PREFACE

In the dynamic landscape of today's global economy, the fields of tourism, hospitality, and wellness are experiencing unprecedented growth and evolution. This compendium represents a convergence of innovation and academic rigor, providing a platform for students to showcase their scholarly contributions. E-proceedings encapsulate a collection of research projects, and insights that underscore the diverse dimensions of tourism, hospitality, and wellness. It is a testament to the curiosity, dedication, and intellectual prowess of our undergraduate scholars. In the pages that follow, readers will find a rich tapestry of research articles that reflect the tourism, hospitality, and wellness disciplines.

Students, lecturers, and industry partners collaborative efforts signify a commitment to advancing knowledge and fostering a community of learners who are well-equipped to navigate the complexities of the modern tourism, hospitality, and wellness sectors. May this collection inspire further exploration, dialogue, and innovation among the next generation of leaders in these dynamic fields.

Therefore, this book summarizes the selected papers of student conference focused on the current issues in tourism, hospitality and wellness field. Presented papers deal with investigation of issues and challenges of tourism, hospitality and wellness to make the industries more sustainable and adapt with the changes in the environment. Presented paper bring a wide database of issues and challenges in the field which could be used in the future researcher and industries players in the future.

ACKNOWLEDGEMENT

It is our pleasure to present this volume consisting of selected papers based on presentations from the Hospitality, Tourism and Wellness Colloquium 7.0, held on May 28 and 29, 2023 at the Universiti Malaysia Kelantan. The main colloquium objective is to explore, within the generative framework, different acquisition contexts, across a variety and between different components of the Hospitality, Tourism and Wellness fields. The colloquium was organized and supported by the Faculty of Hospitality, Tourism and Wellness (FHPK), Universiti Malaysia Kelantan (UMK). We would also like to extend our gratitude to the excellent work of our colloquium organizing committee which comprised of the following:

Roslizawati Binti Che Aziz, PhD
Khairil Wahidin Bin Awang, PhD
Mohd Fadil Bin Mohd Yusof, PhD
Hasif Rafidee Bin Hasbollah, PhD
Ruzanifah Binti Kosnin, PhD
Ahmad Fahme Bin Mohd Ali, PhD

ABSTRACT

The study examines consumer acceptance of innovation in traditional foods among undergraduate students and finds out the relationship between knowledge, attitude, and practice of consumer acceptance. A survey with 390 participants who eat traditional Malay food was carried out applying questionnaires. The data was examined using descriptive and correlational analysis. Findings showed that perception had the least link with customer acceptability whereas the three factors strongly connected to attitude had the largest relationship. Future researchers were given implications and suggestions based on the findings.

Keywords: Consumer Acceptance, traditional food innovation, knowledge, attitude, Undergraduates students

INTRODUCTION

Malaysia was known for its cultural, ethnic, and spiritual diversity. According to Ismail (2021), Malaysia's cultural inheritance is authentic, original, and colorful, with numerous national cuisines of different tribes in the country. As a result, Malaysians may be fairly proud of their diverse gastronomic offerings. A traditional food item, in Bertozzi's words, "represents a group, it belongs to a certain region, and it is a component of a culture that suggests the person's involvement in that territory" (1998). (Jordana,2000) derived the following from this sociological definition: "For a product to be considered traditional, it must be linked to an area and also, be a part of a system of traditions, which will necessarily assure its continuance through time."

Traditional food around the world is strongly anchored in local cultures, constituting the culinary heritage of a nation or a region and contributing to its identity and pride (Licitra, 2010; Bessière, 1998). An expression of this is that national and regional traditional foods are unfailingly served to foreign visitors, as a way to let guests learn to know their hosts through

culinary traditions. Dimensions of culinary heritage and rationality are the basis for the definition of Traditional Food Products (TFPs) from professional perspectives. Malay traditional food may be classified generally based on area. Penang, Perlis, and Kedah have a fiery scorching hot and bitter flavor. (2016) (Muhammad et al.). For example, laksa was a popular dish in the northern states. Rahman (2010) identifies Gulai Tempoyak and rendang as two characteristic traditional dishes typically served in Perak and Pahang for routine meals or festival festivities.

Innovation is a continuous process of learning, searching, and exploring that leads to new goods, processes, organizational structures, and markets (Lundvall, 1995). The three phases of attempts, actions, and outcomes make up the continual process of innovation. Resources that a company invests in activities for the creation of innovations include human and financial resources. These efforts are all resources. Results include the impacts of these innovative efforts on both more and less visible parts of the business, such as firm stability and efficiency (Gellynck et al., 2006) as well as more and less visible aspects, such as increase of market share and profit. Malaysian traditional food consumption was quickly falling in this period of globalization due to technological improvements. In order to improve traditional food in ways that are comparable to non-traditional food, Dogan (2015) states that traditional food innovations must maintain the natural food identity of those products, such as usual, familiar, authentic, typical, and inherited. It was challenging for Malaysian cuisine to distinguish itself as a distinct subgroup of traditional foods. Ismail (2013) asserts that advances in technology and the appearance of pre-made commodities have led to a radical reversal in the way traditional Malay food is prepared on a big scale.

Undergraduate students were selected for this research. This study discusses consumer acceptance among undergraduate students toward innovation in traditional food. Undergraduate students occur after high school and before postgraduate study. Students typically begin undergraduate studies at the age of eighteen, however, you can apply at any time. An honours degree is the most common undergraduate qualification; it is frequently the first degree a student studies and is the highest qualification that can be obtained at this level. (Paul Ellet,2019).

There are three objectives of this research:

1. To investigate the relationship between knowledge and consumer acceptance of traditional food innovation.
2. To investigate the relationship between attitudes and consumer acceptance of traditional food innovation.
3. To investigate the relationship between practice and consumer acceptance of traditional food innovation.

Significance of the Study

Researchers

This research will give information about traditional cuisines. It will also illustrate how undergraduate students' knowledge, attitude, and practise may influence customer acceptance of conventional food innovation. Because the students are of many races and each ethnic group has its own eating tradition, this research will assist the next student in learning more about the invention of traditional food. The information gathered may assist readers in determining the percentage of consumers who embrace innovative traditional foods.

LITERATURE REVIEW

Traditional food is a representation of the cultures, histories, and customs passed down through generations, as well as a progression in culinary taste. Trichopoulou et al. Year after year, the traditional food of Malaysia's multi-ethnic cultures was integrated in novel ways across the country, resulting in the development of a distinct Malaysian traditional identity. Salleh (2006). In order to stay competitive and satisfy consumer wants, the food business is always creating new food products. Increasing production efficiency, expanding their product line, cultivating a reputation as an innovative company that benefits their brand, or adhering to national nutritional policies and guidelines regarding the safety and healthiness of food products, For example, salt reduction in processed foods may be one of the primary drivers of food company innovation (Henard & Dacin, 2010). Legowski and Legetic (2011), Pietinen et al. (2008), Wyness, Butriss, and Stanner (2012).

KAP stands for typical area resident research, which focuses on learning what is understood, held to be true, and is being done with regard to a particular subject. Yang, Wang, Kan, Wu, Maddock, and Lu (2015).

Knowledge

Personal development requires knowledge, awareness, recognition, and application. The development of knowledge will be aided by prior knowledge of the same themes (Nasimi et al., 2013). Taking students' acceptance of traditional food's innovation as an example. To perform something, someone needs to have a little knowledge as a foundation to remember the information (Francis, 1995). Francis (1995) stated that in order to retain knowledge easily, you must always practice it in practice. When people remember information in an indirect way, they may become more adept at using it in other contexts as well, such as informing those around them that a particular cuisine tradition is on the verge of extinction. It takes a lot of time to prepare traditional cuisine, while some of it requires a special cooking technique. Actually, if people consistently prepare a traditional food dish, they not only improve their culinary abilities but also pass along knowledge of traditional cuisine to the next generation. Knowledge is interpreted at many levels. Individual notions are decoded and arranged into a scheme with a more sophisticated meaning (Solomon et al., 2006). Knowledge may be acquired by education, experience, judgment, skill, and a combination of these (Bano et al., 2013; Rav-Marathe et al., 2016). According to Valente et al. (1998), the "learning" sequence, one of the various sequences in the triangle model, happens through information that accumulates to affect attitude, which in turn inspires perception/practice, and therefore has a K-A-P sequence (ab path).

ATTITUDE

Different attribute aspects of attitude are psychological objects. Consumers' attitudes toward novel products can be described as either positive or negative, detrimental or useful, agreeable or unpleasant, liked or dislikeable (Ajzen, 2001). An individual's attitude is a learned mental and psychological level of readiness that determines or impacts how someone responds to all things and events that are pertinent to it (Allport, 1935). Opinions, emotional states, and beliefs about a thing or subject are all examples of attitudes. Customers come from a variety of cultures, demographic groups, and lifestyles. Another crucial factor is how one feels about behavior. The desire to eat ready meals as a culinary innovation seems to be influenced by

affective attitudes like satisfaction, enjoyment, and excitement. Being based on one's origin, one of the independent aspects is attitude, which is how one feels about traditional food innovation (Nie & Zepeda, 2011). Attitude may be defined in two ways: psychologically and socially. Although sociology is a verbal statement intended to act, psychology is a verbal expression connected to conduct (Chaiklin & Harris, 2011). For practical courses, it is essential to learn each student's unique attitudes since they must exhibit a certain personality type in order to put the course into practice. Attitudes are frequently learned and created via experience and/or interactions (Eagly & Chaiken, 2007), and while they are not always permanent, they tend to be constant (Lombard-Roberts & Parumasur, 2017). Existing attitudes are also frequently difficult to modify since attitudinal development occurs gradually and customers are typically reluctant to change (Price, 2019). As a result, marketers should consider tailoring their communications to meet current sentiments rather than attempting to alter them (Kotler & Keller, 2012). Consumer attitude may be characterized as behavior toward people, objects, subjects, or circumstances (Solomon et al., 2006). It is frequently defined as general and lasting since it pertains to more than one event and tends to last over time (Solomon et al., 2006). Attitudes are frequently learned and created via experience and/or interactions (Eagly & Chaiken, 2007), and while they are not always permanent, they tend to be constant (Lombard-Roberts & Parumasur, 2017).

PRACTICE

The last component of the KAP model is practice. According to (Badran, 1995), Practice is characterized as a combination of knowledge and attitude. Practice is the act of demonstrating one's attitude and level of understanding with deeds (Kaliyaperuma, 2004). According to (Launiala, 2009), Practice is the use of standards and knowledge to obtain performance results. Being a good practitioner is an art form that is inherently conducted responsibly and is associated with the growth of knowledge and technology. Currently, the food industry's innovation procedures heavily rely on customer feedback, which is acknowledged as being essential to success. As a result, developing a successful new product requires tactics that combine an adequate sensory evaluation with a thorough grasp of the consumers' acceptance requirements. Besides that, practice describes a person's behavior. In research on nutrition and food, practice or behavior is translated as eating, cooking, feeding someone, or other activities involving the preparation and consumption of food. The diversity of a diet, the consumption of certain foods, the frequency of consumption of particular meals,

and particular dietary patterns can all be used to study food practices. One of the more important sectors in the current global economy is the food one. However, businesses involved in the manufacturing, processing, and provision of food still confront a number of difficulties, the most important of which is the prevalence of new goods that fail. The voice of the customer is given paramount importance in today's innovation practices in the food sector, which are understood to be necessary for success.

Research Hypothesis

There were three hypotheses tested in this study to investigate the link between the independent variables (knowledge, attitude, and practice) and the dependent variable (consumer acceptance of innovation in traditional food among undergraduate students).

H1: There is a significant relationship between knowledge and consumer acceptance of innovation in traditional food among Undergraduate students

H2: There is a significant relationship between attitude and consumer acceptance of innovation in traditional food among Undergraduate students

H3: There is a significant relationship between practice and consumer acceptance of innovation in traditional food among Undergraduate students.

Research framework

A study framework was developed to explore the relationship between consumer acceptability of traditional foods and knowledge, attitude, and practice among undergraduate students.

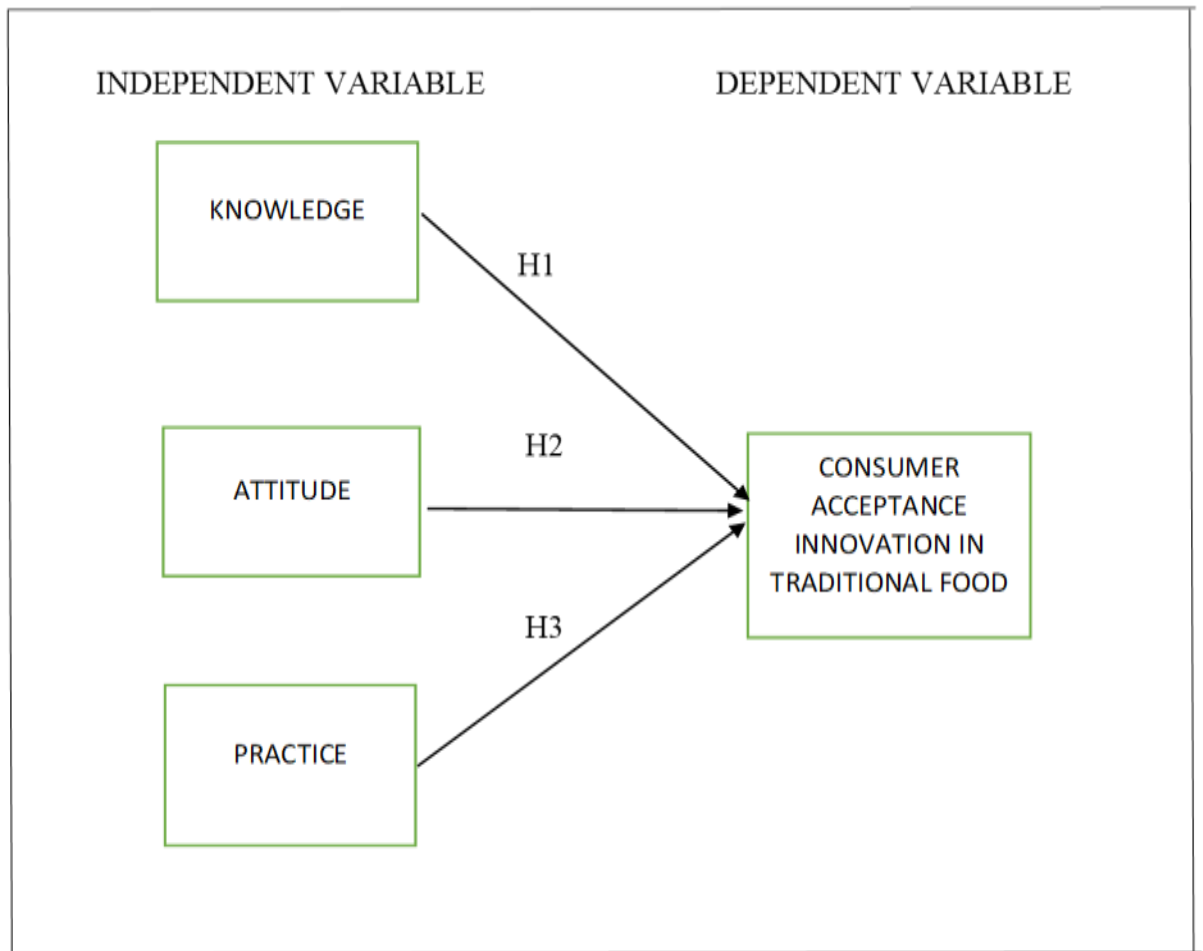

Figure 1: Conceptual Framework of consumer acceptance of Innovation in traditional food among undergraduate students.

