correlation coefficient value which indicate sign of the relationship between them. It also shown that the store atmosphere statistically as the significant obtained is 0.00 where $p < 0.05$.

5.1 Recommendation

For the recommendation, those retailer can use this research as a material to improve their service or their store to ensure that customer will choose the store to purchase the goods. As an example from this research used, the retailer can improve their business with make some of the improvement through store image, store atmosphere and also provided more product variety to the customer. So that, it can help them to gain a new customer, get the high profit for their store.

Other than that, the retailers need to applied strategies such as make some improvement at store atmosphere. It is because when store layout is different from other stores, well-arranged, and artistically organized, the store atmosphere can build positive consumer. Consumers with positive emotion will give a positive evaluation to the store atmosphere. They have an intention to return to the store and make a purchase of the products at the store. Therefore, a strategy that can be carried out by the store in an effort to influence consumer behaviour in choosing the retail store is by creating such a store atmosphere that could generate consumer positive behaviour.

5.2 Limitation

Limitation of this study is only focuses on a general place whereas the respondent is limited to FKP student at UMK City Campus. The geographical location for this study did not represent all Malaysians and student. Accordingly, a future investigation may grow the factor overlooked in this research because of the inaccessibility of information which might give the advantages to them to know the benefit that can get in both retail format in Malaysia. The researcher had to face the time limitation which is it refer to the time to collect the data. It being hard for the researcher because it need to use the student's time to answer the questionnaire. At the same time, some of student just be ignore and did not notice with the questionnaire to answer it that the researcher give to them. So that, researcher need to struggle to spent more time to collected the data and ensure the student will give a their time to answer the question.

6 Conclusion

From this study that has been completed may help to improve in understanding the factor that influence the consumer behaviour in choosing the retail format. Better understanding on the factor influence the consumer behaviour in choosing the retail format may give the benefit to other parties like the retailer especially in traditional retail store to be more understanding about the consumer behaviour as well as to gained more consumer to visit their store. It can be used to not only for the small retailer but it also can applied to a big company to ensure that they will sustained in their business. They may use this research to improve their business to achieve more advantages and profitability in their business.

7 Acknowledgment

I wish to thank to my Supervisor Encik Md Zaki Bin Muhammad, for his professional guidance and help. He has helped me a lot with patience and professionalism in reviewing my research in a complete way. I also thank all parties directly or indirectly involved in completing this task acknowledge a deep appreciation to anyone who contributed their help to me to complete this study especially my group members and lectures.

Abstract:

This research discusses the impact of cashless payment usage on customer's spending behaviour in Kota Bharu Kelantan. Different economic sectors of the state of Kelantan have used the food and beverage market, retail and business online transaction services. Online transaction is a tool for making purchases without cash expenditure by consumers. In 2020, the first preference of customers is the internet transaction, since it enables the transaction of business. The purpose of the research was to explore the relationship between perceived ease of use, security between behaviour intention to use cashless transaction.

Keywords : *cashless, payment method, customer behaviour*

1 Background of The Study

The advancement of information technology has facilitated innovation in electronic payment where goods and services are traded without the use of physical cash. A cashless payment eliminates the usage of money as a medium of exchange for goods and services by allowing electronic transfer payments or non-electronic payment via cheques. Adopting cashless payment has numerous advantages. Unlike traditional cash transactions, cashless payments discourage robbery and other cash payment related crimes (Armey et al. 2014). When people opt for other alternative modes of payment, they tend to hold less physical cash when they shop. Thus, it eliminates the chances for robbers to commit cash payment related crimes. As for vendors who consist of businesses that apply cashless payment methods, the ease of transaction through various payment modes will increase their revenue by reducing control cost on cash payment transactions and attract more customers to buy their product. In addition, this alternative method would improve operational efficiency and lower operating cost (Alliance, 2003). Cashless payments were also regarded as hygienic for food vendors because the vendor and the customer do not need to touch cash notes during the transaction (Paul and Friday, 2012), especially during the pandemic covid 19 outbreak.

Observations from Humphrey and Berger (1990), Humphrey et al. (1996) Olney, 1999; Klee, 2004; Garcia-Swartz et al., 2006) suggest that the increased use of cashless payment systems such as money or scrip which is exchanged only electronically via computer networks, has led to predictions of a 'cashless' society. In a cashless society, consumers can make payments over the Internet, payment at 'unmanned' vending machines, 'manned' point of sale (POS) using mobile phone device, personal digital assistants (PDA), smart cards and other electronic

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

payment systems, including debit and credit cards. Governments and commercial entities provide strong encouragement and support for cashless transactions. Although there are benefits such as cost saving and efficient use of resources, social commentators and environmental activists have expressed concerns that it would increase overall consumption, increase personal debt levels, reduce savings and that the resultant 'over-consumption' will have an adverse impact on the society and environment (Nocera, 1994; Libow, 1955; Taylor and Tilford, 2000; Zavestoski, 2002; MacDonald et al., 2006).

Although this new method of payment has been studied by previous researches, there is little focus given on the challenges of the usage. Therefore, this study is conducted to fill the gap. This aims to identify the impact of cashless payment usage on customer's spending behaviour in Kota Bharu Kelantan. To identify the relationship between convenience in cashless usage in Kelantan. To identify the relationship between the safety of cashless use in Kelantan. To identify factors of cashless transactions that contribute to the change in behavior and lifestyle of people in Kelantan. To identify the benefits and problems of the cashless transaction system for the people of Kelantan.

1.1 Research Objective

The aims of this study are:

To identify the relationship between perceived ease of use and cashless use.

To identify the relationship between the security and cashless use.

To identify the relationship between behaviour intention to use and cashless use.

This study is to address the following question:

Is there a significant relationship between perceived ease of use and cashless use in Kota Bharu Kelantan?

Is there a significant relationship between the security and cashless use in Kota Bharu Kelantan?

Is there a significant relationship between behaviour intention to use and cashless use in Kota Bharu Kelantan?

1.2 Significant of The Study

Entering 2018, we can see the technology involved in cashless payment becoming increasingly accepted by banks and large companies. If the technology used to only be used for credit and debit cards, consumers now have the opportunity to pay only with their smartphones. Cashless is a growing but not widespread trend in Malaysia. Therefore, this study is important for entrepreneurs interested in developing cashless services in Kelantan. This study gives them detailed information on cashless and can help them determine market acceptance and market prospects in Malaysia.

Entrepreneurs can use this study as a reference when deciding whether their company should operate and offer cashless services. The findings of this study can also help entrepreneurs who are willing to offer cashless services to understand the key factors that influence cashless consumption, including speed, convenience, safety, and social influence. Thus entrepreneurs can be based on these factors to make improvements to cashless to increase their customers' acceptance of cashless to make payments.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

In addition, this study also helps financial institutions and software development companies by helping them to identify consumer-related issues when using cashless services. Based on the results of this study, financial institutions and software development companies are able to identify and understand the areas they want to do to successfully introduce cashlessness in Kelantan.

In addition, this study also benefits future students and researchers who want to investigate cashlessness. It gives them more knowledge about cashless in Kelantan. Through this study, consumers can find out what cashless is and the factors that influence its use in Kelantan. Therefore, they will have a better understanding of cashless in Kelantan. As cashless has attracted more and more people, it will attract many interested future researchers and conduct research on this topic. This study is useful to them by providing basic information and cashless factors that influence cashless consumption in Kelantan. Therefore, future researchers can use these factors as references for future research.

2 Literature Review

2.1 Discussion of Variable

2.1.1 Dependent Variable

Cashless Use

ForexBonuses.org (2019) analysis suggests that in some countries cashless payment networks are increasingly growing. There are six metrics calculating the maximum number of cash-free countries: number of credit cards per person; number of cards that are usable without contact; development in cash-free payments over the last five years; non-cash payments and mobile payment recognition. Canada has the best cashless technology for more than two credit cards for all people. Canada is a leading region. This follows Sweden in which non-cash approaches are used to complete 59% of Swedish customer purchases. In Asia, the development of cashless payments was heavy in two nations, China and Japan. This paper therefore underlines in detail the effect of cashless payment on the financial and economic outlook and the downside of cashless use in Malaysia on the cashless consumers and items of payment.

"Electronic payments to provide a safer way for money to be transferred over paper-based payments, which are reliable and cost-effective" (Bank Negara, 2010). Cashless payments are one of the most commonly used electronic payments in the world. Tee and Ong (2016) claimed that customers would be free to take cash away and the purchase can be done conveniently by wireless technology through mobile devices (smartphones) with the aid of high technology devices. The condition of the economic situation in which financial transactions are not done by means of actual banknotes or coins, but by knowledge transfers between trading partners (Ragaventhara, 2016) would characterise a cashless society. In other words, the cashless payment reflects a shift in behaviour for the customer, and could minimise the use of money as a means to exchange goods and services by the allowance of electronic transfers such as digital cash and e-wallet. Mukaria (2013) argued that the use of credit cards was calculated luxury and became important in its research "The Plastic Monetary Money Is a Cashless Payment Mechanism."

2.1.2 Independent Variable

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Perceived ease of use

The simplicity and ease to use anything may be considered. In comparison, the use of portability and instant usability has gained some benefits (Sharman & Gutierrez 2010). A modern convenience is a technology, facility or material that makes a process faster or more effective than a conventional way. Convenience is a qualitative term that is context-dependent. The cashless economy is described according to Woodford (2003) as one where no friction is presumed to be reduction in transactions by using cash balance and which thus provide a cause to retain such balance even though they receive a return.

Security

While the latest strategies and attempts to make our society a negotiating company can be seen favourably by many people, according to Dr. Muzzaffar Shah Mallow (2019), it poses another challenge for the people. Today, cybercrimes include various illegal acts. Like atm robbery, carding, identification theft, bribery and misuse of classified documents, cybercrimes associated with online financial transactions. Diverse internet scams are targeted at customers and corporations around the world, including Malaysia, focused on Phishing and Social Engineering. The technological advancement and expanded access for smart technology ensures that hackers can take advantage of multiple access points with users' homes. During 2017, 10,203 cases of this sort were registered with damages in the sum of approximately RM184.2 million. Most telecommunications scams include Macau scams, e-financial fraud, 419 scam, also called love fraud or African scams and e-commerce scams.

2.1.3 Moderating Variable

Behaviour intention to use

Different factors impact the customer in cashless society. The effect of the government on consumers on cashless transactions is one of the key reasons. Private and public banks both facilitate and assist their customers in cashless transactions through mobile banking and net banking. Utilizing mobile wallets, the consumer can track, transact, pay, recharge and book. Besides all these discounts, offers, cash-back, connectivity and other programmes, customers are also drawn to cashless purchases. Certain aspects that boost digital payments include easy to pay, payment monitoring and user-friendly navigation. As Mahor tells, N. (2017) established that individuals are affected by information technologies, desire to pay, social impact and the payment convenience zone, whether it is cash or cashless transactions.

2.2 Conceptual Framework

Theory Acceptance Model (TAM)

TAM is a modification of the Reasoned Action Theory (TRA) to the IS field. TAM posits that perceived usefulness and perceived ease of use decide the intention of a person to use a system to serve as a mediator of actual system use. Perceived usefulness is often seen from the perceived ease of usage as being directly influenced. Researchers have simplified TAM by excluding from the current specification the attitude construct found in TRA (Venkatesh et. al., 2003). In general, efforts to expand TAM have followed one of three approaches: by

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

incorporating influences from similar models, by introducing new or alternate factors of conviction, and by analysing backgrounds and moderators of perceived usefulness and perceived ease of use (Wixom and Todd, 2005). Gefen and Larsen (2017) showed in a recent paper that the construction relationships of TAM mainly arise from semantic relationships between its questionnaire items.

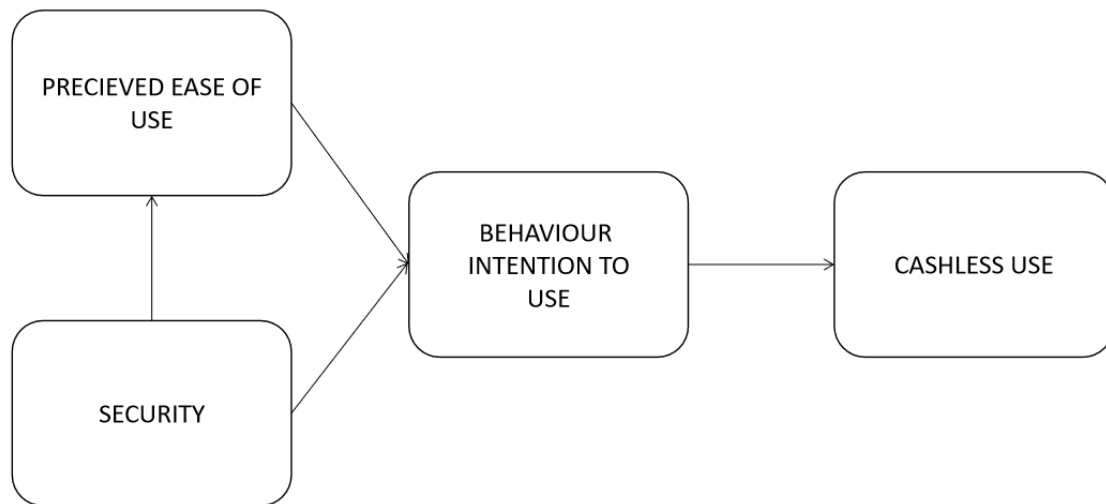

Chart 2.1 Tam Model

The below framework is designed to explain about the relationship between dependent variables (cashless use), independent variables (perceived ease of use, security) and moderating variable (behaviour intention to use).

2.3 Hypotesis Developement

2.3.1 *Perceived ease of use*

H₁: There is a significant relationship between perceived ease of use and cashless use.

2.3.2 *Security*

H₁: There is a significant relationship between security and cashless use

2.3.3 *People behavior*

H₁: There is a significant relationship between people behavior and cashless use.

3 Methodology

3.1 Research Design

This research used descriptive, reliability tests and Pearson's correlation. Descriptive research was taken to investigate the the impact of cashless payment usage on customer's spending behaviour in Kota Bharu Kelantan. Descriptive assisted with reliability and correlation in order to accomplish research objectives. Moreover, it also consists of a research framework design

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

and plan of action for the research. Most importantly, it is to ensure the data collected from field work are appropriate for solving the problems. In general, two types of research methods are being used quantitatively and qualitative.

3.2 Data Collection

This study will use primary data collection methods for quantitative research. [Quantitative data collection methods](#) are based in mathematical calculations in various formats. Methods of quantitative data collection and analysis include questionnaires with closed-ended questions, methods of correlation and regression, mean, mode and median and others. This study will use questionnaires as a medium to collect all data needed.

3.3 Sampling Technique

Convenience sampling is used in this research study. As pointed out by Dornyei (as cited in Farrokhi & Hamidabad, 2007), convenience sampling is a non-probability sampling that the members of target population are chosen for the purpose of a research study as if they meet certain criteria, such as available to be interviewed or willing to participate in the research study. Convenience sampling is used because the respondents are readily available to take part and provide the required information to the study. In this research study, questionnaires are distributed to consumers at hypermarkets and surveying them who are available and consent to being questioned.

3.4 Sample Size

The population usually contains too many individuals to learn easily, so the investigations are often limited to one or more samples taken from it. The samples were chosen to contain most of the information about a certain population parameter but the relationship between the sample and the population must be such as to enable the correct conclusion is made about the population of the sample.

3.5 Research Instruments Method

The closed ended questionnaire will have multiple choices of answer and it is allowing respondents to select a single choice from amongst them. This type of questionnaire can help to reach opinions about a product or service in a more efficient manner. Likert scale questions have been chosen from one of the types of close ended questionnaires for this study. It is designed to examine how strongly the respondents agree or disagree with the statements that have been provided and it is also appropriate to measure the attitudes, behaviour and opinion and typically a three, five or seven-point agreement scale used to measure respondents' agreement with a variety of statements. As a consequence, for this study, there are four points Likert with closed ended questionnaire scales ranging from 1 (Strongly Disagree), 2 (Disagree), 3 (Agree) and 4, (Strongly Agree) were used as the instrument in this study.

Strongly Disagree	1	2	3	4	Strongly Agree
-------------------	---	---	---	---	----------------

Figure 3.6: Four-point Likert Scale (Develop for the research)

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

4 Data Analysis & Findings

4.1 Preliminary Analysis

Preliminary test is a pilot study is commonly applied to examine the feasibility of methods, interviews, techniques, and questionnaires and how they work with each other in a given fact (Doody & Doody, 2015). Surveyors also engage with a large number of participants for a pilot survey, so that possible differences can be analysed within and through classes in the subjects. A pilot test to determine the consistency and precision of the questionnaire design will be performed before the questionnaire is implemented. According to Hill (1998), 15-30 respondents are enough for pilot study to confirm that respondents understanding and feedback. Therefore, to answer the questionnaire, a small group of 40 respondents were picked. After the 47th pilot test has been performed, the researchers will conduct a reliability test to analyse the reliability and consistency of the collected data. In the key analysis, the respondents who have done the pilot test would not be included. The results of the reliability study are seen in Table 4.1 and all the variables are significant with a Cronbach's Alpha value greater than 0.70. It showed that it is very well for the strength of interaction between variables.

Table 4.1 Realibility test (pilot test)

VARIABLE	ITEM	CRONBACH'S ALPHA
Cashless use	8	0.804
Perceived ease of use	8	0.864
Security	8	0.918
Behaviour intention to use	8	0.915

4.2 Demographic Profile Of Respondents

Did you know about cashless payment method ?

Table 4.2 Did you know about cashless payment method ?

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	YES	381	93.8	94.5	94.5
	NO	22	5.4	5.5	100.0
	Total	403	99.3	100.0	
Missing	System	3	.7		
Total		406	100.0		

Based on the Table 4.2 and Chart 4.1 shown the results of know about cashless payment method distributions of the respondents. There were a total of 403 respondents. In this study, respondents known about cashless payment method were higher with 93.8% (n=381) respondents as compared to did not know about cashless payment method with 5.4% (n=22). This is mean people in Kota Bharu, Kelantan well known about cashless payment method.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Do you consider using cashless payment method in the future?

Table 4.3 Do you consider using cashless payment method in the future ?

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	YES	351	86.5	87.1	87.1
	NO	52	12.8	12.9	100.0
	Total	403	99.3	100.0	
Missing	System	3	.7		
Total		406	100.0		

Based on the table 4.3 and chart 4.2 shown the results of know about cashless payment method distributions of the respondents. There were a total of 403 respondents. In this study, respondents will use cashless payment method in the future were higher with 86.5% (n=351) respondents as compared to did not use cashless payment method in the future with 12.8% (n=52).

4.2.2 Gender

Table 4.4 Gender

GENDER

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	MALE	182	44.8	45.2	45.2
	FEMALE	221	54.4	54.8	100.0
	Total	403	99.3	100.0	
Missing	System	3	.7		
Total		406	100.0		

Based on the Table 4.4 and Chart 4.3 shown the results of gender distributions of the respondents. There were a total of 403 respondents. In this study, female respondents were higher with 54.4% (n=221) respondents as compared to male with 44.8% (n=182).

4.2.3 Ages

Table 4.5 Ages

AGES

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	18 - 28 years	100	24.6	24.8	24.8
	29 - 39 years	111	27.3	27.5	52.4
	40 - 50 years	133	32.8	33.0	85.4
	51 and above	59	14.5	14.6	100.0
	Total	403	99.3	100.0	
Missing	System	3	.7		
Total		406	100.0		

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Table 4.5 and Chart 4.4 shows the age distribution's results. The respondents were allocated into four groups. The highest number of respondents were from group 40-50 years old with 32.8% (n=133) respondents. The second highest group were from group 29-39 years old with 27.3% (n=111) respondents. Meanwhile, the respondents from young people of group 18-28 years old were 24.6% (n=100) respondents. Lastly, the lowest number of group age was 51 and above with 14.5% (n=59) respondents.

4.2.4 Types of works

Table 4.6 Type of work

TYPES OF WORK

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Government	216	53.2	53.6	53.6
	Private	52	12.8	12.9	66.5
	Self - employed	29	7.1	7.2	73.7
	Student	85	20.9	21.1	94.8
	Not working	21	5.2	5.2	100.0
	Total	403	99.3	100.0	
Missing	System	3	.7		
Total		406	100.0		

Table 4.6 and Chart 4.5 shows the type of work distribution's results. The respondents were allocated into five groups. The highest number of respondents were from group works in government sector with 53.2% (n=216) respondents. The second highest group were from group student with 20.9% (n=85) respondents. The third highest, the respondents from group of works in private sector were 12.8% (n=52) respondents. Meanwhile, the respondents from group self-employed were 7.1% (n=29) Lastly, the lowest number of group not-working with 5.2% (n=21) respondents.

4.3 Validity & Reliability Test

VARIABLE	NUMBER OF ITEM	CRONBACH'S ALPHA
CASHLESS USE	8	0.881
PERCEIVED EASE OF USE	8	0.891
SECURITY	8	0.931
BEHAVIOUR INTENTION TO USE	8	0.936

Table 4.12 Validity & Reliability test

Table 4.12 shows the Cronbach's Alpha values of the questionnaire were above the acceptance level with the value range above than 0.70. George and Mallery (2003) provide the following rules of thumb which is >0.9 (excellent), >0.8 (good), >0.7 (acceptable), >0.6 (questionable), >0.5 (poor) and <0.5 (unacceptable).

The first dependent variable that is Cashless Use found to be good reliable (8 items; $\alpha = 0.881$).

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

The first independent variable is Perceived Ease of Use showed a good reliability (8 items; $\alpha = 0.891$) The second independent variable that is Security showed an acceptable reliability (8 items; $\alpha = 0.931$). The moderating variable that is Behaviour Intention to Use found to be also an acceptable reliability (8 items; $\alpha = 0.936$). The Cronbach's Alpha from every variable unchanged after the removal. Therefore, the data was considered suitable for further analysis.

5 Discussion and Conclusion

5.1 Key Finding

RESEARCH QUESTION	HYPOTHESIS RESULT	FINDING
There is a significant relationship between perceived ease of use and cashless use	P=0.01 ($p < 0.01$) R= 0.796	This result shows that there is a relationship between perceived ease of use and cashless use.
There is a significant relationship between security and cashless use.	P=0.01 ($p < 0.01$) R=0.705	This result shows that there is a relationship between security of use and cashless use.
There is a significant relationship between people behavior and cashless use.	P=0.01 ($p < 0.01$) R=0.557	This result shows that there is a relationship between perceived ease of use and cashless use.

Table 5.1 Finding

5.2 Discussion of Finding

H1: There is a significant relationship between perceived ease of use and cashless use.

Based on the table 5.1, it shows the correlation between the perceived ease of use and cashless use in Kelantan. The r value of perceived ease of use is 0.796. The result indicates there is high positive correlation between perceived ease of use and cashless use. Besides, the p-value is less than 0.01. This result shows that there is a relationship between perceived ease of use and cashless use.

H2: There is a significant relationship between security and cashless use.

Based on the table 5.1, it shows the correlation between the security and cashless use in Kelantan. The r value of security is 0.705. The result indicates there is high positive correlation between security and cashless use. Besides, the p-value is less than 0.01. This result shows that there is a relationship between security of use and cashless use.

H3: There is a significant relationship between people behavior and cashless use.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Based on the table 4.18, it shows the correlation between the behaviour intention to use and cashless use in Kelantan. The r value of behaviour intention to use is 0.557. The result indicates there is moderate positive correlation between behaviour intention to use and cashless use. Besides, the p-value is less than 0.01. This result shows that there is a relationship between perceived ease of use and cashless use.

5.3 Conclusion

The findings of the hypothesis test support the extended TAM in descriptive tests satisfactorily. The research approach is focused on the creation of a model for technical adoption through the integration of mechanisms for social control. These results give important insight into the growth of bank management. Marketing tactics to satisfy client demands and to further strengthen customer base.

Abstract:

Nowadays, online shopping culture is growing rapidly. So, theory of planned behaviour (TPB) can be explore to identify the consumer behaviour. The purpose of this research is to explore the theory of planned behaviour (TPB) towards behaviour in online shopping among Universiti Malaysia Kelantan's student. This research was focusing in studying of behaviour in online shopping among UMK's student. This study has been conducted on 361 of UMK's students from two faculties in Kampus Kota which are FKP and FHPK. The researcher applied non-probability method which is convenience sampling. The findings show that attitude, subjective norm and perceived behavioural control have positive significant relationship towards behaviour in online shopping. This research will provide useful information towards student and UMK in understanding the attitude, subjective norm and perceived behavioural control of student. It also enables consumer and retailer to aware and plan about their buying and selling.

Keywords: *Theory of planned behaviour, attitude, subjective norm, perceived behaviour control, behaviour in online shopping*

1 Introduction

Nowadays, the internet is vastly used in our daily life. Based on internetlivestats.com, internet users are shown increasing gradually for the past ten years. It is stated that 40% of the world population are internet users and half of it comes from Asia region users. On top of that, almost 4 billion people are using the internet daily. As, it has been plain that the amount of the internet users is always rising up daily. As an importance of truth, the major target customers of online shopping are internet users (Jubayer, 2015).

Back in a few years online shopping has been rising up in our world scale. As the internet evolves in extent and familiarity, a lot of internet users get familiar with the internet and the acceptance of the internet as a platform for browsing information and shopping online (Frag et al., 2007; Hill and Beatty, 2011; Keisidou et al., 2011). Online shopping is one of the components of electronic commerce. As, internet has been equipped with data and interacting technology and the advent of the internet has transformed business activities by providing new ways of performing business that can be called as electronic commerce. (J. M. O. Gabriell, T. D. Ogbuigwe1 and L. U. Ahiauzu 2016)

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Previously, people only relied on traditional methods of shopping. The traditional method of shopping took place at physical and offline stores. People need to go out from their home and directly go to the physical store to shop and purchase anything. The rate of consumer spending on online shopping is rising as they pick online shopping as an alternative for physical and offline shopping, the online platform dominated as the channel that remained experienced growth that achieved double-digit over the last ten years. In addition, the amounts of categories which online seize a considerable amount of total type revenues is accelerating to expand (Dekimpe, Marnik G Geyskens, Inge Gielens, Katrijn 2019)

In this research, researcher would like to conduct a study topic exploring the Theory of Planned Behaviour (TPB) towards behaviour in online shopping among Universiti Malaysia Kelantan's students. According to the Wikipedia Website, there is study in psychology about Theory Planned Behaviour (TPB). Theory Planned Behaviour (TPB) connected with individual beliefs and behaviour. This theory mentioned that there are three factors as foundation to create a person's behavioural intentions and behaviours that are attitude, subjective norms and perceived behavioural control. So, in the end of this research we will investigate whether Theory Planned Behaviour (TPB) can be applied in decision to make online shopping.

2 Literature Review

The researcher applied theory of planned behaviour (TPB) in this study. Theory Planned Behaviour (TPB) is a model state that the crucial determinant of behaviour is an individual's intention to conduct the behaviour. There are three variables that act as determinants of intention that are attitude, subjective norm and perceived behavioural control (Cooke, Richard Dahdah, Mary Norman, Paul French, David P 2016).

Independent Variable

Attitude

Attitude is defined as the complete assessment of a concept by an individual. It is possible to distinguish two kinds of attitudes: attitudes to objects and attitudes to actions. Since this research is about measuring Jordanian consumer attitudes towards online shopping, behavioural attitudes are important to the context of this analysis. Attitude towards a behaviour refers to the degree to which an individual has a positive or unfavourable assessment or perception of the behaviour to be taken into account (Taylor and Todd, 1995).

Subjective Norm

According to Ajzan & Driver (1980) subjective norms are known to be the perceived pressure exerted by those who conduct the behaviour of interest, such as neighbours, colleagues, peers, etc., and such activity has a direct or indirect effect on the behaviour of the respondent. Subjective norms refer to the " person's view that most people who are important to him feel that the actions in question should or should not be carried out".

Perceived Behavioural Control

The perceived ease or difficulty of carrying out the specific actions of a person (Ajzen and Fishbein, 1980). Perceived Behavioural Regulation is an outcome of perceived power (PP) and control beliefs (CB). Control belief can be characterised as the individual's belief in the existence of certain variables that may encourage or hinder the performance of a particular behaviour (e.g. time, money & opportunity), whereas perceived power refers to personal assessment of the influence of these variables in facilitating or impeding the specific behaviour (Ajzen, 1991).

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

2.2 Dependent Variable

2.2.1 Behaviour in Online Shopping

Online shopping behaviour consists the purchasing process of goods and services through the internet (Moshref et al. 2012). There are various phases in the purchasing process comparable to physical buying actions (Liang & Lai, 2000). There are five steps involved in a typical online buying process. Initially, when the user recognises his or her product or service requirements, one moves to the internet and searches for the data. After collecting product details, the customer compares the product with other choices available, choosing an item according to its specifications and transaction criteria for selected items and receives post-purchase experience (Kotler, P. 2000). Online shopping behaviour contributes to the psychological state of the consumer about the achievement of online purchase (Li & Zhang, 2002).

2.3 Hypotheses Statement

H1: There is a significant relationship between attitude and behaviour in online shopping among UMK's students.

H2: There is a significant relationship between subjective norms and behaviour in online shopping among UMK's students.

H3: There is a significant relationship between perceived behavioural control and behaviour in online shopping among UMK's students.

3 Research Methods

This study is to identify the relationship between attitude, subjective norm and perceived behavioural control towards behaviour in online shopping among UMK's student which is the dependent variable. This study involved the students from two faculties which are FKP and FHPK in University Malaysia Kelantan, Kampus Kota. The researcher implemented quantitative study for this research. Then, the sample size for this research are 361 respondents based on the Krejcie & Morgan table.

The researcher applied non-probability sampling which are convenience sampling. Convenience sampling suits in this research because the limitation of time, budget and the large sample size. The convenience sampling's primary purpose is for researcher to be easily accessible to collect respondent's information (Etikan, Musa, & Alkassim, 2016).

The questionnaires have been distributed and it contain 3 sections which is section A that present about demographic profile of respondent, Section B the theory of planned behaviour (attitude, subjective norm and perceived behavioural control) and Section C is about behaviour in online shopping among UMK's student. The respondents were asked to respond this online questionnaire by using 5 points Likert Scale ranging from 1 (strongly disagree), 2 (disagree), 3 (neutral), 4 (agree) and 5 (strongly agree).

4 Analysis and Discussion

4.1 Demographic Profile of Respondent

Table 1: Demographic Profile of Respondent

	n	%		n	%
<u>Gender</u>			<u>Age</u>		
Male	125	34.6	Below 20 years old	86	23.8
Female	236	65.4	21 – 30 years old	267	74.0
			31 – 40 years old	8	2.2

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

<u>Race</u>					
Malay	247	68.4	<u>Year</u>		
Chinese	69	19.1	Year 1	21	5.8
Indian	37	10.2	Year 2	29	8.0
Others	8	2.2	Year 3	87	24.1
			Year 4	224	62.0
<u>Faculty</u>					
FKP	286	79.2	<u>Platform</u>		
FHPK	75	20.8	Online Shopping Application	242	67.0
			Online Shopping Website	39	10.8
			Social Media	80	22.2
<u>Frequency</u>					
Daily	20	5.5			
Weekly	93	25.8			
Monthly	232	64.3			
Annually	16	4.4			

Table 1 show the demographic profile of respondent. There are 361 respondents. Firstly, this result shows female have higher percentage which are 65.4% (n = 236) compared to male that only have 34.6% (n = 125). Secondly, the researcher obtained that the lowest group age of respondents aged between 31 till 40 years old which are 2.2% (n = 8). The respondents that are aged below 20 years old are 23.8% (n = 86). The highest group age of respondents aged between 21 till 30 years old which are 74% (n = 268). Thirdly, the highest respondents are Malay which are 68.4% (n = 247). The respondents are Chinese which recorded 19.10% (n = 69). The respondents are Indian which are 10.2% (n = 37). The lowest respondent's race were others which are 2.2% (n = 8). Thirdly, most of the respondents are in Year 4 which have 62.0% (n = 224). The respondents are in Year 3 which have 24.1% (n = 87). The respondents are in Year 2 which have 8.0% (n = 29). The least respondents are in Year 1 which have 5.8% (n = 21). Fourthly, the highest respondents are from FKP which are 79.2% (n = 286), meanwhile the respondents from FHPK has lowest number which are 20.8% (n = 75). Fifthly, the highest platform that preferred by the respondents is online shopping application which are 67.0% (n = 242). Its followed by social media which are 22.2% (n = 80). The lowest platform that preferred for online shopping by the respondents is online shopping website which are 10.8% (n = 39). Lastly, the most frequency for online shopping among the respondents is monthly which are 64.3 (n = 232). The frequency is weekly which are 25.8% (n = 93). The frequency is daily which are 5.5% (n = 20). The least frequency is annually which are 4.4% (n = 16).

4.2 Reliability Test

Table 2: Results of Reliability Cronbach's Alpha for The Variables.

Variables	Number of Items	Cronbach's Alpha
Entrepreneurial Attitude	5	.861
Subjective Norm	5	.770
Self-Efficacy	5	.798
Social Entrepreneurship Activities Intention	5	.780

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

The table 2 show the value of Cronbach's Alpha of the variables in the questionnaires. All of the variables are being accepted after tested as the level of acceptance requirement is the value must exceed 0.70. Firstly, the independent variable that is attitude is acceptable for the reliability (5 items; $\alpha = 0.861$). Next, the independent variable that is subjective norm also is acceptable for the reliability (5 items; $\alpha = 0.770$). After that, the independent variable that is perceived behavioural control is acceptable for the reliability (5 items; $\alpha = 0.798$). Lastly, the dependent variable that is behaviour in online shopping also acceptable for the reliability (5 items; $\alpha = 0.780$).

4.3 Descriptive Analysis

Table 3: Descriptive Statistics

Variables	N	Mean	Std. Deviation
IV: Attitude	361	4.1967	.66899
IV: Subjective Norm	361	4.2310	.59845
IV: Perceived Behavioural Control	361	4.2086	.60987
DV: Behaviour in Online Shopping Among UMK's Student	361	4.4454	.52019

The researcher also carried out the descriptive analysis for the independent variables. The highest mean among the independent variable was subjective norm which was 4.2310 strongly agreed compare the other independent variable. Next, attitude mean is 4.1967, perceived behavioural control 4.2086 which both are strongly agree. Lastly, the mean of behaviour in online shopping among UMK's student is 4.4454 which is strongly agree too.

4.4 Hypothesis Testing

The researchers applied the Spearman Correlation Analysis for the hypothesis testing for determining the relationship between the independent variables and dependent variable which are attitude, subjective norm, perceived behavioural control and behaviour in online shopping. Spearman Correlation Analysis measure the degree of association between variables based on their ranks and abnormal distribution between the variables.

4.4.1 Relationship Between Attitude And Behaviour In Online Shopping Among Umk's Students.

Table 4: Spearman's Correlation Between Attitude and Behaviour in Online Shopping Among UMK's Student

Correlation Coefficient (r)	Significant Value (p)	Frequency (n)
0.584**	0.000	361

**Correlation is significant at the 0.01 level (2-tailed)

Based on the table 4, it shows the r value for attitude and behaviour in online shopping among UMK's student. There is positive significant relationship between attitude and behaviour in online shopping among UMK's student, ($p < 0.05$, $r = 0.584$). So, the theory between the variables are accepted. Then, the correlation coefficient is interpreted as moderate positive correlation between attitude and behaviour in online shopping among UMK's student. Therefore, the hypothesis 1 is accepted.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Hypothesis 1: There is a significant relationship between attitude and behaviour in online shopping among UMK's student.

4.4.2 Relationship Between Subjective Norm And Behaviour In Online Shopping Among Umk's Student.

Table 5: Spearman's Correlation Between Subjective Norm and Behaviour in Online Shopping Among UMK's Student

Correlation Coefficient (r)	Significant (p)	Frequency (n)
0.310**	0.000	361

**Correlation is significant at the 0.01 level (2-tailed)

Based on the table 5, it shows the r value for subjective norm and behaviour in online shopping among UMK's student. There is positive significant relationship between subjective norm and behaviour in online shopping among UMK's student, ($p < 0.05$, $r = 0.310$). So, the theory between the variables are accepted. Then, the correlation coefficient is interpreted as low positive correlation between subjective norm and behaviour in online shopping among UMK's student. Therefore, the hypothesis 2 is accepted.

Hypothesis 2: There is a significant relationship between subjective norm and behaviour in online shopping among UMK's student.

4.4.3 Relationship Between Perceived Behavioural Control And Behaviour In Online Shopping Among Umk's Student.

Table 6: Spearman's Correlation between perceived behavioural control and behaviour in online shopping among UMK's student.

Correlation Coefficient (r)	Significant (p)	Frequency (n)
0.606**	0.000	361

**Correlation Coefficient is significant at the 0.01 level (2-tailed)

Based on the table 6, it shows the r value for perceived behavioural control and behaviour in online shopping among UMK's student. There is positive significant relationship between perceived behavioural control and behaviour in online shopping among UMK's student, ($p < 0.05$, $r = 0.606$). So, the theory between the variables are accepted. Then, the correlation coefficient is interpreted as moderate positive correlation between perceived behavioural control and behaviour in online shopping among UMK's student. Therefore, the hypothesis 3 is accepted.

Hypothesis 3: There is a significant relationship between perceived behavioural control and behaviour in online shopping among UMK's student.

4.5 Discussion of Findings

These are the findings of this research. Firstly, one of the research objectives which is to determine the relationship between attitude and behaviour in online shopping among UMK's student has been successfully achieved. In addition, as one of the research questions which is "Is there any significant relationship between attitude and UMK's student?" has been answered through this research. It has been answered by the hypothesis 1 "There is a significant relationship between attitude and behaviour in online shopping among UMK's student" and it concluded that hypothesis 1 is accepted. An individual's attitude toward a certain behaviour is the degree to which a person has a favourable or unfavourable evaluation of the behaviour.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Ajzen and Fishbein (1980) insisted that the attitude multiplied by the measurement of each outcome was the sum of each behavioural belief. The subjective likelihood arising from a certain action is behavioural beliefs.

Secondly, one of the research objectives which is to identify the relationship between subjective norm and behaviour in online shopping among UMK's student has been successfully achieved. In addition, as one of the research questions which is "Is there any significant relationship between subjective norm and UMK's student?" has been answered through this research. It has been answered by the hypothesis 2 "There is a significant relationship between subjective norm and behaviour in online shopping among UMK's student" and it concluded that hypothesis 2 is accepted. Personal understanding of actions that is affected by other people is a subjective norm (Ajzen & Fishbein, 1980; Fishbein & Ajzen, 1975). People prefer to carry out the behaviour if they believe that the behaviour is accepted by people who are important to them. Ajzen and Fishbein (1980) clarified that a subjective standard is a sum of moral values and the motivation of each person to comply.

Thirdly, one of the research objectives which is to examine the relationship between perceived behavioural control and behaviour in online shopping among UMK's student has been successfully achieved. In addition, as one of the research questions which is "Is there any significant relationship between perceived behavioural control and UMK's student?" has been answered through this research. It has been answered by the hypothesis 3 "There is a significant relationship between perceived behavioural control and behaviour in online shopping among UMK's student" and it concluded that hypothesis 3 is accepted. According to France Harden-Fanning, JaNelle M. Ricks (2016) perceived behavioural control is related to perceived ability to change behaviour within the context of perceived barriers. It also determined intention to provide a framework for assessment of individual strengths and barriers to behavioural change.

5 Conclusion and Future Research

5.1 Implication of Study

Firstly, the finding of this research can help the researcher and consumer who are students of University Malaysia Kelantan to understand more about their attitude, subjective norm and perceived behavioural control towards behaviour in online shopping. Then, the finding of this research also can make the researcher and consumer realized and aware about their consumer behaviour. They also can plan and controlling their online shopping activity.

Secondly, the finding of this research can contribute towards UMK in term of behaviour of the student. As the researcher study about the theory planned behaviour (TPB) which is this theory can be applied in various activity such as management of student, academic and cocurricular activity. UMK can utilize this study to get know about attitude, subjective norm and perceived behavioural of the students. UMK can use the data to plan and organized the activity of university that especially activity that involving student.

Thirdly, the finding of this research can provide the useful information towards retailers and retail industry who are targeting UMK's student as their target market. They can exploit the data of theory plan behaviour (TPB) which are attitude, subjective norm and perceived behavioural control of UMK's student. These are example of TPB's function such as information of product that can fulfil need and want of UMK's student, platform that preferred by UMK's student for online shopping and planning promotion for their business.

5.2 Recommendation for Future Research

There are several recommendations that can be used for future research. All of these recommendations are based and related to the limitation of study and the knowledge of the researcher that conducting this research that title is "Exploring the Theory Planned Behaviour Towards Behaviour in Online Shopping Among UMK's Student".

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Firstly, the researcher would like to recommend the future research to extent the sample size. In this research, the researcher was only focusing on the sample size from UMK's student. For the future research, other researcher can extent the sample size by taking IPT's student that will provide a bigger respondent as the population of IPT's student are larger than UMK's student. So, it can contribute in discovering behaviour in online shopping among IPT's student.

Secondly, the researcher would like to suggest the future research to apply other theory to study the relationship with behaviour in online shopping. As the rapid growth of online shopping recently, this topic of research will be crucial for consumer and retailer. Other researchers can explore other theory such as technology acceptance model that can relate with behaviour in online shopping.

Lastly, the researcher recommends the future research to extent the platform of distributing questionnaire. The pandemic of Covid-19 caused the researcher to only rely on Google Form as it is the easiest and less cost method in distributed the questionnaire. Other researchers can use other platform that have high potential of engagement with the targeted respondents such as social media. So, the data that will be obtain for future research will be more accurate in general.

5.3 Conclusion

In conclusion, the researcher succeeding on conducting this research which is to explore the theory planned behaviour (TPB) towards behaviour in online shopping among UMK's student. The researcher also able to achieve the purpose of this research which is to determine the relationship between attitude, subjective norm and perceived behavioural control toward behaviour in online shopping among UMK's student.

The outcome of this research such as writing, data collecting and data analysis have been proven reliable by conducting various of test. It proven to be true by the independent variables that are attitude, subjective norm and perceived behavioural control have positive significant relationship towards behaviour in online shopping among UMK's student. In addition, this data is based on Spearman's correlation analysis.

Lastly, exploring the theory planned behaviour (TPB) towards behaviour in online shopping among UMK's student contributing in helping to understand consumer behaviour. This research can provide useful information to retailer and retail industry in understanding consumer behaviour that can improve their relationship with the consumer. In term of consumer, they will be able to aware of their behaviour that can make them be a good and smart consumer in their buying through online or physical shopping.

Acknowledgement

First of all, praises and thanks to the God Almighty for be able to finish this proposal of final year research project. After blood, sweat and tears I managed to complete this research successfully and I feel proud for myself.

I want to thanked to my supervisor Encik Md Zaki Bin Muhamad Hasan I'm always inspired for her diligent, encouragement, compassion, polite and optimistic as well as her endless spirit in helping in to complete this research.

Then, I am glad because having a supportive girlfriend and friends. Thank you so much for supporting for me to keep motivated and all the warm words for me to finish this research.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Thank you for the guidance by sharing the ideas, keep me being positive and the precious emotional support. They are the root of my victories.

Last but not least, I would like to thank to my University Malaysia Kelantan for the support in term of providing the facilities such as library for me find the articles, journal and more for me and this research.

Abstract:

This paper aims to identify the factors affecting Gen-Z consumers in Malaysia towards selection decision to consume fast fashion. This study was conducted with a quantitative approach with data collection from 384 respondents in Malaysia. The results were investigated with descriptive analysis, reliability tests, frequency tests and correlation analysis. This research shows significant findings that all independent variables including fashion awareness, perceived price, perceived quality, hedonic shopping value and brand consciousness have a positive influence on the selection results to adopt fast fashion. This research contributes to the rapid field of fashion industry by highlighting the greatness of these factors related to some of the special features of Gen-Z.

Keywords: *fast fashion, fashion awareness, perceived price, perceived quality, hedonic shopping value and brand consciousness.*

1 Introduction

Fashion industry is often associated with beauty, luxury and even popularity. But despite all that, fashion industry has played an important and vital role in the economic growth of a country. While many critics label fashion as a proponent of hedonism, but fashion industry contributes to the growth of gross domestic product (GDP). Fashion industry is one of the interdependent economic sub-networks including logistics, manufacturing, retail and more. In Malaysia, from 2006-2010, the industry contributed RM 9.9 billion in total exports of manufactured products (MITI, "Laporan Perdagangan Antarabangsa dan Industri Malaysia", 2011).

France, Italy, United Kingdom (UK), United States (US) and Japan are among the world fashion hubs that have a huge influence on the development of fashion around the world (Research, 2009). Big names of fashion week such as Milan Fashion Week, London Fashion Week and Paris Fashion Week are indeed the dream of designers and fashion fans around the world to be in the event. In addition to glamour and full charm, medium-level fashion is also a witness in making fashion contracts that use millions of ringgit. Now many countries have given tremendous opportunities and justifications to the fashion industry.

Price Waterhouse Coopers in its report Strong & Steady (2011): Outlook for the Retail and Consumer Sector in Asia, expects the growth of the fashion sector in Asia to continue to soar to more than 5% in 2012 (PWC, 2010). Now, China's open door policy provides greater

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

opportunities for the fashion industry to continue to thrive. The wise decision made by China in 2001 to join the World Trade Organization (WTO) has prompted China to become a fashion leader in Asia. The value of the industry in 2001-2004 alone amounted to more than USD 61.96 billion. In the report *Glimmers Amid The Gloom: An Outlook for the Retail and Consumer Products Sector in the New Market*, sales value for the fashion industry in 2008 alone was worth more than USD 33 billion (PWC, 2010).

The rapid development of the regional fashion industry has actually led to the development of the fashion industry in Malaysia. However, Malaysia divides the textile and clothing sub-sectors into the fashion industry. Euromonitor.com reports that the clothing segment in Malaysia is still dominated by international brands. From 1996 to 2005, the total investment earned by the fashion industry amounted to RM 4.9 Billion which is RM 4.1 billion contributed by the textiles sub-sector and another RM 852.5 million contributed by the clothing sub-sector.

This study will help retailers understand the perceptions and emotions of gen-z about the products they offer, how they see and value the brand. Then based on that, the brand management division seeks strategies to enhance their image along with the experience provided by their brand for gen-z and then develop brand strength in the minds of this younger generation.

Research Objectives

The objectives of this research are to determine the relationship between independent variables and selection decision to consume fast fashion.

Significance of the Study

Vital results of this research could be highly significantly and beneficial especially to the fast fashion retailers or traders. By knowing what is the factors that affect Gen-Z consumers, fast fashion retailers or traders can adjust goods and services that they offer suitable to the factors that been studied in order to further increase their sales, profits and help the industry to produce a good quality and safe environment products.

The government can also help the fashion industry in Malaysia through the exposure of factors done in this study. The government can formulate a number of actions that can help Gen-Z consumers in dealing with problems such as management, selection and purchase of customized products from fast fashion stores.

Gen-Z consumers who are the age range of students can be given exposure to the pros and cons of fast fashion products. They can understand more about fast fashion products. For the researchers, this study will help uncover future problem or critical areas regarding this topic, which is selection decision to consume fast fashion that most of local researchers do not explore.

2 Literature Review

1) Fast Fashion

Fast fashion defined from the perspective of business concept as a strategy that aims to reduce the levels included in the buying cycle and lead time. The previous fast fashion objective was to introduce a new collection of clothing into the store as soon as possible to meet the highest

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

consumer demand (Barnes, “Fast fashioning the supply chain: shaping the research agenda”, 2006). Fast fashion refers to a business strategy that reflects a rapid response to emerging trends by improving design and product range quickly to increase product value and demand for short-cycle fashion products (Sull, 2008) (Choi, 2010).

2) Fashion Awareness

Knowledgeably on fashion of consumers adapt to the latest trends in clothing that can be seen as strategic consumers. The more they are interested in fashion, the more they will look for fashion-related information. Compared to others, fashion awareness customers spend more time shopping and finding fresh items (Eastman, 2010). In addition, fashion brands are rapidly introducing new collections in a minimum of three to five weeks by adding five mid-seasons to the fashion calendar. According to Colucci and Scarpi (2013), people in Gen-Z are more willing to try new things, materialistic and easily accept new products than others (Scarpi, 2013).

3) Perceived Price

The perceived price is considered a subjective explanation of the value of the product, to examine whether the price is cheap or expensive. Prices are considered a reflection of costs and in marketing, prices play an important role in gaining customer attention and are also used as a tool to convey some messages to consumers about product and brand perceptions. Moreover, it can influence the consumer decision-making process (Erdil, 2015). Moreover, Gen-Z consumers are less aware of prices and tend to spend more money in stores than other age groups (Scarpi, 2013). Roberts and Manolis (2000) found that the younger generation is more likely to associate higher prices with better quality and value (Manolis, 2000).

4) Perceived Quality

Define as consumer evaluation of overall differences or advantages of products (Zeithaml, 1988). According to Snoj (2004), consumers often compare the specific performance of a brand in general and a product in particular with their expectation that, as a result, it creates a perception of quality (B. Snoj, 2004). The perceived quality results in a beneficial purchase value and is spiritually stimulated to repurchase at a later time (B. J. Babin, 1994). If consumers are aware of the true value of the product and feel the brand offers the right character, quality and performance benefits similar to the ads, they will intend to purchase this particular brand. Products in good quality will be highly valued and linked to the reputation of a particular brand, so it is a great advantage to compete with other competitors in the market (Yoo, 2000).

5) Hedonic Shopping Value

Shopping is sometimes considered an entertaining activity and allows people to be in a happy atmosphere. This value refers to hedonic spending (D. N. Bellenger, 1976). It is interesting to note that hedonic value allows users to experience the advantages of the product without buying it. Overall, hedonistic consumers do not feel that shopping is a waste of time. In addition, they gain enthusiasm through the task of spending, often by buying something fresh and different. Gen-Z consumer was found to be prone to hedonism and enjoyed the pleasure of buying new goods (Scarpi, 2013).

6) Brand Consciousness

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

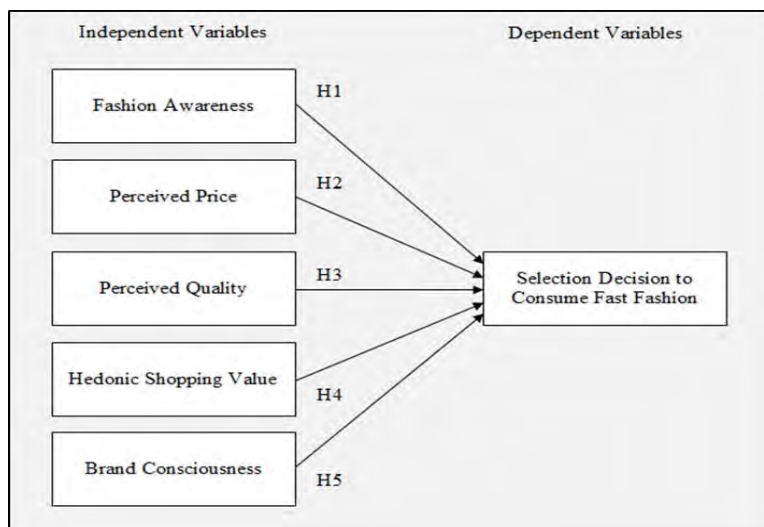

Brand conscious is the notion that branding plays an important role in the psychological process that precedes buying action (M. J. Lachance, 2003). These consumers also like to buy famous and well-known brand clothes. There are several studies that determine the positive relationship between brand conscious and purchasing intention, for example, on luxury products among Gen-Z customers (Lee, 2011). According to Kwan and Yeung (2004), when compared to others, consumers who have a brand have a tendency to buy international brands that are famous for expensive and stylish clothes (C. Y. Kwan, 2004). Further, Gen-Z consumers were found to be not only brand conscious but also innovative (Aghasibeig, 2008).

Research Hypothesis

- 1) H1: Fashion awareness has a positive impact on the selection decision to consume fast fashion by Gen-Z consumers.
- 2) H2: Perceived price has a positive impact on the selection decision to consume fast fashion by Gen-Z consumers.
- 3) H3: Perceived quality has a positive impact on the selection decision to consume fast fashion by Gen-Z consumers.
- 4) H4: Hedonic shopping value has a positive impact on the selection decision to consume fast fashion by Gen-Z consumers.
- 5) H5: Brand consciousness has a positive impact on the selection decision to consume fast fashion by Gen-Z consumers.

Research Framework

In this study, conceptual framework is designed based on the models that adaptation by previous studies. This is to identify variable of factors that affecting selection decision to consume fast fashion among Gen-Z consumers.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

3 Methodology

Research Design

The research design for this research is quantitative descriptive which is investigate by collecting data as it relates to the factors that affecting Gen-Z consumer selection decisions to consume fast fashion that coming from different race, age, gender, income and occupation. A questionnaire will be used to collect the data from Gen-Z consumer that selection decisions to consume fast fashion answering the question made by the researcher through mass media platform. This study may help the researcher to understanding the characteristics of a group especially in Malaysia and the factor Gen-Z consumer selection decisions to consume fast fashion. Researcher also can help to make certain decision (Sekaran, 2013). The researcher choose Gen-Z consumer that consume fast fashion in Malaysia as places that researcher's study about the factors that affecting Gen-Z consumer selection decisions to consume fast fashion.

Data Collection

The data of the research is using primary data. The primary data is originally collected through the questionnaire that divided into 7 parts, that made by the researcher. The validity and reliability of questionnaire is tested to show that the questionnaire is related with the concept and answering the objective which is using reliability coefficients that will indicates just how fit the questionnaire with the research. The data collection of this research is using quantitative method by collecting data as it relates to the factors that affecting Gen-Z consumer in Malaysia towards selection decisions to consume fast fashion.

Sampling

Sample is a set of members selected from a population that usually represent the population in a research analysis (Frederick J. Gravetter, 2016). The sample size for the research study was appropriate with the data collection to obtain a good analysis outcome. The research conducted based on the selected place which is in Malaysia. Sample size was selected wisely because the sampling influenced the accuracy of the data (Salkind, 2003). One of the most widely used methods in achieving sample size is the Krejcie and Morgan Sampling Method. To simplify the process of determining the sample size for a finite population, (Morgan K. a., 1970), created a table using the sample size formula for a finite population. In this research, the researcher choosing the sample size which was randomly consisting of 384 Gen-Z consumers that choose to consume fast fashion as respondents.

Data Analysis

Table 1: Result of Reliability Test for Independent Variable and Dependent Variable

Variables	Cronbach's Alpha	Number of Items
Selection Decision to Consume Fast Fashion	0.797	6
Fashion Awareness	0.718	6
Perceived Price	0.775	6
Perceived Quality	0.740	6
Hedonic Shopping Value	0.805	6
Brand Consciousness	0.820	6

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

Total	0.931	36
--------------	--------------	-----------

Based on the Table 1, show that the reliability tests conducted on each variable to test the validity and reliability of questionnaire. The Cronbach's alpha value needs to be more than 0.700 is considered as acceptable, to continue actual data collection for research. For the dependent variable that is Selection Decision to Consume Fast Fashion is 0.797. Next the first independent variable that is Fashion Awareness is 0.718 and the second independent variables that is Perceived Price is 0.775. The third independent variable that is Perceived Quality is 0.740 and the fourth independent variables that are Hedonic Shopping Value are 0.805. The last independent variables that are Brand Consciousness are 0.820 and the total value for all variables is 0.931. This thus shows that each variable is acceptable for the study conducted.

Table 2: Summary Profile of Respondents

Items	Labels	Frequency	Percentage (%)
Age (Years)	10 - 14	17	4.4
	15 - 19	88	22.9
	20 - 24	279	72.7
Gender	Male	158	41.1
	Female	226	58.9
Race	Malay	268	69.8
	Chinese	72	18.8
	Indian	39	10.2
	Arab	4	1.0
	Bugis	1	0.3
Status	Single	357	93.0
	Married	27	7.0
Employment Status	Employed (Full Time)	52	13.5
	Employed (Part Time)	68	17.7
	Unemployed	264	68.8
Income (RM)	0 - 1000	298	77.6
	1100 - 2000	63	16.4
	2100 - 3000	19	4.9
	3100 - 4000	4	1.0

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

Total	384	100
--------------	------------	------------

Based on Table 2, show the frequency and percentage of frequency test results performed on the study respondents in the demographic section. Test results at the age of 10 to 14 years showed a total of 17 respondents representing 4.4% of the total respondents of the study. At the age of 15 to 19 years showed a total of 88 respondents representing 22.9% of the total respondents of the study. At the age of 20 to 24 years showed a total of 279 respondents representing 72.7% of the total study respondents. The majority of responding age groups were in the 20 to 24 age group representing the Gen-Z age group.

Test results for male gender showed a total of 158 respondents representing 41.1% of the total respondents of the study. For female gender showed a total of 226 respondents representing 58.9% of the total respondents of the study. The majority of the genders answering were females representing the Gen-Z gender.

Test results for Malay race showed a total of 268 respondents representing 69.8% of the total respondents of the study. For Chinese race showed a total of 72 respondents representing 18.8% of the total respondents of the study. For Indian race showed a total of 39 respondents representing 10.2% of the total study respondents. For Arab race showed a total of 4 respondents representing 1.0% of the total study respondents. For Bugis race showed a total of 1 respondents representing 0.3% of the total study respondents. The majority of race who answer are Malays, followed by Chinese and Indian, which represents the race's Gen-Z.

Test results for single status showed a total of 357 respondents representing 93.0% of the total respondents of the study. For married status showed a total of 27 respondents representing 7.0% of the total respondents of the study. The majority of status respondents were single representing Gen-Z status, most likely students.

Test results for full-time employer showed a total of 52 respondents representing 13.5% of the total respondents of the study. For part-time employer showed a total of 68 respondents representing 17.7% of the total respondents of the study. For unemployed status showed a total of 264 respondents representing 68.8% of the total study respondents. The majority of employment status respondents were unemployed representing Gen-Z employment status, most likely students.

Test results at the income of RM0 to RM1000 showed a total of 298 respondents representing 77.6% of the total respondents of the study. At the income of RM1100 to RM2000 showed a total of 63 respondents representing 16.4% of the total respondents of the study. At the income of RM2100 to RM 3000 showed total of 19 respondents representing 4.9% of the total study respondents. At the income of RM3100 to RM 4000 showed a total of 4 respondents representing 1.0% of the total study respondents. The majority of incomes that answer are in the range of RM0 to RM1000 which represents Gen-Z income, which is likely to be students and unemployed.

Table 3: Descriptive Statistic for Each Variable

Variables	N	Mean	Std. Deviation
Dependent Variable (DV)	384	4.1117	0.8174
Independent Variables (IV1)	384	3.3911	0.8368
Independent Variables (IV2)	384	4.1645	0.7893

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

Independent Variables (IV3)	384	4.1129	0.8539
Independent Variables (IV4)	384	4.1832	0.8013
Independent Variables (IV5)	384	3.6263	0.7685

Based on Table 3, show descriptive analysis has been conducted on each variable. For dependent variable (DV) shows the mean is 4.1117 and standard deviation is 0.8174. For independent variable (IV1) show the mean is 3.3911 and standard deviation is 0.8368. For independent variable (IV2) show the mean is 4.1645 and standard deviation is 0.7893. For independent variable (IV3) show the mean is 4.1129 and standard deviation is 0.8539. For independent variable (IV4) show the mean is 4.1832 and standard deviation is 0.8013. For independent variable (IV5) show the mean is 3.6263 and standard deviation is 0.7685.

Table 4: Spearman Correlation between Independent Variables and Dependent Variable

Variables	Means	DV	IV1	IV2	IV3	IV4	IV5
DV	4.1117	1	0.440**	0.846**	0.778**	0.743**	0.614**
IV1	3.3911	0.440**	1				
IV2	4.1645	0.846**		1			
IV3	4.1129	0.778**			1		
IV4	4.1832	0.743**				1	
IV5	3.6263	0.614**					1

Based on Table 4, show spearman correlation between independent variables and dependent variable and there is a positive significant relationship between dependent variable which is Selection Decision to Consume Fast Fashion and independent variables which is Fashion Awareness ($p < 0.05$, $r = 0.440$), Perceived Price ($p < 0.05$, $r = 0.846$), Perceived Quality ($p < 0.05$, $r = 0.778$), Hedonic Shopping Value ($p < 0.05$, $r = 0.743$) and Brand Consciousness ($p < 0.05$, $r = 0.614$).

4 Discussion & Recommendation

All five factors are Fashion Awareness, Perceived Price, Perceived Quality, Hedonic Shopping Value, and Brand Consciousness, positively influencing Gen-Z selection decision for fast fashion products. Among them, Perceived Price is the most important factor that has a positive impact on selection decision. Buying merchandise during the promotion period creates the feeling of earning a good purchase and saving more money. These findings show that Gen-Z is also very interested in the prices offered from fast fashion products especially during promotions.

Second, from the results of this research, Perceived Quality is the second most significant influence on selection decision. Moreover, Gen-Z is considered a potential consumer of the fast fashion industry. These findings prove that they are fans of new styles and quality latest trends. These buyers pay more for the quality of new and stylish clothes to look stylish. It can be proved that compared to others, the younger generation has a strong desire to try to define themselves through their views.

Third, Hedonic Shopping Value is the third factor that significantly has a positive impact on Gen-Z

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

selection decision for fast fashion products. This shows that the store environment is very attractive to consumers which influences the way consumers view product quality. Moreover, Gen-Z usually considers shopping as an adventure to explore something new, so the attractive store environment gives curiosity to consumers to explore the beauty in it and create the intention to enter and buy fast fashion products.

Finally, based on the results of research, there is some recommendation that fast fashion retailers might consider useful and pay more attention to attracting their potential consumers. Because consumers think that the discount price in the promotion program is lower than the regular price, they feel that they spend the same amount of money but can buy more goods than usual. The higher the liking for promotional tools, the higher the likelihood that consumers will come and buy fast fashion products. Therefore, it is recommended that fast fashion retailers should offer promotions in special occasions such as, Big Opening Day, Christmas, New Year's Eve and more, to get the attention of consumers and encouraging buying behaviour. Moreover, promotion can be implemented in various forms. For example, a discount or free sample on the big opening day such as vouchers or coupons after the transaction to encourage consumers to buy again at a later time. By offering attractive promotional strategies, it can help retailers to maximize profits and expand their image in the minds of consumers.

Attractive and stylish style plays an important role in Gen-Z thinking. It is important to update the product range more frequently with new items according to the latest trends every few weeks. In addition, retailers should focus on different designs, materials, colours, sizes and purposes in their collections. Consumers are always looking for new fashion trends by looking at catalogues, people outside, on public displays, on social media, reading fashion magazines, or word of mouth from their friends and colleagues. Therefore, the introduction of the hottest trends and the latest collections should cover all the channels mentioned above to maximize their effectiveness.

The attractive store environment also increases the intention to buy fast fashion products in the minds of Gen-Z consumers. Fast fashion retailers should consider the light, scent, cleanliness and interior of their store to enhance the curiosity of Gen-Z. Lighting creates an attractive atmosphere for visitors and also enhances the appearance of clothing. In addition, the pleasant aroma in the store is a factor that also gives the first impression to the consumer. Store items should be neatly arranged and easy to see for Gen-Z users to explore and try. In addition, managers should pay attention to the cleanliness of the store environment as it represents the first picture of the brand to the buyer and motivates them to visit again. It is also recommended to play music so that users feel comfortable in a fast fashion store.

5 Conclusion

This research achieves the objective to identify the factors that influence the selection decision of Gen-Z for fast fashion products in Malaysia. By using quantitative research methods along with conducting reliability tests, correlation analysis, normality tests and several other tests, the study confirmed that there is a positive relationship between independent variables and dependent variables. The sample of this study is 384, most of which are concentrated in Malaysia, considered good according to (Lee A. L., 1992). However, due to time constraints and undesirable geographical conditions, this research is still limited and does not represent the entire Gen-Z population in Malaysia. It is recommended that future studies base their study based on the results obtained from this research and increase the sample to be larger to get better and more accurate results. Finally, among the five independent variables that influence Gen-Z selection results for fast fashion products, all variables represent Gen-Z's distinctive features namely Fashion Awareness, Perceived Prices, Perceived Quality, Hedonic Shopping Value, and Brand Awareness. While conducting future research, it is advisable to look for more determinants related to Gen-Z features in order to be more valuable. While there are still some limitations, this study combines the views from the minds of Gen-Z consumers and explores the many useful factors that must be taken into account by fashion retailers in Malaysia or have plans to enter the Malaysian market in the future.

Universiti Malaysia Kelantan,
Malaysia

[Email : hafiszudin.a17a0232@siswa.umk.edu.my](mailto:hafiszudin.a17a0232@siswa.umk.edu.my); noorhazila.nm@umk.edu.my

Abstract:

E-business is an online business where it uses the internet as an intermediate medium between the seller and the buyer. Electronic business (e-business) is also a business method that allows a person to trade over the internet or ICT. In addition, the concept of internet business is not much different from conventional business. Traders still need products for sale and need customers to buy. Therefore, this study is to determine the factors that influence the implementation of e-business in Malaysia. The sample size of this study was 384 respondents, mainly focused on the community in terms of traders and retailers in Malaysia. In this analysis, non-probability sampling, which is a purposive method of sampling, has been introduced to allow researchers to collect respondents fast and effectively as the population of the target respondent is high. Descriptive analysis, Pearson Correlation Analysis and Multiple Linear Regression Analysis were used to analyse the findings of the research. This result explains that with the dependent variable with the value of, all the independent variables are significant ($p < 0.05$). In addition, the COVID-19 pandemic with a value of ($p < 0.05$), ($b^b = 0.589$) is the most dominant variable in the analysis. Therefore, this study and results would also assist consumers to effectively implement e-business and provide useful references for researchers interested in developing related theories.

Keywords: *E-business, COVID-19 pandemic, consumer behaviour, internet connection and cost management.*

1 Introduction

E-business is characterised by the use of the internet and computer technology as the process of doing business (Hertwig, 2012). This is an online operation that provides workers, suppliers and consumers with value development as its main objective (Lai, Kan, & Ulhas, 2013). More consumers today prefer online shopping than traditional supermarkets because it is a technological change. Nowadays, consumers are becoming an important element they buy through online. Electronic business (e-business) is also a method of business that enables a person to trade over the internet or ICT. Furthermore the concept of internet business is not so different from traditional business. Traders still need products for sale and need customers to buy. According to Rahman et al. (2013) this asserts by saying that the technology that surrounds us today and in the near future is undergoing a significant, rapid and universal change that has a significant impact on the world in which we live and our daily lifestyle. In addition, these developments can also be seen through the use of e-businesses in Malaysia that have changed

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

the business approach used by small and large companies.

E-commerce terms are often used alternately with e-business terms (Meftah, Gharleghi, & Samadi, 2015). This is supported by Almousa (2011) online companies are also known as e-businesses, which are sold directly on the internet by all entrepreneurs and sell their goods. Before making a purchase, items that do not need to be discussed or seen by consumers suit the ecommerce business model, as well as products that can be sold online at a much cheaper price than in the shop. Internet marketing can be used by e-businesses to spread the word about their businesses and goods, but they can also use more conventional methods (Hashim, Razak, & Amir, 2011). These e-business approaches would help companies work closely to suppliers and partners to better meet the needs and desires of their customers at the same time. This is because there is a justification for the group in Malaysia to affect the implementation of e-business.

Besides, the purpose of this study is to determine the variables that affect e-business implementation. Therefore, this study is to examine the relationship between the independent variables that is COVID-19 pandemic, consumer behaviour, internet connection and cost management towards the implementation of e-business in Malaysia. In addition, this study also to identify the dominant association which the factors influence (COVID-19 pandemic, consumer behaviour, internet connection and cost management) the implementation of e-business in Malaysia.

2 Literature Review

2.1 Technology Acceptance Model (TAM) Theory

The Technology Acceptance Model is formulated to further develop behaviour to magnify knowledge about new technologies. The most influential and widely accepted TAM theories explain the acceptance of the information system by an individual. The Technology Acceptance Model (TAM) has been used by researchers around the world to understand the acceptance of different types of data systems (Reynel-Avila, Mendoza-Castillo, Olumide, & Bonilla-Petriciolet, 2016). The process of adopting IT within the organization is an easy process and takes time to succeed (Wang, Jin, & Mao, 2019). There are several models related to IT acceptance and acceptance (Samarasinghe & Silva, 2019). TAM consists of two significant variables that decide attitudes towards the usage and use of this technology, perceived ease of use and perceived usability (Sutomo, Rahman, & Romli, 2020). In the theory of the expanded TAM model, there are additional factors, namely enjoyment, so that the extended TAM has three factors, namely ease of use, usability, and perceived pleasure (Cho & Son, 2019).

Diffusion of Innovation Theory (DOI) Theory

The theory of DOI is a comprehensive framework that aims to explain the social aspects and relationships of innovation in dissemination and how it occurs in the social system over the time. According to Dwivedi, Papazafeiropoulo, Parker, and Castleman (2009) in e-business literature, he is the author of the most widely cited theory of distribution, although e-business is not explicitly discussed. The four key elements regulating the acceptance rate of innovation, which are innovation, social systems, communication networks and time, are illustrated in this report. In the context of DOI, the concept of a technology cluster would explain e-business more precisely than innovation, as it can be used for various business applications such as sales, payments, acquisitions, employee pickup, online banking and delivery of online services (Parker & Castleman, 2007). One important thing to note about the e-business literature is that it mainly applies the features of DOI innovation which are relative advantages, harmony, difficulty, reliability and observation (Chong, 2006). The use of e-business analysis indicates

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

that individual outcomes processes are more important to small businesses because owners are often the key decision-makers (Dwivedi et al., 2009). This method often includes gaining awareness and basic information about innovation, developing a bad attitude (possibly influenced by opinion leaders), agreeing to use it partially or on probation, fully implementing innovation, and then checking whether the decision is acceptable.

2.3 Previous Studies

2.2.1 COVID-19 Pandemic

Coronavirus is considered one of the infectious diseases that arise mostly after human beings are infected with acute respiratory problems syndrome. Because of the widespread spread throughout the number of nations, some illnesses such as the health problem of prominent societies have arisen. In this specific analysis, COVID-19 was viewed as an independent variable since the entire economy and well-being of the entire population depended on this particular pandemic at a higher level (Varshney & Varshney, 2017). In such an environment, the ultimate aim is to stimulate economic growth as soon as possible, and to make a redistribution mechanism that will reduce economic suffering for the lower economy classes and ensure that the economic framework created will be more resistant in the future. Employment stimulus and support to businesses are therefore indispensable in sectors affected by the recession, in particular small and medium-sized firms as well as a range of large companies, in order to avoid bankruptcy (Jenny, 2020).

H₁: There is a significant relationship between COVID-19 pandemic and the implementation of e-business in Malaysia.

Consumer Behaviour

In line with Hoyer and MacInnis (2010), defining consumer behaviour as the number of consumer decisions made by the human decision-making unit in connection with the purchase, usage and disposal of products, services, time and ideas. In the areas of marketing, information technology, psychology and management, customer behaviour in the online world has gained considerable attention (Nguyen et al., 2018). In addition, customer purchasing behaviour will be influenced by the closure of countries due to the lack of availability of products and services in various stores. This is because, customers should rely primarily on ecommerce platforms to meet the essential requirements needed for their survival (Hasanat et al., 2020). According to Rose, Hair, and Clark (2011) personal communication, providing information, interaction time, and brand presentations demonstrate four main differences between the online user experience and the offline user experience. In terms of order improvement, there is also a distinction between the two contexts, like different items, inventory management, last-stone distribution, and return management (Agatz, Fleischmann, & Van Nunen, 2008). For example, online platforms tend to carry different kinds of goods compared to traditional stores, so they are more capable of satisfying customer demand at the long tail end (Brynjolfsson, Hu, & Simester, 2011). According to Nguyen et al. (2018), this describes consumer behaviour as the entire decision of the consumer with regard to the purchase, use and disposal by the human decision-making unit of products, services, time and ideas.

H₂: There is a significant relationship between consumer behaviour and the implementation of e-business in Malaysia.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

2.2.3 Internet Connection

In addition to attracting a large number of consumers who browse and buy goods online, the internet and the expansion of mobile devices are also generating opportunities for retailers to boost online sales. According to Rahman et al. (2013) this insists that by removing time barriers and accelerating decision-making processes, media networks will boost the coordination and efficiency of the organisation. As noted by Kim and Lennon (2008), with almost three times the overall retail sales rate, the internet is the fastest growing retail platform. The increasing use of the internet by the general public seems to be encouraging a brighter future for the security of the retail internet by customers, despite the challenging economic hardship for consumers around the world.

H₃: There is a significant relationship between internet connection and the implementation of e-business in Malaysia.

Cost Management

According to Raihani et al. (2016), cost is the amount that must be paid or surrendered to get something. Furthermore, cost management is a method in which businesses record or manage the costs involved in doing business by using cost accounting. Cost is generally an evaluation of the efforts, energy resources, time and utilities used in industry, risks occurring, and opportunities forgotten in the manufacture and distribution of products or services. Moreover, because of an unreasonable or modest option of transforming innovation, which is the core point of high production costs, the high cost of development makes entrepreneurs face obsolete innovation (Avinash, 2016). According to Thomas, Adekunle, Olarewaju, and Folarin (2015) they will have to determine whether they want to maintain financial records personally or employ others in the organisation of the financial management system in the company. Overall, business continuity, facilities, business services are some of the key components of business infrastructure. Business operations rely heavily on service quality, strategic decisions, business sustainability and even management costs.

H₄: There is a significant relationship between cost management and the implementation of e-business in Malaysia.

2.2.5 Implementation of E-business

E-business is identified by the use of the internet and computer technology as the process of doing business (Maditinos et al., 2014). According to Lai et al. (2013) this is an online operation that brings staff, partners, suppliers and consumers to its primary objective, thus generating value. Electronics companies, value-changing companies (goods, services, capital and knowledge) can exploit digitally or through computer networks that are asset companies to produce higher returns for customers (Lai et al., 2013). Implement e-business applications and include modifications such as improvements in the process of working with business partners, changes in delivery of goods and services, and changes in employee skills (Kolaric, Petrovic, & Radojic, 2011). Therefore, it should consider serious problems such as making strategies and working with partners involved in e-business operations (Maditinos et al., 2014). In addition, data access protection issues should be taken care of as data exchanges between e-business partners should be handled (Maditinos et al., 2014).

H₅: There is a significant relationship between the dominant association which the factors influence (COVID-19 pandemic, consumer behaviour, internet connection and cost management) toward the implementation of e-business in Malaysia.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

2.3 Conceptual Framework

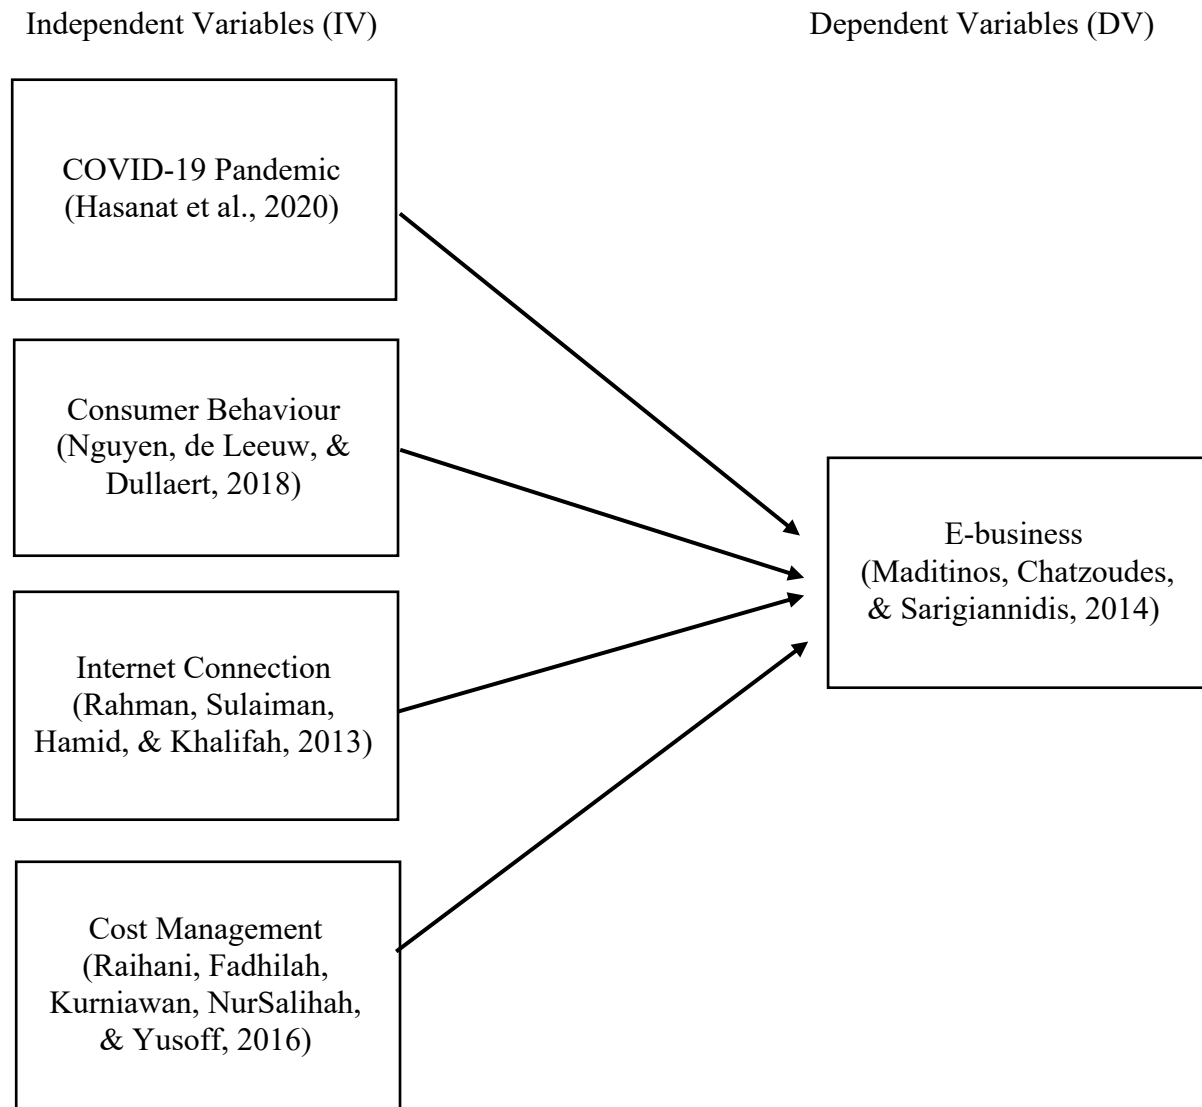

Figure 1 shows the conceptual framework of study the factors influencing the implementation of e-business in Malaysia.

3 Research Methodology

3.1 Data collection and sample selection

Purposive sampling is a form non-probability of sampling in which when selecting population participants to participate in the sample, the researcher relies on his own judgement. This method of sampling allows researchers to have prior knowledge of the intent of their studies to be able to select and approach qualified participants properly. The study selected respondents that have business in Malaysia. This method enables the investigator to efficiently gather more accurate information and data. In addition, this study uses large-scale quantitative research methods with using techniques such as distributed online questionnaires via (Google Form).

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

3.2 Measurement and scales

Questionnaires are used in this analysis as instruments. The measured scale used by researchers is likert Scale. The likert 6 point scale is used to calculate the target of respondents in Malaysia, based on their level of agreement on the relationship of factors influencing e-business implementation. After considering each element, likert's achievement motive test scale of 6 points was found. 5 point likert items suffer from a bias in response design. Answer styles are reaction biases that are expressed by respondents independently of the content of the questions.

3.3 Data analysis method

The data collected will be analyzed using the Statistic Package for the Social Sciences (SPSS) Statistic version 26. The reaction from the respondent will be hinted at as a necessity before the organism enters into the data file for successive analysis actions. Therefore, pilot Study which is Reliability Analysis, Descriptive Analysis, Pearson's Correlation Analysis and Multiple Linear Regression Analysis were used to test the research objectives and hypothesis.

4 Data Analysis

4.1 Reliability Analysis

Table 1: Reliability Analysis

Variables	Cronbach's Alpha	No. of Items
E-Business	0.973	5
COVID-19 Pandemic	0.969	5
Consumer Behaviour	0.972	5
Internet Connection	0.973	5
Cost Management	0.972	5

Source: (Sharma et al., 2016)

Table 1 summarizes the findings of the reliability test of each variable in this study. According to table 1, the range of Cronbach's Alpha for each variable is from 0.969 to 0.973 which means the items for each variable are excellent based on the rule of thumb of Cronbach's alpha coefficient.

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

4.2 Descriptive statistics

Table 2: Respondent's Demographic Profile

Variable	Categories	Frequency	Percent %
Gender	Male	224	58.3
	Female	160	41.7
	Total	384	100.0
Age	20-30 years old	86	22.4
	31-40 years old	205	53.4
	41-50 years old	92	24.0
	51-60 years old	1	0.3
Marital Status	Single	96	25.0
	Married	231	60.2
	Divorced	57	14.8
Monthly Income	Less than RM1,000	89	23.2
	RM1,001-RM3,000	221	57.6
	RM3,001-RM5,000	74	19.3
	More than RM5,001	-	-
Race	Malay	204	53.1
	Chinese	125	32.6
	Indian	54	14.1
	Other	1	0.3
Apply E-business	Yes	282	73.4
	No	102	26.6
Type of platform	Amazon	-	-
	Zalora	14	3.6
	Lazada	46	12.0
	Food Panda	77	20.1
	Shopee	115	29.9
	11 Street	30	7.8
	Other	-	-
	None	102	26.6
Expected use of e-business platform	Never	101	26.3
	Less than 1 year	71	18.5
	2 years to 3 years	187	48.7
	4 years to 5 years	25	6.5
	More than 5 years	-	-

Table 2 show that male respondents are dominant in this study. Most of the respondents are age between 31-40 years old with the value of n=205(53.4%) and majority of the respondents were Malay with the value of n=204(53.1%) and married with the value of n=231(60.2%) followed with monthly income that is RM1,001-RM3,000 with the value of n=221(57.6%). Beside, majority of the respondents had apply e-business with the value of n=282(73.4%) with expected use of e-business platform that is 2 years to 3 years with the value of n=187(48.7%). Lastly, the respondents show that the most number type of platform of e-business that is shopee with the value of n=115(29.9%).

BUSINESS COLLOQUIUM 2020/2021**

4.3 Pearson Correlation Analysis

Table 3: Result of Pearson Correlation Test

		E-business	COVID-19 Pandemic	Consumer Behaviour	Internet Connection	Cost Management
E-business	Pearson Correlation	1	.994**	.992**	.987**	.987**
	Sig. (2-tailed)		.000	.000	.000	.000
	N	384	384	384	384	384
COVID-19 Pandemic	Pearson Correlation	.994**	1	.992**	.988**	.988**
	Sig. (2-tailed)	.000		.000	.000	.000
	N	384	384	384	384	384
Consumer Behaviour	Pearson Correlation	.992**	.992**	1	.989**	.989**
	Sig. (2-tailed)	.000	.000		.000	.000
	N	384	384	384	384	384
Internet Connection	Pearson Correlation	.987**	.988**	.989**	1	.988**
	Sig. (2-tailed)	.000	.000	.000		.000
	N	384	384	384	384	384
Cost Management	Pearson Correlation	.987**	.988**	.989**	.988**	1
	Sig. (2-tailed)	.000	.000	.000	.000	
	N	384	384	384	384	384

The Pearson Correlation analysis between independent variables and dependent variables is shown in table 3. The results showed that there was a significant relationship between all the independent variables that is COVID-19 pandemic ($p < 0.05$, $r = 0.994$), consumer behaviour ($p < 0.05$, $r = 0.992$), internet connection ($p < 0.05$, $r = 0.987$) and cost management ($p < 0.05$, $r = 0.987$) towards e-business implementation showing a very high positive correlation between the variables since $p < 0.001$, the null hypothesis was rejected and the alternative hypothesis accepted by the research.

4.4 Multiple Regression Analysis

Table 4: Multiple Linear Regression

Variables	Simple linear regression			Multiple linear regression		
	b ^a	t-stat(95% CI)	p-value	adj.b ^b	t-stat(95% CI)	p-value
COVID-19 Pandemic	1.009	174.532(0.998, 1.020)	<0.001	0.589	12.848(0.499, 0.679)	<0.001
Consumer Behaviour	0.995	153.032(0.982, 1.008)	<0.001	0.324	6.871(0.231,0. 417)	<0.001
Internet Connection	0.993	119.056(0.977, 1.010)	<0.001			
Cost Management	1.000	119.569(0.983,1 .016)	<0.001	0.096	2.529(0.021,0. 170)	<0.012

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Using the results of Simple Linear Regression (SLR) as shown in table 4. Four unadjusted significant factors with a p-value <0.25 were found by Simple Linear Regression to be included in the variable collection. COVID-19 pandemic, consumer behaviour, internet connection, and cost management were the factors for independent variables. Therefore, the result show on simple linear regression all variable that is significant because the p-value is <0.00. Furthermore, the variable selection method was carried out using the step-wise method. The result shows that on multiple linear regression of the variable COVID-19 pandemic, consumer behaviour and cost management are significant since the p-value is <0.05. Moreover, this analysis did not detect any multicollinearity and interaction. In addition, the COVID-19 pandemic would be the most dominant variables that influence the implementation of e-business in this study as it has the higher beta value, which is 0.589 compared to the other variable.

4.5 Hypothesis Testing Result

Table 5: Result of Hypothesis Testing

Objective	Hypothesis	Result of Analysis	Decision
To examine the relationship between COVID-19 pandemic and the implementation of e-business in Malaysia.	H ₁ : There is a significant relationship between COVID-19 pandemic and the implementation of e-business in Malaysia.	r = 0.994	Accepted
To identify the relationship between consumer behaviour and the implementation of e-business in Malaysia.	H ₂ : There is a significant relationship between consumer behaviour and the implementation of e-business in Malaysia.	r = 0.992	Accepted
To examine the relationship between internet connection and the implementation of e-business in Malaysia.	H ₃ : There is a significant relationship between internet connection and the implementation of e-business in Malaysia.	r = 0.987	Accepted
To identify the relationship between cost management and the implementation of e-business in Malaysia.	H ₄ : There is a significant relationship between cost management and the implementation of e-business in Malaysia.	r = 0.987	Accepted
To identify the dominant association which the factors influence (COVID-19 pandemic, consumer behaviour, internet connection and cost management) the implementation of e-business in Malaysia.	H ₅ : There is a significant relationship between the dominant association which the factors influence (COVID-19 pandemic, consumer behaviour, and cost management) toward the implementation of e-business in Malaysia.	b = 0.589	Accepted (COVID-19 Pandemic)

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

The table 5 shows of the result of the hypothesis testing, and variables such as the COVID-19 pandemic, consumer behaviour, internet connection and cost management can affect the retailer and traders in e-business implementation. Based the Pearson Correlation Analysis conducted, it can be summarized that all of the independent variables in this study, had a significant relationship with the implementation of e-business. So based on the table 5 the researcher have conclude that, all hypothesis in this study were accepted because the p-value is 0.00($p < 0.05$). In addition, the COVID-19 pandemic would be the most dominant variables that influence the implementation of e-business in this study as it has the higher beta value, which is 0.589 compared to the other variable.

5 Discussion and Recommendation

This study was aimed to determine the relationship between the dependent variable which is e-business and independent variables which is COVID-19 Pandemic, consumer behaviour, internet connection and cost management toward implementation of e-business in Malaysia. The study selected from 384 respondents that have business in Malaysia. This survey was fast and secure to pick up existing respondents. In the study, researchers distributed online questionnaires by (Google Form). In addition, Pearson correlation analysis and multiple linear regression analysis were used in this study to analyse each objective and to answer five research questions. In this study, the results of the hypothesis of whether to approve or reject was discussed to confirm whether the four variables are relevant to the implementation of e-business in Malaysia.

The results of this research have some important impacts for business management. The findings of the current study demonstrate that an e-business needs to be able to work within and outside its organisational structure and not focus solely on technical considerations. For the effective implementation of e-business concepts, the causes of the COVID-19 pandemic, customer behaviour, internet connection and cost management should therefore be of great importance. Users should also bear in mind that the emphasis on technology is not the only important success factor for the implementation of e-business. This is because show that in successfully transforming any enterprise into a modern digital company, the factor has a central function. Such an approach would enhance both technological skills and user confidence, as the present study showed that both are needed for the successful implementation of e-business.

In this analysis, there are many limitations during the process. Firstly, the limitations of this analysis are reactive. This aspect of research was conducted in Malaysia among residents who have business through the use of Google form questionnaires. Therefore, because of the critical circumstances of the epidemic problem, most respondents are not open-minded and are not helpful in responding to our questionnaire analysis when most respondents are chosen to the same extent as their responses. Besides that, limitations on time and resources have contributed to minimal geographic scope in the report. Therefore, the short time it takes to gather data can lead to full results that are incomplete.

Researchers found that there are recommendations for future studies based on this report. Through this approach, researchers hope that other researchers will be able to use this style in their research in the future. The recommendation of this study is to encourage potential researchers to carry out more studies on this topic of influencing the implementation of e-

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

business in Malaysia. Furthermore, future researchers are advised to expand the sample size for better comparison, such as expanding research from one country, such as e-business implementation factors in Malaysia or in two countries. However, it is recommended that prospective researchers use different approaches for analysis, such as the qualitative approach. Moreover, sometimes the collection of data is invalid because respondents are not transparent. Finally, in the future, this research can also be referred to by other researchers to add other independent variables or to more identify the factors that influence respondents to participate in e-business implementation.

6 Conclusion

A model that explores the organisational capabilities that lead to the impact of e-business implementation was built in the present research. The research model was based on the synthesis of previous studies, and the results of the statistical analysis showed that the most critical factors for effective implementation of e-business are the COVID-19 pandemic, customer behaviour and cost management. This result theoretically suggests that the corporation has the potential to further implement new technology, such as e-business, as the number of employee increases. Moreover, in the highly competitive market world of today, e-business can be seen as a creative advancement. Consumers should not ignore these factors in order to concentrate on technical qualifications in order to increase the value of e-business, as these factors have a huge effect on the value of e-business. In addition, e-business implementation is found to be an important platform for the growth of e-business. In short, this research successfully demonstrates how e-business implementation can affect e-business value development in terms of these variables. In conclusion, this research will apply to the current situation and can clearly define aspect of the effects of e-business implementation. Consequently, for effective e-business implementation and efficiency, an adequate degree of training access and e-business awareness levels are absolutely important.

7 Acknowledgement

I am would like to send our gratitude for my final year project advisor, Puan Nik Noorhazila Binti Nik Mud for contribute me a lot through guiding and providing me suggestion and encouragement. The research would not complete without her support and sharing her wisdom with me during the process. After that, I am going to thank my friends and my family who support me, inspiration and motivate me to achieve my dreams. I am also thanking to University Malaysia Kelantan (UMK) as it provides me an opportunity to run the research in a well facilities environment. It had provided me a good Wi-Fi situation to let me find the information easily. Besides that, my university provides us plenty of facilities, especially library, places and so on. Through these can get information and references that can simplify my research process. Finally, I am would like to thank to my respondents who help me to answer the questionnaires to complete my research. They had provided me a lot their opinion and suggestion to improve my research.

Abstract:

Malaysia's franchise stores have also brought new competition to the existing competition in the industry. The object of this analysis is the quick service restaurant franchise. The relationship between variables of choice and the factor influencing quick service restaurant (QSR) among youth is examined in this analysis. The purpose of this study is to find the relationship between the variables influencing the choice variables (quality factor of service, environment and ambience factor, price factor, quality factor of food, and brand factor) to franchise quick restaurant service. The methodology for this analysis is a quantitative procedure. The researcher used a questionnaire to collect data relevant to the subject of the research. The researcher needs 379 respondents to answer the questionnaire due to population of Bahau is 31,273.

Keyword: Franchise, The choice, Quick Service Restaurant, Youth, Service Quality

1 Introduction

According to Kurien and Das (2017) the fast food restaurant or the other name is Quick Service Restaurant (QSR) industry has seen phenomenal growth in the last few decades. From 2020 to 2027, Quick Service restaurant industry is one from the world's fast growing sectors. According to Chun and Nyam-Ochir (2020), they state that the global fast food market is projected to expand around 5.1% at a compound annual growth rate (CAGR). Local and international restaurant chains, especially franchise restaurants, are trying to satisfy the demand of consumers for a variety of products and services.

There are many key features that can be distinguished in a quick service restaurant. Standard menus are prepared, portions and ingredients are strictly controlled and the food can be eaten immediately. There is also a young and unskilled workforce working over the counter for fast food chains, chain operations and franchises using a standardised corporate structure and identity (Ozdemir & Ergin, 2017).

Fast-food can be given definition as a restaurant that is able to provide food quickly and needs minimal services, according to Siew, Wai, and Hoe (2016). The same kind of restaurant is integrated with a walk-up counter or a drive thru. Quick service restaurants indicate that you can prepare and serve food or dish orders in a short time (Intan et al., 2014). In recent times, franchise restaurants have evolved rapidly in our country. For category fast service restaurant, there are many franchise restaurants which are McDonald, Pizza Hut, Kentucky Fried Chicken (KFC), Domino Pizza and others.

Among Malaysian youth, the growth of fast food or quick service restaurants has become the preferred choice. As an alternative to eating at a regular restaurant in Malaysia, they are more

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

likely to choose to eat at a fast food restaurant because of the convenience. The fast food restaurant has different criteria and variables that inspire the youth choice. According to Untaru and Ispas (2014), the marketing and advertising of fast food affected the desire of eating by young people. In addition, other factors have been defined as criteria or variables in the election of quick service restaurants, such as price, customer service, location and effectiveness (Siew et al., 2016).

There are six objectives of this research:

- i. To identify the relationship between service quality and factors that influence youth choice franchise quick service restaurant.
- ii. To identify the relationship between environment, ambiance and factors that influence youth choice franchise quick service restaurant.
- iii. To identify the relationship between price and factors that influence youth choice franchise quick service restaurant.
- iv. To identify the relationship between food quality and factors that influence youth choice franchise quick service restaurant.
- v. To identify the relationship between brand and factors that influence youth choice franchise quick service restaurant.
- vi. To identify the most factor that influence youth choice franchise quick service restaurant.

2 Literature Review

The Choice of Franchise Quick Service Restaurant

According to Njite, Dunn, and Hyunjung Kim (2008) restaurant managers understand the real reasons why consumer choose restaurants. Therefore, this study relies on managers' preferences to understand the real variables of consumer choice. According to Abdelgawwad (2017), the selection of customer restaurants is influenced by various factors as the following, which are customer characteristics including age, sex, and job; dining-out location features also including proximity to restaurants, quality, climate, recommendation, ads, previous experience, environmental factors and influences of quality. The author also clarified that efficiency, cleanliness and value are the three main factors in the choice of Quick Service Restaurant (QSR).

Based on previous author, marketers are following the latest food fashion trends to interact customer taste preference of consumers by taking various measures to adapt and customize before setting standards. The selection of menus, the quality of food served, atmosphere of the restaurant, the facilities and most importantly, the price are five important factors in choosing a place to eat among them. Meanwhile, religion is one of the problem that most consumer are concerned about such as consuming pork that has been banned for Muslims or eating beef for non-Muslims for Muslim customers. This is because the customer has been the demand and not the product. For any organization, the secret to success is to consider customers' preferential experience.

Service Quality

Responsiveness and timely delivery involve the degree to which providers can satisfy customers. The ability to provide fast service and to assist clients is responsive and reliable service (Dipesh & Apil, 2018). The timely introduction of a service well established by

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

effective service providers is highly valued by customers (Hasan Iqbal, 2010). At a quick service restaurant, the level of client loyalty will be reached when the employees at the store are able to support their customers when customers need assistance or inquiries. If they are pleased with a service offered, consumers tend to draw the interest of other customers and this can be closely linked to customer loyalty as a consequence of responsiveness.

Environment and Ambience

The elements of the restaurant environment, which are a sign of the environment, social and design, are divided into three aspects (Dipesh & Apil, 2018). The ambient signals provide the restaurant's entire environment. Its architectural marks consist of the restaurant's decoration and interior design, and the social signs involve the people present in the restaurant. It will lead to the restaurant's reputation and status. According to Bohl (2012), the main focus is on the variables that signal the appearance of the restaurant, namely cleanliness and fragrance against the environment and offer customers a positive atmosphere.

Price

Price plays a major part in the choice of commodities (Abd Rashid, Abdullah, Yusuf, & Shaari, 2016) (Dipesh & Apil, 2018). It is not easy to calculate the price for a product or service because the basic value of the offered product is used to measure the substantial cost of customer loyalty because price is the most critical factor in helping consumers estimate the value of products or services. According to (Khan, 2011) for a buyer, price often decides whether or not to settle for a transaction. Therefore, customers are also more likely than others to base their purchase decisions on price considerations. According to Mattila and O'Neill (2003) from a consumer viewpoint, price represents a measure for measuring the user experience with a product or service.

Food quality

Dining experience can be felt when the quality of food in a restaurant becomes the most important factor (Sulek & Hensley, 2004). In terms of restaurant choice, food quality is an important factor influencing the intention to buy. Susskind and Chan (2000) found on a similar note that food quality is the primary factor that draws customers to fast service restaurants. Food quality proves to be a crucial estimator for fast food restaurants in preserving customer loyalty. According to Sulek and Hensley (2004), because other restaurant sectors contrast the environmental components and the quality of service, food quality is a significant element in buying intentions. Moreover, the relationship between food quality and satisfaction is positive.

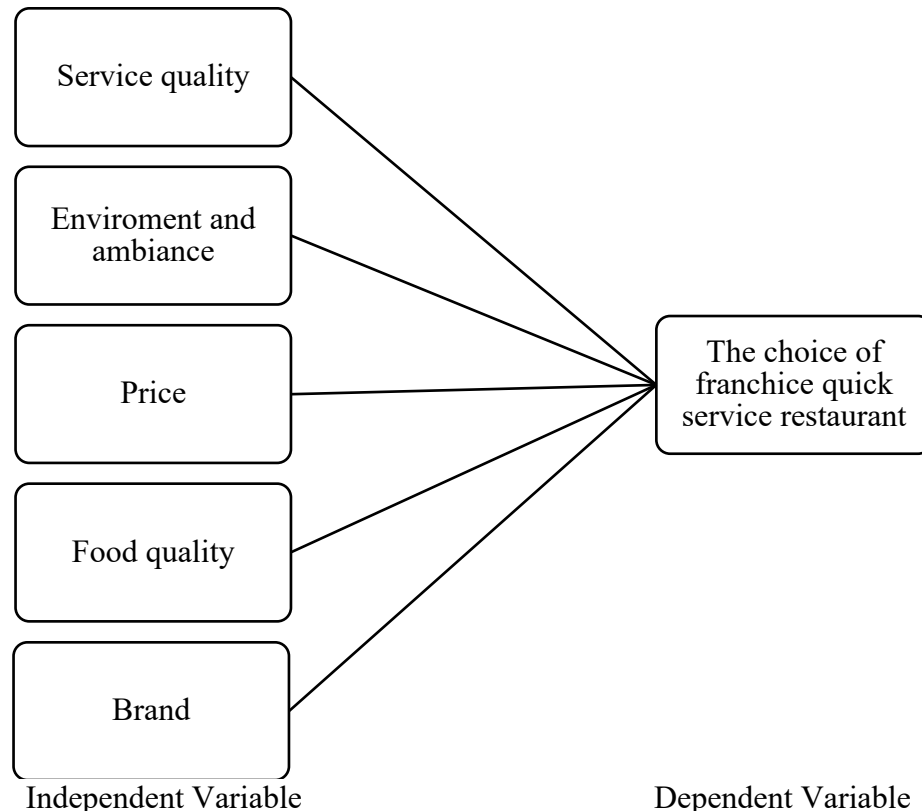

Brand

According to Hanaysha (2016) the term brand loyalty was described to which customers create an emotional bond with the brand through their commitment to repurchasing the product without planning to turn to others. The author also says that the other component of the brand image as the general impression of a brand's consumer memories. Fast-food restaurant clients in Malaysia usually make a brand as a factor in the tendency to choose a restaurant. Peng, Imrie, and Grigoriou (2016) also identified brand loyalty as the desire of customers to establish long-term relationships with a certain brand. According to Laasch and Conaway (2014), on the basis of consumer views and evaluations about the products or services of a company, the reputation of the brand can be conveyed. In addition, brand selection refers to the decision of a consumer to prefer or buy a specific brand before the brand of another competitor, and it can be created on the basis of other people's previous experience or recommendations. According to Zarantonello and Pauwels-Delassus (2015), brand leadership is defined as a competitive advantage that a brand has over its competitors. It reflects the perceptions of customers

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

including its distinctive capabilities of a brand in achieving excellence and offering unique goods that are not easy for competitors to duplicate or imitate.

Research Framework

Source: Adopted from Chow et al (2013). Factors influencing dining experience on customer satisfaction and revisit intention among undergraduates towards fast food restaurants

3 Methodology

Research Design

The researcher used descriptive research which is a quantitative method in this study. Descriptive research is taken to identify the factors influencing the choice of franchise Quick Service Restaurant among youth in Bahau, Negeri Sembilan with the independent variables: service quality, environment and ambience, price, food quality and brand. Those are used in order to accomplish the research objective. The population of this study is focused on youth who have visited the franchise Quick Service Restaurant in Bahau because they will be able to offer reasonable answers based on their present and past experience. Moreover, a set of questionnaires was distributed to respondents in two types of language which is English and Malay to avoid some misunderstanding. The questionnaire is divided into three sections. 5-point Likert Scale will be used in this study to examine the respondent on how strongly of agree or disagree with the provided statement.

Data Collection

In this study, the data will be collected by primary data and secondary data. The primary data will be collected from the respondents that the youth who have visits to the franchise Quick Service Restaurant in Bahau. The researcher has developed a set of structured questionnaires to the respondents. These secondary data are obtained from other sources such as books, journals, literature, information systems, article, computerized or mathematical models of

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

environmental processes that can be searched through the Internet.

Sampling Size

According to Krejcie and Morgan (1970), based on the table has shown a population whose number is equal to 30000 or not exceeding 40000, the required sample size is a total of 379 respondents. The population in the Bahau area is 31273 people, so the expected respondents are 379. Respondents will randomly select the franchise quick service restaurant in Bahau as well as any users who visit the fast food restaurant in Bahau.

Data Analysis

After collecting the feedback from the 379 respondent, the researcher would analyse the data by the Statistical Package for Social Science (SPSS) version 26.0 to carry out the analysis which include the descriptive analysis, reliability analysis and Pearson correlation analysis.

4 Finding and Discussion

Table 1: summary of Pearson Correlations Scores

Correlations							
		Service quality	Environment and ambience	price	Food quality	brand	The choice
Service quality	Pearson Correlation	1	.618**	.473**	.576**	.562*	.541*

	Sig. (2-tailed)	.000	.000	.000	.000	.000	
	N	379	379	379	379	379	379

** . Correlation is significant at the 0.01 level (2-tailed).

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Pearson Correlation coefficient (r) is a measurement of strength associated between two variables. This table showed the result that all the independent variables (service quality, environment and ambience, price, food quality, brand) have a direct relationship with the dependent variable. Furthermore, the correlation for brand of the choice of franchise Quick Service Restaurant is the most positive and moderate relationship in between the entire independent variables that has been tested during this study is conducted. From the result above, the researcher can state that the increase the level of independent variable, the level of dependent variable also be increase.

Table 2: summary of hypothesis testing

Hypothesis	P. value	Empirical Result
H1: There is a significant relationship between service quality and the choice of franchise Quick Service Restaurant.	0.541	Accepted
H2: There is a significant relationship between environment, ambience and the choice of franchise Quick Service Restaurant.	0.573	Accepted
H3: There is a significant relationship between price and the choice of franchise Quick Service Restaurant.	0.579	Accepted
H4: There is a significant relationship between food quality and the choice of franchise Quick Service Restaurant.	0.643	Accepted
H5: There is a significant relationship between brand and the choice of franchise Quick Service Restaurant.	0.734	Accepted

Research Objective 1: To identify the relationship service quality and factors that influence youth choice franchise quick service restaurant.

Table 2 illustrates Pearson correlation coefficient, significant value and the number of cases which is 379. The index obtained on the service $r = 0.541$ and $p - \text{value} = 0.0$ which is high significant. Since 0.541 is relatively close to 0.41 and 0.70, this indicates that both variables are moderate relationship correlated ($p = 0.541, p < 0.0$). Therefore, the service quality is moderate associated with the choice of QSR. Thus, the researcher accepted there is a significant relationship between service quality and the choice of franchise Quick Service Restaurant.

Research Objective 2: To identify the relationship between environment, ambience and factors that influence youth choice franchise quick service restaurant.

Table 2 illustrates Pearson correlation coefficient, significant value and the number of cases which is 379. The index obtained on the service $r = 0.573$ and $p - \text{value} = 0.0$ which is high significant. Since 0.573 is relatively close to 0.41 and 0.70, this indicates that both variables are moderate relationship correlated ($p = 0.573, p < 0.0$). Therefore, the environment and ambience is moderate associated with the choice of QSR. Thus, the researcher accepted there is a significant relationship between environment, ambience and the choice of franchise Quick Service Restaurant.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Research Objective 3: To identify the relationship between price and factors that influence youth choice franchise quick service restaurant.

Table 2 illustrates Pearson correlation coefficient, significant value and the number of cases which is 379. The index obtained on the service $r = 0.579$ and $p - \text{value} = 0.0$ which is high significant. Since 0.579 is relatively close to 0.41 and 0.70, this indicates that both variables are moderate relationship correlated ($p = 0.579$, $p < 0.0$). Therefore, the price is moderate associated with the choice of QSR. Thus, the researcher accepted there is a significant relationship between price and the choice of franchise Quick Service Restaurant.

Research Objective 4: To identify the relationship between food quality and factors that influence youth choice franchise quick service restaurant.

Table 2 illustrates Pearson correlation coefficient, significant value and the number of cases which is 379. The index obtained on the service $r = 0.643$ and $p - \text{value} = 0.0$ which is high significant. Since 0.643 is relatively close to 0.41 and 0.70, this indicates that both variables are moderate relationship correlated ($p = 0.643$, $p < 0.0$). Therefore, the food quality is moderate associated with the choice of QSR. Thus, the researcher accepted there is a significant relationship between food quality and the choice of franchise Quick Service Restaurant.

Research Objective 5: To identify the relationship between brand and factors that influence youth choice franchise quick service restaurant.

Table 2 illustrates Pearson correlation coefficient, significant value and the number of cases which is 379. The index obtained on the service $r = 0.734$ and $p - \text{value} = 0.0$ which is high significant. Since 0.734 is relatively close to 0.71 and 0.90, this indicates that both variables are moderate relationship correlated ($p = 0.734$, $p < 0.0$). Therefore, the food quality is high associated with the choice of QSR. Thus, the researcher accepted there is a significant relationship between brand and the choice of franchise Quick Service Restaurant.

5 Recommendation and Conclusion

The result from this study only constitute an early step in examining the factors influencing the choice of franchise Quick Service Restaurant among youth in Bahau, Negeri Sembilan. As this study only focuses on youth around Bahau, for future research it can be broaden by targeting more people from different generation. Not only for that, for future research, it can also can be expand by entire countries of Malaysia and not only bind with one specific area. It can help to understand the factor influencing the choice of franchise Quick Service Restaurant from all over the countries in Malaysia.

The preference of influence the choice of franchise Quick Service Restaurant is affected by several key variables. However, researchers concentrate only on five independent variables, which are service quality, environment and ambience, price, food quality and brand. There are also a number of other variables, such as saving time, cleanliness and consumer perception. Further research allows researchers to explore and analyse the other main factors affecting the selection of the Quick Service Restaurant franchise.

In conclusion, this analysis was carried out to establish the factors affecting Quick Service Restaurant franchise selection. In addition, this study allows other researchers to perform research on similar subjects and can be used as one of their guides. The results that have been obtained in chapter 4 through Statistical Package for the Social Sciences (SPSS) were discussed further and at the same time conclusions were made based on the results. As a result, it can be concluded that there is a significant relationship between the influence of service quality, environment and ambience, price, food quality, brand and the choice of franchise Quick Service Restaurant. Thus, it is hoped that all the information provided throughout this research will help the other parties to do the next research.

**THE READINESS OF STUDENTS IN UNIVERSITI
MALAYSIA KELANTAN TO USE E – WALLET**

Muhammad Amir Addin Bin Shamsuri and Nik Noorhazila Nik Mud

Faculty of Entrepreneurship and Business,
Universiti Malaysia Kelantan,
Malaysia

[Email: addin.a17b0871@siswa.umk.edu.my](mailto:addin.a17b0871@siswa.umk.edu.my); noorhazila.nm@umk.edu.my

Abstract:

This research is examining the readiness of students in Universiti Malaysia Kelantan to use e -wallet. There are 4 independent variable which is knowledge, technology anxiety and tradition barrier. The quantitative methodology is adopted for this study and the result shows that all the variables are supported by the carried analysis. The application of e-Wallet technology through mobile devices is the recent digital technology trend for consumer market in Malaysia. In addition, the government of Malaysia has introduced an e-Wallet based initiative under the Malaysia Budget 2020, namely “e-Tunai Rakyat” program with the ultimate aim for the nation to opt for digital payment. Studies done by prior researchers revealed that the success of a new technology concept, such as e-Wallet is intensely dependent on the readiness of user toward the new technology. Hence, this study aims to examine the readiness of students in Universiti Malaysia Kelantan to use e - wallet.

Keywords: *E – wallet, Readiness of using e – wallet, knowledge, techonology anxiety, tradition barierr.*

1 Introduction

E-wallet, sometimes as a digital or mobile wallet. E-wallet is an electronic card form capable of executing transactions by phone. Most applications in the e-wallet system allow users to use credit cards, debit cards, or online bank transfers to put cash into the e-wallet. Once users have money in their e-wallet, they can use it to pay merchants with their corresponding physical card to scan a QR code, "tap and pay" with the NFC feature of the phone, or for certain e-wallets. Most e-wallets also allow users to instantly pass money to friends using the e-wallet in the app. (Jackie, 2019)

However as stated by Jayaseelan (2017) e-wallets have sprouted thick and fast in Malaysia over the past few years and with over 40 e-wallet licences granted by Bank Negara Malaysia so far it doesn't look like they're going to slow down anytime soon. The country's central bank aims for Malaysia to be a cashless nation by 2020, with mobile-based payments being a core to the blueprint.

As e-wallets become more commonly accepted in retail stores, F&B shops, supermarkets, and even small vendors across the world, these mobile wallets seem to become a core part of the country's payment landscape. So, if people have not yet started using e-wallets or have reservations about them, here's a prim to get them to speed.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

2 Literature Review

2.1 Technology Acceptance Model

This model has been hypothesized by Davis (1989), which proposed two constructs as primary elements in creating attitudes and behaviours toward IT adoption named as perceived usefulness and perceived ease of use. Perceived usefulness is defined by Davis (1989) as the degree to which a person believes that using a particular technology will enhance his performance. Perceived ease of use is defined by Davis (1989) as the degree to which person believes that using a particular system would be free of effort.

Later TAM has been widely implemented and validated by researchers in many empirical papers as a model can explain the significant factors affecting technology usage 12

(Zhao, 2010). Furthermore, TAM reserved huge concern among online payment acceptance researchers whom have been implemented it during their studies in aim to understand the human behaviour toward using this technology (Mohammed, 2018). Even though the previous researches which have been used TAM, have completely proved the constructs affect peoples' readiness towards using online payment but majority concerned about using and intention to use, while this research focusing on switching behaviour from the physical type of wallet including the usage of debit and credit card to the digital type of wallet.

2.2 Previous Studies

2.2.1 *The readiness of using e – wallet*

According to APA dictionary of psychology, readiness means a state of preparedness to act or to respond to a stimulus. Since this research paper will discuss about the readiness of using e-wallet, it is important to understand the definition of the readiness to using technology. Parasuraman and Colby (2015) describe technology readiness as the level at which users embrace and use the new technology to accomplish their personal goals. Before a consumer adopts a new technology such as a mobile payment app, they must be ready to embrace such a new technology which is the E-wallet. In the other hand, E-wallet means the digital equivalent of a real wallet, with the exception that money is digital and it functions as an app on a smartphone. Similar to regular wallets, e-wallets will need funds to function and perform transactions. This can be done by filling up the wallet with cash via credit cards, debit cards and online bank transfer as mention in CompareHero.my (2020).