METHODOLOGY

Research Design

This study was conducted utilizing quantitative methodologies using the researcher's own raw data. To solve the research issue, the researchers used an experimental or causal study technique (Shariff, 2016). This is due to researchers' desire to learn whether customers prefer conventional food advancements. Researchers that conduct causality studies investigate the relationship between independent factors that are assumed to have an influence on the dependent variable. The major purpose of this study's design is to obtain evidence of causality or test hypotheses. Researchers investigated the relationships between knowledge, attitude, and practice (independent factors) and customer acceptability of traditional food innovation (dependent variables) in this study.

Sampling

To probability data for the study, the probability sampling approach is employed. The sampling approach is utilized in this study to determine how much and how frequently data collecting is required. This tool determines how many samples are needed to analyse a system, technique, problem, or issue. This sample has reached the end of its stages. In the first stage, the target demography must be properly specified. The following step is to select a sample frame. To correctly represent the population, researchers must select a sample frame. The sampling procedure is decided in the third phase of the sampling technique. There are two types of sample processes: probability sampling and non-probability sampling. The next step is to determine the sample size.

The selection of a population's subgroups is known as the sample size, which is used to draw inferences or judgments about the total population. A table previously made by Krejcie and Morgan (1970), which used the population's current approach, was used to determine the size of the study sample.

Data Analysis

Three different types of data analysis were employed in this study: frequency analysis, descriptive analysis, and reliability analysis. The data were examined using the Statistical Package for the Social Sciences (SPSS).

FINDINGS

Using variable data gathered from a particular subject group, descriptive analysis is a type of statistical analysis that aims to provide a description or image of the subject under investigation. In tables of frequency distribution, histograms, mean values, standard deviation values, and other formats, the descriptive analysis of the data may be displayed. The descriptive analysis had the benefit of providing a thorough picture of the data, whether it was presented verbally or quantitatively.

390 respondents made up the sample we used for the data analysis. Table 1 shows the data-collecting correlations, and Table 2 displays a summary of the hypothesis testing.

Table 1 shows the correlations of the data collection

correlations				
	Consumer Acceptance Innovation in traditional food	knowledge	Attitudes	Practice
Consumer Acceptance Innovation in traditional food	1	0.456**	0.765**	0.732**
Knowledge	0.456**	1	0.517**	0.421**
Attitudes	0.765**	0.517**	1	0.750**
Practice	0.732**	0.421**	0.750**	1

*. Correlation is significant at the 0.05 level (2-tailed)

**. Correlations are significant at the 0.01 level (2-tailed)

Table 2 shows the summary of the hypothesis testing

Summary for Hypothesis Testing		
Hypothesis	Pearson Correlation	Result
H1: There is a significant relationship between Knowledge and consumer acceptance of innovation in traditional foods among undergraduate students.	$r = 0.456, p < 0.01$	Supported
H2: There is a significant relationship between Attitude and consumer acceptance of innovation in traditional foods among undergraduate students.	$r = 0.765, p < 0.01$	Supported
H3: There is a significant relationship between Practice and consumer acceptance of innovation in traditional foods among undergraduate students.	$r = 0.732, p < 0.01$	Supported

Research Objective 1: To investigate the relationship between knowledge and consumer acceptance of traditional food innovation.

The first objective is to ascertain if knowledge will affect undergraduate students' awareness of practising innovation in traditional food. Also being discussed is the first of the following hypotheses:

H1: There is a significant relationship between Knowledge and consumer acceptance of innovation in traditional foods among undergraduate students.

Based on the findings and analysis of Chapter 4, the findings show that knowledge and consumer acceptability of innovation in traditional foods among undergraduate students have a substantial link. Undergraduate students had the lowest correlation coefficient (approximately 0.456) for knowledge and customer acceptability of innovation in traditional foods in this study goal. The knowledge p-value and

The standard deviation of acceptability among consumers is 0.000, which is below the extremely significant level of 0.01. Therefore, among undergraduate students, there is a substantial link between consumer approval of innovation in traditional food and knowledge.

The production of traditional foods has been practiced for many generations, hence traditional food knowledge is a blend of knowledge and practices (United Nations, 2007). Traditional food knowledge (TFK) is a food product that is adopted and passed down from generation to generation, (Kwik, 2008). In other words, it is a process of passing along knowledge, preparation, and cooking techniques that enable people to create meals that are wholesome, secure, and appropriate for their culture. The fact that the younger generation lacks knowledge and abilities in the preparation of traditional foods is due to a number of issues. Lack of knowledge, insufficient exposure to the cooking process, a lack of enthusiasm in trying because it takes time, and a lack of time to learn from specialists are the contributing factors, (Mohd Salehuddin bin Zahari, 2013).

Research Objective 2: To investigate the relationship between attitude and consumer acceptance of traditional food innovation.

The second objective is to ascertain if undergraduate students' attitudes would affect their knowledge of using innovation in traditional meals. The discussion also centres on the first premise listed below:

H2: There is a significant relationship between attitude and consumer acceptance of innovation in traditional foods among undergraduate students.

Based on the findings from Chapter 4's results and analysis, it can be concluded that undergraduate students' attitudes have a big impact on whether consumers embrace innovation in traditional food. The first highest correlation coefficient, or 0.765, in this study aim relates to undergraduate students' attitudes and consumer acceptance of innovation in traditional food. Consumer approval and attitude have a p-value of 0.000, which is below the highly significant level of.01. Consequently, there is a significant relationship between attitude and consumer acceptance of innovation in traditional foods among undergraduate students.

A person's attitude is their evaluation of anything or something in a situation. According to Nie and Zepeda (2011), they were distinctive and closely related to culture, demography, values, way of life, and habits. As attitudes affect both expectations and perception, they are essential in a consumer acceptance system. They could also be used to define consumer groups according to demographics and product acceptability.

Research Objective 3: To investigate the relationship between practice and consumer acceptance of traditional food innovation.

The third objective is proposed to determine whether the practice will influence awareness of practicing innovation in traditional food among undergraduate students. Discussion is also based on the first hypothesis below:

H3: There significant relationship between practice and consumer acceptance of traditional food among undergraduate students.

Based on the findings and analysis in Chapter 4, the findings show that practise and consumer acceptability of innovation in traditional cuisine among undergraduate students have a substantial link. The second-highest correlation coefficient in this study aim is related to undergraduate students' attitudes and consumer acceptance of innovation in traditional foods, which is around 0.732. Consumer approval and attitude have a p-value of 0.000, which is below the highly significant level of.01. Therefore, among undergraduate students, there is a considerable link between practise and consumer acceptability of innovation in traditional meals.

Practice is the use of norms and knowledge to produce performance outcomes, according to Launiala (2009). Being a good practitioner is an art form that is connected to the advancement of information and technology and is handled ethically by nature. Customer input is currently a major component of the innovation processes used in the food sector, which is recognized as being crucial to success. The mothers who were interviewed all concurred that the wave of modernization or development has a minor influence on the generational practices regarding the traditional diet of Malaysia, (Mohd Salehuddin bin Zahari,2013). This shows, the practice has a relationship among undergraduate students. having a practice from generation to generation can attract them to the acceptance of innovation in traditional food.

DISCUSSION AND RECOMMENDATION

The future study should use a multilingual questionnaire to reduce language barriers and gather data more quickly and accurately. It is recommended to consider all available criteria to gain a better understanding of customer needs and preferences. Better data collection should be prioritized, with a longer window of time for respondents to provide more information on Malay traditional food innovation. A qualitative approach with open interviews can help researchers gain a deeper understanding of human interaction and provide more detailed responses. Additionally, researchers should include more information about traditional food innovations in their questionnaires to make it easier for respondents to respond and provide clear answers. Future researchers should be well-informed and well-equipped with relevant data to respond to questions and deepen their understanding of the subject.

CONCLUSION

This study examines the relationship between consumer acceptance of innovation in traditional foods among undergraduate students (Knowledge, Attitude, and Practice). 390 questionnaires in total were gathered from the intended respondents, who were undergraduate students. All the 390 surveys that were gathered were valid and could be read. Therefore, this study shows a beneficial association between customer approval of conventional food innovation and undergraduate students. Additionally, this study discovered that among undergraduate students, the attitude had the greatest influence on whether consumers accepted innovations in traditional food, whereas knowledge had the least impact.

THE STUDY ON VISITOR'S ACCEPTANCE OF TRADITIONAL MALAY FOOD IN MALAYSIA

Anggun, Anis Farhani, Anis Nadhirah, Aqilatul Husna & *Derweanna Bah Simpong

Faculty of Hospitality, Tourism and Wellness, University Malaysia Kelantan.

ABSTRACT

The cuisine of the Southeast Asian ethnic Malays who reside in Malaysia is known as traditional Malay cuisine. It stands out for using a lot of spices. Nowadays, visitors to Malaysia tend to prefer 'modern snacks' or quick food over traditional dinners. The gastronomic preferences of today's guests have influenced their decisions. This is a result of the high demand for fast food and other modern food items, which suit customers' busy lifestyles. As an outcome of this, the purpose of the study was to investigate how food knowledge, attitude, and image affect the way in which visitors accept traditional Malay food. There were 400 participants in this survey-based study. Visitors between the ages of 18 and 30 are the subject of this study. Using a quantitative research design, this study was conducted. The Pearson correlation coefficient was used in the study to look at the connection and influence between independent factors and dependent variables. The results of this study indicate that each of these factors plays a part in how well-liked traditional Malay food is among visitors. This is supported by the researchers' findings on the Pearson correlation coefficients for each variable. The extremely positive and substantial correlation between gained food knowledge and the P value was 0.680. Second, with a P value of 0.678, associations for food attitudes were shown to be favorable and significant. Finally, the P value for the strong positive and significant relationship between the food image and the P value was 0.785. This study demonstrated how visitor food knowledge, attitude, and image affect their acceptance of traditional Malay food.

Keywords: Malay Traditional Food, Visitor, Food Knowledge, Food Attitude, Food Image

INTRODUCTION

The term "hospitality" refers to an industry that encompasses a wide range of service-related professions and industries, such as the hotel industry, the food and beverage service industry, event organising, theme parks, travel and tourism, and more. As a result, lodging facilities, tour operators, eateries, and bars are all involved. 2007 (Andrew). The definition of hospitality in the Merriam-Webster Dictionary is "the generous and amiable reception of visitors and guests or the practice of hospitality." It also denotes the area of the economy where hotels, caterers, and event planners are most frequently employed.

According to Weichselbaum et al. (2009) and Almlı (2012), traditional meals have frequently played an important role in the customs of many cultures and regions, helping to build their sense of who they are and their sense of satisfaction. These are traditional dinners that have long been loved in the local and regional communities. (Almlı, 2012; Weichselbaum and others, 2009. Even while most people can recall at least one regional traditional dish (Weichselbaum et al., 2009), describing regional traditional dishes might be challenging since regional traditional food can signify a million different things to a million different people. European Commission, 2007. It is important to define "traditional" in order to assess the viability of alternative production systems for traditional foods (Guerrero et al., 2010).

The Malay people of Malaysia owe a debt to their Malay ancestors for introducing them to a wide variety of traditional cuisines, like Ketupat Palas, Lemang, Nasi Lemak, and others. Department of National Heritage Malaysia (2019) formally acknowledged these foods as representative of traditional Malay food. During this time, visitors who traveled throughout Southeast Asia on business created and disseminated Malay customs, including traditional food and language. As a result, this was a growth moment for traditional Malay food. The introduction of Islam in Malay communities in the 12th century also contributed to the development of a unique Malay culture. At that time, Islamic teachings and life philosophies were closely related to traditional Malay cuisine.

The dictionary defines a tour as "a journey from place to place [that consists of] visits to several places along a route through an area." Making a tour, also known as "circuitous travel, in any direction," is what the transitive definition of the verb tour refers to. A tour is a lengthy excursion that can be taken for either pleasure or business; the act of taking a tour is referred to as "arranging" for a "series of visits." In seventeenth-century London, the term "take a turn" was used to describe a "tour" that involved going about a place, frequently in a coach, such as a park.

RESEARCH OBJECTIVES

1. To examine the effects of food knowledge on the acceptance of visitors on Malays traditional food in Malaysia.
2. To examine the effects of food attitudes towards the acceptance of visitors on Malays traditional food in Malaysia.
3. To examine the effects of food image towards the acceptance of visitors on Malays traditional food in Malaysia.

SIGNIFICANCE OF THE STUDY

Many academic fields, including human ecology, agriculture, health promotion, parenting styles, community involvement, and sociological, sociocultural, and nutritional studies, to name a few, use traditional food knowledge (Warren, 2002). Traditional food practices are those that are thought to help preserve the integrity of natural resources when it comes to supplying food for humans. In this context, "traditional cuisine" refers to culinary techniques that have been developed over many generations and places. Traditional ecological food knowledge has been employed in Western communication since the late 1970s and early 1980s (Kuhnlein V. et al, 2009).

Communities are particularly concerned about the loss of traditional foods and cooking techniques, particularly among visitors. (2011) (Almli et al.), According to many experts, countries risk losing part of their traditional cuisines if traditional food preparation methods are not passed down to the next generation (Albayrak & Gunes, 2010; Bowen & Devine, 2011). There is a steadily declining quality of the culinary cultural inheritance since there aren't enough skilled traditional cuisine cooks, especially among the older generations, to pass on knowledge and abilities to the following generation. Due to a lack of competent cooks who can teach the next generation skills and knowledge about traditional foods, the culinary cultural heritage is deteriorating at an increasing rate. The government can set up processes to support further research and development in traditional foods through a Centre or Institute within the Ministry of Tourism Malaysia. This would allow for the improvement of traditional food preservation, as well as the transmission of traditional culinary expertise to visitors.