2.2.2 *Knowledge*

Knowledge is a combination of instincts, ideas, rules and procedures guiding actions and decisions (Alter, 2002). Empirical support for the causal link between new technology knowledge and usage intentions (Polatoglu and Ekin, 2001; Sathye, 1999; & Howard and Moore, 1982). Apparently, bank customer knowledge has been identified as an important factor influencing the readiness to use e-wallet

2.2.3 *Technology Anxiety*

Technology anxiety is a negative emotional state or a negative cognition experienced by an individual when they use technology or technology equipment (Biozioneles, 2001). According to Hasan & Ahmed (2010), technology anxiety is a negative emotional response, such as fear or discomfort that people experienced when they think about using or actually using technology. As such, technology anxiety is expected to directly influence the use of new technological products and to moderate the relationship between technology leadership and the readiness to use e-wallet

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

2.2.4 Social Influence

Social influence in digital wallets can be defined as encouraging or influencing external factors, which is why an individual becomes a digital wallet user. The social environment affects new technology (Lu, Yao, & Yu, 2015). Social influence consists of various types, such as family or relative influence, friend recommendations, surroundings, advertisements, and user testimonials.

2.2.5 Tradition Barrier

Traditional barriers arise when an innovation changes existing routine in users (Mahatanankoon & Ruiz, 2007). Tradition barrier, according to Dotzauer & Haiss (2017), refers to the barrier where customers need to change their existing e-wallet routines. Traditional barrier is the most important element that negatively affects mobile payment services. According to Low (2016), traditional barrier may correlate with e-wallet mobile payment adoption since most gen-X in Malaysia prefer physical payment methods.

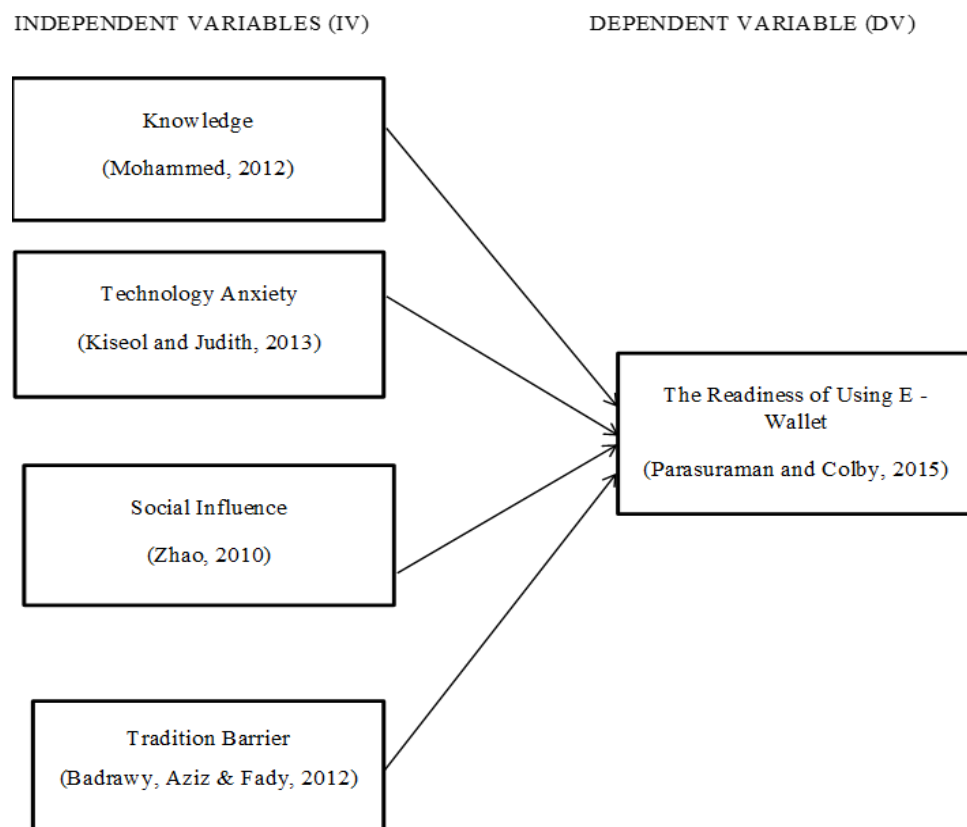

Figure 2.1 The Conceptual Framework of study the readiness of students in Universiti Malaysia Kelantan to use E – wallet in transaction.

3 Research Methodology

This study highlighted the readiness of students in Universiti Malaysia Kelantan to use E - wallet. Therefore, a quantitative methodology was adopted for the present study. The sample are withdrawn from student in Universiti Malaysia Kelantan. To collect the data for this study, a convenience sampling technique was used. Convenience sampling involves selecting sample elements that are most readily available to participate in the present study and can provide the information requires (Heir, 2011). Besides that, this study also utilized questionnaires as a

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

survey to the targeted respondents. In overall, the number of respondent who participated in this study was 361 students. This data was analysed using Statistical Packages for the Social Sciences (SPSS).

3.1 Sampling Techniques

This study was administering a self-governing questionnaire to assess student readiness to use e-wallet at Universiti Malaysia Kelantan City Campus. This study chose non-probability sampling. Convenience sampling is the most suitable technique for this study, due to time and budget limitations and large sample size. It managed to gain data from respondents willing to provide it conveniently (Sekaran, U & Bougie, R, 2016). The main purpose of convenience sampling is to collect information from respondents easily accessible to the researcher (Etikan, Musa, & Alkassim, 2016). In general, respondents were choosing as they happened to be in the right place at the right time

3.2 Research Instrument Development

This study used the questionnaire as a research tool. Questionnaire is recognised as the best research tool when many people approach a researcher (Nardi, P.M, 2018). The questionnaire consists of three sections, section A, section B and section C.

Next, in section A contains background information of the respondent, including gender, ethnicity, age, course, and status. Meanwhile in section B, there are questions related to independent variable and in section C there are questions about dependent variable.

Thus, this study will be used the online platform that is questionnaire through Google Form and will distribute the questionnaire throughout the social media such as WhatsApp, Facebook and Twitter.

4 Findings And Discussion

The respondent profile was summarised. Out of 361 respondents, there were 143 males and 218 females. Most of the respondents were in the age category of between 21-23 (n=170), followed by respondents aged between 24-26 (n=117), respondents aged between 18-20 (n=59), and lastly from respondents aged between 27-above (n=15). Among the 361 respondents, there were 238 respondent's Malay, 52 respondents Chinese, Indians were 43 respondents and other ethnicity ethnicities were 28 respondents. Among 361 respondents who are from Faculty Entrepreneurship and Business (FKP) and Faculty of Hospitality, Tourism and Wellness (FHPK), there were 73 (20.2%) respondents from SAR course, from SAB course 45 (12.5%) respondents, 42 (11.6%) respondents from SAL course, 42 (11.6%) respondents from SAE course, and from SAK course 41 (11.4%) respondents. Respondents from FHPK, SAW course 40 (11.1%) respondents, followed by SAH course 39 (10.8%) respondents and from SAP course 39 respondents (10.8%). Finally, status respondents out of 361 there were 333 (92.2%) were single, and only 28 (7.8%) respondents are married.

4.2 Spearman's Correlation Coefficient

In terms of significance levels in the Spearman's correlation test and in the multiple regression that will be performed in the next part, there is a discourse in the literature of what should be the minimum accepted significance level (p) of a correlation and in multiple regression analysis (Westfall & Young, 1993). Zar (2009) argues that although the significance levels of $p < 0.001$, $p < 0.01$ and $p < 0.05$ are the most accepted significance levels, the 0.05 level is not a sacred or untouchable number, but can be modified depending on the sample size and the

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

circumstances of the study.

4.3 Correlation analysis

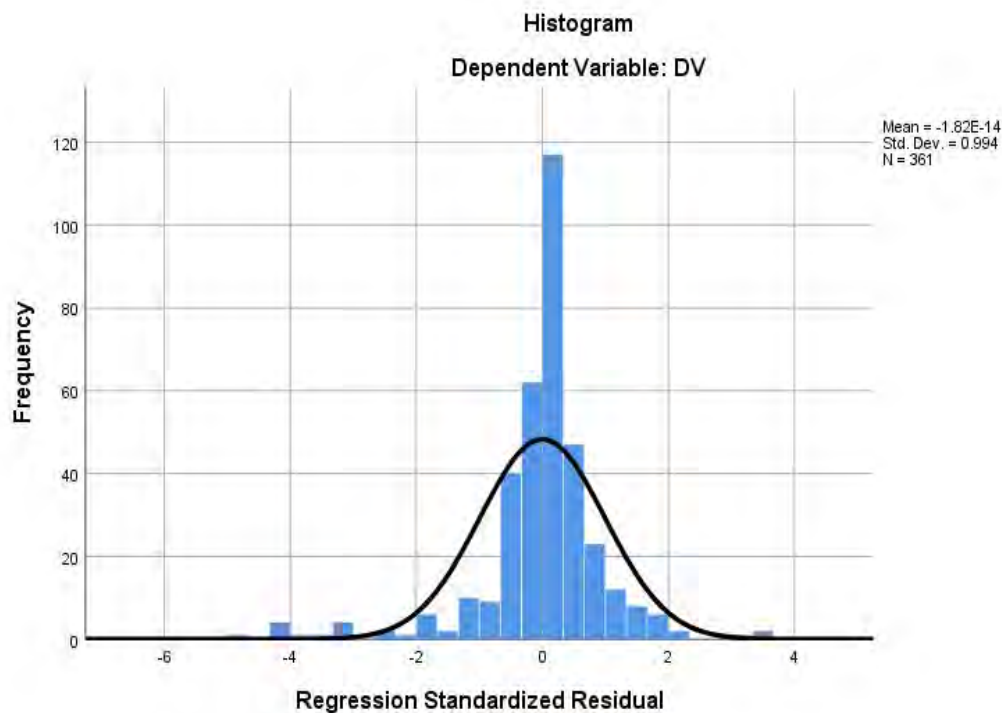

In this research, the researcher had implemented Multiple Linear Regression Analysis in statistics in order to find the relationship between the readiness of using e - wallet as the dependent variable and knowledge, technology anxiety, social influence and tradition barrier as the independent variables. Besides that, this analysis will help the researcher to identify the most dominant factor that the readiness of students in Universiti Malaysia Kelantan to use e – wallet.

Table 4.3 Multiple Linear Regression

Coefficients ^a						
Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Figure 4.6 Histogram of Unstandardized Residual of the readiness that affect the students of Universiti Malaysia Kelantan to use E – wallet.

Based on the figure 4.6, it is shown that there is a normal bell shape distribution of the unstandardized residual of the of the readiness of the students in Universiti Malaysia Kelantan to use E - Wallet.

4.4 Hypothesis Testing

Table 4.4 Summary of the Hypothesis Testing

Objectives	Hypothesis	Result
To examine the relationship between level of knowledge and readiness of using e - wallet among students.	H1: There is a significant relationship between the knowledge and the readiness of students in Universiti Malaysia Kelantan to use E-wallet.	Accepted
To examine the relationship between the level of technology anxiety and readiness of using e-wallet among students.	H2: There is a significant relationship between the technology anxiety and the readiness of students in Universiti Malaysia Kelantan to use E-wallet.	Accepted
To examine the relationship between level of social influence and readiness of using e – wallet among students.	H3: There is a significant relationship between the social influence and the readiness of students in Universiti Malaysia Kelantan to use E-wallet.	Accepted
To examine the relationship between the level of tradition barrier and readiness of using e-wallet among students.	H4: There is a significant relationship between the tradition barrier and the readiness of students in Universiti Malaysia Kelantan to use E-wallet.	Accepted

Based on table 4.12, it can be summarized that all the four independent variables which are the knowledge, technology anxiety, social influence and tradition barrier has a significant relationship among the students of Universiti Malaysia Kelantan to use E - wallet. Hence, all the hypothesis is accepted as the p value is less than 0.05.

5 Discussion and Conclusion

According to overall study, the researchers propose a number of suggestions for future studies. First, future researchers should balance the number of genders in order to get the precise outcome of the gender. Various views or factors have arisen in the formation of counterfeit products among students. Future study should take into account the choice of the number genders to balance the complete number of participants by ages.

Finally, this research presents the summarization the final results based on the data analysis. In other words, this involves an overview of the statistical evaluation and a review of the main location that will be relevant to the quantitative studies and the study issue. In the end, all four hypotheses have been proven to have a positive relationship and none of the hypothesis is rejected. In the meantime, it also included the limitation and recommendation regarding this research is important to provide the wide range of the information about the advantages and disadvantages related to this topic for future research.

**THE SURVIVAL STRATEGY AMONG GROCERIES STORE
IN KOTA BHARU, KELANTAN DURING MOVEMENT
CONTROL ORDER (MCO)**

Muhammad Azim Bin Abu Bakar and Nur Ain Ayunni Binti Sabri

Faculty of Entrepreneurship and Business,
Universiti Malaysia Kelantan,
Malaysia

[Email: Azim.a17b0979@siswa.umk.edu.my](mailto:Azim.a17b0979@siswa.umk.edu.my); ayunni.s@umk.edu.my

Abstract:

Survival strategies describe as cutting costs, laying off employees, tightening profit margins and saving cash, in stark contrast to growth mode, during which a company reinvests profits, expands operations and brainstorms growth planning with long-term payoffs. According to (Roma Priya, April 2020), the Covid-19 slump followed by social distancing and a nationwide lockdown, businesses are experiencing major impacts no matter how established they are and are having to re-look at how they manage and operate their business including re-visitation of their business plan. So, this study will reveal on survival strategies that have been implemented among groceries store. The researcher is focusing directly in Kota Bharu, Kelantan. A conceptual model comprising of different variables like cash flow, financial leverage, operational expenses and employee expenses were studied which influence the survival strategies among groceries store in Kota Bharu, Kelantan. A sample of 120 respondents among groceries store operators were collected and being asked to fill the questionnaire given by the researcher. The data obtained were analysed by using Statistical Package for the Social Science (SPSS). Based on data collected from the questionnaire survey, different methods of data analyses such as descriptive, reliability and internal analyses are carried out. The findings reveal that the variables considered in the study are high positive correlation with survival strategies. It could be concluded from the results that the knowledge had a significant effect to the survival strategies. The results of this study will indicate for the reference for another researcher in the future.

Keywords: survival strategies, cash flow, financial leverage, operational expenses, employee expenses

1 Introduction

1.1 Background of the research

Nowadays, the independent retail and grocery shop (IRGS) sector is facing challenges to remain relevant due to several factors. The reason of this situation is the ever-increasing dominance and expansion of big corporate supermarket chains in both domestic and international markets (Baron et al., 2001). Each enterprise operates in the way of turbulence and propensity in order to change in the business environment. Organizations need to know where they are, where they are going and how to manage the changes (Thompson, 2005). The

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

organization must be flexible because it operates in a dynamic environment. Business develops faster whenever the strategic management is used.

The Covid-19 coronavirus outbreak is a human tragedy affecting billions of people in this world. The outbreak also causes negative impacts on the global economy, industries, corporations and retail store. Economists predict the slowing down of economic activity momentum started from March 2020 onwards without specific ending date (Segal & Gerstel, 2020). Comprehensive statistics and official data about Covid-19 impacts on local retailers in Malaysia are still unavailable at least until the time of this article was wrote. Currently, the Malaysian Statistical Department just launched a special online survey on the effects of Covid-19 on Malaysians and the economy (The Star Online, 2020).

For that reason, this article intends to identify the survival strategies based on the responses of groceries store especially in Kota Bharu, Kelantan. This study is timely important to achieve five main agendas. First, is to provide the survival strategies among groceries store in Kota Bharu during the Movement Control Order (MCO). Secondly, to identify the relationship between cash flow and the survival strategies by groceries store in Kota Bharu during Movement Control Order (MCO). Next, to identify the relationship between the financial leverage and the survival strategies by groceries store in Kota Bharu during Movement Control Order (MCO). Then, to identify the relationship between operational expenses and the survival strategies by the groceries stores in Kota Bharu, Kelantan. And finally, the relationship between employee expenses and the survival strategies by groceries store in Kota Bharu, Kelantan.

1.2 Research Question

- a) What is the survival strategies that have been implied by the groceries store in Kota Bharu, Kelantan during the Movement Control Order (MCO)?
- b) What is the relationship between the cash flow and survival strategies by the groceries store in Kota Bharu during the Movement Control Order (MCO)?
- c) What is the relationship between financial leverage and survival strategies by the groceries store in Kota Bharu during the Malaysian Control Order (MCO)?
- d) What is the relationship between employee expenses and survival strategies by the groceries store in Kota Bharu during Movement Control Order (MCO)?
- e) What is the relationship between operational expenses and survival strategies by the groceries store in Kota Bharu during the Movement Control Order (MCO)?

1.3 Research Objectives

The main objectives of the study is to find the survival strategies among groceries store in Kota Bharu, Kelantan during the Movement Control Order (MCO). To be specific, these are the research objectives that will focus on this study:

1. To identify the relationship between cash flow and survival strategies by the groceries store in Kota Bharu during the Movement Control Order (MCO).
2. To identify the relationship between financial leverage and survival strategies by the groceries store in Kota Bharu during the Malaysian Control Order (MCO).
3. To identify the relationship between employee expenses and survival strategies by the groceries store in Kota Bharu during Movement Control Order (MCO).

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

4. To identify the relationship between operational expenses and survival strategies by the groceries store in Kota Bharu during Movement Control Order (MCO).

2 Literature review

2.1 Underpinning theory

2.1.1 Resource Based-View Theory

Resource Based-View Theory (RBV) has acknowledge the role of idiosyncratic strategies, firm's resources and specific internal factors as firm resources in uplifting firm's performance and sustainability (Barney, 1991; Warnier et al., 2013). The strategic goals of firm are to develop and deploy a combination of valuable, rare, inimitable and non-substitutable (VRIN) resources to achieve their full economic potential (Enders et al., 2009; Warnier et al., 2013). The framework is appropriate to develop integrated strategies that simultaneously cope with the internal and external perspectives of business strategic decisions (Cassia & Minola, 2012; Warnier et al., 2013).

2.1.2 Contingency Theory

Contingency theory suggests that the fit between an organization and its environment determines organizational performance such that an organization actively pursues strategic actions to align itself with the environment (Powell, 1992). As a result, retailers' strategic responses to economic challenges such as recessions can differ across firms (Walters, 1994). Katz's (1970) study proposed that for an effective business strategy, firms should concentrate resources where there is meaningful competitive advantage; however, if a firm's future earning power is less than its liquidated value, it should be sold. Accordingly, a retailer may focus on retrenchment, realignment, or investment (Sands and Ferraro, 2010). Retrenchment occurs when a firm downsizes its product/market objectives to improve performance by reducing costs or operation scales (Pearce et al., 1987). A difficult business environment pushes some retailers toward retrenchment in the form of store closings, bankruptcies, and divestment (Sands and Ferraro, 2010; Srinivasan et al., 2005). On the other hand, some companies, especially more financially robust organizations, view recession as an opportunity to establish competitive advantage and to increase investment in mergers/acquisitions, and/or development of new products, market segments, and channels of distribution (Sands and Ferraro, 2010; Srinivasan et al., 2005; Walters, 1994). Yet others may choose a more cautious approach, focussing on realigning their existing resources with the changed business environment. Realignment occurs when a firm seeks financial stability by pursuing similar objectives under similar product/market domains while emphasizing incremental improvement and adjustment of performance to better fit the firm's strategy with its external environment (Pearce et al., 1987; Walter et al., 2013).

2.2 Hypothesis

The hypotheses of this research developed from the question and objective of this study is:-

Hypothesis 1: there is significant relationship between cash flow and the survival strategies by groceries store in Kota Bharu.

Hypothesis 2: there is a significant relationship between financial leverage and the survival strategies implement by groceries store in Kota Bharu.

Hypothesis 3: there is a significant relationship between employee expenses and the survival strategies implement by groceries store in Kota Bharu.

Hypothesis 4: there is a significant relationship between operational expenses and the survival strategies implement by groceries store in Kota Bharu.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

2.3 Conceptual Framework

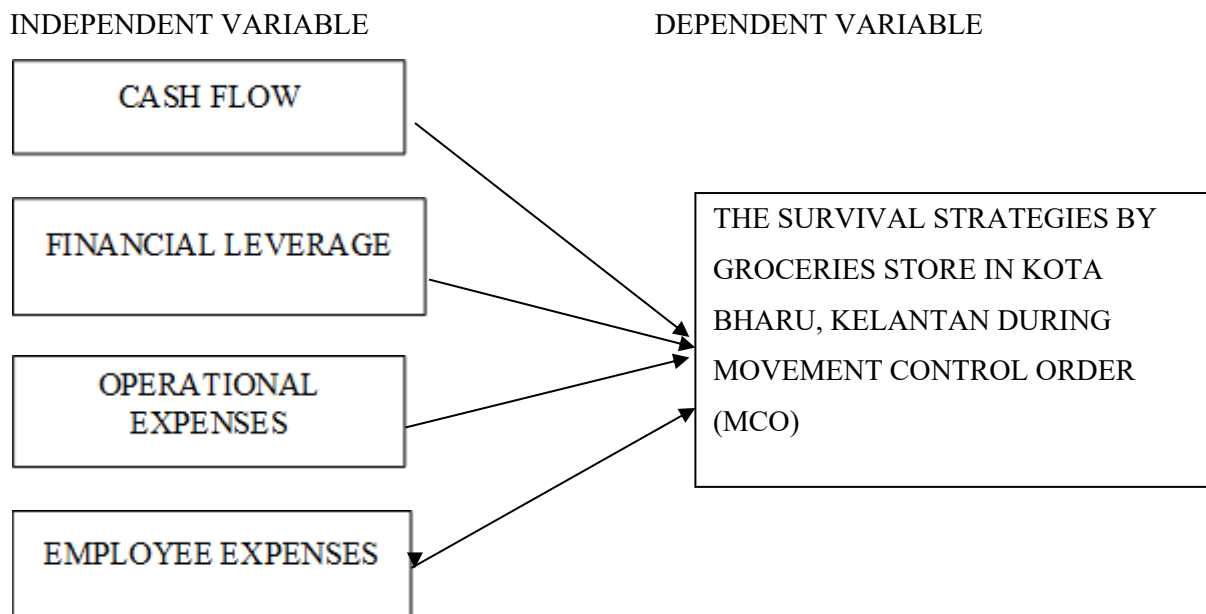

Figure 2.1: the independent variable and dependent variable of the research

3 Research Methodology

3.1 Research Design

In this section, there will be a study of quantitative research. This type of research can measure the independent variable which is financial leverage, cash flow, operational expenses and employee expenses with dependent variable which is the survival strategies used by groceries store in Kota Bharu, Kelantan via questionnaire.

3.2 Data Collection Method

In this study, the researcher will use non-probability sampling method. The meaning of non-probability sampling is the technique being selected for a sample cannot be calculated. It is different from probability sampling whereby you can calculate the odds. In addition, probability sampling involves random selection, while non-probability sampling does not relies on the subjective judgement of the researcher.

There are many types of non-probability sampling such as convenience sampling, haphazard sampling, purposive sampling, expert sampling and snowball sampling. In this case, the researcher will prefer to use convenience sampling method. Convenience sampling method is the method whereby members of the target population that meet certain practical criteria, such as easy accessibility, geographical proximity, availability at a given time, or the willingness to participate are included for the purpose of the study

3.3 Sampling and population

Population means several group of individuals, institutions and objects that have a common characteristics that interest the researcher to study about them. It means the target of the people for this study. The tittle of the research is the survival strategies among groceries store in kota Bharu, Kelantan

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

during Movement Control Order (MCO). The population of groceries store according to Kota Bharu Municipal City (MPKB-BRI) are 170 units of license given to operate groceries store.

Sample size measures the number of individuals that observe in this survey. Based on the data given by MPKB-BRI, sample size of the respondent is based on Krejcie and Morgan Table. After referring the table, there are 118 respondents from groceries store need to be taken. Furthermore, the data collection for this study is through questionnaire while for the data analysis for this study is by using Pearson Correlation and Descriptive statistic through SPSS for the reliability and accuracy of the data.

4 Data Analysis

4.1 Demographic profile of respondents

Table 4.1 Demographic profile of respondents

Demographic Profile	Valid	Frequency	Percentage
Gender	Male	52	43.7
	Female	68	56.4
Age	18-25 years old	95	79.2
	26-30 years old	14	11.7
	31-35 years old	5	4.2
	36-40 years old	1	0.8
	40 years old and above	5	5
Marital Status	Single	103	85.7
	Married	16	13.4
	Divorce	1	0.9
How many years operated business	0-5 years	95	79.5
	6-10 years	12	10.3
	11-15 years	3	2.7
	Above 15 years	10	9.5
Operating Hours	Morning-evening	69	57.3
	Morning- night	33	27.5
	24 hours	18	15.5

Table 4.1 shows demographic profile of 120 respondents that answer the questionnaire. Based on data above, it is shown that female who operates groceries store in Kota Bharu is higher than man with (56.4%) with 68 people with men is around 52 people which covered (43.7%) of the respondent for this survey.

The next category of demographic is Age. It is (79.2%) of this respondent who is age between 18-25

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

years old with 95 amount of people. Others are (11.7%) with the amount of 14 people is in the group of age 26-30 years old, (4.2%) with the amount of 5 people in the group of 31-35 years old. Meanwhile, people in the age 36-40 years old covered (0.8%) of the respondent which has amount of one people only. The balance of (5%) with amount of 5 people is currently age above 40 years old.

In terms marital status, the majority of the respondent are single which amounts of 103 people with percentage of (85.7%). 16 out 120 respondents state that they are married which covers (13.4%). There is one people that operates the groceries store is divorce which covers (0.9%) of this respondent. Next, this survey shows that (79.5%) or 95 out of 120 respondents operates the groceries store between 0-5 years. 12 respondents runs the groceries store in 6-10 years which covers (10.3%), 3 people or (2.7%) between 11-15 years and the remaining balance of 10 people which covers (9.5%) of respondents already operate groceries store in 15 years and above.

4.2 Descriptive analysis

4.2.1 Independent variables and dependent variable

Table 4.2 shows the mean and the standard deviation of both dependent variable and independent variables. Mean for dependent variable of this research is 4.465. For independent variables, the highest mean is cash flow which is 4.53 and followed by the financial leverage which is 4.528. The third highest mean of the independent variable is operational expenses which is 4.29. Employee expenses have the lowest mean as the independent variable which is 3.974.

Table 4.2 the descriptive analysis

Descriptive Analysis		
Description	Mean	Standard Deviation
Cash Flow	4.53	0.6464
Financial Leverage	4.528	0.6532
Operational Expenses	4.29	0.8054
Employee Expenses	3.974	0.9442
The survival strategy among groceries Store in Kota Bharu during Movement Control Order (MCO)	4.465	0.6703

4.3 Validity and reliability test

Table 4.4 The normality test according to Cronbach alpha

Variable	Item	Cronbach Alpha
Cash flow	5	0.782
Financial leverage	5	0.700
Employee expenses	5	0.847
Operational expenses	5	0.856
The survival strategies among groceries store in kota bharu during mco	5	0.831

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

The Cronbach's Alpha is designed to measure a "goodness" reliability criterion in each group item and internal consistency. De Vaus, (2002) suggests that in order to measure the reliability of the scale, whether the internal consistency is unacceptable, poor, questionable, acceptable, good and excellent, the Alpha value of Cronbach should be between $0.5 > \alpha$ and $\alpha < 0.9$. Table 4.3 shows the findings of the reliability test of each variable in this study. According to Table 4.3, the range of Cronbach's Alpha is from 0.700 to 0.856 which indicates that each item for each variable as good based on rule of thumb of Cronbach's Alpha Coefficient. According to the rule of thumb of Cronbach's Alpha coefficient, all the items of each variables represents as good as it exceeded 0.7. Hence, the reliability shows that all the items from each variable are easily understood by the respondents. This questionnaire is also accepted for data collection in this study.

4.4 Normality Test

Table 4.4 the test of normality

	Kolmogorov-Smirnov ^a			Shapiro-Wilk		
	Statistic	df	Sig.	Statistic	df	Sig.
IV1	.372	474	.000	.698	474	.000
IV2	.368	474	.000	.697	474	.000
IV3	.294	474	.000	.774	474	.000
IV4	.210	474	.000	.852	474	.000
DV	.351	474	.000	.726	474	.000

a. Lilliefors Significance Correction

The result based 4.4, outcome of normality test using SPSS revealed to be non-normality data set. Value of Shapiro-Wilk's Test and Kolmogorov-Smirnov's Test for all independent variables (cash flow, financial leverage, operational expenses and employee expenses) with dependent variable (the survival strategy among Groceries Store in Kota Bharu during Movement Control Order (MCO)) were 0.000, which is less than 0.05, this indicated that the data is non normality. Thus, non-parametric correlation will be used which refer to Spearman correlation from the hypotheses testing (Hinkle, Wiersma, & Jurs, 2003).

4.5 Hypothesis Testing

Table 4.5 Hypothesis test

OBJECTIVE	HYPOTHESIS	RESULT OF ANALYSIS	DECISION
To identify the relationship between cash flow and survival strategies by the groceries store in Kota Bharu during the Movement Control Order (MCO).	H1: there is significance relationship between cash flow and survival strategies by the groceries store in Kota Bharu during the Movement Control Order (MCO)	r=0.369	Accept
To identify the relationship between financial leverage and survival strategies by the groceries store in Kota Bharu	H2: There is significance relationship between financial leverage and survival strategies by the Groceries Store in Kota Bharu	r=0.382	Accept

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

during the Malaysian Control Order (MCO).	during the Movement Control Order (MCO)		
To identify the relationship between operational expenses and survival strategies by the groceries store in Kota Bharu during Movement Control Order (MCO).	H3: There is significant relationship between operational expenses and survival strategies by the Groceries Store in Kota Bharu during Movement Control Order (MCO)	r=0.389	Accept
To identify the relationship between employee expenses and survival strategies by the groceries store in Kota Bharu during Movement Control Order (MCO).	H4: There is significant relationship between employee expenses and survival strategies by Groceries Store in Kota Bharu during Movement Control Order (MCO)	r=0.197	Accept

Based on the result shown in table 4.5, we can conclude that all the independent variables are accepted. There is a positive relationship between cash flow, financial leverage, operational expenses and employee expenses with the survival strategies among groceries store in Kota Bharu, Kelantan during Movement Control Order (MCO). It is because the p-value is less than 0.05.

5 Recommendation and Conclusion

5.1 Discussion

The research was conducted to identify the survival strategies taken by the groceries store operator in Kota Bharu, Kelantan when the government started to introduce the Movement Control Order (MCO) during the pandemic of covid-19. . In this research, primary data was undertaken by the online questionnaires through Goggle Form to collect feedback from respondent and secondary data from the journal and article.

For your information, the independent variable collected are cash flow, financial leverage, operational expenses and employee expenses. As for dependent variable is the survival strategy among groceries store in kota bharu during Movement Control Order (MCO). The information given by Kota Bharu Municipal Council (MPKB-BRI) states that the liscened groceries store is 170. A sample size of 120 groceries store operator were collected in doing this research. Google form questionnaire are given to them to fill their basic information alongside getting their opinion on the issued raised.

The analysis of data includes descriptive analysis, reliability analysis and Pearson Correlation Coefficient. The reliability test was conducted in this study to measure consistency, precision, repeatability and trustworthiness of this research. The Pearson Correlation also used in this research to denote relationship between two or more quantitative variable. The results shows that all the hypothesis build by the researcher is accepted since the p-value is less than 0.05.

This research has four different objectives. Firstly, to identify the relationship between cash flow and the survival strategies by the groceries store in Kota Bharu during Movement Control Order (MCO). Next, to identify the relationship between financial leverage and the survival strategies by the groceries

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

store in Kota Bharu during Movement Control Order (MCO). After that, to identify the relationship between operational expenses and the survival strategies by groceries store in Kota Bharu during the Movement control Order (MCO). Lastly, to identify the relationship between employee expenses and the survival strategies by the groceries store in Kota Bharu during movement Control Order (MCO).

5.2 Recommendation/suggestion for future research

Hopefully, in the future another researcher that wants to research about survival strategies can study into different location outside Kota Bharu or Kelantan. This is because another location will totally offer a different opinion on how they survive in order to continue to operate the groceries store.

Other than that, the researcher hopes that people that wants to do this research not only focusing on Movement Control Order policy or when the pandemic Covid-19 disease happen only, but they have to focuss on another crisis that might affect the groceries store operators such as financial crisis or their current situation that really out of their control.

Next, the method of research can be changed by interviewing directly throughout the operator of groceries store. The formal interview might give a detail explanation on their survival strategies in order to continue to operate the groceries store.

5.3 Conclusion

As for conclusion, this research is focused on the survival strategies among groceries store in Kota Bharu during the Movement Control Order (MCO). There are four independent variable that really support the research. There are cash flow, financial leverage, Operational expenses and Employee Expenses. Based on hypothesis test using SPSS, we conclude that the independent variable stated in the research are accepted because the positive result that have been applied using the SPSS data.

6 Acknowledgements

First of all, I would like to thank to ALLAH S.W.T for his mercy in giving me full strength to complete the Final Year Project. The research title is “The survival strategies among groceries store in Kota Bharu, Kelantan”. Even facing with so many difficulties and many corrections to do, but I still managed to do it. A lot of thanks to my supervisor, Dr. Ain Ayunni Binti Sabri for giving guidance in order to help me to finish my task that really tested my patience and full of stress when doing the task.

Then, I would like to thank to my parents and siblings for giving me the support in terms of spiritual so that I have the intention to finish my research. After that, I would like to give a big praise to all of my friends in Bachelor Of Entrepreneurship (Retailing) with Honours in Universiti Malaysia Kelantan from batch 17/18 for giving a big help and ideas to me in order to complete my task. Then, I would like to thank to all my friends that are willing give a big support to me to complete my task. Thanks

**FACTORS THAT AFFECTING ONLINE IMPULSE BUYING
BEHAVIOUR ON MICROTRANSACTION SPENDING IN
FREEMIUM ONLINE GAMES AMONG GEN-Z CONSUMER IN
MALAYSIA**

Muhammad Hafiz Aiman Mohd Hanef and Mahathir Muhamad

Faculty of Entrepreneurship and Business,
Universiti Malaysia Kelantan,
Malaysia

[Email: aiman.a17a0271@siswa.umk.edu.my](mailto:aiman.a17a0271@siswa.umk.edu.my), mahathir.m@umk.edu.my

Abstract:

Freemium games have been increasingly popular in recent years, across all types of online video games. Consumers playing freemium games do not have to pay to play a fully functioning game, but to enhance their playing experience, they are given several purchasing opportunities which is through microtransactions. Microtransaction spending on online games is similar to spending money doing online shopping, thus it is possible that this will invoke impulse buying behaviour. According to (Sani, 2019), current student generation lacks the ability to distinguish between needs and wants when it comes to spending money. Therefore, the aim of this study is to identify factors that affecting online impulse buying behaviour on microtransaction spending in freemium online games. A structure questionnaire was designed to gather the data from 384 respondents who are Gen-Z consumers all across Malaysia. Statistical Package for Social Sciences (SPSS) version 25 was used to assist in data analysis. Descriptive analysis, reliability test, normality test, Spearman Correlation analysis was executed in the data analysis. The results were concluded that the independent variables of sense of achievement, personalization, money availability and content activation have significance relationship towards factors that affecting online impulse buying behaviour on microtransaction spending in freemium online games among Gen-Z consumer in Malaysia. Limitations of this study and recommendations are included in this paper to provide a better idea for future researchers related to studies involving online impulse buying behaviour and freemium online games.

Keywords: *Freemium Online Game, Gen-Z consumer, Malaysia, Microtransaction, Online Impulse Buying Behaviour*

1 Introduction

In the previous decades, online video games have achieved significant growth. Consumers could undertake different social interactions in these games as opposed to playing games in solitude. A broad variety of games, such as massively multiplayer online games (MMO) (e.g., World of Warcraft and Maplestory M), first - person shooter games (FPS) (e.g., Counter Strike Global Offensive, Overwatch and Call of Duty: Mobile), real-time strategy games (RTS) (e.g., StarCraft, Age of Empires and Clash of Clan), multiplayer online battle arena game (MOBA) (e.g., Defense of the Ancients 2, Arena of Valor and Mobile Legends: Bang Bang) and the more recently emerged battle royal games (e.g., PlayerUnknown's Battlegrounds, Fortnite Battle Royale and Apex Legends), belong to this category. It is now projected that the global video game industry will be

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

worth \$159.3 billion in 2020, which is a significant 9.3% rise from 2019. With 2016 estimates predicting a total valuation of \$90.07 billion for the same time, this is a marked change in what was expected for the industry - a massive 76.8% difference between the two figures. The video game industry is currently expected to be worth \$200 billion by 2023 (Gough, 2020).

Freemium games have been increasingly popular in recent years, across all types of online video games. Consumers playing freemium games do not have to pay to play a fully functioning game, but to enhance their playing experience, they are given several purchasing opportunities which is through microtransactions (Wei Shi, Xia, & Huang, 2015). Freemium or free-to-play (F2P) games can be downloaded from app stores or video game digital distribution sites digitally at no cost. Although there may not be an initial purchase cost for F2P games, players frequently have to pay a premium fee in the form of real money transactions (microtransactions) to access such game content.

Following the drastic growth of online video games industry, many scholars have paid attention on why lead consumers to perform microtransaction spending in freemium online games whether it is impulsively or not (Hamari, et al., 2017) (Hsiao & Chen, 2016) (Balakrishnan & Griffiths, 2018). Microtransaction spending on online games is similar to spending money doing online shopping, thus making impulse buying behaviour that this study focus on is also online impulse buying behaviour. The impulse purchase behaviour phenomenon also can be seen in Malaysia as said by Malaysia Retail Chain Association (MRCA) president Datuk Seri Garry Chua, Malaysia will have at least 700 shopping malls in 2019 as the high value retail goods received 30% increase in business such as fashion, mobile phones, luxury items and gadgets compared to the essential items (Kaur, 2018).

Several problems that have arisen in the eyes of the consumers are where the impulse buying behaviour has been connected to debt growth, money-wasting, personal financing illiteracy and lack of sense of differentiating needs and wants (Nur, 2019). This repeated behaviour has contributed to a number of problems among consumers who spend more than what they are capable of, growing debt and lack of sense of differentiating needs and wants (Mohamed, et al., 2020). This study intends to help Gen-Z consumers especially on their understanding on this issue thus making the researcher intend to study factors that affecting online impulse buying behaviour on microtransaction spending in freemium online games among Gen-Z consumer in Malaysia.

1.1 Research Objectives

1. To identify relationship between consumers' sense of achievement and online impulse buying behaviour on microtransaction spending in freemium online games among Gen-Z consumer in Malaysia.
2. To determine relationship between personalization and online impulse buying behaviour on microtransaction spending in freemium online games among Gen-Z consumer in Malaysia.
3. To figure out relationship between money availability and online impulse buying behaviour on microtransaction spending in freemium online games among Gen-Z consumer in Malaysia.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

1.2 Significance of Study

The findings of this study will greatly benefit to the vast sea of knowledge of social studies in relation of academicians, practitioners and students' achievements worldwide. Vital results of this research could be highly significant and beneficial, especially to the consumers of freemium online games. By increasing their own awareness on what is the factors that affect consumers to buy a virtual item through microtransaction spending impulsively, consumers can acknowledge the root of the problem and avoid from being in a problematic position.

On the side of freemium online games developer, by knowing the factors that affect consumers, they can adjust goods and services that they offer suitable to the factors that been studied in order to further increase their sales and profits. For the researchers, this study will help uncover future problem or critical areas regarding this topic that many local researchers do not yet explore.

2 Literature Review

2.1 Underpinning Theory

2.1.1 McClelland's Human Motivation Theory

Human motivation is, according to David McClelland, "a persistent concern for a target condition or state as measured in fantasy that drives, directs and selects the individual's actions". In the 1940s, working with Henry Murray, he concentrated on three specific motives: the Need for Achievement (N Ach); the Need for Association (N Aff); and the Need for Power (N Pow). His work was based on N Ach from the late 1940s through the 1960s. He also said that everybody has all three of these motivations, but simply with a different relative degree, and a special combination that gives one his personality is the product of the requirements (McClelland, 1987).

Figure 1: McClelland's Human Motivation Theory model

For this research, one of the motives of McClelland's Human Motivation Theory are used for references in effort of constructing independent variable for the research. It is necessary to achieve the motive that is being used. The Need for Achievement is an

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

unconscious push towards a degree of performance to do better. Individuals with a deep need for performance measure themselves against clear targets.

2.1.2 *Uses and Gratifications Theory*

The theory of uses and gratifications, first stated in 1959 by Elihu Katz, shows that people use media with various purposes and play an active role in choosing the information services they are able to access (Liang, Lai, & Ku, 2006). Uses and gratifications are a theory used to describe how media are used for different purposes to fulfil the needs of individuals (Smock, Ellison, Lampe, & Wohn, 2011).

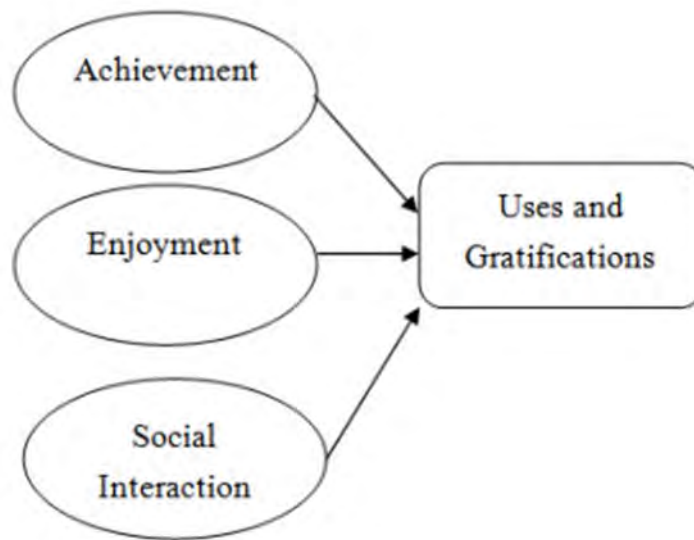

Figure 2: Conceptual model of Uses and Gratifications Theory
Source: (Chuang, 2015)

The theory of uses and gratifications has three key components, according to previous research, one of it is achievement, which refers to improving esteem, status, and credibility (Wu, Wang, & Tsai, 2010) (Wasko & Faraj, 2005). Consequently, the viewpoint of uses and gratifications takes an individual view. In order to satisfy their needs, people can select distinct contingencies to follow suitable social media. In addition, these needs can contribute to multiple cognitive, affective and behavioural outcomes (Wu, Wang, & Tsai, 2010) (Pornsakulvanich, Haridakis, & Rubin, 2008).

2.1.3 *Theory of Personalization of Appearance*

(Blom & Monk, 2003) suggest that the theory of appearance personalization shown in Figure 2.3 is a detailed account of the perceived arrangements for, and consequences of, appearance personalization. The provisions predict behaviour; one would expect personalization to be more likely to take place if they were present. Similarly, the implications derive from behaviour. The more personalization has taken place, the more evident these consequences may be. Psychologists have learned not to trust experience reports as the only proof of a psychological mechanism, and instead tend to conclude from studies in which manipulations result in improvements in behaviour observed.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

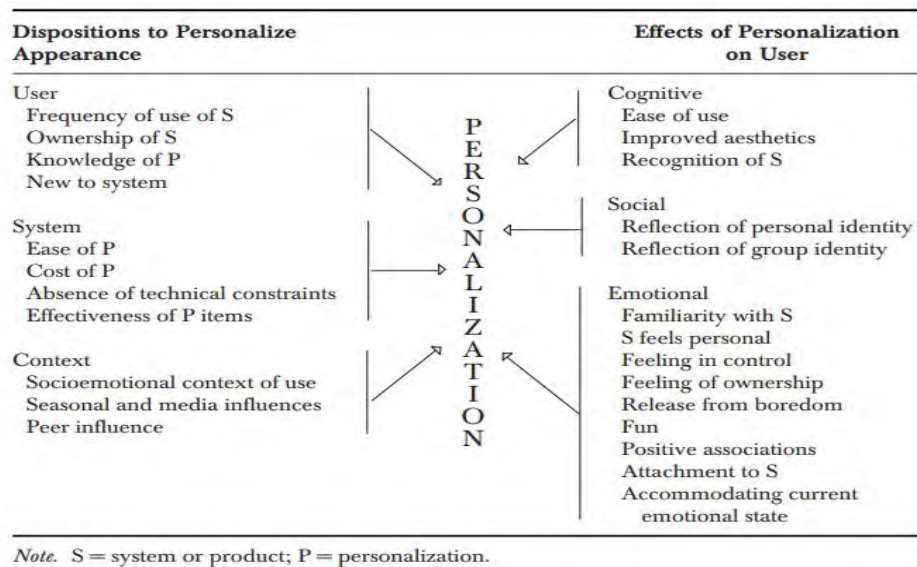

Figure 3: The Theory of Personalization of Appearance
 Source: (Blom & Monk, 2003)

2.1.4 Process-Oriented Theory: User Participation and Involvement

The degree of user engagement in the process of building their interest profiles is another dimension relevant to personalization. Based on the theory of user involvement, the participation of the user in the process can increase user satisfaction. The practitioner and researcher argued that user engagement in the creation and implementation of information systems was important in the early 1960s (Ives & Olson, 1984).

At that time, a design approach reflecting the emphasis on user participation (called participative design) was popular. User participation was later distinguished by (Barki & Hartwick, 1989) as a set of activities or behaviours performed by potential users and user participation as a subjective psychological condition, indicating the significance and personal relevance attached to a given method by a user.

2.2 Money Availability

The availability of money can be defined as a sum of money or additional funds that a person has and that extra money has to be spent on that same day (Beatty & Ferrell, 1998), so that the money availability is considered a significant factor in the impulse buying phase that is simulated by the individuals involved to affect purchasing power (Foroughi, Buang, Senik, & Hajmisadeghi, 2012). The conduct of consumer spending with the availability of additional funds would make customers have their own experience of spending additional funds (Roach, et al., 2018) (Zukin & Maguire, 2004). (Luo, 2004) also illustrates that the availability of money will increase the risk of impulsive purchases.

Furthermore, (Huang & Hsieh, 2011) notes that when they feel they have extra money to spend, consumers feel stimulated, giving rise to a positive emotional state. As a consequence of the feeling of greater financial resources being available, the negative feeling that can be produced from the frustration with the inability to access the affordable products found in the store is reduced (Dinesha & Kankanamge, 2014). The more money

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

you have, the greater the incentive for buyers to make transactions and, of course, the greater the chances of purchasing momentum (Beatty & Ferrell, 1998). Money plays an important role in such circumstances, which can affect the actions and attitudes of an individual (Badgaiyan & Verma, 2011). In the process of impulse buying, money availability is a facilitator since the purchasing power of an individual is defined by the amount of money, he owns (Beatty & Ferrell, 1998).

People's positive emotions are often linked to wealth, employment, or social status, according to research (Seligman & Csikszentmihalyi, 2000). It is more likely that people who feel that they have enough resources will be satisfied. Specifically, the availability of money plays a facilitating role because it increases consumer purchasing power. They seem to be more optimistic and happier when customers have more money on hand to spend (Srivastava & Kumar, 2007). Similarly, (Wood, 1998) found that customers are more likely to experience optimistic emotions with more cash availability. Therefore, the availability of money may positively moderate the relationship between the emotional responses of customers to the environmental characteristics of retail and their buying behaviour because customers with high availability of money may feel happier and respond more positively to the clothing environment and thus make purchases of momentum compared to those with low availability of money (Chang, Yan, & Eckman, 2014).

2.3 Content Activation

Content is that the most of what is found in a game, according to (Shaker, Togelius, & Nelson, 2016) definition: maps, levels, textures, game rules, items, plots, music, quests, vehicles, weapons, characters, etc. In their concept, the game engine itself is not considered to be material. In addition, non-player character behaviour is often not considered content. For example, addons, access to certain gaming options, new gaming content, downloadable content (DLC), the ability to multi-play and delete undesirable content such as advertisements, all by payment, are the most common methods of accessing such content (Harviainen & Hamari, 2015; Lehdonvirta & Castronova, 2014). Access and content are also more or less the two of the same coins on both sides, where one suits the other more or less, such as access to new content.

Related product-based commodity categories associated with console games and personal computer (PC), such as downloadable content, expansion packs and shareware, are rooted in the option of buying additional game content (Nieborg, 2014; Nieborg, 2011). For instance, while the first three episodes of Candy Crush (i.e. sets of levels) are free, players at level 35 are given three options: investing cash by spending bars of gold, spending time playing out a variety of challenges that are postponed again, or spending social capital by asking three Facebook Friends for assistance.

Downloadable content from a strictly consequentialist viewpoint is a complicated issue. If the DLC is actually created after the content sold and intended to provide the game with more, but not critical content, it passes muster from both the point of view of intent and effects, the intention is to provide the player a choice to buy more content to expand your gaming experience and improving it (Kimppa, Heimo, & Harviainen, 2016). During game development, however, a lot of DLC is created and the game has been

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

disadvantaged by delete it before release; make the playable game unplayable; at least significantly decreasing the playing experience, and thus even the purpose, let alone the repercussion, is unethical.

Usually, new gaming content sold inside the game is a fairly straightforward problem, but it just rips the player off. The player is unenlightened of the possibility, and is unexpectedly evoked to the possibility of purchasing content in the game that they did not know they wanted to buy in order to achieve the completion of the game (Kimppa, Heimo, & Harviainen, 2016). On the other hand, the ideal only consequentialist gaming addition is to provide a user-generated content alternative for the players-it is deliberately wise to give the players resources to expand the game, and the results could not be better from the perspective of the players. Regardless of the fact that content monetization produced by third parties can be very tricky (Lehdonvirta & Castronova, 2014), an increasingly viable market strategy for publishers also appears to be.

2.4 Hypotheses Statement

H₀: There is no significant relationship between consumers' sense of achievement and online impulse buying behaviour on microtransaction spending in freemium online games among Gen-Z consumer in Malaysia.

H₁: There is significant relationship between consumers' sense of achievement and online impulse buying behaviour on microtransaction spending in freemium online games among Gen-Z consumer in Malaysia

H₀: There is no significant relationship between personalization and online impulse buying behaviour on microtransaction spending in freemium online games among Gen-Z consumer in Malaysia.

H₂: There is significant relationship between personalization and online impulse buying behaviour on microtransaction spending in freemium online games among Gen-Z consumer in Malaysia

H₀: There is no significant relationship between money availability and online impulse buying behaviour on microtransaction spending in freemium online games among Gen-Z consumer in Malaysia

H₃: There is significant relationship between money availability and online impulse buying behaviour on microtransaction spending in freemium online games among Gen-Z consumer in Malaysia

H₀: There is no significant relationship between content activation and online impulse buying behaviour on microtransaction spending in freemium online games among Gen-Z consumer in Malaysia.

H₄: There is significant relationship between content activation and online impulse buying behaviour on microtransaction spending in freemium online games among Gen-Z consumer in Malaysia.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

2.5 Conceptual Framework

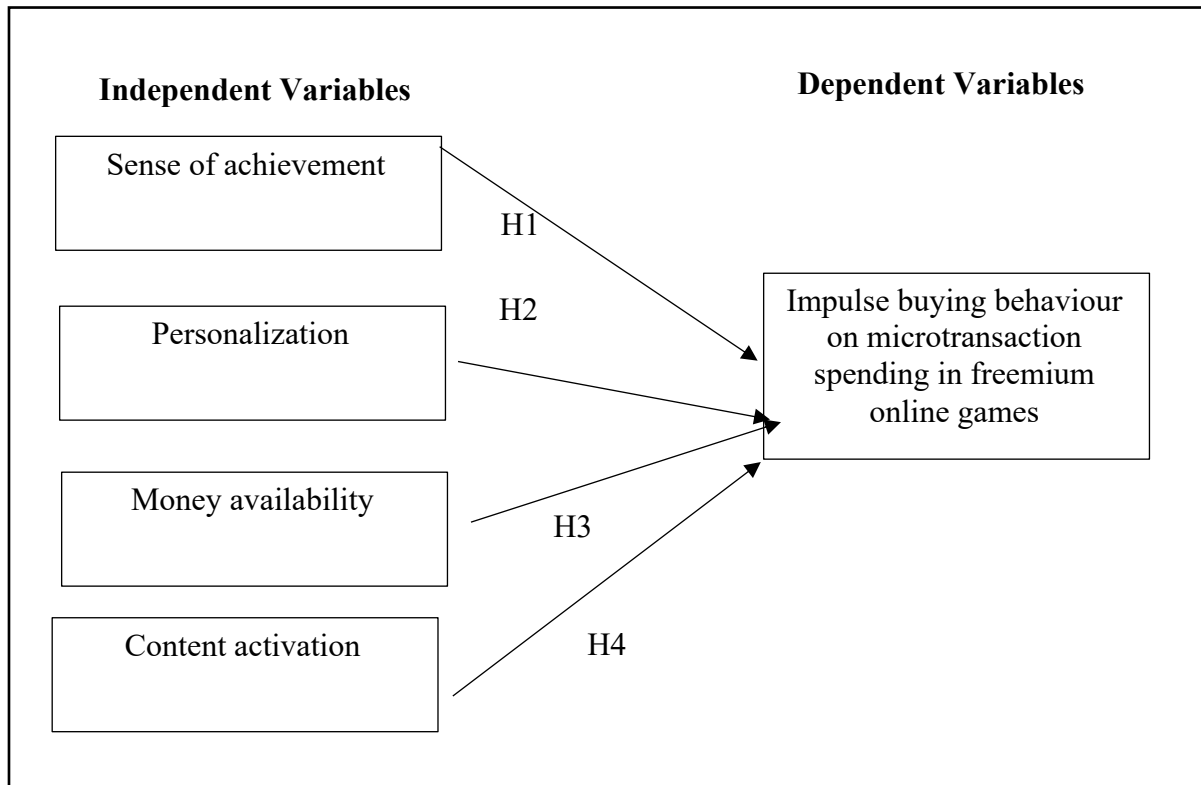

Figure 4: Conceptual framework of the study

3 Methodology

3.1 Research Design

Research design is the key project, according to (Zikmund, 2003), that outlining the methods, processes, and procedures used to collect and analyse the necessary information. Research design may generally be defined as a framework for setting up and carrying out a specific study. In this analysis, researchers used the process of data collection as a quantitative approach. According to (Burns & Bush, 2006), the quantitative method is defined as a study of large numbers of individuals engaged in the use of standardised questions that have prearranged the response options. A random sampling and organised collection of data is a quantitative process, according to (Walliman, 2017). It is possible to calculate and express quantitative data in the form of numbers. The approach that involves selecting samples based on particular intervals is systematic random sampling (Walliman, 2017). By using tools such as questionnaires, the quantitative approach produces statistics. A structure questionnaire was designed to gather the data on factors that affecting online impulse buying behaviour on microtransaction spending in freemium online games among Gen-Z consumer in Malaysia. In order to obtain numerical measurement and discover the relationship, the information was then analysed by entering it into SPSS.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

3.2 Data Collection

Data collection methods are according to (Sekaran, *Research Methods for Business: A Skill Building Approach* (4th Edition), 2003), an important part of the research process. Via two primary and secondary resources, data and information can be gathered. In this research, data collection is a popular online survey questionnaire using the primary method of data collection. An online questionnaire is used to collect information from young consumers in all across Malaysia. Next, based on the questionnaire, SPSS is used as a method to classify and analyse the data. Secondary data is data that has already been gathered and made publicly available to primary sources for researchers to use for their own study. It is a kind of information that in the past has already been gathered. Researchers have used a number of secondary materials and compiled them. Website information, online journals and articles, as well as newspapers and magazines, for example.

3.3 Sampling

In this research, the target population consisted people who are in the age range between 16 - 24 years old, and that are used to perform microtransaction spending once or more in their life that lives all across Malaysia. For the purpose of this research, the data will be collected through student from various local universities and local high schools. According to United Nations, Department of Economic and Social Affairs, Population Division, *Prospects 2010*, the age bracket of 16 -24 years old consist 18.7% of Malaysia total population which is 31,949,777, thus making population for selected Gen-Z consumer 5,974,608 approximately. For this study, the most appropriate sample size which is based on (Krejcie & Morgan, 1970) is 384 considering the population size is 5,974,608 approximately. The selection of the sampling technique in this study will be cluster sampling. Cluster sampling is a probability sampling method that is also frequently used to examine large populations., particularly those widely distributed geographically (Thomas, 2020). Typically, researchers use pre-existing units as their clusters, such as schools, universities or towns. According to (Thomas, 2020), cluster sampling is time-efficient and cost-effective, especially for samples that are widely dispersed geographically and would otherwise be difficult to sample properly.

3.4 Data Analysis

The information obtained from the survey questionnaire was analysed using data analysis. The analytical methods used to transfer raw data into concrete numbers and information are illustrated in this section. In this analysis, the set of data will be measured and analysed using SPSS. IBM SPSS (*Statistical Package for Social Science*) Statistics version 26 would be used for this study. According to Uma Sekaran and Bougie (2016), SPSS was the system which can make the statistical data analysis. The researcher can use IBM SPSS Statistics to understand the data, to analyse, forecast and plan. A pilot test, reliability test, descriptive analysis, normality test and Spearman Correlation analysis will be conducted for this data analysis.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

3.5 Pre-Testing of The Instrument (Pilot Test)

In order to make sure that the questionnaire can be used for the research, a pilot test was conducted to test the validity and reliability of the questionnaire. Researcher distributed questionnaires for pilot test through Google Form and only collected first 30 responses to be used in pilot test as data. Table 1 show the result of reliability test of questionnaire to identify the questionnaire answering the research objective.

Table 1: Result of Reliability Test for Independent Variable and Dependent Variable

Variables	Cronbach Alpha	Number of Items
Online Impulse Buying Behaviour	0.757	5
Sense of Achievement	0.926	5
Personalization	0.830	5
Money Availability	0.717	4
Content Activation	0.826	5
Total	0.922	24

According to Table 1 result, value of each section of questionnaire is acceptable because it is more than 0.700 of Cronbach Alpha. The highest value of Cronbach Alpha is for sense of achievement variable which is 0.926 that is section C in questionnaire and the lowest value of Cronbach Alpha is money availability variable which is 0.717 that is section E in questionnaire. Researcher decides to remain using the questionnaire and there are no changes or deletion in any sections. As a result, the questionnaire is reliable and can be used in this research because the total value of Cronbach Alpha for all variables is 0.922 which is in the range of high correlation that is excellent and acceptable.

4 Findings

The number of respondents needed for this research is 384 respondents but researcher managed to collect 386 respondents. Researcher proceed to use 386 respondents for data analysis.

4.1 Demographic Profile of Respondents

Table 2: Demographic Profile of 386 Respondents

Demographic Profile (N=386)			
Demographic Characteristics	Category	N	Percentage (%)
Gender	Male	169	43.8
	Female	217	56.2
Ethnicity	Bidayuh	4	1.0
	Bugis	6	1.6
	Chinese	74	19.2
	Dusun	3	0.8

4.2 Descriptive Analysis

Table 3: Descriptive Statistics of Dependent Variable and Independent Variables

Variables	Descriptive Statistics		
	N	Mean	Std. Deviation
Online Impulse Buying Behaviour	386	3.4772	1.04861
Sense of Achievement	386	3.5674	.95154
Personalization	386	3.4192	.80592
Money Availability	386	3.1671	1.02244
Content Activation	386	3.5150	.99965

Table 3 showed the overall descriptive statistics of dependent variable and independent variables in factors that affecting online impulse buying behaviour on microtransaction spending in freemium online games among Gen-Z consumer in Malaysia. For the independent variable, sense of achievement that has the highest value of mean indicated at 3.5674 followed by content activation with the mean of 3.5150 and personalization with the value of mean at 3.4192. In comparison, money availability recorded as having the lowest value of mean, which is 3.1671. However, the value of mean for dependent variable which is online impulse buying behaviour was recorded at 3.4772. Through the result, it shows that most of the respondents agreed that sense of achievement has the most effect online impulse buying behaviour on microtransaction spending in freemium online games among Gen-Z consumer in Malaysia, whereas money availability has the least effect. Besides, the standard deviation is indicated how close the data is to the mean. Based on table 3, the highest standard deviation for independent variable is money availability, which represented at 1.02244, followed by content activation, which is at 0.99965, and sense of achievement, which is 0.95154. In comparison, the lowest standard deviation is personalization, which represented at 0.80592. However, the standard deviation for dependent variable which is online impulse buying behaviour represented at 1.04861 making it the highest overall standard deviation of all variables.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

4.3 Reliability Test

Unlike in the pilot test which is only 30 response from 30 respondents were collected in order to test the reliability of the questions before the questionnaire being spread out, this reliability test was carried out in order to test whether the questions in questionnaire is still reliable even after responses being collected from actual number of respondents which are 384 respondents. Table 3 show the result of reliability test of questionnaire to identify the questionnaire answering the research objective.

Table 3: Result of Reliability Test for Independent Variable and Dependent Variable

Variables	Cronbach Alpha	Number of Items
Online Impulse Buying Behaviour	0.909	5
Sense of Achievement	0.852	5
Personalization	0.782	5
Money Availability	0.833	4
Content Activation	0.885	5

According to Table 3 result, value of each section of questionnaire is acceptable because it is more than 0.700 of Cronbach Alpha. The highest value of Cronbach Alpha is for sense of achievement variable which is 0.909 that is section B in questionnaire and the lowest value of Cronbach Alpha is personalization variable which is 0.782 that is section D in questionnaire. Researcher decides to remain using the questionnaire and there are no changes or deletion in any sections. Due to the coefficient obtained for all questions of variables have a good consistency and stability, therefore all questions used for this variable is valid and reliable.

4.4 Normality Test

Table 4: Test of Normality of All Variables

	Tests of Normality					
	Kolmogorov-Smirnov ^a			Shapiro-Wilk		
	Statistic	df	Sig.	Statistic	df	Sig.
Online Impulse Buying Behaviour	.170	386	.000	.870	386	.000
Sense of Achievement	.161	386	.000	.918	386	.000
Personalization	.118	386	.000	.960	386	.000
Money Availability	.179	386	.000	.938	386	.000
Content Activation	.169	386	.000	.922	386	.000

The normality of data was checked and analysed in the SPSS system. The Kolmogorov-Smirnov^a and Shapiro-Wilk test was used in this study to test the data for normality. There are two ways to comprehend about distribution which are normal and abnormal distribution. The any variables that have p-value lesser than 0.05 was data regarding abnormality.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Based on the Table 4, it shows test of normality of all variables in the study through Kolmogorov-Smirnov^a and Shapiro-Wilk test. The outcome in each test shows that all the significant value, p is 0.000 which is less than 0.05 thus making the data as abnormal because does not follow a normal distribution. Due to the result in this test, in order to define the relationship between two variables in this study, Spearman correlation analysis should therefore be applied in hypothesis testing instead of Pearson correlation analysis (Newson, 2002).

4.5 Hypotheses Testing (Spearman Correlation Analysis)

4.5.1 Sense of Achievement

Table 5: Correlation Coefficient between Sense of Achievement and Online Impulse Buying Behaviour On Microtransaction Spending in Freemium Online Games

			Correlations	
			Online Impulse Buying Behaviour	Sense of Achievement
Spearman's rho	Online Impulse Buying Behaviour	Correlation Coefficient	1.000	.788**
		Sig. (2-tailed)	.	.000
		N	386	386
	Sense of Achievement	Correlation Coefficient	.788**	1.000
		Sig. (2-tailed)	.000	.
		N	386	386

Based on Table 5, it shows the Spearman's correlation coefficient, significant value and 386 numbers of respondents. The result of the significant value, ρ , for this analysis is lower than the alpha root (0.01) which is 0.000 and this indicates that there is a positive relationship between sense of achievement and online impulse buying behaviour on microtransaction spending in freemium online games. The correlation coefficient for sense of achievement and online impulse buying behaviour on microtransaction spending in freemium online games is 0.788 and according to (Hinkle, Wiersma, & Jurs, 2003) this indicates a strong strength of correlation between sense of achievement and online impulse buying behaviour on microtransaction spending in freemium online games. Therefore, null hypothesis was rejected after Spearman correlation analysis was conducted and it means that this study accepts alternate hypothesis (H_1).

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

4.5.2 *Personalization*

Table 6: Correlation Coefficient between Personalization and Online Impulse Buying Behaviour On Microtransaction Spending in Freemium Online Games

			Correlations	
			Online Impulse Buying Behaviour	Personalization
Spearman's rho	Online Impulse Buying Behaviour	Correlation Coefficient	1.000	.732**
		Sig. (2-tailed)	.	.000
		N	386	386
	Personalization	Correlation Coefficient	.732**	1.000
		Sig. (2-tailed)	.000	.
		N	386	386

Based on Table 6, it shows the Spearman's correlation coefficient, significant value and 386 numbers of respondents. The result of the significant value, ρ , for this analysis is lower than the alpha root (0.01) which is 0.000 and this indicates that there is a positive relationship between personalization and online impulse buying behaviour on microtransaction spending in freemium online games. The correlation coefficient for personalization and online impulse buying behaviour on microtransaction spending in freemium online games is 0.732 and according to (Hinkle, Wiersma, & Jurs, 2003) this indicates a strong strength of correlation between personalization and online impulse buying behaviour on microtransaction spending in freemium online games. Therefore, null hypothesis was rejected after Spearman correlation analysis was conducted and it means that this study accepts alternate hypothesis (H_2).

4.5.3 *Money Availability*

Table 7: Correlation Coefficient between Money Availability and Online Impulse Buying Behaviour On Microtransaction Spending in Freemium Online Games

			Correlations	
			Online Impulse Buying Behaviour	Money Availability
Spearman's rho	Online Impulse Buying Behaviour	Correlation Coefficient	1.000	.794**
		Sig. (2-tailed)	.	.000
		N	386	386
	Money Availability	Correlation Coefficient	.794**	1.000
		Sig. (2-tailed)	.000	.
		N	386	386

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Based on Table 7, it shows the Spearman's correlation coefficient, significant value and 386 numbers of respondents. The result of the significant value, ρ , for this analysis is lower than the alpha root (0.01) which is 0.000 and this indicates that there is a positive relationship between money availability and online impulse buying behaviour on microtransaction spending in freemium online games. The correlation coefficient for money availability and online impulse buying behaviour on microtransaction spending in freemium online games is 0.794 and according to (Hinkle, Wiersma, & Jurs, 2003) this indicates a strong strength of correlation between money availability and online impulse buying behaviour on microtransaction spending in freemium online games. Therefore, null hypothesis was rejected after Spearman correlation analysis was conducted and it means that this study accepts alternate hypothesis (H_3).

4.5.4 Content Activation

Table 8: Correlation Coefficient between Content Activation and Online Impulse Buying Behaviour On Microtransaction Spending in Freemium Online Games

			Correlations	
			Online Impulse Buying Behaviour	Content Activation
Spearman's rho	Online Impulse Buying Behaviour	Correlation Coefficient	1.000	.771**
		Sig. (2-tailed)	.	.000
		N	386	386
	Content Activation	Correlation Coefficient	.771**	1.000
		Sig. (2-tailed)	.000	.
		N	386	386

Based on Table 8, it shows the Spearman's correlation coefficient, significant value and 386 numbers of respondents. The result of the significant value, ρ , for this analysis is lower than the alpha root (0.01) which is 0.000 and this indicates that there is a positive relationship between content activation and online impulse buying behaviour on microtransaction spending in freemium online games. The correlation coefficient for content activation and online impulse buying behaviour on microtransaction spending in freemium online games is 0.771 and according to (Hinkle, Wiersma, & Jurs, 2003) this indicates a strong strength of correlation between content activation and online impulse buying behaviour on microtransaction spending in freemium online games. Therefore, null hypothesis was rejected after Spearman correlation analysis was conducted and it means that this study accepts alternate hypothesis (H_4).

5 Discussion

5.1 Sense of Achievement

According to previous studies by (Yee, 2007), achievement act as one of three overarching components that gives motivations for various demographic variable such as age, gender and usage pattern to play game. Sub components such as advancement of the game, mechanics of the game and competition among players makes achievement a

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

strong reason to play game. It can be concluded that Gen-Z consumer that has a high sense of achievement is likely to impulsively buy things in game thus proving the positive relationship and strong correlation strength between sense of achievement and online impulse buying behaviour.

5.2 Personalization

According to the previous studies by (Lehdonvirta, Virtual item sales as a revenue model: identifying attributes that drive purchase decisions, 2009), personalisation which is an act that allowing users to modify attributes of the asset according to their preferences can also strengthen the emotional bond the user has with the asset which in this case a character or object used by a character in freemium online game. It can be concluded that personalization becomes somewhat a preference for Gen-Z consumer that cause them to impulsively buy things in game. Thus, proving the positive relationship and strong correlation strength between personalization and online impulse buying behaviour.

5.3 Money Availability

According to the previous studies by (Dey & Srivastava., 2017), money availability positively moderates the relationship between consumers' hedonic shopping value and impulse buying intentions. This situational factor may influence how young consumers feel and therefore trigger their impulse buying intentions. It can be concluded that Gen-Z consumer are also a part of young consumers that can be influence by money availability factor and trigger their online impulse buying behaviour that can cause them to impulsively buy things in game. Thus, proving the positive relationship and strong correlation strength between money availability and online impulse buying behaviour.

5.4 Content Activation

According to the previous studies by (Hamari & Lehdonvirta, Game design as marketing: How game mechanics create demand for virtual goods, 2010), one major form of in-game content is simply more content to play such as maps and levels. Doesn't matter whether its stratified content, increasingly challenging content, horizontal gameplay content or alterations to existing content, content keeps the game interesting and exciting for consumers and leave them wanting more. It can be concluded that activating a content is a thrilling thing to do for Gen-Z consumer that makes them impulsively do their microtransaction spending in game. Thus, proving the positive relationship and strong correlation strength between content activation and online impulse buying behaviour.

6 Recommendations

For the future research, researcher can increase the number of sample size of the study in order to get even higher degree of accuracy and lower margin of error. The sample size that this study currently used has a 0.05 margin of error with 95% of data confidence. The sample size needs to wisely chosen because the sampling affected the usefulness of the data (Salkind, 2003). Future studies could be based on a larger sample and over a longer period of time in order to get more respondents who are used to perform microtransaction spending once or more in their life.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

In addition, future research can also focus on a few data collection methods, for example, using the various assessment devices, for example, next to using the survey, the analyst can make a central gathering and top-to-bottom meetings as well as using the open-finished poll. The researchers can discover more information from the direct interview and open-ended questionnaire that affect the perception of the consumer on online food delivery apps, as well as simply relying on the one methodology. By using the various estimation strategies, the result can be more grounded than using the one methodology.

7 Conclusion

This research was conducted to figure out factors affecting online impulse buying behaviour on microtransaction spending in freemium online games among Gen-Z consumer in Malaysia and also aim to identify the relationship between four independents of the study which is sense of achievement, personalization, money availability and content activation. Researchers have collected data and distributed questionnaires made in Google Form through social media platforms such as WhatsApp, Instagram, Twitter and Facebook to a certain group of users that fit the scope of study.

In this study, there are four hypotheses developed to test the relationship between the dependent variable and the independent variable. Researchers have used probability sampling which is cluster sampling in the collection of respondent's data because cluster sampling is appropriate for samples that are widely dispersed geographically and would otherwise be difficult to sample properly. The minimum sample for this study is 384 people. However, the researcher has managed to obtain a few more responses from the respondents in total of 386. Descriptive analysis, reliability tests, test of normality, and Spearman correlation analysis were executed using IBM SPSS 25 software.

The results of the Spearman correlation analysis have shown that there is a positive relationship between the variables (sense of achievement, personalization, money availability and content activation) to the dependent variables (online impulse buying behaviour). This study becomes beneficial in all three recipient which are freemium online games developer, consumers and researcher because of the new understanding and new knowledge it provides to them either directly or indirectly.

**THE RELATIONSHIP OF BUSINESS AND FAMILY
SUPPORTS ON BUSINESS PERFORMANCE:
CASE OF WOMEN ENTREPRENEURS AT PASAR SITI
KHADIJAH IN KELANTAN**

Muhammad Hafiz Mustakim Bin Suhaimi and Anis Amira Binti Ab Rahman

Faculty of Entrepreneurship and Business,
University Malaysia Kelantan,
Malaysia

[Email: mustakim.a17a0272@siswa.umk.edu.my](mailto:mustakim.a17a0272@siswa.umk.edu.my); anisamira@umk.edu.my

Abstract:

The involvement of women in business began in the 19th century again, especially in Kelantan. Therefore, this study aims to explore the relationship of business and family support on business performance among women entrepreneurs in Pasar Siti Khadijah in Kelantan. The objective of this study is to explore the relationship between entrepreneurship training, financial support, and family moral support on business performance among women entrepreneurs at Pasar Siti Khadijah. A total of 5 entrepreneurs who do business in the Siti Khadijah Market were selected as the study respondents. This study uses questionnaire instruments as well as in-depth interviews. The results of the study showed that 95% of the respondents are women entrepreneurs. The results of this study show that women entrepreneurs venture into business is due to family support and financial support that can encourage them to venture into business. In this study, the relationship of business and family support on business performance among woman entrepreneurs at Pasar Siti Khadijah in Kelantan will be focused and explored. From this study, the women entrepreneurs at Pasar Siti Khadijah area may have better business and family supports on business performance. Therefore, researchers want to research and find out more deeply about why women prefer to venture into the field of entrepreneurship and what causes them to become entrepreneurs in the Pasar Siti Khadijah. Researchers also want to know about the relationship of business and family support on business performance. It is hoped that more women entrepreneurs will venture into business and be able to provide benefits to any stakeholders and improve the country's economy. This clearly shows that women entrepreneurs in Kelantan can face challenges and obstacles in business. Thus, their economy and income are always sustainable and able to maintain business until now.

Keywords: *Women Entrepreneurs, Business Performance, Entrepreneurship Training, Financial Support, Family Moral Support*

1 Introduction

Entrepreneurship is an activity that aims to increase the country's wealth through increasing economic activities to create more employment opportunities and generate higher income for society. Entrepreneurship is the act of forming a new company or returning an existing one to benefit from new opportunities (Nath, 2011). Meanwhile (Sarri & Trihopoulou 2005) acknowledged that entrepreneurship is a crucial factor in achieving the competitive and dynamic essence of today's knowledge economy. They

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

have also confirmed that this is the key driver of economic growth and the production of jobs. It also contributes to the personal growth and manages various pathogens effectively. At present, in the business world, both men and women are actively competing. There is a significantly lower number of women worldwide participating in entrepreneurial activities relative to men. In their state of mind, females have achieved tremendous growth. As the service sector becomes more dependent, several business opportunities, especially for women have been created to improve their capacities by keeping balance in their lives (Nath, 2011). The traditional state of mind has changed so much that women who lead career families are viewed as capable of independently managing business. Thus, the Malaysian government has created and developed endless efficiency, resilient and productive entrepreneurship by promoting an enterprising culture among Malaysian women.

Several studies have been conducted with women entrepreneurs worldwide and most scholars agreed that women entrepreneurs are lacking, particularly in financial support. Since women entrepreneurs in Pasar Siti Khadijah are the focus of the study, the researcher will analyze the business and family support that will affect their business performance. Thus, this research will investigate three business and family support faced by women entrepreneurs which are entrepreneurship training, financial support and family moral supports. Furthermore, this is a qualitative analysis that will be based on data from interviews and not on data archived or accessible on the internet. Due to the recent crisis in our country, the Coronavirus disease-19 (Covid-19) which has caused the government to impose a Movement Control Order (MCO), most traders or small entrepreneurs have had to close their businesses. Due to the closure of the business for more than three months, small entrepreneurs are having trouble continuing their business due to financial and capital problems especially. Most small entrepreneurs suffer losses due to MCOs. After the government allowed the entrepreneurs to reopen their business, some entrepreneurs could not afford to continue their business, and some were unable to start the business again due to having a debt balance with the supplier. Many entrepreneurs are affected as a result of the COVID-19 epidemic that is plaguing the country and the world today, especially in financial and capital problems to start a business again.

1.1 Research Objectives

1. To explore the relationship between entrepreneurship training on business performance.
2. To explore the relationship between financial support on business performance.
3. To explore the relationship between family moral support on business performance.

1.2 Significant of Study

In this study, the relationship of business and family support on business performance among woman entrepreneurs at Pasar Siti Khadijah in Kelantan will be focused and explored. From this study, the women entrepreneurs at Pasar Siti Khadijah area may have better business and family supports on business performance. Therefore, researchers want to research and find out more deeply about why women prefer to venture into the field of

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

entrepreneurship and what causes them to become entrepreneurs in the Pasar Siti Khadijah. Researchers also want to know about the relationship of business and family support on business performance. Does business and family support have a profound effect on business performance.

This research was undertaken to see what corporate and family support among women entrepreneurs would contribute to business performance. This study also aims to find out what business and family support that women entrepreneurs in the Pasar Siti Khadijah they get. Through the study conducted, researchers can find out what business and family support obtained by women entrepreneurs in Pasar Siti Khadijah on business performance. Through the study conducted, the researcher can also observe, study and evaluate the extent of involvement of women entrepreneurs in the Pasar Siti Khadijah.

2 Literature Review

2.1 Relationship of Entrepreneurship training on Business Performance.

Three interesting foundations can explain the connection between entrepreneurship training and rural entrepreneurial achievement (Kunene, 2009; Smith & Perks, 2006; Solomon, 2004). For example, (Solomon 2004) discovered the need for entrepreneurial skills and business skills to improve business efficiency during his research on business training. Meanwhile (Kunene, 2009) argued that the expertise and skills of entrepreneurs are essential drivers of successful companies. Small business training is based mostly internally and provides general management competencies, including marketing, finance, recordkeeping, people, and industrial relations (Solomon, 2004). Similarly, enterprise training is important to the overtime growth of SMEs, and it shows a clear connection between business and entrepreneurial skills and business efficiency (Smith & Perks, 2006). Besides, research has shown that entrepreneurship training significantly led to risk-taking, the creation of new companies (Charney & Libecap, 2000; Garavan & Barra, 1994; Umrani, Kura, & Ahmed, 2018). The perceived possibilities of entrepreneurship or entrepreneurial self-efficacy often seem favorably influenced by the preparation (Alberti, Sciascia, & Poli, 2005; Lepoutre, Van den Berghe, Tilleul, & Crijns, 2011). In the Pasar Siti Khadijah area, the government and NGOs have developed various policies and programs to promote entrepreneurial activities to improve the status of women entrepreneurs in low income and low-income households at Kelantan.

2.2 Relationship of Financial support on Business Performance.

Nearly every entrepreneur needs a substantial financial contribution. It is important to have the financial resources for starting entrepreneurs. A remarkably large part of the Malaysian economy is small entrepreneurial companies, including micro-enterprises such as rural entrepreneurs. Fundamental indicators like GDP growth, job creation, innovation rates, and wealth accumulation all depend to a large extent on the success of emerging organizations, which are constantly revitalizing Malaysian markets. Because of the combined size and dynamism of this business field, the role of financial institutions in financing such companies has become a central area for research and debate.

In Malaysia, some government and non-governmental organizations have set up policies and programs to support entrepreneurial activities to improve women entrepreneurs in

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

low- and marginal households, which provide various kinds of loans, advisory services, and platforms. The following is a list of major innovations and services selected in Malaysia to boost women entrepreneurs' conditions for low- and vulnerable households.

2.3 Relationship of Family Moral support on Business Performance.

Family plays a major role in a woman's life. Many women entrepreneurs operate their companies with the help of family and friends, both at start-up and expansion. Many women now want to work because they think they can help with extra income. Women who are not lucky enough to have a job tend to work individually to fix their unemployment problem. Nevertheless, full support from their families is critical, as women now run both houses and workplaces day by day. Family and close friends also play a crucial role in ensuring the emotional health of women entrepreneurs, support for the family can play a crucial role, particularly as entrepreneurs face new entrepreneurial challenges (Charney & Libecap, 2000) as well as their personal lives. Therefore, I believe that family support can minimize the negative effects of personal work-life problems on business performance because entrepreneurs can deal better with personal problems by having family support and strength.

2.4 Business Performance

Business performance of entrepreneurial and SME is a dynamic, multifaceted construct that should be studied with a view to its complexity. The performances could come from many aspects and one of them is related with the importance of satisfying customers that lead to increase sales (Johlke & Iyer, 2013). Apart from that, (Wolff & Pett, 2006) stated in their study that internationalization and product improvement have positive influences on growth of business. In other word the profitability and business growth are positively associated with the improvement of product orientation. Additionally, according to (Rhee, Park, & Lee, 2010), learning orientation also gives significant affect to innovativeness that sequentially leads to the performance of business.

2.5 Conceptual Framework

3 Methodology

The research methodology that I had been done were focus on the relationship of business and family support on business performance among women entrepreneurs at Pasar Siti Khadijah in Kelantan. Regarding this issue I can say that the business performance among the entrepreneurs is also the issues that always occur in our daily life. As I can see every year the cases regarding business performance still happen. I took this initiative to make some research about the relationship of entrepreneurial support on business performance

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

among rural entrepreneurs in Kelantan. The research design is the establishment of conditions for data collection and analysis to relate relevance for research purposes and economic procedures according to Kothari (2004). Research design is usually a strategy that sets out the procedures adopted by researchers for managing the research goal or testing the hypothesis proposed for their studies (McDaniel & Gates, 1999). Qualitative research approaches are based on the 'deeper' study of the phenomenon (Wycech, 2015) (Wycech, 2015). This study will investigate the literature at Pasar Siti Khadijah in Kelantan that explores the relationship between business and family support on business performance among women entrepreneurs. An interview will be used to develop the research design for this. The conclusion of this study was based on data gathered during the interviews, which, because it is full of beliefs, perceptions, and aspirations, is non-quantifiable information. According to Yin (2003), six commonly used types of information, such as records, archival reports, interviews, direct results, participant observations, and physical items, can be carried out through data collection for case studies. Interviews with traders around Pasar Siti Khadijah obtained the information used in this report.

A case study is a methodology where one or more things are concentrated on by the researcher and the goal is to better understand the event, experience, relationship, and procedure. As the researcher wanted to obtain a deeper understanding of the relationship between business and family support on business results, a case study with the interview of entrepreneurs was the most appropriate approach or method for this study. . Convenience sampling is a type of non-probability sampling which does not require participants to be selected at random. The reverse is chance sampling, where applicants are selected randomly. The main goal of easy sampling is to collect information that is readily accessible to the investigator from respondents. (In 2016, Etikan, Musa, & Alkassim). Convenience sampling has its uses, especially when a study needs to be carried out quickly or with the shoestring budget for this research. Convenience sampling has few benefits, such as sampling is relatively straightforward to obtain, it is inexpensive compared to other methods, and participants are readily accessible (Glen, 2015). So, in a short period of time, it will allow researchers to explore more about the relationship of business and family support on business performance.

4 Data Analysis and Finding

For this study, researcher interviewed around 5 entrepreneurs at Pasar Siti Khadijah. It is because the selection of this study is made based on the convenience sampling to collect the respondents. The respondents or entrepreneurs must be in the business that who do business activities at Pasar Siti Khadijah. Most of entrepreneurs at Pasar Siti Khadijah were consists of women and this will fulfil the requirement of this study to find the relationship of business and family supports on business performance among women entrepreneurs at Pasar Siti Khadijah, Kelantan.

4.1 Entrepreneurship Training

Based on the results of the interview, the entrepreneurs explained that entrepreneurial training is very necessary and can improve business performance. This is because by following entrepreneurship training, entrepreneurs can improve their business

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

performance as well as develop their business and grow their business. There are many advantages that entrepreneurs can take advantage of if they get proper entrepreneurial training.

R1- "From then until now I have never received entrepreneurial training from any agency. I do all this myself. I started a small business first and with the profit of the business then I traded in Pasar Siti Khadijah. But I am confident that if I get the right entrepreneurial training, I can improve my business performance and expand my business even further".

R2- "During my 30 years of doing business here, I once got entrepreneurial training. That is the entrepreneurship training from the Majlis Perbandaran Kota Bharu (MPKB) which invited us to join the entrepreneurship training. Only once was the entrepreneurial training we got. But through these entrepreneurial training we can improve our business performance. I hope more agencies are willing to offer us entrepreneurial training so that we can further expand our business".

So, it can be proven that entrepreneurship training can improve business performance but entrepreneurs in Pasar Siti Khadijah do not get proper entrepreneurship training due to the lack of entrepreneurship training offered by agencies to entrepreneurs in Pasar Siti Khadijah.

4.2 Financial Support

4.2.1 Improves business performance.

In this sub-theme, financial support can improve business performance because when entrepreneurs get financial support this can indirectly improve their business performance and be a motivator for them to continue to grow their business. The recent MCO run by the government has caused many entrepreneurs to have financial problems to continue their business.

R2- "Yes, the financial support assistance offered by Amanah Ikhtiar, it improves my business performance and my sales. After the MCO, financial support is needed by most entrepreneurs here to improve the business performance we run."

R3- "For me, financial support can help improve business performance because after MCO we have financial problems to continue our business. I think with the financial support from any party can improve the performance of our business."

R5- "In my opinion, I think with the financial support from any agency may be able to improve business performance."

4.2.2 Increase the growth of business.

In this sub-theme, financial support can increase business growth because when entrepreneurs get financial support, this can indirectly increase the growth of their business and can further expand their business more widely. After the recent government-run, MCO caused many entrepreneurs to face financial difficulties to grow their business as they could not do business for about three months and after they could do business, they faced a shortage of buyers coming to Pasar Siti Khadijah.

R2- "For me, the financial support given to me and for other entrepreneur, especially

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

financial support from the government, can slightly increase the growth of our business. After MCO we experienced financial difficulties to continue our business.”

R4- “Yes, with financial support I can increase the growth of my business especially after the recent MCO. I hope more financial support is given to us so that we can further increase our business growth and increase our sales revenue.”

Based on the interview session with the entrepreneurs, the result show that mostly of them are agree that financial supports can improves business performance and increase the growth of business. So, it can be proven that financial support can improves business performance and increase the growth of business the entrepreneurs in Pasar Siti Khadijah.

4.3 Family Moral Support

Based on the interview sessions with the entrepreneurs, they said that the family became the backbone who always supported them to become an entrepreneur and continued to rise especially after the MCO. The continuous moral support from the family made the entrepreneurs in Pasar Siti Khadijah continue to rise and continue their business until now.

R1- “Yes. My husband was very supportive of me for being an entrepreneur. He never tired of supporting me. Sometimes my husband comes to help me in business. He was the backbone who always gave me moral support, especially after the MCO that day. I was almost desperate at the time, but he was the one who gave me moral support for me to continue my business.”

R2- “After the recent MCO, I got a lot of support from my family and children to continue doing business here. The family helped me a lot in giving me support and assistance to continue this business.”

R4- “Yes, my family has given me a lot of support for me to do business and become an entrepreneur. They gave me a lot of moral support so that my business could be more developed and able to grow further.”

Based on the data that has been analyzed above, it can be concluded that the family is the mainstay of providing moral support to entrepreneurs in Pasar Siti Khadijah. The moral support provided by the family can improve the business performance of entrepreneurs in Pasar Siti Khadijah and be a catalyst for entrepreneurs to continue to grow their business and continue to be an entrepreneur.

5 Discussion and Conclusion

Women entrepreneurs in Kelantan can face all the challenges and obstacles when there is a shortage of customers by using the opportunity to promote their business to get customers to side by side. They desperately need support from various agencies that are willing to help, especially in terms of financial support and entrepreneurship training. In terms of financial management shows that most entrepreneurs in Kelantan still lack expertise in managing finances effectively. Every challenge and obstacle faced by entrepreneurs prove that they are still able to have a monthly income to help the family economy. In Malaysia, the involvement of women in business has long existed, for example in the East Coast states of the Peninsula such as Kelantan and Terengganu,

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

namely businesses in markets, wholesalers, retailers, and street vendors are largely monopolized by women. Kelantan is one of the poorest states on the East Coast of Peninsular Malaysia seen in terms of per capita income and somewhat lagging in terms of development compared to developed states on the West Coast. However, the state is known as a state with a high rate of participation of women in economic activities, especially in the agricultural sector and small business sector. Although there are some challenges and obstacles in ensuring the economy and family income is always sustainable, but entrepreneurs can adapt and overcome obstacles in business to make income always sustainable. The findings of this study provide the women entrepreneurs at Pasar Siti Khadijah with clues and information about the effects of business and family support on business performance. First, the entrepreneurs will know about the effect of entrepreneurship training on business performance and the growth and development of entrepreneurs in Pasar Siti Khadijah. This shows that the lack of entrepreneurship training causes entrepreneurs in Pasar Siti Khadijah do not get adequate entrepreneurship training and causes them to have problems to expand their business more widely. Then the entrepreneurs will be able to find out about the impact of financial supports on business performance among women entrepreneurs at Pasar Siti Khadijah. It shows that financial support from all agencies and governments can improve business performance among entrepreneurs in Pasar Siti Khadijah, especially after MCO. Finally, we also will know about the relationship between family moral support and the business performance of women entrepreneurs at Pasar Siti Khadijah.

For the conclusion, to solve economic obstacles, entrepreneurship is probably the most inspiring ideology worldwide. In addition to men, women are also the essential gender of the general population and have a tremendous capacity and ability to provide for any nation's overall economic growth. Looking at the global outlook, previous literature primarily claimed that the major obstacles in their industry are financial problems. In reviewing the Pasar Siti Khadijah background, however, we know that the related bodies have provided financial support to women entrepreneurs for their enterprises, so financial support to women entrepreneurs in Pasar Siti Khadijah is not a problem. What can be done to improve their business is that the relevant bodies should have a program not only to promote entrepreneurship but also to train women entrepreneurs not only to compete with male entrepreneurs but also internationally. To develop a trained, intelligent, and skilled female entrepreneur, the Authority should also concentrate on entrepreneurial education programs. Since young generations are not really interested in engaging in business nowadays, authorities should introduce a policy that can support and encourage entrepreneurial culture not only among women but also among young people to instill the spirit of entrepreneurship among them, as this is crucial to the company's future.

6 Acknowledgement

I want to thank anyone who gave me the opportunity to complete this research. I would like to thank you. I also would like to express special thanks to Dr Anis Amira Binti Ab Rahman, who has helped me organize my project especially in writing this research report, for his contribution in stimulating suggestions and encouragement.

I am especially grateful to my friend and family, who have supported and helped me assemble the parts and suggested the project.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Finally thank you to Dr. Anis Amira Binti Ab Rahman, supervisor of the last year's project, whose full effort has been put into guiding the team in its achievement. In the final year of my project presentation, I have to appreciate the guidance given by another supervisor and the examiner who strengthened our presentation skills with their commentary and advice.

FACTOR AFFECTING GENERATION Z CONSUMER TOWARD PURCHASE OF COUNTERFEIT GOODS IN SABAH

Muhammad Hairu Daniel Bin Hairu Zaki and Munirah Binti Mahshar

Faculty of Entrepreneurship and Business,
Universiti Malaysia Kelantan,
Malaysia

[Email: daniel.a17a0274@siswa.umk.edu.my](mailto:daniel.a17a0274@siswa.umk.edu.my); munirah@umk.edu.my

Abstract:

Global counterfeit is a problem that growing rapidly in today's 'economy' there is not a sign of decline (Zhang et al., 2012). Action of purchasing counterfeit can bring harm to economy in the world. If this issue is not stopped (or at the very least, significantly reduced) now, it may become much worse in the future especially with the growing importance of online commerce (Shahbaz, 2019). Online platforms such as Shoppe and Lazada in Malaysia actually contain few of the counterfeit good there in different name or they come from different seller. The seller using this online platform to introduce their counterfeit product without Shoppe or Lazada itself knowing by change the name and description of the product but still counterfeit goods. Zhang et al. (2012) mentioned that the facilitator between the counterfeit online sellers and the consumers is the online intermediary and as a consequence they might be held responsible for any counterfeit products. With 300 respondents, the data will be analysed into the descriptive analysis, reliability analysis, Pearson correlation analysis. Then, Spearman's Correlation also used in this study to test the normality. Three of the purchase factor were generated and tested using Statistical Package for the Social Science (SPSS).

Keywords: Counterfeit Good, Economics, Generation Z, Price, Ethical Concern

1 Introduction

Counterfeiting is said to have its growth since the 1970s (Bian and Veloutsou, 2005), when Levi's discovered a large quantity of counterfeit jeans bearing its trademark logo and label that had been produced in South East Asia and distributed throughout Western Europe (Walker, 1981). Since then, counterfeit goods have flooded the market in the past few decades and have increased at an astronomical rate (Phau and Teah, 2009) in particular the counterfeiting of luxury brands of fashion products is particularly "rampant" and these can include clothes, handbag, wallets, watches and shoes, just to name a few. In Malaysia counterfeit goods is something seen almost in every state, with commonly they sold it at a night market or "Pasar Malam". Nowadays these good can also easily be found in online platforms such as 'e-retail' and media social platform that focus on buying and selling items. These goods can come from many places and the mainly being supplied from Thailand and China this two countries have easy access to

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

obtain these counterfeit goods for a cheap price . They also have shop that sells these counterfeit items by blend in or mix the goods with other necessities in their shop to blind the authorities. These shops willingly sell this kind of good knowingly these are counterfeit products.

In “Malaysia” these counterfeit goods mainly focus on items such shoes, clothes, high tech, spare part for automobile, software, games, DVD, jeans, watches, cap, and even ‘telekung’. In many cases of selling fake products, the main purpose does not seem to deceive consumer but to satisfy them (Arellano, 1994). Selling and buying counterfeit goods become very popular and common among people in Malaysia especially millennial consumer. They are many negative effects that can affect Malaysia mostly in economy sector and this consumer willingly buy this item without knowing the effect they can risk into Malaysia economies. These customers who buy counterfeit goods may not realise the affected to the economic because of their activity. They may not stop to think that their purchase of counterfeit good hurt the economies via loss, job, increases in the trade deficit and slowing the market for original product that they offered. Nor they aware that their contribution to counterfeit may very well funding organisation that have influence in crime such as prostitution.

Lastly, it is important to see the factors that influence intention to repurchase counterfeit products as one of the serious concerns is that consumers do not realize that their action can bring harm to the economies as they tend to purchase again and again (Ahmad et al., 2014; Bestoon et al., 2018). (Europol ,2012) said that counterfeit products have a very damaging effect to the economy as the products are manufactured and smuggled into the market without paying any tax duties. This is supported by Amine and (Magnusson ,2007) who mentioned that counterfeit products can cause government to experience losses in terms of tax revenue as a result of the smuggling activities. A person who purchase or repurchase a counterfeit product is more likely lack of ethical concern. In Malaysia people commonly does not have knowledge about effect for purchase counterfeit goods itself to the economy. People already comfortable using and buying counterfeit goods in Malaysia that it causes a problem to solve on how to avoid people to buy and using counterfeit goods. The purpose of this research is to know the factor that affect generation Z into purchase counterfeit goods. This is to make sure there are factor that can actually involve into help them to buy counterfeit goods. This factor can be decreased depending on how strong the impact of the factor toward generation Z.

There are three objectives of this research:

1. To identify the relationship between price and purchase counterfeit goods in Sabah.
2. To identify generation Z consumer perception toward platforms to purchase counterfeit goods in Sabah.
3. To identify generation Z consumer perception toward ethical concern and purchase counterfeit goods in Sabah.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

1.1 Significance Of The Study

1.1.1 Consumer

Consumer can benefit from this research especially generation Z because they are the main target for the seller counterfeit goods. They need more knowledge about how to differentiate genuine product and or falling victim for counterfeit goods. They also can be patient and save their money for the brand they want to get. This study also can help other consumer to aware that using counterfeit goods is not good and can become reason why few brand cannot become more big because of many counterfeit goods.

1.1.2 Government

Government also can get benefit from this study on term on how many consumers still buying counterfeit goods despite many law that stated that they cannot own or selling counterfeit goods. Government can make a harder penalty for people who uses and own any kind of counterfeit goods whether in physical form or digital form.

1.1.3 Industry

Industry is one of the sectors that heavily impacted when consumer start using counterfeit goods as alternative for them to buy rather than buying authentic goods that most of our industries offered. They also can counter these sellers by doing more promotion and make a better reason why consumer need to buy authentic product rather than keep using counterfeit goods.

2 Literature Review

2.1 Underpinning Theory

Theory of Planned Behavior (TPB)

The TPB (Ajzen 1985) includes a third element, Perceived Behavioral Control (PBC), which also influences intention. PBC incorporates individuals' perceptions of the difficulty of the behavior, i.e., whether or not it is under volitional control (Ajzen and Madden 1986). TPB is usually used to foresee the intention of some human activity. It likewise foresees the behaviour is the intention based on their lifestyles. Attitudes are thought to be influenced by beliefs about the disadvantages and advantages of performing a specified behaviour such as engaging in counterfeit products.

Since Wicker's (1969) earth-shattering review, substantial progress has been made in contemporary attitude research (Eagly & Chaiken, 1993). Particularly noteworthy is the acknowledgment of situational influences on behavior. In response to influences, such as time or monetary costs, different behaviors become more or less difficult to carry out. Evidently, the more the implementation of an act depends on the presence of appropriate circumstances, the less such a behavior is fully intentionally controllable. The inclusion of perceived behavioral control leads to more fully explained behavior, especially behavior that is difficult to engage in (e.g., Madden, Ellen, & Ajzen, 1992).

TPB have already been successfully employed to examine and explain digital piracy (e.g., Chang 1998; Christensen and Eining 1991; Cronan and Al-Rafee 2008; Peace et al. 2003), highlighting the expected relationship between attitudes, subjective norms, and intention to engage in software piracy (e.g., Christensen and Eining 1991).

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Drawing on the TPB, Al-Rafee and Cronan (2006) examined factors that influence attitude and found a number of salient beliefs related to piracy, including the belief that digital piracy helps you save money that digital media is too expensive, that there is no fear of getting caught, and that digital piracy is unimportant.

2.2 Research Hypothesis

In this study, there were three hypothesis that are related between the factors affecting generation Z consumer toward purchase counterfeit goods in Sabah .

H1- There is significant relationship between price and purchase of counterfeit goods in Sabah.

H2- There is significant relationship between platforms and purchase of counterfeit goods in Sabah.

H3- There is negative influence from lack of ethical concern toward purchase of counterfeit goods in Sabah.

2.3 Research Framework

Based on the literature review, the conceptual framework has been developed. Which the conceptual framework had included three independent variables and one dependent variable. The independent variables are price, platforms and lack of ethical concern while the dependent variable is purchase counterfeit goods.

The conceptual framework is shown as below figure:

Figure 2.1: Conceptual Framework of Factor Affecting Generation Z Consumer Toward Purchase of Counterfeit Goods in Sabah.

3 METHODOLOGY

3.1 Research Design

The research design for this research is quantitative descriptive which is investigate by collecting data as it relates to the factors that affecting millennial consumer into purchase counterfeit goods from different race, age, gender, and occupation. A questionnaire will be used to collect the data from millennial consumer who had experience or not about

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

buying counterfeit goods and the question made by the researchers. This study may help the researchers to understanding the characteristics of a factor that influence millennial into purchase counterfeit goods. Researchers also can help to make certain decision (Sekaran, 2013).

3.2 Data Collection

In the first stage, primary data is a source collected at hand for specific research problem using the right method. Some method can collect the primary data for research, such as surveys, questioners, interview, observation, and focus groups. The second stage of data collection was a fieldwork but through online platform. The researchers used the Google form questionnaire to be distributed to the random people for used pilot test. For the secondary survey method, researcher collected data from previous study which is journal and article.

3.3 Sampling

In this research, a non-probability sampling will be used to determine the number of respondents included. Non-probability sampling is defined as a sampling technique where the odds of any member being selected for a sample cannot be calculated (Stephanie, 2015). Also, a Snowball sampling, Snowball sampling method or Chain-referral-sampling of a hidden population begins with a convenience sample of initial subject, because if a random sample could be drawn, the population would not restrict as hidden (Etikan I, 2015). In this study, researcher is using G*Power to calculate the fix amount of respondent. G*Power is a software which is a tool to compute statistical power analyses for many different F test. This is also can be used to compute effect sizes and to display graphically the result of power analyses. After calculate the total of respondent or sample size by G*Power will be receive minimum 119 respondents but researcher decided to collect 300 respondents to complete the questionnaire that distribute by researcher. Furthermore, respondents are required to read the instructions and answer all the questionnaire to complete the survey on their own without the presence of an interviewers.

3.4 Data Analysis

Data Analysis is a process or attempt to process data into new information to make the characteristics of the data easier to understand and useful for solving problems, especially those related to research. Data analysis can also be defined as an activity undertaken to transform data from research into new information that can be used to draw conclusions. The data analysis presents the finding of this study, which were obtained from the various analyses. The chapter starts with the preliminary analysis This chapter is intended to examine the implications and conclusions of the report. This segment would include the respondent's demographic analysis, reliability analysis dependent on Cronbach's Alpha, descriptive analysis and Spearman's Rho Correlation analysis. The results were obtained from 300 respondents of generation Z by using quantitative information. In version 25 of the Social Science Statistical Package (SPSS) the data was evaluated.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

4 Findings

In this study, the reliability test was performed by 300 respondents of generation Z using the survey. It was measured using Cronbach's Alpha Coefficient showing a range from 0.812 to 0.832 which indicated that the result was moderate to good where platforms has the maximum Cronbach Alpha value of 0.832, lack of ethical concern has the second highest alpha value of Cronbach, which was 0.830, and then followed by platforms (0.812). Thus, all variables fulfilled the minimum criterion of reliability, as all Cronbach alpha coefficients of all variables were greater than 0.6.

In the Descriptive Analysis for Independent Variables, the maximum mean value was 3.902 platforms, followed by price (3.804). While the lack of ethical concern is was the lowest mean value for independent variables. It was platform had the biggest factor that affecting generation Z consumer toward purchase counterfeit goods in Sabah.

The researchers carried out the correlation analysis in order to calculate the linear association between the two variables defined as the purposes of this report. A review of Spearman's Rho Correlation Analysis indicating that the linkage between the price and purchase is 0.723 which mean that there was a strong positive correlation, while lack of ethical concern and purchase was in a moderate positive correlation (0690), and the lowest value of correlation was platforms and purchase which only 0.619 and was in a moderate to strong in relationship. A correlation table of these variable as shows as below.

Correlation		Intention to Use
Price	Spearman's Rho Correlation	.723**
	Sig. (2-tailed)	.000
	N	300
Platforms	Spearman's Rho Correlation	.619**
	Sig. (2-tailed)	.000
	N	300
Lack of Ethical Concern	Spearman's Rho Correlation	.690**
	Sig. (2-tailed)	.000
	N	300

Table 4.0: Spearman's Rho Correlation Analysis

5 Discussion & Recommendation

5.1 Price

Based on the result of Spearman's Rho Correlation, the researcher had identified that there was a significant relationship between price and purchase. A strong correlation relationship between price and purchase toward counterfeit goods. In testing the relationship between variables, 0.70 is very strong, within the range of 0.30 to 0.60 is considered moderate and less than 0.16 would be weak. Price is something that people will look before making any purchase before anything else. Price also important for people even in making counterfeit goods purchasing, people tend to go for more

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

affordable and high quality products such as counterfeit goods and this results shows the example. The relationship between the variables is stated as 0.723, which further reinforces the strong relationship between the IV and the DVs. This correlation indicates that the lower the price, the higher the purchase for counterfeit goods..

5.2 Platforms

According to this study, there was a significant relationship between platforms and purchase. A moderate correlation relationship between platforms and purchase toward counterfeit goods is showed. Platforms is something needed for sellers of counterfeit goods to sell their product. This platform also will make purchasing counterfeit goods becoming more easy and convenience. Online and offline platform both offer the same product of counterfeit goods but the difference is experience and privacy. The relationship between the variables is stated as 0.619, which further reinforces the relatively strong relationship between the IV and the DVs. This correlation indicates that the higher the platforms, the higher the purchasing toward counterfeit goods.

5.3 Lack of Ethical Concern

Based on the above finding, the researcher had identified that there was a significant relationship between lack of ethical concern and purchase. A moderate correlation relationship between lack of ethical concern and purchase toward counterfeit goods is showed. The relationship between the variables is stated as 0.690, which further reinforces the relatively strong relationship between the IV and the DVs. This correlation indicates that the higher the lack of ethical concern, the higher the purchase toward counterfeit goods. Lack of ethical concern become a problem when more and more people not aware of many impact toward economies Malaysia in the future.

6 Recommendation

There are several directions that can be taken by future researchers relevant to the factor that affecting generation Z consumer toward purchasing counterfeit goods in Sabah. First, this study's data has been collected in Sabah and focuses on all generation Z that have intentions to purchase counterfeit goods. Therefore, the future can carry out a new study that focuses on a comparative study between the generation Z versus Baby boomers generation on whose generation more likely to buy counterfeit goods This research will get exciting, and the future researcher can compare how counterfeit goods important for them. Second, under part data collection method, the quantitative designs are used in this study. The future researcher can study the qualitative method and should be undertaken to explore how different impact counterfeit goods can bring to local store and brand. The study could be broader in order to get more honest answers. Besides, communication becomes more manageable, and information and news can be spread quickly.

7 Conclusion

In conclusion, the research finding that the three factor really affecting generation Z toward purchasing counterfeit goods in Sabah. This consumer buys counterfeit goods because the price is cheap other than many platforms that offer many counterfeit goods and because lack of ethical concern about what will happen in the future and what effect

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

will they action today will be. Researcher also know that generation Z really like counterfeit goods because of its quality and using top brand around the world to marketing their product and attracting consumer from generation Z. They need to stop selling counterfeit goods and buying counterfeit goods for the Malaysia economy to become better action needed from government and people with power.

8 Acknowledgement

Personally, I would like to express my gratitude for those who take part in this research and give their time into help me complete this research. I also want to appreciate University Malaysia Kelantan because they make research to happen in my last year of study. Also thank you for SAR course that making this research more understandable and other related lectures that help making this research more achievable.

Next, I would like to say thank you to my supervisor, Madam Munirah Binti Mahshar that been guiding and helping me into completing my research. Thanks to her guidance every week I manage to get my proposal better with every submission. Also, thank you very much to my friends from University Malaysia Kelantan and another University because of their help and guidance that I can make this research complete. They also encourage me to continue with this research and helping me in making questionnaire. Last but not least, thank you for my family because they support me all the time to make sure I can complete this research. They also provide necessities that needed to make this research doable. I feel blessed with having my own family support me all the way through during this time.

AN INVESTIGATION OF THE ADOPTION OF POINT OF SALE SYSTEM AMONG SMALL RETAILER IN KEDAH

Najihah Binti Osman and Siti Afiqah Binti Zainuddin

Faculty of Entrepreneurship and Business,
University Malaysia Kelantan,
Malaysia

[Email: najihah.a17a0305@siswa.umk.edu.my](mailto:najihah.a17a0305@siswa.umk.edu.my); sitiafiqah@umk.edu.my

Abstract:

This research proposal will discuss about the adoption of Point-of-Sale (POS) system among small retailer in Kedah. Several different threats to the survival of small and independent retail companies. The implementation and use of the Point-of-Sale (POS) system can provide significant benefits to users. POS systems are not widely used by small retailers. This research investigates the determinants of the adoption of POS systems, using with the current adoption theory's basic idea model. This research was conducted on many small and independent retail operators in Kedah State to address the question of what is the most important determinant for using the POS method. Meanwhile, this research introduces the concept of IT use, especially for small companies. The functional significance of these two outcomes will serve to increase the use of POS systems. These small retailers will indirectly detect any problems.

Keywords: *Adoption of point of sale, price, effectiveness, data security*

1 Introduction

The introduction of the study and has the selection that is background of the study, the problem statement, research objective, research questions, significance of study, and scope of study and also organization of study. Through this chapter researcher will identify the meaning and definition of the term that will help the researchers to more understand about the topic being studied. Lastly, there will be conclusion part that will help researcher to summarize the overall of chapter one. An investigation on the Adoption of Point of Sale systems among small retailer in Kedah is the title that researcher will do a research. Researcher want to know how many small retailers in Kedah know about Point of Sale systems and researcher also want to know whether small retailer in Kedah use this system in their shop for managing sale and purchase with the customers.

1.1 Research objective

There are three objectives on this research

1. To determine relationship between price of Point of Sale system among small retailer in Kedah.
2. To determine relationship between data security of Point of Sale system among small retailer in Kedah.
3. To determine relationship between effectiveness of Point of Sale system among small retailer in Kedah.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

1.3 Significance of the study

Research only focuses specifically on the use of point of sale system among small retailers in Kedah. This study will contribute to the expansion of small retailers in Kedah on the use of the system. It will provide lessons from research that has the potential to influence small retailers objectively and subjectively. It is expected that the use of selling points among small retailers will have a significant positive relationship with the performance of retailers. Therefore, further research needs to be done to get these findings. The results of the study will show that the behaviour of small retailers can adjust the use of point of sale system in their business or not.

2 Literature Review

Adoption of Point Of Sale System

According to (Roel P. Huiden, 2011), several dangers affect the survival of small and independent retail industries. Acceptance and use of the Point-of-Sale (POS) framework may offer and place significant benefits if it is to overcome this danger. The Point of Sale framework is generally not used by these retailers, however. This research investigates the determining factors of acceptance rather than demanding a Sales Point framework that uses a theoretical model that relies on existing selection hypotheses. Depending on this, an overview needs to be done throughout Malaysia, free retailers, to answer the questions that need to be helped by the practical determinants for the acceptance of the Sales Place framework. This consideration strengthens the principle of its use, especially for small associations. Of particular interest may be that its findings may be helpful in advancing the selection of the Point of Sale framework.

Price of Point Of Sale Systems

According to (Jivani, 1998) the motivation behind a value question was to figure out what a client willing to pay for a best of a line framework. To analyze the sensible value that a client sees for a best of line 4-terminal purpose of offer framework. (Intuit Quicks Books , 2014) ‘Cost. It is an essential and urgent leader in any purchasing choice. You should not just ask yourself how much will this cost me, however more critically, what amount of significant worth will I be receiving consequently? The same number of say, you get what you pay for. Now and then a higher forthright expense merits the long haul remunerate.

Data Security of Point Of Sale System

Point of Sale system is a supply net administration system for customer management. It becomes an essential element in distribution industry to construct the database and uses XML-Encryption to complement PKI techniques and standards for security. There are the advantages of Point of Sale system. First, it does not have to be certificated and transmit data every time because there is no server. Next, it can be integrating database by using XML-Encryption. Next, transmitted data is safe. Lastly, processing speed will be faster because it gathers data from data transmission, (Seek-soo Kim and Tai-hoon Kim (2007). As indicated by Seek-soo Kim and Tai-hoon Kim (2007), Point of Sale system is becoming more important in the world because it safe and fast. The existing of Point of Sale system had begun receipts and developed into present web of Point of Sale system. This web of Point of Sale system has emphasized safety of data and considers improvement of the processing speed with wire or wireless device.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Effectiveness of Point Of Sale System

The majority of the data to these deals files is afterward uploaded of the retailer's primary machines. Throughout a polling transform that happens naturally. Those polling methodologies might happen a significant number of times. Throughout those day alternately might happen when a night, relying upon those administration necessities of the business and the requirement to up-to-the-moment deals data during home office. Store frameworks would use to physically wrist bindings stock moving under alternately out of the store. Cases incorporate on-line confirmation for stock gained straightforwardly. Starting with vendors, furthermore instruments to rearranging the methodology for giving back harmed alternately ruined stock will vendors (RTVs) (Rao, 2000).

2.1 Research Question

The three specific research questions for the proposed study are as follow:

What is the relationship between prices of Point of Sale system among small retailer in Kedah?

What is the relationship between data security of Point of Sale system among small retailer in Kedah?

What is the relationship between effectiveness of Point of Sale system among small retailer in Kedah?

2.2 Conceptual Framework

The theoretical framework aims to draw general conclusions about the progress of the study. Here the framework is applied using a model revised by Belk (1975b). It is also used for available theoretical knowledge of a particular problem or problem such as a picture does not fit a person's problem experience. The framework shows where the level of stimulus uses objects and how the effectiveness of the use of point of sale system has an impact on the business of these small traders, this also shows the relationship between price of point sale, and data security of point of sale systems among small retailer in Kedah.