LITERATURE REVIEW

Visitor's acceptance of Traditional Malay Food in Malaysia

Traditional diets have been followed by many generations or passed down from one era to the next. Meals and dishes that are considered traditional have their roots in a particular culture's cuisine, whether that's a national dish, regional cuisine, or a local speciality. Major food processing industries, smaller manufacturing facilities, and individual homes can all contribute to the production of staple foods and drinks. (2016) Oliveira and Kristbersson. Several variables have altered traditionally prepared meals. One of these factors is the accessibility of necessary raw materials. This means that farming methods and geographical location play a role in shaping regional cuisine. Vegetation, for instance, varies greatly in regions of varying altitudes. Countries that lack a substantial coastline typically have a smaller supply of fish and seafood than those that have. While many traditional foods continue to play an important part in a healthy diet today, others may not meet the nutritional needs of modern populations due to their high energy or fat content. So, it makes sense to update the nutritional profile of some classic dishes so that they better suit the needs of the 21st century. The healthful Mediterranean diet may have inspired a shift away from less-than-ideal traditional food compositions and towards using more readily available local ingredients in the past.

Faiz et al.(2017) argue that Malaysia holds the title of “Rice Bowl of Malaysia” because the food will not be complete if it is not served with rice. Food traditional can be classified by state in Malaysia. Athirah (2013) stated that the traditional type of food in the state of Kelantan is Nasi Kerabu, while Faizal et al. (2015) said that the type of traditional food is according to festivals and food symbolic to a state. Traditional confectionery is a food that unites the Malaysia community. Traditional kuih are a factor of cultural diversity and there are variations of kuih which are available now (Mudiana, 2020). As an example of a traditional kuih that is mentioned is *kuih seri muka*, *lepat pisang*, *kuih koci*, *karipap*, and so on. Hairis (2009) states that most tourists from other countries give a positive response to the Malaysian traditional food and traditional kuih has the potential to become a visitor food product attraction. Traditional Malay food is the food of the Malays, an ethnic group native to Southeast Asia. Spices have a significant role in traditional Malay cuisine. Coconut milk adds to the already luxurious texture

and flavour of Malay cooking. The other ingredient is belacan, which is a "prawn paste" used to make sambal, a spicy sauce made from belacan, chilli peppers, onions, and garlic. Both lemongrass and galangal are staples in Malay cuisine (James, 2006). The several courses of a Malay lunch are presented simultaneously rather than in stages. Malay culture emphasises using only the right hand for eating, as the left is allocated for cleanliness and hygiene.

Food Knowledge

The term "traditional food knowledge" refers to the cultural practises that have been passed down from one generation to the next in order to share information, skills, and ideas on food. In particular for marginalised communities, familiarity with traditional foods can help members feel more connected to their heritage and strengthen bonds among family and friends. In addition to connecting cultural diasporas, such data could be utilised to fortify the cultural identities of generations raised in the wake of migration. As an intergenerational practice, traditional food knowledge transfer also helps to socialize. When local food systems and cultures undergo change as a result of global industrialization, urbanisation, and cultural homogenization, traditional food knowledge may be lost within homes and communities. Traditional culinary knowledge is lost when it is recast as an area of industrial production, which can have negative effects on regional cuisine and its unique flavour profiles (Kwik, 2008).

H1: There is a relationship between food knowledge and visitor's acceptance of traditional Malay food in Malaysia.

Food Attitude

Many people engaged in the food industry have reported difficulties with customer attitudes. It also describes the ways in which people make decisions about what to eat based on biological or economic considerations, such as preference, cost, purity, ease of preparation, difficulty of preparation, and access to fuel and other necessary equipment. Accessibility, familiarity, previous experience, and availability are some of the elements that contribute to the formation of opinions held by visitors regarding the food that they consume while on vacation. A person's nutrition can be influenced by a variety of factors, including those cultural, familial, social, and interpersonal. Emotion, tension, and guilt are all examples of elements that fall under the psychological category. views, ideas, and comprehensions pertaining to the topic of food.

Food attitudes are influenced by a multitude of factors, including a person's personal taste, the sensory quality of the food, the cost of the food, its accessibility, its convenience, cognitive limits, and cultural familiarity. In addition, social cues and larger serving sizes affect people's dietary habits (Wansink and Brian, 2004).

Everyone has various eating habits and tastes. These preferences can be shaped over time by a variety of factors, including personal experiences such as being encouraged to eat, being exposed to a meal, the customs and rituals of the family, the effect of advertising, and personal views. For instance, one person may dislike fries despite the fact that they are a popular delicacy among visitors. A cultural group defines proper meals, dietary pairings, eating habits, and eating behaviors. Individuals who adhere to these norms have a sense of belonging and identification. Subgroups within large cultural groups may practice modifications of the group's eating habits, but they are still considered a part of the larger group. A cheeseburger, French fries, and a Coke are typical western meals.

H2: There is a relationship between food attitude and visitor's acceptance of traditional Malay food in Malaysia.

Food Image

Due to the current trend of "camera eat first," it will assist to draw customers when the meal presentation and image are good. People are taking pictures of their meals before they eat it and uploading them to social media in a trend known as "camera eats first.". According to (Julia, 2017), the picture platform "flickr" has seen a growth of more than 6,000,000 "food" images in the previous two years. In February of 2017, there were 168,375,343 posts on Instagram related to food, proving that 90 images are published and hash-tagged every 60 seconds. Thus, how cuisine is presented has a significant influence on how interested tourists are in visiting Malaysia.

H3: There is a relationship between food image and visitor's acceptance of traditional Malay food in Malaysia

Acceptance

There are a variety of reasons why someone could like or dislike a certain meal. It is challenging to make connections between a person's physiological experience and behaviour when complex food matrices are considered. In addition to the food's physiological and aesthetic properties, factors such as marketing, availability, prior experience, attitudes, and beliefs shape how people respond to it. Methods other than surveys were investigated in this study to learn more about consumers' opinions, routines, and future plans. The acceptance of a meal depends on the connection between the diner and the dish. Consumers' acceptance of a product can be affected by a wide range of demographic parameters, including age, gender, physiological and psychological features, and contextual factors such as family and cultural norms, religion, education, fashion, price, and convenience. A person's level of appreciation for a given dish should have a significant impact on his or her consumption patterns. This is a reasonable assumption, and few would disagree with it (Meiselman & Bell, 2003).

Research Framework

The relationship between visitor acceptance of traditional Malay cuisine in Malaysia and food knowledge, food attitude, and food image has been investigated using a conceptual framework.

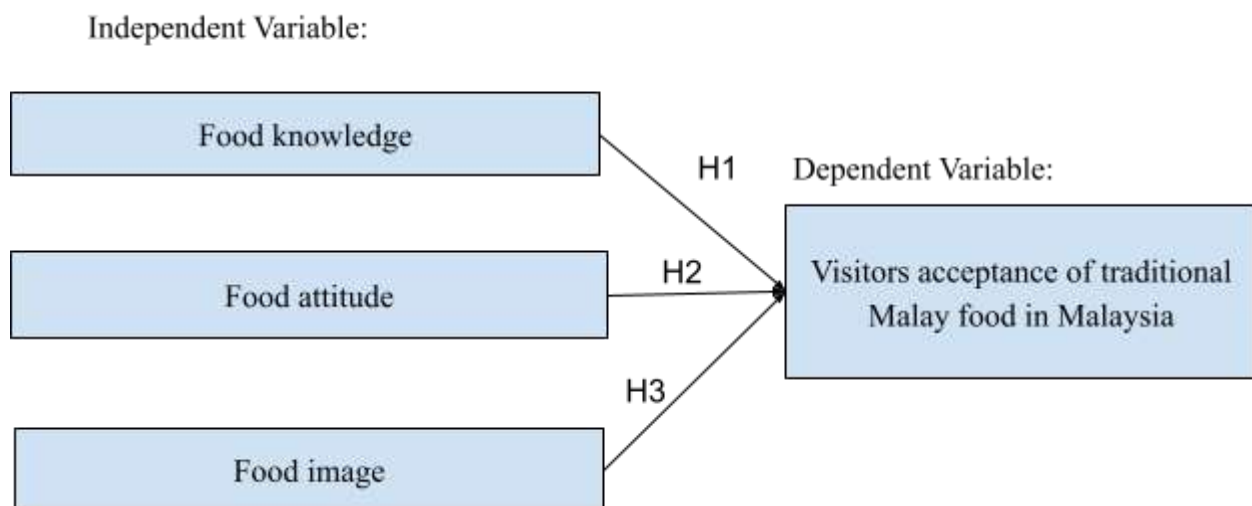

Figure 1: A conceptual framework to examine visitors' acceptance of traditional Malay food.

Source: Developed of the study

METHODOLOGY

Research Design

According to Shuttleworth (2008), this study used the quantitative method, which focuses on proving or disproving hypotheses in a way that is important by looking at variables that have been clearly defined. Quantitative data consists of numerical information that has been compiled through dependable and standardised means of data collection, then analysed statistically. This finding ought to be generalizable, and as a result, it is capable of being utilised with other populations, allowing for an examination of cause and effect as well as the formulation of hypotheses. Leung (2015). According to Kelley et al. (2003), surveys, interviews with closed questions, and controlled experiments are common ways to generate data.

Sampling

A random sample method is used to collect data for the investigation. The method of simple random sampling will be used in this research questionnaire. "Simple random sampling" describes a specific sort of random sampling in which every member of the population has the same, predetermined chance of being selected as part of the sample. Researchers will randomly assign attendees to different groups in order to collect the necessary information. Researchers will employ quantitative methods to examine and analyse the data they get from these participants. All data collected will be treated as confidential and utilised exclusively for this study. Then, we'll utilise these numbers to look for patterns in the variables and determine their averages, standard deviations, and correlations with one another.

The sample size represents a subset of the entire population. The researcher needs to be able to extrapolate from the instances to the overall number of people of interest. There is insufficient data to calculate the precise number of constituents that make up the population's profile. Consequently, it is impossible to estimate a sample size that is statistically significant for the whole population. Therefore, the researcher opted to employ a sample size of 400 respondents based on the guidelines provided by (Krejcie & Morgan, 1970).

Data Analysis

This research used frequency analysis, descriptive analysis, reliability analysis, and the Pearson correlation coefficient. SPSS (Statistical Package for the Social Sciences) was used for the data analysis.

FINDINGS

Result of Pearson Correlation Analysis

Table 4 below shows the Pearson Correlation Analysis

Table 4.14 Pearson Correlation Analysis

Hypothesis	P. Value	Result (Support / Not Support)
H1: Food knowledge positively influences the acceptance of visitor	0.680	H1 is support
H2: Food attitude positively influences the acceptance of visitor	0.678	H2 is support
H3: Food image positively influences the acceptance of visitor	0.785	H3 is support

Table 4 shows that familiarity with food is significantly correlated with host friendliness ($r = 0.680$, $p > 0.01$). Similarly, a favourable outlook on food is significantly associated with a pleasant reception of visitors ($r = 0.678$, $p > 0.01$). The third correlated variable is confidence in

one's ability to choose a good restaurant. With $r = 0.785$, $p > 0.01$, the association between food image and visitor acceptability is likewise statistically significant. All hypotheses were confirmed at the 0.05 level of significance.

Research Objective 1: To determine the effects of food knowledge towards the acceptance of visitors on Malays traditional food in Malaysia.

The data from KEKKWA (2008) backs up these conclusions. According to the results, visitors' openness to traditional Malay fare is strongly correlated with their level of food knowledge. Because of the importance of food in maintaining spiritual and ethnic identities, all visitors to Malaysia should be made aware of the importance of preserving food-related information for future generations. The efforts of the Malaysian Cultural Association, the Ministry of Information, Communication, and Culture, and other government organisations have contributed to the preservation of the traditional cooking practises of the Malay people. This was made abundantly evident when the former minister of culture, arts, and legacy urged Malaysians to teach visitors their culinary techniques in order to protect the country's culinary treasures (KEKKWA, 2008).

As a consequence of this, surveys on food have indicated that the presentation of traditional food from Malaysia has an effect on how it is received in other nations as well. Researchers were able to draw conclusions on the impact of participants' prior food expertise on their impressions of traditional Malaysian fare. This study lends credence to the first research question, which asked, "How does familiarity with regional cuisine influence the willingness of visitors to try dishes from Malaysia's cultural heritage?"

Research Objective 2: To determine the effects of food attitude towards the acceptance of Visitors on Malays traditional food.

According to the outcomes of Wansik and Bryan's (2004) study, an individual's level of acceptance of traditional Malaysian food is substantially connected with other people's perceptions of the food's acceptability. The visitor mentality, which is in turn influenced by their religious convictions, is the single most important factor in determining whether or not they will taste traditional Malay dishes. Whether or not one has a favourable impression of traditional Malay food depends on their level of familiarity with the cuisine and their eating habits. As

defined by Ajzen (1991b) and Pudun, Nor, and Chung (2016), subjective norms are the collective beliefs and expectations of a society as a whole. It's possible that the dish was only eaten in accordance with cultural norms and that no one actually ate it. It's the result of people having a generally pessimistic outlook on life.

There is evidence from studies on culinary attitudes, however, that these biases do affect how visitors perceive classic Malaysian food. The purpose of this research is to quantify how many visitors' enthusiasm for traditional Malaysian food actually helps spread cultural understanding of cuisine. This study also lends credence to the investigation of the aforementioned research topic, "What is the effects of food attitude towards the acceptance of Visitors on Malays traditional food?"

Research Objective 3: To determine the effects of food image towards the acceptance of Visitors on Malays traditional food.

It is possible to anticipate a person's feelings based on how they interpret a picture or visualisation. Many research in psychology have used this visual method to explain perception (e.g., Peterson & Kimchi, 2013; Wagemans et al., 2012), and it is true that one's vision is influenced by their goals and attention (e.g., Vecera et al., 2004; Desimone & Duncan, 1995). For many years, the Gestalt concept of images has also aided numerous academics in understanding perception (Koffka, 1935; Kohler, 1938). Many problems in the disciplines of visual research and emotion research have found resolution as a result of this concept. Emotion researchers use a 'pleasure-displeasure' scale to classify an individual's internal reactions to situations (Russell 1991).