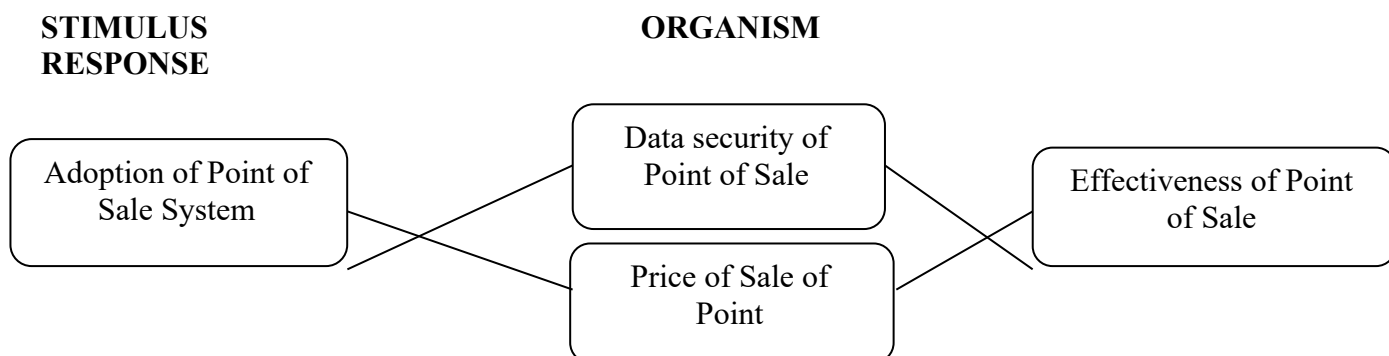

Figure3: Theoretical Framework by using the Revised S-O-R Model by Belk (1975b)

3 Methodology

3.1 Research design

The investigation structure of this investigation is a quantitative strategy using a questionnaire, the survey will be disseminated among retailers in the province of

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Pendang, Kedah. The information collected will help the analyst to obtain the relationship between independent variables and dependent variables through this examination structure which includes organizing and organizing research plans and exercises. This screening strategy leverages based on the fact that quantitative information is collected through surveys. This survey covers data on age, gender, ethnicity, course of study, etc. This questionnaire covers 5 areas A, B, C, D and E which are related to demographic variables, dependent variables and independent variables.

3.2 Data collection

Based on data collection in this research, the sources of research data were a combination of both primary and secondary data. Primary data information is sources that immediate or direct data that initially from the sources. It includes gathering information of the first and it turns into a prerequisite for user in research. Primary data is gathered by a specialist from direct sources, utilizing techniques like studies, meetings, or investigations. It is gathered in view of the exploration venture, straightforwardly from essential sources. Practically in collecting data for this study, questionnaires have been used as the major tool. In the other hand, secondary information is the data that as of now portrays, abridge, break down and assess by different gatherings. This secondary information incorporates government distributions, diaries, data distributed or unpublished, books, site and web. As for this study, secondary data collection was conducted through the study of previous published work that related to this topic. Secondary data also helps researcher on identifying a variable and gathering an accurate data that are necessary on conducting research for the purpose of this study.

3.3 Sample size

According to statistics from the Pendang District Council (MDP), the number of retailers in Pendang registered under the MDP is 636 retailers. Sample size was determined based on Krejcie and Morgan sample size determination tables. Sample size determination Table 3.0 is a derivative of the sample size calculation stated as equation below (3.1) (Krejcie and Morgan, 1970). Krejcie and Morgan sample size calculations were based on $p = 0.05$ where the probability of committing a type I error was less than 5% or $p < 0.05$ (Table 3.4.1). Based on the study, the total population is 636 retailers. Researchers are targeting 70% of the total retailers in Pendang as a population. 70% of the total number of retailers in Pendang is 445. Looking at Krejcie and Morgan's table, the total sample will be 210 respondents.

3.4 Sampling technique

In quantitative studies the researcher aims to measure the variables and generalize the findings obtained from the representative sample of the total population. This Sampling technique uses randomization to ensure that each element of the population has an equal opportunity to be part of the selected sample. Alternatively, it is known as simple random sampling. For this research the focus is on the probability of simple random sampling in which each element has an equal chance of being selected as a part sample. It is used when the researcher does not have any previous information about the target population. The population targeted by researchers is from retail Pendang areas. Since researchers do not have information by population, this kind of sampling technique will make it easier for us to get the results. In this study, a survey will be conducted among small-scale retailers on the application of their point of sale system. Researchers will target 70% of

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

the total retailers in Pendang. In this case, each retailer has the same probability of being selected as the sample subject.

3.5 Data analysis

There were three types of data analysis used in this study that is frequency analysis, reliability analysis, and descriptive analysis. The data obtained was analysed by using Statistical Package Social Science (SPSS) version 25.

Table 1: demographic profile of respondents

Respondent profile (n = 210)	Demographic	Category	Frequency	(%)
	Gender	Male	72	34.3
		Female	138	65.7
	Age	20 years and under	17	8.1
		21-30 years old	94	44.8
		31-40 years old	62	29.5
		41-50 years old	27	12.9
		51 and above	10	4.70
	Industry	Manufacture	65	31.0
		Service	67	31.9
		Commerce	78	37.1
	Number of employees	1 – 5 people	145	69.0
		6 – 10 people	31	14.8
		11 – 15 people	26	12.4
		16 people and above	8	3.80
	Income	RM1000 and below	30	14.3
		RM 1001 – RM2000	35	16.7
		RM2001 – RM3000	57	27.1
		RM3001 – RM4000	66	31.4
		RM4000 and above	22	10.5

Table above demonstrate the percentage of gender in this research. Out of 210 respondents, 138 of them are female which about 65.7% while female respondents are 72 out of 210 respondents, which represent 34.3% of the respondents. From the figure, it demonstrated that majority of the respondents are male. The age range of 20 years and below is a small percentage of respondents in this research which includes 193 respondents. This is probably because most of them are young entrepreneur's aged 21 to 30 as many as 94 respondents which is 44.8%. Next, the age between 31 to 40 years recorded a second increase for 62 respondents. Meanwhile, the age of 41 to 50 years recorded about 12.9% of 210 respondents. The last was followed by the age of 51 years and above which only represented 4.70% of 210 respondents. the largest respondents are from the service industry which is 67 respondents (31.9%). 65 (31.0%) respondents from the manufacturing industry. Meanwhile, 78 (37.1%) respondents came from the trade industry. the majority of employees are 1 to 5 people with 69.0%. The second highest was

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

6 to 10 people with 14.8% followed by 11 to 15 people with 12.4%, and the last was the number of employees of 16 people and above with a record of 12.8%. Respondents' highest salaries ranged from RM3001 to RM4000 with 31.4%, followed by RM2001 to RM3000 with 27.1%. Next, the salary of RM1001 to 2000 or more recorded the third highest with 16.7%, while the lowest salary was below RM1000 and below and RM4000 and above which only recorded 14.3% and 10.5% of the total respondents.

Table 2: dependent and independent reliability coefficient test

Variables	Total items	Alpha values
All variables analysis	21	0.884
Adoption	5	0.725
Price	4	0.705
Effectiveness	8	0.702
Data security	4	0.710

In order to derive the research objective which is to determine the most dominant variable among efficiency, price and data security of POS system in adoption of POS system among small retailers in Pendang, Kedah respectively, a descriptive statistic was conducted and the data been collected according to table above. Therefore, the highest mean show the most dominant variable in the research. Based on the table 4.5, it shows that effectiveness have the highest amount of mean with 8 and standard deviation at 0.702 than others variable. Therefore, it make the most dominant variable in this research was data security of POS system in adoption of POS system among small retailer in Pendang Kedah.

4 Findings

Table 3: Reliability Analysis for All Variables

Reliability Statistics	
Cronbach's Alpha	N of Items
.884	21

In measuring the relationship between dependent variable and independent variable reliability test have been done. For the questionnaire each variables consist of 5 question for section B and C and D consist of 4 question. Section A refer to the demographic of the respondents. The total respondents are 210. The entire questions using Likert-Scale form questions. The overall result of reliability for this research is 0.884 which is very good. Thus, coefficient obtained for the overall question in Likert-Scale is reliable.

How data security of Point of Sale system relates with adoption of Point of Sale system among small retailer in Kedah?	Data security of Point of Sale system had a statically significant high relationship and was influence adoption of Point of Sale among small retailer in Kedah.

4.1 Price of Point of Sale System

Price of Point of Sale system is one of the independent variable that influences adoption of Point of Sale system among small retailer in Kedah. According to (berg et al., 2017) there are varieties of price that sell Point of Sale system in market. The price will different according to the function they provided such as credit payment and settlement tracking which customer can purchase on credit, and Point of Sale system will keep track of customer outstanding, payment and balance.

The price of the Point of Sale system will influence to the small retailer in the making decision whether to use the point of sale system or do not use this system in their business. Price is the one of the hard element for the small retailer in making decision whether they should buy and use Point of Sale system in their business because the price of this system quite high and there are some small retailer who could not afford to buy Point of Sale system.

However, this independent variable to frame small retailer on different level price of the Point of Sale system will affect their decision to buy and use the system for their retail business. For example if the price of the Point of Sale system is not expensive the small retailer maybe will decide to buy and use this system in order to make sure their business will be manageable and successful in future. Price of Point of Sale system is one of the important factors to the small retailer in Kedah because this factor will affect the retailer whether want use or not use this system.

4.2 Effectiveness of Point of Sale system

Effectiveness of Point of Sale system was the most important variable that influences adoption of Point of Sale system among small retailer in Kedah. This is because the retailer believes that effectiveness of point of sale system can help them to expand their business and can give to them a lot of benefit. One of the benefits is speed up during the payment process. Customers not have to wait longer when they want to make a payment

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

and also will help retailer to satisfy their customer. The retailers whether small retailer or big retailer will buy this system if they know there are many benefits they will get from Point of Sale system.

According to Casison (2013) Point of Sale system is a streamlines the process where entering the inventory into a computer upon completion of sales, besides allowing for expedited inventory management for companies or retailer who still doing this counting manually. Then Point of Sale system also can used to create expected sales forecasts based upon previous demand. This will give many benefit to retailer who use Point of Sale system because the effectiveness of this system.

According to Pollanz (2011) another effectiveness Point of Sale system that retailer can apply in their business is to aggregate and collect sales data automatically. This means can be used to produce variety of sales report such as historical data, top selling items, six weeks history reports customer rank by sale and so on. For example, in retail industry, a good system like Point of Sale system can show to retailer which product can making the most money. From this system the retailer can know what product they can provide more than usual because they will know what customer always buy and like to buy through Point of Sale system.

Based on the result that presented in chapter 4, researcher can see that effectiveness Point of Sale system was the one of the factor that influences adoption of Point of Sale system among small retailer Kedah.

4.3 Data security of Point of Sale system

According to Addison- Wesley Longman Publishing Co., Inc., (1982), data security refers to the science and study of the methods of protecting data in computer and communication systems from unauthorized disclosure and modification. Data security is process of protecting data from unauthorized access and data corruption throughout its lifecycle. Data security includes of data encryption, tokenization and key management practices that protect data across all applications and platform.

Data security also one of the independent variable that influence adoption of Point of Sale system among small retailer in Kedah. Data security is very important because all the information about the purchases between customer and retailer will be recorded and all the data will be safe in this system. The Point of Sale systems is the place and time which is when a payment process is completed. At the Point of Sale, the retailer will calculates the number of owed by the customer, show the amount to the customer and also prepare the invoice and show the option to the customer to make the payment.

According to (Seok-soo Kim, 2007) Point of Sale system is a safe and fast system that why this system becoming more important in the world to the retailer whether big or small retailer. The existing Point of Sale system starts with receipt and developed into present web of Point of Sale system. This web of point of sale system has emphasizes safety of data considers improvement of the processing speed with wire or wireless devices.

Point of Sale systems also known as Point of Purchase channels, this system can use to transaction processed through retailer outlets while a product is purchased by customer. The information on the card's magnetic stripe is captured and processed by device with which the Point of Sale system is attached when the customer or consumer pay through

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

credit/debit card at a Point of Sale security system.

According to Ki-rak Son(2001) data security will give a lot of benefit to the retailer, this is because all the information about the product that in and out from shop will kept safe in this system. From this system retailer not have to use traditional method such as use cash register or manual sale system in their business. Furthermore, most of the retailer especially big retailer and also a few small retailers have change from using of cash registers and manual sales systems to use electronic systems which is known as Point of Sale systems. Point of Sale systems is technology that uses to complete and record the sale transactions on the sale floor and all the information will safe because this system have good data security.

5 Discussion and recommendation

In the wake of gathering and breaking down information from all parts, each of the three free factors concurred by all price of Point of Sale, data security of Point of Sale and effectiveness of Point of Sale progressed toward becoming elements of appropriation of Point of Sale framework among small retailers in Kedah. From this examination, the respondents concurred that autonomous progression has an association with the elements that independent variables of Point of Sale system among small retailers in Kedah. Despite the fact that, this exploration goes easily, there are still a few enhancements to research to discover different elements that impact the small retailers in Kedah. In this study, researcher utilize quantitative techniques, for example, questionnaires, utilizing this strategy, researcher can recognize the elements looked by small retailers to receive the Point of Sale system in the business.

Also, while conveying surveys a few respondents at Kedah did not by any means need to furnish input or co-work with us, as respondents did not comprehend the motivation behind noting the questionnaires and among them were not understanding the Point of Sale system. To conquer this issue, the analyst will quickly clarify the assignments given and will likewise clarify the destinations of the examination to fabricate the trust of the respondents to answer the poll. Moreover, there are a lot more factors that impact reception of Point of Sale system. Nonetheless, there are just three free factors explored in this investigation which are elements to receive the Point of Sale system. There are additionally independent variables that have turned into another reason not referenced in this investigation. Future research needs to investigate and explore more autonomous factors which turn into an elements for small retailers to receive the Point of Sale system in the business.

6 Conclusion

In this study, the research objectives were met with the key findings that effectiveness of Point of Sale emerged as the most dominant factor that influence the relationship in adoption of Point of Sale system among small retailers in Kedah. The findings are expected to provide insights for further research in the field of business industry especially system that retailers can use in their business. Furthermore, this research helps small retailers for a better understanding about the factors and the Point of Sale system that can they uses to make the business run smoothly

Abstract:

This paper aimed to study the affect between perceived quality, price fairness and customer loyalty on customer satisfaction in retail industry. This study reviewed the literature of past researchers on measuring factors that affecting customer satisfaction in retail industry from different areas. Three main factors that was used in this study to analyse customer satisfaction were perceived quality, price fairness and customer loyalty. The data were collected from 365 respondents thru google form at University Malaysia Kelantan city campus. These collected data were analysed using SPSS and the result gathered through Pearson correlation coefficient and multiple regression analysis. The findings indicated that perceived quality, price fairness and customer loyalty had positive significant effect on customer satisfaction in retail industry. The result shows that customer loyalty affected customer satisfaction the most compared to perceived quality and price fairness. These findings provide beneficial suggestion for well-established retail industry to focus on customer loyalty it gives important impact on customer satisfaction. Besides that, upcoming retail industry who wants to open new branches around Universiti Malaysia Kelantan can focus on these factors as well.

Keywords: *Customer satisfaction, perceived quality, price fairness and customer loyalty*

1 Introduction

Satisfaction of customers with product and services of the retail industry is considered the most significant factor driving toward sincerity and action (Hennig-Thurau and Klee, 1997). Customer satisfaction is the way to assess the advance execution (Gustafsson, Johnson and Roos, 2005). According to, Kim, Park and Jeong (2004), customer satisfaction is customer response to the condition of fulfillment, and customer judgment of fulfillment level. Customer satisfaction is significant in the present business world as shown, in Deng et al., (2009), the capacity of an organization to be serious on keeping a higher level of customer's satisfaction is critical for item alteration and creating a solid, relationship with customers.

Retail industry mostly takes place in retail stores or service establishments, but may occur by direct sales, like online selling, door-to-door sales or online channels. Since this idea of retail is commonly connected with the purchasing of products, the term can check with service providers that sell to customers. Although this practice may allow customers to believe that they need access to lower prices, while being prepared to negotiate lower prices in crowded in-store environments during a strictly specific system, a store that sells most of its products directly to consumers is understood as a retail store rather than a wholesaler. People with

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

different cultural backgrounds set targets for the customer to business sales revenue which defines a retail business.

2 Literature Review

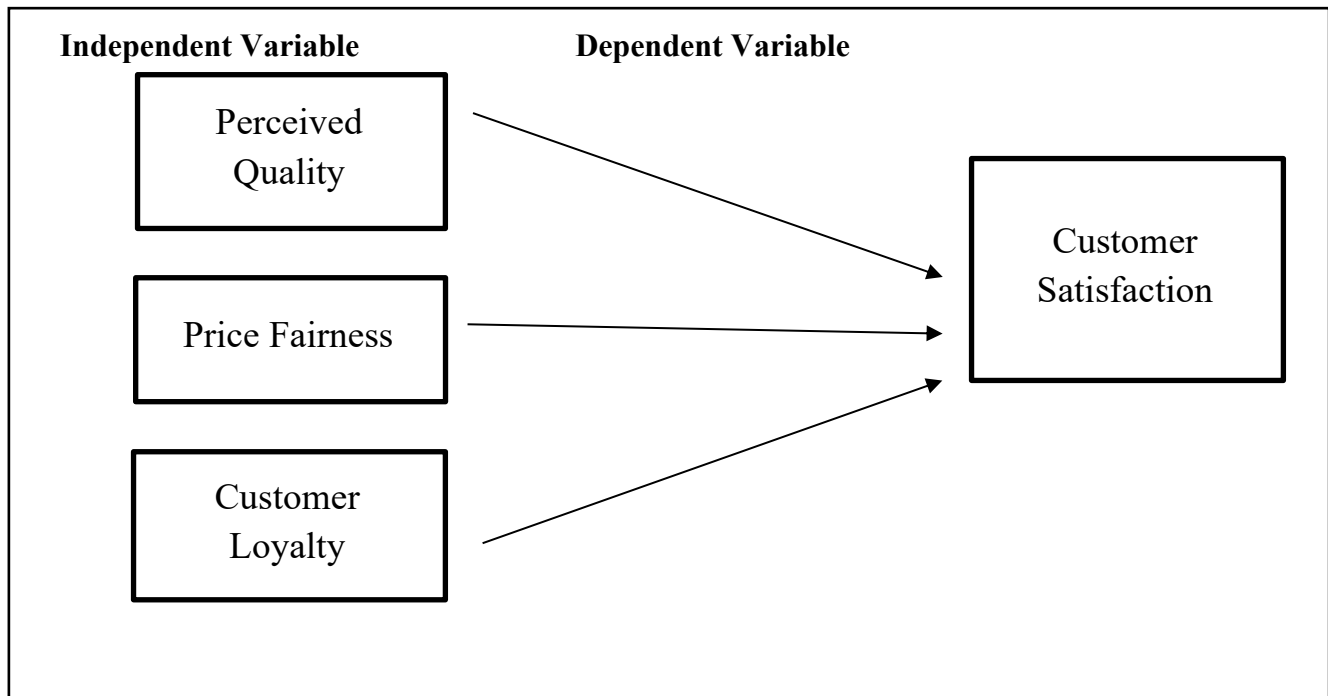

Figure 1: Conceptual Framework Model

2.1 Perceived Quality

The term Perceived Quality is an association of two different words which is service and quality. Perceived means any action that one party can give to a different that is basically intangible and doesn't lead to the control of anything. Quality has come to be acknowledged as a strategic tool for come through operational efficiency and better performance of business. Perceived quality means the ability of a service provider to customer satisfaction which might better the performance of business (Kotler, Philip and Armstrong, Gary 2006). In other words, it is difference between customer perception or expectation of service delivered by retail industry. There are five dimensions as tangibility, reliability, responsiveness, assurance, and empathy were verified by and it had been called as SERVQUAL scale for assessing perceived quality.

2.2 Price Fairness

Price is the amount of cash or goods used to attain some combination of other goods and its associated services (Hanif, Hafeez and Adnan, 2010). Kotler and Amstrong (2010) stated that price is the amount of cash exchanged for a product or service, or the sum of the values that customers exchange for the benefits of getting the merchandise or service. according to Anderson and Sullivan (1993), Perceived means any action that one party can give to a different that is basically intangible and doesn't lead to the control of anything. Quality has come to be acknowledged as a strategic tool for come through operational efficiency and better

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

performance of business. Therefore, the fairness of price is commonly of concern to customers, and retail industry. Many retail store try treating consumers in fair condition because customer perceptions of unfair prices will cause reduced profit.

2.3 Customer Loyalty

C (Oliver, 1999). Customer loyalty is considered to produce greater supply to trade, condensed marketing costs (Aaker, 1991). The more loyal the customer and also the longer the customer is maintained, the more sales and profits the customer strength create. The advantages of built customer loyalty might come from continue extant customers still as attracting new ones. These benefits would, in turn, end in increased sales and profitability for the retail industry. Loyal customers are imagined to keep on with their suppliers or service providers for along time, and are more unlikely to cross-purchase. Loyal customers may express their loyalty by giving a greater share of their case to their high-valued brands product or service providers and by generating positive spoken recommendation. All of those activity would directly affect the profit of the retail industry.

2.4 Customer Satisfaction

Customer satisfaction is measure of how the organisation's overall outcome performs in the relation to set of customer necessary (Hill & Brierley, 2017). They also added understanding of the concept customer satisfaction is easy if we stand in customers place. In the context of retail industry, the customer satisfaction is the result of the customers representation of the value received in a dealing or relation. Based on Krüger (2016), a customer's level of satisfaction with a service or product is discovered by the difference between the customer's expectation and customer's perception of the actual performance. In a easy way to understand the definition of customer satisfaction, it is a result of customer perceiving that the organization has or overstep their belief regarding overall activity and key performance criteria.

3 Methodology

This study designed to test the affects of perceived quality, price fairness, and customer loyalty on customer satisfaction toward retail industry. In relation to that, quantitative research approach was utilized for collecting the relevant data. Specifically, a survey instrument was utilized for obtaining the responses from customers of retail industry. A total of 365 questionnaires were distributed to the respondents using convenience sampling technique. Krejcie and Morgan (1970) stated that the perfect sample size for any research is 365 respondents.

In constructing the questionnaire, measurement scales of variable were adapted and adopted from previous study to measure customer satisfaction taken from Hanaysha (2016). This were also further explain by Bland and Altman (1997) saying that acceptable values of alpha, ranging from 0.70 to 0.95. The items were also measured using a five-point Likert scale that ranges between 1 = "strongly disagree" and 5 = "strongly agree".

The statistical tools and techniques used in this study such as Pearson correlation analysis performed with the help of IBM SPSS latest versions. The data and results are presented in charts and tables. Pearson correlation are used to measure how strong relationship is between two variables. It has a value between -1.00 to +1.00, with zero means that the two variables are not related at all. +1.00 indicates the strongest positive correlation possible and -1.00 is the strongest negative correlation possible. Thus, the larger the correlation coefficient, the stronger the linkage or level of association. The null hypothesis states there is no relationship between

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

independent variable and dependent variable and that the correlation coefficient is zero.

4 Analysis and Discussions

Examining the reliability of constructs is very important in order to proceed with data analysis. However, this study relied on Cronbach's alpha procedure, which done using SPSS 26 to calculate the reliability of constructs. The findings confirmed that all constructs achieved above the suggested value of Cronbach's alpha is 0.7. Out of 365 set of questionnaires personally distributed on the respondents and all the respondents answered the questionnaires. Below shows the descriptive analysis of the respondents.

Table 3: Pilot Test

Variable	N of Items	Cronbach's Alpha
All Variables	19	.890
Perceived Quality (IV 1)	2	.522
Price Fairness (IV 2)	1	.569
Customer Loyalty (IV 3)	2	.502
Customer Satisfaction (DV)	2	.493

Table 1: Data of the Respondent

Table 4: Result of Hypothesis

Hypothesis	PCC	Supported
H ¹ Perceived quality has significant relationship on customer satisfaction in retail industry among university malaysia kelantan, campus kota students	0.573	Yes
H ² Price fairness has significant relationship on customer satisfaction in retail industry among university malaysia kelantan, campus kota students	0.479	Yes
H ³ Customer loyalty has significant relationship on customer satisfaction in retail industry among university malaysia kelantan, campus kota students	0.636	Yes

***p*-value is significant at the 0.000.

Table 4 shows result gathered as the data collected was analyse using Pearson correlation coefficient (PCC). The findings indicated that all three factors (perceived quality, price fairness and customer loyalty has significant affect on customer satisfaction. As were shown in table above, perceived quality has positive moderately relationship with customer satisfaction (PCC - 0.573) which results to H¹ is supported. Price fairness has positive moderately relationship with customer satisfaction (PCC - 0.479) which results to H² is supported. Lastly, customer loyalty has positive moderately high relationship with customer satisfaction (PCC - 0.636) which results to H³ is supported.

5 Conclusion

The primary purpose of this research is to test the effects of perceived quality, price fairness and customer loyalty on customer satisfaction in fast food restaurant in retail industry. Findings show that perceived quality has a significant positive effect on customer satisfaction. The previous studies done by Hanaysha (2016) had confirmed that perceived quality is one of the factor that can affect the customer satisfaction. Perceived quality means the ability of a service provider to customer satisfaction which might better the performance of business (Kotler, Philip and Armstrong, Gary 2006). In other words, it is difference between customer perception or expectation of service delivered by retail industry. There are five dimensions as tangibility, reliability, responsiveness, assurance, and empathy were verified by and it had been called as SERVQUAL scale for assessing perceived quality. Therefore, retail store managers must focus on perceived quality in order to satisfy their customers and keep their values in long term.

Next, the findings also revealed that price fairness has a significant positive effect on customer

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

satisfaction and according to Anderson and Sullivan (1993), price fairness means customer's evaluate and reactions toward the difference between a selling price and the comparative price is absolutely excusable, may be acceptable, or reasonable. This definition represents of price fairness involve a relation of price or process with a related standard. Therefore, the fairness of price is commonly of concern to customers, and retail industry. So, retail store managers should develop a pricing strategies and effective pricing mechanism to enhance customer satisfaction.

Lastly, the result of this study indicated that customer loyalty is the strongest significant positive effect on customer satisfaction among the others variables. Customer loyalty is considered to produce greater supply to trade, condensed marketing costs (Aaker, 1991). The more loyal the customer and also the longer the customer is maintained, the more sales and profits the customer strength create. The advantages of built customer loyalty might come from continue extant customers still as attracting new ones. These benefits would, in turn, end in increased sales and profitability for the retail industry. Thus, retail store managers recommended to emphasize on customer loyalty such as, using an attractive decoration in different style can deliver messages to customers.

There are some limitations in this paper that can be considered in the future researches such as, the struggle in distributing the questionnaire to respondents via google form due to pandemic period. Part of that, some respondents simply answered the questionnaire by ticking any answer they want to which lead to inaccurate result. Other than that, limited of time cause the researchers to limit the target population to a small scope, which is around university malaysia kelantan, city campus.

7 Acknowledgment

This research project was successfully done with assistance and co-operation from various authorities. I would like to express high gratitude to those people who guided, helped and supported to complete this research. My deep gratitude first goes to University Malaysia Kelantan (UMK) for giving me opportunity to do this research. Through this research, I gain a lot of experience, knowledge and expose to situation, which cannot be found in books, and certainly going to benefit in future.

My appreciation also extends to supervisor, Dr, Siti Afiqah Binti Zainuddin who guides me throughout to complete my proposal by sacrificing her time through the whole project. Her patient and advice's ensure this research can proceed very well. Furthermore, I would like to express high gratitude to respondents who willing to spend their precious time to respond the questionnaire of this research project. Finally, I acknowledge my beloved family members, friends and course mates for helping and supporting me until this research project ends.

Abstract:

The purpose of this research is to study the awareness of the importance of e-wallet services among today's society. With the growth of popular mobile payment services, consumers and businesses across Malaysia are entering a new era of modest cashless transactions. The rapid growth of social networks and e-commerce platforms has changed the way people communicate and transact around the world. Malaysia is moving towards cashless to prevent escalation of robbery and theft. robbery and theft involving individuals carrying large sums of money. Because of that, it leads to e-wallets, big pockets, online banking and more. Along with current trends, e-wallets should be implemented and used. therefore, researchers have studied convenience, looking at security and social influence on e-wallet services. quantitative design was applied to 124 target respondents to collect data for a set of survey questionnaires. The results show that all factors such as convenience, security are felt to have a significant positive relationship with e-wallet services. Based on regression analysis, looking at security emerges as the most dominant factor influencing e-wallet services. The result is to increase the knowledge of e-wallet researchers and users to better understand the importance of e-wallet in daily life. The Statistical Package for Social Sciences (SPSS) Statistics 26 is used to assist in the analysis of our data throughout the research. Descriptive analysis, validity and reliability tests, normality tests, Spearman Correlation analysis and Multiple Regression analysis were applied in data analysis. Finally, there are some limitations of this study and suggestions are included in this paper to provide better ideas for future researchers related to studies involving e-Wallet users in Malaysia.

Keywords: *e-Wallet, payment method, convenience, perceive security, social influence.*

1 Introduction

With numerous emerging innovations to replace existing technologies, the technological revolution of 4.0 is on the rise. It covers not only computer and communication technology elements, but also all aspects of life, including technical, medical, social, physical, financial and even political aspects (Azrul Azlan, 2020). This mechanism will accelerate payment transactions compared to conventional payments when the notion of electronic payment (e-payment) is implemented. In order to pay bills, fees and transfers, users no longer have to wait, but only by accessing the payment application or site at anytime and anywhere. This innovation alone is necessary to provide customers with comfort (Azrul Azlan, 2020).

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

It is evident in today's world that having a mobile phone or a tablet is becoming more important in everyday life. The number of smartphone users has risen dramatically with the growing number of affordable smartphones. According to a report by Erricson network experts, it is projected that a smartphone equivalent to 6.1 billion smartphones will be owned by almost three quarters of the global population by 2020. (Boxall, 2015). Only their shape is what separates ordinary wallets and e-wallets; wallets in physical form while e-wallets in virtual form. GrabPay, Touch n Go, Boost, Vcash and Razerpay are all examples of common e-wallets in Malaysia. Samsung Pay, Alipay and Googlepay are famous brands worldwide (Azrul Azlan, 2020).

It is often referred to as a digital or mobile wallet to be more applicable to e-wallets. E-wallet is a form of electronic card that can carry out mobile purchases by storing the credit cards, debit cards or bank account numbers of customers for payment. Utility is the same as credit or debit card (Ray, 2017). E-wallets may be a catalyst for traditional banking because they enable customers to move money or make lower-cost, more convenient and faster payments (Blockchains, 2018). As Jayaseelan (2017) said, however, the introduction of this e-wallet in everyday life is a major step that enables Malaysia to shift towards a cashless society. Once funded, shoppers can use E-wallets online to make transactions.

Jayaseelan (2017) said that in India and China, e-wallet services are well-established and widely used, but their existence in Malaysia is still very rare. While cash payments are still the main medium of exchange in Malaysia, after the increase in the introduction of cashless payments, the trend may shift (Lim & Appaduray, 2017). According to Bernama(2017), Governor Tan Sri Muhammad Ibrahim noted that at the Payment System Forum and Exhibition, the e-payment approach is a crucial element that would boost competitiveness and cost-efficiency for the digital economy, which is rising dramatically. Tan Sri Muhammad also stated that the advance technology, low operation cost by using the QR Code, and also the overwhelming number of Malaysian that holding debit cards and mobile phones should be treated as an advantage to optimize this Epayment technology (Bernama, 2017).

1.1 Research Objectives

The research objectives for this study is:

1. To identify relationship between convenience and awareness of the importance of e-wallet services.
2. To examine relationship between perceived security and awareness of the importance of e-wallet services.
3. To determine relationship between social influence and awareness of importance of a e-wallet services?

1.2 Research Questions

Research question for this study are:

1. What is the relationship between convenience and awareness of importance of a e-wallet services?
2. What is the relationship between perceive security and awareness of importance of a e-wallet services?
3. What is the relationship between social influence and awareness of importance of a e-wallet services?

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

2 Research Methodology

A quantitative descriptive research design is to used in this research. Quantitative research is the process of collecting and analyzing numerical data. It can be used to find patterns and averages, make predictions, test causal relationships, and generalize results to wider populations (Pritha Bhandari, 2020). This approach is used in the current study to calculate the reaction of the respondents to the awareness of the value of e-wallet services.

The target population is the total community of people from which the sample can be derived (Saul McLeod, 2019). The method of selecting a representative group from the population under study is sampling (Saul McLeod, 2019). It is anticipated that 124 users will participate in this research. Users aged between 18 years and 55 and above are the target demographic for the study because they are more open to new technical advances.

The initial analysis of data obtained for a research study is primary data analysis. Analyzing primary data is the process of making sense of the collected data to answer research questions or support or reject research hypotheses that a study is originally designed to assess (Mike Allen, 2017). The online questionnaire becomes the only primary data instrument for this research. This is because of online questionnaire survey allowed in this study to look into the relevant variables and fit into the objective of this study. Primary data analysis is the process of making sense of the data collected to answer research questions or to support or reject research hypotheses that a study is originally intended to evaluate (Mike Allen, 2017).

There are usually too many people in the community to understand quickly, so the investigations are often limited to one or two samples taken from them. The 30 samples were chosen to contain most of the information on a certain population parameter, but the relationship between the sample and the population must be such that the population of the sample is correctly inferred.

3 Analysis and Discussion

3.1 Demographic Profile

Table 1: Demographic Profile

Demographic	Category	Frequency	Percentage %
Gender	Male	47	37.9
	Female	77	62.1
Age	18-29 years old	30	24.2
	30-41 years old	50	40.3
	42-54 years old	28	22.6
	55 years old and above	16	12.9
Race	Malay	77	62.1
	Chinese	21	16.9
	Indian	17	13.7
	Others	9	7.3
Marital Status	Single	27	21.8
	Married	86	69.4
	Divorce/widow	11	8.9
Education Level	Primary school	18	14.5
	Secondary school	13	10.5
	College/diploma	41	33.1

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

	Undergraduate degree	33	26.6
	Postgraduate degree	13	10.5
	Others	6	4.8
Employment	Student	25	20.2
	Employed	54	43.5
	Housewife	19	15.3
	Unemployment	13	10.5
	Own business	13	10.5
Personal Monthly Income	Below RM 1000	32	25.8
	RM 1001 to RM 1500	17	13.7
	RM 1501 to RM 2000	15	12.1
	RM 2001 to RM 2500	22	17.7
	RM 2501 and above	38	30.6

The personal details of the respondents, including gender, age, race, marital status, level of education, employment and personal monthly income, were shown in this segment. The investigator measured the frequencies to illustrate the respondents' demographic history. The number of respondents, both male and female. The number of female respondents was more than the male respondent, as seen in the Table 1 above, based on the sample collected. 47 (37.9%) were male respondents, while 77 (62.1%) were female respondents. The average age of the respondent is between 30-41 years old, which is 50 (40.3%). 30 (24.2) of respondents are between 18-29 years of age. There were few respondents between 55 years of age and above, which is just 16 (12.9%). The remaining 28 (22.6%) were respondents aged 42-54 years old. For the race Malay, was the majority of respondents who answered the survey question 77 (62.1%). 21 (16.9%) Chinese respondents followed, and 17 (13.7%) came from Indian respondents, while the remainder came from Other races 9 (7.3%). The largest group of respondents, 86, were married (69.4%). 27 (21.8%) of the respondents were single, while 11 (8.9%) of the respondents were divorced/widowed. The bulk of the respondents were 41 at the college/diploma level (33.1%). Undergraduate degree, which was 33, followed by (26.6%). 18 (14.5%) of the respondents are from primary school and 13 (10.5%) are from secondary and postgraduate school. Of the other respondents, only 6 (4.8%) responded. The largest number of respondents who contributed to the survey was 54 (43.5%) is Employed. The student respondent was second highest with 25 (20.2%), followed by housewife 19 (15.3%). The individuals from their Own business and the unemployed contribute 13 (10.5%). Most respondents earn RM 2, 501 and above the income level of 38 (30.6%) and 32 (25.8%) earn below RM 1,000 and 22 (17.7%) earn RM 2,001 to RM 2,500 for the respondent. Followed by the respondent's 17 (13.7%) earn RM 1,001 to RM 1,500 and 15 (12.1%) earn RM 1,501 to RM2,000 for the respondent.

3.2 Descriptive Analysis

The descriptive analysis comes out to find the mean for each variables and to determine the awareness of the importance of e-wallet services. The response were scale by using 5-point Likert scale were 1 was anchored to 'Strongly Disagree', 2 as 'Disagree', 3 as 'Neutral', 4 as 'Agree' and lastly 5 as 'Strongly Agree'.

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

Table 2 : Descriptive Analysis

Variable	Mean	Std. Deviation
e-Wallet service (DV)	4.69	0.417
Convenience (IV1)	4.66	0.419
Perceive security (IV2)	4.73	0.367
Social influence (IV3)	4.69	0.426

Table 2 showed that all the independent variables consist of convenience, perceive security, social influence that seems to be common for e-wallet service. Based on the result, the highest mean value came from perceive security based on the description, which was 4.73, where respondents agreed more for this variable, while the lowest mean value was 4.66 for each variable on convenience where respondents agreed lower with that variable in this study. The highest standard deviation is social influences which was 0.426, while the lowest standard deviation is convenience is 0.419.

3.3 Reliability Analysis

The reliability analysis was used to determine the extent to which the items in the questionnaire were related to each other. It also used to provide an overall index of the repeatability or internal consistency of the scale as a whole, and identify the problem items that should not be excluded from the scale. In the study, a Cronbach's alpha analysis was used to access the reliability with the alpha value of 0.6 and above is acceptable.

Table 3: Reliability Analysis

Variable	Cronbach's Alpha	Strength of Association
e-Wallet service	0.866	Very good
Convenience	0.896	Very good
Perceive security	0.955	Very good
Social influence	0.937	Very good

In this research, a total of 124 respondent were involved in the actual survey. Table 3 shows the Cronbach's alpha values for the variables that were used in the measurement instrument. There were four questions used to measure e-wallet service using a 5-point Likert scale. The Cronbach's alpha result for this dependent variable was 0.866 which was good and thus the items coefficient for e-Wallet service was reliable. There were five questions used to measure Convenience. The Cronbach's Alpha result for this independent variable was 0.896. The strength of association between items was good. Thus, the items coefficient for Convenience was reliable. A total of five questions were used to measure Perceive security with the Cronbach's Alpha result for this independent variable was 0.955. It shows that the strength of association between items was also good and thus the items coefficient of Perceive security was reliable. Five questions were used to measure Social influence. The Cronbach's Alpha result for this independent variable was 0.937. The strength of association between items was

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

good. Therefore, the items coefficient obtained for this independent variable was reliable.

3.4 Correlation Analysis between e-Wallet Service (DV) and Convenience, Perceived Security, Social Influence.

Below shows the hypothesis listed as to found out about awareness of the importance of e-wallet services. Correlation analysis is a statistical method used to evaluate the strength of relationship between two quantitative variables. A high correlation means that two or more variables have a strong relationship with each other, while a weak correlation means that the variables are hardly related (Monica Franzese, 2019). This study had used correlation analysis to identify the relationship between independent variables and dependent variables. I used the correlation analysis to identify all the hypothesis can interact between dependent variable and independent variable. There were three independent variables which were Convenience, Perceived Security, and Social Influence.

Table 3: Correlation Analysis

Variable	e-Wallet service
e-Wallet service	1
Convenience	0.672
Perceive security	0.723
Social influence	0.518

H₁: There is significant relationship between convenience and awareness of importance of a e-wallet services?

Firstly, this study had identified the relationship between Convenience and e-Wallet service. According to Table 3, the correlation coefficient is 0.672 which indicates that both variables are correlated and has a positive relationship. From the result, the data is support H₁ where there is a significant relationship between the Convenience and e-Wallet service. There is a positive good significant relationship between convenience and e-Wallet service ($p < 0.05$, $r = 0.672$). Hence, hypothesis 1 (H₁) is supported.

H₂: There is significant relationship between perceive security and awareness of importance of a e-wallet services?

Secondly, this study had identified the relationship between Perceive security and e-Wallet service. Based on the Spearman's correlation, the second hypothesis in Table 3 showed positive relationship between the perceive security and e-Wallet. The correlation coefficient value is 0.723. This research has accepted the alternate hypothesis which Perceive security has a significant relationship with e-Wallet service. There is a positive good significant relationship between perceive security and e-Wallet service ($p < 0.05$, $r = 0.723$). Hence, hypothesis 2 (H₂) is supported.

H₃: There is significant relationship between social influence and awareness of importance of a e-wallet services?

Lastly, this study had identified the relationship between Social influence and e-Wallet service. According to the Table 3, the alternative was accepted since there is a relationship between Social influence and e-Wallet service which has shown by the Spearman's correlation which

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

is high significant. The correlation coefficient value is 0.518. There is a positive good significant relationship between perceive security and e-Wallet service ($p < 0.05$, $r = 0.518$). Hence, hypothesis 3 (H3) is supported.

3.5 Discussion

The aim of this research is to raise awareness of the importance of e-wallets in society. The results of the study show that there is a significant and positive between convenience with e-wallet services. Previous research confirm these findings (Kabir et al., 2017). Convenience is a significant factor in shaping consumers of e-Wallet techniques, according to Bezhovski (2016). Convenience is described as a match between the user's basic requirements, technical advancements and user experience. As advanced e-Wallet technology and e-Payment methods become simpler, consumers have built trust and the habit of using them.

In addition, these findings suggest that the relationship between perceive security is acceptable. The perceive security of the E-wallet, in other words, would influence the user's decision to use the E-wallet. This outcome is backed up by Teoh et al (2013). This is because respondents are increasingly aware of the steps that many financial firms are taking to address security-related issues. Moreover, financial institutions will alert customers regularly and will also notify them of fraud.

The correlation between social influence and the e-wallet is essential and positive. Slade et al. (2015) and Cao et al. agree on this (2016). There is a significant indirect effect of social influence. The social impact of subjective standards and image types, meanwhile, has a direct effect on the continued use of e-Wallets. The inference is that a major factor in shaping the use of e-Wallet is the influence of relatives, colleagues and others (Yang et al., 2012). If the user's family or friends think they can use e-wallet, the usage rate would increase in e-wallet (Lwoga & Lwoga) (2017). Since social influence is an important factor, Junadi and Sfenrianto (2015), departmental marketing can go through individuals-influential individuals whose views are respected for promoting e-wallet services, so from time to time, awareness of the importance of e-Wallet among users can be increased.

4 Conclusion and Future Research

In order to discover more details on the outcomes, future research can perform such research in a longer time frame. This will mean the findings will be interpreted more conclusively and accurately. For example, if there is sufficient time to perform the analysis, future researchers will be able to study more significance regarding e-Wallet service. Furthermore, future research is planned to use various research techniques for data collection to improve the precision of the findings, such as using face-to-face interviews, telephone call interviews and focus group discussions. This is because the self-administered data collection questionnaire approach is often correlated with the bias of involuntary respondents. Since this research has been performed in Malaysia, the suggestion for more research is that the same research can be carried out in spesified states. The comparative research should also be carried out so we can understand that society is alert or not to technology.

The aim of this study is to recognize the value of e-Wallet service awareness. Three goals to be accomplished in this study were highlighted in this study. The first goal is to establish the link between convenience and understanding of the value of e-wallet services. Second, the relationship between perceived protection and understanding of the significance of e-wallet services should be investigated. Finally, to evaluate the relationship between social impact and

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

knowledge of the value of e-wallet services, this study measures the hypotheses as mentioned in Chapter 4 in order to respond to research goals. In order to evaluate the reliability of the object, the data were evaluated using the reliability test and the spearman correlation was tested to determine the relationship between independent variables (Convenience, Perceive security and social influence) and dependent variable (e-Wallet services). In conclusion, the positive interaction with a highly important outcome is shown by all variables. Therefore, in this report, all the targets were successfully achieved.

5 Acknowledgement

First of all, I would like to thank the university for giving me permission to complete this task without any problems. Without permission, of course I will not be able to complete my assignment on the specified date. Next, I would like to thank Dr. Shah Iskandar Fahmie bin Ramlee, as a lecturer at the Faculty of Entrepreneurship and Business at Universiti Malaysia Kelantan and also as a supervisor whom I respect for giving me permission and support throughout this task. Not only that, he also corrected my mistakes and provided a lot of information in case I had an unresolved problem. Without his help, this task will not be submitted on the due date. In addition, I would also like to thank my family, friends, team members, respondents, as well as those who directly and indirectly participated and helped me in completing the research and cooperating with me. The encouragement, support, advice, and criticism given throughout this research gave me a better understanding in completing this research. This research solution would not have been possible without the help of all of you and I am very grateful.

BUSINESS COLLOQUIUM 2020/2021**

**THE IMPORTANCE OF HALAL PRODUCT PURCHASES
AMONG CONSUMERS IN DUNGUN, TERENGGANU**

Noor Hezan Balkis binti Johari and Munirah Binti Mahshar

Faculty of Entrepreneurship and Business,
Universiti Malaysia Kelantan,
Malaysia

[Email: noorhezan97@gmail.com](mailto:noorhezan97@gmail.com); munirah@umk.edu.my

Abstract:

‘Halal’ originally stands for something that are permissible for Muslim according to the Islamic Law. In this day and age, halal has been transformed into a standard of safety and hygiene for the products or service consumed by Malaysian Muslim. The principal of this study is to investigate the importance of halal product purchases among consumers in Dungun, Terengganu. To achieve this objective there were a few variables or factors that was identified. The variables are halal awareness, halal knowledge, and halal certification / halal logo. For the analysis, quantitative research was used to analyze the outcome and the sampling technique to ensure that the research objective is archived. This is quantitative research in which 220 respondents of residents in Mukim Pasir Raja Dungun, Terengganu was involved in this research. The 220 respondents are from different gender, age, and educational level. The data that collected from respondents was analyzed by using SPSS. After this research, researcher acknowledge that factors such halal awareness, halal knowledge, and halal certification / halal logo were significant in its influence towards importance of halal product purchases among consumers in Dungun, Terengganu. The result had been proven by conducting the reliability analysis, descriptive analysis, and Spearman’s Correlation value for each variable that has been studied.

Keywords: *awareness, certification, halal, knowledge, logo, product purchases.*

1 Introduction

Islam is one of religion that is the natural way of life which the follower of the religion called as “Muslim”. Muslim believes that Quran and Sunnah (action and sayings of Prophet Muhammad) are the guidelines to life in the world. For example, the economic system in Islam is fair; its social system is based on peace, good will, and cooperation; and the political system in Islam is established on conferring and consulting (Hussain, Rahman, Zaheer, & Saleem, 2016). Muslims follow Quranic guidance that all foods are Halal except those that are specifically mentioned as Haram (unlawful or prohibited). (Hasan, 2016) defined halal means permissible or lawful by Islamic law and state that religion also influence the attitude of consumers purchase. Nowadays, halal market appears as a promising of global market due to the needs of Muslim’s consumer for the halal product. The halal product is expected to increase from US\$ 2,107 billion market to US\$ 3,007 billion in 2023 (Sosianika & Amalia, 2020).

Halal market now widely accepted with the Halal business sectors currently developing to other sectors beyond the traditional F&B sector (US\$ 1,303 billion) including fashion (US\$ 270 billion), pharmaceuticals (US\$ 87 billion), cosmetics (US\$ 61 billion), finance (US\$ 2,438

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

billion), and tourism (US\$ 209 billion) (T. Reuters & D. Standard, 2018). Therefore this study is conducted to know the importance of halal product purchase among consumers in Dungun, Terengganu. Study by (Shaari et al., 2019), state that halal practice in business gain a worldwide acceptance and no longer a marketing jargon also accepted by Muslim and Non-Muslim countries. It is due to consumers today give more attention toward their health. The halal product is known as a good product among consumers regarding the “halal” perspective.

2 Literature Review

2.1 Underpinning Theory

Figure 2.1: Adopt from Theory of Plan Behaviour (Ajzen, 2019)

(Kan & Fabrigar, 2017) state that the Theory of Planned Behaviour (TPB) is a theory used to understand and predict behaviours, which posits that behaviours are immediately determined by behavioural intentions and under certain circumstances, perceived behavioural control. Behavioural intentions are determined by a combination of three factors: attitudes toward the behaviour, subjective norms, and perceived behavioural control. Theory of Planned Behaviour (TPB) is known as one of the well-known theories for understanding individual behaviour and intentions. It was developed by Ajzen in 1991 (Zakaria, Majid, Ahmad, Jusoh, & Zakaria, 2017).

2.2 Previous Study

Halal Product Purchases Decision

Halal certified product means that the product is permissible or acceptable in accordance with Islamic law. In order for products to receive this certification, they must be from an acceptable source such as a cow or chicken and slaughtered according to these laws (Wentworth, 2018). Halal products being produced by many manufacturers whether they are Muslim or Non-Muslim producers. Halal product nowadays being accepted by the worldwide users even though they are Non-Muslim. The concept of Halal is not related with food products only, but is also related with cosmetics, personal care, pharmaceutical and other products as well. Since these are majorly being produced by non-Muslim manufacturers (J. Lever & J. Fischer, 2018). There are four predictors that motivate consumers to purchase Halal food product, namely safety, religious values, health benefits and exclusiveness (Widodo, 2013). Previous studies also revealed several factors that influence not only Muslim but also non-Muslim's intention to purchase Halal products (Rezai, 2008).

Halal Awareness

The actual threats regarding halal issue is the lack of awareness in individuals itself. Perhaps

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

consumers fail to build their own awareness because of the internal factor within themselves such as value, religiosity commitment and attitude towards halal products, information processing or external factor like environmental influence including culture, opinion leader and community (Yusoff & Adzharuddin, 2017). Therefore, the consequence to have a valid halal certification produced by JAKIM is extremely vital since 61% of 30 million Malaysian are Muslim (Mohamed Elias, Othman, Yaacob, & Mohd Saifudin, 2016). Awareness of halal is something that every Muslim need to know even a little because it is really useful for daily life especially when they in country of minority Muslim. Therefore, awareness can be described as a level of attentiveness or realization among Muslim entrepreneur towards producing what is permitted for Muslims to consume and use (A.R. Ambali & A.N. Bakar, 2014).

Knowledge

It is about how the Muslim individual should digest and practiced some Islamic teachings regarding on halal and haram. In Malaysia most of the consumers have a good understanding and knowledge on halal food and food hygiene, including the ways it is prepared, processed and marketed (M. Said, F. Hassan, R. Musa, & N.A. Rahman, 2014). Therefore, the knowledge about the product ingredients is important for the consumers, since the possibility of acceptance or rejection during the process of purchasing decision is there (Ahmed, Najmi, Faizan, & Ahmed, 2019). Even the halal knowledge among consumers are low they still know what to decide on their purchases. This means, as long as they know about the product ingredient and any that related to the product they will choose it as their item for consumption.

Halal Certification / Halal Logo

It was introduced to protect Muslims consumers through a comprehensive Halal Assurance System. Halal certification not only focusing on the materials or ingredients that goes into the product however the “Toyyiban” or wholesomeness concept that was applied will also scrutinize every aspect of productions (Ismail, Othman, Rahman, Kamarulzaman, & Rahman, 2016). The Halal certification also guarantees that products and services aimed at the Muslim population meet the requirements of Islamic law and therefore are suitable for consumption in both Muslim-majority countries and in Western countries where there are significant population group who practice Islam such France, Germany, United Kingdom, and few more (Human Resources Department).

Figure 2.2: Halal Logo

Figure 2.2 show that few of halal logo used by the Malaysian halal certification on every product that given certification by JAKIM. Here the outline of the logo:

Has an eight cups star at the center of a circle.
The Arabic word – “halal” at the center of the star.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

The word "HALAL" in Roman alphabets below it. The word "Malaysia" written in Roman alphabets and halal in Arabic within the circle of the logo.

Two small five cusp stars are positioned to separate the Roman alphabets from the Arabic word mentioned,

2.3 Hypotheses Statement

H1: There is a relationship between halal awareness with the halal product purchase among consumers.

H2: There is a relationship between knowledge with the halal product purchase among consumers.

H3: There is a relationship between halal certification / halal logo with the halal product purchase among consumers.

2.4 Conceptual Framework

Figure 2.3: Adapted from Theory of Planned Behaviour (Ajzen, 2019)

For the independent variable of theoretical framework and conceptual framework are nearly the same which there are three components halal awareness, knowledge, and halal certification / halal logo. The dependent and independent will be explained in this study. For this study, by using the theory there are adapted there are several contextual factors had been identified to examine the relationship between the factors affecting halal products purchases in Dungun, Terengganu.

3 Research Methodology

Data Collection Methods

In this study will be using the most common method which survey method to collect the primary data. In this research, researcher will use this method of quantitative data to collect and gather all the data from respondents through method of questionnaire. 220 questionnaires will be distributed to the respondents in mukim Pasir Raja. Once the questionnaire is completed and print, it will be distributed to the respondents by face to face. Respondents will be given 15-20 minutes to answer the questionnaire. After the respondent has finished answering the questionnaire given, researcher will collect the question at the same time.

Measurement of The Variables

As to conduct this research, the instrument that being used in order to accomplished this study is by using questionnaire for data collection. the questionnaire is being divided into three sections which is section A (Demographic), section B (factors choose by researcher), and section C. For section A, respondent is given question on their basic demographic which measure in nominal scale and this section adapted from (Ahmad, 2014), section B is related to halal product purchases which, and section C is related to halal awareness, knowledge, and halal certification / halal logo. Section B and C is using Likert scales of 1 (strongly disagree)

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

to 5 (strongly agree). Section B has six items (Latif, Harris, & Rahman, 2019). Section C has nine items with halal awareness with six items (Parhan & Mohd Ismail, 2015), part two related to the knowledge with six items (A. S. Nuratifah, M. S. Sharifudin, & A. L. Mariam, 2019), and part three related to the halal certification / halal logo with six items (Latif et al., 2019).

4 Analysis

Descriptive Analysis – to analyses the demographic data in the study. The outcome of the individual variable can be express through frequency distribution (Saunders, Lewis, & Thornhill, 2009). In the meantime, it can be converted into the form of bar chart, pie, histogram, and to interpret. By doing this analysis, researcher can determine the data of demographic respondents in the research study.

Spearman's Correlation Analysis – Spearman's Correlation is a non-parametric test that is used to measure the degree of association between the two variables (Lani). Spearman's Correlation test does not carry any assumption about the distribution of the data and is the appropriate correlation analysis when the variables are measured on a scale that is at least ordinal. The assumption of the Spearman's Correlation is that data must be at least ordinal and the scores on one variable must be monotonically relate to the others variables.

Reliability Analysis – it means consistency. It is the degree to which an instrument will give similar result for the same individual at different times. Reliability can take on value of 0 to 1.0 inclusive. Test-retest reliability is one of the methods for checking reliability. Cronbach's alpha is a measure of internal consistency. It is also considered to be a measure of scale reliability. The closer Cronbach's alpha to 1, the higher internal consistency of reliability.

Pilot Study - According to (Moser & Kalton, 1985), a pilot study should be carried out and is considered to be the last safeguard against the possibility of the ineffectiveness of the main survey. Therefore, a pilot study will be undertaken before the final process of data collection. The intention of undertaking this test is to check and clarify the questionnaire on the right use of terms, the meaning and relevance of each item. (Moser & Kalton, 1985) also mentioned that 15-30 respondents are considered sufficient for pilot testing.

5 Data Analysis and Discussion

5.1 Preliminary Analysis

Pilot test will be carried out before the questionnaire is adopted to access the consistency and exactness of the questionnaire design. Around 15-30 respondents are enough for pilot study to confirm that respondents understanding and feedback (Hill, 1998). A small group of 20 respondents have been chosen to answer the questionnaire for the pilot test for this study. The respondents who have done the pilot test will not be considered in the main study. Table 4.1 specifies the results of reliability analysis and it shows the variables of halal product purchases, halal awareness, and halal certification / halal logo are significant with value more than 0.70 of Cronbach's Alpha while the Cronbach's Alpha of knowledge is at 0.65. It indicated the strong point of association between variables is very good.

Table 4.1: Reliability Test (Pilot Test)

Variable	Number of Items	Cronbach's Alpha
Halal Product Purchases	6	0.859
Halal Awareness	6	0.741
Knowledge	6	0.650
Halal Certification / Halal Logo	6	0.904

5.3 Descriptive Analysis

In descriptive analysis, every section of dependent variable and independent variables has been using the mean of analysis that being choose by the researcher. It is to find out the factors that effecting Halal product purchases among consumers in Mukim Pasir Raja, Dungun, Terengganu. Researcher will find out which the question respondents strongly agreed and strongly disagreed.

Table 4.8: Level of Mean

Level	Mean
Strongly Agree	4.01- 5.00
Agree	3.01 - 4.00
Neutral	2.01 - 3.00
Disagree	1.01 - 2.00
Strongly Disagree	0.01 - 1.00

Halal Product Purchases

Table 4.9: Halal Product Purchases

Descriptive Statistics		
	N	Mean
I will help spread news about the halal concept to encourage awareness.	220	4.88
I will encourage people to purchases halal products.	220	4.90
I will go to any event that promote halal products.	220	4.60
Halal certification is my main criterion when choosing products to purchase.	220	4.73
I will be satisfied with my decision to experience halal products concept.	220	4.87
The halal product is suitable for Muslim and Non-Muslim.	220	4.93
Valid N (listwise)	220	

The highest mean shown is at level of 4.93 which state that respondents strongly agree that the halal product is suitable for Muslim and Non-Muslim. The lowest result of halal product purchases is at the mean level of 4.60 which that they will go to any event that promote halal products.

Halal Awareness

Table 4.10: Halal Awareness

Descriptive Statistics		
	N	Mean
I understand about the halal concept.	220	4.88
I can differentiate between Halal and Non-halal.	220	4.90
The Halal rules only applied to Muslims.	220	4.66
I have no problem to consume Halal product.	220	4.93
Halal concept is very important to the Malaysia society.	220	4.63
Halal rules should be implemented into all kind of industries.	220	4.89
Valid N (listwise)	220	

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

The highest mean shown is at level of 4.93 which state respondents strongly agree that they have no problem to consume Halal product. The lowest result of halal awareness is at the mean level of 4.63 which Halal concept is very important to the Malaysia society.

Knowledge

Table 4.11: Knowledge

Descriptive Statistics		
	N	Mean
There is 'halal' and 'haram' in Islam.	220	4.94
Haram mean the forbidden.	220	4.93
Halal mean permissible by <i>syari'ah</i> law.	220	4.92
Animal carcass, blood, pigs and alcohol are haram for Muslim.	220	4.95
Halal products are good for personal health (mental and physical).	220	4.92
Are you aware that JAKIM can revoke the Malaysian Halal Certificate if there is an error in foods processing.	220	4.01
Valid N (listwise)	220	

The highest mean shown is at level of 4.95 which state that respondents strongly agree that animal carcass, blood, pigs and alcohol are haram for Muslim. The lowest result of knowledge is at the mean level of 4.01 which that they are aware that JAKIM can revoke the Malaysian Halal Certificate if there is an error in foods processing.

Halal Certification / Halal Logo

Table 4.12: Halal Certification / Halal Logo

Descriptive Statistics		
	N	Mean
In Malaysia halal certificate is given by JAKIM.	220	4.92
Halal certification convince me to purchase any products or service.	220	4.87
The halal logo is important in choosing the halal products.	220	4.86
I choose the product base on halal logo.	220	4.72
I will always be careful when choosing the products with halal logo.	220	4.84
I am aware of the differentiation between the genuine and nongenuine halal logo.	220	4.76
Valid N (listwise)	220	

The highest mean shown is at level of 4.92 which state that respondents strongly agree that In Malaysia halal certificate is given by JAKIM. The lowest result of halal purchases is at the mean level of 4.72 which that they choose the product base on halal logo.

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

Validity and Reliability Test

Table 4. 13: Results of reliability Cronbach's Alpha for the variables

Variables	Number of Items	Cronbach's Alpha before item deletion	Number of items after item deleted	Cronbach's Alpha after item deleted
Halal Product Purchases	6	0.735	6	0.735
Halal Awareness	6	0.699	6	0.699
Knowledge	6	0.566	5	0.897
Halal Certification / Halal Logo	6	0.857	6	0.857

The dependent variable which is Halal Product Purchases found to be acceptable reliability (6 items; $\alpha = 0.735$). The first independent variable is Halal Awareness showed a questionable reliability (6 items; $\alpha = 0.699$) The second independent variable that is Knowledge showed a good reliability (5 items; $\alpha = 0.897$) and the last independent variable that is Halal Certification / Halal Logo found to be also a good reliability (6 items; $\alpha = 0.857$). One item from the second independent variable were deleted that is Knowledge Q6 with the Cronbach's Alpha (6 items; $\alpha = 0.566$). It has been removed in order to save cost, time and avoiding lack of understanding from the respondents. The Cronbach's Alpha is unchanged from every variable after the removal. Therefore, the data was considered suitable for further analysis.

Normality Test

Table 4. 14: Summary of Skewness and Kurtosis Results

		Statistics			
		HPP	HA	KLG	HC/HL
N	Valid	220	220	220	220
	Missing	0	0	0	0
Mean		4.83	4.82	4.78	4.83
Std. Deviation		0.27	0.28	0.245	0.33
Skewness		-2.79	-2.79	-2.67	-2.51
Std. Error of Skewness		0.16	0.16	0.16	0.16
Kurtosis		11.58	10.79	13.78	6.62
Std. Error of Kurtosis		0.33	0.33	0.33	0.33

The skewness value for halal product purchases is -2.791, halal awareness is -2.787, knowledge is -2.674, and halal certification / halal logo is -2.513. For kurtosis values halal product purchases is 11.577, halal awareness is 10.785, knowledge is 13.783, and halal certification / halal logo is 6.624. All skewness values for each variable are close to zero. As for kurtosis value, each variable is more than 3. Thus, all the variables of this study are not normal. Therefore, this study is using Spearman's correlation analysis. Distributed shown by following figure of histogram below.

Figure 4.9: Histogram of Skewness and Kurtosis for Knowledge

Figure 4.10: Histogram of Skewness and Kurtosis for Halal Certification / Halal Logo

Hypotheses Testing

Spearman’s Correlation Analysis is accepted to quantify the strength of the linear relationship between two ranked variables (Saunders et al., 2009; Saunders, Lewis, & Thornhill, 2012). The table 4.15 shows the measurement scale to describe the strength of relationship between dependent and independent variable.

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

*Table 4. 15: Rules of Thumb of Correlation Coefficient
(Source: (Hair, 2007) Research Methods for Business)*

Coefficient Range (r)	Interpretation
0.90 to 1.00 (-0.90 to -1.00)	Very High Positive (Negative) Correlation
0.70 to 0.90 (-0.70 to -0.90)	High Positive (Negative) Correlation
0.50 to 0.70 (-0.50 to -0.70)	Moderate Positive (Negative) Correlation
0.30 to 0.50 (-0.30 to -0.50)	Low Positive (Negative) Correlation
0.00 to 0.30 (-0.30 to 0.00)	Negligible Correlation

Hypothesis 1: There is a relationship between halal awareness with the halal product purchase among consumers.

Table 4.16: Correlation between Halal Product Purchases and Halal Awareness

Correlation			
		HPP	HA
HPP	Spearman's Correlation	1	0.376**
	Sig. (2-tailed)		0.000
	N	220	220
HA	Spearman's Correlation	0.376**	1
	Sig. (2-tailed)	0.000	
	N	220	220
**. Correlation is significant at the 0.01 level (2-tailed).			

The r value of halal awareness is 0.376. The result indicates there is low positive correlation between halal product purchases and halal awareness. Besides, the p-value is less than 0.01. This result shows that there is a relationship between halal product purchases and halal awareness. Therefore, hypothesis 1 is accepted.

Hypothesis 2: There is a relationship between knowledge with the halal product purchase among consumers.

Table 4.17: Correlation between Halal Product Purchases and Knowledge

Correlation			
		HPP	KLK
HPP	Spearman's Correlation	1	0.217**
	Sig. (2-tailed)		0.001
	N	220	220
KLK	Spearman's Correlation	0.217**	1
	Sig. (2-tailed)	0.001	
	N	220	220
**. Correlation is significant at the 0.01 level (2-tailed).			

The r value of halal awareness is 0.217. The result indicates there is negligible correlation between halal product purchases and knowledge. Besides, the p-value is less than 0.01. This result shows that there is a relationship between halal product purchases and knowledge. Therefore, hypothesis 2 is accepted.

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

Hypothesis 3: There is a relationship between halal certification / halal logo with the halal product purchase among consumers.

Table 4.18: Correlation between Halal Product Purchases and Halal Certification / Halal Logo

Correlation			
		HPP	HC/HL
HPP	Spearman's Correlation	1	0.247**
	Sig. (2-tailed)		0.00
	N	220	220
HC/HL	Spearman's Correlation	0.247**	1
	Sig. (2-tailed)	0.000	
	N	220	220
**. Correlation is significant at the 0.01 level (2-tailed).			

The r value of halal awareness is 0.247. The result indicates there is negligible correlation between halal product purchases and halal certification / halal logo. Besides, the p-value is less than 0.01. This result shows that there is a relationship between halal product purchases and halal certification / halal logo. Therefore, hypothesis 3 is accepted.

6 Discussion and Conclusion

This study examines the importance of halal product purchases among consumers in Dungun, Terengganu. Results of the study shows that the literature is being supported and the data collected are reliable. This all is being proven by the independent variables which include halal awareness, knowledge and halal certification / halal logo are supporting the dependent variable halal product purchases based on Spearman's Correlation Analysis. The result of the study shows that according to perceived relative (Halal Awareness), consumers in Dungun, Terengganu are willing to adopt the halal product purchases because it has many advantages. Perceived relative has been influenced the adoption of halal product purchases, and this research shows that it increases the adoption of halal product purchases among consumers in Dungun, Terengganu. Consumers adopted halal product purchases will get many advantages that others users might not get such as maintaining their mental and physical health while helping to increase the prestige of halal products. In conclusion, this study concluded that the halal awareness is a significant factor in adopt halal product purchases among consumers.

To summarize, for future research could extend the scope of the study on different country or place. Next, future research shows examine more variables to obtain a better judgement on importance of halal product purchases among consumer. The number of sample size also should be expended to emerge more accuracy in the data and the outcome. Those who are interest in promoting halal product may find this result helpful in guiding their efforts.

Key Findings

Table 5.1: Summary of Hypotheses Testing Results

Research Question	Hypothesis result	Finding
What is consumers level of halal awareness on purchasing halal product.	p = 0.376 (p<0.01) r = 0.000	There is a relationship between halal awareness with the halal product purchase among consumers.

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

What is consumers level of knowledge help consumers purchasing halal product.	p = 0.217 (p<0.01) r = 0.001	There is a relationship between knowledge with the halal product purchase among consumers.
How can halal certification / logo become important in consumers halal product purchases decision.	p = 0.247 (p<0.01) r = 0.000	There is a relationship between halal certification / halal logo with the halal product purchase among consumers.

7 Acknowledgement

This research project was successfully done with assistance and co-operation of variety authorities. I wish to express my ultimate gratitude to those people who guided, helped and supported me in completing this research. First of all, I would like to thank University Malaysia Kelantan (UMK) for giving me the opportunity to involve in the research. Secondly, I would like to thank my supervisor, Madam Munirah binti Mahshar who had led me by sacrificing her time to guide me throughout the whole project. Thirdly, I would also like to express my gratitude to Madam Nik Noorhazila binti Nik Mud for coordinating and provide me with the relevant information regarding my research project. Last but not least, I would like to express my ultimate appreciation to those respondents who willing to help by spending their precious time to respond to the questionnaire of the research project. Besides that, I would like to thank my family members, friends, and course mates for helping and supporting me till the research project end.

Abstract:

Social media is the term often used to refer to new forms of media that involve interactive participation. This study will conduct to identify the factors that influence purchasing power to UMK student. The status consumption that effect on the consumer's attitude towards counterfeit products, the growth of online social networks provided many different additional online activities for consumers such as blogging, chatting, gaming, and messaging and the coming of the social media and its acceptance by the public, have altered quite a lot in the way organizations promote their products and service as well as the channels of communication between them and their customers. This paper will to determine the relationship between social influencer, promotion, information service and that influence purchasing power to UMK students. This cross-sectional study was analysing in terms of reliability test, normality test and Pearson Correlation. For the result Pearson Correlation that social influencer, promotion and information service has positive relationship with influence purchasing power among UMK students. This study comes out with some limitations and recommendation to provide better viewpoint for future researchers, retailers and other parties can use this research is the business. Those companies can use this research as a material to improve their service quality to their customers to gain more satisfaction indirectly increase their purchasing power by using influence.

Keywords: *social media, influence purchasing power, social influencer, promotion, information service.*

1 Introduction

Social media is the term often used to refer to new forms of media that involve interactive participation. Often the development of media is divided into two different ages, the interactive age and broadcast age. In the broadcast age, media were almost exclusively centralized where one entity such as a radio or television station, newspaper company, or a movie production studio—distributed messages to many people. Feedback to media outlets was often indirect, delayed, and impersonal. Besides that, mediated communication between individuals typically happened on a much smaller level, telephone calls, usually via personal letters or sometimes on a slightly larger scale through means such as photo copied family newsletters. With the rise of digital and mobile technologies, interaction on a large scale became easier for individuals than ever before; and such as, a new media age was born where interactivity was placed at the center of new media functions. One individual could now speak to many, and instant feedback was a possibility also here citizens and consumers used to have limited and somewhat muted voices, now they could share their opinions with many. The low cost and accessibility of new technology also allowed more options for media consumption than ever before and so instead of only a few news outlets, individuals now have the ability to seek information from several

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

sources. As the role of social media has gradually evolved from a single marketing tool to that of a marketing intelligence source in which firms can analyse, observe and predict customer behaviour's, it has become increasingly imperative for marketers to strategically use and leverage social media to achieve competitive advantage and superior performance (Lamberton and Stephen 2016). Everyday people buy things that are relevant to their needs and at the same time they are making purchasing decisions. Specific consumer behaviour is defined as "the activities people undertake when obtaining, consuming, and disposing of products and services" (Blackwell, Miniard & Engel 2006). Consumer behaviours are influenced by personal and environmental factors (Blyth, 2008). A central part of consumer behaviour is, consumers' purchasing decision that included several steps, generally social networks such as groups or individuals who own the power over consumers can affect consumers' purchase decision (Solomon, Bamossy, Askegaard & Hogg, 2010).

1.2 Significance Of The Study

This study needs to be published to help UMK students to know more details about the media social influence purchasing power among students by using the method using a quantitative method which questionnaire will be distributed to the respondents in gaining the data and information giving evidence on the frequency of students using social media for the purchase process. This will make it easier for researchers in the future especially final year students to know about what that factor that influence purchasing power among UMK students because this study not many research about the factors that influence purchasing power among UMK students. This paper also discusses about social influencer, promotion, information service in the social media may be one of the factors that have influenced the purchase among UMK students.

2 Literature Review

2.1 Influence Purchasing Power

According to Nyarko, Asimah, Agbemava and Tsetse (2015), they studied on the research of Kotler and Armstrong (2000), and have agreed that endorsement is a network of brand communication where a personality will represent the brand plus testify the claim that the brand has made to the public, by utilising his or her character, fame, as well as status in the public. Since a celebrity is a person that the society looked up to, they definitely have an influence on the consumer's buying intention, as they will believe in what the celebrity they looked up to endorsed. The consumer might be willing to buy the product because their favourite celebrity endorsed it, might not be because they think the product is good, as mentioned by Chaudhary and Asthana (2015). Chan, Ng and Luk (2013) agreed with the research by stating that public campaign run by celebrity endorser will have the ability to improve the image of the company's brand, therefore influence the intention to purchase.

2.2 Social Influencer

Social influence means individuals alter their thoughts, feelings, attitudes, or behaviours as a result of interactions with other individuals. Informational social influence means accepting information obtained from another as evidence of truth; normative social influence means an influence to conform to the positive expectations of another. This study will research suggests that consumers participate in s-commerce to enhance their shopping performance because they are usually susceptible to information sources with high credibility in this context.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

2.3 Promotion

Promotions can be defined as a form of marketing communication, marketing communication is a marketing activity that seeks to disseminate information, influence, persuade and alerting the target market for the company and its products to be willing to accept, purchase, and loyal to the products offered by the company concerned. Promotion is the most important activities play an active role in introducing, recalls, and inform the benefits of a product in order to encourage consumers to buy the product being promoted. To hold a promotion, every company should be able to determine exactly which of promotional tools used in order to reach success in sales.

2.4 Information Service

Decision-making and the control of information environments have been studied by authors such as Brown et al. (2011), Lano (2015) and Pandey and Mookerjee (2018) who show the importance of the information offered by marketing strategies for decision-making by buyers in ecosystems. Variables such as the external factors (EF) that surround the company, the beliefs of the company and competitors in the sector, the contextualization present in society or the behaviour and attitude of companies when selling certain products or services could be important factors for making decisions when purchasing services (Lano, 2015; Iršič, 2017; Inyang et al., 2018).

2.5 Hypotheses Statement

Three hypotheses are developed in this study which are as following: -

H1: The social influencer has significant effect relationship on influence purchasing power.

H2: The promotion has significant effect relationship on influence purchasing power.

H3: The information service has significant effect relationship on influence purchasing power.

2.6 Conceptual Framework

Figure 1 shows the conceptual framework of this study. It consists of ease of use, social influence, security and acceptance of QR code payment. The framework was adapted from Aydin & Burnaz (2016).

Figure 1: Conceptual framework adapted from Grant & Osanloo, 2014.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

3 Research Methodology

3.1 Research Design

Hair (2015) states that data collection incorporates different various types of a structures or organized process through interviews with structure questions or data observation. A very substantial decision in investigation procedure is research method to be chosen as it determines how applicable information can be extracted for a research paper (Sileyew, 2019). The reason for using the descriptive research design in the study is because it was insightful in the research problem through setting out the variable which is growth of the social media.

3.2 Data Collection Methods

In this study primary sources were highly preferred for obtaining the data. This paper structured questionnaires were used for collection of primary data in the study. Therefore, the source of primary data will be collected by distributing the questionnaire to students of UMK which were sent through E-mail and social media platforms because the targeted respondents for this study are students from UMK and it easy to approach students to distribute the questionnaire.

3.3 Study Population

Population is the whole pool from which to extract a sample data and a population also can refer to whole groups of people, object, measurement and event. A population can be aggregate experiment of subject groups together by a common features (Kenton, 2020). The population of this study is focusing on students in UMK. The study is about investigating the social media factor that influence purchasing power among student UMK.

3.4 Sample Size

A sample is the number of sampling elements that are analyzed from having been selected from the population. Dessler (2013) states that a sample size matters and if big then the lower chances of error in taking a comprehensive view of the population. According to Dattalo, (2013) the sample size is essential in trying to figure out the statistical accuracy of population values estimations.

3.5 Sampling Techniques

When you conduct research about a group of people, it's rarely possible to collect data from every person in that group, you select a sample and the sample is the group of individuals who will actually participate in the research (Shona McCombes 2019). To draw valid conclusions from results, have to carefully decide how will select a sample that is representative of the group as a whole.

3.6 Research Instrument Development

Instrument is refers to method used by the researcher to get data collected from the respondents. Data is the elements of information that researcher gets from the participants of the study. There are other methods can be used by the researchers depends on the nature of research that is be to carried out. There are many types of instrument that can be used by the researchers for their study. The infomation of the instrument is based on the findings of the interview conducted by the researchers from UMK students as well as on the information from the literature reviewed.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

3.7 Measurement Of The Variable

A [measurement variable](#) is an unknown attribute that measures a particular entity and can take one or more values. It is commonly used for scientific research purposes. Unlike in mathematics, measurement variables can not only take quantitative values but can also take qualitative values in statistics.

4 Procedur For Data Analysis

For this study, primary data were used to gather information by distributing questionnaires to be answered by a total of 378 working people. At the same time, secondary data is also used in this study, secondary data consists of articles, books and internet sources. Statistical Package for the Social Sciences (SPSS) software was used to analyse all data collected from the questionnaires. The descriptive procedure also used to explain the demographics of the respondents such as mean, average mean and mode.

5 Findings

5.1 Demographic Profile of Respondents

Demographic		Frequency	Percentage (%)
Gender	Male	115	29%
	Female	275	71%
Age	20 Years Old Below	48	12%
	21 Years Old	52	13%
	22 Years Old	56	14%
	23 Years Old	69	17.7%
	24 Years Old	78	20%
	25 Years Old Above	86	22%
Courses	SAR	101	26%
	SAB	64	16%
	SAK	69	18%
	SAL	70	18%
	SAE	86	22%
Years Of Study	Years 1	47	12%
	Years 2	71	18%
	Years 3	126	32%
	Years 4	146	38%
How Often Do Use Social Media	Several Times A Day	142	36%
	Once A Day	82	21%
	Two To Three Times A Week	106	27%
	Weekly	60	16%

Table 1: Demographic profile of respondents

A set of personal characteristics which are gender, age, courses, years of study and how often do use social media have been examined and presented in Table 1. The questionnaire was distributed through online by using communication application. 378 set of questionnaires were collected where 142 respondents (36%) who use often social media several times a day. For once a day using social media where 82 respondents (21%), and 106 (27%) who often do use social media where two to three times a week. The rest 60 respondents (16%) who often use

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

social media where weekly and participate in answering questionnaire. The main objective for descriptive analysis is to understand the profile of respondents. Table 1 shows demographic profile of respondents. There were 115 (29%) male respondents and 275 (71%) female respondents involved in the study. There were 48 of respondents among 20 years old and below with (12%), 52 of respondents among 21 years old with (12%), there also 56 of respondents among 22 year old with (14%), 62 of respondents among 23 years old with (17.7%) and 78 of respondents among 24 years old with (20%) while 86 of respondents among 25 years old and above with (22%) only. Besides, majority of respondents are from courses SAR which contain 101 of respondents with 26%, 86 of respondents with (22%) from courses SAE, courses SAL and SAK same with 69 and 70 of respondents with (18%) and less from courses is SAB where 64 of respondents with (16%). There were 82 respondents are come from the categories years 1, 47 of respondents with (12%), 71 of respondents with (18%) from years 2, 126 of respondents with (32%) from years 3 and last 146 of respondents with (38%) from years 4.

5.2 Normality Testing

	Tests of Normality					
	Kolmogorov-Smirnov ^a			Shapiro-Wilk		
	Statistic	Df	Sig.	Statistic	df	Sig.
Influence purchasing power (Dv)	.123	378	.000	.924	378	.000
Social influencer (IV1)	.095	378	.000	.944	378	.000
Promotion (IV2)	.126	378	.000	.922	378	.000
Information service (IV3)	.123	378	.000	.924	378	.000

Source: SPSS Data Analysis

According to table 4.7 shows that all the variables have $p < 0.05$ so all the variables can be assumed to be non-normal. Thus, the normality of all variables for this research was met. This research using Kolmogorov-Smirnov normality test instead Shapiro-Wilk normality test. The Kolmogorov-Smirnov normality test Kolmogorov-Smirnov is more general and can work for large scale of research but Shapiro-Wilk normality test are more specific and work on small scale of research. This is because Kolmogorov-Smirnov had no sensitive to problem in tails and it's was suitable for data set more than 50. In addition, Shapiro-Wilk did not work well if several values in the data set were the same and its work best for data set data set less than 50 (Razali and Bee).

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

5.3 Pearson Correlation

Table 4.8: Pearson Correlation

Variable	Mean(SD)	Social influencer	Promotion	Information service	Influence purchasing power
Social influencer	4.18(0.60)	1	0.733*	0.820*	1.000*
Promotion	4.34(0.53)	0.733*	1	0.744*	0.733*
Information service	4.35(0.53)	0.820*	0.744*	1	0.820*
Influence purchasing power	4.34(0.53)	1.000*	0.733*	0.820*	1

*p-value<0.05, pearson correlation analysis applied

Source: Develop for Research from SPSS

The table 4.8 show the outcome result of Pearson Correlation which was run to determine the relationship between social influencer and influence purchasing power has positive relationship and definite relationship, $r = 1.00$, $p < 0.05$. Meanwhile independent variable of promotion there is a good positive significant relationship between promotion and influence purchasing power and definite relationship $r = 733$, $p < 0.05$. Lastly, Pearson Correlation was run to determine the relationship between information service and influence purchasing power there is a strong positive relationship and definite relationship, $r=0.820$, $p < 0.05$.

6 Recommendations/Suggestion For Future Research

The reason of this research is to explore further what the social media factor that influence purchasing power. From this research, it helps for other parties, such as researcher and other parties do similar research for their importance in the future. For researchers, this research could help them to use this research as a reference to achieve their research objective. Apart from that, from this research, future researchers can 78 expand this type of research in a large scope of study and use another method to complete their objective. Other parties can use this research is the business. Those companies can use this research as a material to improve their service quality to their customers to gain more satisfaction indirectly increase their purchasing power by using influence. As an example, from this research used, companies can improve their service such as their line coverage, new marketing plan, loyalty program, service quality, and so on. With this, it can help the companies to gain new customers, higher profits, higher brand image, and make new and retained existing loyal customers.

7 Limitations Of The Study

The limitation of this study was researcher had challenge to make sure the students answer the questionnaire. It is might be disturb the students to answer the questionnaire. Some of students might have less understanding toward the question. The researcher must struggle to ensure that sufficient amount of data like stated in chapter 3. Thus, that there was the first barrier that the researcher needed to face on this research. After that, the researcher had to face the time

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

limitation. The time limitation refers to time to collect the data. It hard for researcher because it needs to use student's time to answer the questionnaire. The limitation time of students to answer the questionnaire make the researcher to know how to interact with student to give their cooperation. At same time, have some students refuse to answer the questionnaire because they have another business to handle. Researcher more time needs to be spent gathering more data.

8 Overall Conclusion Of Study

In the conclusion, the result from the running data analysis are corresponding with the objective stated by the researcher. The researcher discovers what the social media factor that influence purchasing power are social influencer, promotion and information service. Researcher also discover that social influencer is the most important factor to influence purchasing power. Even though the study focused on a small sample size, it is our hope that the research will serve as a platform future research that covering bigger population which would be more information.

9 Acknowledgment

Assalamualaikum. In the name of Allah the most gracious and the most merciful, first and foremost. I would like to extend my deepest praise to Allah S.W.T. who has given me the patient, strength. Determination and courage to implement this research. Next, big thanks to Madam Munirah Binti Mahshar as my supervisor for this research project and the opportunity given to me for do my final year project. I also would like to thank for her kind attention, great advices, brilliant ideas and her guidance for me to complete this project from the beginning until the end of this research project. Not forget to University Malaysia Kelantan for giving me chance to study here and I would like to thank Faculty of Entrepreneurship and Business by provided latest format and information regarding this research. My appreciation and thanks is also dedicated to my beloved family and of course my friends for their helpful insights, cooperation and stimulating comments. I would also like to express my apology for my mistake and shortcoming in caring out this research project. To end with, I am truly delighted, for this research would bring benefits to others, Wassalam.

University Malaysia Kelantan

[Email : salwani.a17a0335@siswa.umk.edu.my](mailto:salwani.a17a0335@siswa.umk.edu.my); nhanum@umk.edu.my

Abstract:

Currently, there is an increase of fast food restaurants worldwide and most young generations, especially university students in Malaysia, now prefer to have dinner outside. Fast food restaurants in Malaysia were now getting more and more popularity and great responses from the local community based on its taste, easy to access, and cheap alternatives. Nevertheless, frequent fast food consumption has brought many health problems to the local community and university students in Malaysia. For the objective in this study, the researchers want to examine the relationship between influential factors of behavioral intention, attitude and perceived behavioral control with fast food consumption behaviors among UMK students in City Campus. There are 357 respondents who have been involved in order to answer the questionnaires conducted by the researcher. Using a quota sampling, the data collection used in this study is an online questionnaire that will require the respondent to answer through google form. Based on the research findings, all research objectives were achieved and all of four hypotheses were supported. The hypothesis of each variable of behavioral intention, attitude and perceived behavioral control have a significant strong positive relationship with fast food consumptions behaviors among UMK students in City Campus. A few recommendations related to the study have been proposed by the researchers.

Keywords: *Fast Food Consumptions, Fast Food Restaurants, Behavioral Intention, Attitude, Perceived Behavioral Control*

1 Introduction

This research is to study the factors that influence fast food consumption behaviors among UMK students in City Campus. Fast food consumption is linked to poor dietary habits and unmet nutrient requirements (Ashdown et al., 2019). About 30% in children to more than 50% in college students used fast food daily (Al-Otaibi & Basuny, 2015). In previous study, fast food consumption is associated with obesity (Burgoine et al., 2016). Fast food typically refers to food that was quickly prepared, self-purchased and service from restaurants with precooked ingredients, and served in packaged form to the customer to take away (Shami & Fatima, 2017). The Indian adolescents reported poor food consumptions patterns, and these findings highlight the need to design effective nutrition promotion strategies to encourage healthy eating in adolescence and targeting food supply and availability (Rathi, Riddell & Worsley, 2017). Hence, it is necessary to improve the adolescents' knowledge on health hazards of fast food in order to save them from the ill effects of fast food (Saranya, Shanifa, Shilpa, Umarani & Shetty, 2016).

There are three objectives for this research:

1. To investigate the relationship between behavioral intention and fast food consumption behaviors among UMK students in City Campus.
2. To determine the relationship between attitude and fast food consumption

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

behaviors among UMK students in City Campus.

3. To identify the relationship between perceived behavioral control and fast food consumption behaviors among UMK students in City Campus.

2 Literature Review

Fast Food Consumption Behaviors

Fast-food consumption was associated with poor eating habits such as drinking soft drinks and higher carbonated beverages while consuming low quantities of vegetables and insufficient nutrient requirements (Ashdown et al., 2019). For example, a study by Ashdown et al. (2019) found that 46.1% of teens ate fast food at least once a week.

Behavioral Intention

Behavioral intention was a motivating factor that can capture the effort that a person is going to do some of the behaviors (Mamman, Ogunbado & Abu, 2016). According to Theory of Planned Behaviour (TPB) assumes that subjective norms, attitude, and perceived behavioral controls can influence built of such human behaviour (Singh, Gautam, Bhandari & Sapkota, 2020). In previous study by Alfaris, Al-Tamimi, Al-Jobair and Al-Shwaiyat (2015), the study found that 95.4% of respondents ate at fast food restaurant and 79.1% ate fast food at least once weekly. Girl respondents intended to consume burgers and carbonated soft drinks when it comes to fast food meals.

Attitude

Fast food consumption behaviors could be analysed to be taken into psychological factors (attitude) that shape the consumer behaviour (Ghoochani, Torabi, Hojjati, Ghanian & Kitterlin, 2018). In previous study by Ghoochani et al. (2018), the finding showed that the main factors of attitude on the health consciousness and trust had influenced most of the respondents to consume the fast food. The results showed that the elder and married respondents were more highly influenced by attitudes toward fast-food consumption.

Perceived Behavioral Control

There are two measures of perceived behavioral control which were internal and external factors. Internal factors indicated some individuals had the ability to act persuaded behavior that was constrained by a person's sense of self-efficacy (Mamman et al., 2016). External factors discussed the impact on constraints that individual can accessed such money, time and technology which the prerequisites for were performing behavior (Mamman et al., 2016). In previous study by Mirkarimi et al. (2016), the study found that there was a medium relationship of fast food consumption with perceived behavioral control. While, male lead to a higher level of perceived behavioral control than female which caused by external factors

Relationship between Behavioral Intention (BI), Attitude, Perceived Behavioral Control (PBC) and Fast Food Consumption Behaviors

In previous study by Mirkarimi et al. (2016) found strong relationship of the fast food consumption behaviors with behavioral intention. This result of fast food consumption was positively by behavioral intention (Mirkarimi et al., 2016). Overall, fast food consumption behaviors were strongly correlated with behavioral intention ($r=0.735$, $P=0.01$).

A study by Saraniya and Kennedy (2015), found there was a positive significant relationship between consumer attitudes and fast food consumption with the correlation coefficient (r) of 0.768. The consumer attitudes towards fast food consumption shown that fast food restaurants should improve on their services.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

In the previous study by Majabadi et al. (2016), the findings found participants of male with 18 years old group were interested in socializing and spending time with peers and parents while dining out at fast-food restaurant. Those participants also stated that they were usually ate the same food at home and they needed to had new types of food while dining outside with friends or family members.

In previous study by Boyland, Kavanagh and Halford (2015), the findings found perceived behavioral control of children interested in fast food were increased after they had reached to the fast food advertisement on television such as McDonald's Happy Meal ($P= 0.004$).

RESEARCH HYPOTHESIS

In this study, there were three hypotheses developed to assume that there is relationship of each influential factors with fast food consumption behaviors as below:

H₁: There is a relationship between behavioral intention and fast food consumption behaviors among UMK students in City Campus.

H₂: There is a relationship between attitude and fast food consumption behaviors among UMK students in City Campus.

H₃: There is a relationship between perceived behavioral control and fast food consumption behaviors among UMK students in City Campus.\

CONCEPTUAL FRAMEWORK

A research framework has been conducted to investigate connection between the relationship of behavioral intention, attitude and perceived behavioral control with fast food consumption behaviors among UMK students in City Campus.

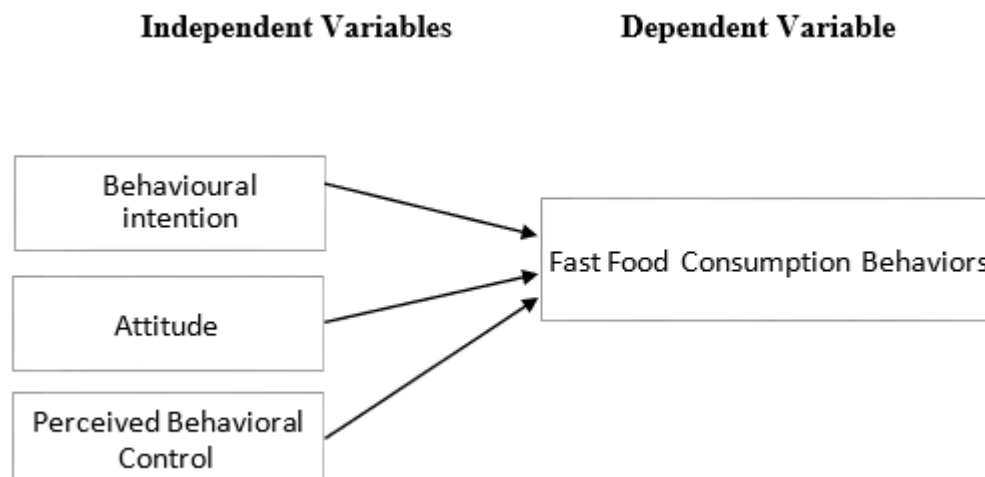

Figure 1: Research Framework of factors that influencing fast food consumption behaviors among UMK students in city campus

3 Methodology

Research Design

This study is a cross-sectional study. Cross sectional study applies to find the factors that exist the group of consumers consuming fast foods as their favorite foods. In addition, it is helps to measures the outcomes and the exposures in the study with the participants. Also, measure the relationship of variables in define the population at the same time. Moreover, research design may help researchers in order to carry out research objectives. UMK City Campus students will be surveyed to answer the research objectives. Unlike case-control trials or longitudinal research, only the participants in a cross-sectional sample are chosen depending on the study.

Data Collection

In the first stage, the data collection used in this study is primary data, which is a quantitative approach, would be used for the distribution of a questionnaire that may encourage respondents to give their opinion on the factor that influencing fast food consumption behaviors among UMK students in City Campus. Primary data are important in proceeding analysis to get the results for the existing problem (Sekaran & Bougie, 2016). Data will be collected through the questionnaire in this report. The questionnaire highlights the aim of this study and the confidentiality of the information provided by respondents will be assured.

In the second stage, the data collection used in this study is online survey or in other name is an online questionnaire that will require the respondents to answer through Google form. Then, the researchers used another effective way which WhatsApp is to distribute to the UMK students. Moreover, this platform easy to find out the exact respondents. The reasons why the researcher used this platform of technology tools is because of this Covid-19 disease pandemic.

Sampling

The sampling method used in this study was the quota sampling as sampling method to collect the data. This type of sampling earns time and effort because quota sampling has a high statistical precision. By using quota sampling and appropriate research questions, interpreting information and responses to the survey is a much convenient process for the researchers. In quota sampling the researchers divide the survey population into mutual exclusive subgroup of the students by each course. These subgroups are selected with respect to certain known and thus non-random attitude or interests.

In brief, the population is 5162 students UMK City Campus and the sample size will be 357 students by referring to Krejcie and Morgan (1970) table. The researchers have using quota sampling which first split 357 students into seven groups. For example, the surveys on 357 of UMK students in City Campus by getting random samples of 51 SAB, 51 SAL, 52 SAK, 51 SAR, 50 SAH, 52 SAW and 50 SAP.

4 Data Analysis

There were four data types of data analysis used in this study, that were frequency analysis, descriptive analysis, reliability analysis, and correlation analysis. The data obtained was analysed by using Statistical Package for the Social Science (SPSS) version 25.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

5 Findings

Demographics Profile of Respondent

The respondent demographics profile was summarized as in table 1 below. From the result based on total 357 respondents, the number of female who involved in this study were higher compared to respondent of male. Female respondents calculated about 68.3% or 244 respondents of female while male respondents only calculated about 31.7% or 113 respondents of male.

From the result based on total 357 respondents, the highest number of respondents by age who involved in this study was the category of 21-23 years old with 215 respondents (60.2%), followed by category of 18 - 20 years old with 116 respondents (32.5%), then category of 24 - 26 years old with 20 respondents (5.6%), and lastly followed by category of 27 years old and above with 6 respondents (1.7%).

From the result based on total 357 respondents, the researcher had observed that the number of respondents who involved in this study was mostly respondents with single status, contributed as 98.0% or 350 respondents out of the total number of 357 respondents. The married status respondents contributed the second highest which is 2.0% or 6 respondents out of the total number of 357 respondents.

From the result based on total 357 respondents, the highest number of respondents by race who involved in this study is Malay respondents for 69.2% and represents 247 number of respondents, followed by Chinese respondents for 19.0% and represents 68 number of respondents, then Indians respondents for 11.8% and represents 42 number of respondents

From the result based on total 357 respondents, the number of respondents by course who involved in this study were from 51 SAB (14.3%), 50 SAH (14.0%), 52 SAK (14.6%), 51 SAL (14.3), 50 SAP (14.0%), 51 SAR (14.3%) and 52 SAW (14.6%)

Table 1: Demographics Profile of Sample

Profile		Frequency	Percentage
Gender	Female	244	68.3
	Male	113	31.7
Age	18 - 20 years old	116	32.5
	21 - 23 years old	215	60.2
	24 - 26 years old	20	5.6
	27 years old and above	6	1.7
Marital Status	Married	7	2.0
	Single	350	98.0

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

Race	Chinese	68	19.0
	Indian	42	11.8
	Malay	247	69.2
Course	SAB	51	14.3
	SAH	50	14.0
	SAK	52	14.6
	SAL	51	14.3
	SAP	50	14.0
	SAR	51	14.3
	SAW	52	14.6

Reliability Analysis

Reliability Analysis of Pilot Data and Actual Data

Table 2 below showed the overall value of pilot data and actual data Cronbach's Alpha Coefficient for the independent and dependent variable in this study. From the table, the researchers could conclude each of the variables were above the value of 0.7 for both pilot data and actual data. Thus, overall variables for pilot data were 0.960 while for actual data were 0.954. Therefore, the result shown is excellent reliable and it can be accepted in this study.

Table 2 showed that Cronbach's Alpha result for this fast food consumption behaviors section's questions of pilot data was 0.769 which resulted as acceptable reliability level while for actual data was 0.828 which resulted as good reliability level. The result of Cronbach's Alpha Coefficient that showed in this behavioral intention section for pilot data was 0.918 which indicated as excellent reliability level while for actual data was 0.855 which indicated as good reliability level. The Cronbach's Alpha result for this attitude section's questions of pilot data was 0.876 while for actual data was 0.859 which both resulted as good reliability level. The result of Cronbach' Alpha Coefficient that showed in these subjective norms section for pilot data was 0.822 which indicated as good reliability level while for actual data was 0.739 which indicated as acceptable reliability level. The Cronbach's Alpha result for this perceived behavioral control section's questions of pilot data was 0.912 which resulted as excellent reliability level while for actual data was 0.886 which resulted as good reliability level.

Since the Cronbach's Alpha charge for the overall variables of both pilot data and actual data had exceeded 0.9, it shows that questionnaires were excellent reliable and can proceed with the study. All in all, the reliability has proven that the respondent understood the questions provided well and this means the questionnaires has been accepted for this study.

Table 2: Results of Reliability Analysis of Pilot Data and Actual data

Variable	Pilot Data Cronbac h's Alpha coefficient	Reliability Level	Acutal Data Cronbach's Alpha coefficient	Reliability Level

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

Fast Food Consumption Behaviors	0.769	Acceptable	0.828	Good
Behavioral Intention	0.918	Excellent	0.855	Good
Attitudes	0.876	Good	0.859	Good
Subjective Norms	0.822	Good	0.739	Acceptable
Perceived Behavioral Control	0.912	Excellent	0.886	Good
Overall variables	0.960	Excellent	0.954	Excellent

Descriptive Analysis

This study has analyzed the mean and standard deviation for section B (dependent variable) and section C (independent variables) of the questionnaires. Table 3 below showed the number of respondents, mean and standard deviation of dependent variable and independent variables. Among of all variables, the dependent variable of fast food consumption behaviors had the mean value which was 4.2381. This mean that most of respondents were strongly agree that they do ate fast food. Fast food typically refers to food that was quickly prepared, self-purchased and service from restaurants with precooked ingredients, and served in packaged forms to the customer to take away (Shami & Fatima, 2017). In the dependent variable sections, the researchers asked questions about the frequency of fast food consumption and factor that motivated UMK students in City Campus to ate fast food. Among of all independent variables, attitude had the highest mean value which was 4.4011. This mean that most of respondents were strongly agree that they ate fast food because of attitude. According to Alfaris et al. (2015), respondents consume fast food because of the delicious taste and followed by convenience. Hygiene and safety food at fast food outlets had found to be very important for 62.2% of girls (Alfaris et al., 2015). Therefore, in this study it shown that UMK students in City Campus were usually consume fast food by monthly and they ate fast food because of attitude such as the taste was delicious, fun environment, clean environment, and fast food were clean and safe.

Behavioral intention had the second highest of mean value which was 4.3008 that influencing fast food consumption behaviors, followed by perceived Behavioral Control which was 4.1905.

By this study, the researchers could conclude that most of the respondents were followed their self-opinion to consume fast food while there were still several of respondents had followed the opinion of others to consume fast food. In previous study by Mirkarimi et al. (2016), the findings found about 52.2% of high school students meet their friends at fast food outlets and they followed the opinion of friend to consume fast food.

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

Table 3: Descriptive Statistics

Variables	N	Mean	Standard Deviation
Fast Food Consumption Behaviors	357	4.2381	0.55819
Behavioral Intention	357	4.3008	0.45385
Attitude	357	4.4011	0.31301
Perceived Behavioral Control	357	4.1905	0.47430

Pearson Correlation Analysis

The Pearson's correlation analysis was one of the important analyses that measured the linear relationship between the two variables. The objective of this analysis was to determine the relationship between independent variables (behavioral intention, attitude and perceived behavioral control) and the dependent variable (fast food consumption behaviors).

Table 4 below showed behavioral intention had a significant strong positive relationship with fast food consumption behaviors which the p-value of 0.000 that was less than 0.01 significant level and correlation coefficient value of 0.541. Next, attitude had a significant strong positive relationship with fast food consumption behaviors which the p-value of 0.000 that was less than 0.01 significant level and correlation coefficient value of 0.051. Moreover, perceived behavioral control had a significant strong positive relationship with fast food consumption behaviors which the p-value of 0.000 which was less than 0.01 significant level and correlation coefficient value of 0.667. This study will be using the guideline on the strength of association categories by (Meghanathan,2016).

Table 4: Pearson Correlation Analysis

Correlations					
		Fast Food Consumption Behaviours	Behavioural intention	Attitude	Perceived Behavioural Control

5 Discussion & Recommendation

There is a significant strong positive relationship between behavioral intention and fast food consumption behaviors among UMK students in City Campus. Therefore, if there is increase in behavioral intention, then fast food consumption behaviors will increase too. Thus, this result has shown that hypothesis 1 has been accepted and research objective 1 was achieved. Next, there is a significant strong positive relationship between attitude and fast food consumption behaviors among UMK students in City Campus. Therefore, if there is increase in attitude, then fast food consumption behaviors will increase too. Thus, this result has shown that hypothesis 2 has been accepted and research objective 2 was achieved. Lastly, there is a significant strong positive relationship between perceived behavioral control and fast food consumption behaviors among UMK students in City Campus. Therefore, if there is increase in perceived behavioral control, then fast food consumption behaviors will increase too. Thus, this result has shown that hypothesis 3 has been accepted and research objective 3 was achieved.

Based on the findings in this study, attitude has the strongest correlation coefficient of 0.701 with fast food consumption behaviors among UMK students in City Campus. For the recommendation based on this study, the researchers had suggested on the stakeholders of

University Malaysia Kelantan in City Campus to start spread awareness among their students to change the attitude of often consuming fast food and to cultivate the healthy eating behaviors among UMK students in City Campus to less taking fast food and replaced with taking more of fruits and vegetables which was better choices for health. Besides that, there was a recommendation that the researchers would like to point out to be overcome in future work. This research suggest that further studies can be also carried out on the staffs or lecturers in University Malaysia Kelantan City Campus since this study had only focused among students in UMK City Campus. This may help future researchers to have a comparison on fast food consumption behaviors between staffs or lecturers and students in UMK City Campus.

6 Conclusion

The influential factors of behavioral intention, attitude and perceived behavioral control had significant strong positive relationships with fast food consumption behaviors among UMK students in City Campus. Thus, all of the four hypotheses above were accepted and the research objective which is to investigate the relationship between behavioral intention, attitude, perceived behavioral control and fast food consumption behaviors among UMK students in City Campus had achieved.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

For the recommendation based on this study, the researchers had suggested on the stakeholders of University Malaysia Kelantan in City Campus to start spread awareness and to cultivate the healthy eating behaviors among UMK students in City Campus to less taking fast food and replaced with taking more of fruits and vegetables which was better choices for health. This research suggest that further studies can be also carried out on the staffs or lecturers in University Malaysia Kelantan City Campus since this study had only focused among students in UMK City Campus.

Abstract:

Mobile payment transactions are projected to be the most prevalent means of completing sales transactions, in line with the exponential growth of internet connectivity, Fintech, online shopping and cross-border trading in recent years. For the Malaysia Budget 2020, an RM30 incentive for the use of e-wallets has been announced to stimulate the use of e-wallets in Malaysia, whereas the Central Bank of Malaysia (BNM) has launched the Financial Sector Blueprint 2011-2020 aimed at eliminating the issuance of cheques and increasing e-payments, accelerating the transition into a cashless society and stimulating the change to elected companies. The study examines the impacts of customer satisfaction in terms of reliability, responsiveness and service quality. A quantitative approach had been applied in this study where 384 sets of online questionnaires had been distributed to target respondents by using a convenience sampling method to obtain necessary information. The data analysis of this research was acquired with the assistance of SPSS 25 throughout this study. This cross-sectional study was analyzed in terms of descriptive analysis, normality analysis, and Pearson Correlation analysis. The results concluded that all three independent variables in this study were related customer satisfaction..

Keywords: Customer Satisfaction, E-wallet, Servis Quality, Reliability, Responsiveness.

1 Introduction

E-Wallet has grown rapidly in Malaysia in recent years. According to a report released by Fintech Malaysia (2019) to date, there are a total of 53 e-wallets in the country, with the industry occupying 19% of Malaysian fintech space. E-wallet is a new application equipped with high technology. E-wallet are developed to facilitate the affairs of the public so that there is no need to carry a physics wallet anywhere. Apart from these facilities, e-wallet also offers other advantages such as overcoming security issues because users do not need to bring cash to avoid snatch theft, no need to queue to withdraw money at ATMs or at bank counters, we no longer need to keep receipts and various bonuses and discounts offered by this e-wallet application. Therefore, this study indicated reliability, responsiveness and service quality as independent variables in this study. Besides, the researcher strongly believes that this study capable to provide significant insights towards customers satisfaction impact to e-wallet. The objective of this study is to examine reliability, responsiveness and service quality toward customer satisfaction.

2 Literature Review

Customer Satisfaction

Hoffman and Novak have indicated that one of the determinants of user satisfaction is download speed. Timothy indicated that it is only through customer satisfaction that the potential of a user-oriented company can be increased. It is therefore important to recognise the needs of the

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

consumer and function accordingly to satisfy them so that the customers can be maintained. F. Bagheri, A.Jafari, and N. Hosseinzadeh indicated that the strategies for maintaining customers and their longevity, ensuring novel services, have paved the way for organisations to come up with strategies not only to maintain current customers, but also to attract new customers. Customer satisfaction is defined as a measure tool that determines whether a product or service produced by a company is successful or not. The product or service produced must meet the needs and wants of consumers to achieve the best level of customer satisfaction. Customer satisfaction is one of the measuring tools that can be used to measure the level of consumer loyalty of a product or service and the intention of the purchase is made.

E-wallet

According to Dato Seri Dr Mohd Uzir Mahidin, Chief Statistician in the Department of Networking (DOSM) (2020). In 2018, the trade and retail sector recorded revenue of RM92 billion compared to RM62.4 billion recorded in 2015, a growth of 13.8 percent. The value of online retail sales jumped to RM1.2 billion in 2018 from RM300 million in 2013. The rapid growth in this sector proves that the disposable income of Malaysians has also increased year by year and is now better than other equivalent countries. semi-finished is among the identified defective industries. Retail sales of textiles, food, newspaper agents, retail sales of food are categorised as industries for survival. Technology has shaped consumer behavior and the way traders conduct business. In the past, goods and services were traded in the form of barter trade and in that way gradually developed using cash then switched to the use of cards. Further in this modern age, the phone is an essential product that everyone needs. Phones will be taken anywhere while e-wallets are said to be increasingly used to change the payment methods used by all levels of users.

Reliability

Yang and Fang (2004) claimed that reliability consists of accurate order of fulfilment, accurate record, accurate quotation, accurate billing, and accurate measurement of commissions which keep the service promising to the customer. There are two significant variables that affect the banking service; quality and efficiency. First, consistency refers to uniformity between objects or parts, or compatibility. It ensures that the consistency is still the same, doing things in the same way and maintaining the same expectations. Frei et al. (1999) propose that the standard of service should provide service performance uniformity around an optimal customer-determined target value. In a predictable and consistent manner, banks need to resolve evolving needs. Second, reliability refers to the assurance, as planned, of delivering services.

Responsiveness

Responsiveness is described as the ability to respond timely and flexibly to customer requirements. Mariappan (2006) claimed that information technology revolution has brought astonishing changes in the market climate that have not been affected by technology development as much as banking and financial institutions by any other industry. Banks need to incorporate technology to provide their services while reducing costs due to the production of value-added customer services (Zhu, Wymer and Chen, 2002).

Service Quality

In the service sector, service quality concepts tend to concentrate on meeting the needs and requirements of consumers and how well the service provided meets their standards (Lewis and Booms 1983). In order to provide and sustain the standard of service, a company must first determine what quality means for those it serves (Gronross 1984). Service quality was categorised by Gronross (1984) into two categories: technological quality, based primarily on what customers

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

actually got from the service; and functional quality, focused on the service delivery process. Quality perceptions of those who provide and those who consume services have been defined as the product of a contrast between service expectations and what is perceived to be obtained (Czepiel et al . 1985; Parasuraman et al . 1985).

Hypothesis Statement

The three developed hypotheses of this research are:

H1: There is a significant relationship between reliability as service quality toward customer satisfaction.

H2: There is a significant relationship between responsiveness as service quality toward customer satisfaction.

H3: There is a significant relationship between service quality toward customer satisfaction.

Conceptual Framework

Figure 1: The Conceptual Framework of the Study

Figure 1 illustrates the conceptual framework of this study. Thus, this framework displays the relationship between independent variables namely reliability, responsiveness, and service quality with customer satisfaction toward e-wallet which is the dependent variable of this study.

3 Methodology

A quantitative approach was applied in this study where questionnaires were used to collect the data from consumers who used e-wallet as a payment tool. The researcher used the quantitative method since quantitative analysis is an approach to evaluating concepts of objectives by evaluating the relationship between variables (Creswell, 2017). According to the Krejcie and Morgan (1970) table, the sample size taken for this research was 384 respondents in Malaysia. In this analysis, the convenience sampling approach was chosen as the best way to easily and cost-effectively access and cover the greater amount of the sample.

The investigator circulated the questionnaire to target respondents through message and email and collected the data via an online survey using Google Form. The style of the rating scale was used in the questionnaire to create the questions. The scale was used to measure the degree of agreement or disagreement that the respondent had to identify in a specific statement. In section A, the investigator used a nominal and interval scale, while in sections B and C, the 5-point Likert scale was applied. The data analysis of this study was documented and analysed using the programme version 25 of the Statistical Framework for Social Sciences (SPSS). In terms of descriptive analysis, reliability analysis, normality analysis, all the data collected was analysed

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

and followed by Pearson Correlation analysis.

4 Findings

Demographic Profile of Respondents

The respondent profile is summarized in Table 1 out of the 384 respondents, 195 were female and 189 were male. Most of them were in the 18 to 25 age category (n=236). Next, most of the respondents race are Malay (n=220) and status single (n=243). Other than that, for the respondents education level are University (n=136). Then, occupationa sector the highest number were 42.4% (n=163) which is employed and. The highest frequency using e-wallet are 33.6% (n=129). Majority level of spending per week of the respondents is less than RM50 (n=113).

Table 1: Demographic profile

Characteristic	Item	Frequent	%
Age	18-25 years	236	61.5
	26-30 years	109	28.4
	31-40 years	27	7.0
	41 and above	12	3.1
Gender	Male	189	49.2
	Female	195	50.8
Race	Chinese	103	26.8
	Indian	61	15.9
	Malay	220	57.3
Martial status	Married	141	36.7
	Single	243	63.3
Education level	College	76	19.8
	Diploma	95	24.7
	Secondary school	73	19.0
	Stpm	1	0.3
	stpm	2	0.5
	STPM	1	0.3
	University	136	35.4
Occupation sector	Employed	163	42.4
	Housewife	24	6.3
	Retiree	9	2.3
	Self-employed	77	20.1
	Student	103	26.8
	Unemployed	8	2.1
Frequency using e-wallet	Everyday	28	7.3
	Once a week	127	33.1
	Twice a week	129	33.6
	Three a week	73	19.0
	Five a week	27	7.0
Spend per week	Less than RM50	113	29.4
	RM50 – RM100	110	28.6
	RM100 – RM200	90	23.4
	RM200 – RM 300	32	8.3
	More than RM300	39	10.2
Total		384	100

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Descriptive Analysis

Table 2: Level of Mean

Variable	Mean	Interpretation
Customer satisfaction	4.36	High
Reliability	4.36	High
Responsiveness	4.30	High
Service quality	4.35	High

Based on table 2, it can be concise that the first independent variable which is reliability and dependent variable which is customer satisfaction has the highest value of mean at 4.36. Besides, the third independent variable which is service quality has the second highest value of mean at 4.35. Furthermore, the lowest value of mean falls on the third independent variable which is service quality the value of 4.30. Summing up, the range of mean for both the independent variables and dependent variable lies within 4.30-5.00 which indicated the high level of acceptance based on the responses from target respondents in this study according to the justification from Hadiyanto and Suratno (2015). Hence, the outcome of the mean for each variable is distinguished as a good result.

Normality Analysis

Table 3: Table of coefficients Analysis

Variable	Simple Linear Regression			Multiple Linear Regression		
	b	t-stat(95% CI)	p-value	b	t-stat(95% CI)	p-value
Service Quality	0.74	20.72(0.04, 0.73)	<0.001	0.74	11.14(0.04, 0.73)	<0.001
Reliability	0.73	19.62(0.04, 0.71)	<0.001		-	
Responsiveness	0.72	0.72(0.04, 0.71)	<0.001		-	

The table 3 above had shown the table of Coefficients Analysis that determines which independent variables was individually predictor of dependent variables. The independent variables included reliability, responsiveness and service quality had influenced the dependent variable which is customer satisfaction. According to the table above, for the service quality variable were significant since their p-value was less than 0.05. According to the result shown in the table above, the service quality is the strongest independent variables in measuring the influencing factor as its Beta value is the highest ranked value among all the independent variables which is 0.74. while the other variable were excluded.

Pearson Correlation Analysis

Table 4: Results of Pearson Correlation Analysis between Variables

Variables	Customer Satisfaction
Reliability	Pearson Correlation 1.000 Sig. (2-tailed) N 384
Responsiveness	Pearson Correlation 0.683**

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

	Sig. (2-tailed)	0.000
	N	384
Service Quality	Pearson Correlation	0.698**
	Sig. (2-tailed)	0.000
	N	384

**correlation is significant at the 0.01 level (2-tailed)

Table 5 presented the results of the Pearson Correlation analysis between variables on the impacts of factors influencing customer satisfaction toward e-wallet. The value of the Pearson correlation for reliability is 1.000. It is shown that the relationship between reliability and customer satisfaction is at a moderate positive level. For responsiveness, the value of the Pearson correlation is 0.683. It indicated that the relationship between responsiveness and customer satisfaction is at a high positive level. Followed by service quality, the value of the Pearson correlation is 0.698. It is shown that the relationship between service quality and customer satisfaction is at a high positive level. Hence, it can be determined that reliability, responsiveness and service quality are related to customer satisfaction toward e-wallet.

Hypotheses Testing

Table 5: Summary of Hypotheses Testing

	Hypotheses	Statistical Analysis	Result
H1	There is a significant relationship between reliability as service quality toward customer satisfaction.	1.000	Accepted
H2	There is a significant relationship between responsiveness as service quality toward customer satisfaction.	0.683	Accepted
H3	There is a significant relationship between service quality toward customer satisfaction.	0.698	Accepted

Based on table 5, it can be concluded that all the three independent variables namely reliability has a moderate positive relationship, while responsiveness and service quality has a high positive relationship on customer satisfaction towards e-wallet service. In short, three hypotheses in this study were accepted after Pearson Correlation testing was conducted.

4 Discussion

Reliability

The results of hypothesis H1 were studied to answer RQ1. H1 proposed that there is a relationship between reliability as a service quality toward customer satisfaction. From the finding, it revealed that there is a moderate positive relationship between reliability as a service quality toward customer satisfaction ($r= 0.683$). Hence, H1 is accepted.

According to Ibrahım and Mohd Taufik (2016), reliability refers to the ability to deliver the desired quality at all times, how the company tackles the issue of customer services, conducts the correct services for the first time, delivers services within the promised time and holds a record free of errors. Jay and Barry (2014) noted that the reliability of machine parts or product parts is regarded as consistently good in quality or output that can be managed at any time with respect to ATM services. The condition and technological reliability of the ATM environment are equated with efficient functional design.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Responsiveness

The results of hypothesis H2 were studied to answer RQ2. H2 proposed that there is a relationship between responsiveness as a service quality toward customer satisfaction. From the finding, it revealed that there is a high positive relationship between responsiveness as a service quality toward customer satisfaction ($r= 0.683$). Hence, H2 is accepted.

Responsiveness is described as the ability to respond timely and flexibly to customer requirements. Mariappan (2006) claimed that information technology revolution has brought astonishing changes in the market climate that have not been affected by technology development as much as banking and financial institutions by any other industry. In order to offer their services, banks must implement technology and at the same time minimize costs due to the development of value-added services for clients (Zhu, Wymer and Chen, 2002). In order to compete more efficiently with global organisations, it is important for banks to better understand the changing needs of customers and implement the new IT framework (Malhotra & Mukherjee, 2004).

Service Quality

The results of hypothesis H3 were studied to answer RQ3. H3 proposed that there is a relationship between service quality toward customer satisfaction. From the finding, it revealed that there is a high positive relationship between service quality toward customer satisfaction ($r= 0.698$). Hence, H3 is accepted.

The primary objective of business entities is the secret to achieving customer satisfaction by delivering outstanding quality of service because of the value of customer retention (Ehigie, 2006). The banks considered ATM to be able to minimize the excessive traffic in the banking hall when the banking industry introduced ATM machines, give customers easy access to their accounts and make life comfortable to a certain extent.

5 Limitations

In limitations have limited several, first is lack of research in service quality during pandemic especially for online service and making researchers do research. As a result, the researcher aiming to study of factors influencing customer satisfaction toward e-wallet is the first research explorer during pandemic.

Next, the reliability, responsiveness and service quality on customer satisfaction based on e-wallet service. Future researchers will compare the quality of e-wallet service with others. Dependent variables is customer satisfaction will provide a comparison based on their experience using e-wallet service during pandemic. Other than that, researcher did not do the face-to-face interview during the pandemic, but researcher will make an interview online.

Interview online which might have limited the research ability to gather more insight from the respondents, although the respondents used a Google form questionnaire to answer the questions. And finally, the qualitative method is the only one the researcher used, although the qualitative method can help researchers to more understanding and explore more about e-wallet.

6 Recommendations

From this study, researcher found that reliability, responsiveness and service quality effected on customer satisfaction in e-wallet service and this independent variable important. This study was made to find out what customer response and what factors they use e-wallet service.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Based on multiple regression analysis shows these three independent variables effect on customer satisfaction in performing e-wallet service because during pandemic online platform makes it a convenience for customers to make a payments.

Most customers do not have difficulty using e-wallet applications as the result shown in chapter 4. There may be customers who prefer to use e-wallet because it is easy, convenient and safety.

The recommendation is that e-wallet need to upgrade their service. Such an, e-wallet needs to improve services in terms of the function. Such as e-wallet can make collaboration with My Sejahtera, two in one application. Other than can make payment, user also can update their attendance of the places they go in order to know whether the places high or low risk of Covic-19 during the pandemic. With that I recommend to e-wallet to upgrade their service.

7 Conclusion

This research showed out that the factor that influence customer satisfaction toward e-wallet. The factor that affected is the reliability, responsiveness and service quality as an independent variable. This research also will carry out what the data collection method used, sample size, sampling techniques, populations study, development of the research instrument, data analysis procedure and variable measurement. The data analysis of this research will be an online questionnaire which is Google form by survey the questions to the respondents. Data analysis was collected by using reliability, descriptive analysis, multiple regression analysis and Pearson correlation analysis. Other than that, the researcher determined the significance of the research hypothesis and results shows that there is significant between independent variables and dependent variables. Finally, the improvements for e-wallet service and future research.

8 Acknowledgement

Firstly, I would like to express my deepest gratitude to my Supervisor Madam Norfazlirda Binti Hairani for giving endless advice and more insightful knowledge to me during this journey of the Final Year Project. I am very grateful to have Madam Norfazlirda as a Supervisor as she has always assisted me and provide guidance to complete this project successfully. Secondly, my acknowledgement to the library of University Malaysia Kelantan for providing the necessary materials and allowing me to utilize the facilities. In conclusion, I need thank to my respondents because they spend their precious time answering the questionnaire given. I will appreciate the handwork of respondents to fill up my questionnaire.

AN EMPIRICAL STUDY OF THE IMPACT OF BRAND EXPERIENCE AND BRAND ATTACHMENT TOWARDS BRAND TRUST TO THE ONLINE PURCHASING IN MALAYSIA.

Nor Aisyah Binti Ramli and Noor Hasmini Binti Hj. Abd Ghani

Faculty of Entrepreneurship and Business,
Universiti Malaysia Kelantan,
Malaysia

Email: Aisyah.a17a0341@siswa.umk.edu.my ; hasmini.ag@umk.edu.my

Abstract:

This study primary aim to investigate the impact of brand experience and brand attachment towards brand trust to the online purchasing in Malaysia. A total of 150 people from Malaysia have participated as research respondents in this study. In order to test the hypothesis, the reliability and the multiple linear regression analysis is used. From the finding indicated that all of the brand experience and brand attachment had positive significant impact on brand trust in online purchasing in Malaysia.

Keywords: Brand trust, Brand Experience, Brand Attachment.

1 Introduction

Nowadays, there are quite huge of challenge that the world need to face for including Malaysia. The pandemic of Covid-19 gives a big impact to the economy system in every country. Malaysia also one of the country that have effected from that pandemic Covid-19. There are so many businesses in the industry that get affect from the pandemic including the retail and SMEs industry. In this cases, the online platform purchasing is play an important character to help the country to build up again their economy that get affected.

In addition, the to get into the online purchasing platform, there are also some factor that need to focus for. The trust issues between the brand is a huge challenge for the customer and the seller to using the online platform. Trust is an important factor in the online retail environment. As identified by Khan and Rahman (2016, p. 591) “trust is the corner stone of the relationship between buyer and seller” Muhammad Ali Khan, Roshan Panditharathna, David Bamber “trust is enables [online customers] to understand the offering and to face the perceived risk associated with buying and consuming the product”.

Based on Delgado-Ballester, Munuera-Aleman and Yagui-Guillen, (2003) trust is conceptualized as confident expectation of the brand reliability and brand intention is situation entailing risk to the customer. They said that there are two dimension of the brand trust. First, problem is about their reliability between the consumer and also the entrepreneur (Delgado, 2003). Despite the growing of the online purchasing platform that seems to be lack of research on the trust of the brand when make a purchasing from the online platform.

Next, the intention which is based on the past literature, the brand intention is when the customer would believe that the brand focus on the customer interest instead of their self-interest when they faced with unexpected problem (Delgado, 2003). There is some strategy that can be used to help the SMEs entrepreneur to solve the trust problem which is with the brand experience and also the

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

brand attachment.

Hence, the objective of this study is to investigate the relationship between brand experience toward brand trust in online purchasing *hijab* form SMEs context. This study also to investigate the relationship between brand attachment toward brand trust in online purchasing *hijab* form SMEs context.

2. Literature Review.

2.1 Brand Trust

Trust is the expectation of the agents involve in a transaction and the risk which related with the expectation and behaviour (Rai and Medha, 2013; Atkinson and Rosenthal, 2014). Brugha (1999) defined trust as an expression of a feeling. The feeling has an effect to cognition, affection and behaviour. Assael (1998) said that trust could be measured by determining the attribute and benefit of a brand.

Based on past literature, Brand trust and brand affect: their strategic importance on brand loyalty (2012), Chaudhuri and Holbrook (2001) has said that brand trust can be define as the willingness of the average consumer to rely on the ability of the brand which is it to perform its started function. Other than that, Barber (1983) also said that brand trust are consider that those attributions are made about. Firstly, the partner is carrying out her responsibilities and also the obligation by placing other's interest before their own, and second, the partner's is a technical competencies related into their role of the performance. Besides, brand trust is having significance importance for SMEs in order to retain loyal customers given their small number of customers (Chaudhuri & Holbrook, 2001; Delgado-Ballester & Munuera-Aleman, 2005; Eggers et al., 2013; Rauyrueen et al., 2009).

AUTHOR	YEAR	DEFINITION
Chaudhuri and Holbrook	2001	Brand trust can be define as the willingness of the average consumer to rely on the ability of the brand which is it to perform its started function.
Barber	1983	Brand trust are considering that those attributions are made about. Firstly, the partner is carrying out her responsibilities and also the obligation by placing other's interest before their own, and second, the partner's is a technical competencies related into their role of the performance.

According to Reijonen (2010), SME rely on close relationship with customers to ensure ongoing revenues and profits. Besides, brand trust is having significance importance for SMEs in order to retain loyal customers given their small number of customers (Chaudhuri & Holbrook, 2001; Delgado-Ballester & Munuera-Aleman, 2005; Eggers et al., 2013; Rauyrueen et al., 2009). The brand trust is an important role in the branding context. This is because, the brand trust is needed because they need to make sure that the customer has the trust into the brand that they used.

2.2 Brand Experience

Brand experience is created when customers use the brand talk to others about the brand seek out brand information, promotions, and events, and so on (Alloza, 2008, Ambler et al, 2002). In line with Morgan-Thomas and Veloutsou (2013) the present study that brand experience as an experiential response to the brands and defines that brand experience as a holistic response to the brand-related stimuli within website environment.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Plus, based on the (J. Josko Brakus, Bernd H. Schmitt, and Lia Zarantonello, 2009) the brand experience is conceptualized as sensation, feeling, cognitions and also the behavioural responses are evoked by the brand that related to the stimuli which are part of a brand design and also the identity, packaging, communication and also the environment.

AUTHOR	YEAR	DEFINITION
Alloza	2008	Brand experience can also be defined as the consumer's first interaction or repetitive interaction through different sources, such as images, physical possession or through online medium with the brand
J.Josko Brakus,	2009	Brand experience is the conceptualized as sensation, feeling, cognitions and also the behavioural responses are evoked by the brand that related to the stimuli which are part of a brand design and also the identity, packaging, communication and also the environment.

A positive brand experience can often mean the difference between to being chosen from the another brand or losing the sale. Based on the Chris Cavanaugh, CMO at freeman, he said that "When they are well-crafted, brand experiences inspire new thinking, connect people in meaningful ways, move audiences to take action like no other medium and, as a result, they deliver results. At the end of the day, the measure of any medium is its ability to move your audience farther and faster, and brand experiences do that in a really compelling way".

2.3 Brand Attachment

Brand definition is one of the independent variable in this research. The brand attachment also has been defined as the strength of the bond connecting the brand with the self. Consistent with attachment theory (Mikulincer and Shaver 2007), This bond is exemplified by a rich and accessible memory network (or mental representation) that involves thoughts and feelings about the brand and the brand's relationship to the self.

In social psychology theory, attachment is an emotional related bond between a person and a particular object (Bowlby, 1979) in marketing theory, consumers can also create and maintain emotion laden bond with brands (Fournier, 1998). Besides, the brand attachment is also can be considered as an emerging construct, particularly important in the representation of the affective component of consumer-brand relationship.

Brand attachment is an important moderator of consumers' responses to CSR actions because high attachment makes consumers more sensitive and less critical to brands' activities (Park, Macinnis, priester, and Iacobucci, 2010).

AUTHOR	YEAR	DEFINITION
Mikulincer and Shaver	2007	The brand attachment also has been defined as the strength of the bond connecting the brand with the self. Consistent with attachment theory .
Bowlby and Fournier	1979, 1998	Attachment is an emotional related bond between a person and a particular object in marketing theory, consumers can also create and maintain emotion laden bond with brands.

Attachment to the brand in this sense depends on its ability to retain the identity of the individual,

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

brand preserving the past by establishing identity connections that maintain individual character. The brand then plays a very important role that allows the individual to remember a subject, a group of people to whom he is associated or to be. The brand can also meet the need for belonging. Brand attachment is an important moderator of consumers' responses to CSR actions because high attachment makes consumers more sensitive and less critical to brands' activities (Park, Macinnis, priester, and Iacobucci, 2010).

3. Methodology

3.1 Sampling and Data Collection.

This research uses the online data collection. Survey questionnaire is used for data collection method. A systematic sampling technique is selected for the purpose of obtaining the data needed to achieve the objectives of this study. This research use 150 respondent which have been taken from the Malaysian people.

3.2 Research Construct.

BRAND TRUST (DV)
Reliability dimension
Intention dimension
BRAND EXPERIENCE (IV)
Sensory dimension
Behavioural dimension
Intellectual dimension
BRAND ATTACHMENT (IV)
Brand-self connection
Prominence

3.3 Data Analysis Method

The data collected in the study will be computed and analysed using the Statistical Package for the Social Science (SPSS) version 24.0 software program. Accordingly, this research applied descriptive analysis, reliability analysis, and Multiple Regression and Pearson correlation analysis to the collected data. In reliability analysis the Cronbach alpha of all variable that exceeds 0.7 which makes it acceptable, in fact since it ranges for 0.7 to 0.9 they are acceptable for an excellent measure. This is also supported by Cronbach (2016) when Cronbach's alpha is higher, it means the internal consistency of item from the scale is higher. For multiple regressions the p value for variable must less than level of significance of 0.05 to accept the hypothesis. The Pearson Correlation could range between -1.0 and +1.0, with a significance of $p=0.05$ is usually accepted as statistical significant.

4. Result and analysis

4.1 Sampling characteristics

For sample this study table shows that the profile of the respondent of 150 participants from Malaysia. That can be show by frequencies and percentage for every demographics question.

	FREQUENCE	PERCENTAGE
Gender		
Male	58	23.31
Female	69	76.69
Age		

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

19-21 years old	62	41.33
22-25 years old	59	32.33
26 and above	25	21.33
Race		
Malay	92	61.33

RM 3001- RM 5000	19	12.67
More than RM 5001	10	6.67

4.2 Hypothesis Testing

Table 2 as in below has showed the result of reliability analysis for the variables. The dependent variable (brand trust) of this study has produced a value of Cronbach's Alpha on 0.641 from total number 10 items measured. This number of result has proved the dependent variable (brand trust) has a very good strength of association While, the brand attachment has been measured and generated in Cronbach's Alpha with a result value of 0.755. Brand experience has reported as the lowest association in Cronbach's Alpha which only valued at 0.704. Although it is the lowest association among all measurement, yet brand experience was still in a very good strength of association. This result also indicated that all the variables were reliable for further analysis.

RELIABILITY ANALYSIS			
Construct	Cronbach's Alpha	Number of items	Strength of Association
Brand experience	0.704	10	Acceptable
Brand attachment	0.755	10	Acceptable
Brand Trust	0.641	10	Acceptable

4.3 Multiple Liner Regression Between Independent Variable And Dependent Variable

For this research, there are two variables which are brand experience and brand attachment that used to measure dependent variable of this study which is brand trust. In model summary table for brand experience, the value for R² (R square) is 0.585 which is equivalent to 58.5% of brand trust are explained from the brand experience and brand attachment. It is illustrating on how influential of the independent variables which is brand experience and brand attachment that influence the brand trust for the dependent variable.

a. Dependent variable: Brand Equity

5 Recommendation And Conclusion

The result of this study highlighted about the impact of brand experience and brand attachment towards brand trust to the online purchasing in Malaysia. This study focused on population in Malaysia. Brand trust is an important role in Malaysian SMEs industry. This is because with brand trust, it can help the SMEs industry to know their limitation in their business. Besides, they also can explore more about the trust issues in the brand context. They also can explore more other independent variable or other adding variable that can help the Malaysian SMEs industry in knowing the brand trust level.

Overall, the results of the present study confirm the significant influence of brand experience and brand attachment toward brand trust. Also, the result of the study has strong support for the value of research on brand trust toward online purchasing in Malaysia. This study focused on population in Malaysia. As a recommendation, there are few future opportunities for future research. Firstly, the future studies need to get extend their sample size to get better result for this study because this study only focusing on 150 populations on the Malaysian people. The knowledge, experience and expectation towards brand trust could be varied from different group of population. Thus, a more accurate research could be conducted when studying different groups of respondents. The larger population can help to generalize the result to a wider scope and helps the results to be more exact.

In addition, other researchers were encouraged to use a qualitative approach to further analyse this study in order to further supplement and justify the results of this analysis that were performed using a convenient method of sampling using a qualitative method. Doing a survey itself has pros and cons in a way that respondent might misunderstand the survey questionnaire that had been given to them to be answer. It can influence the validity and accuracy of the result. Besides, to conduct this study in long term would be more useful, it is because the researcher can see the impact on public involvement as they are the key indicate of these research study.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Other than that, the future researcher should do more methodology work to make independent variable more acceptable and getting the outcome to be more precise. Therefore, the future researcher can explore others independent variable or adding other variables in this study to know the level of the brand trust. As for benefit to others marketers, the online marketers could understand the online purchasing platform concepts in order to boosts their sales by knowing what factors that influence brand trust towards online purchasing platform among Malaysian people.

FACTORS AFFECTING SELF-SERVICE TECHNOLOGY BUYING EXPERIENCE AMONG GENERATION Z

Nor Fatirah Binti Mat Fauzee and Raja Rosnah Raja Daud

Faculty of Entrepreneurship and Business,
Universiti Malaysia Kelantan,
Malaysia

Email: fatirah.a17a0349@siswa.umk.edu.my; rosnah.d@umk.edu.my

Abstract:

This study was conducted to investigate factors affecting self-service technology buying experience among generation Z. Self-service technology is an interface technology that allows customers to perform the service itself without relation to the employees of the organization. Nowadays, smart technology has becoming necessity for all people in their life especially in shopping. Everything that we do is connected to technology and same goes online shopping. In retail industry, technology gives you the platform to better satisfy your customers by helping you concentrate on their needs. So, this research focuses on the factor that influencing generation Z to use self-service technology in buying and their shopping experience. The independent variable in this study comprised service quality, convenience and store atmospheric; whereas the dependent variable in this study is self-service technology buying experience. The quantitative research method was used and 124 respondents were evaluated in this study. Questionnaires were distributed to collect the primary data as a survey with online questionnaire and personally to get the information needed for this study. Data collected is analyzed by using IBM SPSS Version 25 software based on descriptive statistics, reliability analysis and Pearson correlation analysis. As for the result, all of the independent variables (service quality, convenience and store atmospheric) that had been studied in this research have a significant relationship with the dependent variable (self-service buying experience) among generation Z in Malaysia.

Keywords: *Self-Service Technology, Generation Z, Buying Experience*

1 Introduction

Self-service technology (SST) has become prevalent in our daily lives. Then, more face-to-face services industry was replaced by SST, such as banking, tourism and hospitality, food and beverage, retail and airline (Chin & Hong, 2018). SST is an interface technology that allows customers to perform the service itself without relation to the employees of the organization (Robertson & McDonald, 2016). Past research shows that some businesses use self-service technology to help customers check out and make payments without interacting with the cashier. Thus, Amazon is also pushing this concept and using technology Amazon Go on a smartphone client that automatically detects the customer profile using Artificial Intelligence (Junsawang & Chaiyasoonthorn, 2020).

There are some examples of self-service technologies that being used in Malaysia. Previous study has shown that Malaysia already opened a first-time convenience store in Subang Jaya. The Irispay E-Concept Store requires customers to download the Irispay application using its personal details and scan the QR code on the product for payment. Also, McDonald's Malaysia has launched a self-service kiosk in the Klang Valley for customers to place customized orders and make payments on machines (Chin & Hong, 2018). Past research shows that McDonald's constantly monitors changes in demand from consumers and due to long queues all the time and

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

this is one of the factors McDonald's launched a cashless facility where they can pay via their Debit or Credit card at their own order kiosk in 2016. There are a number 265 McDonald's stalls in Malaysia, however, not all MCD stalls have self-service kiosks and only 17 stalls use new technology (T. H. Yang & Geetha, 2019).

The research concentrates on the factor that influencing generation Z to use self-service technology in buying and their buying experience. This research will give an idea of the great use of technology in shopping through the experiences created by consumers. Past research has found Gen Z members to be very entrepreneurial, highly educated and independent; more dependent on self-service tools to research products, compared to seek interaction with experts (Schwieger & Ladwig, 2018).

1.1 Research Objective

The objectives for this research are:

1. To examine the relationship between service quality and self-service technology buying experience among generation Z.
2. To examine the relationship between convenience and self-service technology buying experience among generation Z.
3. To examines the relationship between store atmospheric and self-service technology buying experience among generation Z.

1.2 Significant of the Study

1.2.1 Researchers and Publics

This research will provide new knowledge to researchers and the public such as knowledge and how to use the type of self-service technology provided by some grocery stores. Examples of self-service technology available in Malaysia are self-service registers and self-service kiosks. Tesco Malaysia has introduced the Scan & Shop application which aims to facilitate shopping (Wong, 2019). They try the app on the weekends and save time during the payment process.

1.2.2 Businesses

This research can help all retail businesses in using self-service (SST) technology. Past research shows that the SST can be more beneficial to businesses, helping them to serve more customers with fewer resources, causing a reduction in costs because workers can be replaced by SST (Curran & Meuter, 2005).SST also helps businesses to reduce the cost of training, equipment, and communication of staff (Leung & Matanda, 2013). SST also offers more consistent and robust services without being influenced by variations in service demand or employee thinking frameworks (Liljander & Gillberg, 2006).

2 Literature Review

2.1 Independent Variables

2.1.1 Service Quality

Past research indicates that the quality of service has been the subject of extensive research over several decades has emerged in the form of self-service technology (SST) have a profound impact on how customers interact with the firm to generate positive results of the services, namely satisfaction, customer loyalty and attitude (Iqbal & Hassan, 2018). Furthermore, consumers often choose the option of self-service because they feel it to facilitate the delivery of services quickly and efficiently (Ledingham, 1984).

2.1.2 Convenience

Evidence from past magazine shows a primary reason that customers choose self-service is the belief that it will provide more convenience — which often means the customer chooses how and

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

when the interaction takes place. Customers noted that the convenience of a self-service technology significantly affected the accuracy of a transaction; managers, on the other hand, rated the influence of convenience as significantly less important to accuracy. Both the virtual and the physical convenience of a self-service technology play a major role in the customer's comfort and confidence. If customers can choose a convenient time and place to use a smartphone or online app, the experience will be less distracting and more accurate. For example, the online ordering system for Domino's Pizza Inc., the pizza delivery chain based in Ann Arbor, Michigan, has improved accuracy and increased repeat visits by letting customers place orders at their own pace. Customers can review and verify their orders without feeling pressure to hurry, resulting in greater accuracy (E.Kimes & E.Collier, 2015).

2.1.3 Store Atmospheric

The importance of a store atmospheric that uses self-service technology is to enhance the consumer shopping experience (Xu, 2007). Past research shows the role of consumer emotional mediator in this context. They show that the atmosphere of the store, which is caused by various variables in the store, is psychologically represented by the consumer in terms of the main emotional state which is pleasure. This emotional state is a significant intermediary of in-store shopping behavior, such as the pleasure of using technology to shop in-store, the time spent browsing and exploring store space, the tendency to spend more money than originally planned (Robert & John, 1982).

2.2 Dependent Variable

2.2.1 Self-Service Buying Experience

Past research explores the experiences and views of young people on the use of customer kiosks in McDonald's restaurants. Respondents felt that the kiosks increase efficiency by eliminating the need to line up to order and provide a more relaxing time to make their menu selections. Therefore, while using a kiosk does not necessarily speed up the service process, it does allow time to reflect on options and less waiting time to be entertained. The kiosk also provides a clear food category with pictures, simple English instructions, and a simple ordering and payment process. Compared with the amount of information available at the service counter, kiosk provides more detailed information and more details on the menu, ingredients, discounts and promotions (Q. Yang & Goodsir, 2019).

2.3 Research Hypothesis

Research hypothesis is known as a scientific hypothesis and also consists of the statement about the relationship between two variables. This study proposed to test the relationship of both variables which independent and dependent variables. Based on the literature review and the research question that discussed, the hypothesis of this study can be summarized in the following manner:

- H₁: There is a significant relationship between service quality and self-service technology buying experience.
- H₂: There is a significant relationship between convenience and self-service technology buying experience.
- H₃: There is a significant relationship between store atmospheric and self-service technology buying experience.

2.4 Conceptual Framework

Figure 1 show the theoretical framework on the factor that influences generation Z to use self-service technology in buying and their experience. There are two types of variables. The first variable is independent variables, which consist of service quality, convenience and store

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

atmospheric. The second variable is dependent variable, which is self-service buying experience.

Figure 1: Conceptual Framework of Factor that Influencing Gen Z to use Self-Service Technology in Buying and their Experience

3 Methodology

3.1 Research Design

Quantitative survey was applied in this research. Quantitative research is based on measurement of quantity or amount. This applies to phenomena that can be expressed in quantity (Kothari, 2004). Questionnaires are mainly used in conducting quantitative research, where researchers want to display samples in terms of numbers (the sample in different age groups) or can calculate the frequency of opinions, attitudes, experiences, processes, behaviors, or predictions (Rowley 2014). The main objective of quantitative research is to test whether the hypothesis being tested is important.

3.2 Population

A target population is a certain group of the population that share similar characteristics and is identified as the intended audience for a product, advertising or research. It is a portion of the whole universe of people selected as the objective audience (Draugalis & Plaza, 2009). Unit of analysis is the subject that is being studied in the research. It has been defined as who or what is being studied during research (Seaman, 2015). The target population of this research is young adults who are generation Z who buying using self-service technology. The unit of analysis will be their individual who aged 19-25 years old.

3.3 Sample Size

Sample size can be determined based on several rules of thumbs. This research determines the sample size based on rules of thumbs provided by Cohen 1992. Figure 2 below presents the table of statistical power analysis by Cohen 1992. Based on maximum arrows pointing at a construct in conceptual framework, three factors (service quality, convenience, store atmospheric) are pointed to other variable (self-service technology buying experience). Therefore, based on the statistical power analysis table, this research needs a minimum number of 124 respondents to achieve the statistical power of 80 per cent for detecting R^2 values of at least 0.10 with a 5 per cent probability of error.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Exhibit 1.7 Sample Size Recommendation a in PLS-SEM for a Statistical Power of 80%

Maximum Number of Arrows Pointing at a Construct	Significance Level											
	1%				5%				10%

Figure 2: Statistical Power Analysis by Cohen 1992

3.4 Data Collection

This research use primary methods in quantitative to collect the data which is questionnaire through online. It will distribute 124 copies of the questionnaire via the online method to be completed by generation Z aged between 19-25 years who have been selected. This method will facilitate us in the final stages of data encoding, data analysis and data interpretation by making the process simple and easy. Such data collection methods are chosen for use because reliability, direct response, ease of use and use of multiple choice questions can reduce the likelihood of uncertainty in results. Besides that, researcher also used secondary data by referring articles and online journals downloaded in internet. Ease of reliability and accessibility, this research is used with Google as the main search engine and tool to collect secondary data through Google Scholar and My Athens provided by Universiti Malaysia Kelantan (UMK). By making full use of relative online resources researcher was able to complete research and access relative articles online and to reinforce research results by the support of this journal.

3.5 Sampling

For this research, researcher use judgmental sampling, also called purposive sampling or authoritative sampling, is a non-probability sampling technique in which the sample members are chosen only on the basis of the researcher's knowledge and judgment. As the researcher's knowledge is instrumental in creating a sample in this sampling technique, there are chances that the results obtained will be highly accurate with a minimum margin of error. Therefore, researcher selected respondents that have experienced or know about self-service technology to complete this research.

3.6 Research Instrument

In this study, the questionnaire was used as a research instrument and consisted of a series of questions for the purpose of collecting information from the respondents. There are three sections in the questionnaire which is Section A, Section B and Section C. The selected language in a bilingual questionnaire is listed as Malay and English. For the first section in the questionnaire, it asked the respondents about the demographic questions consisting of age, gender and religion. As for second section, there will be questions related to independent variables in the research which are service quality, convenience and store atmospheric. For the last part, it will more focus on asking the dependent variable of this research which is self-service technology buying experience. The measurement is based on likert Scale question which are 1=Strongly Disagree, 2=Disagree, 3=Neutral, 4=Agree and 5= Strongly Agree.

3.7 Data Analysis Technique

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

IBM SPSS (Statistical Package for Social Science) Statistics version 25 will be used for this study. The use of computer software to help researchers reduce the time they are taken to calculate the quantitative analysis of data and facilitate faster and make it easier. Descriptive statistics were used to analyze the data which includes the mean, median, mode and frequency. The researchers can use IBM SPSS Statistics to understand the data, to analyze, forecast and plan. The statistical analysis for the study includes the reliability analysis and Pearson correlation coefficient.

4 Data Analysis and Findings

4.1 Demographic Profile

The demographic profile of the respondents included the information of age distribution, gender distribution, race, status, education level, occupation and income level. From the sample collected, majority respondents come from female (82.3%) and male is 22 (17.7%). This can be concluded that people who are most prefer using self-service technology in buying are dominated by female for the majority, and male people are not so into this technology.

In terms of age, the majority of the respondents are from the age group of 23 to 24 years which are 66 peoples (53.2%) are most in using this technology, followed by 33 peoples (26.6%) from the age group of 21-22 years old, 14.5 percent were from aged 25 years old and minimal respondents fell within the range of 19-20 years old which are 7 peoples (5.6%). Some of people who were aged below 20 years old not aware with this self- service technology because they are too young and everything all depends on their parents.

For the race, the highest number and percentage of individuals who has been using self-service technology in shopping were 100 persons (80.6%), follow by Chinese which are 10 persons (8.1%), then Indian which are 8 persons (6.5%) and the others race becoming the lowest number and percentage which are 6 persons (4.8%).

Next, for the marital status, single people are most preferred to use self-service technology in shopping which representing 104 persons (83.9%). These people want something that make easy for them. For the married people, only 18 persons (14.5%) use this technology and lowest percent on divorced persons which is 1.6 percent representing only 2 persons.

Besides, in terms of education level, majority respondent who has been experiencing in using self-service technology in shopping have degree which representing 82 peoples (66.1%), followed by people who have SPM/ Foundation / STPM / STAM which involved 21 peoples (16.9%), then for diploma only 16 peoples (12.9%) and minimal respondent are belongs to master student which representing 4 percent for 5 persons. Master students are not interested in using self-service technology and more prefer use delivery services to buy foods.

For the occupation, the highest number and percentage of respondent who are student which is 85 persons (68.5%) because they want something that are trending and easy for them to use, then followed by employee which is 31 persons (25%), self- employed which is 6 persons (4.8%) and the lowest are people who unemployed which is only 2 persons (4.8%).

Lastly, for the income level, majority of respondent who earns from RM0 until RM1000 which represent 87 persons (70.2) has been using self-service technology in their shopping, followed by people who earn from RM1001 until RM2000 which is 18 persons (14.5%), then people who earn from RM2001 until RM3000 which is 12 persons (9.7%) and the minimal respondents are from people who earn from RM3001 and above which represent 7 persons (5.6%).

4.2 Descriptive Analysis

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Descriptive statistic summarizes and organizes characteristics of a data set. A data set is a collection of responses or observations from a sample or entire population. For descriptive analysis in this study, researchers have analyzed to find the mean and standard deviation of the independent variables and dependent variables. Table 1 below listed out the summary of the mean and standard deviation of the variables.

Table 1: Summary of the Means and Standard Deviation of the Variables

Variables	Mean	Standard Deviation
Service Quality (IV1)	4.18	0.66
Convenience (IV2)	4.27	0.58
Store Atmospheric (IV3)	4.36	0.56
Self-Service Buying Experience (DV)	4.35	0.59

Table 1 showed that all the independent variables consist of service quality; convenience and store atmospheric are the factors that influence them to use self-service technology in buying. Based on the result, store atmospheric obtain the highest mean whereas service quality has the lowest mean but has highest standard deviation.

4.3 Reliability Test

For this research, researcher has conduct pilot test to examine reliability of the questionnaire towards the research title which is factors affecting self-service technology buying experience. In this research, a total of 124 respondents were participated in the actual survey but for the pilot test the researcher only used 30 respondents to measure if the questionnaire is acceptable or not.

Table 2: Result of Reliability Test using Cronbach's Alpha

Variable	No. of Items	Coefficient Alpha	Strength of Association
Service Quality	5	0.846	Good
Convenience	5	0.827	Good
Store Atmospheric	5	0.895	Good
Self- Service Buying Experience	5	0.876	Good

The internal consistency reliability is measured using the role of thumb of Cronbach's Alpha. The size of the Cronbach-Alpha which is more than or equal to 0.9 is excellent consider as an excellent strength of association in understanding of the questionnaire. However, the coefficient size of 0.8 to less than 0.9 is very good of strength of association and in between 0.7 to less than 0.8 is consider as a good strength of association towards the questionnaire. The Cronbach-Alpha showing $0.6 < 0.7$ have a moderate strength whereas below 0.6 showing a poor strength of association. Table 2 below shows the result of reliability Cronbach's Alpha which is all the variable considered as good reliability.

4.4 Pearson Correlation Coefficient

In this section, Pearson's correlation is employed to examine the relationship between the independent variables (IVs) and the dependent variable (DV). To test the relationship, in this section, the mediator in this study is treated as a dependent variable. Correlation coefficients are

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

able to provide a numerical overview of the direction and strength of the linear relationship between the IVs and DVs. Pearson's correlation coefficients (r) range from -1 to +1 for the indication of positive or negative correlation.

Table 3: Correlation between Independent Variables and Dependent Variable

Correlations					
		Service Quality	Convenience	Store Atmospheric	Self-Service Buying Experience
Service quality	Pearson Correlation	1	.800**	.725**	.697**
	Sig. (2-tailed)		.000	.000	.000
	N	124	124	124	124
Convenience	Pearson Correlation	.800**	1	.812**	.770**
	Sig. (2-tailed)	.000		.000	.000
	N	124	124	124	124
Store atmospheric	Pearson Correlation	.725**	.812**	1	.805**
	Sig. (2-tailed)	.000	.000		.000
	N	124	124	124	124
Self-service buying experience	Pearson Correlation	.697**	.770**	.805**	1
	Sig. (2-tailed)	.000	.000	.000	
	N	124	124	124	124
** . Correlation is significant at the 0.01 level (2-tailed).					

Based on the Table 3, it can be seen that all of the independent variables which are service quality, convenience and store atmospheric are significantly correlated to dependent variable which is the self-service buying experience at 0.01 level (2-tailed). The relationship between variables, 0.60 to 1.0 is strong, within range of 0.30 to 0.50 is moderate and below of 0.20 is weak. The table showed that relationship between service quality is stated as 0.697, while convenience is stated 0.770 and store atmospheric is stated 0.805. Thus, all of the independent variable has a strong relationship with dependent variables of this study.

4.5 Summary

Number of	Statement of Hypothesis	Result	Significant Value
-----------	-------------------------	--------	-------------------

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Hypothesis			
H ₁	There is a significant relationship between service quality and self-service buying experience	Accepted	0.000
H ₂	There is a significant relationship between convenience and self-service buying technology	Accepted	0.000
H ₃	There is a significant relationship between store atmospheric and self-service technology	Accepted	0.000

As the p-value should be less than 0.005, the service quality, convenience and store atmospheric are accepted in this analysis.

5 Discussion and Recommendations

This study is trying to achieve four objectives. The first objective is to examine the relationship between service quality and self-service buying experience. The second objective is to examine the relationship between convenience and self-service buying experience. Lastly, the third objective is to examine the relationship between store atmospheric and self-service buying experience. Hypothesizes that have has been tested showed the positive significant among the variables.

Based on this study, the researcher found that there are some suggestions for future studies. Through this way, the researcher hope that in the future other researchers can use direction and extend to other levels in future research.

The first suggestion for the future research is the other researcher can do research focusing self-service technology in terms of online banking services which is different with this research. This is because online banking service also important in the daily life. This service is said to be safer than ever, as it puts customers in charge of their own finances, whether they want to change fixed orders, make international payments or settle their bills. As a result, most of them no longer enter the local branch of the bank to settle financial matters.

Furthermore, researcher suggest that the other researcher also can do research focusing on self-service technology in buying among all generation and not for specific generation. This technology will be used by all people who want to make purchase. Therefore, in the future when other researchers do the research, researcher can know more about the factor that influence people in using self-service technology. The researcher also can compare factors that influence all people to use this technology and the specific generation Z.

6 Conclusion

Technology enables a machine to perform tasks that can be executed repeatedly with a standard set of instructions without getting tired, thus letting the human mind function and focus on what is more important. Especially in retail, self-service technology gives you the platform to better satisfy your customers by helping you concentrate on their needs. And happier customers mean more business.

In conclusion, the results for this study have contributed beneficial information about self-service technology and factor that makes people prefer them to future researchers as a reference to their

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

research. Then, the entire objective for this research has been fulfilled with the supported hypothesis. Not only that, based on the findings of the research, all the independent variables which is service quality, convenience and store atmospheric have a significant relationship towards self-service buying experience among generation Z.

It means that all variables play an important role during the research process. As our respondent was generation Z which is people who aged 19 to 25 years old and the data collected on this research, it is show that they have been aware and experiencing in using self-service technology. These self-service technologies have really made their day because it make easy for them and save their time.

7 Acknowledgement

First of all, praise and thanks be to God, for showing His blessings throughout my research work to complete the research successfully.

I would like to thank my research supervisor, Raja Rosnah Binti Raja Daud, a lecturer from the Faculty of Entrepreneurship and Business, Universiti Malaysia Kelantan, for giving me the opportunity to do research and provide invaluable guidance throughout this research.

I would also like to thank all my colleagues involved for their acceptance and patience during the discussions I had with them in this research. I am very thankful to my parents and family for their love, prayers, understanding and continuing support to complete this research work. Thank you to all of you.

THE CUSTOMER SATISFACTION TOWARDS ONLINE SHOPPING DURING A PANDEMIC COVID-19 IN MALAYSIA

Nor Laila Binti Abu Bakar and Tahirah Binti Abdullah

Faculty of Entrepreneurship and Business
Universiti Malaysia Kelantan
Malaysia

Email: laila.a17a0353@siswa.umk.edu.my; tahirah@umk.edu.my

Abstract:

Nowadays, lifestyle changes that are increasingly busy during the pandemic and online shopping are get a place in the hearts of customers. This is because they cannot leave the house to buy goods because of the Movement Control Order (MCO) and they only use online shopping. Most of people prefer to online shopping because it is more convenient and fast. The objective of this study is to determine whether or not the speed of delivery, the price of product and review and web site quality will affect the customer satisfaction towards online shopping during pandemic Covid-19 among people in Malaysia. The purpose of this research is to find out the factor that influenced customer satisfaction by speed of delivery, price of product and review and web site quality. Those factors played an important role for online shopping in create a positive perception that can influence the customer satisfaction. The primary research data will be collected through a structured questionnaire and SPSS software will be used for analysis process. The questionnaire was distributed to 384 respondents that using online shopping in Malaysia. Therefore, the study will find out the most important factors that have influence customer satisfaction towards online shopping during a pandemic Covid-19 in Malaysia.

Keywords: *online shopping, speed of delivery, price of product and review, web site quality, customer satisfaction*

1 Introduction

Nowadays, online shopping is a form of electronic commerce which allows customers or consumers to directly buy goods and services via a web browser provided that they have access to the internet. Online shopping is one of the common things that most people use in their daily life. But the situation changed after the appearance of the COVID-19. The government has implemented Movement Control Order (MCO) and has resulted in many institutions and agencies shutting down operations. One that affected was a business that had to shut down business operations for several months. Among the initiatives taken by entrepreneurs is to implement e-shop. During this period of MCO, the demand of online shopping is increase but the delivery process was interrupted as the courier services has to limit their employees and some places were restricted. Some of the customers do not care about the timing of receiving the goods but some are very concerned about the timing of delivery. This is because they cannot leave the house to buy goods because of the Movement Control Order (MCO) and they only use online shopping.

Other countries such as Japan, South Korea, Thailand, France and the United States also affected by spreading of the virus of Covid-19. The effects of this virus can be serious to health and can death. Instead of this unfortunate situation, people have to stay at home and cannot leave the house. This phenomenon has make the online shopping is the only platform for people to buy goods and groceries. The proposed study aims to investigate the factor influence the customer satisfaction towards online shopping during pandemic in Malaysia.

The female customers are more motivated in online purchase rather than male customer because

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

according to a survey by Rakuten Insight, 65 percent of the female respondents stated they purchased more online during pandemic in Malaysia and only seven percent of the male respondents said there is no impact on their purchases behaviour. This is because most of female are very familiar with online usage but there are still lots of them not interested in using online shopping. According to Zhou, Dai and Zhang (2007), online shopping was one of the platform has been increasing the number of consumers prefer to purchase product from online shopping. This study will be focused on people in Malaysia because they cannot go out to shopping complex and have to use online shopping during COVID-19. The customers don't have any choice if they want to buy goods and must use online shopping. More customer will prefer online shopping if the delivery of goods is fast and the quality of website is in good condition. Other than that, the price of the product has to affordable according to the product. The customers will find a product of interest by visiting the website of the retailer directly. Generally, the success of the online shopping is based on the customer satisfaction during their purchase.

This research is to investigate the customer satisfaction towards online shopping during pandemic. This is because, during pandemic is difficult for people to buy product at the store and they only have to use online shopping. Because of the pandemic many people use online shopping and it will give some problems to people. First, about the speed of delivery. The problem is when MCO, people cannot go out to buy the goods or shopping and they only use online shopping. Sometimes when they use this platform, it takes a long time for the delivery of goods. It causes customer dissatisfaction with the ways the online shopping company involved manage it. The consumers pay more attention to and distribution of the items provided by online retailers. This is because the speed of delivery plays a positive role in the customers' satisfaction level, especially during outbreaks because demands from customers on online shopping have increased more than other types of shopping (Khan, Sadat & Kamboj, 2020). Customer satisfaction is the level of comparison between consumers' feelings by comparing services received with their expectations. Customers will feel happy or disappointed with the performance of products delivery and all depends on the speed of delivery product to the customers (Disman et al. 2018).

Meanwhile, the price of product and review also influences the customer satisfaction towards online shopping because the price of product is not the same and has to add with the shipping charge. According to Janda and Ybarra (2005), the price of product is one of the most significant factors in attracting consumers to a website and the prices of online retailers are partially dependent on the level of quality of service provided. Other than that, according to Changchit and Klaus (2020) as online shopping does not allow the level of contact and interaction with online retailers of a product, they aim to provide online product assessments as an alternative to physically engaging with a product. This gives the confidence of online consumers to make a purchasing decision based on the details of the product price and quality reviews (Von Helversen et al. 2018). This is because both the customer and the seller gain benefit from the review websites. According to Disman et al. (2018) product quality will satisfy the customer if the product received is the same as the customer expectations.

The web site quality is also important for customers, especially those who prefer online shopping. According to Khan, Sadat and Kamboj (2020), many web-based shopping customers go for online platform purchases because of the excellent quality of the service. But according to Janda and Ybarra (2005) the general satisfaction of consumers with an online retailer is affected by their satisfaction with the user interface. This is means that, website quality standards are focused on content, design, processing speed, security and product details. The customer satisfaction depend on web site quality online shopping. If the web site put all information clearly, it can make customer satisfy to buy product using online shopping. Meanwhile, Changchit and Klaus (2020) claimed that e-commerce companies want consumers to have a high level of satisfaction with the

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

product being purchased and to increase the probability of repeat purchases, so e-commerce companies aim to have websites that increase customers' product trust. This is also achieved by clarifying product lists with comprehensive details, different graphics, and a helpful product review. Thus, the present study explored the factor speed of delivery, the price of product and review and web quality influenced the customer satisfaction towards online shopping during a pandemic Covid-19.

2 Literature Review

Theory of Reasoned Action (TRA) and Theory of Planned Behaviour (TPB)

The phenomenon of online shopping is very important in Malaysia during pandemic and thus measuring attitude at this stage which influences the attitude to shopping online according to the theory of reasoned action (TRA) and theory of planned behaviour (TPB) (Al-Debei, Akroush and Ashouri, 2015). The customer satisfaction attitude is described as the overall assessment of a factor in the use of online shopping by an individual. Since this research is about measuring the attitudes of Malaysian customers towards online shopping, behavioral attitudes are important to the context of this study.

According to the TPB, behavioral beliefs that relate to an individual's inner beliefs about the results of performing a certain action affect attitudes towards actual behavior. (Ajzen, 1991). Based on their experiences, such as their own past experiences, these beliefs differ from one individual to another. This study showed that Malaysian consumers' attitudes towards online shopping are primarily affected by the characteristics of the speed of delivery, the price of product and review and web site quality. Hence, this study assumes three major characteristics which influence Malaysian consumer attitudes toward online shopping. The researcher provides a detailed literature review on attitudes towards online shopping in the following subsections. In order to establish and support the hypotheses of this study, the researcher also used relevant literature.

According to Wikipedia, online shopping is a form of electronic commerce or E-commerce which allows consumer to directly purchase goods and service from online seller over the internet by using a web browser such as Google and Yahoo. This is because, consumers can easily find the product that they interest to buy by visiting the website of the retailer or the consumer can searching among alternative vendors using a shopping search engine which displays the same product availability and with different price with different retailers. Nowadays, consumers can shop online by using computers and devices such as computers, laptops, tablet and smartphones (Noorshella Che Nawi et. al., 2019).

On the other hand, according to Changchit and Klaus (2020) was identified factors which affects to the customer satisfaction of online buyers. These are personal factors, product factors and website factors. Among the personal factors, opinion on transaction safety and privacy are the important factors which affect the customer buying behavior, type of the product was prominent factor out of the product related factors and out of the website factors. Other than that, Jayapradha (2018) stated that most of the people were considered to be better than manual shopping for online shopping and comfortable with their online shopping transaction. Jemila (2017) contended that the price of the product and discount, product quality and quality of information are important factors when shopping online.

According to Kim and Lim (2001) the factors of entertainment, convenience, reliability, and information quality and speed of delivery plays important role in customer satisfaction while shopping online. Lin, Wu and Chang (2010) stated that delivery quality, product quality, service

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

quality, device quality and a large level of perceived cost are the most critical factors influencing the satisfaction of online customers. The catalysts for online customer satisfaction are the knowledge available with diversified products, reasonable pricing, easy ordering procedure and delivery without damage. The attitude towards the behaviour depending on the individual because there are people who do not mind slow or fast delivery. The perceived behavioural control can be controlled by the individual to accept if delay in delivery.

Besides, it can make more customers turn towards online shopping due to pandemic. Online reviews are seen as a guide that affects the decision process of the customer. As online shopping does not allow the degree of touch and contact with a product that may be available in traditional retail outlets, as an alternative to physically engaging with a product, online retailers aim to provide product reviews online. This is because online reviews offer future user insights into what can be expected from the product or service on the basis of the review is written and the use of terms in the review allows the review reader to assess trusting and factual elements in a review. This study supported by Changchit and Klaus (2020) potential buyers prefer to search for feedback first, then read the details shared by previous users, and finally look at the product's monetary value. According to Kasuma et al. (2020) consumers may also display pictures or videos of products containing product details, including product descriptions and the price of the products.

Meanwhile, in order to influence customers to purchase or buy from online shopping, the characteristics of website design or functionality often play a significant role. The design of websites presented to customers is important for online shopping (Ganguly et al. 2010). A research by Kasuma et al. (2020) found that, while the website design or features were done by the website consultants, online shoppers were very dissatisfied with the inadequate website design. Consumers prefer to avoid visiting the website due to ineffective website design or functionality and may risk the user leaving the website without any purchase. Therefore, factors in website design are important predictors of customer satisfaction. Typically, online retailers allow customers to use search features to locate the unique or precise goods, models, labels or things they want if they know the exact product name (Roy & Datta., 2018). According to Billy, Rob and Ivan (2008) website quality has a direct and positive impact on customer satisfaction. Accordingly, the study tested the following hypotheses;

- H₁: There is a positive low significant relationship between speed of delivery and customer satisfaction towards online shopping during a pandemic Covid-19 in Malaysia.
- H₂: There is a positive low significant relationship between price of product and review and customer satisfaction towards online shopping during a pandemic Covid-19 in Malaysia.
- H₃: There is a positive moderate significant relationship between web site quality and customer satisfaction towards online shopping during a pandemic Covid-19 in Malaysia.

3 Research Methodology

This study highlighted the factor influenced the customer satisfaction towards online shopping during a pandemic Covid-19 in Malaysia. Therefore, a quantitative methodology was adopted for the present study. To collect data for this study, the researcher use reliability test, normality test, correlation analysis and multiple linear regression.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Besides that, this study also utilized questionnaire as a survey to the targeted respondents. This study using the google form to distribute the questionnaires via platform online. The population in this study is all Malaysians which is working people. The number of respondents who participated in this study was 384 working people. Population study also in different age ranges and income levels. This data was analyzed using Statistical Package for Social Sciences (SPSS) version 26.

4 Finding and Discussion

4.1 Demographic Profile of Respondent

The demographic information includes gender, age, race, status, education background, occupation, current monthly income, the number of respondents online shopping, frequency respondents of online shopping in the last six months, respondents spend on the internet every day and the frequency and percentage of Malaysian people will be shown. For the present study, the analysis from Table 1 shows that there are 145 respondents (38%) which is represented male meanwhile 239 (62%) respondents that represented female. It shows that female respondents are higher compared with male respondents in this research. To get working respondent, the researcher use the Facebook and Whatsapp to distribute the questionnaire to working people. Meanwhile, the researcher also asking for help from friend and family to distribute this questionnaire to their friend that working.

Age is divided into 4 categories. The highest number of age respondents is 19-30 years old that is 262 (68%). The second age categories are 31-45 years old that is 82 (21%) meanwhile for less than 18 years old categories there were 25 (7%). As for lowest age respondents is 46 years old above categories that is same with 15 (4%). Next, for the race, the highest race of respondents is Malay that is 244 (63%). For Chinese and Indian, there were 92 (24%) and 37 (10%) respondents respectively. Meanwhile the lowest number race of respondents is others that is 11 (3%). The others respondent is from Iban, Kayan, and also bumiputera Sabah and Sarawak. Based on table below, the status will be shown. As for single respondent there were 261 (68%) meanwhile for married respondents there were 123 (32%).

Based on Table 1, the education background of respondents was shown. The highest education background of respondents is from Bachelor Degree that is 143 (37%). The second highest education background is from Diploma that is 108 (28%). For High School and Master Degree there were 80 (21%) and 36 (9%) respondents respectively. Meanwhile the lowest number education background of respondents is have PHD that is 17 (5%). For the occupation, the highest number of occupation in this research is respondents who is working under private sector that is 167 (44%). Second highest the occupation of respondents is from self-employed that is 116 (30%). After that, the lowest number of respondents who is working under government that is 101 (26%). After that, based on current monthly income of respondents in this research, the highest income of respondents is RM0-RM2000 that is 147 (38%). The second highest group income of respondents is RM2001-RM3000 which stand of 140 (37%) meanwhile the third group income that is RM3001-RM4000 which stand of 55 (14%). The lowest group income of respondents that is more than RM4001 which is 42(11%). Based on table below, all the respondents are like to use online shopping that is 383 (100%).

Table 1 shows the frequency respondents of online shopping in last six months. The highest respondent always to shopping online once a month that is 143 (37%). The second highest respondents like shopping online 2 times a week that is 133 (35%). After that, respondents like to online shopping every 2 or 3 month that is 92 (24%). Meanwhile, there are respondents who

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

like to online shopping every day and others that is same 8(2%). The others means that respondents have their own answer which is uncertain for online shopping. Then, Table 1 shows how much respondents spend on the internet every day in this research. The highest of respondents spend on the internet every day in this research is respondents who is spend 1-2 hours that is 179 (47%). Second highest is respondents spend 3-4 hours on internet every day which is 78 (20%). Meanwhile, there are respondents like to spend on internet below 1 hours and above 5 hours that 64(17%) and 63(16%).

Table 1: Demographic Profile Analysis

Background	Information	Frequency	Percentage (%)
Gender	Male	145	38
	Female	239	62
Age	less than 18 years old	25	7
	19-30 years old	262	68
	31-45 years old	82	21
	46 years old above	15	4
Race	Malay	244	63
	Chinese	92	24
	Indian	37	10
	Others	11	3
Status	Single	261	68
	Married	123	32
Education Background	High School	80	21
	Diploma	108	28
	Bachelor Degree	143	37
	Master Degree	36	9
	PHD	17	5
Occupation	Working under private sector	167	44
	Working under government	101	26
	Self-employed	116	30
Current Monthly Income of Respondents	RM0-RM2000	147	38

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

	RM2001-RM3000	140	37
	RM3001-RM4000	55	14
	More than RM4001	42	11
The Number of Respondents Online Shopping	Yes	384	100
	No	0	0
Frequency Respondents of Online Shopping in Last Six Months	Every Day	8	2
	2 times a week	133	35
	Once a month	143	37
	2 or 3 month	92	24
	Others	8	2
Respondents Spend on the Internet Every Day	Below 1 hour	64	17
	1-2 hour	179	47
	3-4 hour	78	20
	Above 5 hours	63	16

4.2 Descriptive Statistics

In descriptive analysis, the researcher come out with analysis by using the mean for every section and to find out the customer satisfaction towards online shopping. Table 2 shows the mean of the factor influence the customer satisfaction towards online shopping during a pandemic Covid-19 which is the speed of delivery, price of product and review and web site quality. Among of the factor, web site quality is the most factor that influence customer satisfaction towards online shopping which the mean is 4.5552 (SD=0.41345), and the second is speed of delivery which is 4.5349 (SD=0.41991) and the third variable is price of product and review which the mean is 4.5260 (SD=0.41531). For the customer satisfaction is the dependent variable which record as 4.5521 (SD=0.42653).

Table 2: Descriptive Statistics for independent and dependent variables

Descriptive Statistics					
Items	N	Minimum	Maximum	Mean	Std. Deviation
Speed of Delivery	384	3.00	5.00	4.5349	0.41991
Price of Product and Review	384	2.60	5.00	4.5260	0.41531

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Web site Quality	384	2.20	5.00	4.5552	0.41345
Customer Satisfaction	384	2.80	5.00	4.5521	0.42653

4.3 Reliability Test

The reliability of a measure is an indicator of the stability and precision of which the concept is calculated by the instrument, thus helping to gain access to the quality of the measure. The average of these values is similar to the value of Cronbach's Alpha (Cronbach, 1951). Table 3 show the Cronbach coefficients alpha values for independent variable and dependent variable after 384 respondents for this research. The result of Cronbach's Alpha reliability test for web site quality is 0.760 and price of product and review is 0.744. The range of the result of the reliability test is good category which means that the survey questionnaire is reliability. Meanwhile, for the speed of delivery, the Cronbach's Alpha reliability test is 0.687 and the range of the result is moderate category. For the customer satisfaction, the Cronbach's Alpha reliability test is 0.739 and the range of the result is good category which means that the questionnaire is reliability.

Table 3: Results of Reliability Test (n=384)

	Variables	Number of Item	Cronbach Alpha
Independent Variables	Speed of Delivery	5	0.687
	Price of Product and Review	5	0.744
	Web Site Quality	5	0.760
Dependent Variable	Customer satisfaction	5	0.739

Source: Develop of Research from SPSS

5 Conclusion and Limitations

This study showed that there are three independent variables are tested which were speed of delivery, price of product and review and also web site quality. According to the finding, it shows that web site quality was the most influencing customer satisfaction towards online shopping during a pandemic Covid-19 in Malaysia. As an overall, this study has a limitation. The limitation of this study was researcher had challenge is face the time limitation. The time limitation refers to time to collect the data. It hard for researcher because it needs to use people's time to answer the questionnaire. The limitation time for working people to answer the questionnaire make the researcher to know how to interact with working people to give their cooperation. At the same time, most of people who work are too busy with their work as well as their daily routine. Because of pandemic Covid-19, the researcher go through difficulties to interview employees and need to distribute the links to respondents via Facebook and Whatsapp for them to answer the questionnaire. Other than that, the researcher had challenge to distribute the questionnaire. This is because, the respondent for this study only focus for working people. So that, it difficult for researcher to find the respondents. From the study, it was found that this study only focus to working people. So that, future researcher can expand this study to students or villagers who do not work. This is because, some of them also like to use online shopping. Indirectly, future

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

researcher will be easier to get respondents due to not focusing too much on certain groups only.

6 Acknowledgement

First and foremost, praise and thanks to the Almighty Allah for His shower of blessings throughout my research work to successfully complete the research. I would like to express my deep and sincere gratitude to my research supervisor, Dr. Tahirah Binti Abdullah for giving me the opportunity to carry out research and providing invaluable guidance throughout this research. This work would not be completed on time without her time, guidance, effort, support, and patience. I fervently appreciate her contribution during the meeting as she has given us a lot of constructive comments, sincere advice as well as steady guidance throughout the progression of this research project to achieve my objectives.

The credit is also given to my parents and family who have assisted me in terms of morale and financial support. Undeniably, the understanding of my parents has allowed me to carry out the assignment in a free pressure environment. I get to concentrate in my research without worrying for the financial constraints as my parents have given me the full financial support. Our sincere gratitude to the University Malaysia Kelantan for the opportunity they have given me. I also thank to Dr. Siti Afiqah Binti Zainuddin for her hard work as a final year project panel this year. She also guides me on how to do the research, how to format the project and how to explain the project clearly. I would also like to acknowledge my friends and classmates for their opinions, encouragement and enthusiasm. I would like to thank the respondents of this study as they have participated in my questionnaires survey. Finally, I would like to thank go to all the people who have supported me in completing the research work, either directly or indirectly. Thank you.

THE FACTORS INFLUENCING CUSTOMER LOYALTY TOWARDS TELECOMMUNICATION PLAN AMONG PEOPLE IN BESUT

Laila Fatin Mohd Zaki and Nurul Izyan Mat Daud

Faculty of Entrepreneurship and Business,
Universiti Malaysia Kelantan,
Malaysia

Email: laila.a17a0354@siswa.umk.edu.my; izyan.md@umk.edu.my

Abstract:

Telecommunication service providers plays important role in giving best services to their customers and turn them to loyal customers. Reaching the level of where a company has a loyal customer, the image of the company will be projected as a highly recommended company by customers and also be a strong competitor by companies. This will give positive environment where other companies compete in the market to get their loyal customers. The purpose of this study was to examine the factor influence customer loyalty to use what kind of telecommunication plan among people in Besut (Terengganu). This study is purposely to identify the factors influencing customer loyalty towards telecommunication plans among people in Besut. This study is to help researcher more understanding on what the cause or factors for customers in becoming a loyal customers to certain company's products or services. This study analysed between factors influence (loyalty program, service quality, brand image, and customer satisfaction) and customer loyalty towards telecommunication plan among people in Besut. This research discussed about the relationship between customer loyalty and the four factors as mentioned earlier. Questionnaire survey method was used to collect data from respondents. The data obtained were analyzed by statistical methods in the Statistical Package for Social Sciences (SPSS). Regression and correlation techniques will also be used in this study to study the relationship between dependent and independent variables.

Keywords: *loyalty program, service quality, brand image, customer satisfaction, customer loyalty*

1 Introduction

"Tele" means "distance" in Latin. The definition of telecommunication is "distance contact. A need to connect remotely with others has fuelled a man's resourcefulness. It's going to result in such a phone, a simple basic telegraph system, and evolution to those other systems. Telecommunications relates to the electronic and electrical exchange of information over a large distance. The perfect telecommunication arrangement comprises two or more transmitter and receiver stations. From the Mitel blog, (2020) telecommunications can also be described as distance communication science and technology. A capability to transmit information faster, correctly and effectively has always been one of human innovation's main goals.

In a service environment, customer satisfaction identifies a desired result of service experiences involving an assessment of whether the services fulfilled the needs and expectations of customers. (Orel & Kara, 2014). Meanwhile customer loyalty is a measure of a customer's likeliness to do repeat business with a company or brand. it is the result of customer satisfaction, positive customer experiences and the overall value of the goods or services a customer receives from business, (Blog sendpulse.com).

The key challenge in the telecommunications industry is to protect the subscriber base by

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

gaining loyalty to subscribers. When the customers switch to another service provider, that's mean, the company does not provide the competitive and excellent service (Crow, 2017). From the prehistoric humans with his signs to today's high-powered mobile executives, connectivity remains a key to survival and achievement. Telecommunications systems are examples of mobile networks, broadcast radio systems, computer systems and also the Network. Often known as telecommunications. (Margaret Rouse, 2019).

Over the past decade, we have seen a significant global increase in the number of individual mobile subscribers from 1 billion in 2003 to 3.4 billion in 2013 (GSMA Intelligence Report, 2014). The increasing interest in Previous Devices for example tablets and phones have reached an incredible speed in people's daily lives to be a major social forum for computer mediated communication (Correa, Hinsley, & De Zu'n~iga, 2010; Hong & Tam, 2006).

In Malaysia, since March 2019, Digi reported that they have 11.25 million mobile subscribers. Besides that, the total number of Maxis is 12 million in 2013. The total number of Celcom Axiata subscribers has 8.95 Million as of December 2018. Then, As of January 2018, 3 U Mobile has 6 million subscribers (Malaysia Wireless portal). This study also aimed on which factor that gives the most impact on and customer loyalty towards telecommunication plans among people in Besut.

2 Literature Review

2.1 Loyalty Program

The loyalty program is a program that runs by an organization or company for give benefits to frequent customers. It is a program that enable customer to get free reward when they make rehashed buys with the same company (Gupta and Sahu 2015). Nowadays, telecommunication plan frequently give reward to their customers to make customer loyal such as give free call during birthday. Those benefits can be in rewards, promotion, loyalty card or rebates. These programs typically give customers to accumulate and redeem free rewards with frequently purchasing from a company, (Colliander, Söderlund et all. 2016).

H1: There is no significant relationship between loyalty program and customer loyalty to use telecommunication plans

2.2 Service Quality

Service quality can be classified under four factors which is namely competence, assurance, tangibility and reliability. (A. A. Khatibi, et al). In addition, the best telecommunication services industry has shown that the dimensions of service quality such as tangible, reliable, assurance and quality of the network are positively and significantly linked to customer's satisfaction. Service quality is the differentiation between the customer's expectation and the perception of services delivered by organization. (Nhavira, 2014).

H2: There is a significant relationship between service quality and customer loyalty to use telecommunication plans

2.3 Brand Image

Branding can be defined from those as a name, term, design, symbol, or any other feature that identifies one seller's good or service as distinct from other sellers (Tanase 2011). If talking about specific products, services and activities in business, it needs to perceive a brand as the concept or picture people have in mind, both in a realistic and emotional way. Brand image can

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

be defined as a unique set of associations within the minds of target customers which represent what the brand currently stands for and implies the current promise to customers (Sabbir Rahman 2011). According to Aaker, 1996 in the Journal of Retailing and Consumer Services, a positive brand image helps firms to establish a brand's position, strengthen the brand's market performance and protect the brand from rivalry (Munyaradzi W. Nyadzayo 2016).

H3: There is no significant relationship between brand image and customer loyalty to use telecommunication plans.

2.4 Customer Satisfaction

Customer satisfaction describes a desired outcome of service that services have met the customers' needs and expectations (Orel and Kara, 2014). Satisfaction can also be explained as consequences of the customers' post-purchase evaluations of both tangible and intangible brand attributes and a key determinant of customers' loyalty (Krystallis and Chrysochou, 2014). Prior studies report that positive influences of satisfaction on behavioral and attitude loyalty outcomes such as customer's referrals, purchase intentions, service usage and relationship length (Seiders et al, 2005).

H4: There is a significant relationship between customer satisfaction and customer loyalty to use telecommunication plans

2.5 Customer Loyalty

Customer loyalty can be defined as the willingness of any customer to buy the company's goods or services available in the marketplace (Tomalieh 2015). A strong company that has a loyal customer on their side does not have to worry about attracting new customers with such marketing plan. Other researcher also defined that customer loyalty is as a consumer behavior that will built on positive experience and value, something that can leads to purchase products, even what they thought may not appear to be the most rational decision (Ahmad 2019). Which means that consumer will repurchase products or services from the same company even, as example, increase in price and based on experience. Loyalty is a deeply held commitment to continually rebuy a certain product or service in the future, that can lead in repetitive a specific consumption of the same brand (Munyaradzi W. Nyadzayo 2016). From the regularly consumption of the same company's product and services may show that customer is pleased with the product or services offered. According to (Khan 2012), satisfied customers will come back. This important for the telecommunication plan providers to make their satisfied customer to loyal customer with their telecommunication plan services. It is important because it cost so much to influence customer to buy and so little to induce a repurchase.

2.6 Conceptual Framework

The conceptual framework describes the relationship between specific variables identified in the study and it is much more specific in defining this relationship. Researcher must have to be more explored in the investigation. In order to build this proposed conceptual framework, researchers have to review a lot of literature related to chosen research topic which is QR codes effectiveness. From that, researcher formulate own proposed conceptual framework to serve as guide in this research venture. This study provides independent variables which is QR codes effectiveness (additional information, promotion, payment and e-feedback) and dependent variable (user propensity to use towards QR codes) for research proposal.

INDEPENDENT VARIABLE (IV)

DEPENDENT VARIABLE(DV)

Figure 1: Research Framework

3 Research Methodology

For this research study, researcher using quantitative research design which is descriptive and correlational research. Researcher using non-probability convenience sampling method in collected the targeted respondents. The target population of this study is the user that have telecommunication plan among people in Besut. The total number of population in Besut in 140,952 people. Researcher using table Morgan and Krejcie as guideline for sampling size. So the total respondents are 384 approximately. After researcher collecting data, the total respondent is 384 students.

The questionnaire is distributed using Google form link which is through online since all students stay at home. In addition, the questionnaire using 6 likert scale which is from 1 (strongly disagree) to 6 (strongly agree). In the questionnaire, there are consists three section which is section A demographic which include gender, race, and others. Section B is factors that affecting customer loyalty which is loyalty program, service quality, brand image, customer satisfaction. Section C consists of customer loyalty towards telecommunication plan.

In addition, researcher used Statistical Package from Social Science (SPSS) version 22 for analyze and measuring the data that has been collected from respondents. Data analysis method that the researcher used in this study is the reliability test and Pearson's Correlation Coefficient analysis. The functionality for each data analysis method will be further discussed in the next paragraph.

Researcher use reliability analysis to do a pilot test which consist of 30 respondents that purpose to identify the consistency or validity for each variables in this study. After finish the test, result of the reliability test is based on Cronbach's Alpha that value must be exceed 0.7. Furthermore, Pearson's Correlation Coefficient also used to analyze the data. The purpose of using this correlation is to test the significant relationship between the variables and to evaluate the strength of the relationship by values. Researcher also uses Multiple Linear Regression to determine the most factor that affecting customer loyalty towards telecommunication plan.

4 Research Findings

4.1 Frequency Analysis

Table 1 shows the summary of the 384 respondents demographic profile that has been collected through Google form. The demographic profile of respondents consists of gender, race, and others. It can be conclude that majority is from female 198 (71.9%) and also Malay 200 (92.7%) students. In addition, majority respondent has ever used telecommunication plan in places that has been seen and the area have a network strong.

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

Table 1: Respondents Demographic Profile

Variable	Frequency	Percentage %
Gender		
Male	108	28.1%
Female	276	71.9%
Total	384	100%
Race		
Malay	356	92.7%
Chinese	16	4.2%
Indian	12	3.1%
Total	384	100%
Age group		
15-22 years old	57	14.8%
23-30 years old	162	42.2%
31-40 years old	77	20.1%
41 and above	88	22.9%

Unify	33	8.6%
Xox	17	4.4%
Redone	1	3%
Total	384	100%

4.2 Reliability Analysis

Table 2 shows that the results of the reliability test through the value of Cronbach's Alpha Coefficient for independent and dependent variable in this study best on the survey of 384 respondents among people in Besut. The result shows that the Cronbach's Alpha value is on the range 0.837 to 0.927, which means all the variable include loyalty program, service quality, brand image, customer satisfaction and also dependent variable which is customer loyalty toward telecommunication plan is the value exceeds 0.887.

Table 2: Reliability test

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

variables	Number of item	Cronbach's Alpha Coefficient	Strength
Loyalty program	6	0.837	Good
Service Quality	6	0.865	Good
Brand Image	6	0.840	Good
Customer Satisfaction	6	0.927	Good
Customer loyalty toward telecommunication plan	6	0.887	Good

4.3 Person's Correlation

In this part, the Pearson's Correlation Analysis will be used to examine that whether the independent variable which is loyalty program, service quality, brand image and customer satisfaction is statistically significant with dependent variable which is the customer loyalty towards telecommunication plan. In this case, the researcher had used Pearson Correlation Analysis (two-tailed) to investigate the relationship between customer loyalty factor and telecommunication plan. The table below shows the result of the variables.

Table 3: Pearson's Correlation Coefficient

	Service Quality	Brand image	Customer satisfaction	DV
Customer loyalty towards Telecommunication service (DV)	.602**	.711**	.814**	1
Pearson Correlation	.000	.000	.000	384
Sig. (2-tailed)	384	384	384	
N				

** . Correlation is significant at the 0.01 level (2-tailed).

4.4 Multiple Linear Regressions Analysis

Table 4: Simple and Multiple Linear Regression Analysis

Variables	Simple Linear Regression			Multiple Linear Regression	
	b	t-stat (95% CI)	p-value	B	p-value
Loyalty Program	0.64	10.09(0.33,0.50)	0.001	0.85	0.000

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

Service Quality	0.82	10.40(0.34,0.50)	0.000	0.131	0.000
Brand Image	0.84	14.63(0.45,0.60)	0.004	0.67	0.000
Customer satisfaction	0.857	13.50(0.41,0.55)	0.000	0.660	0.000

5 Discussion

5.1 Loyalty program

The first correlation is between loyalty program and customer loyalty toward telecommunication plan. From the table, it shows that there is no significant relationship between loyalty program and customer loyalty because the significant value is 0.001 which is equal 0.01. The positive correlation coefficient for loyalty program and customer loyalty 0.602** means there is moderate relationship between loyalty program and customer loyalty. Hence, the H1 of objective one which is to identify the relationship between loyalty program and customer loyalty is unaccepted. It shows that program loyalty no effect to customer loyalty.

5.2 Service quality

Secondly is the correlation between service quality with customer loyalty. From the table, it shows that there is a significant relationship between service quality with customer loyalty because the significant value is 0.000 which is less than 0.01. The positive correlation coefficient for service quality with customer loyalty is 0.6711** means there is moderate relationship between service quality with customer loyalty. Hence, the H² of objective two which is to find out the relationship between service quality with customer loyalty is accepted. It shows that service quality give effect to use telecommunication. As stated by (Okazaki et al., 2019) found that advertisement with good perceived fit has positive relationship with telecommunication plan.

5.3 Brand image

Next is the correlation between brand image and customer loyalty toward telecommunication plan. From the table, it shows that there is no significant relationship between brand image and customer loyalty because the significant value is 0.004 which is more than 0.01. The positive correlation coefficient for brand image and customer loyalty code is 0.711** means there non moderate relationship between brand image and customer loyalty. It shows that brand image no effect to use telecommunication plan in their daily life depend of coverage at their place. Hence the H³ of objective three which is to investigate the relationship between brand image and customer loyalty is unaccepted.

5.4 Customer satisfaction

Lastly is the correlation between customer satisfaction and customer loyalty. From the table, it shows that there is a significant relationship between customer satisfaction and customer loyalty because the significant value is 0.000 which is less than 0.01. The positive correlation coefficient for customer satisfaction and customer loyalty is 0.814** means there is moderate relationship between customer satisfaction and customer loyalty. It shows that customer satisfaction very give effect to telecommunication plan in their daily life. Hence the H4 of objective 4 which is to examine the relationship between customer satisfaction and customer loyalty is accepted.

5.5 Hypothesis Testing

Based on the Pearson's Correlation Coefficient Analysis, it can be concluded that the loyalty program, service quality, brand image and customer satisfaction has a significant relationship

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

towards the customer loyalty to use telecommunication plan among people in Besut. While from the Multiple Linear Regression Analysis, the most factor that affecting user propensity to customer loyalty is customer satisfaction.

6 Recommendation

The reason of this research is to explore further what the factors influencing customer loyalty towards telecommunication plan. From this research, it helps for other parties, such as researcher and telecommunication company to do similar research for their importance in the future. For researchers, this research could help them to use this research as a reference to achieve their research objective. Apart from that, from this research, future researchers can expand this type of research in a large scope of study and use another method to complete their objective.

Other parties can use this research is the telecommunication companies. Those companies can use this research as a material to improve their service quality to their customers to gain more satisfaction indirectly increase their customer loyalty. As an example, from this research used, companies can improve their service such as their line coverage, new marketing plan, loyalty program, service quality, and so on. With this, it can help the companies to gain new customers, higher profits, higher brand image, and make new and retained existing loyal customers.

7 Conclusion

The main aim of this research is to investigate the relationship between factors that affecting customer loyalty toward telecommunication plan. Total of 384 sets of questionnaires had been prepared and distribute to the target respondents in completing this research which is people in Besut.

Overall, the Pearson Correlation Analysis had shown that two of the variables which is service quality and customer satisfaction had a positive correlation to the customer loyalty towards telecommunication plan, meanwhile another two factors which is loyalty program and brand image had a negative correlation to the customer loyalty towards telecommunication plan.

8 Acknowledgement

This study is a collaborative with many people. To begin with, I most goes many thank and respect to my supervisor, Dr Nurul Izyan Mat Daud for his abundantly guidance, assistance and encouragement that she constantly gives to me, despite all the flawless and mistakes that I made throughout the completion of this report. I deserves a special thank you for her patience, caring, generosity, and guidance proceed with this research study.

Last but not least, I also dedicated thanks for those who have helping me in working out this report project. Without each and every one of them, completing this report might not be an easy task that can be completed in such a breeze. Each and every one's style of research and opinions has always been an eye opener that directly and indirectly enlightening the thought of others.

STUDY ON THE RELATIONSHIP OF HALAL AWARENESS, HALAL CERTIFICATION WITH ATTITUDES TOWARD PURCHASE INTENTION AMONGST NON-MUSLIM

Nor Shafiqah Binti Jahubar Sadique Ali and Norfazlirda Binti Hairani

Faculty of Entrepreneurship and Business,
Universiti Malaysia Kelantan,
Malaysia

Email: jahubar.a17a0358@siswa.umk.edu.my ; fazlirda.h@umk.edu.my

Abstract

Gone were where goods were showcased in an exhausting, old-school market. In Malaysia, the supermarket scene is grasping of high quality nourishment, unfamiliar and privately created, with and without halal confirmation as a component of the commercial center and has been driven by request among buyers for valid, gourmet and particular staple goods. Halal markets assume a significant job in furnishing guests with a novel shop and in extending the food of the travel industry by raising goods to another level where the line of items accessible the store looks unique and tasteful. The aim of this study is Study On The Relationship Of Halal Awareness, Halal Certification With Attitudes Toward Purchase Intention Amongst Non-Muslim. Beside that, the data were collected using online form which is online Google Form to approach and to reach a wider number of respondents of non-Muslim in Malaysia. These studies are used for convenience sampling as 385 statistics are amassed. The records may be analysed using Statistical package for the Social science (SPSS) version 25.0 used for reliability take a look at, descriptive analysis and Pearson Correlation Coefficient. Then take a look at locations that all impartial variables have been significant to the dependent variable and attain the goals. Lastly, researcher additionally make certain hassle and advice for destiny researcher to discover extra buy purpose amongst non-Muslim.

Keywords: *Halal Market, Halal Awareness, Halal Certification, Attitudes, non-Muslim*

1 Introduction

Malaysia is a distinctive nation of more than one culture, ideologies, and cultures. However, people in Malaysia take shelter beneath the equal roof. The total population was 33.8 million, of which 30.5 million were citizens of Malaysia and 3.3 million were non-citizens. Beside that, it is estimated that the worldwide halal industry is worth about USD 2.3 trillion a year (excluding Islamic finance). Halal (which means 'lawful' or 'allowable') has become a strong market force, becoming increasingly a worldwide market phenomenon for both Muslims and non-Muslims, no longer simply a moral requirement or observance for Muslims. The Halal Development Corporation is leading the development of an integrated Malaysian and extensive halal ecosystem and infrastructure in Malaysia's currently used halal industry sector to place Malaysia as the most competitive country leading the global halal industry. Beside that, grocery stores specialise in the selling of goods such as paper towels, toilet paper, cleaning products and over-the-counter medications for fresh and pre-packaged products, as well as household non-food items. Furthermore, in halal food environment, Planned Behavior Theory has been used by (Billah, Rahman, & Hossain, 2020)⁴⁵. To measure the factors influencing the consumption behavior of Muslim and non-Muslim consumers: A case study of halal food. Meanwhile, in other research conducted by (Mathew, Abdullah, & Ismail, 2014)⁴⁶ accepted the approval of Halal food by non-Muslim customers has shown a favourable attitude towards the Halal concept of food. Therefore,

⁴⁵ Bashir, A. M. (2019a). Applying the Institutional Theory at the Level of Halal Consumers: The Case of Cape Town in South Africa

⁴⁶ Mathew, V., Abdullah, A., & Ismail, S. (2014). Acceptance on Halal Food among Non-Muslim Consumers.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

this research is to aim to explore Study On The Relationship Of Halal Awareness, Halal Certification With Attitudes Toward Purchase Intention Amongst Non-Muslim.

1.1 Problem Statement

The problem in this studies for halal awareness is although suppliers are beginning to understand the importance of halal awareness, there is still much to be known about the halal components and other determining factors that influence non-Muslim intentions to purchase halal food items. This is because, through processing in terms of logistics will also affect the purchase intention because it involves the cleanliness and trust of a halal product produced out there and it is also quite different from the production of non-Muslim products. Beside that, according to (Aziz & Chok, 2013)⁴⁷ halal food and qualification reports, there is no theoretical application and it is also in its early stages. Problem that occurs for halal certification on this observe is the lack of compliance and oversight of the use of the certified halal logo. However, has led the public to doubt the legitimacy of the halal logo for some goods or services. Lastly, attitude towards the behaviour is referred to the extent to which an individual has a favourable or unfavourable assessment of the behaviour in question. The problems for attitudes is the willingness to purchase halal products in terms of services that also have a significant effect on non-Muslim customers and they are not yet aware of toyyib contained in the halal definition, it would also be an issue with the adoption of halal products and it also be possible to affect an individual's mindset to consider something the slightly different ones.

1.2 Research Objective

There are three (3) research goals that need to be addressed:

1. To examine the relationship between Halal awareness and amongst non-Muslim purchase intention in buying halal groceries.
2. To identify the relationship between Halal certification and amongst non-Muslim purchase intention in buying halal groceries.
3. To identify the relationship between Attitudes and amongst non-Muslim purchase intention in buying halal groceries.

2 Literature Review

2.1 Halal Awareness

Awareness is the ability of activities and objects to hear, and observe them. This is an idea to suggest an event or subject through awareness and interpretation. In determining the intention to vote, perception is hypothesized as an important function. Awareness subjectively speaking, is a relative term where a person may be partly, subconsciously or accurately aware of a problem or problems related to the halal aspect of what Allah permits. In their research, (Rezai, Mohamed, Shamsudin, & Chiew, 2010)⁴⁸ they found that the understanding of halal values and halal product, goods are measured by a positive outlook with the TPB consonant the hypothesis is that the activity would be carried out by customers who have a favourable attitude (which is action to purchase or buy halal products in the context of the current study). According by (Azam, 2016)⁴⁹

⁴⁷ Aziz, Y., & Chok, N. (2013). The Role of Halal Awareness, Halal Certification, and Marketing Components in Determining Halal Purchase Intention Among Non-Muslims in Malaysia: A Structural Equation Modeling Approach.

⁴⁸ Rezai, G., Mohamed, Z., Shamsudin, M. N., & Chiew, E. (2010). Non-Muslims' awareness of Halal principles and related food products in Malaysia.

⁴⁹ Azam, A. (2016). An empirical study on non-Muslim's packaged halal food manufacturers: Saudi Arabian consumers' purchase intention.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

there is a positive relationship between halal awareness with purchase intention in their research. Therefore, results have shown that the attitude of people towards the purpose of buying is dictated by their level of misunderstanding the concept of halal products.

2.2 Halal Certification

For manufacturers of good products, halal certification may also be a method of product distinction. The instruments of quality management such as labels, have been able to transform quality aspects into actively sought food attributes, thus helping the consumers buying process. (Mohayidin & Kamarulzaman, 2014)⁵⁰. The majority of customers have stated accepting that halal certification was an important factor in their procurement processes. Results have shown that most customers accepted that halal certification was an important factor in their procurement processes. An optimistic view in terms of current research is a useful understanding of halal certification.

Attitudes

Attitudes is the measurement of the output of a given action concerning the object of attitudes such as the purchasing of the item (Rachbini, 2018)⁵¹. Furthermore, according by (Alam & Sayuti, 2011)⁵² it was found that there is a significant and optimistic correlation between attitudes and intention to buy halal goods. According to (Mukhtar & Butt, 2012)⁵³ it was found that there is a clear link between the desire to buy halal food and the attitude of the consumer to buy such items. An optimistic view in terms of current research is a useful understanding of attitude.

Purchase Intention

Purchase intention is the probability that a consumer may choose a certain group of products in the future in a specific purchasing situation (Crosno, Freling, & Skinner, 2009)⁵⁴. Furthermore, (Madahi & Sukati, 2012)⁵⁵ in recent years customers have access to and exposure to all kinds of advertisements, reports and articles about product purchasing intentions have become more complicated and significant. According by, (Bashir, 2019)⁵⁶ found that consumers purchase intention has a significant effect on their buying behaviour towards purchasing halal food products. This is because consumers who have a high purchase intention would increase the consumers' buying behaviour towards purchasing halal food products. Lastly, it is evident, from previous studies that there is a relationship between the consumer's purchase intention and their buying behaviour (Omar, Mat, Imhemed, & Ali, 2012)⁵⁷.

⁵⁰ Mohayidin, M. G., & Kamarulzaman, N. H. (2014). Consumers' Preferences Toward Attributes of Manufactured Halal Food Products.

⁵⁶ Bashir, A. M. (2019a). Applying the Institutional Theory at the Level of Halal Consumers: The Case of Cape Town in South Africa.

⁵⁷ Omar, K. M., Mat, N. K. N., Imhemed, G. A., & Ali, F. M. A. (2012). The direct effects of halal product actual purchase antecedents among the international Muslim consumers. *American journal of economics*, 2(4), 87-92.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Hypothesis Statement

There is a hypothesis that consists of Halal Awareness, Halal Certification and Attitudes as the independent variable and Purchase Intention as the dependent variable.

Hypothesis 1: Halal Awareness

H₁: There is no significant of Halal Awareness on purchase intention.

H₀: There is significant of Halal Awareness on purchase intention.

Hypothesis 2 : Halal Certification

H₂: There is no significant of Halal Certification on purchase intention.

H₀: There is significant of Halal Certification on purchase intention.

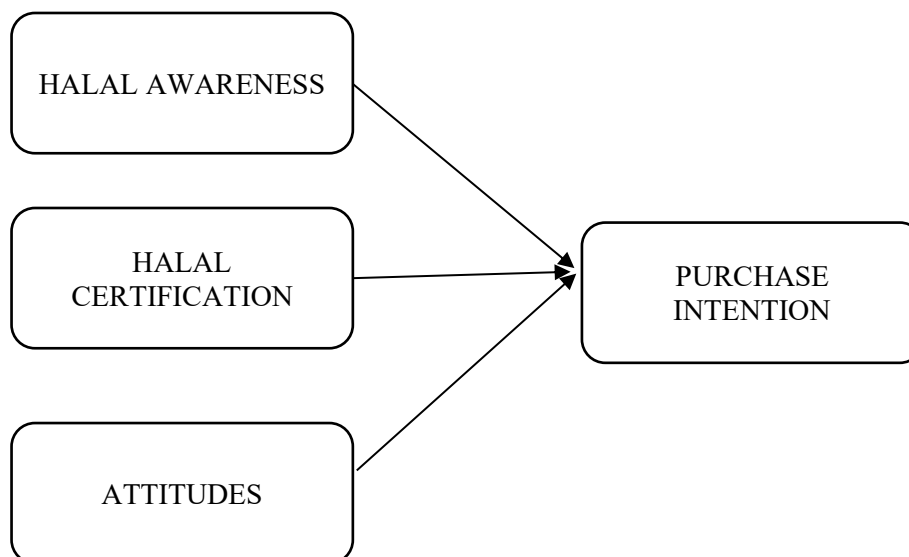

Hypothesis 3: Attitudes

H₃: There is no significant of attitude on purchase intention.

H₀: There is significant of Attitudes on purchase intention.

Conceptual Framework

The research model consists of Halal Awareness, Halal Certification, and Attitudes as the independent variables, and Purchase Intention as the dependent variable as per illustrated in this figure.

3 Methodology

The research design involved in this analysis is reliability test, descriptive research and Pearson's Correlation Coefficient for aimed purchase intention of non-Muslim by halal awareness, halal certification and attitudes accurately and systematically or phenomenon. The researcher used a systematic questionnaire for a test method for quantitative research. Quantitative techniques are a good match for deductive techniques, where the inputs, the purpose statement, and the course

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

of the narrowly defined research questions are justified by a theory or hypothesis. The sample size is the sub-population to be analysed to allow a reference population to be approximated, a larger population to which the observations of a study are to be applied. According to researcher are expected to use the Krejcie & Morgan source table for research as below and can look only for 385 people as non-Muslim respondents.

Beside that, the researcher used online surveys which can be dispersed thru attachment as mail messages or posted at the net because the extensive web or dispensed thru excessive-visitors publicly reachable devices and as number one records as nicely. Researcher additionally use Google Form to acquire records in this survey. The tool has been given to the 385 respondents on this research to interpret the quantitative records and the instrument which is in section A demographic profile where in is the query the usage of a nominal scale and interval scale for section B and section C. Techniques for information analysis researcher had used Statistical Package Social Science (SPSS) all the records collected had been analyzed for reliability test, descriptive analysis and Pearson Correlation Coefficient.

4 Findings

4.1.1 Demographic Of Profile

Researcher presented the respondents' demographic profile as obtained from Section A of the questionnaire in Table 1 below. Section A consists of 6 items of gender, age, occupation, marital status, monthly income and race.

Table 1: Descriptive Analysis for Demographic Profile of Respondents

Demographic	Item	Frequency (n=384)	Percentage (%)
Gender	Female	237	61.6
	Male	148	38.4
Age	Below 20 years old	143	37.1
	21 – 30 years old	95	24.7
	31 – 40 years old	120	31.2
	41 – 50 years old	25	6.5
	Above 51 years old	2	5
Occupation	Student	183	47.5
	Employed	182	47.3
	Self – Employed	20	5.2
Marital Status	Single	219	56.9
	Married	160	41.6
	Other	6	1.6
Monthly Income	RM 1000 below	231	60.0
	RM 2001 -RM 3000	141	36.6
	RM 3001 – RM 4000	12	3.1
	RM 4001 above	1	.3

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Races			
	Indian	167	43.4
	Chinese	181	47.0
	Others	37	9.6

Table 1 shows the demographic profile respondents in this research. In analyzing, the most of the participants are female which is 237 (61.6 %) respondents and 148 (38 %) out of 385 respondents is male. It may be assumed that the non-Muslim female population rather than the non-Muslim male population and non-Muslim female are more out buying daily necessities. Beside that, for age the largest respondents is 20 years below which is 143 respondents equivalent to (37.1 %) are answer to this survey. It is because respondents between this age are more serious about the definition of halal before making any purchase of products, and information can be added and really positive for this age. Furthermore, for occupation students are the largest of the respondents answering this questionnaire with 183 respondents within the percentage of (47.5 %) because in the meantime, students are a demographic that is quick to cooperate in reacting to the survey, they can even inquire about the research carried out and what advantages are gained. Then, in table 1 the majority of respondents who react to the questionnaire are single with 219 respondents out of 385 respondents equal to (56.9 %) because almost all of the respondents are 20 years old below it consists most of them still studying. After that, followed by income most respondents answer this questionnaire is 231 respondents out of 384 equal to (60.0 %) income are RM 1,000 below and it can be conclude some of them have a low wage and most of them have no income of their own. Lastly, for races as shown the majority of respondents were Chinese which is 181 respondent out of 385 equal to 47.0 % and it can be concluded the population Chinese in Malaysia is more than Indian or others.

4.1.2 Descriptive Analysis

Table 2: Level of Mean

Variable	Mean	Interpretation
Halal Awareness	4.15(0.42)	Agree
Halal Certification	4.13(0.45)	Agree
Attitudes	4.17(0.43)	Agree
Purchase Intention	4.17(0.45)	Agree

Based totally on table 2, it could be concluded that variables have the highest cost of suggest at 4.17. Furthermore, the second highest imply is independent variable for attitudes at 4.17. Next, the third highest fee of imply is likewise on the independent variable it is halal certification at the cost of 4.13. Next, the lowest cost of simply halal awareness at 4.15. In a nutshell, the range of mean for each independent variable and established variable lies within 3.51-4.50 which indicates the high degree of agreement based totally on the responses from goal respondents in this examination.

4.1.3 Reliability Test

Table 3 : Reliability Analysis

Variables	Cronbach's Alpha	Item	N (sample size)
-----------	------------------	------	-----------------

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Halal Awareness	0.899	5	385
Halal Certification	0.924	5	385
Attitudes	0.897	5	385
Purchase Intention	0.944	5	385

Based totally at the table of 3 reliability analysis, the Cronbach's Alpha coefficient for 3 independent variables for this research is miles halal awareness is 0.899, even as halal certification is 0.924, and attitudes which is at 0.897. Except, the dependent variable is purchase purpose shown the coefficient at 0.912. As a result, it is demonstrated that each one the constructs are exceptional within the energy of association on the guideline of Thumb about Cronbach's Alpha coefficient size. The consistency and balance of all objects in this exam are excellent and top. Consequently, all the constructs of this examine are robust and stable.

4.1.4 Pearson Correlation Coefficient

Table 4 : Pearson Correlation Coefficient

Variables	Purchase Intention	
Halal Awareness	Pearson Correlation	.645*
	Sig. (2-tailed)	.000
	N	.385
Halal Certification	Pearson Correlation	.734*
	Sig. (2-tailed)	.000
	N	.385
Attitudes	Pearson Correlation	.707*
	Sig. (2-tailed)	.000
	N	.385

*.correlation is significant at the 0.01 level (2-tailed)

Based on table 4 the consequences of the Pearson Correlation evaluation among variables on the acquisition aim amongst non-Muslim. The Pearson correlation for halal awareness is 0.645 it is miles proven that the relationship between halal awareness and purchase intention is at a moderate positive stage. Next, for halal certification the value of the Pearson correlation is 0.734. It considers the relationship between halal certification and purchase intention which is a moderate positive level. Furthermore, the variable for attitudes of the Pearson correlation is 0.707. It is miles shown that the relationship between attitudes and purchase goal is at a moderate stage. Consequently, it could be decided that halal awareness, halal certification and attitudes have the relationship with the purchase intention amongst non-Muslim.

4.1.5 Hypothesis Testing

Table 5 : Hypothesis Testing

Hypotheses	Statistical Analysis	Result
H1 There is a positive perfect significant relationship between halal awareness and purchase intention. ($p < 0.05$, $r=0.645$).	0.645	Accepted

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

H2	There is a positive perfect significant relationship between halal certification and purchase intention. ($p < 0.05$, $r=0.734$).	0.734	Accepted
H3	There is a positive perfect significant relationship between attitudes and purchase intention. ($p < 0.05$, $r=0.707$).	0.707	Accepted

Based on table 5, it can be concluded that all the three independent variables have the relationship with purchase intention amongst non-Muslim. Furthermore, these three independents are at a moderate stage. In a nutshell, after Pearson Correlation testing was conducted, these three hypothesis were accepted.

5 Discussion

5.1.1 Halal Awareness

According to the result in Chapter 4, there is a moderate correlation relationship between halal awareness and purchase intention. In the result, the p value is 0.000 which is lower than 0.01 (α root $p < 0.01$). In conclusion, halal awareness plays a role towards purchase intention.

Awareness describes the first stage in the purchase process in which buyers who are primarily not well versed in the product or service are familiar with it (Bashir, 2019)⁵⁸. In addition according to (Mutmainah, 2018)⁵⁹, if the customer is knowledgeable of halal awareness, then the desire to buy becomes strong and compatible with the halal product only and not only is halal awareness seen from the point of view of customers, but even from the manufacturer's standpoint. Therefore, halal awareness will affect the consumers of non-Muslim to purchase at halal groceries and also effect manufacturer as the researcher explain in significant of the study. Based on the result achieved by the research questions has made “ Is there any relationship between Halal Awareness towards halal groceries purchase intention amongst of non-Muslim ?” has also been answered in this research. The first hypothesis of the research is “There is a positive perfect significant relationship between halal awareness and purchase intention”. Furthermore, the result indicated that halal awareness demonstrated by non-Muslim consumers had positives effects on intention to purchase halal product meanwhile according to (Aziz & Chok, 2013)⁶⁰ halal awareness seems to have a significant effect on the explanation of the intention to buy halal goods.

5.1.2 Halal Certification

According to the result in Chapter 4, there is a moderate correlation relationship between halal certification and purchase intention. In the result, the p value is 0.000 which is lower than 0.01 (α root $p < 0.01$). In conclusion, halal certification plays the role towards purchase intention.

⁶⁰ Aziz, Y., & Chok, N. (2013). The Role of Halal Awareness, Halal Certification, and Marketing Components in Determining Halal Purchase Intention Among Non-Muslims in Malaysia: A Structural Equation Modeling Approach.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

In the Muslim consuming determination on whether a product is Halal, halal certification is an acute consideration. As a result, the Halal guidance and accreditation programmes were designed to make it easy for Muslim customers to purchase goods that adhere to Islamic jurisprudence (Awan, Nabeel, & Haider, 2015)⁶¹. After that, the certification of goods on the product as halal and halal symbol not only means that the Muslim hat they eat or drink is in compliance with the Islamic Law, but also gives the producer faith to follow the halal quality (Arif & Ahmad, 2011)⁶². Futhermore, for the second research question, “ Is there any relationship between Halal Certification towards halal groceries purchase intention amongst of non-Muslim ?.” also has been accepted. Certification can be characterised as certification provided by a related authoritative body to a business entity. Therefore, halal certification will affect the consumers of non-Muslim to purchase at halal groceries. The perception of halal food in the context of halal certification by non-Muslim is determined by a positive personal attitude, which in turn may influence their intention to purchase halal food (Aziz & Chok, 2013)⁶³.

5.1.3 Attitudes

According to the result in Chapter 4, there is a moderate correlation relationship between attitudes and purchase intention. In the result, the p value is 0.000 which is lower than 0.01 (alpha root $p < 0.01$). In conclusion, attitudes play a role towards purchase intention. According to (Rezai et al., 2010)⁶⁴ consumer attitudes towards halal food have been shown to be an effective indicator of intention. Therefore, this is proof that attitude will affect the consumers of non-Muslim to purchase at halal groceries. Furthermore, the third research question “Is there any relationship between attitude towards halal groceries purchase intention amongst of non-Muslim during ?.” also has been successful. Beside that, previous studies it has been shown that attitude has an important and positive effect on buying intentions, which is generated from the positive attitude of consumers towards halal products, in relation to the purchasing intention of the halal product (Mukhtar & Butt, 2012)⁶⁵, (Alam & Sayuti, 2011)⁶⁶. In order to relate attitudes to the purchasing intention of halal products, previous studies have shown that attitudes have a significant and positive impact on the purchasing intention, based on the positive attitude of consumers towards halal products (Mukhtar & Butt, 2012)⁶⁷.

5.2 Limitation Of The Study

This research has certain limitations. A lack of information about the study carried out, the lack of research reference tools has been one of the issues. The shortcomings of this research also render these questions unsolvable. The researcher limited the sample size in this analysis to non-Muslims only. Therefore, only non-Muslims will be able to respond to this research and it will also be an issue to locate respondents. Next, all online interviews were performed, which could restrict the ability of researcher to obtain more views from respondents, particularly though respondents use Google questionnaires, arguing that face-to-face interviews may improve efficiency. Finally, time limitations have also been one of the challenges, since researchers have used qualitative approaches that have helped researchers obtain knowledge, but because of

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

implementation, it can still not be generalized.

5.3 Recommendation

From the study, the researcher discovered from the sample that halal certification has a stronger relationship to purchase intentions. Furthermore, the demand for sales by non-Muslims will not only be impacted by halal certification. Halal awareness and Attitudes are also important. This research just needs to know which variable is suitable to non-Muslim compilation. It was discovered that halal certification is an independent variable that will influence non-Muslims to make a purchase while performing the Pearson Correlation Coefficient because individuals purchase products to complete it as a store of supplies. Recommendation for this research is marketers should bring good services to the homes of customers, such as products and it will be increase level of purchase amongst non-Muslim. After that, the plan to enable the site for social media by posting about the business so that the public can see and it was one of marketing strategies must be used in this era. However, proposed that more variables be used by prospective researchers. Finally, only when conducting surveys can prospective studies even use qualitative approaches instead of questionnaires.

5.4 Conclusion

The goal of this study is to get a clear picture of the study on the relationship between halal awareness, halal certification and attitudes towards non-Muslim purchase intention. Furthermore, this research focuses on research design, data collection methods, study population, sample size, sampling techniques, research instrument development, measurement of the variables and procedure for data analysis. Beside that, in this research was using survey questionnaires to meet the defined targets and answering the research question. Around the same time, this study has been evaluated and has been able to provide sensible responses to research questions. After that, data collection methods used in this research are reliability test, descriptive analysis and Pearson Correlation Coefficient. In addition, independent variable and dependent variable also have the significant. As the study shows, it can be concluded that despite the limitations discussed above, the design of the study produces reasonable answers and allows us to answer the research questions posed. In brief, future researchers need to continue pursuing this study with a new level of understanding that can affect the purchasing of non-Muslims and increase the sample size further.

6 Acknowledgement

Alhamdulillah, first of all I would like to express my thankfulness to Allah S.W.T the almighty for this great inspirational guidance, which had helped us in completing our research project successfully.

Next, I would like to express our deepest gratitude to my main supervisor, Madam Norfazlirda Binti Hairani for her constructive guidance, brilliant idea and patience in fulfilling my aspiration and helping me in completing this research. I would just like you to know that you are an incredible supervisor, from whom I have learned so much. Furthermore, you give encouragement and support in various ways and I want to thank you so much for challenging me every step of the way.

Lastly, I would like to thank all those who had contributed in or research, especially special thanks to my parents and friends for their support and kindness throughout in completing this research. After that, I also want to thank all respondents who are willing to cooperate and help in answering the questionnaires for this research.

THE FACTOR THAT INFLUENCE TO JOB SATISFACTION AMONG MILLENNIAL EMPLOYEES IN KOTA BHARU, KELANTAN

Nur Aina Nabilah Hanapi and Nurul Izyan Mat Daud

Faculty of Entrepreneurship and Business,
University Malaysia Kelantan,
Malaysia

Email: nabilah.a17a0393@siswa.umk.edu.my; izyan.md@umk.edu.my

Abstract:

The purpose of this study is to examine the factor that influence to job satisfaction among millennial employees in Kota Bharu, Kelantan. Specifically, this research aims to assess the impact of independent variables such as salary, promotion and co-worker and job satisfaction as dependent variable. The survey was conducted among 375 millennial employees who work in various multinational companies in Kota Bharu, Kelantan particularly Kota Bharu districts. The data analysis was done via SPSS (or commonly known as Statistical Package for the Social Sciences). Besides, there are total 3 hypotheses being constructed in this research project to be tested. The correlation and multiple regression analysis specify that the three independent variables (salary, promotion and co-worker) have significant and positive relationship with the dependent variable (job satisfaction). As a result, it provides the researcher a correct guideline and directs to achieve the researcher's goal and objective. Finally, the research project also provides with clear view of limitations therefore brought forward some useful recommendations and lastly conclusion indicating that the all three hypotheses constructed is acceptable.

Keywords: Job Satisfaction, Salary, Millennial Employees, Promotion, Co-worker

1 Introduction

The topic of this research is the factors that influence to job satisfaction among millennial employees in Kota Bharu, Kelantan. Job satisfaction is widely interpreted as an emotional reaction by an individual worker to a value decision, arising from the apparent fulfilment of one's valuable job values. Therefore, if the work values of workers are fulfilled, a good feeling of happiness is encountered, but the job values are ignored, the negative emotion of discontent is experienced (Angeline, T. 2011). In order to increase their work efficiency and productivity, people or workers who gain job fulfilment would be able to inspire themselves, thus creating a beneficial impact on their company. This study is focuses on the influence of salary, promotion and co-worker toward job satisfaction among millennials which is employees who were born 1980 until 1994 in Kelantan (KASASA, 2020).

2 Literature Review

2.1 Salary

Salaries are one of the external factors of job satisfaction that plays an important role in employee satisfaction (Ayodele & Olorunsola, 2012). Salary is a central factor in the study of job satisfaction, based on Worrell (2004), and there is a near association between salary and job satisfaction at work. Low salary levels lead to low levels of employee satisfaction in the workplace. In reality, salaries are not an indicator of work satisfaction, but among workers, they may be an appropriate motivator. Ahmed et al. (2010) also stressed that pay contributes to a high degree of workplace satisfaction and affects employee attitudes towards jobs. The meaning of this

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

aspect came from the common assumption that a high wage contributes to high happiness of workers. Thus, since the early 20th century, scholars have sought to resolve the relationship between salary and work satisfaction. It is also clear that the aspirations of workers for competitive compensation in input exchange can be a crucial factor in deciding the attitude towards the work and hence the degree of satisfaction.

H1: There is a significant relationship between salary and job satisfaction among millennial employees in Kota Bharu, Kelantan.

2.2 Promotion

Job satisfaction is generated by multiple external motivators, such as promotion. External assistance that pays respect to workers with distinct traits and feelings is the key point of promotion (Jessen, 2010). In reality, promotion is one of the significant factors in work satisfaction that contributes significantly to the amount of job satisfaction. Indeed, this external factor impacts the efficiency of workers and contributes to high standards of results for universities. In addition, promotion plays a vital role in the high degree of employee duties and tasks (Ayan & Kocacik, 2010). Promotion, according to Noraani (2013), is one of the key reasons for hitting employment satisfaction and the amount of job satisfaction determined by this external factor 's presence among employees. Likewise, Luddy (2005) referred to promotion as a driving force for increasing organizational efficiency, employee satisfaction and expertise. In reality, promotions and work satisfaction have a positive relevance (Alam, 2009).

H2: There is a significant relationship between promotion and job satisfaction among millennial employees in Kota Bharu, Kelantan.

2.3 Co-worker

One of the external variables affecting the amount of employee satisfaction and emphasising social habits that occur in the workplace was believed by co-workers (Wu, 2004). In practise, co-workers have a strong and supportive link with job satisfaction and feelings of change towards jobs and the workers. This item illustrated how employees achieve their accomplishment by supporting and paying attention to the actions and posture of their co-workers. The action of friendly co-workers plays a formative role in the number of good emotions (Alam, 2009). A good association between the existence of the job and the standard of service was found by Snipes et al. (2005). ScottLadd et al. (2006) have discovered that the number of activities had an effect on decision-making engagement. In addition, the findings of the study performed by Tims et al. (2015) showed that the job commitment of workers is favorably linked to in-role performance.

H3: There is a significant relationship between co-worker and job satisfaction among millennial employees in Kota Bharu, Kelantan.

2.4 Job Satisfaction

Previous researchers have contributed the study of job satisfaction from many perspectives. Job satisfaction is defined as an attitude towards work-related conditions (Wiener, 1982). On the other

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

hand, Feinstein (2000) was defined that job satisfaction is more of a response to a specific job or various aspects of job. Other researchers have found that employees job satisfaction would significantly impact job performance, absenteeism and turnover and employee relations (Al Ajmi, 2002). The most empirical studies suggest that the biggest contributor to one's job satisfaction is the nature of the job itself. The job itself must be meaningful to the individual

2.5 Conceptual Framework

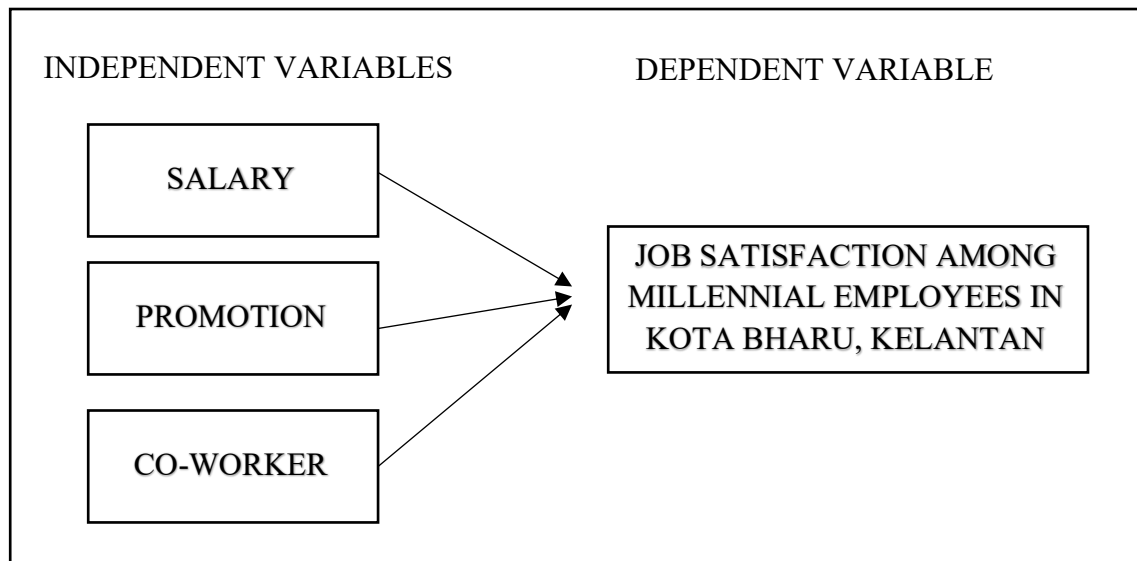

Figure 2.5 shows the relationship between independent variables and dependent variable. Based on the figure 2.5.1, shows the relationship between salary, promotion, co-worker and the job satisfaction among millennial employees in Kota Bharu, Kelantan. The main objective is to study the effect that influence to job satisfaction among millennial employees in Kota Bharu, Kelantan. The independent variables are salary, promotion and co-worker. The dependent variable is the effect that influence to job satisfaction among millennial employees in Kota Bahru, Kelantan.

3 Research Methodology

In this study, the data collection that had been used by researcher in this study is quantitative method. Quantitative method research can also generate statistic through the use of large-scale survey research which is we used the questionnaire method. Hence, this research used the cross-sectional study that questionnaire was distributed to 375 employees by online. Furthermore, the researcher was using questionnaire to gain sources of data by online survey and was distributed through Google form. The researcher spread the questionnaires through Whatsapp, Facebook and Twitter apps and millennial employees who works in Kota Bharu, Malaysia. The information was gathered online and takes for three months because of the current issues of the pandemic Covid-19 that happened all over the world. in various multinational companies in Kota Bharu, Kelantan.

Other than that, the sampling method used in this study was non-probability sampling which was snowball sampling. Snowball sampling was a recruiting strategy in which study respondents were asked to help the researcher in selecting a possible respondent that fits the requirements for the

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

aim of the study. The researcher chose to use this sampling technique because it supported the process of spreading an online survey among millennial employees in Kota Bharu, Kelantan. The population of this sample was 158,900 people employed in Kota Bharu. Thus, according to Krejcie and Morgan's table (Krejcie & Morgan, 1970), the sample size of this research was 375 millennial employees.

In addition, four types of data analysis used in these studies were frequency analysis, reliability analysis, descriptive analysis and Pearson correlation analysis. The data collected by the researcher was analyzed using the software version 22.0 of the Statistical Package for Social Sciences (SPSS).

4 Research Findings

4.1 Frequency Analysis

Table 1 shows the summary of 375 respondents demographic background that has been collected by questionnaire in Google Form. There are five questions were asked such as gender, age, race, academic background and how long they have been working.

Table 1 Respondents Demographic Profile

Variable	Frequency	Percentage (%)
Gender		
Male	115	30.5
Female	260	69.5
Total	375	100%
Age		
26 – 30 years old	217	57.6
31 – 35 years old	111	29.8
36 – 40 years old	30	8.0
41 – 45 years old	17	4.6
Total	375	100%
Race		
Malay	334	89.0
Chinese	33	8.8
Indian	8	2.1
Total	375	100%
Academic background		
SPM	49	13.1
DIPLOMA	155	41.0
BACHELOR	145	38.9
MASTERS	23	6.2
PHD	3	0.8
Total	375	100%
How long have you been working?		
Less than a year	54	14.4
A year and half	72	19.3
More than two years	249	66.3
Total	375	100%

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

4.2 Reliability Analysis

Table 2: Reliability test

CONSTRUCT	Number of items	Coefficient	Strength
Job satisfaction among millennial employees in Kota Bharu, Kelantan. (DV)	5	0.920	Excellent
Salary (IV 1)	5	0.935	Excellent
Promotion (IV2)	5	0.965	Excellent
Co-worker (IV3)	5	0.954	Excellent
Total	25	0.931	Excellent

Table 2 above shows the reliability test for dependent variable and independent variables. The Cronbach alpha coefficient value for dependent variable which was job satisfaction among millennial employees in Kota Bharu, Kelantan was 0.920 which indicated excellent and reliable. On the other hand, for the independent variables, the Cronbach alpha coefficient value for salary, promotion and co-worker factors were 0.935, 0.965 and 0.954 respectively, which show the reliability are excellent and reliable. Generally, the result showed that the variable of Cronbach's Alpha Coefficient was occurred to be reliable and acceptable by 0.931 which is excellent.

4.3 Pearson Correlation

Table 3: Summary Result of Pearson's Correlation

Hypothesis	Result	Results
H1: There is a significant relationship between salary and job satisfaction among millennial employees in Kota Bharu, Kelantan.	$r = 0.814^{**}$ $p = 0.000$ High positive (negative) correlation	H1: Accepted
H2: There is a significant relationship between promotion and job satisfaction among millennial employees in Kota Bharu, Kelantan.	$r = 0.778^{**}$ $p = 0.000$ High positive (negative) correlation	H2: Accepted
H3: There is a significant relationship between co-worker and job satisfaction among millennial employees in Kota Bharu, Kelantan.	$r = 0.756^{**}$ $p = 0.000$ High positive (negative) correlation	H3: Accepted

Table 3 shows the Pearson's Correlation coefficients. The correlation coefficients for salary and job satisfaction among millennial employees was 0.814 and it shows that the strength of

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

correlation between salary and job satisfaction among millennial employees is high positive correlation according to rule of thumb for interpreting the size of a Correlation of Coefficient (Hinkl. D. E., Wiersma, W., & Jurs, S. G., 2003). Besides that, the P value was 0.000 indicates the significant value for the analysis where it is lower than alpha root which is 0.01. therefore, there is a significant high positive correlation relationship between salary and job satisfaction among millennial employees in Kota Bharu, Kelantan.