As a result, the study's findings (Barrett, 2006 a, b) support the existence of an important connection involving the influence of food image and the acceptance of Malay traditional food among visitors. An individual's sense of valence provides a response to the good and negative stimuli elicited by a wide range of material and immaterial factors. Many theories in psychology (Rolls, 1999; Russell, 2003; Smith & Ellsworth, 1985; Scherer, 1984) set up a significant amount of stress on valence as a fundamental and important component of an individual's emotional life.

It's clear that the presentation of food influences how well visitors like traditional Malay food. The purpose of the study, which was to identify the impact of food appearance on visitors'

responses to traditional Malay costs, was successfully accomplished. The findings of this study also provided support for the question, "What is the effect of food image on visitor acceptance of Malays traditional food?"

DISCUSSION, LIMITATION AND RECOMMENDATION

In general, this study has conducted significant research on the acceptance of traditional Malay food of visitors. The study investigated the association between three variables with traditional Malay food which are food knowledge, food attitude, and food image.

Due to the fact that respondents were not tested beforehand, the researcher discovered that the completion of the questionnaire took respondents an excessive amount of time. In spite of this, the researchers concluded that the findings of the investigation were sufficient. This is because the vast majority of people who participate in polls using Google Form questionnaires reside in distant or secluded areas. Because of this, completing the Google Form was challenging for the respondents, which was made much more difficult by the fact that their internet connection was poor.

For the purpose of future study, the results are also important. As a result, it is suggested that future scholars can locate more skilled providers of traditional food to preserve the culinary cultural history that is being lost with each passing generation. The study's author thinks that quantitative methods will remain the standard of excellence for future investigations in this area. Since quantitative analysis may be completed considerably more quickly than qualitative analysis and with far less effort.

CONCLUSION

The main objective of this study is to analyse how familiarity with, and perceptions of, traditional Malay food are influenced by factors such as food knowledge, food attitude, and food image. Visitors were chosen at random to participate in this survey. Frequency analysis, descriptive analysis, reliability analysis, and Pearson Correlation analysis were used in SPSS to examine the survey data. There was a positive and important relationship between the acceptance of traditional Malay food and the three independent variables tested which are food knowledge, food attitude, and food image. This means that every hypothesis put forward, including H1, H2, and H3, is correct.

ABSTRACT

There are several famous theme parks in Malaysia that attract tourists from home and abroad and become one of the attractions that trigger a person's intention to visit and travel. The purpose of this study is to identify the factors that affect the intention of tourists to visit a theme park. The respondents of this study will be obtained from tourists in Malaysia and examine how individual profiles, preferences, motivations, and attitudes affect the intention to visit a theme park in Malaysia. A simple sampling method was used to obtain data with 384 valid goggle form responses. The questionnaire was distributed in an interval scale. Cronbach's Alpha was used to obtain trust results in the hope that this study can contribute to future researchers and marketers to understand more about tourists' visiting intentions towards theme parks.

Keywords: Visit intention, Motivation, Attitude, Preference

INTRODUCTION

The largest and fastest expanding industries are in the hospitality and tourist sectors (Walker, 2013). Both industries are related to one another and fall under the same general heading. Walker (2013) argued that the five components of travel, hotel construction and event management, restaurants and managed services, and recreation make up both hospitality and tourist offerings. The research in this study will concentrate solely on the recreation component theme park, a product of the hospitality and tourism industry.

A theme park is a location that combines various types of entertainment, such as roller coasters and water rides, with retail stores, dining establishments, lodging, transportation services, and other entertainment facilities to provide fun and memorable experiences for people of all ages (Thomas, 2022). Theme parks are listed by the United Nations World Tourism Organization as one of the main attractions of a city.

Theme parks are one of the tourism goods in Malaysia that create income and have an impact on economic growth, having grown from a modest to one of the largest tourism sectors in the world (Hogan, 2015). According to Bernama (2012), the World Tourism Organization now lists Malaysia as the ninth most visited country in the world. The majority of visitors and locals are eager to attend theme parks to take advantage of the entertainment options, leisure settings, and recreational facilities.

With its 16 internationally renowned theme parks, including Legoland and Sunway Lagoon, Malaysia is a vacation destination that is rapidly expanding and gaining popularity. In addition, at least 10 theme parks are anticipated to open in the upcoming years. For instance, the Resorts World Genting will open the first 20th Century Fox World theme park on the planet later in 2019. On the other hand, the industry leader in video games, Ubisoft, intends to construct a theme park in Kuala Lumpur by the year 2020.

The theme park's presence would benefit the local community and the entire nation greatly. Theme parks have the ability to encourage tourism, which enhances the reputation of the place and boosts economic growth where they provide opportunities for people to engage in education, recreation, and enjoyment. Additionally, a theme park will boost local residents' employment rates.

Theme parks are crucial for both tourism and the overall economy of the nation. To understand and meet visitor demand, it is crucial to identify the elements that will motivate them to visit a theme park. Therefore, this study is being undertaken to identify the variables that affect visitors' intentions to visit theme parks in Malaysia. To benefit local communities, residents, and international visitors, this issue needs to be addressed in the tourism and academic sectors.

SIGNIFICANCE OF THE STUDY

LITERATURE REVIEW

Over the past several decades, philosophers have become concerned with the topic of intention (Cohen and Levesque, 1990). Numerous studies have investigated the nature and function of intent (Anscombe, 1957; Bratman, 1987; Fishbein and Jajzez, 1977; Levelt, 1993). Intention could be defined as the desires of a person to achieve a goal (Ajzen, 1991). Cohen and Levesque (1990) proposed that intention is typically studied separately from other terms such as belief and knowledge, which are typically viewed as propositions, whereas intention is typically viewed as action. The term purchase intention (Liu, 2015) could be used to characterise a customer's intent when making a purchase decision. According to Ajzen and Fishbein (1980), purchase intention is the customer's preparedness and desire to ingest a specific product or service. Purchase intention and purchase behaviour are interrelated, with Eagly and Chaiken (1993) stating that purchase intention represents a person's motivation to extend purchase behaviour.

Other researchers, such as Schiffman and Kanuk (2000), concurred that purchase intention is a person's propensity to engage in purchasing behaviour. Numerous researchers have examined purchase intention in the marketing and economics disciplines, and Morwitz (2021) suggests that purchase intention may be a common measurement in marketing and economics. In the meantime, market importance is placed on purchase intent (Agarwal and Teas, 2002). Purchase intent is significant to the market because it can be used as a predictor to estimate future customer demand (Armstrong, Morwitz, & Kumar, 2000).

Intention is a person's propensity to engage in purchasing behaviour. Numerous researchers have examined purchase intention in the marketing and economics disciplines, and Morwitz (2021) suggests that purchase intention may be a common measurement in marketing and economics. In the meantime, market importance is placed on purchase intent (Agarwal and Teas, 2002). Purchase intent is significant to the market because it can be used as a predictor to estimate future customer demand (Armstrong, Morwitz, & Kumar, 2000).

According to Schlosser (2003), purchase intent is the consumer's evaluation of their own purchasing behaviour. Many factors, such as product presentation, temperament, and perceived risk, influence purchase intention (Park, Lennon, and Stoel, 2005; Park and Stoel, 2002). Swinyard (1993) conducted a study on the purchasing experience and found that customers pay more attention to purchases when they have a positive store experience in terms of an engaging store exhibit, compared to customers who have a negative store experience. Customers also tend to make larger purchases when in a good mood (Bitner, 1992).

In addition, Bennett and Harrel (1975) proposed that confidence can be a predictor of purchase intention and that a reduction in perceived risk can increase consumers' purchase intent. By focusing on tourism and hospitality studies, visit intention is a term that has been used to investigate customer and tourist behaviour (Han, Hsu, and Sheu, 2010; Kozak, 2001; Ng, Lee, and Soutar, 2007). However, studies on the concept of visit intention for tourism and hospitality products are scarce (Jang, Bai, Hu, and Wu, 2009; Wu, 2015).

According to Jang, Bai, Hu, and Wu (2009), visit intention is an individual's intention or commitment to travel. In other words, visit intention is the propensity of a tourist to visit a specific destination (Abubakar and Iikan, 2016; Chen, Shang, & Li, 2014).

Additionally, Wu (2015) supported the visit to a particular location. In fact, visit intention is crucial because it serves as a link between travel motivation and future travel behaviour (Jang, Bai, Hu, & Wu, 2009). Jang, Bai, Hu, and Wu (2009) had previously demonstrated that visit intention can contribute to an activity and transform motivation into behaviour. Therefore, it is essential to investigate visit intention, as it benefits the tourism and hospitality industries (Lam and Hsu, 2006).

Research Hypothesis

RH1: There is a significant relationship between motivation and Malaysia tourist's visit intention.

RH2: There is a significant relationship between attitude and Malaysia tourist's visit intention.

RH3: There is a significant relationship between preferences and Malaysia tourist's visit intention.

Research Framework

By referencing the literature review, a research framework has been developed to examine the relationship between the factors and travellers' intentions to visit. The proposed conceptual framework would be depicted in Figure 2.3 below. The proposed independent variables consist of four components: motivation, attitude, and preference. while the only dependent variable is the intention of tourists to travel.

Figure 2. 1: Conceptual Framework of the study

METHODOLOGY

Research Design

The broad strategy for conducting a study to look into testable research topics of interest is known as the research design. Researchers will utilize a quantitative design in this study, which is a formal, objective, systematic approach that uses numerical data to gather information. According to Bum and Grove (2010), this research methodology is used to characterize variables, analyze correlations between variables, and identify cause-and-effect interactions between variables.

Data Collection

As the primary method of data collection for this study, questionnaires will be used. In Malaysia, a convenient distribution technique will be used to provide the questionnaire directly to pertinent respondents who are also the target demographic. This method is the best way to get the most sincere and accurate data from respondent as they are not influence by any circumstances including by the researchers. Besides, this method enable questionnaire to be carried out in a faster pace compared to other data collection method such as interviewing. Moreover, by understanding the important and concern of respondent’s privacy, every answer and opinion made will be kept anonymous. The questionnaire will be provided to respondent.

The Likert scale consists of 5 choices of scale. The purpose of choosing 5 Likert scale is to avoid bias where according to Toner (1987), respondent have the tendency to say “Yes” indiscriminately in answer to questions provided to them and this can cause a serious problem. To avoid such problems in the future, researchers might use forced-choice scales which also called as Likert-type scale.

Table 3. 2: Likert-Type Scale Table

Strongly disagree	Disagree	Neutral	Agree	Strongly Agree
(1)	(2)	(3)	(4)	(5)

Sources: Likert-Type Scale Table (Toner,1987)

Sampling

This study's sample strategy used a non-probability convenience sampling method. Instead of choosing from the complete populations, the researchers can use this sampling strategy to select any of their preferred respondents who are available. Due to some members in the population does not have chance to be sampled, the use of convenience sampling regardless of the size of sample, it can represent the entire population that cannot be known. By using this convenient sampling method, the researchers can distribute the questionnaire easier to collect the data.

Data Analysis

Shamoo and Resnik (2003) state that various analytical techniques "offer a way of drawing inductive inferences from data and differentiating the signal (the phenomenon of interest) from the noise (statistical fluctuations contained in the data)". Data analysis, by definition, is the process of analysing data. Statistical Package for the Social Sciences will be used to analyse the data that has been obtained (SPSS). The programming language SPSS is used to carry out statistical analysis. It is a piece of software that illustrates how independent and dependent variables relate to one another when using the regression, correlation, or factor analysis methods. On the other hand, it is a very convenient and straightforward method for the researchers to transmit the respondent's responses with the appropriate coding before being converted into a data file for the subsequent analysis methods.

FINDINGS

The demographic profile provided in the questionnaire, as well as the mean and average mean of the dependent and independent variables, are all described using descriptive analysis. A straightforward quantitative presentation of the gathered data set is what is implied by descriptive analysis. It assists the researcher in fully comprehending the experiment or data set and provides all necessary context-setting information.

249 respondents were the respondents we used for the data analysis. The correlation of the data collection is shown in table 1.

Table 1 show the correlation of the data collection.
 **Correlation is significant at the 0.01 level (2-tailed)

		INTENTION	MOTIVATION	PREFERENCE	ATTITUDE
INTENTION	Pearson Correlation	1	.733**	.733**	.749**

** Correlation is significant at the 0.01 level (2-tailed).

Motivation

Research objective 1, research question 1, and hypothesis 1 are provided in Table 5.1. According to hypothesis H1, there is a considerable correlation between visitor intention and motivation. According to the findings of Pearson's correlation analysis (table 4.13), the first independent variable, motivation, had a strong positive association with the dependent variable, intention to visit. H1 is therefore approved. This is in reference to Pearson's correlation coefficient, whose r-value of 0.733 indicated a positive association between motivation and visit intention.

Table 5. 1: Research Objective 1, Research Question 1, And Hypothesis 1

No	Research objective	Research question
1	To access the factors attribute to the Malaysia tourist visit intention toward theme park in Malaysia	What are the factors attributed to the Malaysia Tourist visit intention toward theme parks in Malaysia?
H1- There is a significant relationship between motivation and tourist visit intention		

To conclude, the research objective, which is “What is the relationship of tourist motivation towards theme parks visit intention in Malaysia” achieved. While the research question, which is “What is the relationship of tourist motivation towards theme parks visit intention in Malaysia?” is answered.

Attitude

Research question 2 and hypothesis 2 are provided in Table 5.2. According to H2, there is a considerable correlation between attitude and tourist intention. According to the findings of Pearson's correlation analysis (table 4.14), the independent variable (attitude) and the dependent variable (intention to visit) showed the strongest positive relationships. H2 is therefore approved. This is in reference to Pearson's correlation coefficient, whose r-value of 0.749 indicated a positive association between attitude and visitation intention.

Table 5. 2: Research Objective 2, Research Question 2, And Hypothesis 2

No	Research objective	Research question
2	What is the relationship of tourist attitude towards theme parks visit intention in Malaysia.	What is the relationship of tourist attitude towards theme parks visit intention in Malaysia?
H2- There is a significant relationship between attitude and tourist visit intention		

To conclude, the research objective, which is “What is the relationship of tourist attitude towards theme parks visit intention in Malaysia” achieved. While the research question, which is “What is the relationship of tourist attitude towards theme parks visit intention in Malaysia?” is answered.