Other than that, the correlation coefficients for promotion and job satisfaction among millennial employees was 0.788 and it shows that the strength of correlation between promotion and job satisfaction among millennial employees is high positive correlation. Besides that, the P value was 0.000 indicates the significant value for the analysis where it is lower than alpha root which is 0.01. therefore, there is a significant high positive correlation relationship between promotion and job satisfaction among millennial employees in Kota Bharu, Kelantan.

Lastly, the correlation coefficients for co-worker and job satisfaction among millennial employees was 0.756 and it shows that the strength of correlation between co-worker and job satisfaction among millennial employees is high positive correlation. Besides that, the P value was 0.000 indicates the significant value for the analysis where it is lower than alpha root which is 0.01. therefore, there is a significant high positive correlation relationship between co-worker and job satisfaction among millennial employees in Kota Bharu, Kelantan.

4.4 Multiple Linear Regression Analysis

Table 4: Table of coefficient analysis

Variable	Multiple linear regression		
	b	t-stat(95&CI)	p-value
Promotion	0.19	4.30(0.10,2.70)	<0.001
Co-worker	0.28	7.20(0.21,0.36)	<0.001
Salary	0.39	6.28(0.23,0.44)	<0.001

*normality assumption was fulfilled/met

According to the table 4, the factors such as promotion, co-worker and salary were significant since the p-values were less than 0.05. the equation of regression can be written as follows, where

$$\gamma = \alpha + b_1x_1 + b_2x_2 + b_3x_3$$

γ = job satisfaction among millennial employees

x_1 = Salary

x_2 = Promotion

x_3 = Co-worker

Hence, the equation becomes

$$\gamma = 0.938 + 0.39 x_1 + 0.28 x_2 + 0.19 x_3$$

Unstandardized coefficients beta represents the strength of the effects of every single of the independent variables to dependent variable. The higher the value of the beta, the stronger the effect of independent variable towards dependent variable. According to table 4, the most influence independent variables in measuring the factors that influence to job satisfaction among millennial employees was the salary variable (=0.39). the co-worker ranked at second rank

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

(=0.28) and followed by the promotion ranked at third rank (=0.19).

There is a significant effect of salary, co-worker and promotion towards job satisfaction among millennial employees in Kota Bharu, Kelantan ($p < 0.05$). In every unit increase of promotion, job satisfaction will increase by 0.19. In every unit increase of co-worker, job satisfaction will increase by 0.28. In every unit increase of salary, job satisfaction will increase by 0.39.

5 Discussion

5.1 Salary

The correlation between salary and job satisfaction among millennial employees in Kota Bharu, Kelantan. From the table, it shows that there is a significant relationship between salary and job satisfaction among millennial employees in Kota Bharu, Kelantan because the significant value is 0.000 which is less than 0.01. The positive correlation coefficient for salary is 0.814** means there is a good relationship between salary and job satisfaction. It shows that salary is an influence factor to job satisfaction among millennial employees in Kota Bharu, Kelantan. Hence, the H1 of objective one which is to determine the relationship between the salary and job satisfaction among the employees in Kota Bharu, Kelantan is accepted. Based on Worrell (2004), salary is a main factor in the study of employee satisfaction and there is a strong relationship between salary and job satisfaction at the workplace.

5.2 Promotion

The correlation between promotion and job satisfaction among millennial employees in Kota Bharu, Kelantan. From the table, it shows that there is a significant relationship between promotion and job satisfaction among millennial employees in Kota Bharu, Kelantan because the significant value is 0.000 which is less than 0.01. The positive correlation coefficient for promotion is 0.778** means there is a moderate relationship between salary and job satisfaction. It shows that promotion is an influence factor to job satisfaction among millennial employees in Kota Bharu, Kelantan. Hence, the H2 of objective two which is to determine the relationship between the promotion and job satisfaction among the employees in Kota Bharu, Kelantan is accepted. Moreover, Maharjan (2012) found that there is a good positive relationship between promotion and job satisfaction.

5.3 Co-worker

The correlation between co-worker and job satisfaction among millennial employees in Kota Bharu, Kelantan. From the table, it shows that there is a significant relationship between co-worker and job satisfaction among millennial employees in Kota Bharu, Kelantan because the significant value is 0.000 which is less than 0.01. The positive correlation coefficient for co-worker is 0.756** means there is good relationship between co-worker and job satisfaction. It shows that co-worker is an influence factor to job satisfaction among millennial employees in Kota Bharu, Kelantan. Hence, the H3 of objective three which is to determine the relationship between the co-worker and job satisfaction among the employees in Kota Bharu, Kelantan is accepted. In addition, the co-worker has a close and positive relationship with job satisfaction and changes the feel of job satisfaction towards workplace, (Alam, 2009).

5.4 Hypothesis Testing

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Table 5.1 Hypothesis testing

No	Hypothesis	Results
H1	There is a significant relationship between salary and job satisfaction among millennial employees in Kota Bharu, Kelantan.	Accepted
H2	There is a significant relationship between co-worker and job satisfaction among millennial employees in Kota Bharu, Kelantan.	Accepted
H3	There is a significant relationship between promotion and job satisfaction among millennial employees in Kota Bharu, Kelantan.	Accepted

6 Recommendation

The research included just 375 respondents, and all respondents were from Kota Bharu, Kelantan. Researchers also propose that prospective researchers will expand sample size and reach by involving more respondents from other regions or nations. The more respondents present, the more credible, valid and meaningful the outcome will be due to many other respondents who have varying views and beliefs on factors that affect their job performance. This will allow the researcher to produce more precise, credible test data.

In addition, the researcher could also carry out a clearer plan for data collection by surveys in order to increase the accuracy of the study. In this study, the researchers ask the respondent, who are in the millennial workers group, to fill out the questionnaires and, after the respondent has completed the questionnaires, to place them in a box prepared by the researchers.

Finally, prospective researchers ought to be aware of the vocabulary used in the production of questionnaires. In this study, some of the respondents' standard of schooling is up to or below high school. As a result, their comprehension of English words is minimal. Future researchers would also have included three languages in the questionnaire (eg: malay, English and Chinese).

7 Conclusion

Through this study, a deeper understanding of the factors that affect job satisfaction among millennial workers is well known. Research demonstrates that the three independent variables (salary, promotion and co-worker) have a significant role to play in shaping workplace satisfaction. Researchers hope that this research review will provide valuable lessons for future studies. This research project will serve as a roadmap which will allow the employer to determine how to better increase work satisfaction among millennial workers and improve their job performance effectively. Overall, the Pearson Correlation Analysis had shown that all variables including salary, promotion and co-worker had a significant positive correlation to the job satisfaction among millennial employees in Kota Bharu, Kelantan. Lastly, all the hypothesis had been tested, where all the hypothesis including salary, promotion and co-worker had a significant relationship to the job satisfaction among millennial employees in Kota Bharu, Kelantan

8 Acknowledgement

It's been a long road in finally reaching this goal. There have been so many people that have helped me along the way. I would like to acknowledge several individuals whose help was

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

invaluable in helping me get to where I am. First, I owe my deepest gratitude to my supervisor, Dr. Nurul Izyan Binti Mat Daud for her unceasing guidance and believing in my abilities to reach my goals. She gave me the encouragement and expertise every step of the way to mentor my success. Beyond this project, I would like to acknowledge several people that have helped me reach this point in our life. First and foremost, I would like to thank my family members, lecturers, and classmates who have always support and encourage me in order to accomplish my research project. Furthermore, I would also like to thank to all participating respondents for their willingness in spending their precious time and efforts to contribute questionnaire. I am sincerely appreciating the tolerance and patience's of participating respondents when we conduct this research. In the other hand, I wish to thank University Malaysia Kelantan for providing the facilities to aid me in completing this project. I have gathered information and found numerous references and resources from the Library and Computer Lab of the university. Last but not least, I felt very grateful to have reliable and cooperative group members in the group. Without the contribution and sacrifice from all members, my research would not reach the desired expectation.

THE IMPACT OF LEADERSHIP SKILLS TOWARD WORK PERFORMANCE AMONG UPPER-LEVEL EMPLOYEES AT MANUFACTURING INDUSTRY IN KELANTAN

Nur Amalin Aisyah Binti Shamsul Bahari and Nurul Azwa Binti Mohamed Khadri

Faculty of Entrepreneurship and Business,
Universiti Malaysia Kelantan,
Malaysia

Email: amalin.a17a0401@siswa.umk.edu.my; azwa.mk@umk.edu.my

Abstract:

The research is purposely studies the impact of leadership skill toward the work performance among upper-level employees at manufacturing industry in Kelantan. The study examines the leadership skill which includes are in terms of management skill, technical skill, and time management skill. Total of 35 set questionnaire were accepted in this study by using convenient sampling. SPSS 26 was used to assist in our data analysis along the research. This cross-sectional study was analyzing in terms of reliability test, Spearman correlation, and multiple linear regressions. The results concluded that management skill, technical skill and time management skill significantly affect towards work performance. This study comes out with some limitations and recommendations to provide better viewpoint for future researchers.

Keywords: *manufacturing industry, management skill, technical skill, time management skill and work performance*

1 Introduction

In 21st century, leadership skills bring impact towards the work performance not only for the top management but also lower-level employees. A business needs a leader for the progress of the company. Where the company has leaders responsible for managing, controlling, supervising, and providing a policy. The performance of staff in achieving the target company will be affected by a leader, so the company needed a leader who could do with a good employee approach. With a forced leadership that is owned by a leader, the staff can use their ability to achieve good performance to be able to direct them. According to Peterson and Van Fleet (2004) believes that management skills could assist to better management performance helps the organization to attain its goals. Management skills is a skill regarding the technique, practice, or managing a company and business.

The purpose of this study is to examine the impact of leadership skill toward the work performance among upper-level employees at manufacturing industry in Kelantan. This focuses on the impact of leadership skills toward work performance among upper-level employees. The objective of this study is to examine the impact of leadership skill toward work performance among upper-level employees at manufacturing industry in Kelantan. Furthermore, the study identify the most significant factor that influence the leadership skill toward work performance among upper-level employees at manufacturing industry.

2 Literature Review

Management Skill

Management skills is the skills that can helps the organization achieve its goals through the better management performance that lead by manager Peterson and Van Fleet (2004). Management skill

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

is very important for an organization to grow, expand and sustain their business in the market. If the management skill of an organization is weak, thus the business of an organization will faced failure or difficulty to sustain in the market. An organization will success if their management skill is implementing with efficiency and effectiveness.

H₁ There is a significant relationship between management skills towards work performance of the upper-level employees

Technical Skill

Technical skill is the ability to perform the specific task that acquired from experience, education and training Imaga (2001). Technical skill includes the intellectual and ability that professional in a specific field. Mostly, technical skill is often related to information technology, mechanical and the other. Technical skill is important for an organization, this is because technical skill can let the operation of an organization more efficient, boost their employees' confidence and make employees more valuable candidates to employers which contribute to organization success.

H₂ There is a significant relationship between technical skills towards work performance of the upper-level employees

Time Management Skill

Time management skill is the behaviors that purpose for achieve an effective use of time when performing a goal-directed activities Rapp, Bachrach, and Rapp (2013). Time management skill is very important because it can help the organization saves the money and increases revenue in the performance organization. Besides that, good time management can enables a manager to work smarter, more productive, efficiency, self-discipline, deliver work on time so that they have less stress.

H₃ There is a significant relationship between time management skills towards work performance of the upper-level employees

Work Performance

Work performance playing an important role in an organization. Performance standardized is the driving force behind every successful organization. It refers to a part of formal job description and evaluates the basic duties of particular job by the top management. It is an individual evaluation which measured based on an employee effort. An employee's work performance in the office will influence by a number of internal and external factors. Job suitability, personal issues, working condition, lack of skills will affect their work performance. Hence, to get maximum performance from employees, company should provide them training in order to succeed.

Conceptual Framework

The purpose of this research is to examine the impact of leadership skills on work performance. The research framework as illustrated in the figure 2.1 below which consists of 2 key component, leadership skill and work performance. Leadership skill acts as independent variable while work performance acts as dependent variables.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

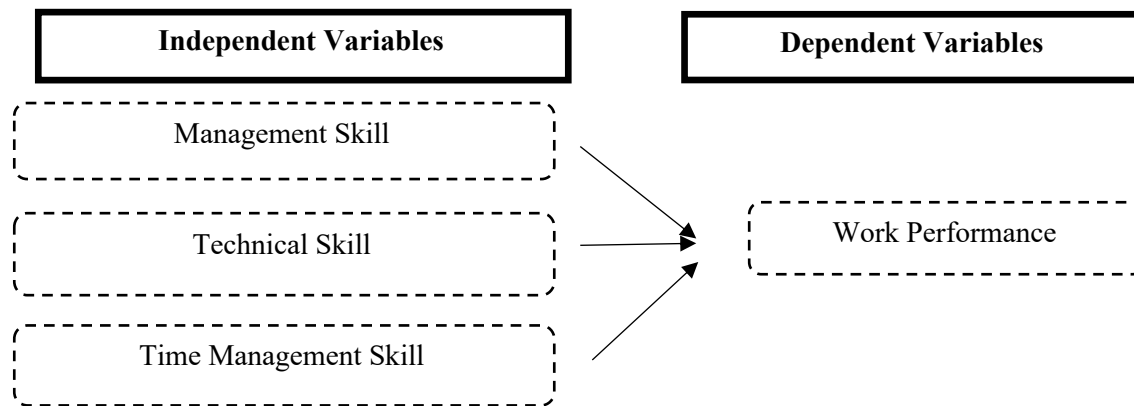

Figure 2.1 Conceptual Framework

3 Research Method

Methodology is a blueprint of activities that be carrying out systematically in order to complete the study successfully. The step of methodology of the study begin with the research design, data collection method, study population, sample size, sampling techniques, research instrument, measurement of the variables and end with the procedure of data analysis. In this research, a quantitative research method has been applied. The researchers apply a case study and survey in this research study. Meanwhile, out of 35 questionnaires are distributed, 32 questionnaires are collected from the target respondents. Respondents are the top management. Respondents selected in the research study indicated that the information received is from knowledgeable and experienced people in their industry who could provide high-quality information for the research study. The purposive technique will choose as the sampling design of the research. Purposive sampling is a sampling technique in which, when selecting population participants to participate in the study, the researcher relies on his or her own judgement. The researcher use purposive technique because she fit a particular profile. According to the 8 departments in 5 manufacturing company, the sample organization also will be selected. Manufacturing was chosen because it is in Kelantan and it is also close to the researcher's residence. So easy for the researcher to find information and manipulate them. In each manufacturing, the researcher selects top management to answer the questionnaire that will be provided.

Likert scale is applied in the research. Section A has six questions which are intended with an arrangement of nominal scale and ordinal scale. The nominal scale is applied to identify the respondents' wide-ranging info which is gender, ethics, marital status, highest academic qualification, and job category. The ordinal scale is applied to classify the respondents' age. The 5-point Likert scale in section B allows respondents to indicate their consent or disagreement with the statement of the problem. The scope ranges from "strongly disagree", "disagree", "neutral", "agree", and "strongly agree". There are several types of analytical techniques that are used to check the accuracy of the data collected throughout the research such as descriptive analysis, spearman correlation coefficient analysis, and Multiple Regression Analysis.

Data analysis is the processes that collects data and convert the data into information use for the decision-making by the researchers. The data that receive in the research will be calculate and analyze with using the Statistical Package for the Social Science (SPSS) with the version [24.0.0.0](#) software program. Besides that, the analysis of the data will be performing in two stages.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

In first stage, the main data analysis for this stage is testing the reliability of the study. The raw scores, average scores and relative scores of each respondent will be collect and calculate. These data will become the consecutive analysis in the research. Besides that, the variables, mean, standard deviation, skewness and the other statistical manipulated also will be calculate and transform. Cronbach's Alpha that use to identify the reliability and consistency also will use in the research. The finding of the research will be support by the illustration of tables and graphs.

In second stage, various statistical procedures will be use to answer the research objectives. There will use the methods like descriptive statistics and multiple regression analyses to measure the contribution of each of the forecast of work performance of lower-level employees in manufacturing company. Besides that, regression analyses also will be use in the research. Regression analyses are a set of statistical techniques which use to model the relationship between a response variable and one or more predictor variables.

4 Analysis and Findings

In this chapter, the researchers show the result that was obtained throughout the survey questionnaire. The data analysis was collected from the survey to conduct a reliability test, descriptive analysis, and normality test. The researcher determined the significance of the research hypothesis in the study. Further studies will be discussed in the next chapter.

Normality Test

In this segment, normality test (Kolmogorov-Smirnov^a and Shapiro-Wilk) will be conducted to assess whether the data set collected from 35 respondents are normally distributed. This assumption need to be fulfilled for further analysis of Multiple Regression Analysis and Spearman's correlation coefficient analysis in the next section.

Table 4.1: Summary of Shapiro-Wilk Test

Shapiro-Wilk	Statistics	Df	Sig
MeanWP	.888	35	.002
MeanMS	.771	35	.000
MeanTS	.857	35	.000
MeanTMS	.832	35	.000

The result of the data show that the data was not normally distributed. This is because the Sig. show the 0.000 value. If the Sig. value is more than 0.05 so the data is normal, but if the sig. value is below than 0.05 the data will be considered as abnormal. In this as been show in the table normality test the independent variable recorded the Sig. Value is 0.000 and dependent variable recorded the Sig. value is 0.002 so this data considered as abnormal data for all the variable. If the data is abnormal so the Spearman correlation analysis will be used.

Descriptive Analysis

A set of personal characteristics which are gender, age, ethics, highest academic qualification and job category have been examined and presented in Table 4.3. The questionnaire was distributed

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

through online by using communication application. The main objective for descriptive analysis is to understand the profile of respondents.

Table 4.2 Respondent's Demographic

Items	Frequency (n=35)	Percentage (%)
Gender		
Male	22	62.9
Female	13	37.1
Age		
21-30 years old	23	65.7
31-40 years old	8	22.9
Above 41 years old	4	11.4
Ethics		
Chinese	3	8.6
Malay	32	91.4
Marital Status		
Single	18	51.4
Married	17	48.6
Highest Academic Qualification		
SPM	3	8.6
STPM	2	5.7
Diploma	11	31.4
Degree	19	54.3
Job Category		
Finance and Accounting Department	4	11.4
Sales and Purchasing Department	3	8.6
Quality Control Department	2	5.7
Operation Department	5	14.3
Product Department	2	5.7
Logistic Department	3	8.6
Human Resources Department	9	25.7
Information Technology Department	7	20.0

Table 4.2 shows demographic profile of respondents. There were 22 (62.9%) male respondents and 13 (37.1%) female respondents involved in the study. There were 23 of respondents among 21 to 30 years old with (65.7%) while 4 respondents between above 41 years old with 11.4% only. The total of the Chinese respondent is 3 and Malay is 32 out of 35 people. The highest marital status of the respondents was married which represented 48.6% (17 respondent) and followed by single showed that 18 respondents with percentage of 51.4%. Besides, majority of respondents are holding Degree which contain 54.3% and only 2 respondents (5.7%) hold STPM. There were 4 respondents are come from the categories of finance and accounting department, 3 respondents in sales and purchasing department, 2 respondents from quality control department, 5 respondents from operation department, 2 respondents from product department, 3 respondents from logistics department, 9 respondents from human resources department and only 7 respondents from information technology department with the percentage 11.4, 8.6, 5.7, 14.3, 5.7, 8.6, 25.7 and 20.0% respectively. Most of respondents from human resources department is in the range of 21 to 30 years old.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Univariate Analysis

This section presents the result of univariate analysis that was conducted for each item in dependents variable and independent variables. The results reported in the form of frequency distribution, mean and standard deviation. All the items were measured using five points Likert scale Strongly Disagree (SD), Disagree (D), Neutral (N), Agree (A) and Strongly Agree (SA).

Table 4.3 Univariate Analysis

Item	Frequency	Mean	Std. Deviation
MeanWP	35	4.4943	.46963
MeanMS	35	4.5500	.44059
MeanTS	35	4.4143	.57184
MeanTMS	35	4.6429	.36018

Based on table 4.3 for dependent variable, mean for the work performance is 4.49 shows in range of agree with standard deviation 0.47. Mean for management skill is 4.55 shows in neutral range with 0.44 of standard deviation. Technical skill, the mean equal to 4.41 also in a neutral range with of 0.57 standard deviation. For time management skill, the mean is equal to 4.64 that's in the range of agree with 0.36 standard deviation. In summary the highest mean for all the items of demand is the time management skill equal to 4.64 with 0.36 standard deviation.

Hypotheses Testing

The researcher will use a spearman correlation analysis to test the hypothesis. This is because the data is abnormal, so a spearman correlation analysis will be used. In this research, the Spearman correlation coefficient will be used for the purpose of measuring the strength and the significant relationship between the independent variable and the dependent variable.

Table 4.4: Summary for Hypotheses Testing

Hypotheses	Spearman Correlation	Results
H1 There is a significant relationship between management skills towards work performance of the upper-level employees	r=0.605, 0.000	Supported
H2 There is a significant relationship between technical skills towards work performance of the upper-level employees	r=0.535, 0.000	Supported
H3 There is a significant relationship between time management skills towards work performance of the upper-level employees	r=0.635, 0.000	Supported

There was a positive correlation between the two variable work performance and management skill, which is $r=0.605$, $n= 35$ and $p=0.000$. There was statistically significant correlation between the average impact of leadership skill toward work performance among upper-level employees at manufacturing industry in Kelantan.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

H₁ There is a significant relationship between management skills towards work performance of the upper-level employees.

There was a positive correlation between the two variable work performance and technical skill, which is $r=0.535$, $n= 35$ and $p=0.000$. There was statistically significant correlation between the average impact of leadership skill toward work performance among upper-level employees at manufacturing industry in Kelantan.

H₂ There is a significant relationship between technical skills towards work performance of the upper-level employees.

There was a positive correlation between the two variable work performance and time management skill, which is $r=0.635$, $n= 35$ and $p=0.000$. There was statistically significant correlation between the average impact of leadership skill toward work performance among upper-level employees at manufacturing industry in Kelantan.

H₃ There is a significant relationship between time management skills towards work performance of the upper-level employees.

4 Conclusion and Recommendations

The research results, limitations and difficulties in the completion of this study and recommendations on the impact of leadership skills toward work performance among lower-level employees at manufacturing industry in Kelantan are addressed in this chapter. The research issue being studied and to clarify any new understanding or observations that have emerged as a result of the study problem. Using the research questions or hypotheses raised and the literature examined. The results show that management skill, technical skill and time management skill have a significant impact on work performance.

From the factors given in this study can help employees' leadership in work performance. Also, employees can refer to this study for knowledge to know leadership skills towards work performance of the upper-level employees. This will help employees to focus on what they need to do to attract and gain customer interest in their business. As with other factors, it should also be on the website as an attraction for users to visit the website.

The study's limitations are those design or methodology features that have affected or influenced the interpretation of the results from this study. The goal of the study is to explore the relationship between the management skills, technical skills and time management skills towards work performance of the upper-level employees. The limitation of this study is that respondents are incapable of fully understanding the research material. The participants usually misinterpret the significance of the questionnaire requested. In order to answer the questionnaire, most respondents need guidance. Researchers were also unable to recognize the truthfulness of the respondents when responding to the questionnaire by doing this technique. Based on their comprehension, the respondents answer the question in various ways. Then, the effect would be prejudice and subjectivity will not be accepted.

The research does a study of the impact of leadership skills toward work performance of upper-level employees at manufacturing industry in Kelantan. Based on the result, few recommendations are suggested to enhance work performance among employees. From this study, the researchers found that leadership skill is very important to work performance. The

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

suggestion is that upper-level employees should show their best performance to support their lower-level employees. They should improve their work performance like punctual. For the future research must include more variables to get results that will be more reliable.

5 Discussion

Management skills is the skills that can helps the organization achieve its goals through the better management performance that lead by manager Peterson and Van Fleet (2004). Management skill is very important for an organization to grow, expand and sustain their business in the market. If the management skill of an organization is weak, thus the business of an organization will faced failure or difficulty to sustain in the market. An organization will success if their management skill is implementing with efficiency and effectiveness. According to the result in Chapter 4, there is a moderate correlation relationship between management skill and work performance. Therefore, the p value is .000 which is lower than 0.01. For conclude, the management skill has been a role toward work performance. So that management skill will affect work performance.

Technical skill is the ability to perform the specific task that acquired from experience, education and training Imaga (2001). Technical skill includes the intellectual and ability that professional in a specific field. Mostly, technical skill is often related to information technology, mechanical and the other. Technical skill is important for an organization, this is because technical skill can let the operation of an organization more efficient, boost their employees' confidence and make employees more valuable candidates to employers which contribute to organization success. According to the result in Chapter 4, there is a moderate correlation relationship between technical skill and work performance. Therefore, the p value is .000 which is lower than 0.01. For conclude, the technical skill has been a role toward work performance. So that technical skill will affect work performance.

Time management skill is the behaviors that purpose for achieve an effective use of time when performing a goal-directed activities Rapp, Bachrach, and Rapp (2013). Time management skill is very important because it can help the organization saves the money and increases revenue in the performance organization. Besides that, good time management can enables a manager to work smarter, more productive, efficiency, self-discipline, deliver work on time so that they have less stress. According to the result in Chapter 4, there is a moderate correlation relationship between time management skill and work performance. Therefore, the p value is .000 which is lower than 0.01. For conclude, the time management skill has been a role toward work performance. Therefore, time management skill will affect work performance.

6 Acknowledgement

The success and outcome of this proposal required a lot of guidance and assistance from many people and I extremely fortune to have got this along the completion of my project work. I would like to share my sincere gratitude to all those help me to completion of this project. During the work, I cope with many challenges duet to my lack of knowledge and experience but these people help me to get over from all the difficulties and in final completion of my idea to a formed sculpture. First and foremost, all respect and gratitude to my supervisor, Cik Nurul Azwa Binti Mohamed Khadri, who provide me her governance and guidance that made I complete this project on time. I extremely grateful to her for still manage guide me despite of her hectic schedule. Lastly, special thank go to Muhammad Syafiq Fakhmi Bin M Anuwar, Nur Atiffah Binti Rosli and my beloved family for their support and guide me when I have a difficulties time to finish this project.

FACTORS INFLUENCING INTENTION TO USE E-WALLET AS A PAYMENT SYSTEM AMONG UNIVERSITY STUDENTS ON EAST COAST REGION IN MALAYSIA

Nur Asilah Binti Mohd Hazmil and Mohammad Bin Ismail

Faculty of Entrepreneurship and Business,
University Malaysia Kelantan,
Malaysia

Email: asilah.a17a0411@siswa.umk.edu.my; mohammad.i@umk.edu.my

Abstract

E-wallet are becoming famous in online transactions system and changing in money transferring systems. Research related to study the level of intention to use e-wallet among university's students on East Coast Region in Malaysia. Hence, this study has been undertaken to examine the perceived usefulness, perceived ease of use, privacy or security, social influence and trust that influence student intention to use e-wallet. A sample of 200 students from three states: Terengganu, Kelantan and Pahang were involved in the study. The research instrument consisted of several sections on demographics, perceived usefulness, perceived ease of use, privacy or security, social influence and trust towards intention to use e-wallet. The data was analysed using SPSS version 25. Descriptive statistics were used to analyse the data. The study found that perceived usefulness is higher which (mean=4.44) and the second is perceived ease of use (mean=4.22). The findings that perceived usefulness and perceived ease of use give effect of the level of intention to use e-wallet. This study helps the service providers of the digital marketplace further to have better understanding of the usefulness of using e-wallet for transaction purposes.

Keywords: *Perceived Usefulness, Perceived Ease of Use, Privacy or Security, Social Influence, Trust, Intention to Use*

1 Introduction

Now, world internet has made life easier for people. Payments are being done using smart devices. One of the best inventions is the electronic wallets (e-wallets) an integral part of electronic payment system. A term of "e-wallet" means that a type of electronic card which is used for transactions made online through a computer or a smartphone. Its use same as credit or debits cards. E-Wallets need to be linked to individual bank accounts to make payments.

Payment is made using a payment instrument. Cheque and cash are examples of payment instruments. However, digital payment is not an instrument but a real term used for many instruments used in various ways. It can be defined as a way of paying for services or goods through electronic media without the use of cash or cheque. It is also known as electronic payment system. The origins of digital payments are linked to the advent of the internet, which is changing the world unlike ever before. If there is no internet, there will be no e-services and online stores. The history of the internet began in 1969 with the Advanced Research Project Administration Network (ARPANET), a military network intended as a communication network during the Vietnam War. However, the turning point came in 1989 when Tim Berners-Lee discovered what is called a "page" or "page" that facilitates access and publication of information on the internet (Angela, 2016).

In Malaysia, there are two main electronic payment systems used, namely the additional payment system (SIPS) which includes electronic funds transfer system and real-time securities

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

(RENTAS) and retail payment system which consists of three categories. The first category is retail payment systems, such as national check information clearing system, joint automatic teller machine (ATM) system, GIRO Interbank e-debit, financial process exchange, and direct debit. The second category is retail payment instruments such as credit cards, charge cards, debit cards, e-money and retail payment channels such as ATMs, internet banking, mobile banking and payments (Wendy et al, 2005).

Bank Negara Malaysia has issued more than 30 e-wallet licenses in Malaysia which shows that e-wallets have great potential to transform Malaysia into a cashless society even earlier than expected by 2050 (Cheng et al, 2018). According to Chern et al (2018), e - wallet services are well established and widely used in India and China but their presence in Malaysia is still rare. Although cash payments in Malaysia are still the main medium of exchange, trend changes can be seen after the increase in the introduction of cashless payments.

According to Bernama (2017), Governor Tan Sri Muhammad Ibrahim mentioned that the payment method is an important element that can increase the productivity and cost efficiency required for the drastically growing digital economy at the Payment System Forum and Exhibition. Tan Sri Muhammad also stated that advanced technology, low operating costs using QR Codes, as well as the large number of Malaysians holding debit cards and mobile phones should be considered as advantages to optimize this e-payment technology.

2 Literature Review

Intention

Intention is simply defined as how hard persons are willing to try and how much determinations they are planning to use towards performing behaviour (Mamman et al, 2016). From time to time, humans develop and try to make life easier. Many forms have been taken into practice such as trading by bartering and then shifting towards a cash payment known as money. Money was created to make the trades more efficient and convenient. Money also takes various forms in terms of currency. The necessity to seek a more efficient method of payment is gradually being emphasized by many countries as one of the impacts of this digital era (Daniel, Swartz & Fermar, 2004). Money itself is used for many economic activities such as functioning as a unit of measurement and as a payment instrument. The development of money has occurred in the past decades in order to minimize transaction fees that are created from doing transactions. For example, back when money was still in the forms of coins, a transaction with a huge amount and a far location would cost a lot of effort and time to complete (Odior & Banuso, 2012).

Perceived Usefulness

Perceived usefulness can be defined that a form of external motivation and encouragement refers to the potential acceptance to use certain system that give benefits in e-wallet platform performance (Davis, Bagozzi & Warshaw, 1989). TAM is an initial effort to apply psychological factors to information systems and computer use. It is assumed that perceived usefulness and perceived ease of use are a major influence on one's attitude towards the use of technology and, thus, ultimately, are related to actual use (Davis, 1989). Previous research has proven the validity of TAM in various IT. The TAM model is replicated in various studies to provide empirical evidence on the impact of usability and ease of use on the use of new technologies such as online banking, online purchasing, tele-banking, mobile internet, computer technology, broadband services. Interestingly there is a mutual agreement that the TAM model takes place in explaining individual acceptance of new technologies.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Perceived Ease of Use

A term of perceived ease of use signifies to “the extent to which using a particular system will be free from effort” (Davis, 1989). Perceived ease of use is one of the variables of the Technology Acceptance Model (TAM) which is developed by Davis (1989) that refers to the degree in which the perception of users towards the use of a particular system will be effortless or simply, easy to handle. And then, users perceived that the system is very simple to use. Same with the perceived usefulness, perceived ease of use is also said to have important effect toward the attitude of usage (Holden & Karsh, 2010; Teo, 2011). Furthermore, perceived ease of use has been considered as a precursor to the perceived usefulness (Davis, 1989).

Privacy or Security

Privacy is described as an individual’s ability to personally monitor self-relevant information (Cliquet et al., 2015). It is an important feature that everyone is aware of. Based on the study of (Soodan, et al., 2020), one of the factors that affect the use of e-wallet is privacy and security which is found to be more suggestive. Perceived security is defined as online consumer perception of how they are protected from risk that related to security (Mekovec & Hutinski, 2012). Perceived security as a subjective consumer assessment of the safety of the electronically payment system (Linck, Pousttchi & Wiedemann, 2006). Lack of security and privacy is one of the issues that keep customers away from purchasing goods unless it is protected (Milberg, Smith & Bruke, 2000). However, payment through an e-wallet without security feature may lead an unauthorized access of personal information and a lucrative opportunity for cybercriminals to breach the data (Kaur et al., 2018).

Social Influence

Social influence has been called in different names as social factors, subjective norms or social norms in different theories. It is defined as the change in behaviour that one person causes in another intentionally or unintentionally. According to Stockman (2017), people chosen to perform a behaviour even if they are not themselves favourable toward its consequences, if they believe one or more important referents think they should use the new system, this makes them sufficiently motivated to comply with the referents. Social influence plays a notable role in various domains of human behaviour such as product and service consumption. And then, social influence also drives human selection behaviours when numerous objects competing for limited attention which leads to the ‘rich get richer’ dynamics where popular objects tend to get more attentions (Pan, Hou & Lin, 2017) especially in the common context when selecting such as books, movies, restaurants and others.

Trust

Trust can be described as the inclination to adopt a new service with the impression of ease, security and recognition of risk (Kim, Mirusmonow & Lew, 2010). Trust is also online transaction clarified that the danger in economic operations was lowered by the presumed danger resulting from a confidence and would therefore encourage customers to good will for e-payment (Yousafzai et al, 2005). The trust of consumer, according to Gefen et al (2003) is highly essential and guarantees security with little more assurance that the online vendor will not conduct any unethical or unwanted conduct such as providing inaccurate information, unreasonable sales, issue of personal data or buy operations without the previous consent of any user.

BUSINESS COLLOQUIUM 2020/2021**

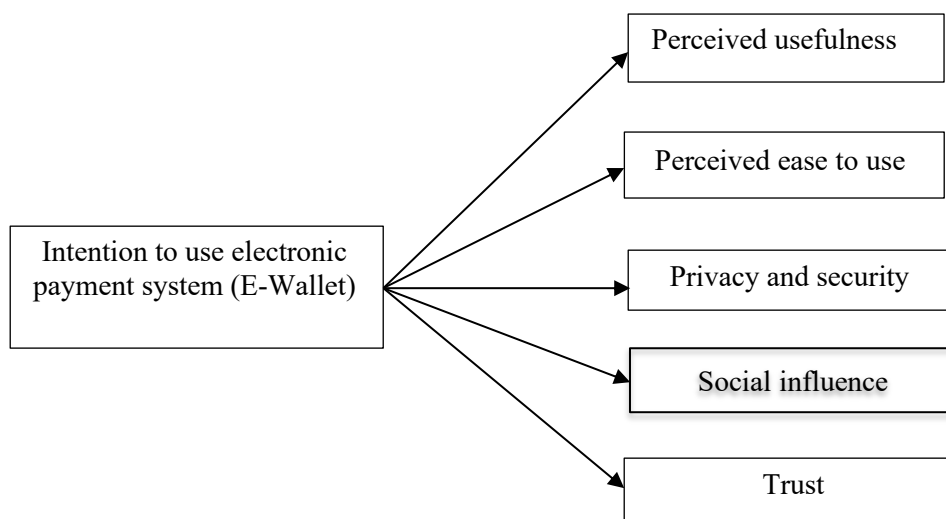

Figure 1: Conceptual Framework

3 Methodology

Data collection

Data was collected by applying online survey (sending Google Form from link to WhatsApp). The target respondents for this study are to those university’s students on East Coast in Malaysia like Terengganu, Kelantan and Pahang as respondent is they used mobile phones from an early and they are interested in new technologies. A total of 200 respondents questionnaire are collected university’s students from Terengganu, Kelantan and Pahang in Malaysia. A five-point Likert scale was used to access students’ intention to use e-wallet.

4 Data Analysis

Demographic Profile

The sample illustrates the responses collected from university’s students on East Coast Region in Malaysia which were 250 in total. However, total of 200 valid data were analysed. Table 1 shows that total numbers of female respondents were 167 which represent 83.5% of the total sample while male represents only 16.5%. Moreover, most of the students are aged above 23 years old and represents 72.5% of the sample total followed by aged 22 years old (16.0%), aged 21 years old (9.5%) and then 20 years old 2.0%). Furthermore, number of students are from Kelantan were 108 in total (54.0%), Terengganu (33.5%) and Pahang (12.5%).

Table 1: Demographic Profile

Variable	Frequency	Percentage (%)
Gender		
Male	33	16.5
Female	167	83.5
Age		
20 years old	4	2.0
21 years old	19	9.5
22 years old	32	16.0
Above 23 years old	145	72.5

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

State		
Terengganu	67	33.5
Kelantan	108	54.0
Pahang	25	12.5

Structural Model

Table 2: Pearson's Correlation

Variable	Mean(SD)	Perceived usefulness	Perceived ease of use	Privacy or security	Social influence	Trust	Intention
Perceived usefulness	4.44(0.65)	1	0.856	0.791	0.739	0.838	0.812*
Perceived ease of use	4.34(0.65)	0.856	1	0.880	0.905	0.875	0.805*
Privacy or security	4.17(0.88)	0.791	0.880	1	0.857	0.942	0.885*
Social influence	4.21(0.79)	0.739	0.905	0.857	1	0.857	0.826*
Trust	4.22(0.84)	0.838	0.875	0.942	0.857	1	0.929*
Intention	4.21(0.84)	0.812*	0.805*	0.885*	0.826*	0.929*	1

*p<value 0.05, pearson's correlation analysis applied

There was a significant relationship between perceived usefulness and intention to use e-wallet among university's students on East Coast in Malaysia. This is because the p-value equal to 0.000 and less than alpha value 0.05. Moreover, the value of the correlation coefficient which is 0.812 fell under the coefficient range 0.76 to 1.00. This indicated a very perfect correlation relationship between perceived usefulness towards intention to use e-wallet.

Next, there was a significant relationship between perceived ease of use and intention to use e-wallet among university's students on East Coast in Malaysia. This is because the p-value equal to 0.000 and less than alpha value 0.05. Moreover, the value of the correlation coefficient which is 0.805 fell under the coefficient range 0.76 to 1.00. This indicated a very perfect correlation relationship between perceived ease of use towards intention to use e-wallet.

There was also a significant relationship between privacy or security and intention to use e-wallet among university's students on East Coast in Malaysia. This is because the p-value equal to 0.000 and less than alpha value 0.05. Moreover, the value of the correlation coefficient which is 0.885 fell under the coefficient range 0.76 to 1.00. This also indicated a very perfect correlation relationship between privacy or security towards intention to use e-wallet.

5 Discussion

There are some limitations in this study. First of all, only university students studying in the East Coast, namely Terengganu, Kelantan and Pahang were selected as the target population of this study. They are all in their 90s and their age is around 20 to 23 and above. The results of this

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

study only represent the opinion of the 90s generation but not the general opinion. E-wallet users are targeted not only at young people, but also people of different ages. Users of different ages have different needs and wants, therefore the opinion or acceptance of their E-wallet may differ from the sample of respondents. Moreover, the use of new technologies differs between generation Z, generation Y, generation X and baby boomers. For example, generations Z and Y are more receptive and start using new technologies than generation X and baby boomers. Using new technology is easy for young people, but not for the elderly, it is a challenge for them. After this research, some limitation had being examined throughout the process. Hence, there some suggestions and recommendations can be referred by future scholars to rectify the limitations. First of all, generations and age of target respondents should be widen in future study. Different generation student grew up with different exposure of technology especially financial technology which is related to e-wallet services. Hence, the level of intention and variables that will affect the intention might have some differences in different category of people. Secondly, for the limitation regarding the education level of target respondent should also being overcome by adding different education level of respondents into the samples. Besides of students of undergraduate, the future could also add in different level of the study. It can be respondents from certificate, diploma, degree, master and PhD. Different education level would have different perception and opinion towards e-wallet services. So, it is suggested that different education level of respondents can be included for more accurate future study.

6 Acknowledgements

The researcher would like to thank the Journal of International Business and Management because contributed for the success of this Final Year Project.

THE CHALLENGES OF GROWTH AMONG MICRO ENTERPRISE IN RETAIL INDUSTRY

Nur Fadhillah Natasya Binti Jamal and Anis Amira Binti Ab Rahman

Faculty of Entrepreneurship and Business,
Universiti Malaysia Kelantan,
Malaysia

Email: natasya.a17a0436@siswa.umk.edu.my; anisamira@umk.edu.my

Abstract:

This study investigated the challenges growth among micro enterprise in retail industry in Tawau, Sabah. The research question of this research is what are the business challenges facing among micro enterprises operating within in retail industry and what strategies are employed by micro enterprises in countering the challenges that they face. The objective was to explore the challenges faced by entrepreneurs among micro enterprise and to identify strategic challenges in among micro enterprise. This study follows by a qualitative research design and using a purposive sample method to gather data from respondents. Owner of Family Optical and FS Fashion were target population. The challenges identified in the growth of micro enterprise are lack of support from supplier, lack of operation management, lack of marketing and competition among themselves and large firms. Recommendations have been proposed to these business owners to further improve their business quality.

Keywords: *Challenges of Growth, micro enterprise, retail industry*

1 Introduction

The micro enterprises sectors are referred to as economic engines for many countries. Researchers in the field of entrepreneurship agree that the sector is critical to economic growth, job creation and compassion reduction and reduced levels of inequality (Fatoki & Smit, 2011). The sector is very important and plays an important role in marginalized and rural territories, such as retail industry in Tawau, Sabah where the majority of people rely on government grants. Unemployment, compassion and inequality levels are also very high in the territory. It was the result of the role played by micro enterprise that the Malaysian government had also called to support this business and for new entrepreneurs, particularly in rural areas (Fatoki & Smith, 2011).

Micro enterprises are typically defined as small businesses that employ nine or fewer people, and have a balance sheet or turnover less than an example of a certain amount of 2 million or 3 million (Kayanula et.al., 2000). The importance of micro enterprise has also been recognized in EU countries by setting a framework for promoting entrepreneurship, simplifying regulatory and policy environments for micro enterprise and eliminating the remaining barriers to their development. Micro enterprise is seen as the most important driver of economic growth and played an important role in job creation and therefore combat unemployment (Muller et.at, 2017).

In addition, planning deficiencies, unreasonable financing and weak management have been the main cause of small company failures (Longenecker, et al., 2006). Credit shortages have also

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

been identified as one of the most serious restraints faced by micro enterprise and hindered their development (Oketch, 2000; Tomecko & Dondo, 1992; Kiiru, 1991). Education is one of the factors that positively affect the growth of the firm. Entrepreneurs with larger human capital stocks, in terms of education and or vocational training, are better placed to tailor their enterprises to constantly transform the business environment (King and McGrath, 1998).

1.2 Problem Statement

Researchers in entrepreneurship agree that micro enterprise play an important role in the economy. In Malaysia, micro enterprise is very important because they can help reduce socio-economic challenges. However, it is disappointing that the majority of these micro enterprises continue to fail in no time. Their unacceptable high failure rate is the result of the various challenges they face. Therefore, it is important to investigate and propose solutions to these challenges. Micro enterprises face challenges from increased competition, the ability to adapt to rapidly changing market demand, technological change, and capacity constraints relating to knowledge, innovation, and creativity (Minilek Kefale, K. P. M Chinnan, 2012).

Last but not least, there are many reasons why challenges are happening around micro enterprise business sellers. The main purpose of this study is to identify the challenges of micro enterprises in the retail industry in Tawau, Sabah. Based on this study, there are four challenges of micro enterprises in the retail industry in Tawau, Sabah. In the study, interview sessions were conducted and focused on business owners for more information on the challenges they faced while running a micro enterprise business. Themed content analysis is used to analyse interview data. Analytical data suggests the theme reflects these challenges.

1.3 Research Question

1. What are the business challenges facing among micro enterprises operating within in retail industry?
2. What strategies are employed by micro enterprises in countering the challenges that they face?

1.4 Research Objectives

1. To explore the challenges faced by entrepreneurs among micro enterprise
2. To identified strategic challenges in among micro enterprise

1.5 Significance of Study

This study is important for the effective formulation and implementation of policies that seek to develop the micro enterprise in retail industry. There is need for a clear understanding of the challenges hampering the growth and development of these micro ventures if meaningful solutions are to be implemented. Although some research has been conducted in the micro enterprise sector, it remains important to also investigate challenges faced by entrepreneurs operating micro enterprise in the retail industry (Tendai, 2015).

2 Literature Review

An according Penrose (1959) theoretically, developed research proposals that the capacity of an internal experienced manager limits the rate at which the firm can grow over a certain period of time. An empirical implication that follows logically from this line of thinking is that the fast-growing firm will ultimately delay its growth over the next time frame as its firm's dedicated

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

management team, posed to be inelastic at least in the short term, cannot effectively address the increased demand placed on experienced internal managers due to increased complexity as well as time and attention that new managers need from. Thus, inefficiency in the firm's current operations will follow if firms maintain a high growth rate. The manager's main role is proposed by the view that "all kinds of productive services, management services are the only type that each firm, because of its nature as an administrative organization, must use" (Penrose 1959:48).

According to this model of learning, owners or managers could raise their efficiency through formal education and training that increases their endowments. Entrepreneurs or managers with higher formal education, work experience and training would therefore be expected to grow faster. The firm grows if successful, closes if unsuccessful (Goedhuys and Hardi, 2002). The other set of growth theories of firms include the 'stochastic' and 'deterministic approaches'. The stochastic model which is also known as the Gibrat's law argues that all changes in size are due to chance. Thus, the size and age of firms has no effect on the growth of small enterprises.

Literature reveals that challenges faced by micro enterprise in developing countries have been learned to be the same to those of their counterparts in developed countries. The only difference between the challenges that confront micro enterprise in developing and developed countries is the fact that the magnitude of their differences weighs more negatively for developing countries. Past studies have shown that a number of factors hinder the survival and growth of micro enterprise.

CONCEPTUAL FRAMEWORK

3 Methodology

Secondary data has been collected by means of thorough literature studies and to collect key data, this study follows qualitative research designs. The purpose of conducting qualitative research is to gain insight into the perception, feelings and attitudes of entrepreneurs towards the challenges faced. An in-depth interview was conducted to collect major data from respondents. The owners of the company were choosing are target to collect information. Respondent were selected from the each of the company which the researchers selected purposively. Respondents were interviewed using a purposive sample method. Respondents are managers or an owner of the company was choosing. Data collected from interviews are analysed question by question.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

4 Data Analysis Process

In this study, researchers used qualitative methods, namely semi structure interviews researchers will interview and explore more about micro enterprise business owners in the retail industry in Tawau, Sabah. The interview is completed using a telephone survey method. Telephone surveys are an alternative from interviews to private, face-to-face interviews, where the creation of collecting relevant information from target respondents through telephone conversations. With this method we can interview respondents and collect data. The study successfully conducted by getting informants of micro enterprise employers in retail industry. The purpose of this data is to support and strengthen qualitative results.

5 Research Findings

This chapter expands the discovery and analyses data obtained from individual interviews about the challenges of growth among micro enterprise in retail industry. This data has been extracted and analysed based on the objectives of the study. Information has been gathered by the central assembly interviews that we focus on growth challenges among micro enterprises in the retail industry. This section discusses research findings from interviews. The researchers found there were growth challenges among micro enterprises in the retail industry. There are a number of challenges faced by the company being interviewed. The growth challenges faced by the company FS Fashion and Family Optical are lack of support from supplier, lack of operation management, lack of marketing and competition among themselves and large firms.

6 Recommendation and Conclusion

The authors of this study have obtained some important reserves for improving micro enterprise business. The recommendation for this if a firm does not have the right knowledge or ability to manage the company. It is necessary to use external consultants to help firms to save time, money, manage financial balance and controls. A company requires a clear business structure to be able to utility time, capability and resources to its full potential. With a clear business structure the company will overcome the many internal challenges presented in this review. Government action is crucial if more micro enterprise businesses should be able to develop and grow into a greater contributor to the nation's economic development. This will be able to reduce the risk of hiring new employees for micro enterprise businesses.

The aim of this study is to identify the challenges of growth that occurs among micro enterprise in retail industry. Therefore there is research on micro business growths; the study authors have used the growth challenges available in micro enterprise as a source of study. Through this study the authors clearly stipulate that there are some similarities in the challenge to growing micro enterprise. One of the most frequently developed challenges, both in previous research and in this study is competition. The authors of this study conclude that competition is the most frequently seen challenge to develop in micro enterprise and is the foundation of many other challenges to grow as well. Thus, there are factors that prevent micro enterprises from developing that are not present in SMEs studies, such as marketing and industry acceptance.

THE EFFECTS OF STORE ATMOSPHERE IN RESTAURANT TOWARDS CUSTOMER BUYING BEHAVIORAL IN KUANTAN, PAHANG

Nur Farrahanim binti Khalid and Nurul Azwa Binti Mohamed Khadri

Faculty of Entrepreneurship and Business,
Universiti Malaysia Kelantan,
Malaysia

Email: nurhanim12.nh@gmail.com; azwa.mk@umk.edu.my

Abstract:

The study aims to identify the effects of store atmosphere in restaurant towards customer buying behavioral in Kuantan, Pahang. It is very important for an organization to ensure sales are doing well. In this research, the researcher choose store atmosphere attributes as the factors which are music, lighting, and layout. In this research, it focuses on three objectives, which is to identify each relationship of independent variables (music, lighting, layout) with dependent variables (customer buying behavioral). 384 respondents were chose from communities in Kuantan, Pahang by using convenience sampling. The findings of the study is three of the independent variables which is music, lighting, and layout have significant relationship with customer buying behavioural

Keywords: *customer buying behavioral, store atmosphere, music, lighting, layout*

1 Introduction

The development of the business world today is very fast which makes it necessary for entrepreneurs to compete to attract consumers. Entrepreneurs are required to be more innovative and creative in order to survive in increasingly challenging competition. The business conducted is expected to be able to meet the needs and wants of consumers. It is because, consumers have begun to be wise in choosing the products and services they needs and how those products and services can benefit them. Therefore, a business needs to understand the development and needs of consumers. By producing different and unique products and services from competitors, it can attract users to make purchases.

The growth of the food and beverage industry is still recorded as high growth in various countries. Almost around 3.2 million consumers for food and beverages in Malaysia until October 2020. From the Statista website, food and beverages has made revenue for 2020 totally reach US\$84 million. Which it show an annual growth rate (CAGR 2020-2025) of 13.2% that can be concluded the result is US\$156 million by 2025.

The provision of food and beverage places such as restaurants, shops or cafes is rapidly evolving in line with the changing lifestyle of the people in Malaysia. Food and beverage products are offered in various types and shapes by various outlets spread throughout Malaysia. The increasingly busy society, is utilized by creative entrepreneurs in providing food places such as stalls, restaurants, shops or cafes.

Kuantan is the district and capital of Pahang, Malaysia. Kuantan is a large city on the East Coast

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

of Peninsular Malaysia. Kuantan saw rapid growth as commercial centers in the city were built in large numbers and the population around the city and in Kuantan increased. Kuantan which was once a peaceful city and described as "suitable for the retired" is now increasingly busy and begins to pursue its status as a city. The metropolitan atmosphere in the city of Kuantan is becoming clearer with the opening of large shopping malls and premises tasteful and high class lately.

2 Literature Review

Underpinning Theory

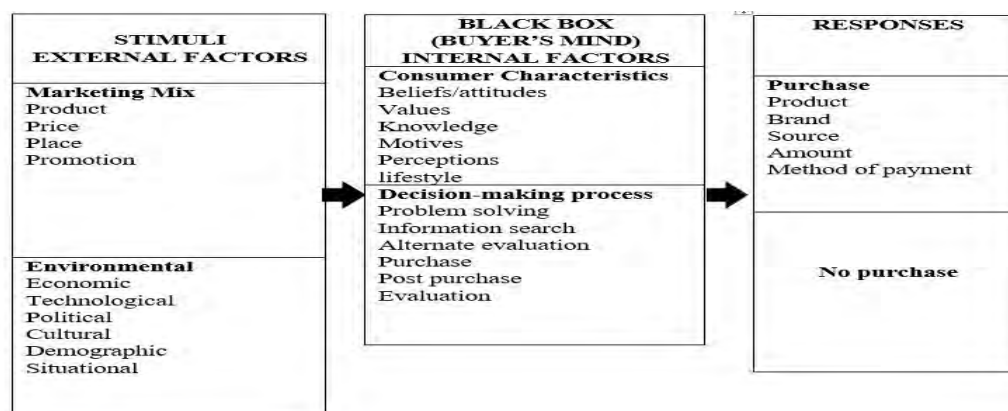

Figure 2.1: Black Box Model

The Model of Consumer Behaviour presented by Kotler (1995: 222) is simple behavior. In this model of behaviour, Kotler give the term black box (black box) for the process decision making and purchase characteristics.

This Black Box contains various factors that are in the person's mind. This includes consumer characteristics, such as beliefs, values, motivation, lifestyle, and so on. The decision-making process is also part of the black box, as consumer realize they have a problem they need to resolve and consider how the purchasing decision can resolve the issue. Because consumers respond to external stimuli, their "black box" choices are based on internal factors and determine consumer response whether to buy or not.

Previous Study

Customer buying behavioural

Psychologically view human behavior as a simple or complex reaction. The meaning of consumer behavior as expressed by Mowen (2002: 6) says, "the study of purchasing units and exchange processes involving acquisition, consumption and disposal, goods, services, experiences and ideas". Meanwhile, according to Swastha and Handoko (2000: 10) said that, consumer behaviour may be defined as the actions of people specifically engaged in the purchase and use of products and services, including the decision-making process in the planning and determination of such activities. From the above understanding, then consumer behavior is the actions and social relationships performed by individual consumers, groups or organizations to evaluate, acquire and use goods and services through the process of exchange or purchase that begins with the decision-making process that determines the actions. Schiffman and Kanuk (1994: 26) argue that the study of consumer behavior is a study of how an individual decides to allocate available

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

resources such as time, money, effort and energy.(Wang, Siu, & Hui, 2004)

Music

Music can be defined as a pleasant voice that influences the conscious and unconscious decisions of the consumer (Banat & Wandebori, 2012). Music played in retail stores greatly influences consumer purchasing intentions. Music style and tempo greatly influence consumers in increasing sales in retail stores. Pleasant music is associated with longer usage times (Holbrook & Anand, 1990). Variety of background music has a significant impact on consumer perceptions and choices (Bruner, 1990). Consumers spend less time on saves when music is played louder than soft music (Smith, Patricia, & Ross, 1966). The effect of rigidity music choices are moderated by gender, with women reacting worse than men to louder music (Kellaris, James & Ronald, 1993). Music generally has a positive effect while tempo music quickly becomes intermediate influencing shoppers' perceptions of shopping malls (Michon & Chebat, 2004). Music has a constructive effect the amount of time and money customers spend because of a good environment (Herrington, 1996).(Hussain & Ali, 2015)

Lighting

Smith (1989) defines that a well-designed lighting system can provide additional dimensions to the inside, point the customer's eyes to the main sales point, create an atmosphere of joy and a positive effect. Lighting is used to highlight products. This brings pleasure and has a constructive effect on the actions of customer transactions. (Mehrabian & Albert, 1976).(Areni & Kim, 1994) define that when lighting used in retail chain stalls is good color, consumers tend touch products to evaluate quality. Good lighting techniques help create the right atmosphere. Store with appropriate lighting can attract attention buyers to experience the store and evoke a desire to buy. The main purpose using brighter lighting in the grocery store is to attract customers so that they started buying from the store because of their comfort. Some manufacturers are aware the importance of lighting, so they put LED lighting on their shelves, to attract customer attention.

Layout

(Abratt & Goodey, 1990)determine product display at retail outlets are a stimulus to attract consumers to create impulse purchase. Arrangement defined as the division of sales area, space used and product arrangement(Banat & Wandebori, 2012). Baker (2002) - quoted in (Mohan, Sivakumaran, & Sharma, 2013)defines, a well-organized store layout increases the buying experience by providing consumer comfort.. A good layout can also make spending more enjoyable, by reducing stress felt in sopping (Baker et al., 2002) and by having a positive effect. (Yoo et al., 1998)

Hypotheses Statement

H1: There is a significant effects of music in restaurant towards customer buying behavioural in Kuantan, Pahang.

H2: There is a significant effects of lighting in restaurant towards customer buying behavioural in Kuantan, Pahang.

H3: There is a significant effects of layout in restaurant towards customer buying behavioural in Kuantan, Pahang.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Conceptual Framework

Figure 2.2: Conceptual Framework of the effects of store atmosphere in restaurant towards customer buying behavioural in Kuantan, Pahang.

For the independent variable of theoretical framework and conceptual framework are nearly the same which there are three factors it is music, lighting and layout. The dependent and independent will be explained in this study. For this study, by using the theory there are adapted there are several contextual factors had been identified to examine the relationship between the effects of store atmosphere in restaurant towards customer buying behavioural in Kuantan, Pahang.

3 Research Methodology

Data Collection Methods

This research uses primary and secondary data for complete the study. Primary data is defined as a collection of data derived from researchers from specific objectives to solve the study problem (Malhotra, 1999). For this study, the researcher used two methods to collect the data. It involves the distribution of the Google form questionnaire through social media.

Secondary data is defined as data collected for the same purpose other than problems in hand (Malhotra, 1999). Secondary data is the data collected and recorded by others before the needs of the current researcher. The researchers used secondary data as the second source in conducting this research. For this study, researchers collected data from books, journals and internet database.

Researchers will refer to journals, articles and reports for complete a literature review. The information gathered can help researchers to find out the determinants that may contribute to this study and help develop the framework of this study as well to complete this research. Researchers will browse the internet and websites to find more information and collect electronic journals or articles which can help researchers to conduct research better. The researchers will search the web on Google, Science direct and Emerald Insight to find the information they need

Measurement of The Variables

The Likert scale is designed to measure the 'attitude' is scientifically accepted and validated way in 1932(Joshi, Kale, Chandel, & Pal, 2015). Attitude can be define as a special way to behave / respond in certain situations that are rooted in relative sustainable beliefs and ideas organization (around object, subject or concept) is obtained through social interaction. This is clear from the discourse mentioned above that thought (cognition), feelings (affective) and actions (psychomotor) all together in various combination / permutation is delivery attitude in a given situation. The question is how to measure the thinking of these subjective priorities, feelings and actions are legitimate and trustworthy method: assistance is offered on a Likert scale.

With the Likert scale, the variable to be measured is translated into an indicator of the variable. Then the indicator is set as the starting point for sorting items instruments that can take the form of questions or statements. Answer each instrument item which uses the Likert scale has a gradient from very positive to very negative. For the purpose of quantitative analysis, the answer will be

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

marked each question from a value of 1 to 5 it is 1- Strongly Disagree, 2- Disagree, 3-Neutral, 4- Agree and 5- Strongly Agree.

Analysis

Descriptive Analysis - Descriptive analysis is an analysis is to get the mean, standard deviation and rank of customer buying behaviour dimensions. All the customer buying behaviour dimensions were calculated to gather the highest mean.

Spearman's Correlation Analysis – Spearman's connection coefficient is a factual measure of the consistency of a monotonic relationship between matched information. . Spearman's correlation coefficient is a measure of a monotonic relationship and the value of do not indicate there is no relationship between the variables

Reliability Analysis - Reliability means consistency. It is the degree to which an instrument will give similar results for the same individual at different times. Reliability can take on value of 0 to 1.0, inclusive. Test-retest reliability is one of the methods for checking reliability. Cronbach's alpha is a measure of internal consistency. It is also considered to be a measure of scale reliability. The closer cronbach's alpha to 1, the higher internal consistency of reliability.

Pilot Study - Pilot analysis can serve many purposes. The purpose of the Pilot study by Prescott and Soeken (1989) based on a review of current nursing research textbooks including an evaluation of (a) eligibility, (b) adequacy of instruments, and (c) data collection strategy problem and the proposed method. To this they added, (d) answer methodological questions, and (e) plan a larger study. In the newer ones articles, Jairath, Hogerney, and Parsons (2000) contributes to the potential of the sixth pilot study, (f) obtain sufficient preliminary data to justify granting. Although some researchers may questioning what this type of initial work is real pilot study, it is often mentioned enough in practice to be included for the purpose this article.(Hertzog, 2008)

4 Data Analysis and Discussion

Reliability Analysis

Pilot analysis is commonly used in order to examine the feasibility of methods, interviews, techniques and questionnaires and how they work with each other in a given fact(Doody & Doody, 2015). Surveyors often interact with a large number of people for a pilot test, so that potential disparities can be analysed within and across groups in the subjects. Before the questionnaire is adopted, a pilot test will be carried out to assess the consistency and exactness of the questionnaire design. According to Hill (1998), 15-30 respondents are enough for pilot study to confirm that respondents understanding and feedback. Hence, a small group of 30 respondents have been chosen to answer the questionnaire. After the pilot test was done, the researchers will implement a reliability test to examine the reliability and exactness of the data collected. The respondents who have done the pilot test will not be considered in the main study. Table 4.1 indicates the results of reliability analysis and all the variables are significant with the Cronbach's Alpha value more than 0.70. It indicated that the strength of association between variables is very good.

Table 4.1: Reliability Test (Pilot Test)

Variable	Number of items	Cronbach's Alpha Pilot Study (n=30)	Cronbach's Alpha Actual Study (n=30)
Music	7	0.866	0.871
Lighting	7	0.891	0.895
Layout	6	0.819	0.816

Descriptive Analysis

In descriptive analysis, every section of dependent variable and independent variables has been using the mean of analysis that being choose by the researcher. It is to find out the the effects of

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

store atmosphere in restaurant towards customer buying behavioural in Kuantan, Pahang. Researcher will find out which the question respondents strongly agreed and strongly disagreed.

Table 4.10: Level of Mean

Level	Mean
Strongly Agree	4.01 - 5.00
Agree	3.01 - 4.00
Neutral	2.01 - 3.00
Disagree	1.01 - 2.00
Strongly Disagree	0.01 - 1.00

Music

Table 4.11: Music

STATISTICS		
	N	MEAN
Listening to music creates a relaxed atmosphere while in the restaurant.	384	4.39
Pleasant environment created by music makes me spend more time in the restaurant.	384	4.17
The existence of background music increase my well-being and comfort in the restaurant	384	4.23
The right genre of music influences my mood in a positive manner.	384	4.39
The tempo of the music increases my willingness to wait for my food.	384	4.26
The rhythm of the music enhances my enjoyment.	384	4.33
The appropriate volume of the music helps to reduce my stress level.	384	4.26
Valid N (listwise)	384	

Table 4.11 illustrates the music variable. From the result, the respondents are strongly agree about listening to music creates a relaxed atmosphere while in the restaurant which the means shows at the level 4.39. Next, the respondents also strongly agree that pleasant environment created by music makes them spend more time in the restaurant which the mean shows at the level 4.17. Respondents also strongly agree that the existence of background music increase their well-being and comfort in the restaurant which the mean shows at the level 4.23. Then, respondents strongly agree that the right genre of music influences their mood in a positive manner which the mean shows at the level 4.39 and respondents also strongly agree that the tempo of the music increases their willingness to wait for my food which the mean shows at the level 4.26. The respondents are strongly agree that the rhythm of the music enhances their enjoyment which the mean shows at the level 4.33. Then, the respondents also strongly agree that the appropriate volume of the music helps to reduce their stress level which the mean shows at the level 4.26.

BUSINESS COLLOQUIUM 2020/2021**

Lighting

Table 4.12: Lighting

STATISTICS		
	N	MEAN
The lighting in the restaurants can pleasing to the eyes, and makes me to stay longer in the restaurant.	384	4.30
Good color of lighting attracts me towards menu offered.	384	4.31
The lighting of the restaurants makes the menu offered more visible and attractive to me.	384	4.33
The different lighting used in each area inside the restaurant is important.	384	4.30
The brightness of the lighting allows me to browse through the menu easily.	384	4.43
The dim of the lighting gave me relaxed feeling.	384	4.19
The attractiveness of the lighting (e.g.: shape and colour of bulb) enhances my perception of the restaurant's image.	384	4.39
Valid N (listwise)	384	

Table 4.12 illustrates the lighting variable. From the result, the respondents are strongly agree that the lighting in the restaurants can pleasing to the eyes, and makes them to stay longer in the restaurant which the mean shows at the level 4.30. Next, the respondents are strongly agree that good colour of lighting attracts them towards menu offered which the mean shows at the level 4.31. Then, the respondents also strongly agree that the lighting of the restaurants makes the menu offered more visible and attractive which the mean shows at the level 4.33. The respondents strongly agree that the different lighting used in each area inside the restaurant is important which the mean shows at the level 4.30 and respondents also strongly agree that the brightness of the lighting allows them to browse through the menu easily which the mean shows at the level 4.43. The dim of the lighting gave them relaxed feeling also strongly agree by the respondents which the mean show at the level 4.19. Then, the respondents also strongly agree that the attractiveness of the lighting, for example is shape and colour of bulb enhances their perception of the restaurant's image which the mean shows at the level 4.39.

Layout

Table 4.13: Layout

STATISTICS		
	N	MEAN
The accessibility of the store layout enhances my positive evaluation.	384	4.47
The design of the store layout encourages me to walk around and select more food and beverages (e.g.: from the fridge or pastries display).	384	4.35

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

The efficiency of the store layout eases my entry and exit.	384	4.49
The creativeness of the store layout (e.g.: seating arrangements) encourages me to stay longer.	384	4.33
Attractively arranged store stimulates me to dine-in in the restaurant.	384	4.39
Particularly attractive display will attract my attention and induce my planned purchase.	384	4.39
Valid N (listwise)	384	

Table 4.13 illustrate the layout variable. From the result, the respondents are strongly agree that the accessibility of the store layout enhances their positive evaluation which the mean shows at the level 4.47. Next, the respondents strongly agree that the design of the store layout encourages them to walk around and select more food and beverages, for examples from the fridge or pastries display which the mean shows at the level 4.35. Then, the respondents also strongly agree that the efficiency of the store layout eases their entry and exit which the mean shows at the level 4.49 and respondents also strongly agree that the creativeness of the store layout, for examples is seating arrangements, encourages them to stay longer which the mean shows at the level 4.33. Attractively arranged store stimulates them to dine-in in the restaurant also strongly agree by the respondents which the mean shows at the level 4.39. Then, the respondents also strongly agree that the particularly attractive display will attract their attention and induce their planned purchase which the mean shows at the level 4.39.

Customer buying behavioural

Table 4.14: Customer buying behavioural

STATISTICS		
	N	MEAN
The atmosphere in a restaurant influences my purchase.	384	4.48
I would consider revisiting restaurant that provide the excellent store atmosphere in the future.	384	4.47
I would like to come back to the restaurant in the future.	384	4.42
I would recommend the restaurant to my friends and other.	384	4.47
I would encourage others to visit the restaurant.	384	4.42
I would say positive things about the restaurant to others.	384	4.43
Valid N (listwise)	384	

Table 4.14 illustrates the customer buying behavioural variable. From the result, the respondents are strongly agree about the atmosphere in a restaurant influences their purchase which the mean shows at the level 4.48. Next, the respondents are strongly agree that they would consider revisiting restaurant that provide the excellent store atmosphere in the future which the mean shows at the level 4.47. Then, the respondents also strongly agree that they would like to come back to the restaurant in the future which the mean shows at the level 4.42. The respondents also strongly agree that they would recommend the restaurant to their friends and other which the mean shows at the level 4.47 and the respondents strongly agree that they would encourage others

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

to visit the restaurant which the mean shows at the level 4.42. Then, the respondents strongly agree that they would say positive things about the restaurant to others which the mean shows at the level 4.43.

Validity and Reliability Test

Table 4. 15: Results of reliability Cronbach's Alpha for the variables

Variable	Number of items	Cronbach's Alpha Pilot Study (n=30)	Cronbach's Alpha Actual Study (n=30)
Music	7	0.866	0.871
Lighting	7	0.891	0.895
Layout	6	0.819	0.816
Customer buying behavioral	6	0.895	0.897

Table 4.15 shows the Cronbach's Alpha values of the questionnaire were above the acceptance level with the value range above than 0.70. George and Mallery (2003) provide the following rules of thumb which is >0.9 (excellent), >0.8 (good), >0.7 (acceptable), >0.6 (questionable), >0.5 (poor) and <0.5 (unacceptable).

The first independent variable that is Music found to be good reliable (7 items; $\alpha = 0.866$). The second independent variable that is Lighting show a good reliability (7 items; $\alpha = 0.891$). Then the last independent variable that is Layout also show a good reliability (6 items; $\alpha = 0.819$). For the dependent variable that is customer buying behavioural show a good reliability (6 items; $\alpha = 0.895$).

Normality Test

Table 4.16: Summary of Shapiro-Wilk Test

Shapiro-Wilk	Statistics	df	Sig
MeanMusic	0.784	384	0.000
MeanLighting	0.796	384	0.000
MeanLayout	0.745	384	0.000
MeanCBBehavioral	0.722	384	0.000

Table 4.16 shows the summary of Shapiro-Wilk Test for three independent variables (music, lighting and layout) and one dependent variable (customer buying behavioral). All items used in each variable will be involved in this normality test. . According to Table 4.1, the value for music is 0.784, lighting is 0.796, layout is 0.745 and customer buying behavioural is 0.722.

Hypotheses Testing

Spearman's connection coefficient is a factual measure of the consistency of a monotonic relationship between matched information. . Spearman's correlation coefficient is a measure of a monotonic relationship and the value of do not indicate there is no relationship between the variables. Table 4.17 shows the measurement scale to describe the strength of relationship between dependent and independent variable.

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

Table 4.17: Result of Spearman Correlation Analysis

Variable	CBB	Music	Lighting	Layout
CBB	1.0	0.750	0.771	0.836
Music	0.750	1.0	0.894	0.826
Lighting	0.771	0.894	1.0	0.857
Layout	0.836	0.826	0.857	1.0

Hypothesis 1: There is a relationship between music and customer buying behavioural.

Based on the Table 4.17, it shows the correlation between music and customer buying behavioural in Kuantan, Pahang. The r value of music is 0.750. The result indicates there is strong positive correlation between music and customer buying behavioural. Besides, the p-value is less than 0.05. This result shows that there is a significant relationship between music and customer buying behavioural. Therefore, hypothesis 1 is accepted. The result shows that music play an important role in influence customer buying behavioural.

1 Hypothesis 2: There is a relationship between lighting and customer buying behavioural.

Based on the Table 4.17, it shows the correlation between lighting and customer buying behavioural in Kuantan, Pahang. The r value of lighting is 0.771. The result indicates there is strong positive correlation between lighting and customer buying behavioural. Besides, p-value is less than 0.05. This result shows that there is a significant relationship between lighting and customer buying behavioural. Therefore, hypothesis 2 is accepted.

2 Hypothesis 3: There is a relationship between layout and customer buying behavioural.

Based on the Table 4.17, it shows the correlation between layout and customer buying behavioural in Kuantan, Pahang. The r value of layout is 0.836. The result indicates there is strong positive correlation between layout and customer buying behavioural. Besides, p-value is less than 0.05. This result shows that there is a significant relationship between layout and customer buying behavioural. Therefore, hypothesis 3 is accepted.

4 Discussion and Conclusion

The objective of this research is to investigate the effects of store atmosphere in restaurant towards customer buying behavioral in Kuantan, Pahang. Store atmosphere is crucial for development of an organization, as it helps to boost sales for the store and indirectly helps to generate revenue for the organization. The researcher used questionnaire method to collect data for this research. Questionnaire was used in this research as researcher will earn instant feedback from respondents. The questionnaire was distributed to the customers in Kuantan, Pahang through Google form. In this study, there are 384 respondents have been selected as sample. The test shows that the reliability analysis of question is acceptable. Most of the respondents were male and age from 19 until 30 years old. Most of the respondent's marital status is single. The respondent mostly have their income less than RM1000 monthly and most of them are students. Besides, most of the respondents are Malay. In addition, most of the respondents visit the restaurant few times a month.

Regression analysis showed that all coefficient sign related with independent variable follow that significant theory. We can conclude that all independent variable are proven related with dependent variable. As for conclusions, we can see that three (3) factors that used in this research

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

is proven succeeded in this study. From all there (3) independent variable, it can be concluded that layout is the most influence factor that affect customer buying behavioral in restaurant at Kuantan, Pahang. This is because the beta for space is highest than other variable.

5 Key Findings

Table 5.1: Summary of Hypotheses Testing Results

Hypothesis	Spearman Correlation	Results
H1: There is a significant effects of music in restaurant towards customer buying behavioural in Kuantan, Pahang.	p=0.00 (p<0.05) r=0.750	There are positive relationship between music and customer buying behavioural in Kuantan, Pahang
H2: There is a significant effects of lighting in restaurant towards customer buying behavioural in Kuantan, Pahang.	p=0.00 (p<0.05) r=0.771	There are positive relationship between lighting and customer buying behavioural in Kuantan, Pahang.
H3: There is a significant effects of layout in restaurant towards customer buying behavioural in Kuantan, Pahang.	p=0.00 (p<0.05) r=0.836	There are positive relationship between layout and customer buying behavioural in Kuantan, Pahang.

6 Acknowledgement

I am very grateful for the opportunity given to me to complete this research to be successful and give strength to complete this research that has been assigned to all students. I am also very grateful to be able to complete this research within the time allotted by my supervisor. This research could not be completed without effort and the supervisor also gave me guidance to complete my research. I would also like to thank my supervisor, Miss Nurul Azwa Binti Mohamed Khadri for guidance and encouragement in completing this research and also teaching and guiding in this research. I could not have completed this research without the guidance of my supervisor. Many thanks to our parents and family members who have given me moral support to complete this research. Finally, I would like to thank the University Malaysia Kelantan for providing a valuable opportunity to conduct this research. Finally, thank you and appreciation is given to all parties involved in the preparation of this research directly or indirectly.

THE IMPACTS OF PANDEMIC COVID-19 TOWARDS MANAGEMENT BUSINESS RETAIL IN GROCERY STORES AMONG RETAILERS IN PARIT BUNTAR, PERAK

Nur Farzana binti Omar and Nur Ain Ayunni Binti Sabri

Faculty of Entrepreneurship and Business,
Universiti Malaysia Kelantan,
Malaysia

Email: farzana.a17a0442@siswa.umk.edu.my; ayunni.s@umk.edu.my

Abstract:

The study aims to identify the impacts of Pandemic Covid-19 towards management business retail in grocery stores among retailers in Parit Buntar, Perak. It is very important for an organization to ensure management business retail in grocery stores are doing well. In this research, the researcher choose grocery stores as the impacts which are unstable financial management, the lack of time management and the insufficient stocks/raw material. In this research, it focuses on three objectives, which is to identify each relationship of independent variables (unstable financial management, the lack of time management and the insufficient stocks/raw material) with dependent variables (management business retail in grocery stores). 150 respondents were chose from retailers of grocery stores by using convenience sampling. The findings of the study is, three of the independent variables which is unstable financial management, the lack of time management and the insufficient stocks/raw material have significant relationship with management business retail in grocery stores..

Keywords: Grocery Store, Time Management, Retailers, Financial Management, Pandemic Covid-19.

1 Introduction

There has been a long tradition of concerns about epidemics. Discussions should not concentrate on when an epidemic will occur, nor when there will be a new outbreak according to Stöhr & Esveld, (2004). A chronic and irreversible practical biological occurrence is the incidence that contributes to influenza pandemics. As a result of the development of new subtypes of viruses from viral reunification, pandemics tend to occur at intervals of 10-50 years according to Potter, (2001).

If we are in a pandemic situation, the long-term consequences are very difficult to quantify. While many pandemics have struck retailers in the past, it is difficult to estimate because of unstable financial management, the lack of time management during operations and insufficient stock or raw materials, as these factors have not been thoroughly studied in the past.

Current minimal literature indicates that low asset returns are generally correlated with the main historical pandemic of the last millennium according to Jorda, Singh, & Taylor, (2020). It appears to be less interested in spending and more interested in saving our resources for the post-epidemic era, resulting in slower economic growth.

Many retail firms have been forced to close by the pandemic COVID-19, creating unprecedented

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

trade disruptions in most retail business sectors. Many short-term problems are faced by retailers, such as those relating to health and safety, supply chain, labor, cash flow, customer demand, revenue, and marketing. However, meeting this obstacle successfully would not guarantee a bright future or a future at all.

This is because it will appear in a world very distinct from the world before the plague when we go through this epidemic. Many markets no longer exist, especially in the field of tourism and hospitality. In the current setting, all organizational roles tend to prioritize and optimize spending or delay activities that will not bring benefit.

There are four objectives of this research:

1. To examine the relationship between unstable financial management and the impacts of Covid-19 towards management business retail in grocery stores among retailers in Parit Buntar, Perak.
2. To identify the relationship between the lack of time management and the impacts of Covid-19 towards management business retail in grocery stores among retailers in Parit Buntar, Perak.
3. To study the relationship between the insufficient stocks/raw material and the impacts of Covid-19 towards management business retail in grocery stores among retailers in Parit Buntar, Perak.

Significance of The Study

Researchers

Researcher as this research can help providing information needed by them. Future researcher who conducted research related to this research can take some information from this study

Retailers

Retailers is a company that buys products from a [manufacturer](#) or [wholesaler](#) and sells them to end users or customers. In a sense, a retailer is an intermediary or middleman that customers use to get products from the manufacturers according to Harper, Douglas, (2018).

2 Literature Review

Management Business Retail in Grocery Store

Grocery stores play a major role in the purchase of raw materials, with an average weekly retail spend of \$38 according to Glanz & Amy, (2004). Further, grocery stores are expanding their offerings at a category known as "raw material stock solutions," which includes deli and food provided; ready-to-eat and hot foods, and energy-saving materials and measures such as pre-cut and cleaned vegetables according to Glanz & Amy, (2004). Supermarkets are now contributing almost a fifth of all food is taken out according to Glanz & Amy, (2004).

Unstable financial management

Financial management related to business retail in grocery store problems affects the cost of failure according to Ang, James S., (1991). The probability of failure can be increased by taking the risk of the retailer, incomplete management team, limited alternative financing resources, lack of alternative value measurement due to lack of traded securities and replacement problem according to Ang, James S., (1991). Therefore, the problem financial management in business retail is more complex.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

The Lack of Time Management

Interest in time management is nothing new. The problem is how managing time was already discussed in the 1950s and 1960s, and some authors proposed methods on how to deal with time problems at work and store opening hours according to Drucker, (1967); Lakein, (1973); Mackenzie, (1972); McCay, (1959). They suggest simple solutions such as writing a work plan on paper (called a “to-do list”) to improve the work performance and operating hours.

Insufficient stocks or raw material

Insufficient stock or raw materials completely is one of the important problems for business retail in grocery store according to Sinha & Sarmah, (2007). Today a competitive retail business environment, stocks on specific suppliers or manufacturers will create opportunities for other competitors and therefore suppliers or manufacturers facing a situation of running out of stock or losing sales must be used effective strategies to retain their customers which is retailers buy some products for their grocery store according to Sinha & Sarmah, (2007).

Research Hypothesis

In this study, there were three hypothesis that are positively related between the factors that influence tourists' satisfaction towards heritage museums in Kelantan

H1: There is significant relationship between unstable financial management and management business retail in grocery stores among retailers.

H2: There is significant relationship between the lack of time management and management business retail in grocery stores among retailers.

H3: There is significant relationship between the insufficient stocks/raw material and management business retail in grocery stores among retailers.

Research Framework

Based on the literature review, the conceptual framework has been developed. Which the conceptual framework had included four independent variables and one dependent variable. The independent variables are travel environment, accessibility, infrastructure and heritage attraction while the dependent variable is about the tourist satisfaction to the heritage museums. The conceptual framework is shown as below figure:

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

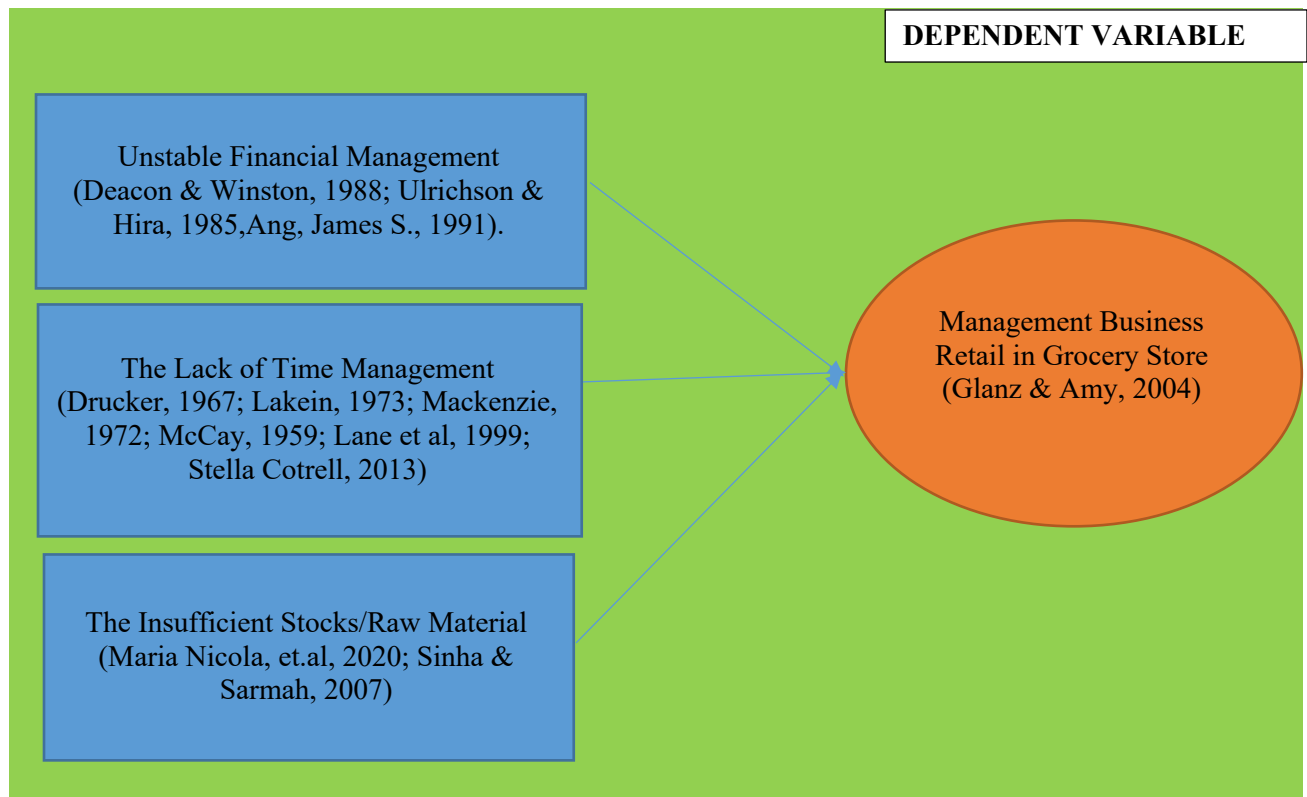

Figure 1: Research Framework

3 Methodology

Research Design

Research design is an outline for the collection, measurement and analysis of data, based on the research questions of the study according to Sekaran & Bougie, (2009). Descriptive study has been used in order to get data for this research. Descriptive study means the transformation of raw material data into a form that can make people easily understand the data to provide descriptive information. The objective of a descriptive study is to describe according to Sekaran & Bougie, (2009). This descriptive study had been chose to be applied in order to illustrate the impact of Covid 19 towards management business retail in grocery stores among retailers in Parit Buntar, Perak.

Data Collection

In the first stage, primary data are data that collected by researchers from first-hand sources, using methods like surveys, interviews, or experiments.

The second stage of data collection was a fieldwork but through online platform. The researchers used the Google form questionnaire to be distributed to the retailers at Parit Buntar, Perak. In the questionnaires, the researchers will set one of the questions to identify whether the person is meeting the criteria or not before answering the survey.

Sampling

In sampling design, the non-probability sampling used is convenience sampling. According to Lewis, Thornhill (2012) described, in this sampling, there are no other criteria to the sampling

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

method except that people available and willing to participate. The sample is drawn by a group of people easy to contact or to reach. It is least biased design and offers the most generalized.

4 Data Analysis

Data Analysis is a process or attempt to process data into new information to make the characteristics of the data easier to understand and useful for solving problems, especially those related to research. Data analysis can also be defined as an activity undertaken to transform data from research into new information that can be used to draw conclusions. In general, the purpose of data analysis is to explain data for more natural understanding, and then comes to a conclusion. A conclusion from data analysis is derived from a sample that is generally based on hypothesis testing or hypothesis. The researchers had analysis the data by using descriptive statistic, reliability test, and Pearson's correlation coefficient. At the same time, Statistical Package for the Social Sciences (SPSS) will be used in this research.

5 Findings

In this study, the reliability test was performed by 150 respondents using the online survey process. It was measured using Cronbach's Alpha Coefficient showing a range from 0.856 to 0.904 which indicated that the result was good to very good where the management business retail in grocery store has the maximum Cronbach Alpha value of 0.930, the insufficient stocks or raw material has the second highest alpha value of Cronbach, which was 0.904, and then to the lack of time management (0.865), followed by a unstable financial management (0.856). Thus, all variables fulfilled the minimum criterion of reliability, as all Cronbach alpha coefficients of all variables were greater than 0.6.

In the Descriptive Analysis for Independent Variables, the maximum mean value was 4.33 management business retail in grocery store, followed by a unstable financial management (4.26) followed by the lack of time management (4.26). The insufficient stocks or raw material 4.19 was the lowest mean value for independent variables. The total mean value was 4.26. It was concluded that the management business retail in grocery store had the biggest effect on the retailers in Parit Buntar, Perak

The researchers carried out the correlation analysis in order to calculate the linear association between the two variables defined as the purposes of this report. A review of Correlation Analysis indicating that the linkage between the insufficient stocks or raw material and management business retail in grocery store is 0.712 which mean that there was a strong positive correlation, while the lack of time management and management business retail in grocery store was in a moderate positive correlation (0.681) and the lowest value of correlation was the unstable financial management and management business retail in grocery store which only 0.653 and was in a weak to no relationship. A correlation table of these variable as shows as below:

Correlation

		Intention to Use
Unstable financial management	Pearson Correlation	.653**
	Sig. (2-tailed)	.000
	N	150
The lack of time management	Pearson Correlation	.681**
	Sig. (2-tailed)	.000

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

	N	150
The insufficient stocks/raw material	Pearson Correlation	.712**
	Sig. (2-tailed)	.000
	N	150

6 Discussion & Recommendation

The insufficient stocks/raw material

Based on the result of Pearson Correlation, the researcher had identified that there was a significant relationship between the insufficient stocks/raw material and management business retail in grocery store. A strong correlation relationship between the insufficient stocks/raw material and management business retail in grocery store towards retailers. Today a competitive retail business environment, stocks on specific suppliers or manufacturers will create opportunities for other competitors and therefore suppliers or manufacturers facing a situation of running out of stock or losing sales must be used effective strategies to retain their customers which is retailers buy some products for their grocery store according to Sinha & Sarmah, (2007).

The lack of time management

According to this study, there was a significant relationship between the lack of time management and management business retail in grocery store. A moderate correlation relationship between the lack of time management and management business retail in grocery store towards retailers. Time management also had a problem for business retail which is the availability and use rarely operating time at the most efficient level in business retail according to Lane et al, (1999) position due the pandemic Covid-19.

Unstable financial management

The result indicated that there was a significant relationship between unstable financial management and management business retail in grocery store. A weak correlation relationship between unstable financial management and management business retail in grocery store towards retailers. Financial management related to business retail in grocery store problems affects the cost of failure according to Ang, James S., (1991). The probability of failure can be increased by taking the risk of the retailer, incomplete management team, limited alternative financing resources, lack of alternative value measurement due to lack of traded securities and replacement problem

7 Recommendation

The researchers discovered from the sample that the insufficient stocks/raw material has a stronger relationship to management business retail in grocery store. Furthermore, the management for retailers will not only be impacted by the insufficient stocks/raw material. Unstable financial management and the lack of time management are also important. This research just needs to know which variables this retailer's compilation of Covid-19 should use. It was discovered that the insufficient stocks/raw material is an independent variable that will convert retailers to make the management while performing the Pearson Correlation Coefficient. In this proposal, the retailer should provide good management to the grocery store, such as product addition. In addition to plans to activate the website for social media by posting about the grocery store business so that people can see. However, it is recommended that more variables be

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

used by prospective researchers. Finally, only when conducting surveys can prospective studies even use qualitative approaches instead of questionnaires.

8 Conclusion

The goal of this study is to get a clear picture of the study on the relationship between unstable financial management, the lack of time management, and the insufficient stocks/raw material towards retailers to management business retail in grocery store during Covid-19. Do a survey using questionnaires to meet the defined targets and answering the research question. Around the same time, this study has been evaluated and has been able to provide sensible responses to research questions. As the study shows, it can be concluded that despite the limitations discussed above, the design of the study produces reasonable answers and allows us to answer the research questions posed. In brief, future researchers need to continue pursuing this study with a new level of understanding that can affect the impacts of pandemic Covid-19 towards retailers and increase the sample size further.

GLOBAL FAST FOOD RESTAURANT AMONG UNIVERSITI MALAYSIA KELANTAN STUDENTS

Nur Hamizah Binti Ghani and Yusrinadini Zahirah Binti Md. Isa@Yusuff

Faculty of Entrepreneurship and Business,
Universiti Malaysia Kelantan,
Malaysia

Email: hamizah.a17a0454@siswa.umk.edu.my; yusrinadini@umk.edu.my

Abstract

The purpose of this study is to identify the factors influencing consumer choice of global fast food restaurant among Universiti Malaysia Kelantan students. The total number of respondents that involve in this study is 361 respondents. This study uses quantitative which questionnaire in a form of Google Form distributed to the respondents. And the data collected will through the test in Software Package for Social Sciences (SPSS). Three factors be as the independent variables which is food quality, convenience, and promotion in this study. The results and finding show that convenience was the highest level of positive significant relationship between consumer choice that be as dependent variable.

Keywords: *Fast food, Consumer Choice, Food Quality, Convenience, Promotion*

1 Introduction

Fast food has been defined as a “general term used for as limited menu of foods that lend themselves to production-lobe techniques; suppliers tend to specialize in products such as hamburgers, pizzas, chicken, or sandwiches” (Bender & Bender, 1995). The fast food industry’s growth has been spurred on by globalisation and the general increase in the incomes of the wider global population. More-so in the developing world, more inclusive economic growth has created a new market for the fast food franchise industry, particularly due to the increased demand for and consumption of convenient, quick serving and ready-made meals (Tabassum & Rahman, 2012).

In Malaysia, fast food is a rapidly growing industry especially in the urban areas such as Kuala Lumpur. Moreover, the food diversity in Malaysia is an implicit characteristic of the diversified culture of the country amongst the different regions within the states. There has been a sustained increase in the demand for convenience foods and snacks over a number of years (Traill, 1994). Furthermore, fast food in Malaysia seems to have been well received by Malaysians after the fast food menu adapted into basic Malaysian food requirements to their preparation excluding pork from the menu in line with Islamic teachings because of Malaysian were majority Islamic.

Because of that, Malaysia are in their hard working to produces and built their own products and services of fast food franchise. With the local fast food franchise, of course the menu offered by local fast food franchise is a must to follow by the culture of Malaysian which Halal. One of local fast food franchise that has been known well by Malaysian and also famous is brand “Ayamas”. And the rest brand of local fast food franchise is not known well by Malaysian. Majority of Malaysian are not knowing about the local fast food franchise brand already existing in Malaysia. This is because of their marketing is low or whatsoever.

In franchise business, it is really important in order to keep consumer loyal toward their products and services. Hence, there are many outlets were opened in many countries include Malaysia. In this sector, it gives so many advantages to whose are involved in franchise which among its

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

advantages is create high number of consumers. The number of consumers will be increase when the outlets were near around them. For example, in Malaysia we can see McDonalds outlet were everywhere and there have always new consumer. Besides, franchise also strengthen the business which open new outlets at new location. With that, the franchise business always growing up fast and fast suitable with the demand in the market.

With that, consumer will able to achieve the products and services that they want from the franchise brand when the outlet were near around them. Indirectly, that franchise business has provide the convenience to their consumer that will make their consumer to keep loyal toward them. Other convenience that usually provide by the franchise business to their consumer especially in fast food industries is drive thru, Wi-Fi, playground for kids and also place to eat at there or it's called as restaurant.

With all of the convenience that offered by the fast food restaurant, convenience is listed among of the factor's consumer choice of global fast food restaurant. This research will be exposed which factor were salient to be as the factors that influencing consumer choice of global fast food restaurant.

1.1 Research Objectives

Below are the research objectives for this research:

1. To identify whether food quality affect consumer to purchase global fast food products and services.
2. To identify whether convenience affect consumer to purchase global fast food products and services.
3. To identify whether promotion affect consumer to purchase global fast food products and services.

1.2 Significance Study

The aim of this study is to identify the factors influencing consumer choice of global fast food restaurant among University Malaysia Kelantan students. All of that factors will be showed as a result in this study and will be practiced by the local franchise business in order to get consumer's attention. This is because majority Malaysian are not realized about the existing of fast food local brand franchise business in Malaysia. Thus, local franchise will get place in customer's choice when consumers were in decision making of purchasing fast food franchise products and services. As a result, local fast food franchise will be successfully similarly global fast food franchise. Furthermore, Malaysian can support the local fast food franchise business in order to increase Malaysia's economy.

2 Literature Review

2.1 Independent Variables

2.1.1 Food Quality

Food quality can be an important element in the fast food restaurants but there is no consensus on the individual attributes that constitute food quality. Therefore, all the food attributes are lumped together in only one variable that is food quality (Sulek & Hensley, 2004). According to Grunert (2005), the food quality attributes are depending on the food type and the individual's food preference itself because the food attributes that constitute quality may change over the time as well in the consumer's mind. Moreover, different individual cognitive determinants on food quality may also lead to the difficulty to understand the consumer behaviour (Van Rijswijk & Frewer, 2008). In addition, consumers are usually poor and confused at predicting the food quality

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

they needed to perceived and are dissatisfied despite the fact they are situated and unable to make confirmation on their own expectations for a particular food product (Grunert, 2005).

2.1.2 Convenience

Convenience encompasses people's desire to save time and energy while engaging the consumption process, which includes planning, shopping, storage, preparation of food, consumption, cleaning up, and disposal of leftovers and wastes (Gofton, 1995; Scholderer & Grunert, 2005; Yale & Venkatesh, 1986). It also entails the transfer of significant amount of preparation time, culinary skills, or energy inputs from the home to the food processor or distributor (Candel, 2001; Costa, Dekker, Beumer, Rombouts, & Jongen, 2001).

2.1.3 Promotion

Promotion is a key component and a valuable tool for marketers. Moreover, it has been widely used to get a competitive edge and increase the sales and attract consumer's intention. Promotion influence the consumers' quantity and reduce the time for decision making. According to Kotler (1999), sales' promotion is a short-term encouraging strategy to increase sales or purchase of brands. Moreover, it is a strategy which demands short time to increase profits (Banerjee, 2009). This strategy has the ability to attract and retain the customers and build a strong link with the sellers (Ndubisi & Moi, 2006). Furthermore, sales' promotion includes three main strategies namely, push, pull and the combination of pull and push. Push means the product is pushed from distributors to the consumer by different promotions like discounts, personal selling, buy back guarantee, contests and more meanwhile pull means the consumer pulls the products for distributors through different ways like samples, games, coupons, premiums, loyalty rebates and cash refund (Dolak, 2010). Sales' promotion plays an important and significant role in the consumers' purchase intention and making-decision for purchasing a specific product (Neha & Manoj, 2013).

2.2 Hypothesis

1. There is significant relationship between food quality and the factors influencing consumer choice of global fast food restaurant.
2. There is significant relationship between convenience and the factors influencing consumer choice of global fast food restaurant.
3. There is significant relationship between promotion and the factors influencing consumer choice of global fast food restaurant.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

2.3 Conceptual Framework

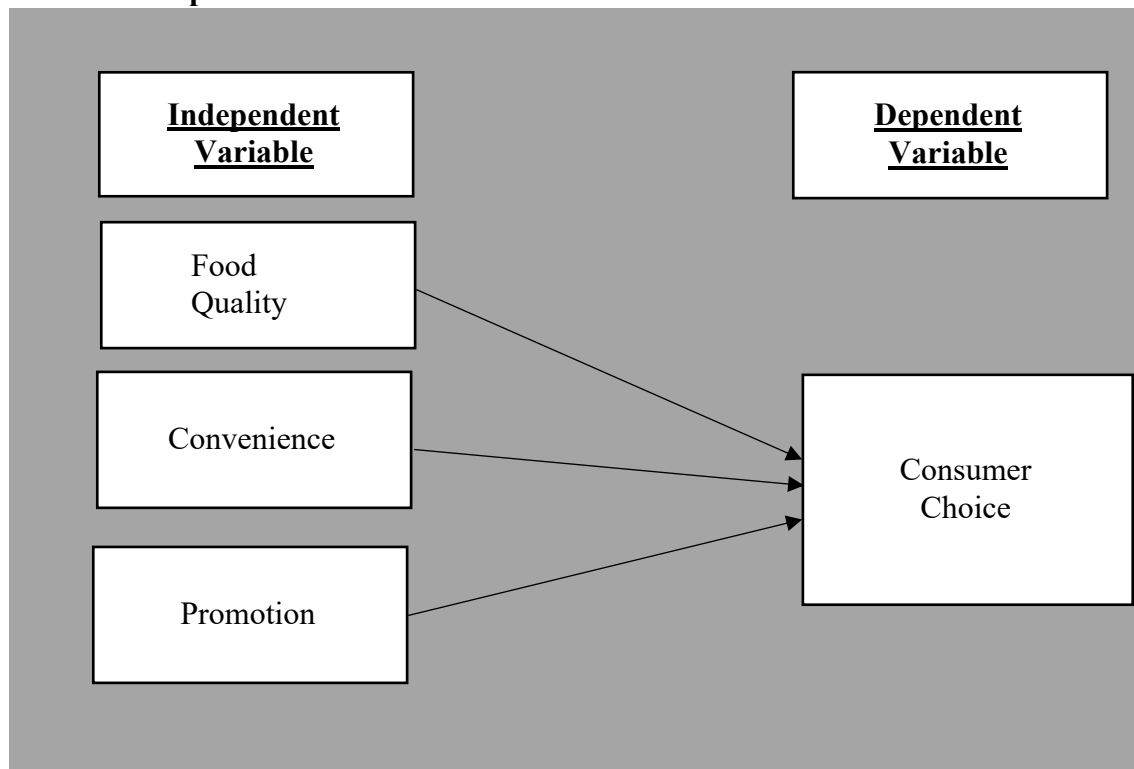

Figure 1: Conceptual Framework of Factors Influencing Consumer Choice of Global Fast Food Restaurant Among Universiti Malaysia Kelantan Students

3 Methodology

3.1 Research Design

This study used quantitative methods which questionnaire in order to study about the factor influencing consumer choice of global fast food restaurant among Universiti Malaysia Kelantan students. From questionnaire, data will be gathered just once because questionnaire only will be distributed through online medium.

3.2 Population

The exploration of this study is in Universiti Malaysia Kelantan Campus City, Pengkalan Chepa, Kota Bharu, Kelantan. This location was chosen as a population to conduct this study because it is near Universiti Malaysia Kelantan has famous and branded fast food outlet which McDonalds in addition Universiti Malaysia Kelantan City Campus students were majority of McDonalds' customer at there.

However, there has three different faculties in Universiti Malaysia Kelantan City Campus, Pengkalan Chepa, Kota Bharu Kelantan which Faculty of Business and Entrepreneurship (FKP), Faculty of Hospitality, Wellness and Tourism (FHPK) and Faculty of Veterinary Medicine (FPV). The total of population for three faculties were 5 864.

3.3 Sample Size

Based on the number of populations collected, 5 864 is the number of total students from all three faculties which are from Faculty of Business and Entrepreneurship (FKP), Faculty of Hospitality, Wellness and Tourism (FHPK) and Faculty of Veterinary Medicine (FPV) in current year which 2020. From that number, the number of sample size can be determined based on table Krejcie and Morgan (1970). 361 students in Universiti Malaysia Kelantan City Campus will be as the

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

respondents in this research.

3.4 Data Collection

Questionnaire is one of quantitative method and was used as the primary data. The questionnaire has been distributed through Google Form to Universiti Malaysia Kelantan Campus City students to get response on self-administered questionnaire. The purpose of using Google Form is because to make this study non-contrive. In addition, people now are in technology era. Majority people are using the internet and electronic devices such as smartphone or tablet. So, using Google Form is the best way and in the same time it is eco-friendly because can reduce the using of papers. Energy, time, and cost also can be saved. This study also used secondary data. The journals, articles, papers and others has accessed through Internet which Google Scholar. The researcher used Google Scholar in order to save time. Others than that, books also used in this research. All the information in the secondary data that used by the researcher has been gathered in this research to studying the factors influencing consumer choice of global fast food restaurant.

3.5 Sampling

Non-probability chosen in conducting this research. From non-probability sampling techniques, convenience sampling has been chosen for this research. This sampling techniques were chosen for this research because of the population was already identified which the respondents are from Universiti Malaysia Kelantan City Campus where three faculties namely Faculty of Business and Entrepreneurship (FKP), Faculty of Hospitality, Wellness and Tourism (FHPK) and Faculty of Veterinary Medicine (FPV) were involved in this research

3.6 Research Instrument

In the questionnaire, it has one dual language which Malay and English for respondents to read and answer. For the cover page, the title of the research will be presented and also have a brief introduction first. From there, the respondents will know the aim of the research. There have four section in the questionnaire. For the first section, it is about general information and demographics of respondents. Next, followed by the section two until four which it is about factors influencing consumer choice of global fast food restaurant. In this questionnaire, has provided the construct measurement of the study involving the independent variables of this research which food quality, convenience and promotion while dependent variable is consumer choice.

Table 1: Sources of Questionnaire

3.7 Data Analysis Techniques

In this study, database Software Package for Social Sciences (SPSS) version 22.0 has been used. Software Package for Social Sciences (SPSS) is a computer software for record any statistical data analysis which looks like a spreadsheet and it can enter, edit, and view the contents of the data file. With the using of Software Package for Social Sciences (SPSS), data management will be recorded effectively, wide range of options and better output organization.

4 Data Analysis and Findings

4.1 Demographic Profile

There have five question in demographic profile section which is gender, age, faculty, year of study and frequently purchase fast food products. For the results, it shows 26.87% or 97 respondents are male. Meanwhile, the rest from 361 respondents which 73.13% or 264 respondents are female.

Next, age. There have four option answer for this question which is 18-20 years old, 21-23 years old, 24-26 years old, and 27-30 years old. The results show mostly respondents are from 21-23 years old which represent 75.07% or 271 respondents. Meanwhile, for 24-26 years old and 18-20 years old, only 14.96% or 54 respondents and 9.70% or 35 respondents. Lastly, for 27-30 years old, there have only 0.28% or 1 respondents. The total number for respondents is 361 respondents.

Next, faculty. Only three faculty provided as the answer for this question which is FKP, FHPK, and FPV. For the results, highest respondents are from FKP which it has 63.43% or 229 respondents from the total number of respondents which 361 respondents. Respondents from FHPK has 31.86% or 115 respondents meanwhile the rest percentage is for FPV which 4.71% or 17 respondents.

Next, year of study. Year 1, year 2, year 3, and year 4 are the option of the answer that were provided for this question. The results show 7.48% or 27 respondents represents respondents are from year 1 in their studying in Universiti Malaysia Kelantan City Campus. Next, 21.05% or 76 respondents are from year 2 meanwhile 23.55% or 85 respondents are from year 3. Lastly, 47.92% or 173 respondents represent respondents are from year 4 which it is their final year in Universiti Malaysia Kelantan City Campus.

4.2 Descriptive Analysis

26 items had tested the descriptive analysis according to their variable and listed on the summary of the mean and standard deviation of computed items in Table 2.

Table 2: Summary of the Means and Standard Deviation of Computed Items according to Variable

Variables	Mean	Std. Deviation
Food Quality	4.63	0.45
Convenience	4.50	0.57
Promotion	4.52	0.59
Consumer Choice	4.43	0.70

Table 2 showed that all the independent variable consists food quality, convenience, promotion and consumer choice among Universiti Malaysia Kelantan students. Based on the result, food

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

quality was the highest mean whereas consumer choice has the lowest mean. The owner of fast food business needs to concern about these three factors to improve the performance of the fast food business in the future in order to attract the customer to make their business as in their list.

4.3 Reliability Analysis

Cronbach' Alpha is defined as a statistic to demonstrate the tests and scales that have been adopted for research are fit for purpose. There has a value for Cronbach's Alpha to be acceptable which it has to be more than 0.7 (Perry, Charlotte, Isabella, & Bob, 2004).

Table 3: Reliability Statistics

	Cronbach Alpha	N of Items	Result
Independent Variable			
Food Quality (IV1)	0.90	6	Excellent
Convenience (IV2)	0.94	10	Excellent
Promotion (IV3)	0.91	5	Excellent
Dependent Variable			
Consumer Choice	0.91	5	Excellent

Researcher got the Cronbach Alpha's result $\alpha \geq 0.9$ for all the variables which mean that instruments are reliable and accepted to use based on the Cronbach Alpha Coefficient Size. For all the variables which food quality, convenience, promotion and consumer choice has excellent reliable to use because the Cronbach Alpha value at range $\alpha \geq 0.9$ which 0.90, 0.94, 0.91, and 0.91 respectively.

4.4 Spearman Correlation Analysis

Spearman Correlation used in this section in order to examine the relationship between independent variables and dependent variable. This correlation coefficients worked to provide a numerical overview of the direction and the strength of the linear relationship between independent variables and dependent variables. When the r value is 0, it indicates there have no relationship between two variables and when it shows the r value is -1, it can be interpreted as a negative correlation. The r value can interpret the strength of the relationship. The result of correlation between independent variables and dependent variable from SPSS show above in Table 4.

Table 4: The correlation between independent variables and dependent variable.

Variables	Mean (SD)	Food Quality	Convenience	Promotion	Consumer Choice
Food Quality	4.63 (0.45)	1.000	0.790*	0.745*	0.620*
Convenience	4.50 (0.57)	0.790*	1.000	0.853*	0.838*
Promotion	4.52 (0.59)	0.745*	0.853*	1.000	0.821*
Consumer Choice	4.43 (0.70)	0.620*	0.838*	0.821*	1.000

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

4.5 Summary

Table 5: Summary of the Hypothesis Results

Number of hypothesis	Statement of hypothesis	Result	Significant Value
H₁	There is significant relationship between food quality and consumer choice	Accepted	0.000
H₂	There is significant relationship between convenience and consumer choice.	Accepted	0.000
H₃	There is significant relationship between promotion and consumer choice.	Accepted	0.000

5 Discussion and Recommendation

The factors influencing consumer choice of global fast food outlet among Universiti Malaysia Kelantan students were examined in this study by distributing a survey in a form of online questionnaire to Universiti Malaysia Kelantan students as the respondents in this research. All the independent variables which is food quality, convenience, and promotion show positive relationship with the dependent variable.

In order to keep the fast food business maintain successful, every owner of the fast food business should improve and practice with all three factors that be as the independent variable in this research which is food quality, convenience, and promotion. Other than that, the company also should give a chance to their workers in order to improve the skills of their workers in providing the services to the customer.

The research has three objectives. To identify whether food quality affect consumer to purchase global fast food products and services is first objective. Second objective is to identify whether convenience affect consumer to purchase global fast food products and services. And the last objective is to identify whether promotion affect consumer to purchase global fast food products and services. For hypothesis results, it shows the positive significant among independent variables (food quality, convenience, and promotion) and dependent variable (consumer choice).

This research will have with few recommendations based on the result in this research. The purpose of recommendation is in order to increase the successful to fast food business industries especially in Malaysia. The recommendations will be based on the independent variables which is food quality, convenience, and promotion and dependent variable which is consumer choice.

Food quality is one of important elements that should be concern in food business industries. In managing food quality, the server should be the one who take care about tidiness and cleanliness. This is because, someone who has the good attitude with tidiness and cleanliness will take a good care with what are he serving with especially serving food. Besides, company should not use the same ingredients that have no freshness to serving to the customers. With that, it will give a bad taste of food and will cause bad food quality. With control those matters in food quality, the performance of the business will be increasing and will took a place in consumer choice.

Next, convenience. As Jekanowski, Binkley, and Eales (2001) stated in their research, the demand for fast food actually depends heavily on the demand for convenience at the fast food restaurant. Convenience make easier to customer who come to purchase the products and services. Talking about convenience, there have many types of convenience include delivery, transport facility, ease entry and exit and others. Delivery is one of important that should be take care by the owner

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

of business. This is because the name of the business is “fast food” that should be fast as its name. In handling delivery, it should be many workers cooperate together to complete customer’s order. For example, one worker should be have at drinks station, one worker should be have at ice cream station, one worker should be have at burger station and lastly the order should be deliver to waitress that are ready to deliver the order to customer who are waiting at their place in the restaurant. With that cooperation, the customer’s order can be complete not more than five minutes. With that fast delivery, consumer will not hesitant to purchase the products because the services offered was so worth it. Besides, the ease of entry and exit also should be concern by the owner of the business because this matters actually give a sign of customer mood to purchase the products and service. For example, if the ease of entry is so complicated because the location was so narrow and it make customer hard to find the parking and at the end it will give a bad mood to customer in their choice to make a purchase at fast food restaurant because afraid that they will get summons by authorities.

Lastly, promotion. Talking about promotion, there have many ways to up the promotion about our products and service. The owner of the fast food business has to take a risk in issue large capital because in order to attract big number of customers, there have need a big number of capitals. For example, the promotion should be with make an advertising at the billboard, television, radio others. But for me, the best way of promotion is doing an advertising through online such as on YouTube, Facebook, Instagram and others social media platform. This is because mostly people nowadays have those social media and this is a good opportunity to make a promotion about our products and services. When people see an advertising through online platforms, they also can order theirs through online too if they have internet banking. And this is also making the customer feel easier to order because there has delivery option that provide by the company to customer.

6 Conclusion

In conclusion, to study the factors influencing consumer choice of global fast food restaurant among University Malaysia Kelantan is the objective of this research and it has achieved through distributing questionnaire to the respondents in Google Form. Food quality, convenience, and promotion among the determinants that influence consumer choice of global fast food. From the result, all those three determinants show the positive significant relationship. Among those determinants which food quality, convenience, and promotion, the higher result that show positive significant relationship is convenience and it show convenience was the most that influence consumer choice to purchase global fast food products and services.

7 Acknowledgement

First of all, I would like to express my highest appreciation to Dr. Yusrinadini Zahirah Binti Md Isa@Yusuff as my supervisor that also lecturer of Faculty of Entrepreneurship and Business in Universiti Malaysia Kelantan. With her guidance, I am finally successfully complete in writing this final year project. She is full with patience in guiding me and she always give me full support and also motivation to me to continuing writing my final year research project.

Besides my supervisor, I am also would like to thanks to my friends who always give many advices and support lots to complete my research project. The friends who that share their knowledge with me and sharing ideas in writing this research project. Furthermore, I am also thankful to my whole family that give me full support that are be as my strength and backbone and also always cheer me up when I am in stress mood in completing this research project.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Lastly, I would like to thank to the management of Universiti Malaysia Kelantan because willing to give the cooperation with me which provides a way to access the material for writing the research project such as online library.

FACTORS AFFECTING PURCHASE INTENTION IN SUPERMARKET AMONG CONSUMERS IN BUKIT MERTAJAM, PENANG.