Preference

Research objective 3, research question 3, and hypothesis 3 are displayed in Table 5.3. According to H3, there is a considerable correlation between attitude and tourist intention. According to the findings of Pearson's correlation analysis (table 4.15), the independent variable (preference) and the dependent variable (intention to visit) exhibited a strong positive association. H3 is therefore approved. This is in reference to Pearson's correlation coefficient, whose r-value of 0.733 indicated a positive association between motivation and visit intention.

Table 5. 3: Research Objective 3, Research Question 3, And Hypothesis 3

No	Research objective	Research question
3	To access the the “ideal Theme Park” consider by Malaysia Tourist	What is the “Ideal Theme Park” consider by Malaysia Tourist.
H3- There is a significant relationship between preference and tourist visit intention		

To conclude, the research objective, which is “What is the relationship of tourist preference towards theme parks visit intention in Malaysia” achieved. While the research question, which is “What is the relationship of tourist preference towards theme parks visit intention in Malaysia?” is answered.

DISCUSSION AND RECOMMENDATION

In order to investigate the relationship between the hypotheses about a significant association, such as motivation, attitude, and preference towards visitors in intention to visit theme parks in Malaysia, Pearson's correlation analysis was utilised. In terms of the various hypotheses, the attitude holds the strongest moderately positive correlation ($r = 0.749$, $p < 0.01$), followed by motivation ($r = 0.733$, $p < 0.01$), and preference ($r = 0.733$, $p < 0.01$), both of which have a positive influence on tourists' intentions to visit Malaysian theme parks. Consequently, the outcome demonstrated that all hypotheses states were accepted at a 0.01 significance level.

Table 4. 16: The summary for hypothesis testing in this study.

H	Research objective	Pearson's correlation results
H1	There is a significant relationship between motivation and tourist visit intention to theme parks in Malaysia	supported $r = 0.733$, $p < 0.01$,
H2	There is a significant relationship between attitude and tourist visit intention to theme parks in Malaysia	supported $r = 0.749$, $p < 0.01$,
H3	There is a significant relationship between preference and tourist visit intention to theme parks in Malaysia	supported $r = 0.733$, $p < 0.01$,

The researcher will provide some recommendations in this section that will be useful for future studies. This will guarantee higher-quality research and better results in the future. Additionally, it can aid the tourism sector in developing better future products and services. In this study, the researcher only identified three variables: visit intention (dependent variable), intentions, motivation, attitude, and preferences (independent variables). The independent variable and the dependent variable only have a weakly positive correlation, according to the results of the two variables.

Future research may integrate fresh discoveries by using additional variables, such as price, as an independent variable. Additionally, the design of websites created by tourism operators receives less attention in this study. This is due to the fact that there are numerous ways to book theme parks, including through theme park websites and online travel firms like (booking.com). Future studies may thus add fresh findings in which respondents decide whether to utilise an online travel agency or make reservations directly from a website. The

best theme park is the only benchmark used in the current study to meet the study's objectives. This is due to the fact that a well-known theme park is the place where visitors first enter and has a high standard of amenities and infrastructure; as a result, choosing the greatest theme park is strongly advised if future research need to examine visitor intentions. Researchers are highly recommended to continue collecting data from respondents using quantitative approaches rather than qualitative methods for future studies.

The researcher did advise handing out the questionnaire to respondents in person, though. This is due to the bias introduced by the fact that social media is currently being used in research to distribute surveys to respondents. The researcher can gather more data from the chosen respondents by handing out the questionnaire in person. The researcher may ask respondents additional questions if the questions and vocabulary are unclear.

Last but not least, the researcher thinks that it would be preferable for future studies if the respondents were visitors who had only visited theme parks. This is due to the fact that visitors have firsthand knowledge of the environment and state of the theme park and can therefore provide a more thorough evaluation. The study's findings will be more reliable if a suitable sample of respondents is chosen.

CONCLUSION

This chapter's conclusion is that there is a significant association between all the variables and tourist visit intention. This demonstrates how the factors had a role in the customer's decision to reserve tickets for Malaysia's greatest amusement park. The variables passed the reliability test, the reliability analysis, and the correlation analysis with scores above 0.7, indicating dependability and suitability for this study. However, because our study was conducted online, the restriction did not stop us from collecting data. Finally, the suggestions made will support further research in this area.

ABSTRACT

The study aimed to reveal the indicators that factors that influence customer satisfaction towards service quality in 3-star hotels in Kelantan. A survey was carried out and a total number of 384 respondents was completing the questionnaires which is consisted overall 38 questions. The result showed the customer satisfaction that fulfil their necessary and feelings are based on “service quality” and the several factors such as “price”, “ambiance” and “location”. Hence, any factors must be addressed appropriately in order to maintain a high level of customer satisfaction and the image of the hotel intact. Furthermore, customers from different subgroups have different feelings on the service quality. In this study, questionnaires were distributed to customers from different segments. The aim was to investigate the factors that influences the customer satisfaction towards service quality in 3-star hotels in Kelantan. The research also tested the mediating effect on customer satisfaction based on the service quality that provided. Thus, the results demonstrated a need for better service quality to create satisfaction from customers to those factors that fail to generate customer satisfaction based on the investigation.

Keywords: Hotels, Price, Ambiance, Location

INTRODUCTION

Hospitality is a contemporary human interaction that is designed to enhance the mutual wellbeing of one another (Brotherton and Wood 2000). In the context of the hospitality industry, the term "hospitality industry" describes a wide range of institutions and departments related to accommodation, food and beverage, travel and tourism, meeting and event, and recreation (MA Ferdous, S Mim, 2021).

The hotel industry is defining all forms of business which are related to a provision. For instance, accommodation in lodging, food and beverage and also other services provided connect and form the public service. Hotels in Kelantan are provided with extra health and safety measures. For example, hotels such as “The Grand Renai”, “Perdana Kota Bharu”,

“Tanjong Inn”, “OYO 90274” “Wadi Isfa Inn” etc. These kinds of hotels are recommended as the best hotel in Kelantan (Tripadvisor,2014).

According to a review of a 5-star hotel which is Perdana Kota Bharu, the reviewer 2022 gave the hotel a 2-star rating to them due to reasons such as the ambiance and structure of the room does not suit the ambiance of a 5-star hotel. The reviewer mentions the room was dingy and furnished very shabbily with old wooden furniture (TripAdvisor, 2022). According to a study by Steffy (1990), this leads to customer satisfaction in hotel environments when lighting is structured to blend in with furnishings and decorations as well as the pleasing aroma that guests detect. However, in some situations where the lighting is unsuited or the scent in the hotel environment is unpleasant with other room elements, this can cause customer dissatisfaction or impacted customer spendings.

Hotels will decide to situate nearby another hotel with comparable features to profit from the external economies of all businesses operating in the same location (Adam, Mensah, 2014). The 3-star hotel has been mentioned earlier, Ibis Styles Hotel Kota Bharu is 1.5 km from tourist spots such as the Handicraft Village and Craft Museum. The hotel is located exactly in the strategic location at the centre of Kota Bharu. In an interview with a reporter from a U.S. economics journal, Conrad N. Hilton, the previous owner of Hilton hotels, emphasized that location is the top, second, and third most crucial aspect for a hotel's success (Park and Min, 2012).

Customer expectation refers to the thoughts and feelings that a customer has. The feelings of customers are required from a product or service they received (Parasuraman Zeithaml and Berry,2018). The expectation that services provided for visitors in 3-star hotels serves as a gauge of consumer satisfaction (Holmes, Ovenden and Wilson,2008, p.28). Customer or customer satisfaction is kind of ill-defined notion, and the actual manifestation of the state of satisfaction varies from person to person or from service to service (Bluestein, Abram, M. Moriarty and R.J. Sanderson,2003). Therefore, the customer’s expectations of hotels are competent services, friendly nature staff, important of 4 courtesies, professional service, etc. It is basically the customer satisfaction that will be shown if the customers will repeat their visitation if they met their expectations based on the above.

SIGNIFICANCE OF THE STUDY

Practical

Hotel Entrepreneur

Hotel entrepreneur is a person that manages hotel operations and oversees aspects from the hotel workers to the guests. This study will help in finding out the specific information on what the hotel guests are dissatisfied with the hotel and would plan ahead and fix what they lack thereof.

Customer

A customer is the most significant factor because they would be the ones to buy a firm's product or service. It is the business's job to fulfil the customer's needs and demands. This study will help customers in a way to receive a better service provided by the hotel side. This is due to them improving what they have lack of while back and now learning to take care of their customers better.

Academic

Researcher

Researcher is a person that carries out research-based papers. They would be the ones to contribute to society by giving out their ideas and analysing information. The study will help them in utilizing the content of the study effectively by gathering recommendations and experience. There would also be high dissemination of knowledge among them.

LITERATURE REVIEW

“Customer satisfaction” is defining as an analysis of the perceived gap between previous expectations and the product's actual performance (Tse and Wilton,1998, Oliver,1999). It is a subjective, ethereal and complex idea that combines how satisfied and thrilled customers are with the goods and services offered by the company. Customers' happiness with its good and services is said to be the most important factor in determining how competitive and successful the firm is (Henning-Thurau&Klee,1997). Customer satisfaction enhances customers' dependability for a single telecommunications provider. Customer satisfaction in the telecommunications industry can beat out brands by cultivating a long-lasting and lucrative relationship with their clientele (Eshghi, Haughton, and Topi, 2007). Although it is expensive to gain satisfied and devoted clients, doing so would ultimately be advantageous for a business (Anderson, Fornell, and Mazvancheryl, 2004). A business should

be focus to improve their quality of services and charge reasonable prices instead of pleasing their customers (Gustafsson, Johnson, and Roos, 2005). This will help the business keep its clients. It is a well-known fact that more than any other factor, a company's ability to keep customers happy depends on the services and the prices it charges (Turel et al. 2006). Customer engagement is crucial because it raises the satisfaction level when a customer views a product as significant and takes time to research it (Russell Bennett, McColl-Kennedy, and Coote, 2007). Quality is an ambiguous and indistinct construct. A product or service's quality can be assessed based on how well it guarantees total customer satisfaction and how well it is used. According to previous studies, customer service is a set of activities that includes ways to assist consumers, handle complaints promptly, make it simple to file complaints and provide a welcoming environment for authorizing complaints. And service quality is the conclusion of a process of evaluation wherein a client contrasts their expectations with their impressions of the service delivery process and its results. According to Kim, Park, and Jeong, 2004: "Customer service is a set of actions that includes methods for providing support to customers, processing complaints quickly, making it simple to file complaints, and providing a friendly environment for filing complaints."

Price is the sum of all the values that consumers are ready to give up in exchange for a product or service's benefits. The entire number of products or money required to purchase a particular combination of one object and associated services may also be mentioned. According to Kotler and Armstrong (2010), price is the sum of the value customers switched for the advantages of owning or using a good or service while Stanton, Michael, and Bruce (1994) state price are the amount of money or other resources needed to buy a specific mix of one product and its ancillary services is referred to as the price. Price fairness referred to consumer evaluate whether a seller's price is fair or reasonable (Xia et al., 2004; Kukar-Kinney, Xia and Monroe, 2007). Pricing is an important consideration when assessing satisfaction. Reasonable pricing has a positive effect on consumer satisfaction and loyalty. According to prior studies, a customer's choice to accept a certain price has been demonstrated to have an impact on both their level of happiness and loyalty, both directly and indirectly (Martin-Consuegra et al., 2007). According to Herrmann et al., (2007), it was determined that pricing perceptions have a direct impact on customer satisfaction while perceptions of price justice have an indirect impact.

The larger service scape includes ambient conditions, which have been observed to have an impact on customers' pleasure, behavioural intentions, and image. A suitable and

comfortable environment has enhanced customer satisfaction by staying in a hotel. Customers' opinions of the services or brand are improved by positive service reviews and favourable service environment aspirations. Aside from influencing these factors, ambiance can also impact how various clients with various personalities respond (Ebenezer & Akaninyene, 2021). According to Eroglu and Machleit (2001), much research is on the aspects of consumers' behaviour or individual characteristics at the expense of other behavioural facts. Openness to experience is correlated with how active person is in seeking out and appreciating novelty; conscientiousness reflects their likelihood of achieving their goals; extraversion factors show how much and how intensely they interact with others; agreeableness is correlated with their propensity to empathise with others; and neuroticism is correlated with their propensity to experience psychological distress (Mowen, 2000).

Choosing the right strategic location for the hotel is important due to an ideal location is linked to higher demand for accommodations, improved company performance, higher level satisfaction of guests, and the least rate of failure (Xiang and Krawczyk 2016). Once the hotel is constructed, hotel management's strategic marketing must fit into the target market of the surroundings. Factors such as local areas economical condition, zone rules, public properties and services, transit convenience and accessibility, parking facilities, geographic considerations, natural resources, and space are taken into account when choose perfect location for a hotel, correlation can be accomplished in order to maintain the business (Chou, Hsu, and Chen 2008; Gray and Liguori 1998). The hotel's location significantly affects how much its customers enjoy and gain from their experiences while there (Yang et al., 2017). After the strategic location of the hotel is identified, the customer that came to the tourist's attraction must chose the hotel based on their travel itinerary.

Research Hypothesis

H1: There is a relationship between prices towards customer satisfaction on services quality in 3-Star hotels in Kelantan.

Price is the sum of all the values that consumers are ready to give up in exchange for a good or service's benefits. The entire number of products or money required to purchase a particular combination of one object and associated services may also be mentioned. According to Kotler and Armstrong (2010), price is the total of what consumers are willing to pay for the benefits of owning or using a good or service while Stanton, Michael, and Bruce (1994) state the amount of money or other resources needed to buy a specific mix of one

product and its ancillary services is referred to as the price. It may also refer to the price paid for a good or service. Price fairness refers to consumer assessments of whether a seller's price is reasonable or fair (Xia et al., 2004; Kukar-Kinney, Xia and Monroe, 2007). Pricing is an important consideration when assessing satisfaction. Reasonable pricing has a positive impact on customer satisfaction and loyalty. It was discovered that customer pricing perceptions have a direct impact on customer happiness, whereas the perception of price equity has an indirect impact. However, the price alone has a big impact on satisfaction.

Customer satisfaction has a strong positive relationship with perceived fairness. In order to satisfy, Oliver and Swan (1989a, b) discovered that the seller's commitment and the worth of the goods and services in comparison to the price had an impact on consumers' views of fairness. The price perception has an impact on consumers satisfaction both directly and indirectly. Al-Msallam (2015), price is playing major role in boosting consumer pleasure because it is believed by experts that customers constantly evaluate services' worth and its price. Campbell (1999) demonstrated that pricing fairness has a significant impact on branded image. As a result, perceived price unfairness may cause consumers to switch brands and spread negative word of mouth. Rothenberger (2015) revealed that customers' negative perception of unfair prices may be a factor in their complaints, decreased repurchasing behaviour, bad word of mouth, and complaints.

H2: There is a relationship between ambiance towards customer satisfaction on service quality in 3-Star hotels in Kelantan.

Staying in a hotel has increased customer satisfaction because of the appropriate and comfortable setting. Positive service ratings and good intentions for the working environment help customers' perceptions of the business or service. Aside from having an impact on these variables, the environment can also affect how distinct clients with different personalities react (E, Ebenezer & Akaninyene, 2021). According to Eroglu and Machleit (2001), despite the detriment of other behavioural facts, many study focuses on the features of consumer behaviour or individual qualities. Extraversion traits reveal how frequently and strongly a person interacts with others, while conscientiousness measures how likely a person is to achieve their goals, agreeableness is correlated the ability to sympathise with others while likelihood of psychological suffering is correlated with neuroticism. Openness to experience is related to how proactive an individual is in seeking out and appreciating novelty (Mowen, 2000).

An essential environmental cue in the hotel sector is ambiances (Jani & Han, 2014, 2015). Jani and Han (2014) examined the atmosphere as a moderator that influenced factors including happiness, hotel image, and overall loyalty that were related to the link between customers' personalities and hotel assessments. They understood the value of hotel ambiance and provided evidence that relationships grew stronger in warm environments. The researcher also mentioned the significance of environments in the hotel industry, where ambience circumstances may influence enhancing customer loyalty.

H3: There is a relationship between location towards customer satisfaction on service quality in 3-Star hotels in Kelantan.

The hotel's location has a big influence on how much its visitors enjoy and gain from their stays (Yang, Mao, and Tang, 2017). The customer who visited the tourist attraction must select the hotel depending on their trip plan after the hotel's strategic location has been determined. In accordance with the rule of distance decay, research on tourism and tourism geography has further revealed that hotel location significantly affects visitor movements (Dredge 1999). Facilities nearby may have an impact on the criteria that customers use to select a hotel. Customers can arrange their travel to nearby facilities in advance. The hotel's geographic location predetermines the level of customer activity. The amount of client activity would increase if the hotel were situated in a city, whereas it would decrease if it were situated in a rural location. The latter is the situation involving the geographical obstacle. A gravity spatial allocation paradigm was introduced to examine location satisfaction criteria for residential buildings. Their approach identifies three factors: neighbourhood influence, site attributes, and accessibility (Werczberger and Berechman, 1988). Since it makes financial sense for hotel guests to reduce their time and financial commute expenses, accessibility plays a significant role in both picking a hotel site and being content with it (Yang, Mao and Tang, 2017). The researchers acknowledged that the hotel's location was significant in providing customers with the appropriate level of service.

Research Framework

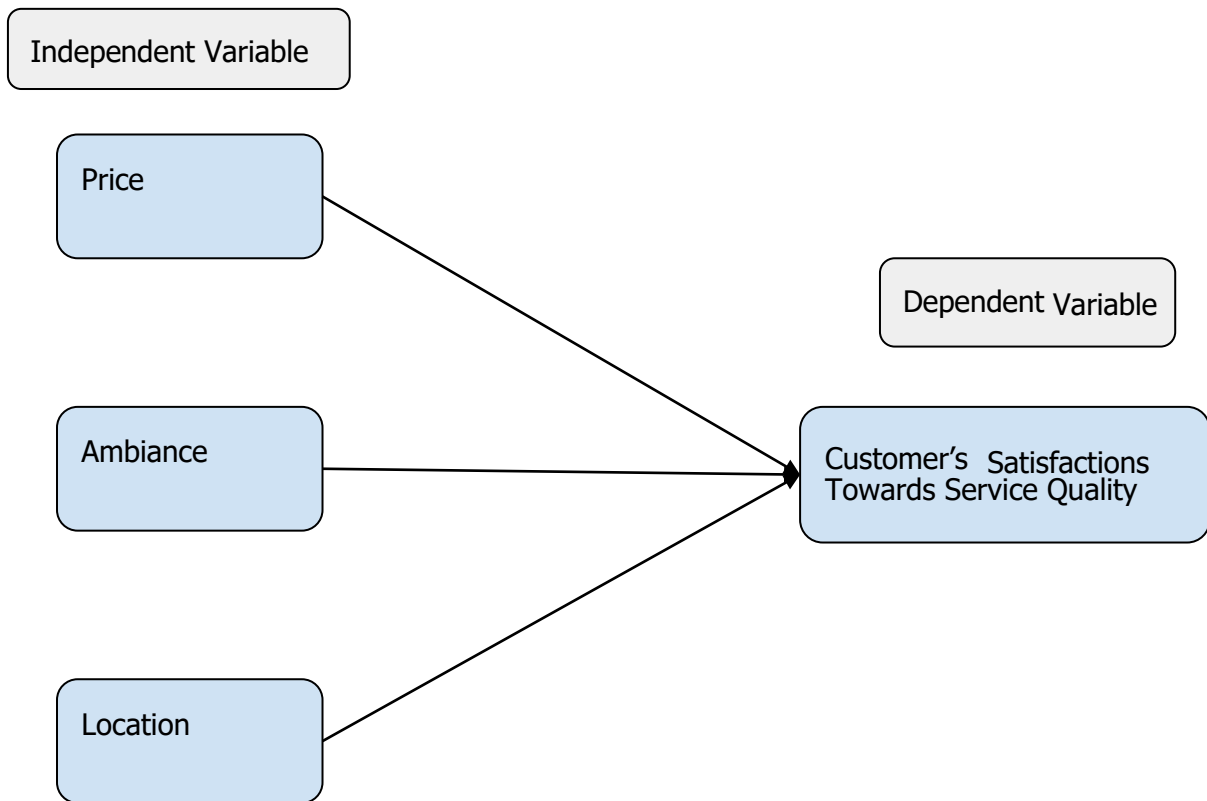

Figure 1: Conceptual Framework

Adapted and adopted from Zelthami and Len Berry (1970), E, Ebenezer & Akaninyene, 2021, and Xiang and Krawczyk 2016)

METHODOLOGY

Research Design

A research design is a collection of techniques and steps used to gather and examine data on the variables mentioned in a research challenge. This study uses a cross-sectional design and a quantitative research methodology, in which the researcher gathers all the data at one particular moment. It also examines how guests pick hotels based on the amenities and services they receive. The researcher also consults journals and other papers linked to development to make sure that the choice of hotels based on facilities and equipment in the hospitality sector is appropriately identified.

Data Collection

To gather, measure, and analyses precise study-related data for this investigation, typical data collecting approaches that have been validated are used. A primary questionnaire titled "Factors that Affect Customer Satisfaction with Service Quality in 3-Star Hotels in Kelantan" was used to gather primary data. Researchers had used a site which is Google Form to collect data and choose appropriate respondents to fulfil the questionnaires. The method utilized in this study is simple random sampling, which facilitates the respondents by using a straightforward survey. In the pilot project, 384 questionnaires were created for participants to complete, with instructions on how to explain their responses in light of the assistance they received at the time. The purpose of this pilot study is to gather insightful comments that will help the researcher rewrite and enhance the publishing paper.

Sampling

The accessible participants for this study were chosen from a pool of individuals or employees in the Malaysian hotel business using a non-probability convenience sampling technique. Instead of choosing from the full population, convenience sampling is utilized since it is quicker and less expensive. These surveys, which are generally filled out by students and the general public, must be completed by respondents who subsequently must submit data based on their answers.

Data Analysis

A well-liked computer tool to analyse quantitative data is called the Statistical Package for the Social Sciences (SPSS). It can be used to create tabular reports with graphs and incentive plots and to examine the collected data using the Pearson Correlation Coefficient method. This study intends to determine the connection between organisational fairness, limitations, trust, work autonomy, and employee performance as well as to assess the relationship between the independent variable (IV) and dependent variables (DV).

FINDINGS

This study discussed the results of the data analysis that was done on the data obtained from the survey. The data collected from 384 respondents were analysed to examine the factors that influence customer satisfaction towards service quality in 3-star hotel in Kelantan. Besides

that, the researchers were able to test the hypothesis and answer the research objective of the study.

Demographic Profile

The demographics collected include gender, race, age, marital status, occupation and how often do they stay in hotels in Kelantan. The result showed the major respondents are female with 274 respondents. Followed by race which is the majority of them are Malay with 156 respondents. Next, we have the age of the respondent mostly were 21-30 years old for 210 respondents which could be explain that this is their prime time in visiting other places whilst staying in Kelantan hotel. Most of the respondents are single and unmarried for 262 respondents which is could be that they have more freedom to move without anyone holding them back. Furthermore, most of them are students too for 192 respondents. The number of how often they stay in hotel in Kelantan most answered were less than 1 time or had stayed once would be 169 respondents. Therefore, most of the students that stayed in hotel once could be choosing hotels as an alternative for a quick pit stop.

Descriptive Statistic

Figure 2 shows the total mean score and standard deviation of the variables for the independent variables which were price, ambience and locations while the dependent variable would be Customer Satisfaction based on service quality. For independent variable, the total of mean scores and standard deviations would be ambience (mean=3.64, SD=1.03). The following would be price (mean=3.48, SD=0.97) and the lowest of them would be location (mean=3.59, SD=0.95). The dependent variable which is the customer satisfaction based on service quality (mean=3.41, SD=0.73). In conclusion, ambience has the most influence on the customer satisfaction based on service quality.

Table 1: Total Mean Scores and Standard Deviation

VARIABLES	N	MEAN	STANDARD DEVIATION
Price	384	3.48	0.97
Ambiance	384	3.64	1.03

Location	384	3.59	0.95
Customer Satisfaction Based on Service Quality	384	3.41	0.73

Reliability Test

The Cronbach's Alpha Coefficient test are to see whether the study is reliable or not. Based on Figure 3, it shows price has Cronbach's value of 0.829. The second variable is ambience with Cronbach's value of 0.932 followed by the last independent variable which is location for Cronbach's value of 0.94. The dependent variable, service quality Cronbach's value would be 0.92. All four variables are considered consistent and therefore are reliable to use in this study.

Table 2: Results of Cronbach's Alpha Coefficient of price, ambience and location and customer satisfaction on Service Quality in 3-Star hotels in Kelantan.

Independent Variable	Dependant Variable	Number of Items
	Customer's Satisfaction Towards Service Quality	
Price	0.829	10
Ambience	0.932	10
Location	0.94	8
Service Quality	0.92	10

Pearson Correlation

Figure 4, hypothesis 1 illustrates the relationship between price and customer satisfaction on service quality in 3-Star hotels in Kelantan. The correlation coefficient of 0.580 suggested a moderate positive relationship between price towards customer satisfaction on service quality in 3-Star hotels in Kelantan. The p-value of food price is 0.000 which is less than the highly significant level of 0.001. Therefore, there is a significant relationship between price towards customer satisfaction on service quality in 3-Star hotels in Kelantan.

Hypothesis 2 illustrates the relationship between ambience towards customer satisfaction on service quality in 3-Star hotels in Kelantan. The correlation coefficient of 0.596 suggested a moderate positive relationship ambience towards customer satisfaction on service quality in 3-Star hotels in Kelantan. The p-value of food price is 0.000 which is less than the highly significant level of 0.001. Therefore, there is a significant relationship between ambience towards customer satisfaction on service quality in 3-Star hotels in Kelantan.

Hypothesis 3 illustrates the relationship between location and customer satisfaction on service quality in 3-Star hotels in Kelantan. The correlation coefficient of 0.384 suggested a weak but definite relationship between location and customer satisfaction on service quality in 3-Star hotels in Kelantan. The p-value of food price is 0.000 which is less than the highly significant level of 0.001. Therefore, there is a significant relationship between location and customer satisfaction on service quality in 3-Star hotels in Kelantan.

Table 3: Pearson Correlation of price, ambience and location and customer satisfaction on Service Quality in 3-Star hotels in Kelantan.

Independent Variable	Dependant Variable Customer's Satisfaction Towards Service Quality	p-value
Price	0.829	0.000
Ambience	0.932	0.000
Location	0.94	0.000

DISCUSSION AND RECOMMENDATION

H1: There is a relationship between price towards customer satisfaction on service quality in 3-Star hotels in Kelantan.

The result for hypothesis 1 has a positive influence on each other due to price fairness can influence guests' perception of value for their money. Xia (2007), price fairness is whether a sellers' price is reasonable or fair that evaluate by consumers. If price fairness does not apply here, the tendency to switch to other hotel alternatives will be high because nowadays it is easily accessible (Abrate, 2012) Having access to online booking applications in their smartphone helps customers in making the right decision.

H2: There is a relationship between ambiance towards customer satisfaction on service quality in 3-Star hotels in Kelantan.

The result for hypothesis 2 has a positive influence on each other because of the inclination of guests to stay in a hotel could depend on the ambiance the hotel exudes. Jani and Han (2014) looked into ambiance as a moderator that affected the connection between guests' personalities and hotel assessments such as contentment, hotel images, and overall loyalties. The role of the human five senses in making deductions on projecting the correct ambiance are significant to their satisfaction. D'Astuous (2000) mentioned in his study that ambiance affected the five senses by defining the ambiance is a term used to describe conditions in the backdrop of an environment that are below the level of immediate consciousness.

H3: There is a relationship between location towards customer satisfaction on service quality in 3-Star hotels in Kelantan.

The result for hypothesis 3 shows a positive influence on each other due to the accessibility of the hotel to the place of their desired destination. Xiang and Krawczyk (2016). The accessibility of a hotel, such as the distance from urban area and tourist attractions is typically correlated with its location. The hotel may be located where transportation would be available for them 24/7 and is safe for them. Enz (2009) discovered a direct relationship between a hotel's location and its level of security and safety.

One of the recommendations that can be done to overcome customer origin is to increase the sample size from different states by not just specific in the Kelantan area. The researcher believes that customers who came from different states will have different perceptions when they answer the questionnaire and may have relied on the perception of the customers. This is because the customers that went to 3-Star hotel are not just people that live in Kelantan, but we must consider the population from different states in Malaysia that came to Kelantan as tourists.

Other than that, limit the age of the respondents to only 18 and above to answer the questionnaire. This is because respondents at 18-year-olds and below did not have income to support the fees such as hotel fees and amenities just yet. It is advised that future research expand the age range of the sample to increase the generalizability of the findings based on the

study's findings. This can be accomplished by actively seeking out and recruiting individuals from a larger age range to ensure representation across all life phases.