Nur Izzati Abdul Rahim and Mahathir Muhamad

Faculty of Entrepreneurship and Business,
Universiti Malaysia Kelantan,
Malaysia

Email: izzati.a17a0465@siswa.umk.edu.my; mahathir.m@umk.edu.my

Abstract:

This study aimed to investigate the factors affecting purchase intention in supermarket among consumers in Bukit Mertajam, Penang. To collect the data for this study, researcher made online questionnaire through Google form with provide or uses 24 questions. The sample size of this study based on population in Bukit Mertajam was 370 people which they was selected random to respond research questionnaire. This study used Theory of Planned Behaviour (TPB) by analyzing and reviewing the literature related to product quality, sales promotion, attitude, and subjective norms. To assess questionnaire validity, content validity and construct validity were used and its reliability was measured through Cronbach's alpha as 0.958. Therefore, based on the results of this study, the variables of product quality, sales promotion, attitude and subjective norms have a significant relationship with customers' purchase intention in supermarket.

Keywords: Purchase Intention, Product quality, Sales promotion, Attitude, Subjective norms, Supermarket

1 Introduction

Consumer is important element for buying and selling process. Consumer can define as a person or a group who intends to order, or purchase and uses the product offered by retailer (Ashmita Dahal Chhetri, 2020). Besides, consumers intention also influence consumer in purchasing product or service. Consumer will selecting or decide to purchase products or services offered if they think or beliefs the product or service can satisfy their needs and wants. According to Dr. Vahidreza Mirabi et al. (2015), purchase intention can define as a situation where consumer decide to buy a certain product in certain condition. Purchase intention of consumer can be changed under the influence of a few factor whether from consumer or product.

Supermarket is a large retail store. It involve self-service basis and offering many categories of product such as grocery product, dairy products and household products. Supermarket has a wider selection and has larger space than grocery stores, but it is smaller and the range of merchandise provide in supermarket more limited than a hypermarket.

This study aimed to identify the factors affecting purchase intention in supermarket among consumers in Bukit Mertajam, Penang. The objective of this study is to examine the relationship between product quality and purchase intention in supermarket among consumers in Bukit Mertajam, Penang. Second objective is to identify the relationship between sales promotion and purchase intention in supermarket among consumers in Bukit Mertajam, Penang. Third objective is to determine the relationship between attitude and purchase intention in supermarket among consumers in Bukit Mertajam, Penang. Forth, the objective is to analyze the relationship between

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

subjective norms and purchase intention in supermarket among consumers in Bukit Mertajam, Penang.

2 Literature Review

Dependent Variable

Purchase Intention

Consumers' buying decision is very complex. Purchasing intention usually related with consumers' behaviour and also their perception and attitude. Purchase behaviour is important for consumers especially when they considering and evaluating of certain product offered by retailer (Dr. Vahidreza Mirabi et al., 2015). Usually, consumer will be driven by their intention after the consumer decide to purchase product or service in certain store. According to Siti Nurafifah Jaafar et al. (2012), purchase intention might be altered by the influence of price, value perception and also quality perception.

Independent Variable

Product Quality

Consumer evaluate product quality based on some of informational cues and then form a set of beliefs about the product. Informational cues involve both extrinsic and intrinsic features related to the product (Cham, T.H et al., 2018). Extrinsic attributes include company reputation, brand image, and price; while intrinsic attributes refer to the physical characteristics of the product such as product characteristics, specifications, design, measurements, shapes, materials used, and perceived durability.

Product quality is a key factor in assessing purchase intention. It is a continuous process of improvement that the continuous changes increase product performance and consequently the satisfaction of customers' needs. Improved the quality of product every moment important to gain belief and attention from consumer. According to Dr. Vahidreza Mirabi et al., (2015), based on their conclusion towards the product quality is if the product has a better quality, customer will be more inclined to purchase it. Also, their study emphasized that product quality has a positive impact on customers' purchase intention.

Sales Promotion

Promotions can be defined as a form of marketing communication. Marketing communication is one of the marketing activity that seeks to disseminate information, attracting or persuading and alerting the target market of the company. On the other word, promotion is the most important activities play an active role in introducing, inform, and recalls the benefits of a product in order to encourage consumers to buy the product being promoted. Sales promotion can help the retailer to influence the consumer intention to decide purchase the product when visit the supermarket. Sales promotion is a tool to attracting consumer and help to increasing the sales volumes. Thus, sales promotions are adopted by brands to motivate customers' purchases and reward fast responses (Kotler et al., 2004). According to Zoellner and Schaefers (2015), price promotion is one of strategies that frequently used by retailer or marketing managers to improve their sales and performance.

Attitude

Attitude refer to an evaluation and emotional belief by individual and the behavior describe the certain things and perceptions, which allow people to form fairly reliable behavior to the similar

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

things. According to Korzaan and Rutner (2003), attitude can define as the psychological emotional and the positive or negative evaluation that arise when an individual involve in the specific behavior. According to Koballa (1988) who was the first psychologists to recognize attitude as the individual mental processes that control a person's ability and actual to responses. This was when the social scientists began to see attitude as a forecaster for behaviour. Consumer attitude and preferences to the purchase of a particular product are based on consumer attitude and personal desirability of performing a behaviour (Mingyan Yang et al. 2014).

Subjective Norms

Subjective norms refer to the belief that important person or group will support and approve a particular behaviour (Marija Ham et al., 2015). For example, the important person or group such as family or friend can influence his/her intention during make a purchase in supermarket. Subjective norms is seen as a combination of perceived expectations from relevant individuals or groups along with the intentions to comply with these expectations (Marija Ham et al., 2015). Subjective norms are determined by the social pressures felt by others so that a person behaves in a certain way and their motivation to adhere to those views (Marija Ham et al., 2015).

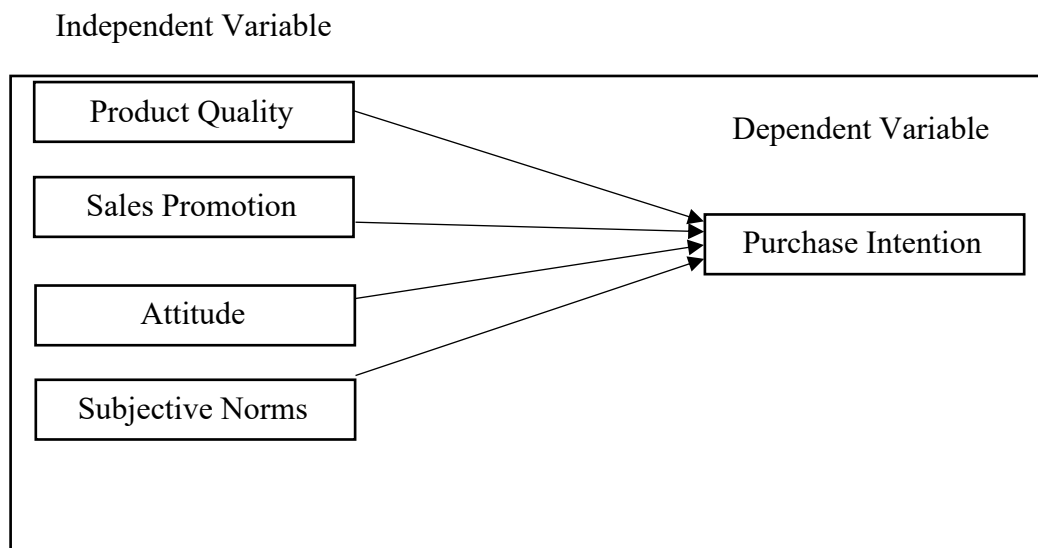

Figure 1.1: Conceptual framework of Study

Theory of Planned Behaviour (TPB)

The theory used in this study is theory of planned behaviour (TPB). In 1980, Theory of Reasoned Action (TRA) was introduced by Ajzen and Fishbein and this theory was updated with the Theory of Planned Behaviour (TPB) by Ajzen (1991), it have been used in recent decades to examine desires and behaviour (Ali Maskur et al., 2007).

Source: I. Ajzen (2011)

Figure 1.2: Theory of Planned Behaviour (TPB)

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

1.3 Hypotheses Statement

H0: There is no significant relationship between product quality and purchase intention in supermarket among consumers in Bukit Mertajam, Penang.

H1: There is a significant relationship between product quality and purchase intention in supermarket among consumers in Bukit Mertajam, Penang.

H0: There is no significant relationship between sales promotion and purchase intention in supermarket among consumers in Bukit Mertajam, Penang.

H2: There is a significant relationship between sales promotion and purchase intention in supermarket among consumers in Bukit Mertajam, Penang.

H0: There is no significant relationship between attitude and purchase intention in supermarket among consumers in Bukit Mertajam, Penang.

H3: There is a significant relationship between attitude and purchase intention in supermarket among consumers in Bukit Mertajam, Penang.

H0: There is no significant relationship between subjective norms and purchase intention in supermarket among consumers in Bukit Mertajam, Penang.

H4: There is a significant relationship between subjective norms and purchase intention in supermarket among consumers in Bukit Mertajam, Penang.

2 Research Methods

2.1 Research Design

Research design is the arrangement of conditions for the collective and analysis of data in a manner that aims to combine relevance to the research purpose with economy and procedure (Inaam Akhtar, 2016). In this study, the researcher used a quantitative approach, by using questionnaire instruments. The structure of questionnaire in study was design to gain the data on purchase intention in supermarket towards the product quality, sales promotion, attitude, and subjective norms. Quantitative analysis is used to measure the issue by creating numerical data or data that can be converted into accessible statistics (Susan E. DeFranzo, 2011).

2.2 Data Collection Methods

In this study, researcher used two methods to collect the data which was primary data and secondary data. The primary data uses in this study is online survey questionnaire as the research instrument. The online questionnaire distributed to respondents live in Bukit Mertajam, Penang to gather the information. The researcher used the Statistical Packages for the Social Sciences (SPSS) to identify and examine the information based on the questionnaires. While secondary data is a data that collected from studies, experiments or surveys which already run by someone else (Stephanie Glen, 2018). The researcher gather the secondary data for a few sources such as used information from website, online journal or article, newspaper and magazines.

2.3 Study Population and Sample size

The population for this study respondents focusing to consumers live in area Bukit Mertajam,

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Penang. Bukit Mertajam is the administrative centre of the city of Seberang Perai in Penang. According to Department of Statistics Malaysia (2010), the population in Bukit Mertajam is approximately 13,097 residents. For sample size of this study refer to Krejcie and Morgan (1970) was 370 people. Researcher choose randomly the consumers who live in area Bukit Mertajam, Penang to answering the questionnaire.

Table 2.1: Determining Sample Size from a Given Population

<i>N</i>	<i>S</i>	<i>N</i>	<i>S</i>	<i>N</i>	<i>S</i>
10	10	220	140	1200	291

Note.—*N* is population size.
S is sample size.

Source: Krejcie and Morgan (1970)

2.4 Measurement of the Variables

To test the hypothesis that workforce diversity affects organizational effectiveness, the researchers have to measure the work force diversity and organization effectiveness. For the questionnaire in this study, the researcher used nominal scale for Section A which is demographic of respondent. Second is interval scale which uses in section B for dependent variable and Section C for independent variable. The researcher using basic types of measurement which is Likert scale to measure on different point scales such as the ranging from “Strongly Disagree (1), Disagree (2), Neutral (3), Agree (4) and Strongly Agree (5).

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

2.5 Procedure for Data Analysis

The data for this study collected using questionnaire. To analyses these data, the researcher will used Software Package for Social Sciences (SPSS). The data that have been collected will be run three tests that called descriptive analysis, reliability analysis and Pearson Correlation analysis.

2.5.1 Descriptive Analysis

Descriptive analysis is a fundamental component of the process because of the role it plays in helping the researchers to observe the world or a phenomenon, and subsequently, in identifying research questions and generating hypotheses based on what has been observed (Susanna Loeb et al, 2017). Descriptive analysis will be used to describe the basic features of the data from the study and it will provide summarize about the sample and measures

2.5.2 Reliability Test

Reliability is the degree of stability of concepts measurement, and correlation which is a measure of the strength of the relationship between two variables; internal reliability which shows whether or not the respondents' scores on any indicator tend to be related to their scores on other indicators and inter-observer consistency (Bell & Bryman, 2007). The reliability test instrument will used Cronbach's Alpha.

Table 2.2: Value of Cronbach's Alpha.

Cronbach's alpha	Internal consistency
$\alpha \geq 0.9$	Excellent
$0.9 > \alpha \geq 0.8$	Good
$0.8 > \alpha \geq 0.7$	Acceptable
$0.7 > \alpha \geq 0.6$	Questionable
$0.6 > \alpha \geq 0.5$	Poor
$0.5 > \alpha$	Unacceptable

Source: David L. Streiner

2.5.3 Pearson Correlation Analysis

The objective of Pearson correlation analysis is to determine whether the correlation coefficient was statically and to identify which hypothesis should be accepted and rejected based on the result shown after measuring all the variable. In this study, the variables will be measure using this test is relationship between product quality, sales promotion, attitude and subjective norms towards purchase intention.

Table 2.3: Strength value of correlation coefficient

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

Size of Correlation Coefficient	Strength of Correlation
.91 until 1.00 or -.91 until -1.00	Very strong
.71 until .90 or -.71 until -.90	Strong
.51 until .70 or -.51 until -.70	Moderate
.31 until .50 or -.31 until -.50	Weak
.01 until .30 or -.01 until -.30	Very weak
.00	No correlation

2.5.4 Pilot Test

The researcher will target 30 respondents to answering the questionnaire for the pilot test. The purpose of the pilot test is not focusing to answering the specific research questions but to prevent researchers from launching a large scale study without adequate knowledge of the methods proposed (Nancy K. Lowe, 2019).

3 Analysis and Discussion

Preliminary Analysis

Pre-analysis is to checking the reliability of measures, evaluate the effectiveness any manipulation, examining the variables.

Pilot Test

Pilot test was conducted to test reliability of the questionnaire and distributed to 30 respondents before conducting the actual questionnaire. Reliability is to show whether or not the independent and dependent variable were agreed for the study. Based on table 3.1, it can be concluded that the coefficient Alpha for reliability of dependent variables and independent variable is 0.985.

Table 3.1: Reliability Coefficient Alpha from Overall Reliability (Pilot Test)

Variable	Number of items	Cronbach's Alpha
Purchase Intention	4	0.767
Product Quality	5	0.842
Sales Promotion	5	0.835
Attitude	5	0.915
Subjective Norms	5	0.921
Overall Variables	24	0.958

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Demographic Profile of Respondents

Gender

Table 3.2: Demographic Profile of Gender

Gender	Total	Percentage (%)
Male	210	56.8
Female	160	43.2
Total	370	100

Based on table 3.2 and chart 3.1, it shows the number of respondents based on group of gender. The total of respondents for this study is 370 respondents. Hence, the highest number of respondent are female with a total 210 respondents (56.8%), follow by male respondent with a total of 160 respondents (43.2%).

Age

Table 3.3: Demographic Profile of Age

Age	Total	Percentage (%)
Below 20	45	12.2
21 – 30	177	47.8
31 – 40	95	25.7
41 and above	53	14.3
Total	370	100

According table 3.3 and chart 3.2, the highest numbers of respondents are between ages 21- 30 years old with 177 respondents (47.8%). Next, the second highest is among 31 to 40 years old with a total 95 respondents (25.7%) and follow by 41 year old and above with a total 53 respondents (14.3%). While the age around below 20 years old record just 45 of respondents (12.2%). As a conclusion, most of the respondent are among age 21 to 30 year old.

Races

Table 3.4: Demographic Profile of Races

Gender	Total	Percentage (%)
Malay	265	71.6
Indian	63	17
Chinese	41	11.1
Other	1	0.3
Total	370	100

Table 3.4 and chart 3.3 shows the number of respondents by races group. The highest number of respondent based on races is Malay with 265 respondents (71.6%). While second highest is India with 63respondents (17%) and it follow by Chinese with 41 respondents (11.1%) and 1 of the respondents is siamese. As a conclusion, most of the respondent are among Malay.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Marital Status

Table 3.5: Demographic Profile of Marital Status

Marital Status	Total	Percentage (%)
Single	217	58.6
Married	151	40.8
Other	2	0.6
Total	370	100

According to table 3.5 and chart 3.4, it shows the marital status of respondents. Single status record the highest number with 217 respondents. While respondents with married status was 151 respondents (40.8%) and 2 of the respondent with divorce status. As conclusion, most of the respondent response to online questionnaire is single.

Monthly Income

Table 3.6: Demographic Profile of Monthly Income

Monthly Income	Total	Percentage (%)
RM 0 – RM 1000	134	36.2
RM 1000 – RM 2000	116	31.4
RM 2000- RM 3000	101	27.3
More than RM 3000	19	5.1
Total	370	100

Based on table 3.6 and chart 3.5 shows the monthly income of the respondents. Respondents with monthly income RM 0 – RM 1000 score the highest number which is 134 respondents (36.2%) and follow by respondents with monthly income RM 1000 – RM 2000 with a total of respondent is 116 (31.4%). While the number of respondents with monthly income RM 2000 – RM3000 and more than RM 3000 is 101 respondents (27.3%) and 19 respondents (5.1%) respectively.

Frequency of Purchase Products in Supermarket in a Week.

Table 3.7: Table frequency of purchase in supermarket in a week.

Frequency purchase	Total	Percentage (%)
Once	124	33.5
2 times	178	48.1
3 times	53	14.3
More than 4 times	15	4.1
Total	370	100

Based on table 3.7 and chart 3.6 above, the highest frequency of purchase the product in supermarket in a week is 2 times with 178 respondents (48.1%). While the total of respondent who purchase the product in supermarket in a week once and 3 times was 124 respondents

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

(33.5%) and 53 respondents (14.3%) respectively. For more than 4 times the total of the respondent was 15 respondents (4.1%).

3.3 Descriptive Analysis

3.3.1 Dependent Variable and Independent Variable

The study has come out with the review to determine the mean and standard deviation for each segment of dependent variables and independent variables for the descriptive analysis. The table below shows the range of the mean score and standard deviation.

Table 3.8: Descriptive Statistics of Dependent Variable and Independent Variable

Variable	N	Mean	Standard Deviation
Purchase Intention	370	4.58	0.509
Product Quality	370	4.64	0.469
Sales Promotion	370	4.66	0.493
Attitude	370	4.65	0.558
Subjective Norms	370	4.63	0.601

Based on Table 3.8, it shows the number of respondents, mean and standard deviation for dependent variable and independent variable. The highest mean for independent variable was sales promotion with 4.66. Second highest mean for independent variable was attitude with 4.65 and follow by product quality and subjective norms with value 4.64 and 4.63 respectively. The highest of standard deviation for independent variable was subjective norms (0.601) and been follow by attitude (0.558), sales promotion (0.493) and product quality (0.469). While the mean for dependent variable of purchase intention was 4.58 and the standard deviation with 0.509.

3.3.2 Purchase Intention

Table 3.9: Descriptive Statistics for Purchase Intention

	Item Description	N	Mean	Standard Deviation
1	I would like to repeat purchase of products offered in supermarket.	370	4.52	0.626
2	If decide to buy certain product, I will find it in supermarket.	370	4.56	0.685
3	I will spend a few time to evaluate the product before I decide to buy it.	370	4.63	0.651
4	I beliefs to use products offered in supermarket.	370	4.61	0.691

dependent variable which purchase intention in supermarket had the highest mean score, which 4.63. It means most of the respondents agrees that they will spend a few time to evaluate the product before decide to buy it. Next, the lowest mean score was 4.52 which most of respondent in Bukit Mertajam, Penang do not agree that they like to repeat purchase of products offered in supermarket.

3.3.3 Product Quality

Table 3.10: Descriptive Statistics for Product Quality

	Item Description	N	Mean	Standard Deviation
--	------------------	---	------	--------------------

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

1	The supermarket provide variety of products with good quality.	370	4.58	0.654
2	I tend to choose products based on quality compare to price.	370	4.64	0.574
3	Most of the products offered in supermarket have satisfactory quality.	370	4.60	0.618
4	I willing to buy products from brand that are often bought because I am confident in it quality.	370	4.66	0.610
5	I will repeat the purchase if I believe with the quality of the product.	370	4.73	0.533

Table 3.10 shows the mean and standard deviation analysis of respondents on independent variable which were product quality. Item “I will repeat the purchase if I believe with the quality of the product” score the highest mean value with 4.73. The lowest value of mean score was 4.58 where respondents disagree that the supermarket provide variety of products with good quality.

3.3.4 Sales Promotion

Table 3.11: Descriptive Statistics for Sales Promotion

	Item Description	N	Mean	Standard Deviation
1	I prefer to buy the product when the supermarket do sales promotion.	370	4.68	0.580
2	I tend to buy products with a lowest priced.	370	4.67	0.610
3	I did not spend much time deciding to buy the product during promotion.	370	4.57	0.745
4	Sales promotion attract my attention to buy that products.	370	4.66	0.649
5	Spending during promotion can save my budget.	370	4.69	0.577

Table 3.11 shows the means for the independent variables which is the sales promotion. The highest mean score is 4.69 which mean most of respondent agree that spending during promotion can save their budget. Meanwhile, the lowest mean score is 4.57 which mean most of respondent disagree that they did not spend much time when decide to buy the product during promotion.

3.3.5 Attitude

Table 3.12: Descriptive Statistics for Attitude

	Item Description	N	Mean	Standard Deviation
1	I think purchasing products in supermarket is a good idea.	370	4.65	0.635
2	I like to compare prices and get the value	370	4.62	0.670

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

	for money.			
3	By purchase products in supermarket can fulfil my need and want.	370	4.68	0.613
4	I like to use products offered in supermarket.	370	4.66	0.636
5	I like the idea of buying the products in supermarket.	370	4.64	0.673

Table 3.12 shows the means for the independent variables which is the attitude. The highest mean score is 4.68 which mean most of respondent agree that purchase products in supermarket can fulfil my need and want. Meanwhile, the lowest mean score is 4.62 which mean most of respondent does not like to compare prices and get the value for money.

3.3.6 Subjective Norms

Table 3.13: Descriptive Statistics for Subjective Norms

	Item Description	N	Mean	Standard Deviation
1	My purchase intention influencing by people around me such my family and friend.	370	4.62	0.689
2	People who are important to me would think that I should use products offer in supermarket.	370	4.58	0.707
3	People who influence my behaviour would think that I should buy the products in supermarket.	370	4.59	0.728
4	I will listen opinion about the product from people around me before decide to buy it.	370	4.68	0.647
5	I will buy the product offered in supermarket if my friends have already used it.	370	4.66	0.676

Table 3.13 shows the mean and standard deviation analysis of respondents on independent variable which were subjective norms. Item 4, score the highest mean value with 4.68 where the respondents will listen to the opinion about the product from people around them before decide to buy it. The lowest value of mean score was 4.58 where respondents disagree that people who important to them would think that they should use product offer in supermarket.

3.4 Validity and Reliability Test

Table 3.14: Reliability Test Coefficient Alpha from Overall Reliability

Variables	No. of Items	Cronbach's Alpha
-----------	--------------	------------------

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Purchase Intention	4	0.767
Product Quality	5	0.842
Sales Promotion	5	0.835
Attitude	5	0.915
Subjective Norms	5	0.921
Overall variables	24	0.958

Based on table 3.14, the independent variable which is subjective norms was the variable which obtained the highest Cronbach's alpha with 0.921. The second highest level of Cronbach's alpha was attitude with 0.915 and been followed by product quality and sales promotion which was 0.842 and 0.835. The lowest Cronbach's alpha of this study can be seen in dependent variable which is purchase intention which obtained 0.767. The overall results of the above reliability test were considered to be strong accuracy and precision for all independent variables and dependent variable as all alpha values of the Cronbach were above 0.

3.5 Normality Test

Normality test is used to determine if a sample of data fits a standard normal distribution. The most commonly used statistical methods such as correlation are based on one basic assumption which is the normal distribution. Normality test through Kolmogorov-Smirnov test and Shapiro-Wilk test was used to determine normality of the data. Therefore, if the value of significant was less than 0.05, it can conclude that variable is not normally distribution

Table 3.15: Output from SPSS (Test of Normality)

Tests of Normality						
	Kolmogorov-Smirnov ^a			Shapiro-Wilk		
	Statistic	df	Sig.	Statistic	df	Sig.
P.Intention	0.226	370	0.000	0.800	370	0.000
ProductQuality	0.249	370	0.000	0.776	370	0.000
SalesPromotion	0.268	370	0.000	0.732	370	0.000
Attitude	0.271	370	0.000	0.679	370	0.000
SubjectiveNorms	0.279	370	0.000	0.680	370	0.000
a. Lilliefors Significance Correction						

Based on the table 4.15, it shows the result of the normality test through Kolmogorov-Smirnov test and Shapiro-Wilk test. The significant value for Kolmogorov-Smirnov test and Shapiro-Wilk test of each independent variable and dependent variable was 0.000 which is less than 0.05, $P < 0.05$. The result shows the data do not follow a normal distribution. Therefore, the null hypothesis for each variable is rejected.

3.6 Hypotheses Testing

3.6.1 Hypothesis 1: Product Quality

Table 3.16: Correlation Coefficient between Product Quality and Purchase Intention

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

Correlations			
		Purchase Intention	Product Quality
Purchase Intention	Correlation Coefficient	1	0.550**
	Sig. (2-tailed)		0.000
	N	370	370
Product Quality	Correlation Coefficient	0.550**	1
	Sig. (2-tailed)	0.000	
	N	370	370
**.			
Correlation is significant at the 0.01 level (2-tailed), Spearman Correlation applied.			

Table 3.16 above shows the result of correlation coefficient for product quality and purchase intention. The hypothesis was significant and positive. From the result of table 4.16 shows the p-value is 0.000 which is less than 0.01, this indicates that there is a significant relationship between the product quality and purchase intention in supermarket. The correlation coefficient for product quality and purchase intention in supermarket are 0.550. Therefore, there is a moderate-good correlation significant relationship between product quality and purchase intention in supermarket ($P < 0.01$, $r = 0.550$).

Hypothesis 2: Sales Promotion

Table 3.17: Correlation Coefficient between Sales Promotion and Purchase Intention

Correlations			
		Purchase Intention	Sales Promotion
Purchase Intention	Correlation Coefficient	1	0.562**
	Sig. (2-tailed)		0.000
	N	370	370
Sales Promotion	Correlation Coefficient	0.562**	1
	Sig. (2-tailed)	0.000	
	N	370	370
**.			
Correlation is significant at the 0.01 level (2-tailed), Spearman Correlation applied.			

Table 3.17 above shows the result of correlation coefficient for sales promotion and purchase intention. The hypothesis was significant and positive. From the result of table 4.16 shows the significant value is 0.000 which is less than 0.01, this indicates that there is a significant relationship between the sales promotion and purchase intention in supermarket. The correlation coefficient for sales promotion and purchase intention in supermarket are 0.562. Therefore, there is a moderate-good correlation significant relationship between sales promotion and purchase intention in supermarket ($P < 0.01$, $r = 0.562$).

Hypothesis 3: Attitude

Table 3.18: Correlation Coefficient between attitude and Purchase Intention in Supermarket.

Correlations			
		Purchase Intention	Attitude
Purchase	Correlation Coefficient	1	0.552**

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Intention	Sig. (2-tailed)		0.000
	N	370	0.370
Attitude	Correlation Coefficient	0.552**	1
	Sig. (2-tailed)	0.000	
	N	370	370
**. Correlation is significant at the 0.01 level (2-tailed), Spearman Correlation applied.			

Table 3.18 above shows the result of correlation coefficient for attitude and purchase intention. The hypothesis was significant and positive. From the result of table 4.18 shows the significant value is 0.000 which is less than 0.01, this indicates that there is a significant relationship between the attitude and purchase intention in supermarket. The correlation coefficient for attitude and purchase intention in supermarket are 0.552. Therefore, there is a moderate-good correlation significant relationship between sales promotion and purchase intention in supermarket ($P < 0.01$, $r = 0.552$).

Hypothesis 4: Subjective Norms

Table 3.19 Correlation Coefficient between Subjective Norms and Purchase Intention.

Correlations			
		Purchase Intention	Subjective Norms
Purchase Intention	Correlation Coefficient	1	0.596**
	Sig. (2-tailed)		.000
	N	370	370
Subjective Norms	Correlation Coefficient	0.596**	1
	Sig. (2-tailed)	0.000	
	N	370	370
**. Correlation is significant at the 0.01 level (2-tailed), Spearman Correlation applied.			

Table 3.19 above shows the result of correlation coefficient for subjective norms and purchase intention. The hypothesis was significant and positive. From the result of table 4.19 shows the significant value is 0.000 which is less than 0.01, this indicates that there is a significant relationship between the subjective norms and purchase intention in supermarket. The correlation coefficient for subjective norms and purchase intention in supermarket are 0.595. Therefore, there is a moderate-good correlation significant relationship between subjective norms and purchase intention in supermarket ($P < 0.01$, $r = 0.596$).

4 Discussion

Hypothesis 1: Product Quality

H1: There is a significant relationship between product quality and purchase intention in supermarket among consumers in Bukit Mertajam, Penang.

The first research objective of this study is to examine the relationship between product quality

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

and purchase intention in supermarket among consumers in Bukit Mertajam, Penang. According to the result showed in chapter four, there is a moderate-good correlation significant relationship between product quality and purchase intention where the result of correlation (r) 0.550 and P value less than 0.01. The result expose that there is a significant relationship between product quality and purchase intention in supermarket among consumers in Bukit Mertajam, Penang.

Hypothesis 2: Sales Promotion

H1: There is a significant relationship between sales promotion and purchase intention in supermarket among consumers in Bukit Mertajam, Penang.

Third objective of this study is to identify the relationship between sales promotion and purchase intention in supermarket among consumers in Bukit Mertajam, Penang. According to the result showed in chapter four, there is a moderate-good correlation significant relationship between sales promotion and purchase intention where the result of correlation (r) 0.562 and P value less than 0.01. The result expose that there is a significant relationship between sales promotion and purchase intention in supermarket among consumers in Bukit Mertajam, Penang.

Hypothesis 3: Attitude

H1: There is a significant relationship between attitude and purchase intention in supermarket among consumers in Bukit Mertajam, Penang.

Second objective of this study is to determine the relationship between attitude and purchase intention in supermarket among consumers in Bukit Mertajam, Penang. According to the result showed in chapter four, there is a moderate-good correlation significant relationship between attitude and purchase intention where the result of correlation (r) 0.552 and P value less than 0.01. The result expose that there is a significant relationship between attitude and purchase intention in supermarket among consumers in Bukit Mertajam, Penang.

Hypothesis 4: Subjective Norms

H1: There is a significant relationship between subjective norms and purchase intention in supermarket among consumers in Bukit Mertajam, Penang.

Third objective of this study is to analyze the relationship between subjective norms and purchase intention in supermarket among consumers in Bukit Mertajam, Penang. According to the result showed in chapter four, there is a moderate-good correlation significant relationship between product quality and purchase intention where the result of correlation (r) 0.596 and P value less than 0.01. The result expose that there is a significant relationship between subjective norms and purchase intention in supermarket among consumers in Bukit Mertajam, Penang.

5 Recommendations / Suggestion for Future Research

The suggestion for future research is expand the sample size and population. This research had covered 370 respondents from the total population in Bukit Mertajam not overall place in Penang. For the future study, the researcher can expand the population of the study include all the city in entire Malaysia.

Next suggestion is adding more variables. In this study, there are four independent variables which is product quality, sales promotion, attitude, subjective norms and one dependent variable

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

that is purchase intention. In order to increase the productivity of the future study, the researchers can refer other article to add more related variables. The possible related variables can improve the outcome of the study.

6 Conclusion

This research was conducted to find out about the factors affecting purchase intention in supermarket among consumers in Bukit Mertajam, Penang. The research also aims to identify the relationship between four independent variables which is product quality, sales promotion, attitude, and subjective norms with dependent variable which is purchase intention.

To collect the data for this research, researcher uses online survey questionnaire and distribute it to respondent in Bukit Mertajam, Penang. The sample size for this study based on the population in Bukit Mertajam was 370 refer to the Krejcie and Morgan table 2.1.

The reliability in this study was determine using survey through Google from towards 370 of respondents. It was tested by Cronbach's Alpha Coefficient. The value of Cronbach's Alpha Coefficient for each independent variable is product quality (0.842), sales promotion (0.835), attitude (0.915), and subjective norms (0.921). Based on the value of Cronbach's Alpha Coefficient for each independent variable, subjective norms shows the excellent results.

The researcher also uses Spearman correlation coefficient to test the data collected or to measure the strength of linear association between two variable which is dependent variable and independent variable as to meet the objective of the study.

8 Acknowledgement

First of all, thanks to Allah S.W.T, because had given me the spirit to complete this research within the time given. Even I have facing some difficulties along with this task, I still manage to complete it. I cannot successfully completion of any project requires without helps from another person. I have also taken help from different people for the preparation of this report. So, I need to show our deep gratitude to that helpful person.

First of all, I would like to express my special thanks to my supervisor, Encik Mahathir Bin Muhamad for being such a good guider and encouragement in finishing this research. He had given a good example and knowledge in order to make sure I understand about this task. Not only that, he also make sure, I understand everything before I start doing the study. He also had dedicated his precious time and effort to guide me patiently to complete this research.

Next I would like to thanks and express my appreciation to people who helps me to answer the questionnaires. The respondent had didecated their precious time and given their valuable feedback by filling out the questionnaire. Besides, I would to show my gratitude to my family and friend who had giving their best in giving support for me. Their encouragement keeps me to finish this task in time. Lastly, I would also like to expand my deepest gratitude to those who have directly and directly guided me in writing this study.

Abstract:

In this age of new technology, there has been the existence of communication technology through social media which has a great impact on the life of society especially to the younger generation. This includes aspects of business, information sharing, marketing and advertising. Sales and purchases through social media platforms are a new phenomenon that is growing on par with existing physical businesses. Social media platform such as WhatsApp, Facebook, Blog, Instagram and Twitter. Thus, this study aims to identify the factors that influence the sales and purchases of products on social media platforms among the younger generation. Among the factors identified and taken in the sales and purchases of products are the factors of trust, convenience, and appearance of the product. The objective of this study is to identify the factors of product purchases on social media platform. Questionnaires were distributed to a total of 100 respondents in the younger generation category who were identified as involved in product buying and selling activities through social media.

Keywords: Sale and Purchase, Social Media, Trust, Convenience, Appearance of the Product

1 Introduction

Social media is a tool to communicate between communities in cyberspace where it can be used to share information, convey current situations and upload pictures or videos. According to Andreas Kaplan and Michael Haenlein (2010), who stated the purpose of social media as an internet-based group that grows on the basis of Web 2.0 ideology and technology where it allows creation and exchange. The increasing use of social media in society is due to the digital lifestyle that is happening nowadays. The use of social media has grown widely in Malaysia and a user has at least one social media account such as Facebook, Instagram, WhatsApp, Telegram and so on (Sulaiman, Moghavvemi, Jaafar, & Mohd Shuib, 2015). The use of social media has evolved in the business world nowadays where it started out just to socialize virtually. Social media is used as a medium for its users to conduct online sales and purchases and conduct marketing activities. Due to the ability of social media across borders regardless of place and time at any time at a more economical cost able to expand the brand of business products to the global level (Alraja, Khan, Khashab, & Aldaas, 2020; Bataineh, Al-Abdallah, & Alkharabsheh, 2015).

EMarketer estimates, 1.61 billion people will log on to social media sites at least every month, from any electronic device. That is a 14.2% increase in total social networks from 2012, and double-digit growth is expected to continue for another year. By 2017, 2.33 billion people will use social networks. Purchases that occur on social media today are to allow users to evaluate products, make recommendations to friends, and relate current purchases to the future. In addition, social media users who make a purchase can recommend the product to other potential

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

users. Today's users often rely on the suggestions and opinions of friends or acquaintances in their social media networks.

Furthermore, social media plays an important role in attracting customers to interact with online users. According to Landscape Digital Malaysia (2016) states that there are 47% of adult Internet users surfing social media such as Facebook, Twitter, MySpace, LinkedIn, and others. According to the same report, there are also a large number of marketers (56%) using social media which takes up to 6 hours or more per week. In Malaysia, users spend a lot of time in a day on social media because they can access social media sites through their fingertips such as mobile devices, such as iPhone, iPod, Android, smartphones, etc.

Consumers in Malaysia face a higher level of risk when making online purchases compared to traditional forms of shopping (Ling et Al, 2010). This perception is related to online shopping which will have a critical impact on consumer decision making. According to Haque et. Al (2011) the perceived risk of consumers is a strong index to explain consumer behavior, as consumers are more often more motivated to minimize the potential for failure after pursuing online shopping success. The risks felt by consumers are of great concern and have led to a hot study for many researchers in terms of business perspectives (Kalakota and Winston, 1996). Next, a better understanding of the risks of online shopping as perceived by Malaysian e-shoppers and the risk reduction strategies used by these e-shoppers becomes very relevant.

The risk is thought to be a measure of possible or unexpected dissatisfaction with the purchase decision, based on the buyer's purchase goals. Risk theory is perceived to have traction and play a role in making it easier for marketers to see that force through the views of their customers. At the same time, it is suggested that the perceived risk is stronger to explain consumer behavior because the consumer is morally motivated to avoid mistakes from the use of tomaximise in purchases. Next, risk analysis can be used in resource allocation marketing decisions (Lim 2003; Mitchell 1999).

Research Objective

The followings are the research objective to be develop for this study:

1. To examine the relationship exists between trust and sale and purchase on social media platform.
2. To examine the relationship exists between convenience and sale and purchase on social media platform.
3. To examine the relationship exists between appearance of the product and sale and purchase on social media platform.

Significance of the Research

This study describes the factors that influence buying and selling on social media platforms. Aspects involved in this study are product reliability, convenience and appearance. There are several importance to conducting trading activities through social media. Below is a description of the importance of this study.

Sale and Purchase

Sale and purchase are an activity that can give satisfaction to sellers and buyers because it can meet their tastes. Therefore, the results of this research can help sellers obtain a source of income from their sales revenue in the right way. This means that sellers should use the right product

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

sales techniques such as building trust from customers so that they are more confident to buy the product being sold. Next, this research is also to shape prudent purchases by consumers. The purpose is to make the buyer enjoy the products he buys.

Social Media

In terms of social media, this study can help business dealings run smoothly as well as provide many benefits. Social media is a web stage wherever people will assemble and share information, photographs, recordings and elective sorts of media with each other. Therefore, the risk borne by the seller is lower in running their business. This is because the seller does not have to incur high costs such as shop rent and salary. Sellers can also market their products to the global market only doing business through social media. For buyers, they can save time when making purchases through social media. They are free to choose the items they want through social media platforms such as Facebook, WhatsApp and Instagram. Therefore, this study can help a little to today's society to make purchases or sales through social media.

Future Research

Overall, the results of this study will benefit future research in the field of buying and selling through social media platforms. In that field, research can shape its development to see if such sales in terms of trust, convenience and product appearance can be a contributor to the performance of social media platforms. Researchers can suggest some suggestions for making improvements in the future. The goal is to help the next new researcher gain knowledge, ideas and make it a good reference.

2 Literature Review

Dependent Variable

Sale and Purchase Behavior

Social Media is an application or website that allows users to share content which is a major source for business activities. So, retailers are the parties who supply goods and services to customers and they can effectively utilize this cost-free media. WhatsApp is one of the social media platforms which is commonly used by everyone. For the effective presence of retailers, WhatsApp is very helpful. Some of the social media tools prefer to use are Wiki, Facebook, WhatsApp, Blog, and Twitter. The use of internet technology has become a common practice in the workplace (Chen et al., 2008). The internet enabled communication media, helps organizations to conduct business anytime from anywhere (Chen et al., 2008). A number of studies investigated the use of Facebook for various organizational objectives such as marketing, communication, sales, advertising, innovation, problem resolution, customer service, human resources, information technology, driving cultural change (Bhanot, 2012), advertising on the social network (Beloff and Pandya, 2010; Handayani and Lisdianingrum, 2012) and internet marketing (Congxi et al., 2010).

Independent Variables

Trust

Trust Mayer, Davis and Schoorman, in 1995, meant trust initially as: "Concept (meant as a party willing to be vulnerable to the actions of another party in the hope that others would perform certain actions for the trustee, regardless of the ability to monitor or controlling others. The study of Mayer, Davis and Schoorman (1995) is one of the first studies on trust in e-commerce purchases and sees the main belief is one's intention to take risks and perceptions of trustee characteristics. Purchase online will influence consumer trust to provide personal information

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

where it is a personal security that should be careful to make payment via credit card online. Various ways that sellers can do where among them are sellers who do business online by selling popular brand products in social media where consumer anxiety can be reduced. Confidence can be increased by selling products from popular brands causing branded products to influence the final purchase decision of the targeted customer (Lim & Dubinsky, 2004). The relationship between customers and sellers is very important that needs to be maintained at that time to build strong e-commerce (Kim & Tadisina, 2007). To ensure that fears occur in secured secure trading transactions, the use of their customers' personal information for other purposes should be avoided so that trust from customers can increase in the future. All customer personal information must be kept in the privacy policy. The seller's compliance with the storage of personal information of his customers can further increase the security of the identity of each such customer. Stores that sell in social media platforms can build integrated mechanisms to ensure high security of users' personal information by preventing misuse of information and payment via credit card (Prasad & Aryasri, 2009). One of the most important factors that can prevent consumers from making online purchases is the lack of trust from customers to vendors over the internet (Gefen, Karahanna, & Straub, 2003).

Convenience

Copeland introduce the facility in 1923, and labeled either most often purchased by consumers and the goods in the store easily accessible for immediate needs as necessary. Seiders et al., (2000) suggested four opportunities related to retailing to provide convenience to customers: a) Access: The ability for customers to reach the retailer b) Search: Ability to identify and choose the products they want c) Ownership: The ability to get what you want product d) transactions: the ability to change or implement the transaction. Although the facility is one of the positive factors that encourage consumers shopping online, (Ahmad, 2002; Jayawardhena et al., 2007), previous research that considers the facilities as predictive variables affecting the results change as customer satisfaction (Colwell et al. 2008; Seiders et al., 2007), or as one of the facts about the quality of online services, such as accuracy (Hu et al., 2009; Kim and Park, 2012; Prasad & Aryasri, 2009; Udo et al., 2010) . According to Wang et al., (2005) facility is one of the factors that most affect the willingness of shopping online. You can shop online at any hour of the day as compared to traditional stores. The online store is open 24/7 (Hofacker, 2001; Wang et al., 2005). According to Berry et al., (2002) and Sieders et al., (2007), ease of service is one of the main factors related to the business and future users. There are many perceptions of when buying or using such services. Ease save effort in the sense that it minimizes physical activity, emotional and cognitive incurred by customers to purchase goods and services online (Berry et al., 2002).

Appearance of the Product

There is a constant increase in online shopping in the US and there are an increasing number of retail sales as well, so this requires more extensive exploration on the pattern of spending per person. To buy more products online, the products and services they buy must first satisfy customers. To understand what the consumer wants in the website, it is important for researchers to develop and then verify the metrics that can capture the feelings and attitudes of customers who shop online carefully (Straub & Watson, 2001). There are many researchers (Lian and Lin, 2008; Peterson et al., 1997; Bhatnager et al., 2000; Liao and Cheung, 2001) have shown that there may be a wide range of products and variety when sold online. Products factor may be the quality of products or services sold. More often, the products are purchased online with a product purchased from a store brick. The customer decides to buy from any place based on factors such as who is offering the best value for the product (Keeney 1999). Other factors include the availability to customize the product, and the total value of merchandise (Zhu & Kraemer, 2002;

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Jarvenpaa & Todd, 1997; Szymanski and Hise, 2000; Keeney, 1999; Torkzadeh and Dhillon, 2002). Research like Szymanski and Hise (2000), Ahn et al., (2004) found that product diversification is a key factor when it gets satisfaction in online purchases.

Hypothesis Statement

H1: There are positive relationship exists between trust and sale and purchase on social media platform

H2: There are positive relationship exists between convenience and sale and purchase on social media platform

H3: There are positive relationship exists between appearance of the product and sale and purchase on social media platform.

Research Framework

Figure 1: Conceptual framework

This section is present about two variable that is independent and dependent variable. The relationship of sale and purchase behavior on social media platform (Dependent variables) and trust, convenience and appearance of the product (Independent variables). This research is aim to investigate the factor influencing sale and purchase on social media platform are shown in figure 2. This framework for the study was developed to show that this study consists aspect of independent variable which is business performance (Figure 2). The dependent variable in this research is the factor influencing sale and purchase on social media platform is trust, convenience and appearance of the product.

3 Methodology

Research Design

According to Smith, Thrope, and Lowe (1991), research design is about organizing research activities, including the collection of data, in ways that are most likely to achieve the research objectives. Each component of research design offers several critical choice points (Sekaran, 2001). The purpose of this study will be to know the factor influencing sale and purchase on social media platform in Kelantan. It will be a correlational research design in that it seeks to determine the relationship between these variables. This study will choose quantitative research means will use survey techniques and questionnaires to collect the data. A survey can measure the independent variables, test multiple hypotheses, and infer temporal order from questions about past behaviour, experiences, or characteristics.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Data Collection

The collection of data is the data compiled for a particular purpose. The research can be started by selecting two methods, namely quantitative or qualitative (Neuman, 2011). Data collection methods used in this study are primary and secondary data. This questionnaire is one of the main data sources for research and secondary data sources including books, journals, internet, articles and electronic library database.

Primary Data

Primary data is a source collected at hand for a specific research problem using the right methods. Some methods can collect the primary data for research, such as surveys, questionnaires, interviews, observation, and focus groups. In this study, the method that was used in gathering information is primary sources. The primary source method used to collect data is by distributing the questionnaires to the target respondents. In this study, survey method is used and is also the most commonly used method to collect key data. Questionnaire forms are distributed to the respondents to be answered according to their respective experiences. The preparation of a clear and orderly questionnaire will make each respondent answer it more easily in a shorter time. However, researchers use quantitative research methods. Respondents will be selected according to the community who have experience in sale and purchase through social media platforms.

Secondary Data

Secondary data is a set of data that already exist, as indicated by (Harrell & Bradley, 2009). Secondary data also define as information from secondary sources, which is not directed by the analyst. This is because of the data collected by other researchers for their purposes, but the general research community can reuse it. For examples of secondary sources are scholarly journal articles, books, and so on. Besides that, secondary data also have been used to support the research. Thus, this study aims to identify the factor influencing sale and purchase on social media platform. Mainly secondary data can be obtained and low-priced as compared to primary data.

Sampling

The sampling technique to be used shows the appropriate method for the purpose in the research study to collect the study sample. Sampling is divided into two types of design, namely probability and non-probability sampling (Bougie & Sekaran, 2010). The sampling method to be used refers to the method chosen to observe the selection of the population to be sampled for the purpose of sample survey. According to Hair (2010), observations must be given attention to the sampling method that has been selected during the process of conducting primary research. Therefore, there are several official lists that have been disseminated for the population of the community around the rural areas where this study will use probability sampling to facilitate the study. The technique used for sampling this cluster divides the population into related groups or groups. Sampling of this cluster refers to those randomly selected to represent the total population and then included in the sample for all selected units. Samples for this study will be selected using cluster sampling techniques to facilitate the required information can be collected. Cluster sampling is a probability sampling method in which refers to a sample which is deliberately chosen to solve the needs of the study. This strategy enables researchers to gather information that is relevant and useful to answer the research question properly. It can refer to the table 3.4, a sample measurement from the Krejcie and Morgan tables.

Sampling techniques showed the methods used in research studies to gather samples. Probability and non-probability sampling are two types of sampling design (Bougie & Sekaran, 2010). Sampling method refer to how the observations were selected from the population to be sampled

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

for the survey sample. According Hair (2010), attention should be given to methods of sampling during the process of conducting primary research. Because there is an official list of people in rural areas around, this study will use probability sampling. Cluster sampling technique is the division of the population into groups or clusters. Referring to the sampling group randomly selected to represent the total population and then all units in the selected group are included in the sample. The sample was selected using cluster sampling technique. Cluster sampling is a probability sampling method and refers to a deliberately selected sample according to the needs of the study. This strategy enables researchers to gather information that is relevant and useful to answer the research questions. This can refer to table 3.4, the sample size from the Krejcie and Morgan tables.

Population

The target population is the population of certain elements related to the research group (Zikmund et al. 2003). The population of each place can be used in the study population as all units have certain characteristics, which is the importance of the study researchers. The meaning of the understood population is as a community or group of people in a targeted place involved or selected by the researcher for this study.

Population refers to a group of individuals who share the same characteristics and are eager to support the researchers and be researching them (Mohd Yusof, 2005). The population of interest for this study will be a few participants from a population of seller and buyer that used social media to sale and purchase a product in Kelantan. A total of 384 participants will be identified.

Sample Size

The sample is a subset of the population studied to be the basis by estimating the facts, situations or results related to the population where it is included in the process of selecting several samples from that sample population. Larger or larger samples may make the sample more representative and more general than the results of this study. The population sample was taken from the manager of the Department of Statistics around Kelantan for the purpose of conducting this study. The Department of Statistics has listed a total population of 1,904,900 in Kelantan.

There are various proposals to determine the sample size. For example, following Krejcie and Morgan (1970), no matter how large the population to be represented, the sample size of 384 is sufficient. According to Roscoe (1975), the sample size is greater than 30 and less than 500 suitable for most who follow the rule of thumb.

Research Instrument

Table 1: Measurement Variables of Factor Influencing Sale and Purchase on Social Media Platform in Kelantan

VARIABLE	ITEMS	MEASURE
Demographic Profiles	Gender, Age, Religion, Races, Education, Frequency use of platform for sale and purchase.	Nominal
Social Media	Definition, Differentiation sale and purchase on social media platform and face to face, Importance social media, Usage of social media, Recommend to the nearest member.	Likert Scale

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

Trust	Trust in sale and purchase on social media, Agreement that it is important for providers to have social media, Frustrated with buying and selling on social media with the information available in the social media environment, Social media trust related to suppliers, All product types purchased through social media,	Likert Scale
Convenience	Easy to find the desired product, Enjoy to buying and selling on the platform, Easy to make a profit through this platform, Price display on the product, Payment options.	Likert Scale
Appearance of the Product	Products are sorted by type, Important feature and quality products sold through social media platforms, Sells up to date products, Various types of products sold that meet the market nowadays, Complete the product description filled	Likert Scale

Our steps adapted from previous literature. All items to construct a measurement study of the available measures are adopted and slightly adapted to suit the context of the study. Demographic profile is measured based on a nominal scale. We used a Likert scale from 1 (strongly disagree) to 5 (strongly agree) to measure the construct of the independent variables and the dependent variable.

4 Data Analysis

According to Sekaran (2003), the purpose of data analysis include variability and central tendency measures (descriptive), test reliability (measurement scale) and test the hypothesis of the research (inferential analysis). The data collected will be calculated and analyzed using the Statistical Package for the Social Sciences (SPSS) to explain the descriptive analysis, Pearson correlation analysis and multiple regression analysis.

Data Analysis and Findings

The purpose of the study was to find out a study on factor influencing sale and purchase on social media platform in Kelantan.

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

Demographic Profiles of Respondents

Table 2: Demographic Profiles of Respondents

Demographic Profiles	Number	Percentage
Gender		
Male	119	31
Female	265	69
Age		
17 years and below	38	9.9
18 - 27 years	158	41.1
28 - 37 years	90	23.4
38 - 47 years	48	12.5

Table 2 summarizes demographic information of the 384 respondents. Female respondents were higher with 69.01% (n=265) respondents as compared to male with 30.99% (n=119). Respondents in age were from group 18-27 years with 41.15% (n=158) respondents. From group 28-37 years with 23.44% (n=90) respondents. Respondents from oldest people of group 48 years and above were 13.02% (n=50) respondents. The respondents from group 38-47 years with 12.50% (n=48) respondents. The lowest number of respondents who responded was from the group of 17 years and below with 9.90% (n = 38). There are 3 religions that are from Islam with 93.75% (n = 360) respondents and so on with Buddhism with 3.65% (n = 14) respondents. Then, the third religion and the least respondents are Hindus with 2.6% (n = 10) respondents. Next, respondents were Malays high with 89.58% (n = 344) of respondents, and followed by the Chinese with 5.73% (n = 22) of respondents. The next respondent was Indian with 2.86% (n = 11) respondents. Respondents from other with 1.82% (n=7) respondents. Respondents in education level were

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Bachelor of Degree with 30.99% (n=119) respondents. Second highest were other with 20.31% (n=78) respondents and next were SPM with 19.27% (n=74) respondents. Next, the respondents of STPM with 11.96% (n=46) respondents. Fifthly, the respondents from Diploma with 10.94% (n=42) respondents. The next one for education level is Master with 3.65% (n = 14) respondents and the last one is from PhD with 2.86% (n = 11) respondents. Respondents who answered occasionally with 38.80% (n = 149) respondents. The next highest is the group from monthly with 26.04% (n = 100) respondents and the next is daily with 20.31% (n = 78) respondents. The last one from weekly with 14.84% (n=57) respondents.

Descriptive Analysis

Social Media

Table 3: Social Media

	N	Mean
1) I understand the concept of social media that apply sale and purchase in Kelantan.	384	4.5833
2) I can differentiate between sale and purchase on social media and face to face.	384	4.5703
3) I like to take opportunities through social media for the purpose of buying and selling.	384	4.5078
4) I often use social media platforms to buy popular products nowadays.	384	4.4818
5) I will suggest social media platforms to sale and purchase products or services to my family members and friends.	384	4.5234
Valid N (listwise)	384	

Trust

Table 4: Trust

	N	Mean
1) Do you trust social media platforms to make buying and selling transactions?	384	4.4245
2) Do you agree that it is important for community to have sosial media?	384	4.4896
3) Have you ever been frustrated with sale and purchase on social media with the information available in the social media environment?	384	4.4167

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

4) Is it true that social media trust today is related to providers?	384	4.4609
5) Are most of the types of products you buy through social media only?	384	4.3854
Valid N (listwise)	384	

Convenience

Table 5: Convenience

	N	Mean
1) I am sure that buying and selling through this platform can make it easier for me to find the desired product.	384	4.5234
2) I feel safer to sale and purchase through this platform.	384	4.4766
3) I can also generate profits easily through this platform due to its increasing use.	384	4.5625
4) The price display on the product makes it easy for me to make price comparisons between different social media.	384	4.5547
5) This payment option through online banking can save time where previously paid in cash.	384	4.5339
Valid N (listwise)	384	

Appearance of the Product

Table 6: Appearance of the Product

	N	Mean
1) I agree that the products sold on this platform are arranged according to the type of product to make it easier for me to make a purchase.	384	4.5495
2) I believe that product sales on social media have important features that can meet my needs and quality products.	384	4.5000
3) I also believe that most social media platforms sell the latest products to compete with existing competitors.	384	4.5443

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

4) I always make a survey that there are various types of products sold which can fill the current market on every social media account.	384	4.5286
5) In my observation, the complete of the description for each product is filled to make it easier for customers to make the right choice.	384	4.6120
Valid N (listwise)	384	

Reliability Analysis

Table 7: Results of reliability Cronbach's Alpha for the variables

Variables	Number of Items	Cronbach's Alpha before item deletion item.	Number of items after item deleted.	Cronbach's Alpha after item deleted.
Trust	5	0.854	5	0.854
Convenience	5	0.839	5	0.839
Appearance of the Product	5	0.871	5	0.871

The first independent variable was that the trust was found to be good (5 items; $\alpha = 0.854$). The next variable is the ease of showing good reliability (5 items; $\alpha = 0.839$) and the last variable is the appearance of the product and also found good reliability (5 items; $\alpha = 0.871$). Cronbach's alpha of each variable did not change after removal. Therefore, these data are considered very suitable for further analysis.

Table 8: Pearson Correlation of Variables

Correlations					
		Social Media	Trust	Convenience	Appearance of the Product
Social Media	Pearson Correlation	1	.759**	.787**	.763**

	N	384	384	384	384

** . Correlation is significant at the 0.01 level (2-tailed).

Hypothesis 1 : There are positive relationship exists between trust and sale and purchase on social media platform.

Based on table 4.17, it shows the relationship between the factors that influence buying and selling on social media platforms that are trust in Kelantan. The trust value of r is 0.759. The results show that there is a high positive correlation sale on social media and trust. In addition, the p value is less than 0.01. These results show that there is a positive relationship between buying and selling on social media and trust. Therefore, hypothesis 1 is accepted. The results show that social media is supported by trust. This shows that most people will rely on buying and selling on social media because of their belief in the judgments made by others.

Hypothesis 2: There are positive relationship exists between convenience and sale and purchase on social media platform.

Based on table 4.17, it shows the relationship between the factors that influence sale and purchase on social media platforms, namely convenience in Kelantan. The value of r is 0.787. The results show that there is a high positive correlation between sale and purchase on social media and convenience. In addition, the p value is less than 0.01. These results indicate that there is a positive relationship between sale and purchase on social media and convenience. Therefore, hypothesis

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

2 is accepted. The results show that social media is supported by convenience. This shows that most people will rely on buying and selling on social media because of the facilities that are already available on the platform to sell or buy products or services at a certain time.

Hypothesis 3: There are positive relationship exists between appearance of the product and sale and purchase on social media platform.

Based on the table 4.17, it shows the correlation between the factor influencing sale and purchase on social media platform which is appearance of the product in Kelantan. The r value of appearance of the product is 0.763. The result indicates there is high positive correlation sale and purchase on social media and appearance of the product. Besides, the p-value is less than 0.01. This result shows that there is a positive relationship between sale and purchase on social media and appearance of the product. Therefore, hypothesis 3 is accepted. The result shows that social media is supported by the appearance of the product. This shows that most people will rely on buying and selling on social media because of the appearance of products that can attract their customers with just a fingertip for sale and purchase.

5 Discussion and Recommendation

This chapter will have more discussions will be collected on the hypothesis in this study. The hypothesis is to test statistics that can be used to determine whether the hypothesis that the sample data are assumed to be true for the entire population. In short, the hypothesis is the hypothesis being tested to determine the relationship between the two sets of data that is between the two variables. Hypotheses have also been tested where they are based on process observations modelled through a random set of variables. Statistical hypothesis testing is statistical inference methods.

Based on the limitations of the study, several recommendations were made to researchers who will most likely be doing similar research in the future. This is in line with the limitations discussed in the previous section. In addition, there is some additional information that can be used by future research that will be done.

First, future research could expand the scope of the study on various types of industries such as manufacturing and services. The difference between the industrial sector will provide different views on the importance of social media use by the public. Research more about the factors that affect the sales and purchases on social media platforms in different industries and assess whether the model is consistent with research studies of other industries.

Second, future research plans examine more variables to get better consideration of the factors influencing sales and purchases on social media platforms such as individual factors and implementation factors that are the most likely determinants that can be compiled in future research. Moreover, it can help the community to increase their understanding and knowledge of the use of social media in their business. This can help those who do business to increase sales and attract more customers through social media platforms.

Third, the total sample size must be removed to generate more revenue and more accurate data. In addition, it is advisable to have more balance in the area of targeted respondents between age and employment for future study and obtain more comprehensive findings also to provide and collect data evenly around the sampling site. Finally, future research should investigate the possible effects of variables such as education, income level, and age society. Analyzing the differences between the demographic profile of respondents would give a better idea about the

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

nature of the target population for a more comprehensive overview on buying and selling social media platform in Kelantan.

6 Acknowledgements

This research project was successfully carried out with the help and cooperation of various authorities. I would like to express my deepest gratitude to the people who guided, assisted and supported me in completing this research.

First, I would like to thank the supervisor, Puan Siti Afiqah binti Zainuddin, who has guided me from the beginning of this project to the end by sacrificing time to guide me throughout this project. His patience and advice ensure that this thesis runs smoothly. I really appreciate what has been done by my supervisor to help me.

Then, I would like to express my deepest appreciation to the respondents who are willing to help by spending their valuable time answering the questionnaires of my research project. In addition, I would like to thank my family, especially my parents, friends and teammates for this project for helping and supporting me until the end of this research project.

Abstract:

E-commerce is a process of selling and buying using electronic devices that make it easier for sellers and buyers. E-commerce also helps entrepreneurs to do business globally, save costs and be more profitable than using traditional methods. E-commerce not only gives an advantage to entrepreneurs but it also gives advantages to buyers where with the use of e-commerce consumers will be able to compare offers and have a wide selection of products. Therefore, the objective of this study focuses on the factors that influence the use of e-commerce as well as the advantages and disadvantages of the use of e-commerce among entrepreneurs. In this study, researchers use case study qualitative methods to achieve the objectives of the study. The results show that the main factors that makes e-commerce as an option for entrepreneurs to continue business is to provide convenience, reduce risk and help entrepreneurs to increase their sales during the implementation of the Movement Control Order. There was four theme discovered as the factor of influencing the use of e-commerce as a business platform namely: (i) easy to access; (ii) low financial cost; (iii) trust; and (iv) potential income. Therefore, the use of e-commerce can be considered as an alternative for entrepreneurs to continue their business. Apps like Shopee and Lazada are one of the platforms for entrepreneurs to market their products without limitation and provide double savings.

Keywords: *Easy to Access, Effectiveness, Competitive Advantage, Remarketing*

1 Introduction

The increasing use of the internet during the Movement Control Order made e-commerce a platform for entrepreneurs to continue their business. This is because it can benefit entrepreneurs to market their products or services according to current technological advances (Mohamad, 2020). In Malaysia, e-commerce platforms such as Shopee and Lazada are the choice of consumers during MCO when they have a movement limit to visit shopping malls and conventional stores to buy their necessities (Mohamad., 2020). In addition, it also gives savings to buyers with much cheaper fees than buying in supermarkets or stores.

E-commerce becomes an alternative for entrepreneurs to continue their business when they have a movement limit to do promotions to market their products or services during the Movement Control Order (MCO) is implemented (Mohamad, 2020). Most entrepreneurs have changed the way they market their products or services by using apps like Shopee and Lazada to help them increase sales and save costs. These applications make it easy for entrepreneurs to do business without borders so that entrepreneurs can penetrate the global market. (Mohamad., 2020).

The existence of e-commerce is a system where it facilitates customers to make online purchases during MCO. This is because, with the use of e-commerce buyers can make purchases anytime and wherever they are. Buyers can make transactions easier and faster than the traditional way (Wong, 2017).

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

1.1 Research Problem

The increase in covid-19 cases makes e-commerce a platform for consumers to obtain essential goods. This is because the declaration of the Movement Control Order (MCO) has advised the public to be at home at all times except to meet the basic requirements to prevent Covid-19 infection. Therefore, this declaration has a big impact on entrepreneurs where they have to stop their business temporarily and have to bear the need to pay the debts of suppliers and other utilities (Mohamad, 2020).

During the MCO, entrepreneurs need to change the way of doing business digitally by using e-commerce such as Shopee and Lazada to continue their business (Mohamad., 2020). According to the President of the Malaysian SME Association, Datuk Michael Kang, stated that the increase in the use of digital technology among entrepreneurs increased after the end of the MCO (Mohamad, 2020).

In addition, technological change also affects entrepreneurs who lack knowledge about current technology. Therefore, entrepreneurs who compete in the same market need to have high knowledge, mental strength and management ability to grow their business by using digital methods such as e-commerce more efficiently and quickly (Faradillah Iqmar Omar, 2019).

1.2 Research Objectives

The objective of this study is to:

To identify the factor ecommerce usage among entrepreneur around Kulim, Kedah.

2 Literature Review

2.1 Buyer Awareness

2.1.1 Easy To Access

The use of e-commerce makes information easier to access quickly. Users with internet access can use digital media such as Facebook, YouTube and Email to get information (Kumar, 2017). Therefore, the use of e-commerce can help both buyers and entrepreneurs to carry out sales and purchase activities. Entrepreneurs also believe that business activities can be expanded with the availability of e-commerce facilities (Rosley., 2016).

In addition, e-commerce facilitates entrepreneurs to communicate with customers or suppliers. According to Kotler and Armstrong, increasing the use of current technologies such as e-commerce can help entrepreneurs to conduct business directly to end users as opposed to using traditional methods (Al-Alawi, 2015). Gharegozi argues that e-commerce is very helpful to entrepreneurs in the effort to increase sales and expand business to new markets (Al-Alawi, 2015). E-commerce provides many benefits to entrepreneurs in growing their business. This is because, the use of e-commerce creates a multi-communication channel where information can be disseminated more quickly to the rest of the world at any time. Therefore, this e-commerce platform plays an important role so that information can be disseminated more widely (Kumar, 2017).

The advent of e-commerce has led many entrepreneurs to choose to change the concept of virtual trading. This is because with the use of e-commerce it can facilitate and expedite transactions whenever and wherever they are (Haqim., 2020). Most entrepreneurs are of the opinion that e-commerce is very beneficial to them when it helps in growing the business, facilitating information to be accessed and entrepreneurs can run a border sign business (Haqim., 2020). Therefore many of them choose to do business online during MCO implementation.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

2.1.2 Effectiveness

The effectiveness of e-commerce can be assessed by entrepreneurs when they are able to understand consumer behaviour. Every entrepreneur needs to understand the consumer response to the product they offer. This is because, in order to gain customer loyalty, entrepreneurs need to gain the trust of consumers to continue business using this e-commerce platform (Liao, Palvia, & Lin, 2006).

In addition, entrepreneurs also need to determine their target market in order to focus on customers who are suitable for the products they produce. This can also help entrepreneurs to reduce competition by determining their customer category (Ana Ribeiro Carneiro, 2014). Seybold defines the customer experience as a whole as “consistent representation and perfect execution throughout distribution and interaction as well as relationships with customers” (Ana Ribeiro Carneiro, 2014).

Entrepreneurs choose to use e-commerce is because it is easier, cheaper, more flexible and suitable for small companies. This is because, the use of e-commerce can increase the competitiveness and productivity of a company (Naul, 2016). Companies do not need to own a large company to convince their customers. This is because, with the use of e-commerce they can convince customers by using a strong and effective network of online services (Haqim., 2020). Therefore, e-commerce is very helpful for entrepreneurs to continue to use it as a platform to make sales and purchases (Norazila Mat, 2016).

2.1.3 Competitive Advantage

To achieve the potential of Digital Marketing, entrepreneurs need to use e-commerce platforms such as Shopee and Lazada as the main channels to convey information to consumers. This is because, the use of e-commerce now creates a competitive advantage in various ways. By using this platform, entrepreneurs can determine customer behaviour and feedback on user needs (Kumar, 2017).

The industry approach is a competitiveness that is often associated where the business market depends on the structure of the external environment and the actions of the company in adapting to the environment (Vaida Pilinkiene, 2013). The use of e-commerce gives competitive advantage to entrepreneurs when important resources can be easily accessed. Barney argues, competitive resources must be something valuable, rare, impeccable and irreplaceable for the creation of competitiveness, which is expressed as an improvement in a company’s performance (Vaida Pilinkiene, 2013).

Therefore, the use of e-commerce can provide resilience to entrepreneurs to ensure that their products or services are not imitated by competitors (Schmidt, 2016). This is because, competition is an economic principle where it will continue to be challenged to protect and strengthen barriers that prevent competitors from taking on the innovations that have been made (Schmidt, 2016).

Latest Development and Strategies

2.2.1 Remarketing

In the use of this e-commerce, remarketing plays an important role in digital marketing. This is because marketers can publish ads that target the appropriate customer categories that their product is (Kumar, 2017). This remarketing is a tactic to display targeted ads to people who have visited or taken action on the entrepreneur's own website. These remarketing platforms will typically display specific ads through the exchange of ads, pages or products that have been used

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

or searched by users in ecommerce such as Shopee and Lazada (Yield, 2016).

Remarketing is also a form of marketing that is personalized at the right time and place. This is because, remarketing will target customers who repeatedly visit the website or business page (Yegin., 2016). This remarketing also allows entrepreneurs to reach their customers in a highly personalized way. Therefore, this remarketing gives an advantage to entrepreneurs to save costs to do marketing repeatedly (Yegin., 2016).

3 Research Methodology

A research method is a strategy, process or technique used to collect data or analytical evidence to reveal new information and create a better understanding of a topic (Debbie Booth, 2020). In this study, researchers use a qualitative approach to collect data on the experiences, behaviours and meanings presented by individuals to researchers. Researchers use interview methods to obtain information from selected individuals such as entrepreneurs from the clothing sector. By using this method, researchers can focus on a number of individuals to understand the opinions of respondents. The use of this qualitative method also helps researchers to analyse and understand the form of data, strengths and methodological weaknesses of each data collected (Jasmi, 2012). Therefore, this qualitative approach helps researchers in exploring the factors that influence the use of e-commerce as a business platform among entrepreneurs from the clothing sector.

Based on the study, the researcher used the qualitative approach of case study to obtain information and data from selected respondents. Researchers chose to use the interview method to obtain data with the number of respondents is 12 people. The respondent is from the clothing sector around Kulim, Kedah.

3.1 Data Collection

In this study, researchers used the interview method to collect data. This is because, this method provides an opportunity for researchers to conduct interviews in more detail based on the guidelines that have been set. Each piece of information mentioned by the respondent is important data for the study conducted (Jasmi, 2012).

Through this method, the researcher will gain a broader understanding as well as be able to delve into the feelings and experiences of the respondents themselves. This interview method is very practical used to obtain accurate information from a small number of respondents. This is because, the study that uses this interview method is an important method and has high validity when researchers obtain information or data directly from the respondents (Margaret C. Harrell, 2016).

3.2 Data Analysis

Data analysis is an analytical method used in the study to identify themes, concepts and meanings. In this study the researchers used a semi-structured interview method. This semi-structured interview method helps researchers to develop respondents' answers and ideas by answering open-ended questions posed by researchers (Rahman, 2019). Semi-structured interview methods have a variety of properties and purposes that allow researchers to determine sampling techniques. Through this method, the researcher will get relevant answers that can help the researcher achieve the objectives of the study.

In addition, the researchers also used Atlas.ti software to analyse the interview transcripts obtained. Atlas.ti helps researchers to analyse data where each respondent's answer is analysed and divided according to the code and theme designed. Atlas.ti is used in qualitative research where it is known as a group of maps (Afriansyah, 2017).

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

4 Findings and Discussion

Data analysis in a qualitative study begins by grouping the same data then interpreting to give meaning to each sub-theme and the relationship with each other (Rijali, 2018). For this study, the researchers divided into four themes where all were stated based on the results of the respondents' interviews on the factors that influence the use of e-commerce among entrepreneurs in the clothing sector. The four themes are easy to access, low financial cost, trust and potential income.

Theme 1: Easy to Access

Based on the data obtained, the researchers found that the factors influencing the use of e-commerce such as Shopee and Lazada as business platforms among clothing entrepreneurs are easily accessible. This can be proven when most respondents think that e-commerce provides many facilities to them, especially when the MCO is implemented. While the MCO is being implemented, the public is advised to limit movement so that the transmission of the covid-19 epidemic can be stopped. Therefore, many choose to use e-commerce as a platform for them to make purchases and sales.

Here are the reviews of entrepreneurs who have the opinion that e-commerce facilitates them:

R1- "... for me by using this Shopee I find it easier to gain customer trust..."

R3- "... sometimes customers are looking for me... so I think Shopee is easier..."

R8- "... For me Shopee and Lazada make it easy for me to attract customers..."

R10- "... Easy to get customers... nowadays not everyone likes to come to boutiques..."

"... Now there is an increase... sales are getting okay..."

R12- "... so sometimes it's raining cannot do business... from there thinking to do business online...", "... so customers do not see... doing business online many new customers know the existence of my boutique..."

Based on these reviews, researchers can ensure that the factor that influences the use of e-commerce among entrepreneurs is because it is easy to access both entrepreneurs and users themselves. The use of e-commerce such as Shopee and Lazada gives them a lot of convenience, this is because e-commerce is easily accessible anytime and wherever they are. Therefore, entrepreneurs are advised to use e-commerce as a business platform to continue their business because it can be done anywhere, especially during the implementation of this MCO.

Theme 2: Low Financial Cost

Entrepreneurs also argue that low financial costs while using e-commerce are also a factor why they choose to switch traditional sales methods to online. With the use of e-commerce, entrepreneurs can save costs such as rental costs, utility costs and marketing costs. During the MCO, entrepreneurs need to wisely manage their finances so as not to incur losses to them. The use of e-commerce is very helpful for entrepreneurs to manage their finances by making savings to continue their business. Therefore, entrepreneurs are encouraged to change the way of business towards digital to help them in continuing the business.

Here are some reviews from entrepreneurs on saving while using e-commerce platforms to continue their business:

R1- "... easier for me to promote goods..."

R3- "... moreover this Shopee helps me to save costs... like rental costs... ehm electricity..."

R6- "... save possible costs... during this MCO as a business I need to manage my finances wisely..."

According to the three respondents above, they changed the way they sell using e-commerce

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

platforms such as Shopee and Lazada is because it helps them to save costs as well as facilitate the marketing process of their products. Many entrepreneurs choose to use e-commerce platform to continue their business is to save costs especially during MCO. This is because, e-commerce such as Shopee and Lazada have a system where it provides convenience to entrepreneurs to do business more easily while saving costs. This change in the way of doing business digitally will impact entrepreneurs in an effort to increase their sales during the MCO.

Theme 3: Trust

The advantage of using this e-commerce is when entrepreneurs gain the trust of customers to make purchases on their products. Customer trust and confidence greatly affects entrepreneurs in an effort to increase their sales. Therefore, entrepreneurs need to ensure that every product offered must be of quality so that customers believe in making a purchase. Customers' trust in the business makes it an important factor in increasing sales.

Here are the opinions of clothing sector entrepreneurs who use e-commerce as their business platform:

R1- "... easier to gain customer trust in my products and goods"

"... This is because while live I can communicate directly with customers ..."

R6- "... in terms of quality... price... that's what I need to take care of so that customers do not run away..."

Based on these respondents, researchers can analyse that trust, communication and quality of goods are very important. This is because it affects the increase in their sales. Entrepreneurs need to gain the trust of their customers so that they can retain regular customers and attract new customers. Entrepreneurs also need to maintain the quality of their products so that customers are satisfied buying on their platform. Customer satisfaction is the priority of entrepreneurs to ensure that their business can continue during the MCO.

Theme 4: Potential Income

The use of e-commerce is very helpful to entrepreneurs in saving costs as well as increasing their sales. This is because, using e-commerce entrepreneurs do not need to do manual marketing where a lot of costs are required. E-commerce such as Shopee and Lazada make it easier for entrepreneurs to promote while increasing sales faster. The increasing use of digital technology gives entrepreneurs the opportunity to change the way they do business where they will be easier to gain customers. Therefore, the use of e-commerce greatly affects entrepreneurs to continue their business while increasing their sales from time to time.

Here are some entrepreneurial reviews on the use of e-commerce that help them to continue business during MCO:

R6- "... a lot of response from customers... especially when I do business on Facebook... Shopee... Lazada..."

"Wholesale... so easy for me to market all over Malaysia..."

"... I also do not need to do promotion or marketing continuously... because the Shopee system itself will do..."

R11- "... from the beginning of this online business, sales increased day by day... compared to trading in the night market..."

According to the entrepreneur, with the use of e-commerce such as Shopee and Lazada helps them to get customers. They argue that after using this platform their business is gaining popularity and sales are increasing day by day. This proves that e-commerce like Shopee and Lazada help them in generating revenue and increasing current sales. Therefore, entrepreneurs need to change the way their business towards digital so that they can generate more income.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

5 Discussion

Based on the data and information obtained, the researchers argue that the respondents chose e-commerce as a business platform is because it has many advantages over disadvantages. Many entrepreneurs think that e-commerce is very easy for them to do business. This is because it is easily accessible by traders and consumers whenever and wherever they are.

E-commerce provides many benefits to entrepreneurs especially when MCO is implemented. With the use of e-commerce, entrepreneurs can save costs, increase sales and expand their business globally. Therefore, this online business is very impactful to entrepreneurs in order to continue their business during MCO.

Based on a recent study by (Kumar, 2017) claims that the use of e-commerce greatly affects entrepreneurs to continue their business with the latest technological developments. According to (Kumar, 2017) states that online marketing and retailing is growing rapidly. This is because many consumers no longer visit the shops to get necessities and they even prefer to use digital devices.

The use of e-commerce facilitates entrepreneurs to communicate with consumers where entrepreneurs can continue business and increase sales while consumers have different options and price comparisons (Haqim., 2020). In addition, digital marketing campaigns also allow entrepreneurs to share their brand and experience with a product (Kumar, 2017)

6 Limitation and Conclusion

According to the study conducted, researchers use qualitative methods to achieve the objectives of the study. However, there are limitations where researchers only focus on clothing entrepreneurs around the Kulim area. This causes researchers to face obstacles to obtain more information or data related to the study. In addition, a small number of respondents limited the data obtained by researchers. The small number makes it difficult for researchers to deepen the experiences, challenges and risks faced by respondents.

Therefore, the researchers found that this study needs to use other methods to achieve the objectives of the study. Researchers can also further develop data or information when the data is obtained from several other samples that are appropriate to the sample that has been set by the researcher.

In conclusion, this study shows that the convenience factor, easy access and cost savings are the main factors entrepreneurs choose to use e-commerce as a business platform. The use of e-commerce also gives many advantages to entrepreneurs where entrepreneurs can expand their business globally. Therefore, entrepreneurs need to change the way they do business, especially when the Movement Control Order is implemented to continue their business while helping them to increase sales.

THE FACTORS THAT INFLUENCE CONSUMERS' BUYING DECISION AMONG UMK STUDENTS

Nur Syafiqah Binti Abdul Satar and Munirah Binti Mahshar

Faculty of Entrepreneurship and Business,
Universiti Malaysia Kelantan,
Malaysia

Email: syafiqahsatar97@gmail.com; munirah@umk.edu.my

Abstract:

Retailing has long existed in industries include Malaysia. By providing the needs and wants of consumers will consider their buying decision. The retail industry is one that contributes to the national economy. To maintain the industry and sustainable competitive advantage, many aspect must be taken into account such as providing good product quality at reasonable and affordable price. Thus, aggressive promotion activities will help present well the products and create brand equity to consumers. It also influences consumer to make a purchases. This study aims to identify the factors that influence consumers' buying decision at supermarket among UMK students. The purpose of this study is to explore the factors of product, image and promotion that influence consumers' buying decision. This study will help researcher to understand the factors that influence consumers' buying decision. For research methods, the quantitative and cross-sectional will be used for this study by distributing questionnaires to 370 respondents through answering in Google form. The data were measured by descriptive analysis to find out which part of the questions was most agreed by the respondents by looking at the mean value. Then, the Spearman correlation will be used to measure the relationship between the two variables to achieve the objectives of the study. The results showed that all the relationships between variables had a strong positive correlation where the $p < 0.05$. To conclude that all retailers need to pay attention to these factors where product, price and promotion in improving every term in their business in order to continuously competitive advantage.

Keywords: Product, Price, Promotion, Consumers Buying Decision

1 Introduction

Retailing is a business activity that has been practiced long (Ismail, Kumaran, Sarifuddin, Gorondutse, & Sabarudin, 2018) includes Malaysia. Currently in the retail industry in Malaysia is growing rapidly through the past a few years and many competitors in that field (Al-Suraihi, Al-Suraihi, Ibrahim, Al-Tahitah, & Abdulrab, 2020). Retail activities continue to expand and become the subsector contributing to the national economy (Ismail et al., 2018). The retail industry in Malaysia is well developed and positively towards Malaysia's economic growth (Al-Suraihi et al., 2020). Retail Group Malaysia (RGM) has increased its 2019 growth forecast for the country's retail sales to RM108.3 billion at 4.9% from 4.5% that was expected for the first quarter and stronger expansion in the second quarter to increase in economic activities in the latter part of the year with an expected sales growth rise to 5.8% for 2019 (Al-Suraihi et al., 2020). The result shows that retail industry in Malaysia is growing well and positively towards the growth of the Malaysian economy.

The increase in supermarkets and hypermarkets was a contributing factor to this situation (Hassan & Rahman, 2012; Hassan, Sade, Rahman, & Management, 2013). Therefore, supermarket is an important business that can fulfil consumer needs and wants. Retailing started as a local activity that involved the transaction where buyers and consumers intend to consumer product through a

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

distribution that covers a wide spectrum of consumer channel in which most businesses are exploring (Hassan et al., 2013). The retail activities includes in providing and selling the goods and services to the end consumer. In general, retailers play a very important role in ensuring that goods or services are sold to final consumers. Therefore, they are considering as one of the main supply chain components other than manufacturer, warehouse, wholesalers or distributor and supplier. After that, these distributors will supply the finished goods to retailers in smaller quantities such as in 7-eleven convenience stores, Mydin hypermarket stores, supermarkets and so on until consumers can purchase and consume. According to Kotler (2013), states that the retail sales activities of products and services are to the end users which involving the private use and not for business purpose.

Retailing businesses are offering the goods and services that can fulfil needs and wants of consumers but the difference can be seen products from the product, prices and promotion. There are many local and international retailers such as Tesco, Giant, Jaya Grocer, AEON, IKEA, Mr DIY, 99 Speed Mart, etc (Al-Suraihi et al., 2020). The increase in supermarkets and hypermarkets Ali et al., (2010) stated that the retailers are divided into large retailers and small retailers. Large retailers are retailers that operate on a large scale, including supermarkets, hypermarkets and so on (Reutterer & Teller, 2009) compare to small retailers store are mostly operate in brick-and-mortar in a small space. Malaysia retail sector consists of a huge number of small shops that offered a variety of goods and services (Al-Suraihi et al., 2020).

Increase in income will increase the purchasing power and consumers able to meet their needs and wants. Buying decision occur before consumers make a purchase. Purchasing decisions are individual activities that are directly involved in the decision to make the purchase of the products offered by the seller (Usman, Nadila, & Decisions, 2019). Thus, they will consider and caution something they desire to buy before they make a payment. The consumer decision-making process can be described as the phases that consumers go through in making a final purchase decision (Hanaysha Jalal, 2018). Furthermore, consumers also tend to go through five senses which sight, touch, sound, smell and taste the products or services. The choices made by consumers before making a purchases are started after the consumer has the will to buy (Nadila, Usman, & Decision, 2020). These decisions can be influenced by marketers by providing information about their products or services that may inform consumer's assessment process (Hanaysha Jalal, 2018).

In addition, retailing has been important in business in ensuring retailers can meet consumers demand and also retailers are able to create and increase the value of goods and services to the end consumers. The demand of consumers and development of innovation in information of processing becomes more important day after day and it competitive environment that will contribute and enhance to the development (Graf et al., 2013; Myllyla, 2019). Among the importance of retailing in industry is provide a variety of product and service assortments, bulk breaking, inventory holding and providing services to end consumers. These important of retailing can meet the consumer needs and wants as well as ensuring the satisfaction of consumer.

Thus, the purpose of this research was identifying the factors influence consumers' buying decision at supermarket among UMK students.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

1.1 Research Objectives

Below are the research objectives for this research:

1. To determine the relationship between product and consumers' buying decision.
2. To determine the relationship between price and consumers' buying decision.
3. To determine the relationship between promotion and consumers' buying decision.

1.2 Significance of Study

The main purpose of this study is identifying the factors influence consumers' buying decision at supermarket among UMK students. Thus, the significance of this study will help researcher conduct the research by using a quantitative method which questionnaire will be distributed to the respondents in gaining the data and information which is more strong shreds of evidence. Beside, this study also beneficial to future researchers especially for final students that will conduct their final year project to refer towards this study because not many research about the factors influence consumers buying decision.

Besides, the significant of this study also can give advantages to small retailers. The results that will shows at the end of this study can help retailers identify the needs and wants of consumers which consumers tend and love to make purchases in supermarket. Besides, this study also helping retailers in improving their marketing strategies to attract more consumes to visit their stores, growing the business and sustainable competitive advantage.

2 Literature Review

2.1 Independent Variables

2.1.1 Product

Product is an element that can influence consumer buying decision and behaviour. Product is a foundation that must know in developing a marketing strategy. Furthermore, product also is one of the marketing mix which is 4Ps. Product quality have been choice of consumer in considering before make a purchase.

Product quality play an important role which is it will determine the satisfaction of consumer. Product quality is a factor that supports buying decision(Nadila et al., 2020). With the quality obtained in a product, it can give added value to the product itself (Usman et al., 2019). Since consumers buy satisfaction in form of the benefits they expect to receive from the product, to design effective marketing programmes, organizations need to know what kinds of products they are offering consumers (Gikonyo, 2020). Therefore, product quality is often considered to be a major contributor to the development of a firm's competitive advantage. Product quality is extent to which a product succeeds to meet the needs of its customer (Gikonyo, 2020).

Packaging is important role for the product to ensure the goods in a good condition and retain the quality. The packages also must be safe, high quality and can attract exciting of consumers. Product package contains visual and sensual attributes which communicate to consumer (Gikonyo, 2020). A product package is a container that has a direct contact with the product, protects, preserves and identifies the product (Ampuero & Vila, 2006). Furthermore, the package design not only improves the visibility of the product but also helps the consumer to recognize the product easily. Packaging is also not only focus on design but ability to convey the information.

Branding will impact to brand awareness which consumers are able to recall or recognize the

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

name of brand. Without branding, it's hard for consumer to identify the products or services. It is difficult for a consumer to identify a product without a brand name or brand identity (Gikonyo, 2020). Therefore, it is important that the branding should be aligned with the product so as to build brand equity and product credibility (Smithson, 2015). Thus, the name, term, symbol, design, sign, colours and uniqueness are important role in order to make consumers remember it and also differentiate the products and services from competitors.

According to the previous study of (Usman et al., 2019) which is effect of products, promotion, price and location of buying decision shows that product in terms of diversity of products, innovation and quality have the effect on buying decision. It proves that quality of product plays an important role in attracting consumers to buy.

2.1.2 Price

Price plays an important role which that can attract consumer whether they want to buy or not. In other words, consumers usually were sensitive with the price. Most of consumers desire a good quality of product with affordable price. They also stated that purchasing decisions are based on how consumers look at the price and what they consider the current actual price (Usman et al., 2019). It can be concluded that the prices greatly affect a consumer's decision to buy a product (Usman et al., 2019).

Value base pricing also important for consumer to ensure the money they invest are worth. Value establishment can be defined as the offer of benefits of equal or superior value to the sacrifices incurred by the purchaser for or product and service (De Toni, Milan, Saciloto, & Larentis, 2017). Value based pricing is product driven and price is based on perceived product value (Gikonyo, 2020). Price affects a firm's competitive position in the market and its market share hence it has a considerable bearing on a company's revenues and net profits (Gikonyo, 2020).

Penetration pricing is like when the firm decides to set the price below the value of the service to the customer, thus ensuring a larger customer base. Penetration strategy is the process of setting a price at a lower price for new products or services hence breaking even. Use of penetration pricing may lead to increase in sales volume and market share(Gikonyo, 2020). Also, Penetration pricing strategy is also used by organizations to promote complementary products (Gikonyo, 2020).

Consumers then form expectations about future price discounting, based on their previous exposure to such activity at the point of buying (Gikonyo, 2020). When consumers encounter frequent discounted brand and expect to find it regularly offered at a discount (Shamout & Science, 2016). Nowadays, consumers are more aware about the price discount. Price promotion usually attract consumer interest indirectly it will affect to the increasing of sales of company.

Based on previous study conducted by (Gikonyo, 2020), influence of marketing mix on consumer buying behaviour in the retail supermarkets in Nairobi country shows the results that price have a relationship with consumer buying behaviour. It shows that price will determine on consumer decision in making purchasing and evaluate the price whether worth to buy or not.

2.1.3 Promotion

Promotion has being important element in order to increase the sales of company. Sales promotions increase sales for the company (Usman et al., 2019). To hold a sale, the company must determine the appropriate promotional tools to promote the products of the company (Usman et al., 2019).

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Personal selling is more to traditional way to promote the products or services. The successful firms in the business world are those that are able to successfully study consumer behaviour and determine the factors that affect the development of marketing strategies (Gikonyo, 2020). Personal selling is one of the best marketing strategies which is directly contact face-to-face between buyer and seller indirectly create a good relationship. Therefore, consumers will consider and decide to purchase products displayed in retail store. This way will influence consumers to make buying decision.

Public relations are responsible for constructing and promoting the news and information that will be published for being read by the public, including the consumer (Gikonyo, 2020). Therefore, since the state of mind of the consumer is an important variable in the buying action process (Saliagas & Kellaris, 2015). It is essential to understand how public relations act and prepare the information, in addition to how the publishers present it to the readers (Gikonyo, 2020). Thus, public relation being as a factor that can influence consumers' buying decision.

Advertising seeks to promote products by means of publicizing them through kinds of media e.g. print and electronic (Haider & Shakib, 2018). The platform or social media that usually companies uses are Facebook, Instagram and website. These platforms are common advertising tools used by companies in advertising their products and services in terms of information, price and so on. By using these new era advertising, it will facilitate the consumer to reach the information and also able to access anywhere and anytime. The internet contains all of the information that was available from traditional media and, when used together with personal devices such as tablets and smartphones, consumers are able obtain information anywhere, anytime (Woo, Ahn, Lee, Koo, & Systems, 2015).

New media is a digital technologies that can connect with internet where people can communicate to each other. There are various mediums that firms are using to communicate to their existing and potentials customers about their products and services (Gikonyo, 2020). these includes word of mouth, social media, sponsorship, experimental marketing etc (Gikonyo, 2020). These elements of promotion could help companies to increase their sales as well as influencing the buying decision of consumers.

From the past research conducted by (Gikonyo, 2020), this paper was investigating influence of marketing mix on consumer buying behaviour in the retail supermarkets in Nairobi country. The result of this study showed significant relationships between promotion and consumer buying decision. Promotion activities such as advertising, personal selling and new media can give impact on consumer buying decision which they interested in the promotions offered.

2.2 Dependent Variable

2.2.1 Consumers' Buying Decision

Buying decision involves consumers make a choices before making a purchase any products or services they desire to buy. It also can describe as a journey for consumer face before they make a purchase. Consumer decision making is basically a problem-solving process whereby a growing number of products are circulating in the community so consideration is needed for the community in making Buying Decision (Nadila et al., 2020). Decision making is the activities of individuals who are directly involved in obtaining and using the goods offered (Usman et al., 2019). Understanding the buying decision is important for marketers and salespeople or every organization in order to align the sales strategy accordingly. It will helps in set the marketing plan that convinces consumer to buy the products or service because it meets the needs of buyer.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Purchase decision involves a sequence of choices formed by a consumer before making a purchase which starts once he/she has a willingness to fulfil a need (Hanaysha Jalal, 2018). They go through several stages of consideration and look for other alternatives (Nadila et al., 2020). Studies suggest that customers generally go through a five-stage decision-making process whenever they make a purchase (Furaiji et al., 2012). Those five stages are problem recognition, information search, and evaluation of alternatives, purchase decision and post-purchase evaluation. Consumer behaviour involves the psychological processes that consumers go through in recognising their needs, finding ways to solve these needs, making purchase decisions (e.g., whether to purchase a product and, if so, which brand and where), interpret information, make plans, and implement these plans (e.g., by engaging in comparison shopping or actually purchasing a product) (Furaiji et al., 2012). These stages will determine whether consumer willing to buy or not. When someone wants to buy something expensive, important and risky they usually do it with caution (Nadila et al., 2020).

2.3 Hypothesis

H1: The product has significant effect relationship on consumers' buying decision.

H2: The price has significant effect relationship consumers' buying decision.

H3: The promotion has significant effect relationship on consumers' buying decision.

2.4 Conceptual Framework

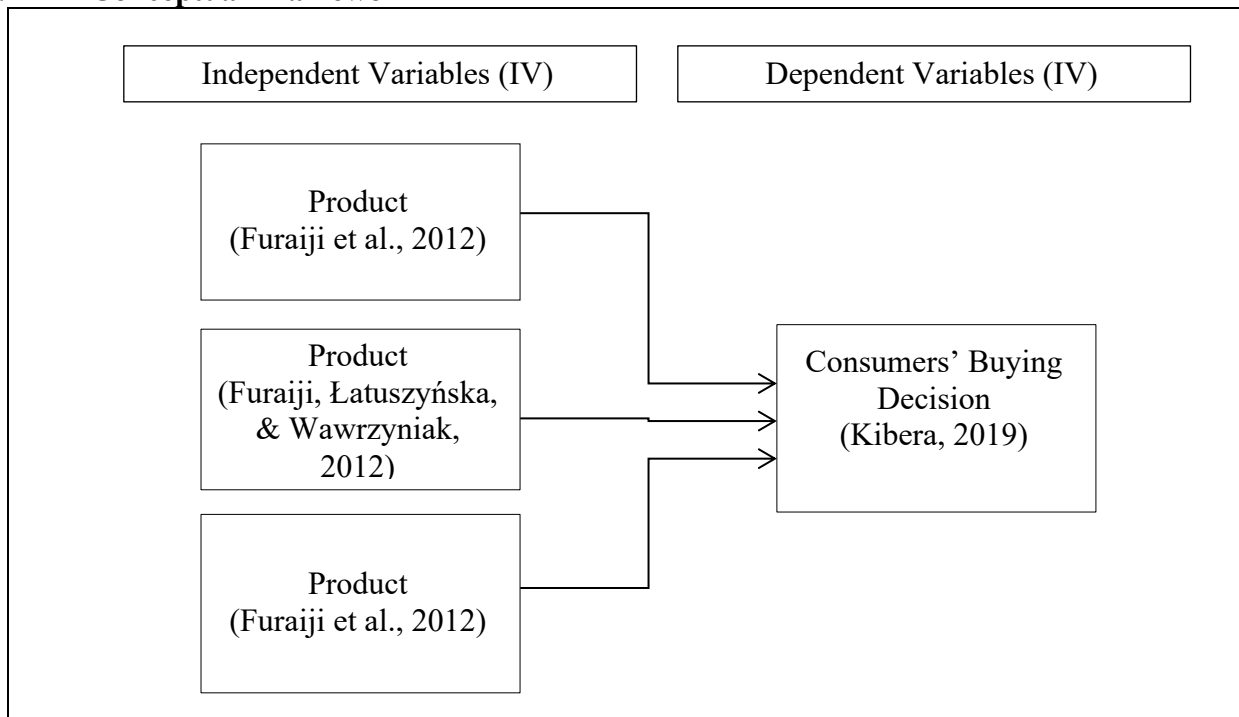

Figure 1: Conceptual Framework of the Factors That Influence Consumers' Buying Decision at Supermarket among UMK students.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

3 Methodology

3.1 Research Design

The study was investigating the factors that influence consumers' buying decision. The cross-sectional used by distributing the questionnaire which it takes only one-shot in gathering the data. Hence, in order to obtain data for this research, the quantitative study had been used by distributing the questionnaire. The collected data will run by statistical SPSS version 22 to analyze the results from the data of questionnaire which related to the study. The questionnaire might be distributed by Google form in a few days, weeks or months in order to complete answering questions. This method will help in saving time and cost.

3.2 Population

The study was about investigating the factors that influence consumers' buying decision at supermarket among UMK students. Therefore, students from Universiti Malaysia Kelantan will be respondents in order to obtain the data. To be more specific, students of UMK will be choose as respondents for this study. Basically population of UMK is 10 186 students for last update on 25 October 2020 (Sources Bahagian Pentadbiran Akademik UMK). There are three campuses namely Kota, Bachok and Jeli which consists of 5 864, 2 395 and 1 927, respectively.

3.3 Sample Size

Based on total of population, it will determine the sample size of the study which the total targeted respondents. So, sample size for this study will be 370 which mean it is total of respondents for this study based on table Krejcie and Morgan (1970).

3.4 Data Collection

In order to achieve research objective, the research will used primary data which the data will be gathered from questionnaire data to get response on self-administered questionnaire. Primary data is easy way in obtain the data in the same time save the time, cost and more efficient especially during the pandemic outbreak nowadays. In addition, this method also helps to achieve a large number of sample sizes or respondents in a short time. Therefore, the source of primary data will be collected by distributing the questionnaire to students of UMK via Google form. Furthermore, secondary data also will use for this research. Before conducting the research, previous study will be reference in order to get more information that associated with the research. The materials that will use are article from Google scholar, journals and books.

3.5 Sampling

For sampling techniques, non-probability will be used in this research. It is because the targeted respondents have been identified which participants have all the characteristics of the study population in the sample. Thus, the sample had already known which is population are students as respondents from UMK. Convenient sampling is type of sampling non-probability techniques because it is accessibility, geographical proximity availability at a given time or the willingness of respondents to participate in this study. In addition, this sampling method will help in conducting the research in large number of surveys and cost effectively.

3.6 Research Instrument

In this study, the questionnaire will be used to distribute to respondents in order to obtain data. Therefore, the questionnaire will be designed into four sections which A, B, C and D. Section A will be covered a general information of respondents. Second, section B covered based on first independent variable which is about influence of product on consumers' buying decision. Then,

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

section C will cover based on second independent variable which is about influence of price on consumers' buying decision. For section D covered based on third independent variable which is about influence of promotion on consumers' buying decision. Lastly, section E will recover dependent variable which is consumers' buying decision. Table 1 below shows the source of questionnaire.

Table 1: Source of Questionnaire

Section	Description	Sources	No. of Items
Section A	Demographic	(Furaji et al., 2012)	5
Section B	Product	(Furaji et al., 2012)	7
Section C	Price	(Furaji et al., 2012)	7
Section D	Promotion	(Furaji et al., 2012)	7
Section E	Consumers' Buying Decision	(Kibera, 2019)	7
Total			33

3.7 Data Analysis Techniques

After the data was collecting, the next step will be analysed them in order to test the research hypothesis. To analyse the data, "Software Package for Social Sciences" (SPSS) version 22 will be used. SPSS Statistics is a software program for statistical data analysis. There are many advantages or benefits using the SPSS. Among the advantage are effective data management, wide range of options and better output organization. SPSS is also commonly used for business. The collected data has been run through three tests namely descriptive analysis, reliability analysis and Pearson correlation.

4. Data Analysis and Findings

4.1 Demographic

The demographic profile of the respondents included the information of gender, age, years of study, faculties and frequency of going to supermarket in a week. In term of gender, the results show that respondent involve in the research are female that is about 298 respondents or 80.54%. Meanwhile, there are about 19.46% of male, which is 72 respondents involved.

Furthermore, the respondents from the group of age is from 21 – 23 years old which the result is 73.24. While others group of age which is 19 – 20 years old and 27 years old and above are 7.30%, 18.38% and 1.08%, respectively. Beside, the frequency of respondents of UMK students based on their year of study are most of the students that dominate in this research are from year 4 with 241 respondents which is 65.14%. The second respondents that dominate are from year 3 which is 59 respondents or 15.95 involve. Other two respondents which year 2 and 1 are 49 respondents, 13.24% and 21 respondents, 5.68%, respectively.

Next, the frequency of respondents based on faculties that involve for this research are from UMK students from 3 campuses which is Kota, Bachok and Jeli. Faculty from FKP are most dominant which is 248 students are involve with percentage of 67.03%. meanwhile, FHPK, FPV and FTKW are 73 respondents, 19.73%, 12 respondents, 3.24% and 16 respondents, 4.32%, respectively. While others faculties FAE, PBI, FIAT, FSB and FBKT are 11 respondents, 2.97%, 3 respondents, 0.81%, 3 respondents, 0.81%, 2 respondents, 0.54% and 2 respondents, 0.54%, respectively.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Lastly, the frequency of respondents going to supermarket in a week is that once is the most dominant which 132 respondents with percentage of 35.68%. The second dominant that respondents vote is 2 times which 99 respondents with percentage of 26.76%. Meanwhile, 3 times and more than 4 times are 53 respondents, 14.32% and 86 respondents, 23.24%, respectively.

4.2 Descriptive Analysis

Descriptive analysis had been running in SPSS to understand the variability of every each variable and listed out summary of the mean and standard deviation of variables in Table 2.

Table 2: Summary of the Mean and Standard Deviation of Variables

Variables	Mean	Std. Deviation
Product	4.47	0.518
Price	4.46	0.550
Promotion	4.43	0.619
Consumers' Buying Decision	4.55	0.519

4.3 Reliability Analysis

The Table 3 below show the reliability test of all variables after distributed to 370 respondents in order to see the validity of variables. Based on Cronbach alpha, all the variables are more than 0.7 which is reliable and accepted. For product and price variables have very good to be accepted to use because the Cronbach alpha value at range $0.9 > \alpha \geq 0.8$ which is 0.88 and 0.87. Meanwhile, for promotion and consumers' buying decision have excellent value of Cronbach alpha in range of $\alpha \geq 0.9$ which is 0.92 and 0.93, respectively.

Table 3: Reliability Statistics of All Variables

Variables	Cronbach's Alpha	N of Items	Results
Product	0.88	7	Very Good
Price	0.87	7	Very Good
Promotion	0.92	7	Excellent
Consumers' Buying Decision	0.93	7	Excellent

4.4 Spearman Correlation Analysis

Correlation hypothesis will be used for hypothesis testing to determine whether there is significant relationship between two variables. In order to have a significant value between two variables, p-value must below than 0.05.

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

Table 4: The Correlation between Independent Variables and Dependent Variable

Variables	Mean (SD)	Product	Price	Promotion	Consumers' buying decision
Product	4.47 (0.52)	1	0.837	0.820	0.782**
Price	4.46 (0.55)	0.837	1	0.844	0.822**
Promotion	4.43 (0.62)	0.820	0.844	1	0.791**
Consumers' Buying Decision	4.55 (0.52)	0.782	0.822	0.792	1

**p-value<0.05, spearman correlation analysis applied

Based on Table 4 above, for independent variable of product, there is a strong positive significant relationship between product and consumers' buying decision ($p < 0.05$, $r = 0.782$). Meanwhile, the independent variable of price there is a strong positive significant relationship between price and consumers' buying decision ($p < 0.05$, $r = 0.822$). Lastly, the independent variable of promotion there is a strong positive significant relationship between promotion and consumers' buying decision ($p < 0.05$, $r = 0.791$).

4.5 Summary

Table 5: Summary of the Hypothesis Results

Number of Hypothesis	Statement of Hypothesis	Result	Significant Value
H1	The product has significant effect relationship on consumers' buying decision	Accepted	0.000
H2	The price has significant effect relationship consumers' buying decision	Accepted	0.000
H3	The promotion has significant effect relationship on consumers' buying decision	Accepted	0.000

Tables 5 showed the acceptance of all hypothesis in this study. For H1, relationship between product and consumers' buying decision is significantly positive and accepted. This is because the p-value is less than 0.005 which is 0.000. Meanwhile, for H2 which is relationship between price and consumers' buying decision is significantly positive because the p-value is less than 0.05 which is 0.000. Thus, H2 is accepted. Lastly, p-value for H3 is 0.000 which is accepted because it is less than 0.05. Therefore, H3 is accepted and there is positive significant relationship between promotion and consumers' buying decision.

5 Discussion and Recommendation

From the research, product has a positive significant relationship with consumers' buying decision at supermarket among UMK students. For product, there is significant value of product which $p = 0.000$. According to Gikonyo (2020) research, product has a significant relationship with consumers' buying decision with $p = 0.025$. The finding was supported by Ismail (2018) where the

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

quality of product able to be addressed to the satisfaction of consumers. At the same time, the trustworthy also could influence and attract consumer intention to buy the product. Hence, the previous has identified that product has relationship with consumers' buying decision. Therefore, the alternate hypothesis (H1) was accepted.

From the research, price has a positive significant relationship with consumers' buying decision at supermarket among UMK students. For price, there is significant value which $p=0.000$. From the previous finding by Giao (2020), there is significant relationship between price and consumers' buying decision which p value was 0.000. According the finding by Al-mamun and Rahman (2015), consumers are concerned about assessing the benefits of product they paying for. Beside, consumer also will compare the price include reasonable and affordable price with the quality of product. Therefore, the research has identified that price relationship with consumers' buying decision. Therefore, the alternate hypothesis (H2) was accepted.

From the research, promotion has a positive significant relationship with consumers' buying decision at supermarket among UMK students. For promotion, there is significant value between promotion and consumers' buying decision which $p=0.000$. According to the finding by Usman (2019), it show that the promotion has a significant relationship which the the significant value was 0.017. From the research Gikonyo (2020) said that promotion can attract and influence consumer to make a decision in buying. Consumers will have intention to buy the product or service when there are various promotional sales. From that finding, it can conclude that promotion has relationship with consumers' buying decision. Therefore, the alternate hypothesis (H3) was accepted.

The purpose of this research is to explore further about the factors that influence consumers' buying decision at supermarket among UMK students. In future, researcher that desire to conduct research in investigating the consumers' buying decision, the research should conduct to focus on every group of people as respondents. Therefore, the results will be more quality. Besides, there are still a lot of factors that can influence consumers' buying decision. Hence, the researcher can refer to this study to expand more idea to achieve the objective of the research.

Besides, the results of all independent variables which is product, price and promotion are has significant relationship with consumers' buying decision. Therefore, retailers should improve on product, price and promotion in many terms such as the quality, reliability, reasonable price and sales promotion in order to attain consumers over many geographical locations. This is because most of the consumers will concern and consider the things they will buy especially product based on price and promotion attributes. In short, marketing strategy is important in business which it affected to the growth of organization in a long term.

6 Conclusion

After undergoing this study in a few months and have obtained results the researcher has been discover and identify that product, price and promotion influencing consumers' buying decision at supermarket among UMK student. As a conclusion, the purpose of this study has been success in achieving the objective. This study might help a lot to the performance of retailing sector in the future in enhancing the organization to ensure the business is growing. Even though this study have a small sample size, there is still hope for this research will used as a reference in the future research that covering bigger population which it would be more information.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

7 Acknowledgement

There are many parties that I truly appreciated and want to say thank you during completing of this research. First of all, in particular Universiti Malaysia Kelantan had provided the courses that give the students including me a lot of advantages. The university also has provided an opportunity for me and all students to experience conducting their own research.

Then, here I owned many thanks and fully respect to my supervisor, Puan Munirah Binti Mahshar. I would like to thanks for her abundantly guidance, assistance and encouragement that she constantly gives to me and ensuring my report of research is good. She deserves receive a special thank you from me for her patience, caring, generosity and guidance when supervising my work despite all the mistakes that I made throughout the making of the research report and for enabling me to proceed with this research study.

Last but not least, I would also to thank my family members for giving me support and understanding of the current situation that the world is currently facing as covid19 disease causes all students must undergo online learning. Not forgetting also to my colleagues who are involved either directly or indirectly for helping me a lot in completing my research. Without them, completing this research alone would not be an easy task for me to complete in such a simple situation.

THE IMPACT OF SELF-SERVICE KIOSKS ON CONSUMERS PURCHASING BEHAVIOUR IN KEPALA BATAS, PULAU PINANG

Nur Syahirah Binti Suhaini and Munirah Binti Mahshar

Faculty of Entrepreneurship and Business,
Universiti Malaysia Kelantan,
Malaysia

Email: syahirah.a17a0505@siswa.umk.edu.my; munirah@umk.edu.my

Abstract:

Self-service technologies (SST) have become ubiquitous in modern life. The research project aims to determine the impact of self-service kiosks on consumers purchasing behaviour in Kepala Batas, Pulau Pinang. This research would also show if consumers perceived SST as a supportive role or already become a vital role in daily life. This study includes three independent variables: perceived usefulness, convenience, and time to measure consumer purchasing behaviour on SST. Secondary data was used for the literature review; the proposed research framework was the results after analysing information from many researchers' literature review. TAM model was adopted for the study. This cross-sectional study analyzed reliability test, descriptive analysis, Pearson correlation, and multiple regressions. This research found that perceived usefulness, convenience, and time are positively related to SST consumers' purchasing behaviour. This study comes out with some limitations and recommendations to provide a better viewpoint for future researchers. This study's findings contribute to business management and the government over Malaysia's behaviour overusing self-service technologies.

Keywords: *self-service kiosk, consumers purchasing behaviour, perceived usefulness, convenience, time*

1 Introduction

Self-service Technology (SST) was introduced to the world due to the revolution of technology. A more recent and cost-effective approach to reducing waiting times has been introducing self-service technologies (SSTs) into the service delivery process. SSTs have been defined as technological interfaces that allow customers to produce services without a service employee's involvement (Meuter et al., 2000). The self-service industry has used the simultaneous reductions of waiting-times and operating costs as a selling point for SSKs (Avery, 2008; IBM, 2009).

Self-service kiosks were known as an interactive kiosk, which is mentioned by Mexen (2015). Nowadays, the interactive kiosks can be found in many places likes airport, banks, mall, hotels and also can be found in a fast-food restaurant. Some examples make self-service kiosks becoming one of the important platforms for people. For example, Maybank in Malaysia has executed the first self-service Automated Teller Machine (ATM) in 1981, mentioned by Mexen (2015). The cash deposit machine and cheque deposit machine have also been introduced as a self-service machine in the banking industry. Not only that, but according to Mexen (2015), the self-service laundry also had started operating in Malaysia 30 years ago. One of the examples of self-service laundry is Cleanpro Express Sdn. Bhd., which is the biggest self-service laundry franchisor in South East Asia, includes Malaysia.

Self-service kiosks give many benefits to consumers likes by using this platform. Consumers can be saving their time from wasting time by waiting too long when purchasing the product and reducing their stress when they need to deal with the staff. Besides, self-service kiosks also operate 24/7. Self-service kiosks are also operating as interactive information kiosks that can give satisfaction to the consumers. Self-service kiosks are a technology that providing information and offering other services to consumers by multimedia digital content. With that, self-service kiosks in Malaysia are widely used in many industries such as banks,

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

airports, fast food restaurants, the retail industry, etc. Consumers' purchasing behaviour and experience of using self-service kiosks in Malaysia are different in their attitudes. Moreover, every consumer in all countries has different perspectives and other purchasing behaviour. Researchers aim to determine the impact of self-service kiosks on consumers purchasing behaviour in Kepala Batas, Pulau Pinang, from this study.

1.1 Significance of the Study

This study contributes to identify the impact of self-service kiosks on consumers purchasing behaviour in Kepala Batas, Pulau Pinang. This study includes a short overview of the research's importance and provided the three categories; government, retail industry, and consumers. These factors help determine if any significant relationship impacts SST's attitude, influencing behaviour intention, and SST use. This study can give high-value information to the government to determine Malaysians willing to purchase products by using self-service kiosks or not. This study also could significantly impact Malaysia's retail industry for retail industry, which can understand the effect of using self-service kiosks to buy goods on customer buying behaviour from this analysis. Lastly, this study will be a helpful and good guideline for consumers who choose self-service kiosks as their platform to purchase products. It will also be useful for consumers because self-service kiosks can benefit consumers, helping consumers save their time buying products. This study also can help consumers to improve their knowledge about self-service kiosks.

2 Literature Review

2.1 Theory of Planned Behaviour (TPB)

According to the researcher (McEachern, Schroder, Willock, Whitelock, & Mason, 2007), the Theory of Planned Behaviour (TPB) is one of the principal models used to determine and understand consumer purchasing behaviour. However, one criticism of the model does not consider the consumer's moral obligations without worrying about the evidence increasing. No matter the moral responsibility and ethical ideologies, inform consumer attitudes and consumer purchase behaviour, as mentioned by (McEachern et al., 2007).

According to (Johari et al., 2010), it is important to understand and examine consumers' behaviour when using machines or technology like self-service kiosks. The Theory of Planned Behaviour (TPB) might be useful to identify consumer's purchasing behaviour. TPB is the extension of Theory Reasoned Action (TRA). As mentioned by (Johari et al., 2010), the theory is about the intentions and perceived behaviour control of technology acceptance to predict behaviour. This is because direct human contact is disappearing, and the existences of machines or technology are more expansive in this current world. As studied by (Johari et al., 2010), the human attitude is about the self-service task's negative or positive evaluation.

Besides that, resource availability, such as the self-service kiosks, is connected with the behaviour (Collier & Sherrell, 2010). This is because factors included in the resources are accessibility, time and effort availability, payment options, and other additional resources that need to be made more accessible. So, those factors are cover by the idea of convenience, as stated by (Collier & Sherrell, 2010). This theory is used to understand the behaviour and fill up the relevant gap in this research.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

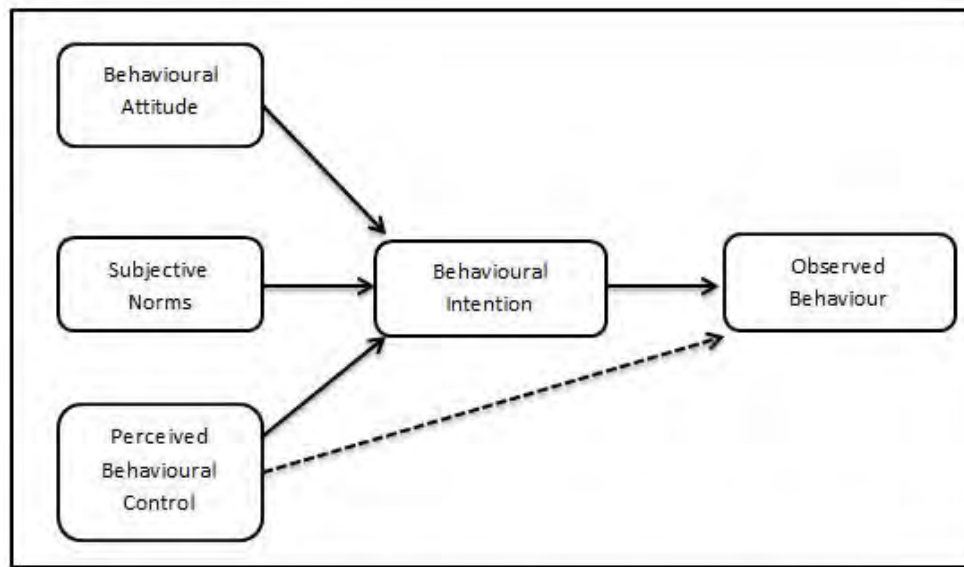

Figure 1: Theory of Planned Behaviour

2.2 Technology Acceptance Model (TAM)

According to (Srinivasan 2014), Technology Acceptance Model (TAM) is an information systems theory that explains how consumers want to accept and use a specific technology. The researcher stated that TAM's main reason is to understand the impact of external factors on beliefs, performance, and intentions. The researcher also says that to understand new technology, a user to the receptiveness, a TAM model is most widely used by the researcher. TAM is the most widely recognized empirical study through validations, applications, and replications (Legris, Ingham, and Collette 2003). However, Chuttur (2009), who did the overview study on TAM, has found that this model could be better established if the gap on lack of rigidity and relevance were fulfilled (Chuttur, 2009).