The next one should use qualitative methods in collecting data from respondents. This is because some respondents lacked the necessary information to complete the survey. Some of them would rather have an interview session. It's suggested for future research to consider other factors other than price, ambience, and location in influencing customer satisfaction of service quality in 3-Star hotels in Kelantan. The hotel facility or the type of room provided by the hotel could be made as one of the variables because it has the efficiency of helping understanding factors affecting hotel customer satisfaction.

On top of that, to deal with the respondents who, tend to answer neutral in the questionnaire would be to give up on the possibility of neutral option. This way, the respondents will be forced to choose a definite answer one way or another. The researcher may want to opt for a more accurate mode of Likert-scale questionnaire which is by using the seven-point Likert items. 7-point Likert scales are more precise, simpler to use, and a better representation of the real opinion of the respondents

In addition, the researcher may only focus on a single location. In this study, the researcher only focused on the Kelantan area. This limitation has restricted the generalizability of hotels that are in other places with potentially varied customer expectations, cultural influences, and service standards. So, the future research should be testify the effect of geography on the phenomenon under inquiry, according to the study's conclusions.

CONCLUSION

To be conclude, this study carried out to investigate the relationship between price, ambience and location towards customer satisfaction on service quality in 3-Star hotels in Kelantan. The conceptual framework is developed using the reviewed literature. The researcher intended to look into the relationship between the independent and the dependent variables. Survey was conducted via online questionnaire and drew 384 respondents. The data was collected and analysed by usage of descriptive statistics, reliability analysis, and correlation analysis using SPSS software version 28 and 27. The overall variables were 0.9003 as a result of the reliability analysis. As a result, the presented result is trustworthy and can be accepted in this study.

ABSTRACT

“The world has been presented with a variety of modernity and technological sophistication that can match human efficiency. Robots are among the technologies that can replace humans in terms of daily work. But to what extent can these advanced robot capabilities meet and give satisfaction to humans in their use, especially in industrial sectors such as the hospitality industry where robots are now increasingly taking over all the tasks that were previously done by humans. Research has shown that there are several factors that influence customer satisfaction towards robotic service restaurants. The purpose of the study is to determine the four main factors in knowing customer satisfaction with robot restaurant services. These four factors are service efficiency, time saving, security and monetary value. For gathering information and data, an online questionnaire has been distributed through social media. Malaysian population is used, and samples have been taken to analyse the data to find answers to this study. Scientific methods are also applied to obtain excellent results along with making this study more practical and useful”.

Keywords: Customer Satisfaction, Time Saving, Service Efficiency, Security, Monetary Value

INTRODUCTION

Numerous sectors around the world use robots nowadays, particularly in the restaurant sector of the hospitality industry. Our daily lives now contain many robots (Ferreira, 2017). The restaurant sector makes use of several different kinds of robots. For instance, a cook robot oversees preparing various foods, and a host robot oversees welcome clients to the reception area and directing them to their tables (Lu, 2019). Customers place orders, and a waiter robot brings the food to the tables (Eksiri & Kimura, 2015). In 2014, Aloft Hotels debuted the A.L.O "robotic butler or Botlr" in its Cupertino location, making it the first hotel chain to use robot technology. The robot can deliver packages across the hotel. Robot service is already being used in the restaurant and hotel industries in Arabic. Due in part to the fact that concepts of mechanisation and self-administration are unquestionably playing a key role in the customer experience, restaurant hotel robots in Saudi Arabia have become a popular technological trend within the hospitality industry. The use of robots can lead to improvements in terms of speed, cost effectiveness, and even precision (Insureqlik, 2021). In the core of Dubai's city centre, at Umm Hurair 1, the restaurant known as "Drink and Spice Magic" is the first to employ the services of a robot server named Ruby which is entertains and increases customers satisfaction who visit his restaurant (AirTimes,2018).

The main problem in this research that there is still less use of robot service in Malaysian restaurants because it can have a negative impact on human employment opportunities. In Malaysia, the use of robot service in restaurants can be said to be very unsatisfactory because only some restaurants use the service. Only 50% of restaurants in Malaysia use robot services because some restaurants do not meet the criteria, especially in terms of the size of the premises (Berita Harian et al., 2022). This is evident since robots were unable to perform tasks other than those programmed into their systems.

Significance Of the Study

Practical

This study will help hospitality sector entrepreneurs to build and sustain a good service with a right choice when they want to decide an appropriate service to their customer. In another practical aspect, it will open the eyes of hospitality sector operators to the use of advanced robots from a positive or negative point of view.

Academic

This study reopens the gap of lack of research resources carried out by researchers in matters related to this study and open space for their research to venture and deepen far in their research. Besides, with this study, an increase in related reference materials or similar searches can be accessed by researchers to carry out their future studies where this research will provide information on customer satisfaction and factors also related to the use of robot's service.

LITERATURE REVIEW

Service Efficiency

Robotic service has grown in favor among customers and organizations. A serving robot, a sort of service robot built for the primary purpose of serving and utilized in the restaurant business, is a robot with a limited objective of "serving," as opposed to service robots with a broad range of applications (Jang & Lee, 2021). When the serving robot brings the requested meal to the front of the client's table, the customer places the food on the table himself. The serving robot substitutes the serving that the employee must do, allowing the person to deliver additional high-quality services while enhancing efficiency. It can also give clients with a robot serving attraction and advertising impacts (Park, 2020). Service efficiency (total length and delay time) expectations were considerably different for service-related elements, with carry-out evaluated as the most efficient, followed by human delivery and finally robot delivery. Notably, even though the specific robot for each meal delivery attempt was not monitored, researchers and customer survey participants observed delivery robots frequently halting for significant periods of time. Restaurants may benefit from robotics in a variety of ways, including greater efficiency and production, improved safety and sanitation,

and improved customer service. Furthermore, robots can help free up humans for other activities or even allow organizations to run with fewer personnel.

Time Saving

Robots produce various benefits over human labour, one of which is time savings. Reducing the amount of time required to complete a task, particularly in restaurants where customer happiness is highly impacted, is known as time saving. Robots can work continuously for 7 days a week, providing customers with any services in restaurants without becoming weary. Due to their ability to work continuously and incredibly effectively, robots do not require breaks or vacation days because robots are created to help human jobs (Robotworx, 2021). This allows businesses like restaurants to save time and money while also enhancing the quality and value of their business. With the presence of this robot, it can indirectly reduce the amount of time it takes for human labour to deliver and collect each order from clients by a short amount of time. Given the rise in orders, most restaurants currently employ robot labour since it saves time and gives the establishment an advantage over human labour, which requires more time to move about while performing work in restaurants. As a result, this robot can reduce delivery times overall and may even enable the restaurant to expand. Collaboration between humans and robots can save time and resources on specific jobs (Amanz, 2021). Due to the high number of robot employees, many managers of restaurant use them as staff because there are many advantages obtained from human labour, especially in terms of time saving (Soyacincau, 2021).

Monetary Value

Financial value can also be linked to an agreement in the payment of goods and services according to economic value (Lo & Spash, 2013). Investing in something affects the decision in the portfolio for monetary value (Amendinger et al., 2003). The use of this robot focuses on the customer's reaction as a service value with the advanced technology available on the robot. Blanche et al. (2021). Telemedicine is successfully addressed with the help of robots and robots become an economic option in terms of telemedicine consultation systems. (Jang et al., 2020). This causes telemedicine to affect the demand for the value of money to meet human needs. This robot will also accelerate economic growth through business operations. This robot service is also able to reduce the covid-19 infection for the process of economic recovery to the value of money. The service sector contributes to the economy in monetary value, especially in restaurants with good work results.

Security

Security is the state of being or feeling secure, free of fear, anxiety, danger, and uncertainty. Something that provides or guarantees safety, tranquillity, or certainty, such as protection or safeguard. Security is an outsourced service in which an outside company handles and manages your security because robots can directly perceive and affect the physical world (Webster's New World College, Houghton Mifflin. 2014). Besides, security is especially important in robotics. As autonomous systems interact with humans and robotic systems grow more widespread, the necessity to safeguard these systems becomes crucial. As robots gain

popularity in a wide range of disciplines and applications, increasing emphasis is being placed on the safety and security aspects of robotic performance. The term "safety" typically relates to human-robot interaction or the protection of the robot from physical injury (Jorge Pea Queralt, Qingqing Li, and Tomi Westerlund. 2021). What is commonly overlooked is that the safe operation of an autonomous robot is closely tied to the rigorous security of the data involved includes mission order data.

Customers Satisfaction

Customer satisfaction is defined as the degree to which customers are satisfied with a company's products, services, and capabilities. Customer satisfaction data, such as surveys and ratings, can help a company decide how to improve or modify its products and services. According to the Service robot acceptance model (sRAM) proposed by (Stefanie Palunh, Jochaen Wirtz, Werner H Kunz.2018), in addition to functional components like perceived ease of use and utility influencing customer satisfaction, social-emotional and relational elements are also important factors forming customer satisfaction of service robots (Marketing Metrics, Paul Farris.2010). The number of customers, or proportion of all customers, reporting positive experiences with a company, its goods, or services surpasses predetermined satisfaction goals. Customer satisfaction as a 'person's emotion of joy or disappointment, which comes from measuring a product's perceived performance or outcome versus his/her expectations'. However, in the case of hospitality, experts have proposed that additional criteria may be required to completely explain the adoption of robot technology (Go et al., 2020). For example, may be impressed by the faster service provided by robots (Lee, 2011). Similarly, the novelty of the robot service experience itself may boost client pleasure (Bello and Etzel, 1985; Duman and Mattila, 2005). In restaurants, this means that order wait times can be significantly decreased, perhaps leading to higher customer satisfaction by (Stefanie Paluch, Jochen Wirtz, Werner H Kunz.2018).

Research Hypothesis

1st Hypotheses:

H (1): There is relationship between service efficiency with customers satisfaction towards robotic service restaurant in Malaysia.

The results of hypothesis H1 stated that there is a significant relationship between service efficiency and customer satisfaction toward robotic service in the restaurant industry. From the findings, it shows that it is moderately positive with a correlation coefficient of 0.529 at a p-value of 0.00 which is less than the highly significant level of 0.1. Therefore, H1 is accepted.

2nd Hypotheses:

H (2): There is relationship between time saving with customers satisfaction towards robotic service restaurant in Malaysia.

This was answered by reviewing the outcomes of hypothesis H2. According to H2, there is a significant relationship between time saving and customer satisfaction toward robotic service in the restaurant industry. To the findings, the correlation coefficient is 0.689, and the p-value is 0.00, which is less than the highly significant level of 0.1. Therefore, H2 is accepted.

3rd Hypotheses:

H (3): There is relationship between security with customers satisfaction towards robotic service restaurant in Malaysia.

To answer this need to review and look at the result of hypothesis 3. H3 mentioned that there is relationship between security with customer satisfaction towards robotic service restaurant in Malaysia. From the findings, it is positive with the correlation coefficient of 0.70 while p value is 0.00 which is less than the highly significance level 0.01. As a result, H3 is accepted.

4th Hypotheses:

H (4): There is relationship between monetary value with customers satisfaction towards robotic service restaurant in Malaysia.

To answer RQ4, need to review and look at the result of hypothesis 4. H4 mentioned that there is relationship between monetary value with customer satisfaction towards robotic service restaurant in Malaysia. From the findings, it is positive with the correlation coefficient of 0.68 while p value is 0.00 which is less than the highly significance level 0.01. As a result, H4 is accepted.

Research Framework

Figure 1 : Conceptual Framework Adapted From Gronroos (1984), (Lloyd, , A. E., Chan, R. Y., Yip, L. S., & Chan, A., 2014), (Tam, 2004), (Byrd, K., Fan, A., Her, E., Liu, Y., Almanza, B., & Leitch, S., 2021)

METHODOLOGY

Research Design

In this study, a quantitative method will be used to gain all the data through questionnaires. A good research design aids in the resolution of the research topic. According to Abutabenjeh and Jadara (2018), Babbie (2004) stated that the study design is a plan for the researcher to determine what to observe and analyse, why, and how. To collect all the data for this investigation, a quantitative method is used. The quantitative research method comprises a variety of techniques for conducting systematic investigations of social issues using statistical or numerical data.

Data Collection

This research must clarify the data sources, data types, and methodology used during data collections. For this research, before data can be measured, it could be necessary to analysed once it is collected. For examples, it might be required to change questionnaire and survey results from words to numbers. In this research use Google Form because it easy to obtain responses without to ask face to face. There are random respondents who were chosen to complete the questionnaires or survey were used to collect the data. The questionnaires will be divided into Sections A and B, and they will each be represented in both English and Malay. This questionnaire is about how customers can give answer or perspective about customers satisfaction toward robotics in the restaurant.

Sampling

Sampling is the method used to choose this subgroup from the population, and this subgroup is called as a sample. In this research, sampling method strategies which are probability sampling technique. Probability sampling technique have many techniques, but simple random sampling is suitable for this research. So, in this case the researcher use questionnaire using social platform is Google Form and research give the questionnaire through social media such as WhatsApp, Facebook, Instagram and more. This way is easier because of people nowadays use smartphone to communicate. This method is helpful and suitable by using simple random sampling.

Data Analysis

The data in this study was analysed using the Statistical Package for Social Science (SPSS), version 28. SPSS is a piece of software that can utilise descriptive analysis and correlation to describe the relationship between independent and dependent variables. SPSS can convert data from Malaysian respondents into meaningful information. As a result, the researcher benefits, and the reliability analysis aids in data interpretation. There are three types of data analysis: reliability analysis, descriptive analysis, and Pearson's Correlation Coefficient.