Bobbitt and Dabholkar (2001) modify TAM by incorporating the previous self-service experience over an individual's attitude towards using the technology. In this study, a slightly modified TAM model will be carried out to fill up the relevance gap to figure out perceived factors influencing the acceptance and adoption of SST. As stated by (Srinivasan 2014), the TAM model focused on two theoretical constructs, which are perceived usefulness (PU) and perceived time (PT). Refers to (Rose & Fogarty, 2006) based on the Theory of Reasoned Action (TRA), the researchers had stated that Technology Acceptance Model (TAM) has stabling being a robust model, powerful and economic model for predicting the acceptance of the staff in the information's technology domain. The researcher also describes explaining and indicating consumers' acceptance of new computer and information technology in the organizational contexts as a mature research area due to models like TAM.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

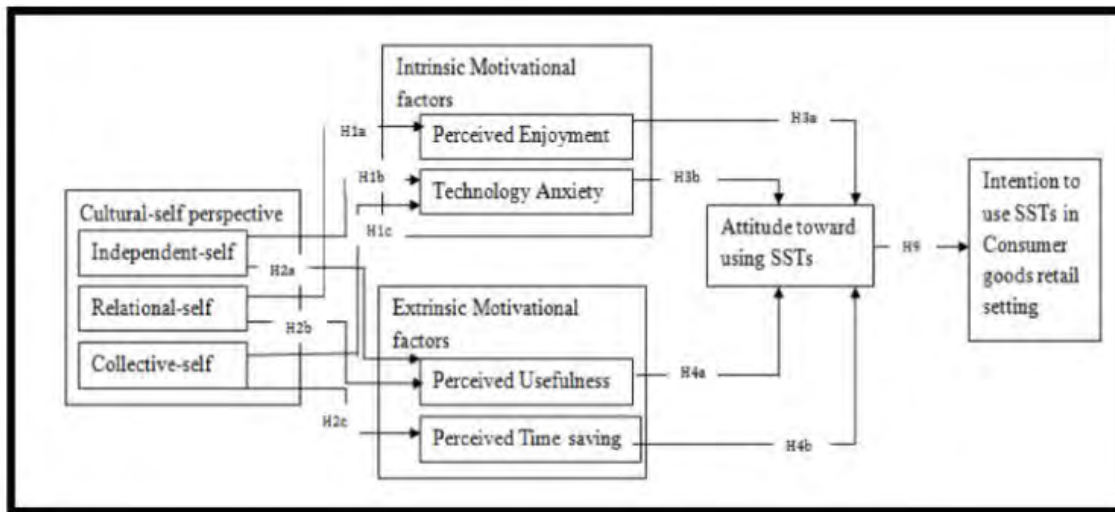

Figure 2: Technology Acceptance Model (TAM) for Perceived Usefulness (PU) and Perceived Time (PT)

Figure 3: Technology Acceptance Model (TAM)

2.3 Consumers Purchasing Behaviour

Consumers' purchasing behaviour is directly linked to the satisfaction of using self-service technology. As stated by (Currtouter 2005), the researcher read that consumers' decisions are influenced by the service providers that provide self-service technology like self-service kiosks. This is because every service provider's goals are to attract many customers by implementing current technology. This is important as it determines people's feelings about different technologies, as mentioned by (Curran & Meuter, 2005). Thus, it can be stated that consumers' purchasing behaviour plays an important role in any company that provides services, especially self-service kiosks, that very useful for today's society. One of the important factors is to offer better services. According to (Dabholkar, Michelle Bobbitt, & Lee, 2003), many service providers hope that adapting technology-based self-service offering better service to consumers.

2.4 Perceived Usefulness

Perceived usefulness has been defined as the degree to which a person believes in using a particular technology system to improve productivity, performance, and effectiveness (Davis, 1989). According to (Elliott et al., 2012), perceived usefulness is reflected in the benefits individuals associate with technology. Besides in appear industry, such as banking, airport, and trading industry also have the similar outcome, identified perceived usefulness as one of the

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

significant drivers for attitude toward an SST (Cho, 2011; Liu, Huang, and Chiou, 2012; Esman et al., 2010) Dabholkar and Bagozzi (2002) mention it isn't easy to measure perceived usefulness in SST as SST consumers do not own the technology. However, they use the technology unless this construct is measured consistently and accurately on a performing task. Refers to (Rose & Fogarty, 2006), the researcher also has the same opinion (Elliott et al., 2012) that perceived usefulness strongly influences consumers' acceptance of using self-service technology. As mention by the researcher, perceived usefulness is the factor that can influence technology acceptance and also reasonable that can influence subsequent continuance of the technology.

2.5 Convenience

According to (Collier & Sherrell, 2010), previous research about 'convenience' focuses on full-service perspectives, which is traditional services. The rapid growth of technology has changed the perspectives which are to self-service technology. This is because the convenience of self-service technology makes consumers easy to use. Furthermore, convenience is defined as the utilization of self-service technology that needs the consumers' perceived time and effort, as stated by (Collier & Kimes, 2013). Convenience can also be interpreted that the location, operating hours, and availability of SST influence consumers' perceptions that are using self-service technology, which is mentioned by (Collier & Sherrell, 2010). Besides, convenience is also focused on the time and effort that utilize a transaction process before, during, and after a transaction, as mentioned by (Collier & Kimes, 2013). This means that the process between consumers and self-service kiosks uses time and effort when doing the self-service task.

2.6 Time

Time is considered to be a scarce resource, which should be carefully spent. This study also stated that the more valuable the consumer's time, the more negative their perception of those wastes. The increase in waiting time decreases satisfaction. (McGuire et al. (2010). According to Kokkinou and Cranage (2013), waiting lines are common in many service settings where capacity is fixed as peak-time demand can exceed the available supply. Kokkinou and Cranage (2013) indicate that waiting-time reduction has been a significant objective of service providers. The more recent and cost-effective approach to reducing waiting times has introduced self-service kiosks into the service delivery process.

2.7 Research Hypothesis

The research hypotheses developed from the questions and objectives of the study are:

H1: There is a significant relationship between self-service kiosks' perceived usefulness and consumers' purchasing behaviour in Kepala Batas, Pulau Pinang.

H2: There is a significant relationship between self-service kiosks' convenience and consumers' purchasing behaviour in Kepala Batas, Pulau Pinang.

H3: There is a significant relationship between self-service kiosks' time and consumers' purchasing behaviour in Kepala Batas, Pulau Pinang.

2.8 Conceptual Framework

The theoretical framework is important because it provides a rationale for predictions about the relationships among variables of a research study and plays a role in guiding the research study's entire process, Ram Sharan Mehta, (2018). This is to recognize the variables of impact self-service kiosks on consumers purchasing behaviour in Kepala Batas, Pulau Pinang. Figure 1 below shows the conceptual framework of this study. It consists of perceived usefulness, convenience, time, and consumer purchasing behaviour.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

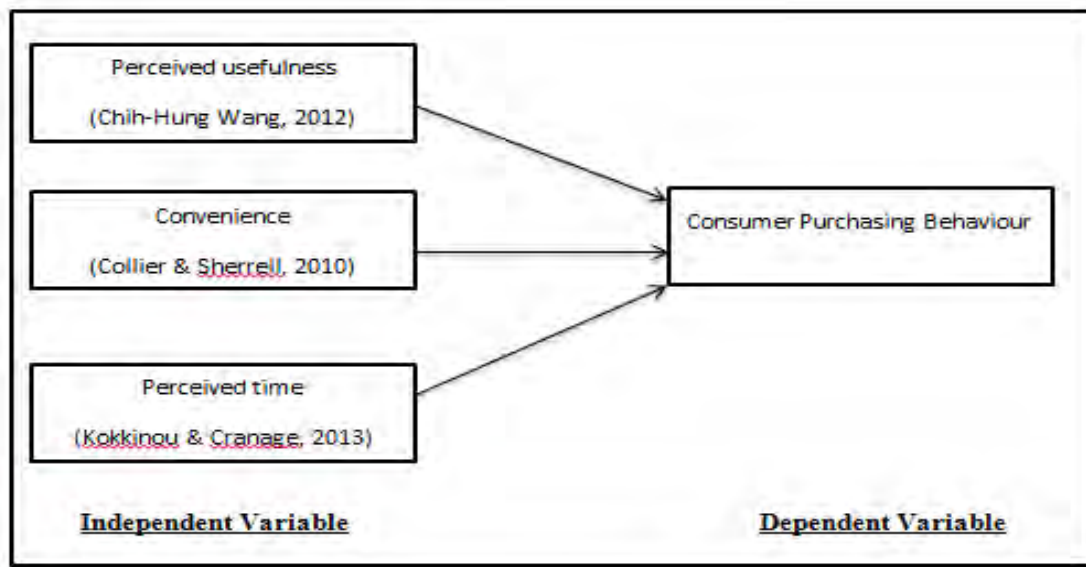

Figure 4: Theoretical Framework of the Study

3 Research Methodology

3.1 Research Design

This study used a quantitative method where construct a survey questionnaire to collect data. The questionnaire was distributed online to be answered by anyone and anywhere (Debois, 2016). In this research, quantitative research will measure the independent variables for self-service kiosks' impact on consumers' purchasing behaviour via a questionnaire survey. This study's population or focus groups stay and use the self-service kiosks in Kepala Batas, Pulau Pinang.

3.2 Data Collection Methods

According to (Johnson & Turner, 2003), the data collection method is a simple technique used as a method of data collection to collect empirical research data. There are two types of data are collected, which are primary and secondary data. In this study, the primary data is collected in a questionnaire, collecting the data from our target respondents. A self-administered questionnaire is applied to require respondents to complete the questionnaires. The results are tabulated and interpreted using the data from this questionnaire. This study's secondary data is the information created and collected by other researchers (Muhajan, 2017). Several relevant literature kinds of research from different sources, such as Google Scholar, the UMK E-journal Portal, and other databases, forming a triangulation of data to be used with the primary data collected for this research. In this study, the method that was used in gathering information is primary sources. The primary source method used to collect data is by distributing the questionnaires to the target respondents. Besides that, secondary data also have been used to support the research. Thus, this study aims to identify the impact of self-service kiosks on consumers purchasing behaviour in Kepala Batas, Pulau Pinang.

3.3 Sample Size

In this research, researchers will use the non-probability sampling technique is used for sample selection. The convenience method is also adopted; this research questionnaire link is distributed on social media, blogs, and e-mail. To achieve a reliable and valid sample, Krejcie & Morgen (1970) used to determine the sample. A sample size of 378 is sufficient for the study. Respondent's opinion was collected and recorded through a questionnaire as primary data to complete this research.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

3.4 Research Instrument Development

Researchers developed an online questionnaire to collect data. Measurement scales of the research model constructs were adopted from previous studies. This study used 5- point Likert scales, moving from "strongly disagree "to "strongly agree" to measure the items. The questionnaire had two versions, which are English and Bahasa Malaysia.

3.5 Data Analysis

The data collected from the respondents through the questionnaire is analysed using through Statistical Package for the Social Science (SPSS) software. This is due to SPSS being user-friendly and allowing the researchers more flexibility to evaluate the research design (D'Amico, Neilands, & Zambarano, 2001). This study involves the descriptive, reliability analysis, Pearson's correlation analysis, and multiple regression analysis. Therefore, it also can subsequently carry out statistical analysis and data interpretation. The mean, standard deviation, and percentage were used to measure and describe the descriptive summary statistics.

4. Findings and Results

4.1 Demographic Profile of Respondents

A set of personal characteristics, gender, race, age, marital status, and education level, has been examined and presented in the table below. The questionnaire was distributed online by using the communication application. 378 sets of questionnaires were collected.

Table 1: The Demographic Characteristic of the Respondents
(Source: Developed from research)

Demographic Characteristic	Category	Frequency (N)	Percentage (%)
Gender	Male	102	27.0
	Female	276	73.0
Race	Malay	339	89.7
	Chinese	22	5.8
	Indian	13	3.4
	Other	4	1.1
Age	19 years old to 20 years old	55	14.6
	21 years old to 22 years old	60	15.9
	23 years old to 24 years old	198	52.4
	25 years old and above	65	17.2
Marital Status	Single	340	89.9
	Married	37	9.8
	Divorce	1	0.3
Education Level	Pre-university / STPM / A-level	43	11.4
	Diploma	84	22.2
	Degree	238	63.0
	Master / PhD	4	1.1
	Others	9	2.4

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Source: Developed from research

Table 1 shows that female respondents are dominant in this study. The majority of the respondents were Malay and followed by Chinese and Indian. Most of the respondents are age between 23-24 years old. The highest number of respondents falls under the category single, and the second-highest status is on married status, followed by divorce. Besides, the respondents mostly come from having a degree of education qualification, which are 238 respondents.

4.2 Descriptive Analysis

Table 2: The Descriptive Statistics of Independent Variables and Dependent Variable
(Source: Developed from research)

Description	Mean	Standard Deviation
Perceived Usefulness	4.1942	.55553
Convenience	4.1794	.58314
Time	4.2646	.58274
Consumers Purchasing Behaviour	4.2233	.60034

Source: Developed from research

Table 2 shows the mean and standard deviation of independent and dependent variables. Mean of independent variables, and the highest mean is the time, which is 4.2646 and followed by perceived usefulness, which is 4.1942, and the lowest is convenience, which is 4.1794. The dependent variable in this research is 4.2233.

Descriptive statistics uses a five-point Likert Scale, which starts from "strongly agree" to "strongly disagree." It calculates and summarizes depend on data. Descriptive statistics will analyse standard deviations, means, median, mode, and other arithmetic information. George and Kumar (2012) mean values that greater than 3.0 to 4.5 is a positive trend. Table 3 showed that the three variables are 3.0 to 4.5, which considered as high interpretation of precautions, and it shows that the majority of respondents agree on the questions in the questionnaires relating to which are perceived usefulness, convenience, and time (independent variables) are relating to consumers purchasing behaviour (dependent variables).

4.3 Reliability Analysis

The reliability test is conducted to determine respondents' understanding of all items, and it could be measured by using Cronbach's Alpha values (Hair et al., 2012). Cronbach's Alpha is used to determine the items' stability and consistency, and if the variables are reliable in the questionnaire. If the value of Cronbach's Alpha is 0.9 and above, it shows that the questionnaire is reliable. If the value is less than 0.60, the association's strength is considered a poor relationship. Table 1 present the results of the reliability test in this study from all variables.

Table 3: Reliability Statistics of Independent Variables and Dependent Variable
(Source: Developed from research)

Variable	N	Cronbach's Alpha	Result
Perceived Usefulness	378	0.813	Good
Convenience	378	0.830	Good
Time	378	0.871	Good
Consumers Purchasing Behaviour	378	0.874	Good

Source: Developed from research

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Table 1 shows that the value of Cronbach's Alpha is range from 0.813 to 0.874. The values indicated that all the variables in this study are reliable and valid since the Cronbach's Alpha value exceeds 0.7, as suggested by Hair et al. (2012).

4.4 Pearson's Correlation

This Pearson Correlation Coefficient Analysis was adopted to examine the relationship between variables and evaluate the relationship's strength. Table 4 is the outcomes of the Pearson Correlation Coefficient Analysis for the dependent variable, which is the intention and independent variables, which are perceived usefulness, convenience, time, and consumer's purchasing behaviour.

Table 4: Summary of Pearson's Correlation
(Source: Developed from research)

		Perceived Usefulness	Convenience	Time	Consumers Purchasing Behaviour
Perceived Usefulness	Pearson Correlation	1	.791**	.707**	.718**
	Sig. (2-tailed)		.000	.000	.000
	N	378	378	378	378
Convenience	Pearson Correlation	.791**	1	.783**	.745**
	Sig. (2-tailed)	.000		.000	.000
	N	378	378	378	378
Time	Pearson Correlation	.707**	.783**	1	.694**
	Sig. (2-tailed)	.000	.000		.000
	N	378	378	378	378
Consumers Purchasing Behaviour	Pearson Correlation	.718**	.745**	.694**	1
	Sig. (2-tailed)	.000	.000	.000	
	N	378	378	378	378

** . Correlation is significant at the 0.01 level (2-tailed).

As stated in hypothesis 1, there is a significant relationship between self-service kiosks' perceived usefulness and consumers' purchasing behaviour in Kepala Batas, Pulau Pinang. Table 4 showed that the correlation coefficient between perceived usefulness and consumer's purchasing behaviour is 0.718, with a p-value of $0.000 < 0.05$. Hence, hypothesis 1 (H1) was supported. There was a high positive relationship between perceived usefulness and consumer's purchasing behaviour. Next, hypothesis 2 stated that convenience significantly affected customers' purchasing behaviour in Kepala Batas, Pulau Pinang. The table above showed the correlation coefficient between convenience and consumer's purchasing behaviour is 0.745, with a p-value of $0.000 < 0.05$. Hence, hypothesis 2 (H2) was supported. There was a high positive relationship between convenience and consumer's purchasing behaviour. Hypothesis 3 stated that there is a positive perfect significant relationship between time and customer's purchasing behaviour. Table 4 showed that the correlation coefficient between time and consumer's purchasing behaviour is 0.694, with a p-value of $0.000 < 0.05$. Hence, hypothesis 3 (H3) was supported. There was a high

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

positive relationship between time and the consumer's purchasing behaviour.

4.5 Multiple Regression Analysis

The independent variable in this study, which is perceived usefulness, convenience, and time were entered into the same regression equation to predict either there, was any significant relationship with the consumers purchasing behaviour in Kepala Batas, Pulau Pinang.

Table 5: Summary of Multiple Regression Analysis
(Source: Developed from research)

Variable	Simple Linear Regression			Multiple Linear Regression		
	b	t-stat(95%CI)	p-value	b	t-stat(95%CI)	p-value
Perceived Usefulness	0.78	20.00(0.70,0.85)	<0.001	0.32	5.44(0.20,0.43)	<0.001
Convenience	0.77	21.68(0.70,0.84)	<0.001	0.35	5.63(0.23,0.48)	<0.001
Time	0.72	18.69(0.64,0.79)	<0.001	0.23	4.13(0.12,0.33)	<0.001

Source: Developed from research

*Normality assumption was fulfilled/met

Table 4 shown a summary of multiple regression analysis. There is a significant effect of perceived usefulness, convenience, and time towards customers purchasing behaviour ($p < 0.05$). In every unit increase of perceived usefulness, customers purchasing behaviour will increase by 0.32. In every unit increase in convenience, customers purchasing behaviour will increase by 0.35. In every unit increase in time, customers purchasing behaviour will increase by 0.23.

4.6 Hypothesis Testing

The hypothesis on the significant relationship between perceived usefulness, convenience, and time with consumers' purchasing behaviour was tested using Pearson correlation analysis. All hypotheses were accepted at 0.01 significant levels.

5 Discussion

This research was about self-service kiosks' impact on consumers' purchasing behaviour in Kepala Batas, Pulau Pinang. The sample size that the researchers need in this research is 378 respondents, according to Krejcie and Morgan (1970) table, which is 102 male and 276 female respondents that were filling up the questionnaires. Based on the survey data, females' total number is more than male respondents because Pulau Pinang is more dominant by females than males. The researchers used primary data to conduct this research by a distributed set of questionnaires to get feedback from the target respondents.

From the data collected by distributed the questionnaire, all the respondents (100%) that fill up the questionnaire admit that they heard and know about self-service kiosks. This research was carried out to determine the impact of self-service kiosks on consumers purchasing behaviour in Kepala Batas, Pulau Pinang, like perceived usefulness, convenience, and time. The researchers have found a significant relationship variable in this study based on respondents' results.

This study's dependent variable is consumers purchasing behaviour on self-service kiosks in Kepala Batas, Pulau Pinang. Consumers' purchasing behaviour is defined as the decision process and acts of people involved in buying and using a product. According to (Schiffman & Kanuk, 2012), customer purchasing behaviour is the customer searching for, purchasing, evaluating, and

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

disposing of products and services that satisfy their expectation of needs. Self-service kiosks are one of the technologies in Self-Service Technologies (SST) and are known as an interactive kiosk. According to (Lee, Fairhurst, & Lee, 2009), a self-service kiosk is a technology that providing information and offering other services to the customers, which is by multimedia digital content. This is because the current generation prefers to do things by themselves than waiting for service.

According to independent variables in descriptive analysis, the highest mean value was time, which is 4.2646 and followed by perceived usefulness, which is 4.1942. Lastly, the lowest mean value is convenience, which is 4.1794. Meanwhile, the mean value for the dependent variable in this research is 4.2233. The researcher had done the correlation analysis to measure the linear relationship between two variables that had started in the study's research objectives.

Based on the result in chapter 4, researchers agree that independent variables like perceived usefulness, convenience, and time impact the dependent variable, which consumers are purchasing behaviour on self-service kiosks. The correlation analysis has shown the significant relationship between perceived usefulness, and consumer's purchasing behaviour, which is the significant p-value is 0.00 that less than 0.05 ($p < 0.05$). Pearson's Correlation between the relationships is 0.718, which indicates a strong positive perfect linear correlation. This shows that there is a significant relationship between perceived usefulness and consumer's purchasing behaviour.

Next, the correlation analysis showed a significant relationship between convenience and consumer purchasing behaviour, which is the significant p-value is 0.00 that less than 0.05 ($p < 0.05$). Pearson's Correlation for the relationship is 0.745, which indicates a strong positive perfect linear correlation. This shows that there is a significant relationship between convenience and consumers. Lastly, the correlation analysis has shown the significant relationship between time, and consumer's purchasing behaviour, which is the significant p-value is 0.00 that less than 0.05 ($p < 0.05$). Pearson's Correlation between the relationships is 0.694, which indicates a strong positive perfect linear correlation. This shows that there is a significant relationship between time and the consumer's purchasing behaviour. Hence, according to (Kokkinou & Caranage, 2013), time is considered a scarce resource for every person and should be spent wisely. This study showed that an increase in waiting times could lead to a customer satisfaction decrease.

5.1 Limitation

The first limitation is time is a very common limitation for many studies. For this research, I was only given around four months to complete the research paper. Therefore, I had limited time to do research and collecting data. I could not get many respondents to distribute a questionnaire because some are unwilling to cooperate with the survey. Due to the lack of respondents, I had to use an online survey, Google form.

Next, the respondent must have a strong internet connection for the online Google Form, such as Wi-Fi or mobile data, to answer the online questionnaire. If the Wi-Fi or data connection is limited to access, the survey is not fully answered and became incomplete. Then it will cause the respondent to need to fill the questionnaire again. Moreover, sending the online questionnaire through Whatsapp and other social media. I had to send the link to the questionnaire frequently to get respondents. Most of them will answer when they have free time. To ensure I reach my total target respondents, I keep spreading the link via Whatsapp group and personal message and choose a suitable time to fill in the online survey.

Lastly, different consumers have different behaviour on purchasing using self-service kiosks. This

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

is because self-service kiosks have many types, such as ATM machines, airport check-in, prepaid reload, etc. Different customers may be experienced the different performance of self-service kiosks. Therefore, the outcome would be different compare with the previous research. This research might be influenced by the culture that shapes current consumer behaviour, which results in different outcomes on the relationship between the models. As so, the results of this study might not apply to other countries.

5.2 Recommendations

The first recommendation is to research other self-service technologies instead of self-service kiosks such as e-banking, online shopping, and so on. It can generate more knowledge about other self-service technologies and be easier for future researchers when researching the technologies. This is because of the acceptance of self-service technologies among the Malaysian people and other country people also plays an important role in this current world.

There are some opportunities that researchers have found at the end of this study to improve the quality of this research in the future. As this study only focuses on the people in Kepala Batas, Pulau Pinang, therefore in future research, the research can broaden the target population by expanding to other cities and states. Not only that, but the research also can be conduct by having more respondents from any country. This can increase the quality of this research in the future.

Besides that, this research in the future can conduct in the qualitative method instead of a quantitative method. The qualitative method is primary data collected from the interview session between the researcher and the respondents, two-way communications. This is because the qualitative method can generate high reliability as there is sharing knowledge or perceptions of this study from the other parties. In the future, the data can be used as guidance for the research.

The government should encourage the public to actively using SST available to enjoy the benefits of convenience, giving adequate support to the design and development team on SST, review and perform process improvement where SST can better fit into the role to serve the public. Besides that, the government also needs to encourage the private sector to establish a solid ground on providing SSTs services to the public by reducing the chances of SST interface failure, making mistakes, and performing poor quality service that could cause the public to be disappointed frustrated. The new way of business operating model would be contributing to the Malaysian economy.

Finally, future researchers depend on the three independent variables: perceived usefulness, convenience, and time in hypothesizing consumers' purchasing behaviour. Other independent variables in similar research must also include perceived enjoyment, ease of use, and many other similar research variables. This is because adding additional independent variables in the regression equation will explain more of the dependent variables' variations than fewer independent variables.

6 Conclusion

This study is focused on the impact of self-service kiosks on consumers purchasing behaviour in Kepala Batas, Pulau Pinang. This study's outcome can be used by retailers to identify the importance and impact of self-service kiosks on consumers' purchasing behaviour. This is because it can help to increase sales performance in the retail industry. The Malaysian government can also use the data to determine the acceptance of self-service technologies among Malaysian people and their impact.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

The minimum requirement of reliability analysis has been satisfied with the entire variable's analysis since the Cronbach's Alpha coefficients value shows above 0.6. The independent variable, which is perceived usefulness, convenience, and time, shows a significant relationship to the dependent variable, which consumers are purchasing behaviour. Based on the hypothesis result, all the H0 have been rejected while H1, H2, and H3 have been accepted in this study. The most important part is this study determined that people in Pulau Pinang are aware of self-service technologies, especially self-service kiosks. Many of them are adopting the technology in their daily lives. This study has been complete successfully.

In conclusion, the researcher can study the relationship between independent variables towards dependent variables. This research also can define the real way to analyse the data. Some of the study's limitations can give the researcher a chance to give more recommendations to improve the research quality.

7 Acknowledgement

First, I would like to show my thankfulness to my supervisor, Mrs. Munirah Binti Mahshar, for her abundant guidance, assistance, and encouragement to complete this research. Next, I appreciate my family members and friends who help me with my data collection; in showing support, they took further steps to share the questionnaire link to their extended friends and family. Thank you for your helping hands and share my stress during my data collection period. I won't know how difficult it is until I realized it in action. My family members always are the biggest supporters of my life. I feel sorry that I am not around and could not help up much during the critical time, and I feel in touch as they have given me all the supports and loves during my difficult period. Finally, I also want to acknowledge my thankfulness to any individuals who were directly or indirectly involved during the making of this research.

FACTORS INFLUENCING THE USAGE OF OMNI CHANNEL IN RETAIL INDUSTRY

Nuraimi Farhana Binti Mohd Hanip and Tahirah Binti Abdullah

Faculty of Entrepreneurship and Business,
Universiti Malaysia Kelantan,
Malaysia

Email: anaamy93@gmail.com; tahirah@umk.edu.my

Abstract:

The aim of this study is examining the factors influencing the usage of Omni channel in retail industry in Malaysia. Furthermore, this study discussed about the cause that influence retailers to use or not use Omni Channel in their business which is the trend in Omni channel, customer experiences and supply chain managements. The quantitative methodology is implemented for this study and the result shows that all the variables are supported by the carried analysis.

Keywords: *Omni Channel, retailers, supply chain management, customer experiences, retail industry.*

1 Introduction

Omni channel retailing refers to an operational model that is synchronized where all channels are aligned to the customers and performed consistently by the company. In other words, Omni Channel retailing is a type of retail involving online and offline methods of shopping available to consumers in the most convenient way. Besides, Omni channels are commonly utilized by sellers nowadays as there is an increase in numbers of customers using numerous and multiple channels to satisfy their shopping journey. For example, Tesco is one of the retailers that utilise Omni Channel. Over the years, there are many major transformations happening around the world which are from brick-and-mortar stores to online shopping, from walk-in to the store for shopping to cash on delivery and others. Besides, sellers have increased the number of purchasing channels which are known as Omni channels – for example, physical stores, kiosks, vending machines, websites, apps, smartphones, tablets, and others. Thus, sellers can maximise profits and give satisfaction to the customers (Chatterjee, 2010). Technology and digitalization have rapidly grown to something advanced which gives customers to the whole new level of shopping and customers experiences. With the emergence of the mobile channel, tablets, social media, and the integration of these new channels and devices in online and offline retailing, the landscape has continued to evolve, leading to profound changes in customer behavior (Verhoef et al., 2015). For a certain amount of time, it became seamless between channels and sellers shifted their strategy of selling into Omni channel strategy.

2 Literature Review

Customer Experience Theory

One of the early theories about Omni Channel is Customer Experience Theory which is predicted on the hypothesis that when a customer does “more” the customers become “more” valuable.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

According to Hillstrom (2018), the data used to support the theory is highly fraudulent, to say the least. Typically, those promoting the theory average historical spend for all customers buying from one channel (i.e., \$100) and compare it to average historical spend for all customers buying from multiple channels (i.e., \$900). Those who promote the theory look at the ratio of spend (900 vs. 100) and say that the Omni channel buyer is worth 9x as much and then paint a picture where the "brand" is encouraged to convert as many customers as possible to as many channels as possible because the opportunity is a 9x increase in customer spend.

Total NY Demand vs. 12mo Buyer Orders (up to 5 Orders)						
Online Orders	Retail Orders					
	0	1	2	3	4	5
0		\$38.65	\$68.93	\$95.09	\$117.48	\$138.68
1	\$31.16	\$68.23	\$99.54	\$123.91	\$147.35	
2	\$54.72	\$90.79	\$122.13	\$147.67		
3	\$76.79	\$114.81	\$145.08			
4	\$88.59	\$135.95				
5	\$120.17					

Online NY Demand vs. 12mo Buyer Orders (up to 5 Orders)						
Online Orders	Retail Orders					
	0	1	2	3	4	5
0		\$14.92	\$20.29	\$23.81	\$25.10	\$27.88
1	\$27.82	\$40.13	\$44.17	\$47.30	\$48.56	
2	\$50.39	\$61.58	\$66.37	\$69.89

3	\$4.97	\$30.11	\$56.12			
4	\$5.51	\$30.14				
5	\$5.98					

Table 2.2 represents the Retail Demand of 2018 in New York . Thus, in aligning with the discussion above, the following propositions are suggested:

Hypothesis 1

H₀ There is no relationship between the Omni Channel utilise by the seller with trends?

H₁ There is relationship between the Omni Channel utilise by the seller with trends?

Hypothesis 2

H₀ There is no relationship between Omni Channel utilise by the seller with customer experience?

H₂ There is relationship between Omni Channel utilise by sellers with customer experience?

Hypothesis 3

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

- H₀ There is no relationship between Omni Channel utilise by sellers with supply chain management?
- H₃ There is relationship between Omni Channel utilise by sellers with supply chain management?

2.1 Trend in Retail Industry

Over the past few years, showrooming has become a trend and practice among consumers in which a buyer uses shopping malls, brick and mortar stores (physical store) and retail as an on-line's seller showroom. Many retailers are concerned about this new trend which gives disadvantages to them and a brilliant step was taken by Target as they were attempting to negotiate with suppliers to provide exclusive products to prevent showrooming (Zimmerman 2012). The idea of claiming exclusivity and getting the right of the product is considered a brilliant verdict to the retailers as they are not willing to let online retailers use their brick-and-mortar stores as a showroom for their product and undercut their prices (Zimmerman 2012). A study 0 from Zimmerman (2012) reflects that this trend is growing and gives negative results to the profitability of brick-and-mortar operation which many forecast it to continue in future time. According to Verhoef et al. (2007), consumers have a habit of obtaining product information in one channel (for example reading product reviews online) and then making actual buys in another place (for example local store). The customers are free to compare the prices and they are not obliged to buy the product at the store where they get the information about the product.

2.2 Customers Experience with Omni Channel

According to Micah Solomon (2015) "Omni channel customer experience" can simply be shorthand for seller customer's ability to order from seller in one channel (for example via online), pick up through another (for example at a brick-and-mortar store) and if necessary, return via yet another (for example from seller porch or a drop-off point). But an Omni channel customer experience also stands for the ability of your customer to be in contact with your company via a variety of channels and to essentially be able to pick up where they left off on one channel and continue the conversation on another. It would be so much beneficial to the customer because they have option in getting the item or for return the product. the outcomes would be the customer will repeat on buying from the same seller and the seller gain customer's trust and loyalty.

There are two basic challenges when input is coming in via myriad channels. First and foremost, seller have a responsibility (and a business need) to make sure to respond: to respond quickly, helpfully and humanly to input from customers, regardless of the channel it comes in on. But a secondary business need, one that is necessary to achieve true, sustainable omni channel communication as part of an omnichannel customer experience is to learn how these channels come together to create the customer experience, and how a more seamless communication landscape can be created.

Apart from that, now that customers have many ways to connect with seller, the seller need to understand how these channels come together to create the customer experience. They have to look at all the customer touch points together – not apart. Customers appreciate having a connected experience. It increases customer loyalty. It's also important to drive effortless customer care by identifying and removing inefficiencies in our systems.

2.3 Supply Chain Management

According to an article written by Mark Quadros (2020), only 28% of retailers provide store-specific stock availability online. The ones that do are likely on the omnichannel-train already.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

After inventory management, returns are the second area most affected by the proliferation of sales channels. Having a simple, customer-friendly return policy can have a huge impact on the sales experience for the customer. People love the option of being able to buy items online and return them in-store. For them, there's no difference. And why should there be? Other than that, what happens when a retailer is holding stock of specific SKUs for one channel — say, for its brick-and-mortar stores — yet visitors to its website are getting an “out of stock” message for those same goods? Without the right systems and process, it's a problem that goes undetected, hurts sales and has the potential to erode customer confidence and brand loyalty. The product was there. It just couldn't be sold. Therefore, to overcome the problem, all inventory processes must be centralized, making it easier to have a clear view of stock movement and related needs.

3 Research Methodology

This study highlighted the factors influencing the usage of Omni Channel in retail industry in Malaysia. Therefore, a quantitative methodology was adopted for the present study. The sample are withdrawn from sellers in Kelantan. To collect the data for this study, a simple random sampling technique was used. Convenience sampling involves selecting sample elements that are most readily available to participate in the present study and can provide the information requires (Heir, 2011). Besides that, this study also utilized questionnaires as a survey to the targeted respondents. In overall, the number of respondents who participated in this study was 345 sellers. This data was analysed using Statistical Packages for the Social Sciences (SPSS).

4 Finding and Discussion

Demographic Profiles of Respondent

The demographic information is included gender, age, ethnicity, nationality, type of business and number of workers. The demographic information will be showing the frequency and percentage of sellers. Table 1 shown the respondent profile. There were 46.1% for male and 53.9% for female. Most of the respondents were in the aged category of between 18–30-year-old, followed by the respondent in the aged category of between 41-50 year old, from respondent aged between 31-40 year old and lastly 51-60 year-old. Among the 345 respondents, there were 59.1% respondents are Malay, 20.0% respondents are Chinese, 19.1% respondent are Indian and 1.7% are others. Next, 89.1% of respondents are Malaysian and 13.9% are foreigners. For the type of business, 20.0% respondent involve in clothing business, 14.8% of respondents involve in hardware business, retails 18.3%, food and beverages 27.8%, cosmetic products 16.5% and 2.6% is others (floristry, gold and jewelleryes)

	SELLER'S RESPONDENT	
	FREQUENCY	%
Gender		
Male	159	46.1
Female	186	53.9
Age		
18 - 30	138	40.0
31 - 40	69	20.0
41 – 50	78	22.6
51 - 60	60	17.4
Ethnicity		

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

Malay	204	59.1
Chinese	69	20.0
Indian	66	19.1
Others	6	1.7
Number of workers		
0-1 people	99	28.7

Other	9	2.6

Table 2

Correlation analysis

According to the result shown in the table 3, factor of trend in Omni Channel had the lowest ranked Beta value among the independent variable which was .113. Meanwhile, customers experience Beta value at the second rank which is .253 and supply chain management was rank at first rank with Beta value .283. The supply chain management was ranked at first where the Beta value .283 which mean the supply chain management had the strongest positive effect on the influencing the usage of Omni Channel in retail industry. It is also can be said that it was the most important independent variable in measuring the factors that influencing usage of Omni Channel in retail industry in Malaysia.

		Coefficients^a				
		Unstandardized Coefficients		Standardized Coefficients		
Model		B	Std. Error	Beta	t	Sig.
1	(Constant)	1.641	.092		17.843	.000
	Trend in Omni Channel	.049	.021	.133	2.354	.019
	Customers Experience	.082	.018	.253	4.453	.000
	Supply Chain Management	.143	.025	.283	5.709	.000

a. Dependent Variable: DV

Table 3

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Testing of Hypothesized Model

No of Hypothesis	Statement of hypothesis	Result
H1	There is a positive relationship between the Omni Channel utilise by the seller with trends	Supported
H2	There is a positive relationship between Omni Channel utilise by the seller with customer experience	Supported
H3	There is a positive relationship between Omni Channel utilise by the seller with supply chain management	Supported

Table 4

4 Discussion and Conclusion

The findings showed all 3 hypotheses were supported. The relationship between supply chain management and dependent variable showed the strongest relationship ($\beta=.283$), customer experience($\beta=.253$) and lastly trends ($\beta=.133$). Each hypothesis was analysed based on the regression results and confirmed or denied. Three of the predictors were significant. This research has shown an increased explanatory of the factors influencing the usage of Omni Channel in retail industry in Malaysia compared to previous research. It also provides guideline for future research to concentrate on the strengths and terminate the weaknesses. As with any studies, there are some drawback in this research such as sample chosen was limited to sellers in Kelantan with low education background. Thus, future study is suggested to sellers with educated background sellers who used to gadget because it is quite hard to make them answer the google form without help and other variable that related to the factors influencing the usage of Omni Channel in retail industry in Malaysia.

THE IMPACT OF BACKGROUND MUSIC ON CONSUMER SHOPPING BEHAVIOUR

Nur Aini Bt Suhaemi and Anis Amira Binti Ab Rahman

Faculty of Entrepreneurship and Business,
Universiti Malaysia Kelantan,
Malaysia

Email: nuraini.a17a0933@siswa.umk.edu.my; anisamira@umk.edu.my

Abstract:

A hypermarket is a retail store that combines a department store with a supermarket. Hypermarkets offer a one-stop shopping experience to shoppers. Background music is known to influence people's behaviour. But sometimes sounds are put together in purposeful ways to create a specific atmosphere or to express ideas or emotions. This research is to investigate the impact of background music on consumer shopping behaviour at hypermarket among UMK students. By using convenience sampling technique, total 357 respondents are ready to use for further analysis. All data collected were analysed using SPSS v.26. From all factors that have been listed, the researcher conclude into 3 types of independent variables which is the tempo of music , the genre of music and the rhythm of music. This study utilized a survey research design. The population of this study was from students from University Malaysia Kelantan City Campus. This analysis of this study was conducted by quantitative methods using the google form questionnaires. For the findings, all of them showed significant positive relationship with the consumer shopping behaviour.

Keywords: Hypermarket , Tempo ,Music Genre , Rhythm , Consumer, Music

1 Introduction

Consumer buying behaviour refers to the selection, purchase and consumption of goods and services for the satisfaction of their wants. There are different processes involved in the consumer behaviour (Ramya & Ali, 2016). Music is a collection of coordinated sound or sounds. Making music is the process of putting sounds and tones in an order, often combining them to create a unified composition. Music can alter moods, which alters behaviors (White & Stone, 2018.); in particular, music like ability (valence) exerts a positive influence on consumers' mood (Lang, 2015). Music is made of sounds, vibrations, and silent moments, and it doesn't always have to be pleasant or pretty. This study aims to observed the impact of background music on consumer shopping behaviour among UMK students.

There are three objectives of this research:

1. To determine whether the tempo of music influence the consumer shopping behaviour at hypermarket among UMK students.
2. To identify how music genre affect the consumer shopping behaviour among UMK students.
3. To examine how music rhythm gives an impact toward consumer shopping behaviour among UMK students.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

1.1 Significance Of The Study

This study provides the various research objectives related to the the impact of background music on consumer shopping behavior. For researcher, this study become an opportunity to apply a theoretical knowledge in practically ways by conducted and produced an own research paper rather than just accept any of speculation produced by the internet. For researcher, this study become an opportunity to apply a theoretical knowledge in practically ways by conducted and produced an own research paper rather than just accept any of speculation produced by the internet. This study gave for future researcher as they can use this research and guidelines especially to help them making some comparisons on their research proposal.

2 Literature Review

2.1 Consumer Shopping Behaviour

Consumer buying behaviour refers to the selection, purchase and consumption of goods and services for the satisfaction of their wants. There are different processes involved in the consumer behaviour (Ramya & Ali, 2016). Many Atmospherics or some elements of it, such as music and odour, can negatively impact consumer decision making process (Luca Petruzzellis, 2009). This could cause confusion in the customer overwhelmed by atmospheric cues, leading to an unpleasant shopping experience and dissatisfaction. Background music is known to influence people's behavior. Numerous experimental studies have shown that different background music and structural components of the music (sound level,tempo ,tonality..) affected consumer's behaviour (Yi & Kang, 2019) by varying the sound level of the same music played in two supermarkets , have found that customers spent significantly less time in the markets during loud session than did the customers during the soft sessions. The type of background music played also has an effect. Empirical studies cited above seem to attest that background music has a positive impact on consumer's behavior. Background music is played in clothing stores, shopping malls, grocery stores, cafeterias, restaurants, hotel lobbies and even in restrooms and elevators.

2.3 The Tempo Of Music

Tempo can be defined as the pace or speed at which a section of music is played. Tempos, or tempi, help the composer to convey a feeling of either intensity or relaxation. The lower the number of beats per minute, the slower the tempo will feel. Inversely, the higher the number of beats per minute, the faster the tempo will be (Liz Manlusoc, 2016). The fast tempo music makes consumers more likely to opt for smaller- immediate benefits at the expense of larger-delayed benefits by changing how long the future delay is perceived to be (Kim & Zauberman, 2019). Fast tempo music slows the walking pace of shoppers at grocery stores and increases sales (Caldwell Clare, 1999).

2.4 The Genre Of Music

The music genre refers to a 'conventional category that identifies pieces of music as belonging to a shared tradition or set of conventions' (Michel et al., 2017). Music can be divided into different genres in a number of ways, such as popular music and art music, religious music and secular music. The artistic nature of music speaks that these classifications are often subjective and controversial, and that certain genres may overlap. Genre and style are two separate terms, and that secondary characteristics, such as subject matter, can also distinguish between genres. The genre of music selected for testing may play a significant role in the resulting stress response.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Loud music negatively influenced sales but music genre did not (Kim & Zauberman, 2019). The genre of music influence consumer shopping behaviour.

2.5 The Rhythm of Music

Rhythm may be defined as the way in which one or more unaccented beats are grouped in relation to an accented one. Rhythm can exist without melody, as in the drumbeats of so-called primitive music, but melody cannot exist without rhythm (Peter, 2016). In music that has both harmony and melody, the rhythmic structure cannot be separated from them. Melody and rhythm are intimately connected. In music, rhythm is simply defined as the “beat” or pulse of music. In performing arts, rhythm is the timing of events on a human scale; of musical sounds and silences that occur over time, of dance steps, or the metre of spoken language and poetry. In certain performing arts, such as hip hop music, the rhythm of the lyrics is one of the most important elements of the style.

2.6 Research Hypothesis

In this study, there were three hypothesis that are have a positive relationship between the impact of background music on consumer shopping behaviour

H1: Background music tempo has a positive influence on consumer shopping behaviour.

H2: Background music genre has a positive influence on consumer shopping behavior

H3: Background music rhythm has a positive impact on consumer shopping behavior.

2.7 Research Framework

The conceptual framework is the researcher understands of the variables in studies that related to each other. In this investigation, the researcher want to identify the factors influencing consumer shopping behaviour among UMK students. Based on the conceptual framework, the independent variables of this study were consisted of three factors influencing, which were tempo , music genre and rhythm. These factors were associated with impact of background music on consumer shopping behavior which was the dependent variable of this study.

This conceptual framework can conceptualized in Figure 1.

Figure 1: Conceptual Framework

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

3.1 Research Design

Research design is essentially a study plan that specifies the process to be followed by researcher to achieve their research goals or test the hypothesis developed for their studies. The objective of this study is to analyze the impact of music background music on consumer shopping behavior at hypermarket among UMK students area Kelantan. It created with the brief highlight method used in the data collection by the sample selected for the study. In this following chapter, the appropriate methodology used in this study on the consumer shopping behavior will be discussed. There have two type of research design, which is qualitative and quantitative design. In this study, the researcher used the quantitative research design method.

3.2 Data Collection

Data collection methods are important, because how the information collected is used and what explanations it can generate are determined by the methodology and analytical approach applied by the researcher (Paradis et al., 2016). We had used a quantitative research method through this research. Quantitative method was known as one of the questionnaire surveys. Quantitative methods were used to explain a scenario or phenomena by collecting and analyzing numeric or mathematical data appropriately. The focus was on many participants as opposed to a few, so that a larger pool of data can be obtained by using quantitative research methods so that a diverse range of opinions can be explored and analyzed. Specifically, survey research was used in this study to better understand usage and attitudes

In this research, the researchers are using the primary data and secondary data. Secondary data is important, as just a recent survey, which can adequately represent past improvements and/or trends cannot be performed. The secondary that researcher used are based on collection sources are government publications, websites, books, journal articles, internal records etc. (Ajayi, 2017).

3.3 Sampling

According to (Etikan et al., 2016), convenience sampling is one of the main types of non-probability sampling methods. A convenience sampling also made up for respondents who are easy to reach and randomly selected from sample. A non-probability sampling that procedure used to select samples, when the subject in the population do not have equal chance to be selected as research respondents.

Table 1 : Krejcie and Morgan (1970)

4 Data Analysis

Data analysis is a method used by researchers to analyse data using statistical methods and to

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

discover knowledge analytically. Data analysis can be state as a process or way of applying a systematic order or technique to describe, illustrate, condense , recap and also evaluate the data. In analysing a data , there are a few issues that should be consider which is currently selecting data collection methods and appropriate analysis ,drawing and unbiased reference,data collection methods and others. That issue should be considered as it determined whether the date that been collect are reliable enough to be use in study. For this study, there are many quantitative data analysis methods; we prefer to use reliability analysis using the Statistical Package of Social Science (SPSS). The information will be collected via the questionnaire and systematically processed and coded according to the analysis procedure. We analyse data gathered using version 26.0.0 of SPSS software. The SPSS would process the data and display the relationship between dependent variable and independent variable in numbers after all accurate data was key in into SPSS.

5 Findings

The researcher analysed the relationship between three independent variables, which are the tempo of music, the music genre and the rhythms, whereas, the dependent variable consumer shopping behaviour . The result shown that all three independent variables have significant relationship with the consumer shopping behaviour among UMK student. The Pearson Correlation Coefficient has been done to prove from the research that independent variables, have a positive relationship between dependent variable.

Current research is also very important to identify the impact of background music on consumer shopping behavior. Thus, this study will influence future research in studying related matters where the latest research will provide basic knowledge to future researchers on the impact on consumer shopping behavior as well as the factors that influence it.

The questionnaires about the impact of background music on consumer shopping behaviour, researcher agree that the three independent variables influenced the dependent variable. The first objective is to determine whether the tempo of music influence the consumer shopping behaviour at hypermarket among UMK students. The result show there has a significant relationship between the tempo and consumer shopping behaviour . The p-value this variable show .000, is lower than 0.05, which is mean that significant. The correlation coefficient between the tempo of music and consumer shopping behaviour show 0.738, which positive significant relationship between the variable.

The second objective to identify how music genre affect the consumer shopping behaviour among UMK students. From the result, there has a significant relationship between income level and impulse buying behaviour during covid-19. The correlation coefficient between the music genre and consumer shopping behaviour was 0.761, that have positive significant relationship between the variable. While the p-value this variable show .000, which is lower than 0.05, which mean that it is significant.

Next, the third objective is to examine how music rhythm gives an impact toward consumer shopping behaviour among UMK students . Based on chapter 4, show there has a significant relationship between the rhythm of music and consumer shopping behaviour. The p-value this variable show .000, which is lower than 0.05, which mean that it is significant. The correlation coefficient between the rhythm and consumer shopping behaviour was 0.727, which illustrate that positive significant relationship between the variable.

** . Correlation is significant at the 0.01 level (2-tailed).

5 Discussion & Recommendation

According on the result from chapter 4, there is a positive relationship between the tempo of music and consumer shopping behaviour. The researcher gained a significant value were p-value is 0.000 less than 0.05 for the hypothesis. Therefore, the tempo was influencing the consumer shopping behaviour . The Pearson correlation shows the relationship between the tempo and consumer shopping behaviour is positive. The result show the tempo give impact to the consumer shopping behaviour . Therefore, the researcher has accepted the H1 which is there is a significant relationship between the tempo and consumer shopping behaviour.

For the second hypothesis, the result indicate that there is significant relationship between the music genre and consumer shopping behaviour among UMK students. Then, Pearson correlation also shows the relationship between the music genre and consumer shopping behaviour is positive. The result show that the music genre give impact to consumer shopping behaviour. Furthermore, according the table 4.10, the result showed significant result, which is the p-value is 0.000 which less than 0.05. So, the researcher has accepted the H2 which is there was significant relationship between the music genre and consumer shopping behaviour among UMK students.

For the third hypothesis, the result indicates that there is a significant relationship between the rhythm of music and consumer shopping behaviour. Then, Pearson correlation also show the relationship between the rhythm of music and consumer shopping behaviour is high positive. This result show that the rhythm of music was important because the appropriate music rhythm make

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

the customer feel clam. Besides, the result showed significant result that the p-value is 0.000 which less than 0.05. So, the researcher has accepted the H3 which is there is a positive significant relationship between the rhythm of music and consumer shopping behaviour.

6 Recommendation

From the limitation as mentation earlier, some recommendation have been suggest to improve the quality of research. Firstly, In the questionnaires, extra questions may be included to ask the respondents to fill in whether they have ever faced impulse buying behavior before. In this study, researcher only ask people who ever faced the impulse buying behavior during covid-19, but not include the customer how also faced the impulse buying behavior before covid-19 to answer these questionnaires.

Furthermore, That respondents are only expected to complete the questionnaires once. This reminder could be place at the header in google form of the questionnaires to remind all the respondents. In addition, if respondents want to contact the researcher with the questionnaires to explain their doubts, the best approach is to indicate contact numbers and emails in Google form on the first page to facilitate respondents.

A part from that, although long questionnaires might reduce respondent's interest to answer the questionnaires, it is unavoidable in order to reach the research objective. It is necessary to collect data required to test the hypothesis. The only way to reduce the respondent's negative feelings is by designing the interesting layout that can get the respondent's attention to continued answer the questionnaires.

Lastly, future researcher are also suggest to diversify the study and not only focusing on a small group of respondents. Based on this study, researcher was realized that population of this study came from very small population, which is from Selangor, Negeri Sembilan, Kedah and Pulau Pinang. This due to the time restriction that the researcher faced in completing this study. Therefore, future researcher are suggest to broaden the study by widening the size of the population from other state also. This will make the study more reliable since it has a larger size of sample size.

7 Conclusion

This study was accomplish to determine the impact of background music on consumer shopping behaviour where the respondent were from UMK student. There are 357 respondent from two faculty in University Malaysia Kelantan City Campus. Based on chapter 4, it shown the result of hypothesis for independent variable, which are the tempo of music , the music genre and the rhythm of music . The researcher have been recognizing the relationship between three independent variables and dependent variable. The all three hypothesis were accepted. The hypothesis (H1) was accepted since there are significant relationship between the tempo of music and the consumer shopping behaviour. While the correlation coefficient between the tempo and the consumer shopping behaviour show 0.738 .Next the second hypothesis (H2) also accepted because there are significant relationship between the music genre and consumer shopping behaviour and the correlation coefficient shown 0.761. Furthermore , the third hypothesis (H3) also were accepted since there is a significant relationship between the rhythm of music and consumer shopping behaviour while the correlation coefficient between these variables shown 0.727 .

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

8 Acknowledgment

First, Alhamdulillah, thank Allah for encouragement, chance to start on my research thesis, and effectively conclude this long and difficult trip. Nevertheless, it would have been possible without many people's kinds support and help. My heartfelt thanks go out to all of them.

I would also like to express my appreciation to my supervisor Dr. Anis Amira bt Abd Rahman and my examiner Dr. Shah Iskandar Fahmie, for being lost without their support and continuous monitoring. They provided me the requisite path details so any potential mistakes may have arisen from the research. Their vast expertise, observations, opinion, and energy was a huge benefit to me. It is because of the support and love it is possible to complete this research.

Secondly, thanks to my parents that have supported me financially to do this research proposal. Other than that, they never ending support and motivation is one of the reason we could finish this research proposal. Next, I take this time to share my sincere appreciation and special thanks to all respondents for their help in answering the questionnaires. Your input is greatly valued, because it lets me make my work on this subject more credible. Last but not least, also thanks to my friends for their loving support and motivation during finishing this research project.

A dedicate a deep sense of gratitude to Universiti Malaysia Kelantan especially to the Faculty of Entrepreneurship and Business (FKP) for giving us the chance and a precious time to complete this research and opportunity to prepare the project.

A STUDY ON CUSTOMER SATISFACTION TOWARDS PRODUCTS AND SERVICES OF TESCO AT ALOR SETAR

Nuraliah Syafiqah Aisyah binti Muhamad Rodzi and Raja Rosnah Raja Daud

Faculty of Entrepreneurship and Business
University Malaysia Kelantan,
Malaysia

Email: aliah.a17a0517@siswa.umk.edu.my; rosnah.d@umk.edu.my

Abstract:

The purpose of this study is to find out customer satisfaction with Tesco products and services. The value of customer satisfaction comes from the widely accepted concept that it must satisfy customers in order for the company to be efficient and profitable. Tesco Customers General know the satisfaction of Tesco products and services using the factors that require them to choose it has not been explored. This study aims to see the impact of quality, product quality and price felt through customer satisfaction on Tesco products and services. Quantitative data collection method had judgemental sampling technique has been used. This study uses cross-sectional design where development questionnaires and deadlines to 150 respondents with go to Tesco at Alor Setar and then, the customers must be answer questionnaire through google form. A total 124 of customer's Tesco were tested using questionnaire and being analysed by using Spearman rank correction with Statistics Package for the social science (SPSS). The results indicates that all the elements have significant relationship with customer satisfaction towards products and services at Tesco. Finally, as customer satisfaction studies on products and services are reduced, it is hoped that more such studies can be done in the future.

Keywords: Product quality, Service quality, Price, Customer satisfaction towards products and services at Tesco

1 Introduction

This study is conducted to determine the factors that affect customer satisfaction towards products and services of Tesco. The value of customer satisfaction is derived from the widely accepted concept that it must satisfy customers in order for a company to be efficient and profitable, and there are many advantages from this as follows (Clemes, Gan, Kao and Choong, 2008). It has a great impact on the durability of customer ties with service providers.

For foreign hypermarket operators, Malaysia is no longer a viable arena, with a very bleak outlook in the coming years as larger operators such as Tesco Plc's continue to pull the shutters down due to high operating costs and the dwindling appetite of customers. VP Datuk Liew Bin of the Malaysia Retail Chain Association said the overall view shows that it will be difficult for foreign brands to survive in the region. For instance, Carrefour SA was the last hypermarket to pull out of the market and now we have news that Tesco is doing the same. Currently, Malaysia and Thailand are the only countries in Asia where Tesco has stores. It has 1,951 stores in Thailand and 60 hypermarkets and nine convenience stores in Malaysia.

This research was done because the researchers wanted to know in more detail how the services and goods they provide are handled by Tesco. Tesco has once managed to draw buyers by offering

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

relatively cheap commodity prices and it can also be said that traders want to purchase products in bulk with Tesco. Therefore, researchers want to explore whether the cheap price on the commodity is claimed to have quality or not quality. In addition, Tesco has all sorts of items for the food segment, from raw materials to dry goods, then the category of sports equipment, children's toys, appliances and even clothing is available for shopping for their customers. Like most of the items on show for sale, all of these products are of high quality. This is therefore a topic for researchers and a source for researchers to review Tesco's goods and services.

This study will be investigating the factors that affecting customer satisfaction towards products and services of Tesco at Alor Setar. Specially, the objectives of this study are:

- i. To examine the relationship between service quality and customer satisfaction.
- ii. To examine the relationship between product quality and customer satisfaction.
- iii. To examine the relationship between price and customer satisfaction.

1.1 Significant Of The Study

This study was conducted to measure the relationship between factors that customer satisfaction towards product and service at Tesco. This research will contribute to the deeper understanding about service quality, product quality and price in the customers and staffs at Tesco.

This research study also will assist researcher to do the improvement on their issue. The three of the factors which are service quality, product quality and price will have a positive and significant relationship with customer satisfaction towards product and service at Tesco. Further research should be undertaken to build on this finding is the study and hopefully improve on the understanding and meaning of the relationships. Results of this study will recommend that factors involved three element which play a big role and will significantly contribute to the positive customer satisfaction towards product and service at Tesco. The study may have some implications in the selection of customer satisfaction, vary answer from the respondents and small data collection by the researcher.

The researcher is therefore conducting this study since little attention is paid to the customer satisfaction based on service quality, product quality and price. This research also focuses on explaining the influence of service quality, product quality and price on customer satisfaction towards products and services. This research will also provide Tesco with valuable insight in order to establish a proper product and services strategy. The need to look at this topic in the current research is in the context of emerging market. It also allows Tesco to build a better to customers of product and services and offers new perspectives on how to promote the product to certain customers. Last but not least, the retailers and Tesco can improvement for their services, products and quality to get more satisfaction from their customers.

2 Literature Review

The main issues will determine by the definition of customer satisfaction, related theory and model on customer satisfaction and three factors that affecting customer satisfaction among customer's Tesco. Besides that, theoretical underpinning about customer satisfaction, the literature on selected variables which are independent variables and dependent variable.

2.1 Dependent Variable

2.1.1 Customer Satisfaction

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Satisfaction can be divided into two approaches, either as a transaction-specific satisfaction (Olsen & Johnson, 2003) or as a combined satisfaction / post-consumption satisfaction and overall judgement on buying actions (Johnson, Anderson and Fornell, 1995; Engel, Blackw and Fornell, 1995; Engel and Blackwell, 1982; Hunt, 1997; Oliver, 1997). Transaction-specific satisfaction is the very own measure of the client's experience and reaction to a specific service encounter (Cronii and Taylor, 1992). The customer who experiences a product or service at this time expresses this reaction. In the meantime, accumulated satisfaction applies to the overall assessment of the user experience by the customer to date, and to the accumulation of interactions with services offered to them from day-to-day (Johnson, Anderson and Fornell, 1995).

Then, the previous study in hospitality and tourism industry, it was crucial to understand customers' responsive factors that related to their spending involvement and repeated purchases. The customers got chances to interact with a product or services by this industry during their spending involvement. It was supported by Orel, F. D., and A. Kara, (2014), customer satisfaction was total equal gratification with a goods (product or services) involvement. Thus, customer satisfaction was been thought as a significant predecessor of loyalty for a long term. However, previous studies defined the customer satisfaction in numerous ways. According to Caruana, A., (2002), it was the customers' reaction towards the product or service whether the product or service can fulfill their needs or wants. Besides, customer satisfaction was important factors that lead the customers to repeat sales, spread the good word of mouth and maintain customer loyalty. Alternatively, this study accomplished to explore three factors towards customer satisfaction at Terengganu Equestrian Resort (TER), Terengganu. These factors were service quality, product quality and price of the goods or services by TER.

2.2 Independent Variables

2.2.1 Service Quality

In order to provide its customers with a solid, long-term connection, the quality of service has received significant attention from the service provider. For companies operating in the service sector, the quality of service was a reasonable benefit (Bartlett, and Han, 2007). Previous researchers defined service quality from separate viewpoints, depending on the service provided by the service provider. In the attempt of a service provider to distinguish its services from its adversaries, service quality is a critical instrument (Ladhari and Morales, 2008). In retailer self-checkout study, the consumer expectation of the service provider versus customer awareness of the actual service from the service provider was theorised as service quality (Orel, and Kara, 2014). Service quality researchers have used SERVQUAL, the model for assessing service quality, extensively (Parasuraman, Zeithaml, and Berry, 1994). This model indicated that five components comprising tangible, reliability, responsiveness, assurance, and empathy could be rated for service quality (Bakti and Sumaedi, 2015). Moreover, several studies have shown that the standard of service contributes to customer satisfaction (Akbar and Parvez, 2009). If the experience of the consumers with a product and service and these products and services exceeded their needs, the customers feel happy (Parasuraman, Zeithaml, and Berry, 1994). Consequently, the customers assessed the practical and functional characteristics of the service offered by service providers (Gremler and Brown, 1996). Practical characteristics focused on what was delivered, but the functional characteristics focused on how, why, who and when it was given (Gremler and Brown, 1996).

Even the study of Cronin and Taylor (1992) found it a key antecedent to customer satisfaction. Service quality not only play vital role to satisfy customers (Grzinic, 2007). But also regarded as a market value oriented and a way to place the product in a vibrant environment (Kaul, 2005). In

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

certain respects, recognising the customer's desire for service quality is helpful in this respect (Shahin, 2002).

Service quality has a positive impact on customer satisfaction for mobile services in the next previous study and helps to generate the requisite competitive advantage by being an efficient differentiating factor (Leisen and Vance, 2001). Quality represents the expectations of customers regarding a product or service (Parasuraman, Zeithaml and Berry, 1998). A conceptual model of service quality was offered by Zeithaml, Berry and Parasuraman (1996) and found that service quality influences specific behaviours that indicate whether clients will stay loyal to or leave an organisation. However, five dimensions of service efficiency, such as tangibility, reliability, responsiveness, assurance and empathy, are calculated (Zeithaml and Bitner, 2000). Oyeniyi and Abiodun (2011) found that meeting with customer service increases the intent and satisfaction of customers. They also iterated that for building customer relationships, quality customer service is important, which in turn would contribute to customer loyalty, retention and preference. Research by Uddin and Akhter (2012) shows that the quality of service and fair price indirectly affect the consumer loyalty of a mass service industry (i.e. mobile phone operators) through perceived value. Perceived value plays a mediating function between consistency, fairness of charge and fulfilment. The study shows that fair prices have a positive direct influence on customer satisfaction, while the standard of service does not have a major direct impact on customer satisfaction.

2.2.2 Product Quality

In addition to the physical dimensions of a company attracting or deterring selection, it has been proposed that the physical design of a company can also affect the degree of success that customers achieve within one (Darley and Gilbert, 1985). This includes research into the "service climate," which is the "designed man-made environment," and how it impacts both customers and workers in the service process (Bitner, 1992)

Product quality was another aspect of consumer satisfaction in this research. One of the essential elements for consumer loyalty was the accepted product consistency of previous observed studies (Gremmler, D. D., and S. W. Brown, 1996). Some firms have supplied consumers with both goods and services. Therefore, several research centred on service quality as these service providers were concurrently selling a commodity (Kim, M., Vogt, C. A., and B. J. Knutson, 2015). Quality is product performance, which results in customer satisfaction freedom from product deficiencies, which avoids customer satisfaction. In brief, quality is zero defect doing it right first time and meets the requirements of customer. All service should be aimed at meeting the customer's requirements by eliminating non-quality traits (Erdil and Yildiz, 2011).

In addition, in the previous report, Tata Motors is committed to achieving leadership in the automotive industry through corporate excellence while retaining principles and dignity to enhance the quality of life of the communities served by Tata Motors (Hanno, Christian, 2009). Tata Motors Company provides high quality vehicles to meet the highest quality requirements and customer needs in India. In designing their goods, their goal is to be Indian leaders in value and satisfaction. In the automotive industry, consistency is an elusive notion. It is the entirety of a product or service's features and characteristics that bears on its ability to meet particular needs (Winder, 1996 and Chavan, 2003). If a product meets the standards of the customer, the customer will be satisfied and will feel that the product is of reasonable or even high quality. Although studies have been going on for more than two decades on the manner in which quality affects customer satisfaction, much of the research on how quality affects satisfaction and loyalty in the past has concentrated mainly on pure goods (e.g. Garvin 1988, Gronroos 1983, Steenkamp 1990)

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

or pure service environments (e.g. Brady and Cronin 2001, Oliver 1997, Parasuraman et al. 1985).

2.2.3 Price

In the service context perceived price is playing significant role in decision making. Customers' perception of price has been studied in terms of price perception (Munnukka, 2005; Varki and Colgate, 2001), price fairness perception (Bolton et al., 2003), and price equity (Bolton and Lemon, 1999). Price is an important element in consumers' purchases; therefore it has a large influence on consumers' judgments regarding service (Herrmann et al., 2007). Perceived price and fairness plays an important role in selection of bank because price structure is relatively complex than other service contexts, like education, hotel and other. The price of the goods on the menu will also have a huge effect on consumers because the price will attract or repel them (Monroe, 1989). And then, especially because price functions as a quality indicator (Lewis and Shoemaker, 1997)

The price was one of the primary principles that reflected the customer's way of buying (Han, H. and S. S. Hyun, 2015). Previous studies have agreed that service quality and product quality function as important customer satisfaction components (Gremler, D. D., and S. W. Brown, 1996). In the decision-making activities of clients, price awareness among customers plays a crucial role (Jiang, P., and B. Rosenbloom, 2005). Observed research analysed the consumer's knowledge of a company's price and compared it to the cost of its competitors in order to establish promising goals and loyalty to that company (Kim, B., M. Choi, and I. Han, 2009). Therefore, whether costly or cheap, fair or unjust, the price provided by the firm acts as a benchmark for the continuation of the transaction by the customer or not. Market knowledge of the price charged by a business or service provider has given customers the advantage of comparing and deciding whether or not a good price was offered by the company or service provider (Watchravesringkan, K., R. N. Yan, and J. Yurchisin, 2008).

3 Research Hypothesis

Based on the research objectives and research framework, the research hypotheses for this study were developed. The software SPSS is modified to better explaining on customer satisfaction towards product and service of Tesco which are service quality, product quality and price included in explanations. The present study has put a focus on the understanding of the relationship between product quality, service quality, price and customer satisfaction towards products and services of Tesco. The details justification on the hypotheses development is discussed in the next sub-points.

H1: Service quality is positively associated with customer satisfaction towards products and services of Tesco

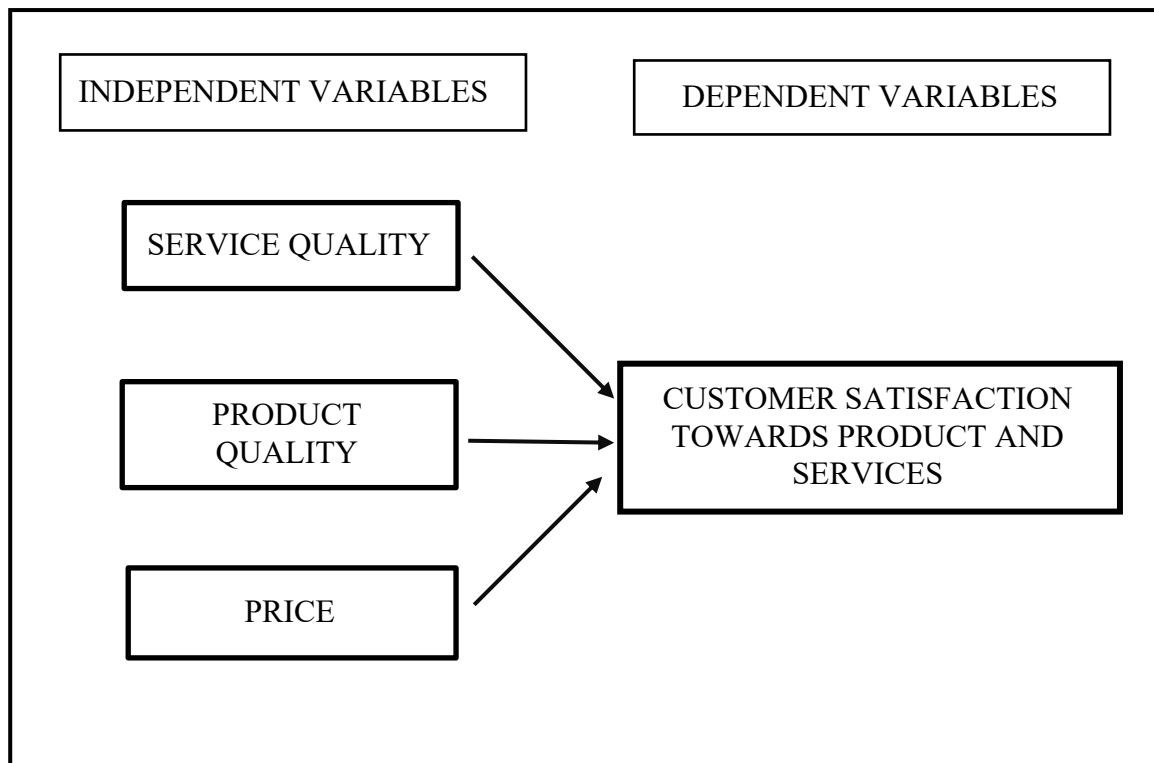

H2: Product quality is positively associated with customer satisfaction towards products and services of Tesco.

H2: Price is positively associated with customer satisfaction towards products and services of Tesco.

4 Conceptual Framework

By referring the literature review and research problem the research framework has been conducted to investigate the connection between the independent variables and dependent variables and it shown in Figure 1.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

5 Methodology

5.1 Research Design

According to Jahoda, Deutch and Cook (1951), a research design is the arrangement of condition for the collection and analysis of data in a manner that aims to combine relevance to the research purpose with economy and procedure. Research design is the plan, structure and strategy and investigation conceived so as to obtain ensured to search question and control variance. Henry Manheim (1980) says that research design not only anticipates and specifies the seemingly countless decisions connected with carrying out data collection, processing and analysis but it presents a logical basis for these decisions. However, Gall and Borg (2003) stated that before structuring the appropriate research design, the researchers need to become familiar with all the research design namely qualitative and quantitative approaches. Therefore researchers must aware of the situation and make some justification before choosing the right research paradigm.

The study is develop to examine the relationship between service quality, product quality and price and customer satisfaction towards products and services of Tesco. Thus, quantitative approach is the most suitable researched paradigm that should be used to test hypotheses in this study. Additionally, the quantitative approach was used to act as fulfilments to the results of the hypotheses testing. This is because 24 results will not be influenced by the emotions and opinions of the researcher but purely derived from the data that are provided by the respondents (Hair et al., 2007). Furthermore, the strength of the quantitative analysis lies on its ability in analyzing mass and large group of data in a short period of time and at relatively low cost (Sekaran, 2005).

Consequently, this study involved a large number of respondents from customers of Tesco. Therefore, a quantitative approach is more different for this study as tis approach will enable to test the hypothesis of this study. However, it may neglect some contextual details of respondent's personal interpretation in time experiences and in-depth experience explanation (Miles and Huberman, 1994).

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

5.2 Data Collection

Data collection can be classified into two which are primary data and secondary data. In this study, quantitative data collection technique will be applied. The data will be collected through the online platform using Google form and share the survey link in websites such as Facebook, Instagram, and Twitter, 124 questionnaires will be distributed to the respondents.

5.3 Sampling

The present study opts for judgement sampling under non-probability sampling due to the researcher wants to obtain specific information from the specific respondents. The present study chooses to Malaysian citizen only consumers that experienced in purchases services and products of Tesco within the range of age between 21 to 55 years old. The choice of the respondents' age between 21 to 55 years old is because this group falls under group young generation that sufficiently knowledgeable to make decisions and have purchasing power. Furthermore, the choice of the judgemental sampling technique is appropriate for the present study since it is the most usable and feasible method to gather the type of information that is needed from a specific type of people that are best placed to provide the information to the researcher (Cavana et al., 2001).

5.4 Data Analysis

Data analysis procedure is important to explain the basic feature in the study and it helps the researchers to summarise the data or measure in the sample (Christensen et al., 2014). The collected data was analysed by using Statistical Package for the Social Sciences (SPSS). SPSS is a programming language for conducting statistical analysis. It is a software to show the relationship between independent variables and dependent variables in the method of regression, correlation or factor analysis. It was very convenience and simple way for the researchers to convey the responses from the respondent with the way coded accordingly before being transferred into data file for the subsequent analysis procedures.

6 Finding

Frequency Analysis is the simple analysis from this research where had been analysed exactly. This part has been described more detailed about the respondent's profile. Part A from the questionnaire is about demographic profile of the respondents such as gender, race, age group, marital status, education level, monthly income level, the duration of using products and services of Tesco and the frequency of respondent visiting to Tesco. The analysis of respondent's demographic has been presented into various forms of tables and bar charts.

Table 1: Summary of Demographic Profile of Respondents

Items	Frequency (n=124)	Percentage %
Gender		
Male	50	40.3
Female	74	59.7
Race		
Malay	101	81.5
Chinese	14	11.2
Indian	8	6.5
Others	1	0.8
Age Group	61	49.2

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

21 – 25 years old	21	16.9
26 – 33 years old	18	14.5
34 – 41 years old	9	7.3
42 – 49 years old	15	12.1
>50 years old		
Marital Status		
Single	77	62.1
Married	47	37.9
Others	0	0
Education Level		
SPM	30	24.2
STPM	14	11.3
Diploma	28	22.6
Bachelor of Degree	52	41.9
Monthly Income Level		
Below RM1000	42	38.9
RM1001 – RM1999	30	24.2
RM2000 – RM2999	27	21.8
RM3000 – RM3999	15	12.1
Above RM4000	10	8.1
How long have you been using products and services of Tesco?		
Below than one years	14	11.3
1 - 5 years		
6 - 10 years	24	19.4
11 - 15 years	36	29.0
More than 15 years	21	16.9
	29	23.4
How often do your go to Tesco?		
Daily	0	0
Weekly	13	10.5
Monthly	51	41.1
Rarely	60	48.4

The summary of the demographic profile. Regarding to the Table 4.1, it illustrate that 50 male respondent and the rest, 74 respondents are female out of 124 respondents. Thus, the percentage of male is 40.3% and another 59.7% is female. In the term of race shows, the race frequency of 124 respondents. The majority of the respondents are Malay which is 81.5% or 101 respondents. Secondly is 11.2% or 14 respondents is from Chinese. 6.5% or 8 respondents are from Indian. Last but not lease, the other race is only 1 respondents or 0.8% who was willing to answer the questionnaire. Meanwhile, the age frequency of the respondents. From 124 respondents, there are 49.2% who are 21 until 25 years old which equivalent to 61 respondents. Next, 16.9% are ages 26 until 33 years old which are 21 respondents. Then, there are 14.5% responds the survey are aged between 34 to 41 years old which are 18 respondents. After that, there are 7.3% responds the survey are aged between 42 to 49 years old which are 9 respondents. Lastly, there are 12.1% responds the survey are aged over than 50 years old which are 15 respondents. Then, the frequency of marital status of among the respondents. From 124 respondents, there are 62.1% who is still single which equivalent to 77 respondents. Then, 37.9% is married which are 47 respondents. Furthermore, shows the frequency of education level among the respondents. Out of 124 respondents, 24.2% education level is SPM which are 30 respondents. Next, there are 11.3%

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

education level STPM which are 14 respondents. Then, there are 22.6% education level Diploma which are 28 respondents. After that, there are 41.9% education level Bachelor of Degree which are 52 respondents that responds the questionnaire. After that, regarding of Table 4.6 shows the frequency of the monthly income that was obtained by the customers of Tesco at Alor Setar. Based on the data collected, there are 33.9% responds the questionnaire for monthly income level below than RM1000 which are equivalent to 42 respondents. Then, 24.2% responds for RM1001 until RM1999 which are 30 respondents. Next, there are 21.8% monthly income level from RM2000 to RM2999 which are 27 respondents. After that, there are 12.1% responds for monthly income level RM3000 until RM3999 which are 15 respondents. Last but not least, the lowest percentage are 8.1% responds for monthly income level above RM4000 which are 10 respondents the customer of Tesco at Alor Setar. Based on table above, the frequency of how long the respondents have been using the products and services of Tesco. From 124 respondents, there are 11.3% responds using the products and services of Tesco below than one year which are 14 respondents. Next, 19.4% have been used the products and services from 1 until 5 years which are equivalent 24 respondents. The highest percentage is 29% who responds from 6 until 10 years using products and services of Tesco which are 36 respondents. After that, there are 16.9% stating that they have been using products and services from 11 to 15 which are 21 respondents. Lastly, the second highest percentage 23.4% who responds the survey are above 15 years old using products and services of Tesco which are 29 respondents. Last but not lease, the table shows the frequency of how often the respondents go to Tesco. From 124 respondents, none of them have go to Tesco daily. Next, 10.5% are often go to Tesco weekly which are 13 respondents. Then, the second highest percentage is 41.1% who responds the survey are often go to Tesco monthly which are 51 respondents. Lastly, the highest percentage 48.4% responds the survey are rarely go to Tesco which are 60 respondents.

7 Discussion

The hypothesis to found out the relationship between dependent variable which is customer satisfaction towards products and services of Tesco and independent variables. There are three independent variables which were product quality, services quality and price.

7.1 Research Objective 1

The first objective was to examine the relationship between service quality and customer satisfaction. Therefore, the researcher proposed a hypothesis which stated that there is a significant relationship between service quality and customer satisfaction.

7.1.1 Relationship between services quality and customer satisfaction

The relationship between service quality and customer satisfaction towards products and services of Tesco at Alor Setar. Null hypothesis was rejected after Pearson Correlation testing was conducted. It means that this study accepts alternate hypothesis (H1). From the result of the significant value ($p < 0.01$), this indicates that there is a positive relationship between service quality and customer satisfaction towards products and services of Tesco. Based on the Table 3.2 "Guilford's Rule of Thumb", the positive value of Pearson Correlation 0.577 indicates that the strength of relationship between product quality and customer satisfaction towards products and services of Tesco are moderate.

7.2 Research Objective 2

The second objective was to examine relationship between product quality and customer satisfaction. Therefore, the researcher proposed a hypothesis which stated there is a significant relationship between product quality and customer satisfaction.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

7.2.1 Relationship between product quality and customer satisfaction

The relationship between product quality and customer satisfaction towards products and services of Tesco at Alor Setar. Null hypothesis was rejected after Pearson Correlation testing was conducted. It means that this study accept alternate hypothesis (H2). From the result of the significant value ($p < 0.01$), this indicates that there is a positively relationship between product quality and customer satisfaction towards products and services of Tesco. Based on the Table 3.2 “Guilford’s Rule of Thumb”, the positive value of Pearson Correlation 0.559 indicates that the strength of relationship between product quality and customer satisfaction towards products and services of Tesco are moderate.

7.3 Research Objective 3

The third objective was to examine relationship between price and customer satisfaction. Therefore, the researcher proposed a hypothesis which stated that there is a significant relationship between price and customer satisfaction.

7.3.1 Relationship between price and customer satisfaction

There is a positive relationship and good correlation between twp variables ($r=0.00$, $p < .01$). The relationship between the variables is stated as 0.725 respectively, which furthers reinforces the relatively strong relationship between price and customer satisfaction towards products and services of Tesco.

8 Recommendation

The future research, this research only involves 124 customers of Tesco at Alor Setar. This is not fully representing profile of the whole population of customer of Tesco in Malaysia. This is more relevant to the future research to get the best result in the end, because by collect of the good result, future research may gain feedback or respond by the respondents. Thus, other location is recommend and preferable by doing this research. This is because it can help to get more opinion and research will become more widespread.

However, this study should use quantitative method by distributing questionnaire to the respondent which may lead to accuracy. A combination of interviews and questionnaire survey method is not encourage to provide because the explanation of customer satisfaction towards products and services of Tesco at Alor Setar to become not successful. In this research, researcher just focus only three customer satisfaction which is product quality, service quality and price. So future research must add on the customer satisfaction and not only focus the three of these customer satisfaction to be gain the best result and successful of the research.

9 Conclusion

In this research, there are three independent variables included the product quality, service quality and price. In order to conduct this research, the researchers collected the data by using questionnaires. The questionnaires were distributed to 124 customer of Tesco at Alor Setar. This area was chose by researcher because it is nearby and it will make easier for researchers to do the research. Besides that, almost residents in Alor Setar often go to Tesco, so it will be a bonus for researcher to do this research. The aim of conducting this study was to find out customer satisfaction with Tesco products and services. The findings of the research showed that product quality, service quality and price have positive relationship with customer satisfaction towards products and services of Tesco.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

These three variables are important factors that needed to be concerned by every branch of Tesco. Customer would repeat purchase and Tesco will be successful if they take into consideration with all of this. So, Tesco are suggested to retain or improve their product quality, service quality and price.

10 Acknowledgement

First and foremost, all praise to Almighty Allah, the most gracious and most merciful God for the blessing, health, strength and patience that he bestowed upon us throughout this exciting Degree journey. Indeed, all this is only by His permission.

First of all, we would like to express our deep and sincere gratitude to our research supervisor, Dr. Azila binti Jaini, for her invaluable guidance, patient, encouragement, and suggestions in the improvement of this research. It was a great privilege and honour to study under her guidance. We are forever grateful to have given the opportunity to work with such a great lecturer.

Our foremost gratitude goes to our parents for the love, strength, prays, caring and sacrifices for education and preparing us for our future. Without their support, we cannot be to where we are right now. Also, we would like to express our thanks to our friends for their support, help and encouragement to finish this research. I have no valuable words to express my thanks, but my heart is still full of the favours received from every person.

Next, we would like to dedicate our gratitude to University Malaysia Kelantan (UMK) for giving us the opportunity to complete this research. We are thankful for the assistance and necessary support that had be given to us.

CUSTOMER SATISFACTION USING ONLINE SHOPPING DURING PANDEMIC COVID-19 IN KUALA TERENGGANU

Nuramira Syafiqah Binti Mazuki and Yusrinadini Zahirah Binti Md. Isa@Yusuff

Faculty of Entrepreneurship and Business,
Universiti Malaysia Kelantan,
Malaysia

Email: amira.a17a0518@siswa.umk.edu.my; yusrinadini@umk.edu.my

Abstract:

Since COVID-19 hit the world, online purchasing has increased dramatically. It not only in Malaysia, but it also happened around the world. Because of the sudden demand from customers, the sellers and logistic company cannot meet the satisfaction of all customers simultaneously especially during Movement Control Order (MCO). It is because the employees who are allowed to work have been limited to each company. Therefore, the logistic company unable to expedite the delivery of goods and it cause in dumping at the courier office. Because of that, this study performed to identify the factor that affecting customer satisfaction towards the online purchasing especially during pandemic COVID-19. This study is using quantitative method which is in a structured questionnaire to 384 respondents in Kuala Terengganu, Terengganu. This study also analyse the factor of customer satisfaction towards online purchasing especially during pandemic COVID-19 which are the punctuality of delivery time, goods safety and information security, and services that offered affecting the customer satisfaction. This study uses preliminary analysis, descriptive analysis, reliability test, normality test, Pearson or Spearman Correlation and hypothesis testing. The result that receive from this study is showing that an increase in online purchases higher that offline purchases. In this way, customers can reduce the risk of Corona Virus infection that is spreading around the world. Covid-19 pandemic managed to change the customer trust towards depending more on online platform especially during lockdown and quarantine. Therefore, despite not being able to go out shopping in the physical store, customers can shopping using online shop and this can prevent COVID-19 infection to the community. Overall, the online purchasing is statistically significantly with customer satisfaction. Future research should consider about the variety of services that can be done by the seller other than use the courier company to deliver the goods. This is to ensure the goods that reach to customers are punctual and safe. Different methodologies, such as focus group, method and interview, may also be used in future research.

Keywords: *Customer Satisfaction, Pandemic COVID-19, Punctuality of Delivery Time, Goods Safety and Information Security, Service that Offered.*

1 Introduction

In the era of IR 4.0, the use of internet network is very important and it not only for social, but it also for education, business and so on. The daily use of the internet in life has a huge impact on society. The cause of increasing number of COVID-19 cases, the use of internet networks is increasing especially in the use of shopping platforms. Using this internet network, it also can make people around the word connect each other especially for those who are far abroad.

In this global pandemic outbreak, by using an online platform, individuals will prevent this disease, so that this epidemic may be less severe. Using the online portal, individuals can prevent

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

current physical store congestion, preserve the Standard Operating Procedure (SOP) so that we can minimise COVID-19 infection in Malaysia. Because of its versatility, free, informal and synergistic, the internet is also a utilitarian tool for disseminating data to consumers. As the use of the internet grows, many new ways of communicating with the world are being added. Online shopping is one of the Internet 's biggest contributions (Ali, Samsuri, Sadry, Brohi, & Shah, 2016).

Customer satisfaction can be characterised as a component of the product and service that sellers offer to meet the expectations of customers. In addition, it can also be defined as a consequence of a satisfying level of consumption-related satisfaction expressed by a product and service. The satisfaction of customers can also be recognised as the customers' inner feeling of contrasting their desires with the accomplishment of the purchase and past purchase experience of customers.

So that, after elaborating the output of the goods and services, the customers can display their emotion as pleased, angry, upset and so on. In fact, customer satisfaction is very significant because it represents the performance judgments of customers that relate to the consumption experience. The loyalty of customers is very important to an organisation's survival and it is the greatest online shopping challenge.

According to Rita, Oliveira, and Farisa (2019), consumer satisfaction is an indicator of the customer's confidence that a service is likely to lead to a favourable sensation. It is also the product of the interactions of consumers during the purchasing process, and it plays a key role in shaping the future actions of consumers, such as online buying and loyalty. Satisfaction is one of the most significant indicators of performance in the online business-to - consumer (B2C) world.

Finally, when consumers are happy with the goods or services they are purchasing, they prefer to buy from the same vendors or businesses again. The evidence for a positive relationship between consumer satisfaction and repurchasing intent has been found in many studies. If consumers have a high degree of faith in the website, they are more likely to decide to buy it. In addition, if clients had previously experienced purchases from a website and had a positive purchasing experience from it, then they would possibly buy back from the same website.

There are there factors that have identified as a major barrier in customers' satisfaction in online shopping especially during pandemic outbreak in this study. For example, punctuality of time delivery, goods safety and information security and service offered by sellers and couriers. Firstly, the researcher finds that the punctuality of delivery time is one of the factors that can measure the level of customer satisfaction especially at the time COVID-19 was spreading. Secondly, goods safety and security is also one of the important things to measure the level of customer satisfaction using online shopping. It is because if the customers information such as personal information like name, address, phone number and customers' bank information such as account number misused, the customers will in danger and it possibility to lose their money in bank account. Therefore, the sellers must honest and do not abuse customers' personal information for self-interest.

The last factor in this study is the service offered by sellers and Courier Company. The good services will make the customers more satisfied and the probability to them to repeat the order form the same company is high. It is because; when the sellers get the trust from customers its mean they will get the new customers after that. This is because the Word of Mouth (WOM) of each customer is high.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

2 Research Methods

For the purpose of this study, a survey was carried out to find out the customer satisfaction using online shopping during pandemic COVID-19 in Kuala Terengganu. A few questions have been built in a Google Form to collect the data. This questionnaire given randomly to 384 people who use online platform to shop and they must stay at Kuala Terengganu. This questionnaire distributed through a link and it will be answered by respondents using their own gadgets whether smartphone, tab, laptop or others. The link for the questionnaire is given to 384 respondents via social media such as Facebook, Instagram, Telegram and WhatsApp. The respondents can click on the link that provided by researcher and they can answers the entire question given.

Before the questionnaire given to the respondents, the researcher has done Pilot Test to 30 respondents first. It is to increase the validity and reliability for the questionnaire. The researcher found out that the result of Cronbach's Alpha for Pilot Test is exceeds 0.70 to all the dependent variable and independent variables that the researcher studies. Next, after the Pilot Test, the researcher distributes this questionnaire to 384 random respondents to collect the new data. The constructed questionnaire based on the past sources from (Dian Palupi Restuputri, Ilyas Masudin, & Citra Permata Sari, 2020; Francisca & Hapsari, 2018; Rita et al., 2019).

Table 1: The Questionnaire Items

Punctuality of Delivery Time	
Code	Description
Q1_Punctuality	Sellers post the parcels on the time.
Q2_Punctuality	The operating hours for parcel delivery only on office hour.
Q3_Punctuality	The courier provides several estimated delivery time options.
Q4_Punctuality	The operating hours delivering by the sellers at weekends and weekdays.
Q5_Punctuality	The services involved by courier are related to the speed and accuracy of drivers and their means of transportation in delivering goods.
Q6_Punctuality	Can be delivered to all location without additional cost.

Goods Safety and Information Security	
Q1_Safety	I feel safe in my transaction with the online shop.
Q2_Safety	The online shop has adequate security features.
Q3_Safety	This site protects information about my bank information.
Q4_Safety	I trust the online shop to keep my personal information safe.
Q5_Safety	I trust the website administrators will not misuse my personal information.
Q6_Safety	It protects information about my web-shopping behaviour.
Q7_Safety	The product was damaged during delivery.
Q8_Safety	The ordered products arrived in good condition.
Services that Offered	
Q1_Services	I can file complaints or ideas on this site.
Q2_Services	This site delivers unrivalled freedom to exchange thoughts.
Q3_Services	It takes a short time to shop on this site.
Q4_Services	Provide accurate information about the features and quality of the

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

	products.
Q5 Services	Provide various type of information (payment, shipping, return).
Q6 Services	I am satisfied with the offer that is available on this site.
Customer Satisfaction	
Q1 Satisfaction	I am satisfied with this online shop.
Q2 Satisfaction	The online shop is getting close to the ideal online retail.
Q3 Satisfaction	The online shops always meet my needs.
Q4 Satisfaction	I will make more purchases through this online shop in the future.
Q5 Satisfaction	I will increase purchases through this online shop.
Q6 Satisfaction	I will not to shop again from this online shop.
Q7 Satisfaction	I will re-visit this online shop in the future.

In Table 1, the questionnaire items for each structure of this study are summarised. One of the non-probability samples was used to obtain the potential participants identified from different mailing lists using the convenience sampling method (Sherah Kurnia & Chien, 2003). The survey respondents were asked to indicate whether they agree or disagree on a Five-Point Scale for each item, which are:

- 1-Strong Disagree
- 2-Disagree
- 3-Neutral
- 4-Agree
- 5-Strongly Agree

In order to determine the consistency for each construct used in the questionnaire, Cronbach's Alpha was analysed. In this study, the researcher use five statistical techniques to test the data which are Pilot Test, Reliability Test, Normality Test, Multiple Linear Regression and Hypotheses Test. Hypotheses Test is to test the three hypothesis which are H1, H2, and H3.

H1: The punctuality of delivery time significantly influenced the customer satisfaction using online shopping especially during pandemic outbreaks.

H2: The goods safety and information security significantly influenced the customer satisfaction using online shopping.

H3: The services that offered significantly influenced the customer satisfaction using online shopping.

Next, the reliability of the questionnaire can be accessed by Cronbach's Alpha. Cronbach's Alpha is need to be 0.7 and above.

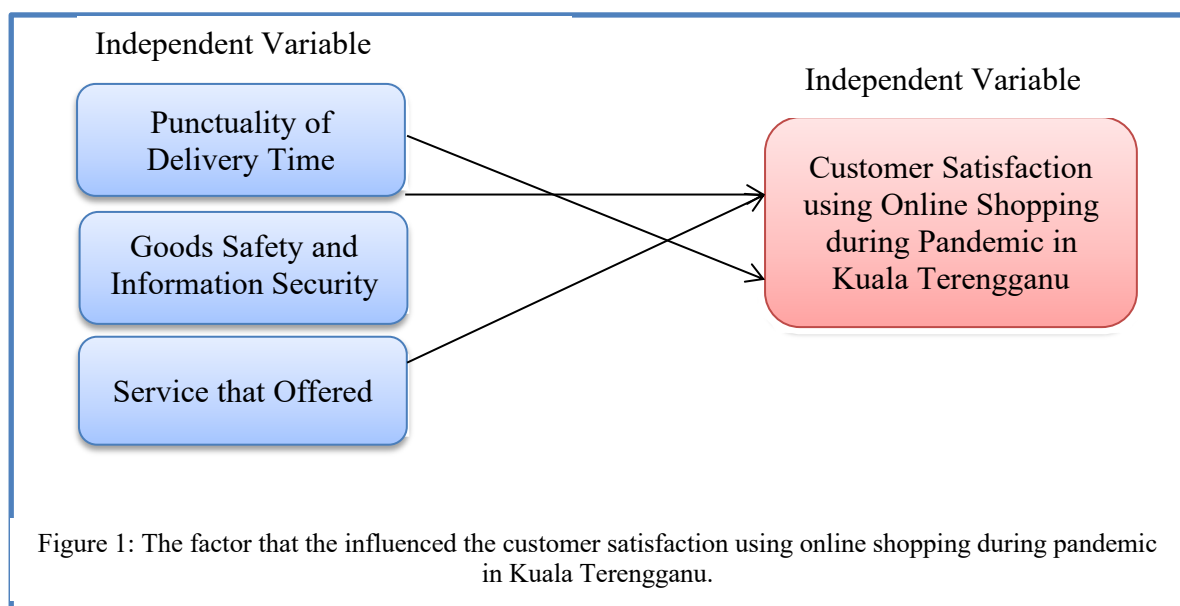

Table 2: Cronbach's Alpha for Reliability Test

Variables	Number of Item (N)	Cronbach's Alpha
Customer Services	7	0.701
Punctuality of Delivery Time	6	0.701
Goods Safety and Information Security	8	0.709
Services That Offered	6	0.728

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

In this study, the researcher analysed three of independent variables which are Punctuality of Delivery Time, Goods Safety and Information Security, and Services That Offered, and the dependent variable which is Customer Satisfaction using Online Shopping during Pandemic COVID-19 in Kuala Terengganu. Table 2 shows the result of Reliability Test for Dependent Variable and Independent Variables are acceptable.

Figure 1 above shows the framework for both dependent variable and independent variable. There are punctuality of delivery time, goods safety and information security, and services that offered by seller and courier company. The factor of punctuality of delivery time evaluate based on the customer satisfaction when they using online shopping especially during pandemic to make sure either the parcels arrived punctually or not. After that, this research also identified that the factor of goods safety and information security influenced the customer satisfaction using online shopping. It is because goods safety and information security is the important point to make sure the customer satisfaction. Lastly, the factor of services offered also influenced the revisit that shopping platform and repurchase the goods when using online.

Lastly, the researcher does this study to fulfil the three objectives. Firstly, the objective that highlighted is to study the level of punctuality of delivery time for delivering goods and services to customers that can affect the level of customer satisfaction using online shopping during pandemic. Second, the objective in this study is to make sure that goods safety and information security can give an influence in make sure the level of customer satisfaction using online shopping during pandemic. The third objective is to identify the services that offered can affect the level of customer satisfaction using online shopping during pandemic.

3 Analysis and Discussion

The purpose of this study is to identify the customer satisfaction towards online purchasing during pandemic COVID-19 in Kuala Terengganu. The focus of this study is to identify the factors that affecting customer satisfaction towards online shopping which are Punctuality of Delivery Time, Goods Safety and Information Security, and Services that Offered. The data used in this study were primary data and secondary data. The primary data is to be originally collected, while the

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

secondary data is simply a compilation from the available published sources. In this study, primary data was collected via Google Form that answered by respondents.

Through this study, it was found that the population in Kuala Terengganu that age around 18-30 years old is more likely to choose online platform as a medium to shop especially during pandemic. It is because the people age around 18-30 years old more skilled in using gadgets such as smartphone, laptop and so on compared with people age more than 50 years old. Therefore, age is the factor that affecting the online purchasing.

Through the studies that conducted, the researcher found that there three factors that influence the customer satisfaction which are Punctuality of Delivery Time, Goods Safety and Information Security, and Services that Offered. The result of this study found out that the use of online platform to shop highly recommended especially during pandemic COVID-19. Online shopping is not a new thing for Malaysian, but since COVID-19 hit the world, the use of online platform surged up unexpectedly. The researcher found out that in future, the use of online platform especially for shopping will rise higher. It is because Malaysian have begun to know all the advantages of using the online platform to them. Beside from preventing Coronavirus infection, these online shopping also can save their time and energy for shop. Actually, online purchasing has many advantages, beside offer the lowest price; it also offers many services that can customers choose.

Next, the researcher found out that punctuality of delivery time is the important things to make sure their customer satisfaction. If the seller offer the good services for their customers, their customers will re-visit their online shop in future. Besides, they also can promote that shops to their contact and it will added the customers that purchase in their shops. Besides that, the most important thing in using online shop is security either goods or information. It is the sellers' duty to make sure the entire customer's personal information such as bank account, address, and phone number is safe. If the sellers fail to make it safe, they will lose many customers because of the strong viral power by customers. It is because the customer trust is very important in the business especially online business.

Sellers or Courier Company must offer the good services to their customers to make sure their customers are satisfied. The important service that can offer is website design for online shop. If the website design is not customer friendly, the customers will find other online shop that more easily and friendly. It is because they will more satisfy with the services that make them easy and give them the advantages.

This study found out that customer satisfaction had a positive impact on punctuality of delivery time, goods safety and information security, and services that offered. When the customers satisfy with the services, they will re-purchase in the future. From this study, it was found that the customers less satisfied with the punctuality of delivery time. It is because, when the COVID-19 hit world, the sellers late to post the customers' parcel that they purchase. Because of the most people use online platform to shop, the parcel which has been posted by sellers is experiencing dumping at courier office. It is because of lack of employees in Courier Company that can make the parcels not arrive on time to the customers.

Lastly, this research is found that the services that offered are satisfied. The services that offered by online retailer is ability for customers to make complaints about the sellers and courier company. Besides, this online retailing makes the customer easily to shop. It is because all the detail such as price, size, material and others has been given by sellers. It can make the customers

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

easy to choose the products that they want. Next, the payment, shipping and return products are very easy to customers. It is because sometimes, the customers receive the damage goods or they do not satisfy with those goods. So that, they can return the goods to the sellers and they can choose either the goods return or money return. Overall, the customers satisfy with the services that offered especially using online platform during pandemic.

5 Conclusion and Future Research

This study is focus on customer satisfaction that use online platform to shop during pandemic COVID-19 in Kuala Terengganu. The organization can use this research to determine the customer satisfaction towards online purchasing not only during pandemic but also for future. The minimum requirements for reliability analysis has been met from the overall study of variable, because of the Cronbach's Alpha are more than 0.7. The dependent variable identified as customer satisfaction and the independents variable identified as punctuality of delivery time, goods safety and information security, and services that offered. Based on the hypothesis result in this study, all H0 is rejected, while H1, H2, and H3 are accepted. It is prove that the customer satisfaction affected by punctuality of delivery time, goods safety and information security, and services that offered. This research was successfully completed.

The future researcher can able to conduct research in different areas and more extensively area in Malaysia. Every state in Malaysia is different and it has different culture and thinking as well as the different satisfaction. Future research can find out more information about the customer satisfaction in the other state for future proof. The future researcher can know the important things about the customer satisfaction not only during pandemic but for new norm. Next, future researcher is recommended to expand the sample size and population to get more accurate and varied study results. This study conducted only in Kuala Terengganu and the future researcher recommended expanding to other state or districts. This is to improve the result that receives by the future researcher. To get the accurate result in future study, the researcher must collect the data in a longer time. It is because, the large sample size, the longer time was taken to get the good and accurate result.

Besides, the future researcher must consider to use qualitative to the study. It is because using this way, the future researcher can get the accurate result and they can get the more experience about customer satisfaction. Interview with respondents is better to make the future researcher know what makes respondents more satisfied with the online shopping. Therefore, the use of qualitative method is better to get the different responses from the respondents.

The organization as well as logistic company or retailing company recommended learning about the customer satisfaction from the small thing to big thing. It is because customer satisfaction is the determinant of the progress of an organization. Besides, this study finds out that if the organization offers low customer satisfaction to their customers, they will lose their customers because of customer service is half of the important thing in customer satisfaction. Customer trust also can make the increasing of new customers because of Word of Mouth (WOM) from past customers. Lastly, the organization must know about the customers' needs and wants to make sure the organization can improve their services to their customers next time.

6 Acknowledgements

Alhamdulillah and thank the Almighty that blessing me in order to finish this Final Year Project (FYP) with success. I would also like to thank to all the people who have lend me their continuous support, encouragement and guidance throughout the period to doing this Final Year Project

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

(FYP).

First, I am grateful to my supervisor, Dr. Yusrinadini Zahirah binti Md. Isa @ Yusuff for the support, supervision and valuable guidance during I do my Final Year Project (FYP) and also my examiner, Dr. Nur Ain Ayunni binti Sabri.

Secondly, I am grateful to my family for their continuous support, encouragement and committing their resources towards my education this far. Their sacrifices accorded to me have enabled me come this far.

Next, I salute the entire University Malaysia Kelantan fraternity for giving me conductive environment to thrive academically and for providing me with the resource I need to see me through my Proposal of Final Year Research Project (PPTA1). I also want to thank to my friends that support me when I complete my Proposal of Final Year Research Project (PPTA1).

Lastly, I would like to thank all of those who had contributed to this Final Year Project (FYP), whether directly or indirectly. In addition, I would not have been possible to complete this project without the kind support and help of many individuals and organizations. Thank you very much.

EXPLORING FACTORS OF PURCHASING COSMETICS AMONG UNIVERSITY' STUDENTS IN KELANTAN

Nurshahirah Binti Ajmin and Nurul Ashykin Abd Aziz

Faculty of Entrepreneurship and Business
University Malaysia Kelantan,
Malaysia.

E-mail: shahirah.a17a0873@siswa.edu.my; ashykin.a@umk.edu.my

Abstract:

Year after year, the cosmetics and skincare industry expanded exponentially. Malaysia has a rapidly rising in beauty and wellness sector (Hassali, Al-Tamimi, Dawood, Verma, & Saleem, 2015). Many new cosmetic and skincare businesses are entering the local market in Malaysia, as well as a founder and a cosmetic brand. The aim of this study is to explore the factors of purchasing cosmetics among university students in Kelantan. The word 'cosmetics,' which means adornments, being derived from the Greek word 'cosmeticos'. Materials for embellishment or beauty enhancement have also been known as cosmetics. This study is using qualitative case study method that has been employed in the form of semi-structured in depth interview. Eight participants which comes from different university institution in Kelantan are involved in the interview sessions to get their information and opinion about the factors of purchasing cosmetics among university students in Kelantan. Findings shows there are four themes had discover as the factor of purchasing cosmetics among university students in Kelantan because of celebrity endorsement or Insta-famous review, brand awareness, price fairness and attitude.

Keywords: cosmetics, purchasing, brand awareness, celebrity endorsement, price, attitude

1 Introduction

Cosmetics and skincare were popular as beauty products from customers were strongly requested. Thus, our local population also rises quickly in economic terms. The total capital of the cosmetics industry is typically millions of dollars from cleansers, toners, serum, moisturisers, powders, lipsticks, clothing, blushes and mascaras. These lists continue to be transformed into new and improved products, which sustain the consumer response continuously. In addition, the cosmetics industry has grown beyond the market, particularly for women, including males and females. When emerging technologies and services changed, sales of cosmetics and skin care grew exponentially. This is because societies are aware of their appearance and well-being enhanced demand for cosmetics (Hassali et al. 2015; Lau, de Run & Jee, 2017).

There is already a steady growth of the cosmetics industry in mature and developing markets, like Malaysia (Hassali et al., 2015). There are several social media platforms which facilitate the company's ability to market and reach customers including Facebook, Instagram and TikTok which are now the most successful digital marketing and many businesses company has used to show customers its product. Social networking has changed the behaviour and knowledge and sharing of goods, with more and more customers searching for product vision and analysis through online social media tools and platforms (Nadeem et al., 2015). Although various cosmetics has been released, however negative effect are still issued, the brand or the original products can be misrepresented, in particular for the customers who use counterfeit cosmetic products, including the presence of such counterfeit cosmetic products.

Based on this issue the following research question is propose:-

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

“What are the factors of purchasing cosmetics among university students?”

The objectives of this study is:-

To identify the factors of purchasing cosmetics among university students.

1.1 Problem Statement

Although entrepreneurs have published multiple brands, the issue of imitation of popular cosmetic products still has a negative impact on traders or businessmen. Bad effects do occur, particularly for customers using artificial cosmetic products, despite the presence of certain artificial cosmetic products, which could be misrepresented by the brand or the original cosmetic products.

2 Literature Review

2.1 Celebrity Endorsement Or Insta-Famous Reviews

Presently, celebrity endorsement and unfamiliar reviews have been recognised by advertisers as an effective advertising method. There are various ways to materialise celebrity sponsorship, give testimony for goods, be the actor/actress in publicity or even be a spokeswoman for corporations (Schiffman, Kanuk, & Wisenblit, 2010). Cosmetic advertisers have been steadily marketing their goods by using celebrities' endorsements. Celebrity sponsorship is a significant factor in brand awareness creation and helps to assess the perceived value and sensitivity of a brand (Younus, Rasheed, & Zia, 2015). It has been found that celebrity endorsement impacts shampoo purchases directly (Bhakar, Bhakar, & Dubey, 2015; Younus, Rasheed, & Zia, 2015). The celebrity who endorses the substance and cosmetics promoted should, however, be reasonably logically important so that this endorsement is successful in attracting more customers (David & Benedikte, 2004).

In the meantime, consumer focus is commonly introduced with many local cosmetic product use of these advertising devices. Marketers are now trying to make publicity more interesting, appealing and noticeable to audiences. One way to do this is with the sponsorship of celebrities. Choi et al (2005) suggests celebrity personalities, traits and breathtaking pictures. Celebrity sponsorship in modern marketing is therefore very widespread (McCracken, 1989; Choi and Rifon, 2007). Indeed, about 56% of Malaysians are able to spend on their favourites while 30% will purchase the items that they endorsed (Anon, 2011). This advertising tool thus profoundly impacts the buying of cosmetic products from consumers especially students, young generation. For customers in today's world the media's position has become very critical. Therefore, the views on television and the Internet adversely impact users. You want to look like a favourite star or hero that leads you to buy (Blomert, 2009). In addition, the quantity of online feedback is also used to measure product success since they reflect product output in the market (Mayzlin & Chevalier, 2006). The number of feedback can be the number of customers involved in recent purchasing and product experience (Chatterjee P., 2001). The range of feedback shows increasing the confidence of online shoppers and reducing the unpleasant sense that such items are vulnerable to harm (Buttle, 1998).

2.2 Brand Awareness

Aaker (1991) is defined brand awareness as the willingness of potential purchasers to understand and recall that a brand forms part of a specific product category. The cosmetic product is considered on the list if consumers are aware of cosmetic brand products. Another element of brand identity is brand name. Brand image means a consumer's view of a specific brand (Keller, 1993). The organisation uses a brand image for presenting its product and a group image. The brand profile of Loudon & Della Bitta (1988) describes the way buyers look at goods and reduces

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

purchasing risks. Brand image can be defined as perceptions that consumers associate with a particular brand (Keller, 1993). According to Kotler and Keller (2009, 203) and Asch and Wolfe (2001, 25), the process by which people select, organize and interpret information in the mind is called perception. With the help of perceptions people create a meaningful picture of the world. Noel (2009, 94) notes that before perceiving anything, people have to first be exposed to an object and also pay attention to it. This chain of events of exposure, attention and perceiving is played out many times during one day. In terms of studying consumer behaviour, people's perceptions are more important than reality because perceptions are what actually affect a consumer's behaviour.

Asch and Wolfe (2001, 25) notes that the way consumers are behaving influences their own knowledge of the situation when a customer understands a need or a willingness to buy something. Because any person has a subjective way of shaping opinions, there can be various forms of interpretation of the same object or situation. Brand reputation is among the beneficial considerations for consumer evaluation before a product is bought. (Newsletter, 1988). A brand appearance plays an important part in customer first experience. Not only does brand image affect the way buyers view a product, but it decreases the purchasing risks (Loudon & Della Bitta, 1988). The method of assigning the brain ability to certain inputs is, according to Kotler and Keller (2009, 203). People must select the stimuli that they take care of, since the mind can only absorb a small amount of information at one time. This process, by which most stimuli are examined, is called selective focus. Certain focuses are targeted and some of them unintended. In other words, people pay attention to things intentionally and implicitly. When something is focused, unconscious, also recognised as inferred, without a person making a concerted effort to take care of it, time is allocated. (Kotler and Keller 2009, 81-203).

Students tend to notice the prompts they need to consciously and deliberately devote their attention. An individual who needs to buy facial foam will usually concentrate more on facial washing advertising than a person who does not need the substance. People also pay more attention to stimulation, which means that they would pay more attention to skin care items, particularly between students, in a cosmetics store than in a food stores. A third attention recipient is discounts when it comes to the use of disc capacity. People are more susceptible to stimuli whose variations are greater than their average size (Kotler & Keller 2009, 204.).

2.3 Price Fairness

Price fairness can be described as 'a market judgement and related emotions that indicate whether it's appropriate, necessary, or justifiable to differentiate (or lack of difference) between the price or price of a comparable other party' (Xia, Monroe, & Cox, 2004, p. 3). We generally equate the price of the goods themselves as a customer. Price fairness has also been shown to lead to price understanding, which in turn influences behavioural intentions (Petrick, 2004a; 2004b). In a review of Semuel & Chandra (2014) when buyers want to purchase a commodity, price is very critical. If the product is pricey, this can affect buyers who are interested in purchasing the product. Price is possibly the most important consideration among users, particularly students. However, the price of a product does not influence the desire of the customer to buy a product as it is in brand loyalty (Rahim, 2018). Consumer trust may also be created by contrasting prices with the costs and qualities that are taken into account. It is also one of the strongest consumer satisfaction metrics (Singh & Pattanayak, 2014). For each procurement of goods and services, customers have only desired the best price. The consumer will not be pleased if the set price does not represent the worth of a good. Pricing is important because it contributes to the use or rendering of products and services to customers. Quality prices are also related to (Kotler & Keller, 2009).

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Alfred (2013) notes that some consumers will not pay more than a certain amount, irrespective of the form of commodity it might be, while others will buy it. In order to buy a product, it must achieve the desired level of efficiency. Any types of high price goods are known to be high quality and vice versa. The perception as an external influence, as reported by Ralston (2003), is essential to customers in decision making before they buy the product. In short, price is used as a measure of consistency of the product. It can result in greater satisfaction if a product exceeds expectations (Alfred, 2013, Kotler & Keller, 2009; Ralston, 2003). If the worth of the viewed product exceeds the cost, note that the buyer buys the product (Yee & Sidek, 2008). When the price is affordable for them, the customer would purchase cosmetics product.

2.4 Attitude

Attitude means thought, patterns and responses to something like object or concept (T.E.O Yuan Sim et al, 2012). The attitudes of customers are formed through personal experience, truthfulness, friendly and seller knowledge (L.I.M. Ying San et al, 2012). Some consumers know and understand each ingredient in cosmetics because they realise the long-term effect on your skin, avoiding the risk on your skin and money as well. Some consumers, however, were not concerned with the long-term skin effect. In a short period without regard to the long term impact or in potential, they just needed a beauty and light skin. As one's behaviour is the product of a neurological mechanism, it cannot be explicitly tested, but what is said and done can be assumed (Suprapti, 2010, in Tommy, 2012). According to Rodda (2004), when consumers use a beauty product that does not suit their skin, skin might be more susceptible. Not all consumers have the same skin conditions and they need to know the exact makeup or products that complement their skin in order to reduce skin damage. Customers also plan to purchase cosmetic products, particularly in women, because of skin problems. There are certain skin conditions, including wrinkles, dry skin, dirty skin, white head, dark head and dull skin. Because the whole problem affects the customer purpose, particularly carriers or students. The process for evaluating any good and service is a mindset in the field of marketing. The previous research indicates that buyer expectations influence buying decisions and when a purchase is carried out (Fishbein & Ajzen, 1975).

3 Research Methodology

"The framework or plan for the study, used to provide a guide to collecting and analysing data," as described in Churchill and Iacobucci (2005, P.74), research design were three forms of research that are exploratory research, descriptive research, and casual research. Exploratory analysis seeks to gain knowledge and perspectives and helps to identify the real issue, raise understanding and prioritise more research. Descriptive analysis reveals the traits of various individuals and is used to determine the proportion of individuals who act in a particular way. You need a straightforward explanation of who, when, where, and how analysis is conducted. The association between two variables is often illustrated in case of a causal analysis. This is the most appropriate for research in laboratory and field. This study may be put in the first category, i.e. exploration, as the quest, survey, interview and analysis of a chosen case requires a literature. The study aims more directly, i.e. to gather evidence and to assess the impact of cosmetics on the consumers by systemic analysis. It would be also correct to conclude that the exploratory design of the research was carried out on the basis of its purpose, in particular for smaller and more detailed purposes, to overcome large and vague problems.

The aim of exploratory research is to gather a wealth of information and to collect materials using several different techniques (Patel & Davidson, 2003, p. 12-13). Eriksson and Wiedersheim - Paul (1991, p. 155) demonstrates that research in discovery is ideally suited where a challenge is difficult to classify and the researcher is unsure on which significant models, properties, or

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

relationships (ibid). Kinnear & Taylor (1996, p. 127) It also states that at the early stage of the testing process exploratory experiments are more satisfactory. This study was early in exploratory analysis, as the researcher wanted to study the issue to collect knowledge so that the research issues could be dealt with. Study in fields in which there is already much information that can be described by models is descriptive. The researcher focuses on various issues through descriptive study, such as he/she may concentrate on all aspects or focus on the interaction between different aspects. This method uses only one strategy in gathering information (Patel & Davidson, 2003, p. 12-13).

The study was also analytical to a certain degree, as we used data obtained to characterise the present scenario. The researcher would first investigate the subject and collect a lot of knowledge and then describe the trends. Qualitative approach is the analysis technique applied in this research. There are two classes of techniques for analysis, qualitative and quantitative methods, according to Denscombe (2000, p. 203). The aim is to generate, adapt and analyse the information collected by the researcher (Patel & Davidson, 2003, p. 12). Newman and Benz (1998, p. 16) describe qualitative analysis as 'a complete explanation of the environment, events, entities and experiences.' Qualitative analysts examine objects in their natural world, trying to explain the meaning they add to them in their own natural surroundings (ibid). Near proximity to the topic of analysis determines quality studies, the goal being to face up to the situation.

Consequently, the aim of qualitative methods is to gain a better interpretation of the problem rather than a general knowledge method. (Holme & Solvang, p.100, 1991). This research methodology is categorised as qualitative, since it is intended to achieve a better understanding of the consequences and influences that motivate university students to buy cosmetics. A qualitative methodology was also most suitable for our analysis, as answers to the questions of research could not be quantified and numbers measured.

3.1 Data Collection

Data collection that has been use in this study is primary data. Primary data is described as "data obtained by the investigators, by means of such instruments as interviews, observations and questionnaires, rather than merely dependent upon available data sources, by Wilson (2010, pp. 135-136). There are several explanations why the primary data has to be obtained, according to the author (Wilson, 2010). For eg, when there is not enough existing secondary data available or when there is not enough and insufficient existing secondary data for the analysis. On the other hand, secondary data are data originally gathered by other scientists for other purposes. A variety of references can provide secondary data: general papers, theses, articles, scholarly journals, text books, blogs, dictionaries, etc. In addition, the university library and the website provided secondary data from academic papers, theses, textbooks to create the history and formulate the theoretical chapter of the studies. The researcher's knowledge will save time and expenses and address the researcher's problems while looking for primary data.

A purposive sampling was selected to provide the data collection with a sampling methodology that is descriptive of qualitative analysis methods. The analytical method of sampling, also called the judgement survey, is to make the participant's conscious choice depending on the attributes that the sampling process. This approach is non-random and does not contain underlying theories or a set number of participants. In short, the researcher decides what needs to be understood and seeks individuals who, on the basis of expertise or experience, can and are prepared to provide information. In the purposive sampling of individuals or groups that are experienced and well educated about phenomena of interest (Ilker Etikan et al., 2016).

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

4 Findings and Discussions

Qualitative descriptive research refers to a number of methods intended to synthesise the sensory properties of language technology. Descriptive analysis uses an expert analyst group to detect, describe and evaluate product sensory properties (Mukesh Kumar, Salim Abdul Talib and Ramayah, 2013). The role is quantitative and contributes both to characteristics and the whole to statistically comparable profiles. However, different needs require different approaches (Retiveau Krogmann, Stapleton, & Civile, 2017). As a result, qualitative approaches in descriptive analysis have advanced and become more popular (12th Pangborn Sensory Science Symposium, 2017). Qualitative analysis allows researchers to generate information and facts in depth and meaningfully (Wainer, 2000).

This study provides 8 informants which involves students from different institution. Most of them are frequently using cosmetics product as daily routine. For the present study, the findings are segmented into four thematic categories where all of them are revealed based their experience on factor of purchasing cosmetics among university students. There are four dominant themes had been identified during the discussions: (i) celebrity endorsement or insta-famous review; (ii) brand awareness; (iii) price fairness; and (iv) attitude. Each of thematic categories is discussed in the following sections:

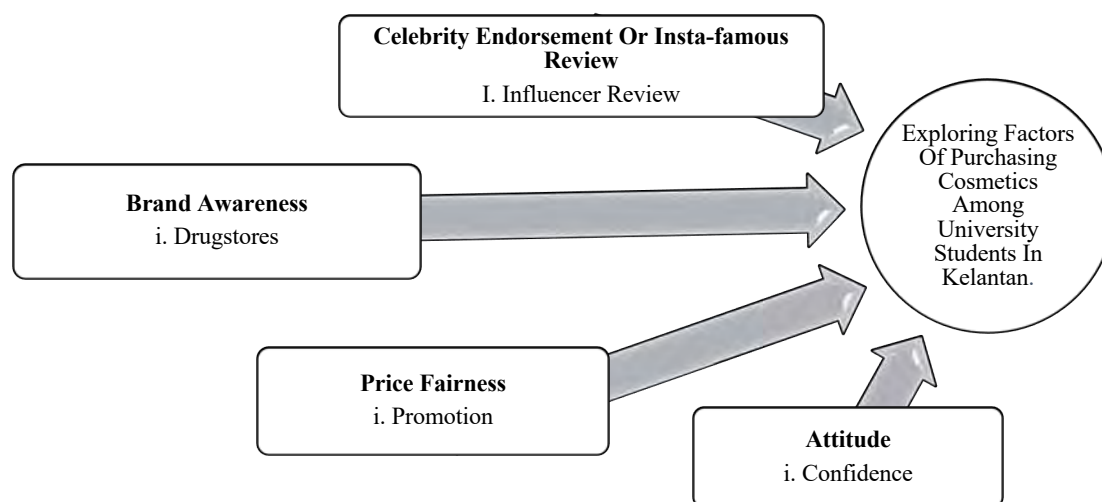

Figure 1

Theme 1: Celebrity Endorsement and Insta-Famous Review

For this theme, consumers highlighted that celebrity endorsement or insta-famous reviews is the factor that influence them to buy cosmetics or skincare. There only one sub-theme has found in this analysis which is influencer reviews. This category are described in detail as following below.

i. Influencer reviews

Based on findings from interview sessions, most of the students explain that influencer reviews is the strong factor that influence them to purchase cosmetic and skincare for themselves. It is because they believe the product that reviewed from a famous influencer is a good product. Below is the informants' quotations which has been prepared and analysed from the interview sessions that will support this sub-theme:-

IF1- "**Influencer.**"

IF2- "*From twitter, that is the reason based on **influencer**. He said the product is good so we*

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

were like.. okay lets try... ”

IF3- *“Emmm, **influencer, also blogger, insta-famous.** That’s it.”*

IF5- IF5- *“Okay, I actually after used the product I have mentioned earlier, I was more careful in choosing the product. I will look at **feedback from influencers** as well first. But if I go to the store, I will actually see the price. Because the price of the product always varies according to the promotion that the store makes. Usually, if there is a promotion I will buy more. Haha (laughs)”*

IF6- *“...Sometimes the **ambassador of the product** is influence me to purchase a product.”*

IF7- *“The most influence person on my purchasing behaviour is **an actor** named Izzue Islam. I always follow his media social and his review on a product that he use. I really love his skin and its lead me as a men to have a smooth skin like him. He is my favourite actor actually.”*

This quotation shows that most of the informant agree that influencer reviews is the factor of purchasing cosmetics among students. In the informant 7 quotation, he explain that his intention on purchasing skincare is because of his favourite actor review and he is adore to his favourite actor skin. Besides, informant also shows that they are coincidently see the reviews and it touch their sense to buy that product. This illustrate that people especially students is easy to trust a product through a review from trusted sources, famous influencer and also favourite actor or actress.

Theme 2: Brand Awareness

For this theme, informant highlighted drugstores as their place to buy cosmetics or skincare product. Informants believe that they can trust on the brand which sold only at the drugstores. It will be support with the result in researcher’s findings.

i. Drugstores

Based on findings, researcher found one sub-theme in brand awareness which is drugstore. All of the eight informants admit that they purchase cosmetics and skincare in drugstores. To prove this sub-theme, researcher have prepare informants’ quotations from interview session as following below.

IF1- *“**Watson also Guardian**”*

IF2- *“Okay, I usually purchase it at **Watson**. But, if there’s no **Watson** at my places I prefer go to aaa.. **Shopee or Guardian**. That’s it.”*

IF3- *“Emm.. At **drugstore, Guardian, Watson.**”*

IF4- *“Usually, I will buy at **Watson and Guardian** because it is one stop centre shop and I can bought what I need in one places while survey on another product.”*

IF5- *“I bought it at **Watson, or the Guardian** or at a regular store.”*

IF6- *“The best cosmetics product would be product in convenient store such as **Watsons, Guardians** and etc. Why I said so because at these store, people have choices of cosmetic products.”*

IF7- *“I usually buy at **Watson.**”*

IF8- *“From clinic, hospital and convenient store such as **Guardian** because it guarantee their safety on the consumer when they use and consume it.”*

All of these quotations shows that all of the informants admit they purchase cosmetics from drugstores. This illustrate that university students are aware about the counterfeit products. Informant 4 said that drugstores is a one stop centre shop which she purchase her needs in one places. It will ease consumer’s purchasing because they do not have to go to another places to buy their needs. As we all know, drugstores provide all health and beauty product in one places. Thus, the products has been approved from Ministry of Health Malaysia. Same goes to informant 6, she also said so. The result of this study shows that students are choose to buy cosmetics in the drugstores because it gives more benefits to consumers. It is one of the factor that influence students’ purchasing on cosmetics and skin care products.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Theme 3: Price Fairness

When buyers are going to purchase a good, price is really important. This will effect customers who are interested in purchasing the product because the product is costly. Prices are possibly important among users, especially students. In this theme, researcher found a sub-theme which is promotion.

i. Promotion

On this sub-theme, 4 out of 8 informants believe that promotion is one of cause that influence them to purchase cosmetics or skincare. Promotion is a must to a business in order to attract more target customers and also rise up the sales of a product. Quotations below will support this sub-themes strongly.

IF2- *"I think because of **promotion**, it will be cheaper than regular price. So I will buy that product."*

IF3- *"Yes, for example **promotion**, sometimes they make a review..."*

IF4- *"...I really care about Price, Brand, **Promotion** and Ingredient."*

IF5- *"Okay, I actually used the product I mentioned, I was more careful in choosing the product. I will look at feedback from influencers as well first. But if I go to the store, I will actually see the price. Because the price of the product always varies according to the **promotion** that the store makes. Usually, if there is a **promotion** I will buy more. Haha (laughs)... They make many campaigns such as new year promotions, promotions for each festival & promotion according to the theme which they provides."*

This shows half of informants agree that promotion of a product influence their purchasing. Most of informant are aware about promotions and informant are showing their interest to a product when the day of promotional activity held. Informant 2 explain when there is promotion on a product, the price will be cheaper than usual price. It shows that university student use this opportunity to save their money. One of these informant also shows that she is aware of promotional campaign. All of these four informants are agree this sub-theme is influence them on purchasing intention of a cosmetics and skincare product.

Theme 4: Attitude

Attitude signifies feeling, pattern, or reaction to something like object or concept (T.E.O Yuan Sim et al, 2012). The attitudes of customers are derived from personal experience, acquiring truth, friendly and seller knowledge. There are one sub-theme in the theme of attitude which is confidence that highlighted in the interview session.

i. Confidence

Based on the interview session, researcher found that this sub-theme which is confidence has been highlighted in the most of informants' quotation. A confidence is an important part in a person life. As to support this, researcher will analyse and explain the quotations below.

IF1- *"To increase **self-confidence**."*

IF2- *"Students wants to increase their **self-confidence** when they goes to class, walk in campus."*

IF3- *"Because to increase **self-confidence**."*

IF4- *"I believe that using make up and cosmetic make me feel more **confident**..."*

IF5- *"Okay, in my opinion there are many factors aaa .. why do university students buy cosmetics. First, I think cosmetics or skincare is a necessity because we are very exposed to the external environment. With the activities that u organize, aaa .. students involvement. So I think students need to take care of appearance because we have to deal with classes, presentations and so on. And all that requires a lot of **confidence**. If we are not confidence, then what we did that day will not perform. Because we face a lot of people, right, if other people take care of their appearance, why don't we? Because for me, skin care makes us feel clean. Haa like that."*

IF6- *"I personally think having healthy skin is important because that will **improve your self-***

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

esteem...”

Six out of eight informants mention, they use cosmetics and skincare in order to improve their self-confidence. We can conclude that university students are very concern about their appearance because of they had to face many people during study and self-confidence is needed. Some of them explain it is very important to take care of skin health and wear some make-up to increase their self-confidence. It is very important because we understood that confidence is a needed to a university students because during study they cannot avoid from group assignment, presentations and so on. As conclusion, this shows that informant agree and believe that confidence is one of the factor which lead them, to purchase the cosmetics or skincare product.

5 Discussion & Conclusion

Based on the data and information analysed, it shows that most of the participant are conscious about their purchasing intentions on cosmetics and skincare products. According to the findings one of the factors that affect cosmetic purchasing among university students at Kelantan is celebrity endorsement or unorthodox analysis. In this theme, one sub-theme, influencer reviews, is founded in this study. It shows clearly that feedback from an influencer or famous people can have an impact on the minds of people, particularly younger people, such as university students. Moreover, university students are introduced to several technologies, social media, where various marketing instruments have been announced via an interactive network. These popular celebrities affected the purchasing habits of the customer significantly, making it the most appealing advertisement weapon today. The key purpose of advertising and the implementation of this strategy is to convince customers to select goods (Ahmed Rahim, 2015). There are many cosmetics and the brand has been released and several authorities can widely prove the product benefits by paying input from popular influencers, especially celebrities. Erdogan (1999) concludes that many popular figures have encountered others.

Brand awareness is the second element. Brand awareness is, according to the results, one of the dominant influences in influencing student purchases of cosmetics. There is a topic of this problem that is pharmacy. A Drugstores is an American term for a pharmacy shop, according to Wikipedia. There are numerous cosmetics brands from many international brands in the drugstore, including local products which are assured safety. As can be seen in the discussion in the previous chapter, students actually illustrate that whatever kind of cosmetics brand they offer, customers will still mention, the drugstores name for example Watson, Guardian, etc. The powerful brand will boost the customer attitude of the brand's association of brands according to Ukpebor and Ipogah (2008). The impact of the brand on consumer preference and custody, through identification and differentiation of product and origin, and in the creation of additional values, can mainly be seen, as argued by Vranesević and Stancec (2003).

Promotion is the sub-theme in price fairness. 50% of the students interviewed claimed that marketing is one of the reasons purchasing cosmetics. Y. Castagnol describes promotion as a selling activity consisting of the temporary added benefit of a good or service that provides a special profit to the buyer's accurate and observable intent (Castagnol, p. 1972). Students are mindful of promotion because the costs can be cheaper than on an everyday price. So that we can see, a university student's price is really relevant because they have to save money and minimise their purchasing on unnecessary items. To support this finding, the price identified by Bruce N et al, (2006) is closely associated with customers' selling promotional expectations as the promotion of purchases basically means lowering market prices or the amount of money spent by buyers.

Lastly, confidence is the only sub-theme in the attitude theme that highlighted from findings. Most of the informant said that they use cosmetics and skincare to increase their confidence level.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

When we have to meet other people outside, confidence is necessary, it is vital to improve ourselves in the modern age where something has to be noticeable in order to accomplish goals in our lives. To support this, Miller & Cox (1982) notes that cosmetic products such as foundation, mascara and blush are a simple and easy way to boost your self-look and establish confidence.

In conclusion, this study shows that the factor of purchasing cosmetics is as stated above. There are advantages and disadvantages in using cosmetics and skincare. Therefore, consumers has to study and make a research about the ingredients of cosmetics and skincare before made decision to purchase it because there are certain cosmetics product are not suitable for our skin.

CONSUMER ATTITUDE CHANGES TOWARDS ONLINE SHOPPING AMONG GENERATION Z

Nurul Ain Binti Mohd Salim and Raja Rosnah Raja Daud

Faculty of Entrepreneurship and Business,
Universiti Malaysia Kelantan,
Malaysia

Email: nurulain.msalim@gmail.com; rosnah.d@umk.edu.my

Abstract:

Online shopping has been a trend in today's society since the use of the internet has increased in the last 10 years. Items and services sold online using various channels such as social media (facebook, twitter, instagram), websites (web) and advertised in individual blogs or specific groups. The main purpose is to attract consumers to browse and buy goods or services offered by traders. Furthermore, online shopping has been further simplified with electronic payment via online banking or credit card. According to the Economic Report 2013/2014, the increasing number of internet users and online shoppers illustrates the vast market potential for online businesses. In addition, it is important for businesses to focus on mobile phone customers as their number far exceeds internet users. The report also mentions that Malaysians spend more time surfing the internet than other media such as television, radio and newspapers with the widespread use of the internet for social networking.

Keywords: Attitude, online shopping, generation z, behaviour, media social and internet.

1 Introduction

In this era of globalization, electronic marketing is a pretty great revolution. Maximum business organization runs with technological change. Buying or marketing online is the use of technology for better marketing performance. And most retailers plan strategies to meet the demands of online shoppers and most retailers study consumer behavior in the field of online shopping, to see consumers' attitudes toward online shopping (Umar and Nasir, 2011).

In a consumer behaviour context, an attitude is a learned predisposition to behave in a consistently favourable or unfavourable way with respect to a given object. (Michael, 2011). Although attitudes are actually a way of thinking, we know that a person has an attitude only by what he or she says or does. Attitudes are learned. This means that we are not born with the attitudes relevant for our purchasing behaviour. (Leon and Leslie, 2008). Attitudes are derived from past experience and they direct future behaviour. It is important to remember, however, that they are just tendencies to behave, and can be affected by the situation (Putit, 2015). In general, the more favourable the attitudes a market segment has towards a brand, the more likely the consumers are to buy it. But because attitudes are only tendencies to behave, all aspects of the situation, including attitudes, must be taken into consideration in order to make predictions. (Shiffman and Leslie, 2010).

According to a study conducted by the Department of Statistics Malaysia involving a total of 31,433 households covering 96,225 individuals aged 15 years and above found a total of 56.0 percent of respondents using computers. The findings of the study also revealed that 57.0 percent use the internet with the frequency of internet use at least once a day (60.3%) while a total of 94.2 percent of respondents surveyed using mobile phones. In terms of types of goods and services

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

purchased through the internet consists of clothing, bags and shoes (50.4%), food and beverage (49.7%), tourism and travel products (35.4%), accommodation services (28.7%) and personal accessories (27.9%) (Portal Tourism Satellite Account, 2019).

The online payment agency, PayPal, in collaboration with Nielsen Company researchers, revealed that in 2010 alone, about 1.1 million Malaysians were willing to spend an average value of RM2,461 to purchase products online (Harian Metro, 2013). Meanwhile, the 2013/2014 Economic Report stated that the number of internet users in Malaysia is expected to increase to 25 million people by 2015 compared to 18 million people in 2012. Statistics also show that more internet users in Malaysia are buyers than sellers with the size of online transactions Malaysia is expected to reach RM5 billion by 2014 compared to RM1.8 billion in 2010. According to the report, Malaysia is among the three core countries in Asia for average online spending over the past 12 months and this is driven by tourism services, particularly flight tickets and hotel bookings (Portal MCMC, 2018). Therefore, based on current developments, this study aims to examine consumer demographics, consumer purchase preference, consumer benefit perception and consumer lifestyle towards online shopping among generation z.

2 Literature Review

The main aim of his study is to predict attitudes changes towards online shopping among generation z. as highlighted earlier, the phenomenon of online shopping is still emerging among generation z. The present study adapts the notion of Theory of Reasoned Action Model (TRA) as the underpinning theory in constructing the proposed conceptual framework. The following subheadings discuss further the background of the theories and justification on the choice of TRA theory in the present study.

Hypothesis

The present study has put a focus on the understanding on the relationship between consumer demographics, consumer purchases preference, and consumer lifestyle and the attitude toward online shopping. The details justification on the hypothesis development is discussed in the next sub-points.

H1: Consumer demographics has a positive effect on attitude towards online shopping

We would like to study demography in terms of age, gender, income and education as are there any differences while consumers shop online, differences within the age groups such as does online shopping attracts elder people or younger people. Studies have shown that online shoppers mainly consist of people with Higher education and income and working in middle to senior management or professionals (Kehoe, 1998; Hoffman, 1996).

H2: Consumer purchases preference has a positive effect on attitude towards online shopping.

Examination of preferences and purchase decision-making for micro packs remains a less thoroughly explored area and hardly any comprehensive study has been conducted so far to a bridge the gaps in the existing literature (Preeti Mehra, 2016). The survey revealed that consumers have strong preference for trustworthy online store. This is consistent with findings by (Chua, 2006) who concluded online consumers in Malaysians still lack confidence and trust in utilising the Internet as a shopping channel as they are very concerned about issues related to privacy and trust when dealing with online retailers. According to (Enrique, 2008; Kim and Song, 2010; Xie, 2011), perceived usefulness was proven to have significant impact on the preference to purchase via internet.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

H3: Consumer benefit perception has a positive effect on attitude towards online shopping. Customer perception refers to the customers opinion. It summarises how customers feel about brand including every direct or indirect experience they have had with company (Carley Stec, 2019). (Benedict, 2001) study reveals that perceptions toward online shopping and intention to shop online are not only affected by ease of use, usefulness, and enjoyment, but also by exogenous factors like consumer traits, situational factors, product characteristics, previous online shopping experiences, and trust in online shopping.

H4: Consumer lifestyle has a positive effect on attitude towards online shopping. Existing literature has emphasised upon utilising lifestyle information to understand consumers in different cultures (Plummer, 1974). In order to make the necessary accommodation to different economic conditions, a change in ways of living will always follow. Hence, the authors suggest that segmentation in terms of lifestyle should (Lawson & Todd, 2002) be based on social stratification. Armstrong (1992) studied the prediction of consumer behavior by experts and novices.

Demographic Profile of Respondents

A descriptive analysis was conducted on the data of section A for the purpose of summarize the background information on demographic profile of the respondents that involved in this study. For descriptive analysis (demographic), the researcher has come out with this analysis to find the percentage of demographic for 150 respondents which are from generation z. The demographic profile of respondents has been showed in section A of the survey. There are 6 questions in section A that were asked regarding gender, age, status, level of education, occupation and average income per month. In order to examine this demographic information of this demographic profile at the respondents has been utilized. The following discussion explain on the respondent's demographic and information that were obtained.

Table 4.2: Gender

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Male	37	24.7	24.7	24.7
	Female	113	75.3	75.3	100.0
	Total	150	100.0	100.0	

Based on the sample collected through the distribution of questionnaires, female respondents slightly outnumber male respondents, accounting for 75.3 percent as against 24.7 percent, respectively.

Table 4.3: Age

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	12-15 years old	1	.7	.7	.7
	16-19 years old	37	24.7	24.7	25.3
	20-23 years old	112	74.7	74.7	100.0
	Total	150	100.0	100.0	

In table 4.3 shows the majority of the respondents are from the age group of 20 to 23 years (74.7%)

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

and 16 to 19 years (24.7%), 0.7 percent were from the 12 to 15 years group and minimal respondents fell within the range of 8 to 11 years.

Table 4.4: Status

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Single	135	90.0	90.0	90.0
	In relationship	9	6.0	6.0	96.0
	Married	6	4.0	4.0	100.0
	Total	150	100.0	100.0	

From the status groups, the single status the highest percentage (90.0%), followed by in relationship (6.0%) and married status (4.0%).

Table 4.5: Level of Education

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Secondary School	16	10.7	10.7	10.7
	Certificate	13	8.7	8.7	19.3
	Diploma	46	30.7	30.7	50.0
	Degree	75	50.0	50.0	100.0
	Total	150	100.0	100.0	

The majority of the respondents have first degree as their highest educational qualification achieved (50.0%). Followed by diploma (30.7%) and secondary school (10.7%), 8.7 percent were from certificate level of education.

Table 4.6: Occupation

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Student	120	80.0	80.0	80.0
	Government Worker	6	4.0	4.0	84.0
	Private Sector Employee	19	12.7	12.7	96.7
	Unemployed	5	3.3	3.3	100.0
	Total	150	100.0	100.0	

In occupation, most of the respondents are from students (80%), followed by private sector employee (12.7%), the remaining government worker (4.0%) and unemployed (3.3%).

Table 4.7: Average Income

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Less than RM1000	120	80.0	80.0	80.0
	RM1001-RM2000	21	14.0	14.0	94.0
	RM2001-RM3000	7	4.7	4.7	98.7
	RM4001 and above	2	1.3	1.3	100.0
	Total				

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Total	150	100.0	100.0	
-------	-----	-------	-------	--

For average income, the majority of the respondents are income less than RM1000 (80.0%). Followed by income RM1001 to RM2000 (14.0%) and income RM2001 and RM3000 (4.7%). The balanced 1.3 percent from income RM4001 and above.

Table 4.8: Frequency used online shopping platform

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	once a month	69	46.0	46.0	46.0
	once every 3 months	46	30.7	30.7	76.7
	once every 6 months	19	12.7	12.7	89.3
	once a year	16	10.7	10.7	100.0
	Total	150	100.0	100.0	

In table 4.8 shows the majority of the respondents are used once a month frequency used online shopping (46.0%) and once every 3 month (30.7%), 12.7 percent were used once every 6 month and minimal respondents fell within once a year.

Table 4.9: Payment Method

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Credit Card	10	6.7	6.7	6.7
	Cash	11	7.3	7.3	14.0
	Online Transfer	129	86.0	86.0	100.0
	Total	150	100.0	100.0	

The majority of the respondents used online transfer for payment method (86.0%). Followed by cash (7.3%) and credit card (6.7%)

4.10: Delivery Method

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Sent at home	147	98.0	98.0	98.0
	Taken at store	3	2.0	2.0	100.0
	Total	150	100.0	100.0	

From the delivery method groups, send at home (98.0%), and the balance is taken at store (2.0%).

Descriptive Analysis

Descriptive Statistics

Valid N (listwise)	150						

The overall results show that the distribution of the sample is normal. Thus, the sample is acceptable and can be regarded as normal distribution through the random sample from the population. The residual between the observed value and predicted value must be relatively small to be fitted into the model, thereby indicating that the sample is representative of the population.

5 Conclusion

The researcher has explained the detail of the data analysis and findings such as preliminary

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

analysis, demographic profile of respondents, descriptive analysis, validity and reliability test, normality test and hypothesis testing which applied in this research. The researcher were analyze the data obtained through the questionnaires from respondents and perform the results of data analysis. The preliminary analysis explain about the process of a small group of 30 respondents have been chosen to answer the questionnaire. After the pilot test was done, the researchers will implement a reliability test to examine the reliability and exactness of the data collected. For descriptive analysis (demographic profile and consumer purchase preference) is to summarize the background information and for DV & IV, the researcher compared the mean between dependent variable and independent variable for every question. For the validity and reliability analysis, the researcher use to measure the Cronbach's value for each variables. The hypothesis testing were tested by Spearman's Correlation Analysis to measure the relationship between independent variables and dependent variable.

6 Discussion

The hypothesis is for a statistical test that can be used to determine whether the hypothesis assumed for a sample of data is true for the whole population. In summary, a hypothesis is a hypothesis that is tested to determine the relationship between two sets of data. The hypothesis can also be tested based on observations of a process modelled through a set of random variables. Statistical hypothesis testing is a method of statistical inference.

7 Implication

This study will enrich the literature on the online shopping in Malaysia context using Theory of Reasoned Action (TRA) model. First, the result of the study can serve as an indication or trend not only certain products can be sold through online but can cover a much wider rangers among generation z context. Secondly, it is expected that result from this study can help online retailers draw further marketing strategy to attract more consumer through online shopping among generation z context. They can know their weaknesses and try to improve or change their business strategy so that they can attract more online buyers to visit their website and buy their products and services. As benefits perception is the most significant influencing factors on attitude, one of the important implications of this study to practice is that the merchant needs to ensure that the websites to be developed to facilities online shopping and be easy to use by the consumers and must be able to demonstrate the benefits of shopping online to consumers.

Thirdly, the survey revealed that consumers have strong preference for trustworthy online store. This is consistent with findings by Chua (2006) who concluded online consumers among generation z still lack confidence and trust in utilizing the internet as a shopping channel as they are very concerned about issues related to privacy and trust when dealing with online retailers. As such, an online store merchant of similar nature can make use of such info to improve their website design and devise their marketing strategy in promotion their online store. In the internet marketing context, internet consumers will favour sites that represent a merchant with which the consumer is already familiar from traditional channels. As such, the merchant should actively promote their online channel option to their existing consumers who frequently visit their current retail store. This is because the reputation of the physical store will most likely influence the perceptions of an online site. Concurrently, in order for consumers to engage in trust related internet behaviour like this online shopping, the merchant must make trust-building interventions such as posting a privacy policy, use a third-party seal, interact with customers, advertise its good reputation, link to other reputable sites, or offer guarantees on product delivery and quality. It is also very important for internet merchants to ensure that consumers have a positive shopping experience each time the consumer visits their online stores.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

In addition, it also indicated that there are opportunities out there where many people can become entrepreneurs or technopreneurs as encouraged by the government, without heavy investment compared to traditional retailers. Last but not least, this study could serve as a reference and guides for the future researchers who would like to study about the similar topic.

AWARENESS OF SYSTEM POINT - OF - SALE (POS) AMONG RETAILERS IN PONTIAN

Nurul Amira Binti Kamaruddin and Nurul Izyan Binti Mat Daud

Faculty of Entrepreneurship and Business,
Universiti Malaysia Kelantan,
Malaysia

Email: amira@gmail.com; izyan.md@umk.edu.my

Abstract:

Enticing retailer or wholesaler experience is the fundamental key to their company's success and there are certain criteria for the right technology for successful marketing to achieve this experience. Point of sale (POS) systems monitor the execution of retail transactions, often assess the payment due for the purchased products/services, document the receipt of funds, recording the receipt of funds, recording the completion of the transaction and the receipts issued. Minimizing clerical costs, reducing the stock-out situation, increasing flexibility, improving sales, reducing time, are some of a company's fundamental goals. In this paper, the efficacy of POS data in the management of the supply chain is studied at the retail level. The retailer in Pontian is selected and a questionnaire is used to collect information. The independent variable are performance expectancy, effort expectancy, facilitating conditions, social influence and the dependant variable is awareness system POS. The thesis offered an insight into the procedures that the researcher would follow in the methodology section in order to successfully carry out the analysis and draw a successful conclusion. The data analysis segment provided the participants' answers with regard to the current research subject.

Keywords: Point of sale, POS, retailers, performance expectancy, effort expectancy, facilitating conditions, social influence ,awareness

1 Introduction

POS system is a technology that is often used by the retail industry. For that reason, most of the establishments in this industry implement point of sales systems (POS) technology with the intention of make their services faster and gain more control over diverse operational aspects (Vineet Kaushika,2020). POS distributors usually provide a security measure to the systems in order to protect the data. However, it is important to take additional measures, protections especially when it will be handled by employees with different job categories. Unfortunately, few establishments operating under the F&B industry have the financial resources to protect these systems. Also, many of these businesses are understaffed which affect the good supervision of the systems use (Hardi Emrie,2015).

(Abubakar,2017) As a business owner are always looking for ways to minimize the cost and maximize the profit. In order to better compete with larger retailer and keep track of sales and inventory, may be in the market for a point-of-Sale (POS) system for your small business. POS has undergone technological innovation changes from traditional POS to POS System. Because of that, researchers want to see the extent of retailer awareness at Pontian on the use of POS.

Due to that, there is a POS, POS systems as well as are run on Apple or Android devices. Not to be confused with e-menus (those iPads customers order on at their tables), which can only order

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

and must still be integrated with a POS (Rosanna Passavanti,2018). Cloud-based POS are often apps. In contrast to the traditional system, cloud-based POS tools are web hosted solutions that store information in a secure online environment and it can be accessed from virtually anywhere. It is also easily accessible that managers and owners don't need to be physically present at the outlet in order to update tools. It works better for managers, who can access sales and analytics from wherever they are. (Eleonora Pantano,2018)

POS also has an advantage to retailers. (Kartik Kalaignanama, 2018) POS systems streamline retail operations by automating the transaction process and tracking important sales data. Basic systems include an electronic cash register and software to coordinate data collected from daily purchases. Retailers can increase functionality by installing a network of data-capture devices, including card readers and barcode scanners. Depending on the software features, retailers can track pricing accuracy, inventory changes, gross revenue, and sales patterns. (Kevin Mun, Weng Cheong,2020) (Obioma Uchendu,2018) Customers can also interact directly with POS systems, particularly in the retailing industry. The problem that retailers now, need to be aware of with the availability of innovative technologies need to be present in their business because it gives them more advantage.

2 Literature Review

2.1 Performance Expectancy

Performance expectancy is defined as the degree to which an individual believes that using the system will help him or her to attain gains in a job (Shin, 2019). Within each of the individual models tested, the variables related to performance expectancy were the strongest predictor of intention to use the target technology. People who worked exhibited a high of IT acceptance and use influenced by performance expectancy (Kijisanayotin, 2019). Zhou et al. (2010) found that performance expectancy, task technology fit have significant effects on user adoption.

H1: There is significant positive relationship between performance expectancy to use POS system

2.2 Effort Expectancy

Effort expectancy is defined as the degree of ease associated with the use of the system. According to Venkatesh et al. (2015), this factor was derived from the perceived ease of use factor as proposed in Technology Acceptance Model (TAM). Park and Ohm (2014) have shown that the user-friendliness of POS system exerted positive significant influence over the adoption of POS because the lesser effort was required to use. Prior studies suggested that effort factor played a crucial role in determining is effort expectancy has to do with the use of technology.

H2: There is significant positive relationship between effort expectancy to use POS system

2.3 Social Influence

Social influence referred to the degree to which individuals perceived that significant others, such as other retailer believed they should use a technology (Martin & Herrero, 2015). They tend to influence the behaviour of the person to adopt or use POS. Venkatesh et al. (2016) also described social influence as the extent to which an individual concern about opinion and perception of others who were important to the person. Individuals who desired social acceptance likely comply with others' expectations, and it might contribute to individual factor to use the POS system (Gruzd et al., 2016).

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

H3: There is significant positive relationship between social influence to use POS system

2.4 Facilitating Conditions

Facilitating conditions are defined as the degree to which an individual believes that an organizational and technical infrastructure exists to support the use of the system (Venkatesh et al., 2015). Indeed, using POS system usually require a particular kind of skill, resources and technical infrastructure (Alalwan ,Dwivedi, & Williams, 2016). Therefore, user could be more motivated to use POS if they have a certain level of support service and resource as well as perceive POS system as compatible with other technologies already used by them. Theoretically, the impacting role of facilitating conditions on the usage factor toward using POS (Alalwan, Dwivedi, & Williams, 2016).

H4: There is significant positive relationship between facilitating conditions to use POS system

2.5 Awareness of System POS

Point of Sale (POS) software system has become an integral part of retail industry. A point of sale system, or POS, is the place where your customer makes a payment for products or services at your store. The POS serves as the central component for your business; it's the hub where everything like sales, inventory and customer management merges (Agnes Teh Stubbs 2019). According to Patriccia Amanda, (2017)they did a study adopted POS has its own advantages and uses for retailers. POS makes faster check out of customers by scanning items increases throughput of customers at the cash register. At busy times this reduces the chances of a customer seeing a long line and not making a purchase. Faster approval of charge purchases via either dial up or always on connection increases the speed of the transaction thereby reducing the chance of a customer seeing a long line and not making a purchase.

2.6 Conceptual Framework

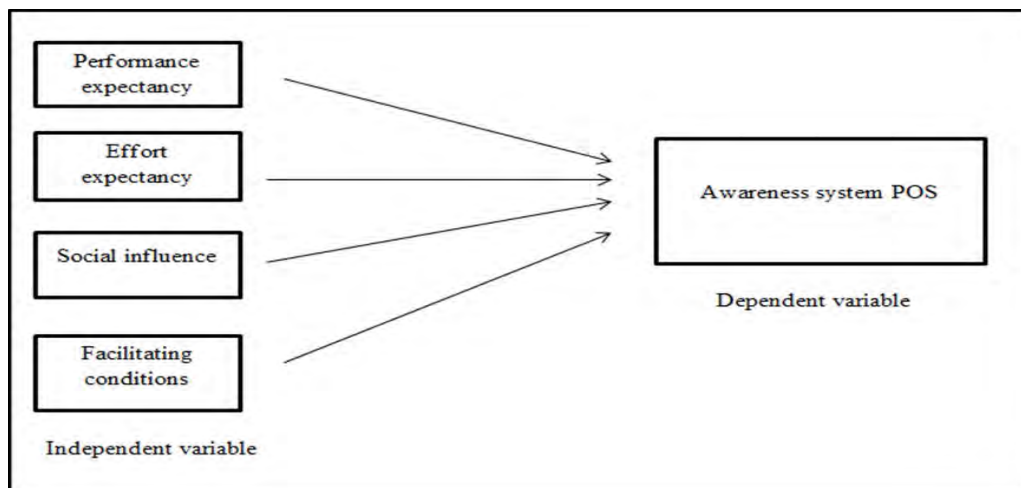

Figure 1: Theoretical Framework

As showed in Figure 2.1, the reason of this research is to awareness in Point - Of - Sale (POS)

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

system among retailers. This section explains the proposed theoretical framework. The research framework as illustrated in Figure 2.1 has two components, first is independent variable that is performance expectancy, effort expectancy, social influence, facilitating conditions and second is awareness use POS system serve as dependent variable.

3 Research Methodology

3.1 Research Design

This is a quantitative study, the data will be calculated through statistical, analytical, or mathematical analysis, then analysed with computational techniques by collecting data via questionnaire or surveys. The potential relationship within this study is established. To collect the data from target respondents, a collection of questionnaires will be produced in questionnaire form. The questions will be generated by secondary data obtained from previous research on similar topics in order to gather information such as the demographic profile, the opinion of respondents, and the factors that awareness in POS among retailers.

3.2 Data Collection Methods

In researcher users, primary data collected through questionnaire for this study. Questionnaire method was conducted due to it could increase the efficiency and effectively. To be more accurate for this study, the retailer in Pontian were targeted in this research. The main reason for collecting data from them is that they can provide the information needed by researchers about awareness use POS system. Second, secondary data is data that has been collected and recorded by others and available from other sources. Researchers also use reference materials such as books, journals to get information on the subjects studied by researchers.

3.3 Sample Size

The sample size is determined by the ability for the researcher to get participant contribute in the research. Since all participant's retailers in Pontian will be selected, because choosing this target population area is time consuming to get more accurate results and achieve high data collection speed. The researcher selects a table (Krijcie & Morgan,1970) to determine the number of respondents required. The number of the of respondent that will be fill out the online questionnaire is 181 respondents (Krijcie & Morgan,1970).

3.4 Procedure For Data Analysis

The analysis that involved in the analysis data collection of this study descriptive statistics, reliability statistics and correlation analysis.

3.4.1 Descriptive Analysis

Based on Mukesh et al. (2013), descriptive research describes a phenomenon, situation or characteristics of organization or people and the objective of descriptive research is to describe the acceptance of new concept to respondent.

3.4.2 Reliability Analysis

The used of reliability analysis is to test the consistency and the stability of responds. For the reliability test, we will be using Cronbach's alpha.

3.4.3 Pearson's Correlation

Pearson's Correlation is often referred to as Pearson's Product Moment Correlation and this is also the most common method for calculating the correction. The researcher would like to use

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Pearson's Correlation in this analysis to measure the linear relationship degree between two variables, which is between dependent variable and independent variables.

3.4.4 Multiple Regression Analysis

A procedure that is used to calculate the linear relationship between a dependent variable and two or more independent variables is multiple linear regression. The multiple linear regression will be tested in this study as a result of performance expectancy, effort expectancy, facilitating conditions and social influence use the POS system. The higher the independent variable percentage influences the dependent variable, the higher the relationship between dependent variable and independent variables.

4 Research Findings

4.1 Frequency Analysis

In this study, there are six questions were asked under respondent's demographic section such as gender, age, occupation, and salary per month of retailer in Pontian.

Table 1: Respondents of Demographic Profile

VARIABLE	FREQUENCY	PERCENTANGE (%)
Gender		
Male	92	50.8%
Female	89	49.2%
Total	181	100%
Age		
20 – 29-year-old	99	54.7%
30 – 39-year-old	42	23.2%
40 – 49-year-old	21	11.6%
50 – 59-year-old	11	6.1%
60 – 69-year-old	8	4.4%
Total	181	100%
Academic		
SPM	67	37%
STPM/MATRIC/DIPLOMA	27	14.9%
DEGREE	44	24.3%
MASTER	22	12.2%
OTHER	21	11.6%
Total	181	100%
Business Area		
Small Town	91	50.3%
City	90	49.7%

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

Total	181	100%
Know about POS		
Yes	168	92.8%
No	13	7.2%
Total	181	100%
Use POS		
Yes	137	75.7%
No	44	24.3%
Total	181	100%

From the table 1 Respondents of Demographic Profile. The majority gender there have 92 respondents are male, and 89 respondents are female. In this survey, this result indicates men little more than female. Respondents from male, which consist of 50.83%, while the female respondents 49.17% out of the total respondents.

Besides, there of the respondent is at age 21 to 29-year-old which is 99 people and 54.7% from the total of respondent and the second is 30 to 39-year-old that which is 23.2% (42 people). Where, the total respondents, 40 to 49 years old is 21 (11.6%), 50 to 59 years old is 11(6.8%) and lastly age 60 to 69-year-old is 8 (4.42%). Next, respondent's academic the majority respondents are SPM with total of 67 (37.02%) respondent and followed by Degree which consist of 44 (24.31%) respondent. The rest of the respondents are STPM, Master and other which consist of 27 (14.92%), 22 (12.15%) and 21 (11.60%) among the total respondent. After then, respondent business area there have half of the respondent's retailers at small town 91 (50.28%), and 90 (49.72%) respondents at City.

Addition, respondent is question about "Have you know the POS system?". The respondents 168 (92.82%) are answer Yes, and 13 (7.8%) respondents answer No. lastly for question about "Do you use the POS system?". The respondents 137(75.69%) are answer Yes, and 44 (24.31%) respondents answer No and not use POS in their business.

Reliability Analysis

Table 2: Reliability of Coefficient Alpha for the Dependent Variable and Independent Variable

VARIABLE	NUMBER OF ITEMS	COEFFICIENT	STRENGTH
Performance	5	0.929	Excellent
Effort	5	0.931	Excellent
Social	5	0.927	Excellent
Facilitating	5	0.923	Excellent
Awareness	5	0.929	Excellent
Total	25	0.984	Excellent

Table 3 shows the reliability for the dependant and independent variable. From the table, we can

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

conclude that the Cronbach's Alpha for the overall reliability is 0.984 which is determined as excellent according to the rule of thumb of Cronbach's Alpha Coefficient. The result shown is reliable and it is accepted in this study. Reliability, performance, effort, social and facilitating are the independent variable in this study which shows the Cronbach's Alpha value of 0.929, 0.931, 0.927 and 0.923. The results shown are considerably accepted and excellent. Awareness in POS system among retailers is the dependent variable in this study and its Cronbach's Alpha value shows 0.929 which is excellent. Since the Cronbach's Alpha value for the variables has exceeded 0.6, it shows that the questionnaires are highly reliable and result is acceptance.

Pearson's Correlation

Table 3: Summary Result of Pearson Correlation

Hypothesis	Result	Findings of Data Analysis
H1: There is significant positive relationship between performance expectancy to use POS system	r = 0.923** p = 000 High positive (negative)	H1 : Accepted
H2: There is significant positive relationship between effort expectancy to use POS system	r = 0.887** p = 000 High positive (negative)	H2 : Accepted
H3: There is significant positive relationship between social influence to use POS system	r = 0.888** p = 000 High positive (negative)	H3 : Accepted
H4 There is significant positive relationship between facilitating conditions to use POS system	r =0.857** p = 000 High positive (negative)	H4 : Accepted

Table 2 shows the Pearson's Correlation coefficients. The correlation coefficients for awareness of system POS and performance expectancy was 0.923 and it shows that the strength of awareness of system POS and performance expectancy is high positive correlation according to rule of thumb for interpreting the size of a Correlation of Coefficient. Besides that, the P value was 0.000 indicates the significant value for the analysis where it is lower than the alpha root which is 0.01. Therefore, there is significant high positive correlation relationship between awareness of system POS and performance expectancy.

Moreover, the correlation coefficients for awareness of system POS and effort expectancy was 0.887 and it shows that the strength of correlation between awareness of system POS and effort expectancy is high positive correlation. The P value was 0.000 indicates the significant value for the analysis where it is lower than the alpha root which is 0.01. Therefore, there is significant high positive correlation relationship between awareness of system POS and effort expectancy.

In addition, the correlation coefficients for awareness of system POS and social influence was 0.888 and it shows that the strength of correlation between awareness of system POS and social influence is high positive correlation. Besides that, the P value was 0.000 indicates the significant value for the analysis where it is lower than the alpha root which is 0.01. Therefore, there is significant high positive correlation relationship between awareness of system POS and social influence.

Lastly, the correlation coefficients for awareness of system POS and facilitating condition was

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

0.857 and it shows that the strength of correlation between awareness of system POS and facilitating condition is high positive correlation. Besides that, the P value which was 0.000 indicates the significant value for the analysis where it is lower than the alpha root which is 0.01. Therefore, there is significant high positive correlation relationship between awareness of system POS and facilitating condition.

Multiple Regression

Table 4: Coefficients Analysis

Model		Unstandardized Coefficients		Standardized Coefficients	Sig.
		B	Std. Error	Beta	
1	(Constant)	0.196	0.123		0.112
	Performance	0.653	0.084	0.659	0.000
	Effort	0.141	0.099	0.140	0.158
	Social	0.171	0.099	0.162	0.087
	Facilitating	0.019	0.087	0.018	0.827

The result show in table 4, the factor such performance, effort, social and facilitating were significant since the p-value were less than 0.05. The equation of regression can be written as follow.

$$Y = a + \beta_1 X_1 + \beta_2 X_2 + \beta_3 X_3 + \beta_4 X_4$$

Where

- Y Awareness
- X₁ Performance Expectancy
- X₂ Effort Expectancy
- X₃ Social Influence
- X₄ Facilitating Condition

Hence, the equation becomes

$$Y = 0.196 + 0.653 X_1 + 0.141 X_2 + 0.171 X_3 + -0.019 X_4$$

Unstandardized coefficients beta represents the strength of the effects of every single of the independent variables to the dependent variable. The higher the value of the beta coefficient, the stronger the effect of independent variable towards dependent variable. According to the Table 4, the most influence independent variables in awareness of system POS was performance expectancy variable ($\beta_1 = 0.653$). The social influence ranked at second rank ($\beta_2 = 0.171$) and followed by the status effort expectancy ranked at third rank ($\beta_3 = 0.141$). The lowest facilitating condition towards counterfeit products was the personal gratification ($\beta_4 = 0.141$).

5 Discussion

The study was conducted identify the awareness in POS system among retailers. The study is to identify the most effective impact that bring awareness in POS system among retailers. The

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

researcher was identified 181 responses to perform data collection by the online questionnaires. In this research, the researcher had managed to collect data using the research instrument (online questionnaire) and after analyzing the data using IBM SPSS Statistics version 23, the result for the tests was obtained. The analysis of data includes descriptive analysis, reliability analysis and Pearson Correlation Coefficient.

5.1 Performance Expectancy

The correlation between performance expectancy to use POS system. From the table, it shows that there is a significant relationship between performance expectancy to use POS system because the significant value is 0.000 which is less than 0.01. The positive correlation coefficient for performance expectancy to use POS system is 0.923** means there is a moderate relationship between performance expectancy to use POS system. It shows that performance expectancy very give effect to use POS system. Hence, the H1 of objective 1 which is to identify the relationship between of performance expectancy to use POS system is accepted. Zhou et al. (2010) found that performance expectancy, that perceived usefulness, perceived enjoyment, trust, cost, network influence, and trust have significant influence on consumers POS system.

5.2 Effort Expectancy

Next, the correlation between effort expectancy to use POS system. From the table, it shows that there is a significant relationship between effort expectancy to use POS system because the significant value is 0.000 which is less than 0.01. The positive correlation coefficient for effort expectancy to use POS system is 0.887** means there is a moderate relationship between effort expectancy to use POS system. It shows that effort expectancy very give effect to use POS system. Hence, the H2 of objective 2 which is to identify the relationship between of effort expectancy to use POS system is accepted. Park and Ohm (2014) have shown that the user-friendliness of POS system exerted positive significant influence over the adoption of POS because the lesser effort was required to use.

5.3 Social Influence

After then, the correlation between social influence to use POS system. From the table, it shows that there is a significant relationship between social influence to use POS system because the significant value is 0.000 which is less than 0.01. The positive correlation coefficient for social influence to use POS system is 0.888** means there is a moderate relationship between social influence to use POS system. It shows that social influence very give effect to use POS system. Hence, the H3 of objective 3 which is to identify the relationship between of social influence to use POS system is accepted. Chong (2016) proposed that social influence played an important role in determining users' factor in the study of POS among retailers.

5.4 Facilitating Condition

Then, the correlation between facilitating condition to use POS system. From the table, it shows that there is a significant relationship between facilitating condition to use POS system because the significant value is 0.000 which is less than 0.01. The positive correlation coefficient for facilitating condition to use POS system is 0.857** means there is a moderate relationship between facilitating condition to use POS system. It shows that facilitating condition very give effect to use POS system. Hence, the H4 of objective 4 which is to identify the relationship

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

between of facilitating condition to use POS system is accepted. Huang, 2015 found that the facilitating conditions had a positive and significant influence on perceived ease of use and perceived usefulness. It's served as a critical indicator for the of a new technology to retailer because they not only helped users learn to use the POS in a shorter period of time but also minimized the problems they may encounter when using it.

Lastly, there is to investigate the most factor that influence awareness to use POS system. Based from table 4.14, it shows the summary of the Multiple Linear Regression result and it can be concluded that to find out the most factor (performance expectancy, effort expectancy, facilitating conditions, social influence) that influence awareness to use POS system. As a conclusion, there is a significant the most factor is performance expectancy ($p < 0.05$) that influence awareness to use POS system but according to the beta value, in this analysis, the most dominant variables that the most factor is performance expectancy that influence awareness to use POS system will be the propensity to trust as it has the higher value of beta compared with the other variable. H. S. Martín & Herrero, 2015 found that the POS system is positively influenced by, the levels of performance expected with regard to the transaction and the level of innovativeness of users. The innovativeness construct has a most effect on the relationship between performance expectancy using POS system.

5.5 Hypothesis Testing

Table 5: Hypotheses Result

Hypotheses	Objective	Result
H ₁	To investigate the relationship between performance expectancy and toward the awareness of using the POS system.	Accepted (Most Factor)
H ₂	To examine the relationship between effort expectancy and toward the awareness of using the POS system.	Accepted
H ₃	To identify the relationship between social influence and toward the awareness of using the POS system.	Accepted
H ₄	To investigate the relationship between facilitating conditions and toward the awareness of using the POS system.	Accepted

6 Recommendations

Based on the findings of the research to conducted, it can be a reference to the researchers to assist them conduct the research due to the data collected and obtained the information is analyzed accurately. The suggestion is that researchers need to identify problems as well as explore many studies related to this research.

Furthermore, for future researchers who plan to collect more data and information from respondents in different ethnic groups. This collection can achieve the higher accuracy in data

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

analyzing of the study. In addition, by including the different ethnicity the research project will be more persuasive.

Not only that, in terms of the use of questionnaires, most respondents do not longer like to contribute and cooperate due the questions are too hard to understand and the use of sentences is too long, so researchers should avoid this. Researchers must to ensure that the questionnaire set should be simple, comprehensive, precise, and easy to understand for the respondents to answer and help fill out the questionnaire to be more smooth and effective.

7 Conclusion

As conclude, the researcher title is "Awareness of System POS among Retailer in Pontian" and the number of respondents in this researcher is 181 respondents. The findings in this research clearly show that there is a strong relationship between the three independent variables, performance expectancy, effort expectancy, social influence, and facilitating condition. For awareness of system POS among retailer which are the dependent variables in this research. The findings of this research show that the most factor influence for awareness of system POS among retailers is performance expectancy. Finally, the researcher also discusses the implications and some limitations faced by the researcher while conducting this research. Not only that, but the researcher also stated suggestions that can help to improve the research in the future. In conclusion, researcher is expected to obtain good feedback from relevant businesses in improving the use of POS system.

8 Acknowledgements

The author would like to acknowledge the cooperation, assistance, guidance, support and motivation of various individuals who have made it possible for me to conduct this research. The author would like to thank to all participating in this study also deeply grateful to supervisor, Dr Nurul Izyan binti Mat Daud, for her guidance, patience and support. I also want to thank to my family in helping me encourage in running this research paper. I am grateful to all other member at the Faculty of Entrepreneurship and Business for support, encouragement and, facilitation. Last but not the least, I would also like to thank all the respondents and key informants for answering my questions enabling me to complete this study.

THE USE OF TECHNOLOGICAL INNOVATION ON RETAILING STORE EFFECT ON CONSUMERS PURCHASING

Nurul Husna binti Zainal and Nurul Izyan binti Mat Daud

Faculty of Entrepreneurship and Business,
Universiti Malaysia Kelantan,
Malaysia

Email : husna.a17a0578@siswa.umk.edu.my, izyan.md@umk.edu.my

Abstract:

Technological innovation will have a significant impact on retail. The use of a large number of benefits enjoyed by retailers using technologies such as cost reduction, increased consumer satisfaction, flexible job introduction and finally in the field of market dominance and increased company competitiveness (Gil et al., 2014). The retail industry is one of the sectors connected to the revolution because of continuous technological advances (Priporas et al., 2017). Although retailers traditionally lack modern ability and typically adapt to innovation, products and services are available and increasing rapidly to support consumers and retailers with technology and creative systems and digital sales (Pantano, 2014). The aim of this paper is to deepen the study of retail technology innovation and explore the direct effect of innovation in the areas of level of satisfaction, image storage and consumer value to stimulate corporate economic efficiency (Townsend, 2010). There are several other key issues identified related to store image, satisfaction and consumer value that will use of technological innovation in the retailing.

Keywords: Consumer Value, Retailing, Satisfaction, Store Image, Technological Innovation

1 Introduction

Innovation is usually linked with technology-based change. Innovation not only pose challenges for retailing but also creates new effective solutions to improve consumer experience and retail management (Imtiaz, Eissa.A & Mosab, 2019). The level of innovation that may occur vary between firms operating in the same industry in terms of the nature and volume of successful innovations (Cao, 2014). Moreover, by providing new instruments to add value to the consumer experience, the rapid development of information and communication technology has fundamentally changed business conditions (Thiesse et al., 2009). In this study, technological innovation will have a significant impact on retail. The use of a large number of benefits enjoyed by retailers using technologies such as cost reduction, increased consumer satisfaction, flexible job introduction and finally in the field of market dominance and increased company competitiveness (Gil et al., 2014).

As Cyber Monday statistics show, smartphone use, in particular is driving retail e-Commerce sales with the rapid growth of technology. The mobile share of e-Commerce retail sales reached \$ 1.4 trillion in 2017, which is 58.9 percent of the total. It is expected to hit \$ 3.5 trillion by 2021, which will account for 72.9 percent of all retail e-commerce revenue. Outstanding growth in the e-Commerce retail sector, widespread use of information technology, increase mobile internet connection, and increased investment will increase market share. The aim of this paper is to deepen the study of retail technology innovation and explore the direct effect of innovation in the areas of level of satisfaction, image storage and consumer value to stimulate corporate economic efficiency (Townsend, 2010). The objectives of this study are to :

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

1. To determine the relationship between store image on technological innovation.
2. To determine the relationship between satisfaction on technological innovation.
3. To determine the relationship between consumer value on technological innovation.

2 Literature Review

2.1 Store Image

Store image management is a key strategic tool to achieve competitive advantage (Delgado et al., 2014). According to Kumar et al., 2014, this concept gets a lot of attention from academics and the world today and is associated with consumer perceptions of the business world (Morschett et al., 2005). The study began in the 1950s, and the literature is very extensive. A large number of authors use Martineau's classic conceptualization concept (1956) as a basis for which he describes the picture or "the way the mind of the buyer envisions the store partly through the quality of its function and partly through its psychological attributes".

Therefore, the image of the store represent the identify or personality of a store because it is a mixture of values and expectations centred on customers' tangible and intangible elements associated with the business (Ailawadi and Keller, 2000; Hartman and Spiro, 2005). According to Shen, 2010, a number of variables or attributes have been recognized as contributors to image formation and, in particular, atmosphere, product display, service, pricing facilities and more. Based on (Beristain and Zorrilla, 2011; Delgado et al., 2014; Gil et al., 2017) as a result of this different approach, various attributes have been considered as part of the sales point image, although most studies retain accessibility-related attributes, space organization, comfort and convenience as key technology components to enhance their store image.

H1 : Store image have a positive effect on technological innovation in retailing.

2.2 Satisfaction

For retail managers, satisfaction is the key goal and a definition that is of great interest in market research (Coil et al., 2007). From a specific or cumulative approach (Boulding et al., 1993) and a cognitive or affective approach (Oliver, 1997), satisfaction has been defined in the literature. An approach shared by several writers is an analysis of satisfaction with a concrete encounter (Spreng et al., 1996; Giese and Cote, 2000). However, fulfillment refers to a collection of cumulative interactions in the retail sense (Jones and Suh, 2000; Sivadas and Baker-Prewitt, 2000). A decision on a pleasurable level of consumption-related fulfillment is happiness from a cognitive perspective (Oliver, 1997). Store satisfaction in this line refers to a subjective judgement that meets or exceeds expectations in the store (Helesen et al., 2010), and the principle of expectation dis-confirmation is most widely accepted in the literature. The affective viewpoint notes that a summary of emotional responses of varying severity is happiness (Giese and Cote, 2000). Therefore, we consider customer satisfaction with the technology to be a cumulative evaluation, affective and cognitive.

H2 : Satisfaction have a positive effect on technological innovation in retailing.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

2.3 Consumer Value

Values are also easily equated with satisfaction even though the contract is different. This is because value takes sacrifices in exchange into account, while satisfaction is not (Grace and O’Cass, 2005) and this is because value occurs at different stages of the purchase process, while satisfaction is post-purchase (Oliver,1997). Research on value has traditionally focused on technology and little on the retail context, focusing on a variety of perspectives, such as the value of in-store experience (Terblanche and Boshoff, 2004) the value of the shopping process (Mathwick et al., 2002) or the value of general shopping experience (Babin et al., 1994). A study by Sharma et al., 2012, presents empiric retail studies that traditionally focus on more beneficial aspects of the shopping process, but more recent literature shows that consumers have motivations that go beyond buying a product.

H3: Consumer value have a positive effect on technological innovation in retailing.

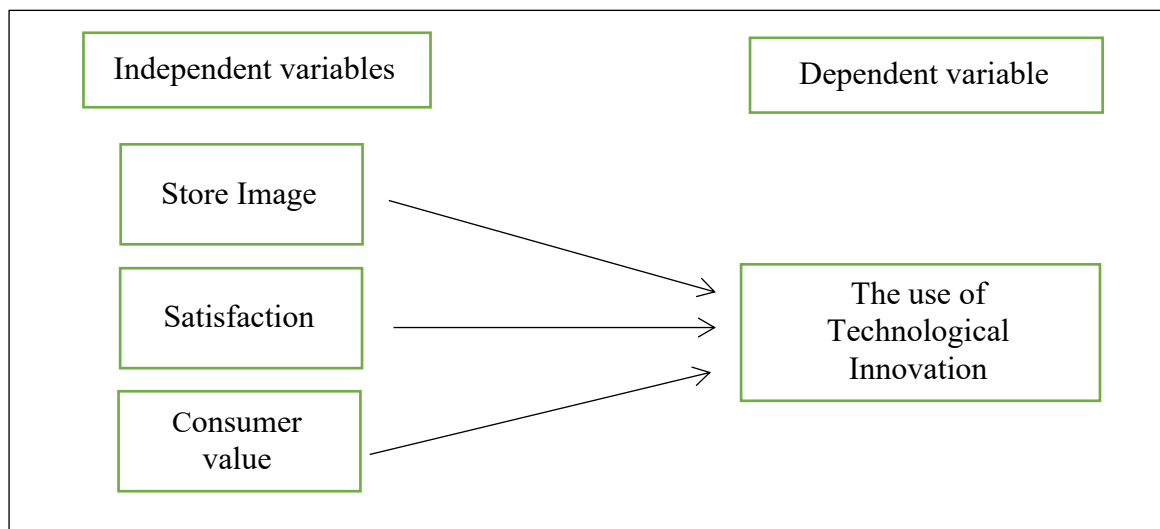

2.4 The Use Of Technological Innovation

Technological innovation provides opportunities for entrepreneurs to find new organizations and create a competitive position as a source of employee advantage. The impact of innovation may not be so obvious that it is too late for providers who use older knowledge to compete with new competitors. Thus, the underlying technology and technological innovations can have a profound effect on the dynamics and evolution of organizational population competition. Ecological research linking the technological cycle with population dynamics, albeit limited in scope, provide strong support for this assertion (Baum, 1996).

New technologies can increase efficiency, build on existing knowledge and strengthen the position of incumbents or destroy competencies, making existing knowledge obsolete and making it possible for newcomers to become superior competitors in terms of technology. Technology advances return to additional enhancements to dominant technologies. While the universality of this technological cycle is debated, it has proven to illuminate various industries.

2.5 Conceptual Framework

A theoretical framework has been developed and present in Figure 2.1. It used to examine the relationship among three variables such as:

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Figure 1 : Conceptual framework

3 Research Methodology

3.1 Research Design

Research design is an important element in methodology. This is "a study design to provide a specification of the procedure that must be followed by the researcher to achieve the objectives of the study or test the hypotheses formed for the study" (McDaniel & Gates, 1999). Study design can ensure that the evidence generated from the data can answer research questions confidently and convincingly (Lewis, 2015). The target respondents for this research are residents in Parit Buntar, Perak. Researchers use independent variables and dependent variables to construct questions. This study uses descriptive research analysis to identify the role of technological innovation on store image, satisfaction and consumer value in retailing among resident Parit Buntar, Perak.

3.2 Data Collection Method

Data collection is a process of collecting information from all the relevant sources to find answers to the research problem, test the hypothesis and evaluate the outcomes. Data collection methods can be divided into two categories that is primary data and secondary data.

3.3 Study Population

Population refers to the whole group of people, events or interesting things that the researcher wants to investigate (Kumar, Abdul Talib & Ramayah, 2013). The target population of this research is in Parit Buntar, Perak. But considering the cost and time limit, this study focuses on residents in Parit Buntar. The total population in Parit Buntar, Perak is 97,975 (Portal Rasmi Majlis Daerah Kerian, 2017). The reason for choosing this target population area is less time consuming to get more accurate results and achieve high data collection speed. The target population for the research is the customer from in Parit Buntar, Perak. The number of the of respondent that will be fill out the online questionnaire is 382 respondents (Krijcie & Morgan,1970).

3.4 Sample Size

The sample size is a subgroup of the population, by examining the sample, the researcher should be able to draw conclusions from the general to the interested population "(Sekaran & Bougie, 2013). Sample sizes were selected based on sample size calculations using Krejcie and Morgan sample size determination tables. They have simplified the process of determining the sample size for a limited population developed in 1970. It is the number of respondents chosen from population by researchers. The number of populations in Parit Buntar, Perak was 97,975. Due to the sample size of a known population of Krejcie and Morgan (1970), there will be 382 will be chosen as the respondents. Study will be used a convenience sampling.

3.5 Sampling Techniques

Sampling technique is the process of selecting a sufficient number of elements from the population. Sampling design for this study is a non-probability sampling. Non-probability sampling is a sampling technique in which the researcher decides in sample based on subjective judgment of the researchers rather than random selection. Convenience sampling is chosen in conducting the sampling method as it's allows researchers to identify respondent. It is also

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

referred to the researching subjects of the population that are easily accessible to the researcher (Etikan et al., 2016). Convenience sampling is affordable, easy and the subjects are readily available.

3.6 Research Instrument Development

The survey questionnaire was used as a measurement tool by the researchers to obtain data in this study. Questionnaires were used to ask respondents to give their opinions by answering the questionnaire. Questionnaires printed in bilingual. Nominal scales will be used for Sections A, B, C, D and E in the questionnaire for this study. This questionnaire was made with simple and standard words for respondents who easily understand the questions in the questionnaire. Moreover, this question is made based on the objectives and questions of this study. Questionnaire made as a closed question, which is a Likert type scale. Respondents can choose the answer that is closest to their point of view.

3.7 Measurement of The Variables

The questionnaire will be used as an instrument in this study. The measured scale used by the researcher is the Likert scale. A Likert scale will be used to measured targeted respondents responses based on the use of technological innovation on retailing store effect on consumers purchasing.

3.8 Procedure for Data Analysis

Once the information was collected from the respondents, the researcher began to collect and analyze the questionnaire. Respondents' feedback was converted to numerical values before entering the data in the spreadsheet. The Statistics Package for Social Sciences (SPSS) is selected and applied to collect and analyze the information collected. SPSS Statistics is a software package used for interactive statistical analysis, or batch. The statistical analysis for the study included the descriptive analysis, reliability analysis, Pearson correlation analysis and multiple analysis. Result of analysis came out and the discussion, conclusion also can be proceed.

3.8.1 Descriptive Analysis

Descriptive statistics help researchers to simplify large amounts of data in a sensible way. Each descriptive statistics reduces lots of data into a simple summary. For instance, consider a simple number used to summarize the use of technological innovation on retailing store effect on consumers purchasing based on store image, satisfaction and consumer value.

3.8.2 Reliability Analysis

Reliability analysis is a way of estimating the quality of the measurement procedure used to collect data in a research. Reliability is concerned with consistency or how far the questions used in a survey which is the same kind of information each time respondent has been asked. Reliability is concerned with consistency or how far to the questions used in survey which is the same kind of information each time respondent has been asked.

3.8.3 Pearson Correlation Analysis

Pearson correlation analysis is used when it believed there is a linear relationship in data. In this study, Pearson correlation analysis was used to determine the relationship between store image, satisfaction and consumer value.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

3.8.4 Multiple Regression Analysis

Multiple regression was computed to ascertain the best linear combination of store image, satisfaction and consumer value in the use of technological innovation on retailing store.

4 Research Finding

In this chapter shows that data questionnaires in SPSS.

4.1 Demographic

Table 1: Demographic respondent profile

Variables	Frequency	Percentage%
Gender		
Male	127	33.2
Female	255	66.8
Total	382	100
Age		
15-25	186	48.7
26-35	97	25.4
36-45	71	18.6
45 >	28	7.3
Total	382	100
Education		
STPM	51	13.4
Matriculation	22	5.8
Diploma	80	20.9
Degree	122	31.9
Others	107	28.0
Total	382	100
Occupation		
Student	159	41.6
Unemployed	33	8.6
Employee	155	40.6
Housewife	35	9.2
Total	382	100
Retail Store		
Food	153	40.1
Household goods	82	21.5
Electronic goods	77	20.2
Textile	70	18.3
TOTAL	382	100

Table 1 shows that respondent of demographic profile. First, based on the sample obtained by the questionnaire distribution, the total sample have been collected reached a total of 382. From the sample collected, the respondents were majority female respondent which has dominated a total of 255 in total, and the rest were male respondent. 66.8% of the respondents were female and only 33.2% were male. For age, the population of Parit Buntar in the age range of 15 to 25 years is the

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

majority in this study. Next, based on the data collected, the highest academic qualification which was Degree and Matriculation has recorded as the least number between STPM, Diploma, and others. After that, the highest occupation which was students and unemployed has recorded as the least number between employee and housewife. Last but not least, the highest retail store which was foods and textile has recorded as the least number between household goods and electronic goods.

4.2 Reliability

Table 2 : The Actual Result of Reliability

Variable	Cronbach's Alpha	N of item	Result
Dependent variable			
Technological Innovation	0.904	5	Excellent
Independent variable			
Store image	0.740	5	Good
Satisfaction	0.748	5	Good
Consumer value	0.906	5	Excellent

Table 2 showed the Cronbach's Alpha for technological innovation was 0.904 and it indicated as a "excellent" result because it closed to 1.0. Besides that, consumer value obtained a "excellent" result in the reliability test, which was 0.906 respectively. The Cronbach's Alpha for store image and satisfaction was 0.740 and 0.748 respectively, there was considered as "good" reliability. Generally, the items will be acceptable when the result of Cronbach's Alpha was more than 0.70. Based on this statement, all of the items in this research can be accepted and there was positively correlated with each other.

4.3 Pearson Correlation

Table 3 : The correlation between independent and dependent variables

		Technological innovation	Store image	satisfaction	Consumer value
Technological innovation	Pearson Correlation	1	.418**	.521**	.876**
	Sig. (2-tailed)		.000	.000	.000
	N	361	361	361	361
Store image	Pearson Correlation	.418**	1	.518**	.343**
	Sig. (2-tailed)	.000		.000	.000
	N	382	382	382	382
Satisfaction	Pearson Correlation	.521**	.518**	1	.494**
	Sig. (2-tailed)	.000	.000		.000
	N	361	361	361	361

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Consumer value	Pearson Correlation	.876**	.343**	.494**	1
	Sig. (2-tailed)	.000	.000	.000	
	N	361	361	361	361

** . Correlation is significant at the 0.01 level (2-tailed).

*p-value <0.05

Table 3 shows that there is a positive fair significant relationship between store image and technological innovation ($p < 0.05$, $r = 0.418$). Next, there is a positive good significant relationship between satisfaction and technological innovation ($p < 0.05$, $r = 0.521$) and there is a positive perfect significant relationship between consumer value and technological innovation ($p < 0.05$, $r = 0.876$).

4.4 Multiple Linear Regression Analysis

Table 4 : Table of Coefficients Analysis

		Coefficients ^a				
		Unstandardized Coefficients		Standardized Coefficients		
Model		B	Std. Error	Beta	t	Sig.
1	(Constant)	-.628	.203		-3.098	0.002
	Store image	0.181	0.049	0.107	3.715	0.000
	Satisfaction	0.109	0.050	0.068	2.177	0.030
	Consumer value	0.822	0.029	0.806	28.431	0.000

a. Dependent Variable: Technological innovation

Table 4 showed the table of coefficient analysis. There is a significant effect of store image toward technological innovation (< 0.05). In every unit increase of store image, technological innovation will increase by 0.18. Next, there is a significant effect of satisfaction toward technological innovation (< 0.05). In every unit increase of satisfaction, technological innovation will increase by 0.11. Last but not least, there is a significant effect of consumer value toward technological innovation (< 0.05). In every unit increase of consumer value, technological innovation will increase by 0.82.

5 Discussion

In this research, the researcher had managed to collect data using the research instrument (online questionnaire) and after analyzing the data using IBM SPSS Statistics version 23, the result for the tests was obtained.

The first objective of this study is to determine the relationship between store image and technological innovation among the residents of Parit Buntar, Perak. The strength of the correlation between store image to technological innovation is a moderate positive correlation. Based on Gil et al., 2017, found that various attributes have been considered as part of the selling

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

point picture, although most studies maintain attributes related to accessibilities, space organization, comfort and convenience as key technology components to enhance store image. This study has a positive effect on the store image

The second objective is to determine the satisfaction of the relationship between satisfaction and technological innovation among the people of Parit Buntar. The strength of the correlation between satisfaction with technological innovation is a simple positive correlation. Store satisfaction refers to subjective assessment that meets or exceeds store expectations (Helesen et al., 2010). Therefore, satisfaction with technology is considered a cumulative, effective and cognitive assessment. This study has a positive effect on satisfaction.

The last objective is to determine the relationship between consumer value and technological innovation among the people of Parit Buntar. The strength of the correlation between satisfaction with technological innovation is high positive correlation. Research on value has traditionally focused on technology with a focus on various perspectives, such as the value of in-store experience (Terblanche and Boshoff, 2004). This study has a positive impact on consumer value.

There is a significant effect of store image toward technological innovation (<0.05). In every unit increase of store image, technological innovation will increase by 0.18. Next, there is a significant effect of satisfaction toward technological innovation (<0.05). In every unit increase of satisfaction, technological innovation will increase by 0.11. Last but not least, there is a significant effect of consumer value toward technological innovation (<0.05). In every unit increase of consumer value, technological innovation will increase by 0.82.

5.6 Hypotheses Testing

Table 5 : Hypotheses testing

Hypotheses	Objective	Result
H1 : Store image have a positive impact on technological innovation in retailing.	the p-value for store image had indicated 0.000, which $p<0.01$, meaning that there is significant relationship between store image and technological innovation.	Accepted
H2 : Satisfaction have a positive impact on technological innovation in retailing.	the p-value for satisfaction had indicated 0.03, which $p<0.01$, meaning that there is significant relationship between satisfaction and technological innovation.	Accepted
H3 : Consumer value have a positive impact on technological innovation in retailing.	the p-value for consumer value had indicated 0.000, which $p<0.01$, meaning that there is significant relationship between consumer value and technological innovation.	Accepted

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Based on the table 5, it can be concluded that the store image, satisfaction and consumer value have a significant relationship between the use of technological innovation in retailing.

6 Recommendation

This study focuses on the use of technological innovation on retailing store effect on consumers purchasing toward resident Parit Buntar, Perak. Clear research should be out in the Parit Buntar, Perak area as it has been shown that there is no wide-range research done in Parit Buntar. Future studies in other universities and elsewhere can use the proposed model. For future studies, the number of respondents should be increased and distributed elsewhere not only in Parit Buntar but also in each district in Perak to get a clearer study on the factor of the use of technological innovation on retailing store effect on consumers purchasing. This study can also be useful for future researchers as they can utilize it as a source of perspective and rules in leading comparative research, as they can direct exploration of research the factors that successfully influence the use of technological innovation on retailing store effect on consumers purchasing.

7 Conclusion

In conclusion, the results of this study have contributed useful information on the use of technological innovation on retailing store effect on consumers purchasing and success factors to future researchers as a reference for their study. In addition, this study provides an understanding of the use of technological innovation in retail stores effect on consumers purchasing. Retail stores can improve a business to increase its effectiveness in the use of technology. This study involved the resident of Parit Buntar. A total of 382 respondents to complete this study. The results for correlation is that there is a positive fair significant relationship between store image and technological innovation ($p < 0.05$, $r = 0.418$). Next, there is a positive good significant relationship between satisfaction and technological innovation ($p < 0.05$, $r = 0.521$) and there is a positive perfect significant relationship between consumer value and technological innovation ($p < 0.05$, $r = 0.876$). Finally. This study is expected to obtain good feedback from relevant businesses in improving the use of technological in business. Although there are some limitations to this study, its is hoped that the first step taken in studying the use of technological innovation on retailing store effect on consumers purchasing is important for further justification.

8 Acknowledgement

The success and the final outcome of this assignment required a lot of guidance and assistance from people that I truly appreciated and are extremely privileged to have along the completion of this assignment. Everything I have done just because of the endless supervision, help and encouragement I will never forget during this semester. Here, I would like to thank the supervisor for the Retail Research Project, DR. NURUL IZYAN BINTI MAT DAUD for the guidance and help given to me. Although there are flawless and mistakes that I have made throughout the completion of this research study. Not forgetting also many thanks to the family who helped a lot to provide complete facilities to me while completing this project due to the pandemic problems that hit the country that caused me to stay at home to complete this final project. I would like also to thank the friends behind me for their encouragement in completing this project. Therefore, without them the process of completing a task would probably be quite challenging.

THE EFFECT OF PERCEIVED RISK TOWARDS ONLINE CONSUMER BUYING BEHAVIOR AMONG STUDENT IN UNIVERSITI MALAYSIA KELANTAN, CITY CAMPUS

Nurul Shafinaz Binti Sahul Hamid and Nur Ain Ayunni Binti Sabri

Faculty of Entrepreneurship and Business,
Universiti Malaysia Kelantan,
Malaysia

Email: shafinaz.a17a0595@siswa.umk.edu.my; ayunni.s@umk.edu.my

Abstract:

The purpose of this study to examine the relationship between perceived risk towards online consume buying behavior among student in UMK City Campus. The study covers the student from Universiti Malaysia Kelantan, City Campus and the target respondents is from the first year until fourth-year student of Faculty of Entrepreneurship. Three types of risk were examined in this study that is perceived financial risk, perceived product risk, and perceived non-delivery risk. The survey was conducted for data collection using online questionnaire distributed. Sample size of 341 respondents were gathered and the data was analysed using SPSS software. The demographic statistics, reliability test and correlation analysis was analysed. The findings indicated that perceived financial risk, perceived product risk and perceived non-delivery risk have a significant relationship with online consumer buying behaviour. The findings provide a useful context in explaining the barriers in online shopping.

Keywords: Perceived Risk, Risk Dimension, Online Consumer, Buying Behavior, Online Shopping

1 Introduction

Internet has become important tool to our daily life. The development of the technology has made more people connected to the internet. Start from searching information, sending emails, using social media and so on, everything will be using internet. Due to the development of the internet, it has strongly impact the worldwide marketing environment and internet has provided the companies with the ability to expand their business reach consumer through e-commerce (Alkailani and Kumar, 2011). These technologies offer consumer an additional channel for information, service and purchasing, as well as potentially increased the choice, more convenience among retailers and save cost. Due to the development of the technology, consumer is now more likely to buy things online instead of going to the offline store. Thus, the reason for shopping online has been cited for time efficiency, avoid the crowds, and available to shop for 24 hours. Moreover, through online shopping everyone can purchase product in faster way and have more alternatives to order various type of product or services with much cheaper price. Online shopping also has become a suitable way to make a purchase whether you are at home, office, or any places (R Bashir, I Mehboob, WK Bhatti, 2015). For developed countries every stores have its websites which they can buy from there. Despite of the online shopping, people going through the risk while buying online. Most of the consumer enjoy buying products online but they need to know whether the online platform can be trusted to shop. When consumers shop on internet,

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

they cannot touch, feel and watch for real of the products before they purchase the products (Li & Huang, 2009).

Previous research has noted that clearly understanding what motivates consumer. To shop online can inform the strategy, technology and marketing decision as well as web. Site design. Despite the significant growth and optimistic future growth of online shopping, the negative aspects were also becoming frequently associated with this alternatives shopping method. Online shopping had greater risk that consumer need to take responsibility such as product risk, financial risk and non-delivery risk. Stated that in online environment, in contrast to a physical one, greater risk and less trust is expected due to the fact that there is major difficulty in evaluating a product or services as there is no visual or tangible indications about the quality of the product no face-to-face interaction with the staff and the purchased is affected by security and privacy issues (Laroche, et al.,2005). Hence, it assumed that people may feel a certain degree of risk when purchasing a product through online shop. This portrays that consumers have low and no confidence towards online shopping. Thus, the consumer perceived risk when shopping in online stores, when compared to shopping at the bricks and mortar store (Hong, Nawi, and Zulkifli, 2019).

Therefore, the aim of this study is to investigate the effect of financial risk towards online consumer buying behaviour. To investigate the effect of product risk towards online consumer buying behaviour. Lastly, to investigate the effect of non-delivery risk towards online consumer buying behaviour.

2 Literature Review

Online consumer buying behavior: Online purchasing of goods or services through e-commerce platforms referred as online consumer buying behavior. A study conduct stated that people who shop online were less technically at risk compared to those who shop at the offline store (Wai, Dastane, Johari and Ismail, 2019). Online shopping involves consumer to search, select and purchase the goods and services to meet his needs and wants. For the matter of fact, consumers experiencing high risk when they shopping through the online shop compared to traditional brick and mortar store.

Perceived risk: when facing a buying situation, consumer perceives a certain degree of risk that involved choice of particular brand and how to purchase it. Stated that perceived risk is a fundamental concept in consumer behaviour that implies the consumer experience pre-purchase uncertainty and the degree of expected loss resulting from the purchase and the use of a product (Naiyi *et al.*, 2004). The idea of perceived risk has been captured through the use of various scales by measuring the perception of dangerous that occur (Masoud *et al.*, 2013). Perceived risk also is a measurement of unanticipated disaffection and disappointment purchased decision that based on the purchased target, hence it is a strong pointer of consumer behaviour because consumer likely to lessen the possible failures rather than seek for the purchase accomplishment (Wai, Dastane, Johari and Ismail, 2019). According to Ariff *et al.*, (2014), perceived risk is the possibility of loss in achieving a favourable outcome while consumers doing online shopping, indicating individuals feeling of uncertainty with the possibility of negative outcome in their online purchasing. Generally, there are many type of perceived risk that have been experiencing by consumers in online shopping.

Financial risk: Consumer might be worried regarding online safety and security in the use of their credit or debit card and the disclosure of the consumer personal information. Abrar, Naveed, & Ramay, (2017) stated that the probability of suffering monetary loss as a result of purchasing a

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

product or services is termed as a financial risk. Financial risk also defined as potential net loss of money and will include the consumer sense of insecurity regarding online credit card or debit card usage, which has evidenced as a major obstacle in online purchasing (Masoud *et al.*, 2013). Financial risk is the perception that a certain amount of money may be lost or required to make the product work properly. Financial risk also referred to the probability of not getting the lowest possible price for the selected product from a particular online shop. According to Wai, Dastane, Johari and Ismail, (2019) financial risk often occurs in the first phase of online shopping; right after the customer make an online order.

H1: Financial risk has a positive significant effect on online consumer buying behaviour

Product risk: Product risk relates to the performance or the quality of goods and services that consumer choose through online shopping. According to Abrar, Naveed, & Ramay, (2017) stated that product risk as likelihood is a chosen product that will fail to meet the formerly anticipated requirements. Product risk is a generally about a purchased product that may fail to function as it is originally expected (Ariff *et al.*, 2014). The loss that incurred when a brand or product does not perform as expected, is largely due to the shopper's inability to accurately evaluate the quality of the product online. The product problem is more towards goods that do not have the after-sales service. Wai, Dastane, Johari and Ismail (2019) indicates that there is a product or performance risk in the online environment or concerns that products are not functioning properly and performing poorly is increasing between online shop. According to Forsythe & Shi, (2003) the incapability of touching, feeling, testing or trying the products before they purchased are the primary concerns when purchasing online, and those concerns will increase the product risk perceived by consumer.

H2: Product risk has a positive significant effect towards online consumer buying behavior

Non-delivery risk: the probability of not getting the product after completing the online transaction and making payment to the online store describe as the non-delivery risk. According to Abrar, Naveed, & Ramay, (2017), they stated that consumers quite often find uncertainty while dealing with new online merchants while making the payments due to the risk that vendors will not deliver the product to them. A variety of factors may impact whether the goods by the consumer, for example like improper deal with the goods while in the process of the delivery (Wai, Dastane, Johari and Ismail 2019). According to Naiyi *et al.*, (2004) consumers are concerns with the delivery process, for example the product may get damaged during transportation, delivered to the wrong address or in some cases, delayed. The consumers fear about the delivery will be delayed due to a various circumstance, such as the delivery company would not deliver the product within the time framed agreed with consumer (Ariff *et al.*, 2014). Hence when consumer decide to purchase the product online, they will be facing the non-delivery risk.

H3: Non-delivery risk has a positive significant effect towards online consumer buying behavior

3 Research Methodology

3.1 Sampling and Data Collection

The data collection method that being used is online questionnaire. This study targeted on student UMK, City Campus that use online platform to buy product online. Next, a simple random sampling is selected in determining the data of UMK student from the sample size 341 student. The study is designed to collect data from 200 valid samples based on minimum sampling theory (Sekaran, 2016).

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

3.2 Research Construct

This study use research construct as abstracts ideas in measuring survey questions. This questionnaire was adopted and combined by investigating the past research and the expert's suggestion. The research construct below consists of 5 items independent variable (perceived financial risk, perceived product risk, perceived non-delivery risk) and dependent variable (online consumer buying behavior), and several items that selected from past research.

Table 3.1: Adoption of question details

Variables	Question Item	Source
Dependent Variables: Online Consumer Buying Behavior	5	1. Wai, K., Dastane, O., Johari, Z., & Ismail, N. B. (2019). 2. Javadi, M. H. M., Dolatabadi, H. R., Nourbakhsh, M., Poursaedi, A., & Asadollahi, A. R. (2012).
Independent Variable: Perceived Financial Risk	5	1. Forsythe, S., Liu, C., Shannon, D., & Gardner, L. C. (2006). 2. Naiyi, Y. E. (2004).
Independent variables: Perceived Product Risk	5	Forsythe, S., Liu, C., Shannon, D., & Gardner, L. C. (2006).
Independent variables: Perceived Non- Delivery risk	5	Wai, K., Dastane, O., Johari, Z., & Ismail, N. B. (2019).

3.3 Data Analysis Method

The data that have been collected in the study will be analysed using the computer software which is Statistical Programme for Social Science (SPSS) version 26.0. Furthermore, descriptive analysis, reliability analysis and Spearman Correlation Coefficient has been conducted in this study. For reliability analysis, Cronbach's Alpha for variables is acceptable since it ranges from 0.6 to 0.8. This is also supported by Cronbach (2016) when Cronbach's Alpha is higher, meaning that the internal consistency of the item from the scale also high. For Spearman Correlation all of the variables is significantly affected. The significant value for. Independent and dependent variable is below 0.01 (p-value<0.01).

4 Analysis and Discussion.

4.1 Sample Characteristics

This section is discussed on the sample characteristics of 341 respondents who is using online platform to purchased product online and their buying behaviour among UMK student. Apart from that, this section presents the findings on the gender, age, year, course, online platform used, and how often buying online.

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

Table 4.1: Sample Characteristics

Sample Characteristics	Frequency (341)	Percentages (%)
Gender		
Male	139	40.8
Female	202	59.2
Age		
19 – 21	139	40.8
22 – 24	168	49.3
25 - 27	34	10.0
Year		
1	87	25.5
2	80	23.5
3	82	24.0
4	92	27.0
Course		
SAB	77	22.6
SAE	48	14.1
SAK	74	21.7
SAL	64	18.8
SAR	78	22.9
Online Platform Used		
Facebook	86	25.2
Instagram	102	29.6
Shopee	123	36.0
Lazada	20	5.9
Mudah.my	5	1.5
Taobao	2	0.6
WhatsApp	2	0.6
Sociolla	1	0.3
Zalora	1	0.3
How often buying online		
1-2 times	147	43.1
3-4 times	161	47.2
5-6 times	33	9.7

4.2 Reliability Analysis

Table 4.2 shows the indicates result of reliability analysis in the independent variable (perceived financial risk, perceived product risk, perceived non-delivery risk) and for dependent variable (online consumer buying behaviour) for this study. The result of the Cronbach's Alpha for perceived financial risk 0.750, followed by product risk the Cronbach's Alpha value is 0.730 and both variable indicate as acceptable for this study. For non-delivery risk the Cronbach's Alpha value is 0.883 which indicate as good result. For dependent variable that is online consumer buying behaviour the result of Cronbach's Alpha is 0.669 that indicate as questionable. Online consumer buying behaviour has a questionable result due to the low consistency between independent variable and dependent variable. Hence, it shows that all of these variable is acceptable and reliable to be test in this research.

**3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND
BUSINESS COLLOQUIUM 2020/2021**

Table 4.2: Reliability Analysis

Variables	Number of item	Cronbach's Alpha Coefficient	Internal Consistency
Perceived Financial Risk	5	0.750	Acceptable
Perceived Product Risk	5	0.730	Acceptable
Perceived Non- Delivery Risk	5	0.883	Good
Online Consumer Buying Behaviour	5	0.669	Questionable

4.3 Spearman Correlation Coefficient

Table 4.3: Correlation Analysis

Variable		Financial risk	Product risk	Non-delivery risk	Online buying behaviour
Financial risk	Correlation Coefficient	1.000	0.440**	0.764**	0.513**
	Sig. (2-tailed)	.	.000	.000	.000
Product risk	Correlation Coefficient	0.440**	1.000	0.344**	0.571**
	Sig. (2-tailed)	.000	.	.000	.000
Non-delivery risk	Correlation Coefficient	0.764**	0.344**	1.000	0.430**
	Sig. (2-tailed)	.000	.000	.	.000
Online buying behavior	Correlation Coefficient	0.513**	0.571**	0.430**	1.000
	Sig. (2-tailed)	.000	.000	.000	.

According to table 4.3 shows the correlation analysis based on Spearman Correlation (r), in which shows the degree of association among independent and dependent variable. Based on the result below, the correlation coefficient (r) of each variable is $r = 0.513$ for financial risk, meanwhile for product risk is $r = 0.571$. For non-delivery risk the correlation coefficient $r = 0.430$ and all the variables show a strong relationship between independent variable and dependent variable. On top of that, the significant value for all variables is less than 0.01 ($p\text{-value} < 0.01$). Hence, the affiliation among the three variables and online consumer buying behaviour is significant between independent variable and dependent variable.

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

Table 4.4 Interpretation Table of Spearman Rank Order Correlation Coefficients

Spearman (p)	Correlation
≥ 0.70	Very strong relationship
0.40-0.69	Strong relationship
0.30-0.29	Moderate relationship
0.20-0.29	Weak relationship
0.01-0.19	No or negligible relationship

The result above shows that all the independent variables is significantly affect towards independent variables. Thus, financial perceived risk such as fear of. Losing only and. The probability of disclosing debit or credit card information has positive effect towards online consumer buying behavior, this finding is compatible with the findings of (Forsythe & Shi, 2003)⁶⁸, in these studies, financial risk is important factor for not shopping online. Next for. The study results of product perceived risk are the difficulty of quality judgement of product, touching and examining the actual product over online shop are consistent with the findings from previous studies that stated perceived product risk is important significant factor for not shopping online (Forsythe & Shi, 2003)⁶⁹. It indicates that the perceived of non-delivery risk is significantly affect towards online consumer buying behavior. Consumer do not shop online because they are not sure whether the ordered merchandise will be delivered or not but the lack of efforts in deliver the product will reduce the trust in online seller.

5 Recommendation and Conclusion

This study intended to measure the impact on three of the perceived risk that is perceived financial risk, perceived product risk, and perceived non-delivery risk towards online consumer buying behaviour among UMK, City Campus students. It can be concluded that the objectives of this study have been achieved by testing the effect of perceived towards online buying behaviour. This research confirming that all the variables has a positive significant with online consumer buying behaviour. On the other hand, the outcome of this study recommended that online seller should organise a better online shopping platform. A better online shopping should enhance a good and better platform in order to have the consumer to shop well. Besides that, by having better online shopping platform, the seller can improve the service for their customer and have more information about their consumer needs and wants as they know they can improve their online shop.

Besides that, for product risk, the risk can be reducing by displaying a clear information. In order to make sure that consumer have more trust to buy the product. Financial risk is what consumer would want to avoid because they know, their financial information must be secure by the online seller. Hence, online seller should be alert in every transaction that happen in online platform in order to reduce the effect after buying. Lastly, for delivery service should be taking care as the delivery is important. Therefore, the status of the delivery should be update all the time to make sure that consumer will keep up to date. In addition, the delivery option also should be increase to make it easy for the consumer to shop online and have their product delivered safely.

Online shopping likely to have greater risk that can effect online consumer buying behaviour. It

⁶⁸ Forsythe, S. M., & Shi, B. (2003). Consumer patronage and risk perceptions in Internet shopping. *Journal of Business research*, 56(11), 867-875.

⁶⁹ Ibid

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

is important for the online shopper to understand the characteristics and behaviours of the new market and meet what consumer needs. Online seller should determine the risk perceived by their consumer in order build their marketing strategy in understanding the consumer. This research is highlighted the common scenario that happen in community who love to buy things online. The consumer is perceiving risk while buying online, such as perceived financial risk, perceived product risk, and perceived non-delivery risk. In Malaysia, online shopping context, it was confirmed that the negative effect of perceived risk influences the attitude of online shopping. Therefore, further investigation is necessary to provide empirical justification, thus allowing a better understanding of the reason of these differences. In addition, this study shows that the need to attempt for future studies, to consider the influences of individual characteristics of the respondents such as gender and experience on the composition of perceived risk dimension and analyse their different influences on online consumer buying behavior.

6 Acknowledgement

First and foremost, I would like to express my appreciation to everyone who have been helping me since the first day I started my final year research project. I would like to express the most gratitude to my supervisor, my family, my friends and to all respondents for supporting me.

I am very thankful to Dr Nur Ain Ayunni Binti Sabri who provide me all the information, guiding me, give me an advice in the process of writing this research. She has been motivating me and encouraging me in finishing my final year research project.

I also would like to express my indebtedness and appreciation to my respondents that willing to participate in the survey despite of their busy schedule of classes. Lastly, thank you to my family and friends that have been supporting me from far. This final year research project would not complete without them.

FACTOR INFLUENCE CONSUMER'S PURCHASING BEHAVIOR DURING PANDEMIC COVID 19

Nurul Syuhaidah Binti Rozlan and Tahirah Binti Abdullah

Faculty Of Entrepreneurship And Business,
Universiti Malaysia Kelantan
Malaysia

Email: syuhaidah.a17a0604@siswa.umk.edu.my; tahirah@umk.edu.my

Abstract:

The aim of the study was to investigate the factors influencing consumers purchasing behavior among student Universiti Malaysia Kelantan during the coronavirus disease (COVID-19) pandemic. The study measured the influence of product factor, price factor, and psychological factor on consumers' purchasing behavior during the coronavirus disease (COVID-19) pandemic. The research collected data by online survey method through a structured questionnaire with five-point Likert scales from 346 students. Results exhibited that price factor, product factor had a relationship and positive association with consumers' purchasing behavior during pandemic Covid-19.

Keyword: *influence factor, consumer purchasing behaviour, Covid-19, online shopping*

1 Introduction

Consumer purchasing behaviour defined as the processes they use to select, secure, use, and dispose of products, services, experiences, or ideas to satisfy needs and the impacts that these processes have on the consumer and society. Word "they" refer to individuals, groups, and organizations. Consumer purchasing behavior refers to the actions taken online and offline which is a physical store by consumers before buying a product or service. This process may include consulting search engines, engaging with social media posts, or a variety of other actions. For example in the United Kingdom (UK), most people in the UK use the internet every day and spend six hours online. First factor that influences consumer purchasing behaviour in the UK consumer is the price and price as a key deciding factor for 59% of British shoppers. So it is not surprising price comparison is widespread (Evans, 2019). The second is most UK consumers are loyal shoppers and this can be through social media advertising, personalized services, or unique in-store experiences. 65% of UK shoppers identify themselves as loyal shoppers who prefer to shop with retailers and sellers they are already familiar with and have experience with it (Baumber, 2018).

Third is most UK consumers support their local product. UK consumers respond well to advertising campaigns, especially on social media. So, 40% of those who have interacted with a brand online prefer to spend more on online platform (Evans, 2019). (Baumber, 2018) 29% of the consumer like a fast and reliable delivery is a main reason their shopping at the same store. Customers also prefer free any of charge delivery from sellers, 80% of all online purchases received free deliveries and expect some form of parcel tracking after making their orders. Another top reason UK shoppers buy from the same stores is a free product return policy (Baumber, 2018).

The objective of the study is to identify the factors that influence consumer purchasing behavior during the pandemic. In 2020, the world has rapidly changed in terms of economics, society, and

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

politics because of the spread of a dangerous disease that began in Wuhan, China which is Coronavirus or known as a COVID-19. The obvious thing that changes during a pandemic is in a business firm. Most countries such as China, Brazil, Spain, and Italy had implemented the lockdown procedures to stop the transmission of COVID-19 from spreading. Malaysia also has duplicated these procedures. The occurrence of this pandemic has a profound effect on both the positive and negative to the retailing industry, especially small shops. Thus, it has changed the way retailers conduct business operations by complying with the standards operating procedure (SOP) provided by the government. For example, SOP is limiting the operating hours, compliance with social imprisonment, wearing a face mask, taking and recording body temperature, online transactions, use of hand sanitizer, and limit of customer quantities in a premise.

COVID-19 rapidly changed customer behavior, this is because during the pandemic most consumers are required to stay at their home working from home if necessary, avoiding using public transport and practice of social distancing from friends and community. So their purchasing behavior also changes by focus on online shopping. During the pandemic, they will spend less and buy what they need. In response to this rapidly evolving public health crisis, consumers are changing how they live and work and what and how they buy. They have reason to believe some of these fundamental shifts will have long-lasting effects on consumer purchasing behavior.

2 Literature Review

Model of Buyer Behaviour

According the theory of buyer behavior represents an approach to predict and analyze the method that consumers usually use in making their purchase decisions. In many cases, a consumer will use a generic decision making model. The first step generally represents them conducting research on varied products and prices. In most cases the process is prompted by replacing a product the consumer already owns that has become outdated or not function (Ramya & Ali, 2016).

According to this model, stimuli in the form of both the external environment and the elements of the marketing mix enter the buyer's 'black box', after that it interacts with the buyers characteristics and decision processes to produce a series of outputs in the form of purchase decisions. The task faced by the marketing planner involves understanding how the black box operates, for which two principal components of the box must be considered firstly the factors that the individual brings to the buying situation and secondly the decision processes that are used.

Consumer Buying Behaviour

In the marketing context, it is quite difficult to make a purchase decision as a result of so many available options. Consumer behavior defined as study of people needs, wants, motivations, and thought processes used in choosing one product over another that can fulfil their satisfaction. Other than that, to study the patterns of purchasing different goods and services (Auf, Meddour, Saoula, & Majid, 2018). Online stores ensure consumers get a benefit by conveniently providing different types of products and services. Through e-payment, the transaction was easier than other time which is consumer can pay anywhere and anytime and it is benefit of e-commerce. (Neger & Uddin, 2020). Shopping online is include social media platform such as Twitter, Facebook, Instagram and e-commerce platform such as Lazada and Shopee are the key sources that fanned the rush among people to stockpile basic household goods.

Thus, since the penetration of technology and business trends has changed to online the behavior is important to study. In the era of information technology, the internet has given an open new window and advantage for the peopel to use internet technology to buy and sell online products

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

where physical involvement is not necessary. The online shopping business is not something secret of sale products therefore it is essential to analysis consumers behaviors towards products shopping and payment online because there is not physical interaction between them (Ahmad, 2018). A consumer engages in purchasing activities several times per day. The purchase itself is the only visible evidence of a more complex process that a consumer goes through for every decision he or she makes. However, every purchase decision is different and requires different amount of time and effort (Lautiainen, 2015).

Price is defined as an activity to decide the amount payment consumer to pay for something which is a product and service offered for sale (Oxford Manpower Dictionary 2002). Pricing is the process of determining and applying prices to goods and services (Al-Salamin & Al-Hassan, 2016). Product, place, price, and promotion is a element in Ps of marketing and it is perhaps the most important because it can helps companies generate revenue especially retailing sector . Prices are determined by the balance of supply and demand and set with a certain degree of confidence that consumers will pay for the product and service (Al-Salamin & Al-Hassan, 2016). Pricing is the only clear factor that produces money and provides an obvious signal of success or failure of products and services.

Anything that offers to market to get some attention or consumption including physical objects, services, organizations, and desires (Andreti et al., 2013). Good quality of the product know as a defect, damage, and fault free product that can be identified by eight key dimensions. For example product performance, product features, confirmation of product, the durability of products, serviceability, reliability of the product, and perception of quality (Neger & Uddin, 2020). The product can be describe as a pack of benefit of advantages that a marketer presents to the customer for a price. The product can also include the shape of a service like train travel and communication. Thus, the product is the one of main element of the marketing mix that give impact to consumer. (Thabit & Raewf, 2018).

According to Maslow's hierarchy of needs, purchase decision including motivation perception, learning, beliefs and attitudes. Friend and family often influence other people in term of consumers' purchase decisions. The marketer needs to know and analyze which people are involved in the buying decision or target market. Marketer also need know what role each person plays, so that marketing strategies can also be aimed and target at these people. Psychological factors can be divided into 4 categories which is motivation, perception, learning as well as beliefs and attitudes.

Motivation is the strength of internal energy that directs and influences a person's activities to achieve and fulfill customer needs, wants, and goals. According to Maslow articulating the hierarchy of needs has five levels of essential needs. First is that Basic needs come at the bottom of the hierarchy which is a physiological need, while at the top of the hierarchy is the need for self-actualization. Even so, this need does not have to be fully achieved. (Auf et al., 2018).

Perception describes as a producer which an individual need to selects, manage, organize, and interprets the world around you through the information which been received in order to do something that makes sense. How individuals act at certain period of given time is decided by the perception of a situation, selecting, managing, organizing and interpreting the information in a way to construct a meaningful experience. Individuals also tend to interpret with information which they already understand or familiar with. People experience, selective attention, and selective distortion know as a three different important of perceptual process. (Al Shishani, 2020). In case of selective attention, marketers have to provide the good marketing if want to attract customer intention. While, in case of selective distortion, customers try to interpret the

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

information obtained to support what the customer already believes. Similarly, in the event of selective selection, marketers strive to keep the information that can supports customer trust. (Gajjar, 2013).

Learning can be defined as changes in individual behavior from previous experience. In every situation, perception is a change according to previous experience of purchasing, because this is one of our preparations or expectations and the framework in which we attempt to place and organize new stimuli. In other words, need to learn from past experience and try to maintain balance or consistency by relating and interpreting new stimuli in terms of past or learned stimuli (Durmaz, 2014). Learning always goes through actions, when we take actions, we learn. Learning implies a change in the behaviors resulting from a certain experience. Learning reshapes the behaviors of individuals by acquiring the information and living the experience (Al Shishani, 2020).

H1: There is a relationship between price and consumer purchasing behavior.

H2: There is a relationship between quality of product and consumer purchasing behavior.

H3: There is a relationship between psychological and consumer purchasing behavior.

3 Research Methodology

This research used questionnaire methods to collect the information by distributing the data process to the respondent. The questionnaire was focused on factors that influence consumer purchasing behaviour during pandemic. Information was collected by a distributed questionnaire to the student Universiti Malaysia Kelantan (UMK). Statistical procedures are a method of analysing or representing statistical data, a procedure for calculating a statistic by using SPSS, originally named the Statistical Package for the Social Sciences. A sample is then a representative subset of the target population. A total of 346 respondents will be participating in this research investigating with 346 questionnaires given to the student. The sample will be distributed to the student with different programs out of the total of population size of the study.

This study involved 346 consumers from Universiti Malaysia Kelantan. A total of 108 (31.2%) of them are men and the rest of the 234 (68.8%) are women. The majority of the respondents are Malays where the total respondents were 284 (82.1%), followed by other which is Bumiputera Sarawak 3 (0.9%) respondents, 36 (10.4%) Chinese respondents and 23 (6.6%) Indian respondents. Students with aged between 21 – 23 years old are the most number of respondents involved in online purchasing which is 261 (75.4%) respondents, followed by students aged between 24-26 years old (n=58, 16.8%) and only a small number (n=27, 7.8%) who were actively engaged in online purchasing. 125 (45.4%) of the respondents involved in online purchasing was students from year 4 (the highest), followed by students from year 3 125 (36.1) students year 2 (13.6) respectively had 47 respondents and student year 1 (the lowest) of the respondent involved in online purchasing behavior which 17 (4.9%). Based on the data, most of the students courses Bachelor of Entrepreneurship (Commerce) with Honour (SAK) (n=91, 26.3%) were involved actively in online purchasing during MCO, followed by students from Bachelor of Entrepreneurship (Retailing) with Honour (SAR) (n=89, 25.7%), students from Bachelor of Entrepreneurship (Islamic banking and finance) with Honour (SAB) was (n=82 23.7%), students from Bachelor of Entrepreneurship (Logistic and Distribution Trade) with Honour (SAL) (n=71, 20.5%) and last is student from courses Bachelor of Entrepreneurship with Honour (SAE) (n=13,3.8%). During the pandemic Covid-19, product category that students purchasing from online platform is was the higher is food and beverage (n=141, 40.8), followed by clothing and shoes (n=129, 37.3%), Cosmetic was (n=37, 10.7%), Stationery/Book (n=19, 5.5%),

Electronics/software (n=17, 4.9) and last is Skincare (n=2, 0.6%)

Table 2

Coefficients^a							
Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.	Impact
		B	Std. Error	Beta			
1	(Constant)	1.261	.232		5.440	.000	
	IV1	.276	.053	.291	5.257	.000	Accepted
	IV2	.350	.057	.348	6.142	.000	Accepted
	IV3	.088	.054	.097	1.628	.105	Rejected

Coefficients

As illustrated in Table 2, the results show that two out of three factors are significantly related to consumers' purchasing behaviour during pandemic Covid-19. In contrast, the rest of the one factors have no significant relationship with consumers' purchasing behaviour during pandemic COVID-19. Price factor ($\beta_1 = 0.276$, $t = 5.440$), quality of product factor ($\beta_3 = 0.350$, $t = 6.142$), psychological factor ($\beta_7 = 0.088$, $t = 1.628$) significantly related to consumers' purchasing behaviour during pandemic Covid-19 pandemic at $p < 0.05$. Therefore, the hypotheses H1 and H2 are accepted. Conversely, H3 are rejected as psychological factor have no significant connection with factor influence consumers' purchasing behaviour during pandemic Covid-19.

Table 3: Descriptive analysis

Variable	mean(SD)	Behavior	Price	Quality of Product	Psychological
Behavior	4.5464	1	0.524	0.554	0.470
Price	4.5854	0.524	1	0.510	0.571
Quality of Product	4.6069	0.554	0.510	1	0.596
Psychological	4.5909	0.470	0.571	0.596	1

H1: There is a positive relation between price and consumer purchasing behavior during a pandemic crisis.

The relationship between price and consumer purchasing behavior during pandemic Covid-19 was investigated using Pearson correlation coefficients. As indicated in Table 2, the strong relationship was found to exist between price and factor influence consumer purchasing behavior ($r = 0.492$, P-value = 0.000). Since the average score is $p < 0.01$, hypothesis 1 is accepted.

H2: There is a positive relationship between quality of product and consumer purchasing behavior during a pandemic crisis.

The relationship between attitude toward quality of product and consumer purchasing behavior during pandemic Covid-19 was investigated using Pearson correlation coefficients. As depicted in Table 2, the strongest linear relationship was found to exist between quality of product and

3rd MULTIDISCIPLINARY RESEARCH ON THE ENTREPRENEURSHIP AND BUSINESS COLLOQUIUM 2020/2021

consumer purchasing behavior ($r = 0.554$, $P\text{-value} = 0.000$). The positive correlation coefficient of 0.73 indicates that as the score for quality of product and consumer purchasing behavior. Therefore, it showed that quality of product are highly and significantly correlated with consumer purchasing behavior. Since the average score is $p < 0.01$, hypothesis 2 is accepted.

H3: There is no positive relationship between psychological factor and consumer purchasing behavior during a pandemic crisis.

The relationship between attitude toward psychological factor and consumer purchasing behavior during pandemic crisis was investigated using Pearson correlation coefficients. From the results, the weakest relationship was found to exist between psychological factor and consumer purchasing behavior during pandemic ($r = .470$, $P\text{-value} = 0.105$). Since the average score is $p < 0.01$, hypothesis 3 is rejected.

5 Conclusion and limitation

Consumer buying behavior is the study on the customer traits and how the customer behaves while purchasing and selections process to fulfil his needs or wants and what motivates the consumer to buy a certain product. The conclusion, this research specifies two independent variables which is price and quality of product having significant influence toward consumer purchasing behavior during pandemic Covid-19. However, the other one independent variables, psychological factor have no positive significance with the consumer purchasing behavior. Eventually, this study could be helpful to several parties, especially the future researchers and marketers. Limitation in this study is testing only the significant relationship between the factors and it is not focused on any particular group of consumer. The study has some limitations within the need to be interpreted carefully.

This study focused only on university Malaysia Kelantan, so results derived from this study may not be generalized for other university. This finding is clearly indicated that university Malaysia Kelantan student has positive purchasing behavior toward online shopping. However influencing factors has significant impact on student's online shopping behaviors. This study only focus and carried out measure in university Malaysia Kelantan Malaysia respondents. It signifies that the results may only applicable in the small sample size. Carrying out and figure this study in other university may generate and develop different results. Students in other university may also have different factor influence toward consumer purchasing behavior during pandemic Covid-19. Therefore, this study should be develop or expanded to different university and include measurement across different of students behavior.

Abstract:

Leadership is an important roles in contributing to better organizational outcomes efficient support from leaders will motivate the employees to increase the level of quality in performing the duties and also will increase full focus in the workplace. Servant leadership as a leader to serve the employees and improve employees' performances. The main objectives of the study is to understand the importance, characteristics, and challenges for leaders of servant leadership. The main focus of the study is directed at the educational organizations in Kelantan. A qualitative approach is used to interview informants at school environment during Covid-19 Pandemic. The big challenges for administrator to the staff and students from home. An important finding in this paper is many school principals are not ready to face this condition so that the leaders as a servant leader take the responsibilities to manage the employees work from home and in the organization. The leaders have to face the challenges during pandemic to lead the organization with procedures and SOPs. This paper concludes that servant leadership are really needed created by the leaders who can considered will take the responsibility in managing the employees in the organization.

Keywords: leadership, servant leadership, Covid-19 pandemic, organization, employees performances

1 Introduction

Leadership is considered important in contributing to better organizational outcomes. In other words, efficient support from a leader will motivate employees to increase the level of quality in performing the duties and will increase full focus in the workplace. In the process of leadership that influences the efforts of what needs and wants of employees and will be facilitated and collective pursue their objectives (Yukl, 2010). However, as a leader should be more responsible to help and guide all employees to achieve goals and ensure that goals are in line with the goals of the organization.⁷⁰ The good leadership must focus on the specific behaviors of their employees' needs to ensure the employees achieve job-related tasks. On the other hand, the leadership behaviors will also have a positive relationship with the supportive performances. Servant leadership is one of most popular types of leadership today. Moreover, servant leadership is a conceptual leadership that leader that serves as a leader to serve the employees to improve employees' performances⁷¹. There are employees to ensure that employees will improve the performances. The leader will treat the employee as servant and do not know how to handle it. It

is different from people who act like leader. The leaders must be able to change to be more successful in attitude and charisma. The different between servant leadership and other type of leadership is in the servant leadership because the leaders act like a servant who cares about other people and the priority of the action to serve others (Andre & Donald, 2015). Nowadays, Covid-19 is a global health crisis under economic threat. Among the specific leader-subordinate activities that are important to consider in to Covid-19 Pandemic and how the performances system will work⁷². For example, without being able to directly supervise subordinates in the setting of the office it is possible that there is a change in the results of the focused assessment. In addition, the effect of the COVID-19 Pandemic on various work practices and arrangements, some of the social and economic costs of the pandemic for individuals will include those who lose the jobs as well as those who remain employed (Gelfand, 2019).

During Covid-19 pandemic, every division and operation required work from home for all employees, employers, wherever possible. On the one hand, the effect of organizational and economic organization is a negative way to find other alternative ways to conduct operations as usual (Petriglieri et al, 2019). In the positive way that work from home change many people to stay productive and work life balance. The situation will work stress and provide the creation of an organizational that will improve the employee performances. In addition, the servant leadership in the organization can be knows the responsibilities in providing a safe place for their thoughts, opinions, or even concern and will be taken seriously.