FINDINGS

Demographic Analysis

Table 1: Respondents' Gender

		Frequency	Percent
Valid	Male	192	50.0
	Female	192	50.0
	Total	384	100.0

Table 2: Respondents' Age

		Frequency	Percent
Valid	18 - 25 year old	181	47.1
	25 - 30 year old	104	27.1
	30 - 45 year old	77	20.1
	45 year old and above	22	5.7
Total		384	100

Table 3: Respondents' Race

		Frequency	Percent
Valid	Malay	220	57.3
	Chinese	94	24.5
	India	64	16.7
	Other	6	1.6
	Total	384	100.0

Table 4: Respondents' Education Level

		Frequency	Percent
Valid	Primary School	3	0.8
	Secondary School	69	18.0
	Stpm / Diploma	139	36.2
	Bachelor Of Degree	161	41.9
	Masters	12	3.1

Table 5: Respondents' Occupation

		Frequency	Percent
Valid	Student	143	37.2
	Self-Employee	92	24.0
	Government Staff	89	23.2
	Private Staff	56	14.6
	Other	4	1.0
	Total	384	100.0

Table 6: Respondents' Income Level

		Frequency	Percent
Valid	No Income	134	34.9
	Below RM 1000	9	2.3
	RM 1000 - RM 3000	182	47.4
	RM 3000 - RM 5000	54	14.1
	RM 5000 and above	5	1.3
	Total	384	100.0

Table 7: Respondents' State

		Frequency	Percent
Valid	Kelantan	54	14.1
	Terengganu	27	7.0
	Pahang	37	9.6
	Johor	58	15.1
	Melaka	8	2.1
	Kuala Lumpur	24	6.3
	Selangor	31	8.1
	Negeri Sembilan	18	4.7
	Perak	30	7.8
	Kedah	26	6.8
	Perlis	21	5.5

	Total	384	100.0

Descriptive Analysis

Service efficiency

Table 8: Descriptive Analysis of Service Efficiency

NO.	Item Description	N	Mean	Level Of Agreement
1.	Did you satisfied did with the speed and efficiency of the robot service you received?	384	3.90	Agree
2.	Did the efficiency of the robotic service at the restaurant impact your overall satisfaction with the dining experience?	384	3.62	Agree
3.	The robot service was efficient in meeting my needs.	384	3.88	Agree
4.	The robot service was easy to use and navigate.	384	3.98	Agree

5.	Did you satisfied with the accuracy of robotic service provided.	384	3.93	Agree
6.	Did robotic service function-able to you nicely?	384	3.99	Agree
7.	The robotic service responded quickly to my queries.	384	3.91	Agree
8.	I would use the robotic service again in the future.	384	3.99	Agree
9.	The robotic service met my expectations.	384	4.00	Agree
10.	Overall, I am satisfied with the efficiency of the robot service.	384	4.00	Agree
	Average Mean	384	3.92	Agree

Time Saving

Table 9: Descriptive Analysis of Time Saving

NO.	Item Description	N	Mean	Level of Agreement
1.	The time-saving benefits of robotic service in a restaurant are more important to me than the novelty of using a robot.	384	3.97	Agree
2.	Did the robotic service save your time?	384	3.79	Agree
3.	Did the robotic service reduce your waiting time in the restaurant?	384	3.91	Agree
4.	Are you satisfied with the time it takes to receive your order when using robotic service in a restaurant?	384	3.91	Agree
5.	Did you satisfied with the time it took for your food to be prepared and served by the robotic system?	384	3.95	Agree
6.	Did the robotic service save your time compared to traditional service methods?	384	3.94	Agree
7.	The time-saving benefits of robotic service in a restaurant make me more satisfied with the value of the food and service.	384	3.89	Agree
8.	The speed of robotic service in a restaurant is more important to me than personalized service from a human server.	384	3.89	Agree
9.	I am willing to use a robot server for faster service than a human server in a restaurant.	384	3.92	Agree

10.	I believed that the speed and efficiency of robotic service in a restaurant enhances my overall dining.	384	3.98	Agree
	Average Mean	384	3.96	Agree

Security

Table 10: Descriptive Analysis of Security

No.	Item Description	N	Mean	Level Of Agreement
1.	I believe the robotic service is reliable and trustworthy.	384	3.96	Agree
2.	I feel comfortable interacting with the robotic service.	384	3.74	Agree
3.	The robotic service provides clear instructions on how to use it safely.	384	3.97	Agree
4.	Did you satisfied with the security measures of the robotic service you have used.	384	3.99	Agree
5.	I am confident that the security measures in place for robotic services are effective.	384	4.02	Agree
6.	Did you satisfied the security measures in place for the robotic service in the restaurant.	384	4.00	Agree
7.	Are you satisfied with the level of training and knowledge displayed by the restaurant staff in regard to the robotic service.	384	3.92	Agree
8.	I trust the security measures implemented by the restaurant for the use of robotic service.	384	3.99	Agree
9.	I would recommend the restaurant's robotic service to others based on its security measures.	384	4.02	Agree
10.	The presence of security measures for robotic service in restaurant enhances my overall dining experience.	384	4.01	Agree
	Average Mean	384	3.96	Agree

Monetary Value

Table 11: Descriptive Analysis of Monetary Value

No.	Item Description	N	Mean	Level of Agreement
1.	The cost of the robotic service in the restaurant was reasonable.	384	3.91	Agree
2.	I received good value for the price I paid for the robotic service.	384	3.75	Agree
3.	Have you ever felt that the cost of the robotic service in the restaurant was too high for the benefits it provides.	384	3.87	Agree
4.	Did you will recommend the restaurant to others based on its cost or value for money for the robotic service.	384	3.96	Agree
5.	Would you be willing to pay more for a restaurant that offers a wider range of robotic service options, such as automated ordering, robotic food delivery, and automated payment.	384	3.78	Agree
6.	Would you be more likely to visit a restaurant that offered a discount or promotion for the use of robotic service.	384	4.02	Agree
7.	Do you agree that the cost of the robotic service in the restaurant is fair compared to the cost of traditional human service.	384	3.93	Agree
8.	Did the cost of the robotic service affect your decision to dine at this restaurant.	384	3.97	Agree
9.	Did the price of the robotic service influence your decision to order more or less food or drinks than you would have otherwise.	384	3.91	Agree
10.	The cost of the robotic service did not negatively impact my overall satisfaction.	384	3.94	Agree
	Average Mean	384	3.90	Agree

Customer Satisfaction

Table 12: Descriptive Analysis of Customer Satisfaction

No.	Item Description	N	Mean	Level of Agreement
1.	Robotic service in a restaurant improves the efficiency of my dining experience.	384	3.90	Agree
2.	Robotic service in a restaurant increases my overall satisfaction with my dining experience.	384	3.70	Agree
3.	I find robotic service in a restaurant to be impersonal.	384	3.83	Agree
4.	Overall, robotic service in a restaurant is more accurate than human service.	384	3.65	Agree
5.	I believe that a restaurant using robotic service cares less about its customers.	384	3.12	Neutral
6.	I believe that a restaurant using robotic service cares less about its customers.	384	3.72	Agree
7.	I feel comfortable interacting with a robot in a restaurant setting.	384	3.86	Agree
8.	Overall, robotic service in a restaurant increases the quality of my dining experience.	384	3.84	Agree
9.	I am willing to pay more for a restaurant that uses robotic service.	384	3.86	Agree
10.	The availability of robotic service in a restaurant increases my overall satisfaction with the dining experience.	384	3.90	Agree
	Average Mean	384	3.74	Agree

Reliability Analysis

Table 13: Results for Reliability Analysis

Item Description	N.	No. of items	Cronbach's Alpha
Service Efficiency	384	10	0.810
Time Saving	384	10	0.795
Security	384	10	0.765
Monetary Value	384	10	0.752
Customers Satisfaction	384	10	0.779

Pearson Correlation Analysis

DISCUSSION AND RECOMMENDATION

For demographic analysis:

The frequency and proportion of respondents' gender is shown above. A total of 384 responders are female 192, with a ratio of 50.0%. The total number of male responders is 192, representing a ratio of 50.0%. The highest age frequency 181 (47.1%) respondents with the age 18 – 25-year-old. The age with the lowest frequency is 45 years old and above with only 22 (5.7%) respondents. The highest frequency race 220 (57.3%) of the 384 responders is Malay. The lowest just 6 (1.6%) respondents for the last race, which is others. The education level of respondents, a total of 161 (41.9%) respondents has a Bachelor's degree as their greatest level of education. Primary School has the lowest frequency of respondents, with only three (0.8%). The highest frequency respondents' occupations with 143 (37.2%) responders are student. The lowest frequent occupation followed by others with 4 (1.0%) respondents. In income level of respondents most of respondents are not earning with a frequency of 134 (34.9%) respondents. The lowest frequency is followed by 5 (1.3) with an income level of RM5000 and above. The highest frequency and the corresponding percentage values for each state is Johor where 58 occurrences which make up 15.1% of the total. The lowest is Melaka, just appears 8 times, representing 2.1% of the total.

For descriptive analysis:

For service efficiency, the highest mean value is 4.00 which is for item “The robotic service met my expectations” and “Overall, I am satisfied with the efficiency of the robot service” refer to agree on level of agreement. The lowest mean is 3.62 refer to item “Did the efficiency of the robotic service at the restaurant impact your overall satisfaction with the dining experience?” also agree for level of agreement. For time saving, "I believed that the

speed and efficiency of robotic service in a restaurant enhances my overall dining." the highest mean in the range of means is 3.98, and their level of agreement is agreed. The lowest mean is 3.79 refer to item "Did the robotic service save your time?" with agree level of agreement. The highest range of mean for security is 4.02 which are for item "Are you the security measures in place for the robotic service in the restaurant" and "I would recommend the restaurant's robotic service to others based on its security measures". Both are agree in the level of agreement. The lowest mean is 3.74 for item "I feel comfortable interacting with the robotic service" and agree were mentioned. For monetary value, the highest mean is 4.02 with agree level of agreement for item "Would you be more likely to visit a restaurant that offered a discount or promotion for the use of robotic service" and the lowest mean is 3.75 with agree level of agreement for item "I received good value for the price I paid for the robotic service". The highest mean for customer satisfaction is 3.90 and agree level of agreement which have two item "Robotic service in a restaurant improves the efficiency of my dining experience" and "The availability of robotic service in a restaurant increases my overall satisfaction with the dining experience". The lowest mean is 3.12 and the level of agreement is neutral for this item "I believe that a restaurant using robotic service cares less about its customers".

For reliability analysis:

The first one is service efficiency; the variable had a total of 10 items under it with Cronbach's alpha value of 0.810 with the internal consistency of good ($0.9 > \alpha \geq 0.8$). The last is monetary value, also with 10 items used as well under it and Cronbach's alpha value for this variable is 0.752. This value fall under the internal consistency of acceptable ($0.8 > \alpha \geq 0.7$).

For Pearson Correlation Analysis:

The highest is the relationship between security and customer satisfaction toward robotic service in restaurant. The interpretation of the value 0.703 means that the relationship between those two variables is moderate positive correlation. The lowest is the relationship between service efficiency and customer satisfaction toward robotic service in restaurant. The interpretation of the value 0.592 means that the relationship between those two variables is moderate positive correlation.

Recommendations is the quantitative method is suited for this study because the goal is to determine the elements that influence customer satisfaction with robotic service restaurants in Malaysia. The second piece of recommendations is to choose respondents who are familiar with the questionnaire. This will facilitate data collection and increase the number of sample data. The last recommendation would be to increase the languages used for the questionnaire. The 2 languages were used for the questionnaire which were Bahasa Melayu and English. It would be more advantageous and beneficial if the questionnaire included languages such as Chinese and Tamil for wider and better understanding. This could potentially increase understandable languages in the questionnaire.

CONCLUSION

Finally, the purpose of this study was to look at the elements that influence customer satisfaction with robotic service restaurants in Malaysia. Furthermore, other scholars undertaking study on robotic service restaurants in Malaysia may find this paper useful. The data obtained in Chapter 4 using the Statistical Package for the Social Sciences (SPSS) were investigated further, and conclusions were formed. As a result, it is reasonable to conclude that in Malaysian robotic service restaurants, there is a link between service efficiency, time savings, security, monetary value, and customer enjoyment. As a result, it is believed that all the information supplied throughout this research will assist parties involved in improving robotic service in restaurants comparable to industrialised countries.

THE VIRAL MARKETING ROLE IN DIRECTING CUSTOMER PURCHASING DECISION REGARDING FOOD IN TIKTOK

Muhammad Fikri Akmal bin Mohd Anura, Muhammad Farez Nabil bin Abd Wahab,

Muhammad Harriz Erfan bin Zamani, Muhammad Faisal Arif bin Rosdi

Faculty of Hospitality, Tourism and Wellness, Universiti Malaysia Kelantan

Corresponding email: azimahothman@umk.edu.my

ABSTRACT

The advent of social media platforms has had a significant impact on consumer behavior, particularly in the realm of food purchasing choices. Among these platforms, TikTok has gained immense popularity as a platform for sharing short videos, including those related to food and dining experiences. This abstract delves into the influence of TikTok on customer purchase decisions specifically regarding food, and examines the underlying factors that shape these decisions. The research primarily aims to identify the factors that impact customers' purchase decisions in relation to food on TikTok. It specifically focuses on attractiveness, confidence, and incentives as the factors expected to play a role in shaping these decisions. The data for this study was collected using a structured questionnaire and subsequently analyzed using SPSS data analysis software.

Keywords: The viral marketing role in directing customer purchasing decision regarding food in TikTok

INTRODUCTION

This chapter serves as an introduction to the research conducted on the impact of viral marketing on customer purchasing decisions specifically within the realm of TikTok food. It begins by providing background information, stating the problem that the research aims to address, presenting the research question and objective, defining the scope of the study, highlighting its

significance, and providing definitions of key terms. The chapter concludes by summarizing the content covered in Chapter 1.

Viral marketing is an innovative marketing strategy that leverages the power of internet users to spread messages and attract new customers. It involves the creation of messages that rapidly circulate within online communities, such as TikTok, in order to disseminate information and engage potential customers. Previous studies have indicated that several factors contribute to the success of viral marketing campaigns. These factors include the value of the product, its accessibility, the online distribution strategy employed, the characteristics of the viral marketing team, and the target audience. Additionally, trust, dependability, the desire to share content, and the attractiveness of the viral message are all crucial elements. For instance, Wei (2014) discovered a positive correlation between consumer incentives and attitudes toward viral marketing, and consumer attitudes toward viral marketing significantly influence their intention to make a purchase. Furthermore, Francis and Alexander (2015) established a positive causal relationship between consumers' propensity to rely on wireless marketing techniques and the social aspects of viral marketing.

By conducting research in this area, the aim is to shed light on the impact of viral marketing on customer purchasing decisions in the context of TikTok food. The chapter provides an overview of the relevant background information, outlines the problem statement, presents the research question and objective, specifies the scope of the study, emphasizes its significance, and provides definitions of key terms. Finally, it summarizes the content covered in Chapter 1.

There are three objectives of this research:

1. To determine the attractiveness of the direction customer purchasing decisions food in TikTok.
2. To determine the confident of the direction customer purchasing decisions food in TikTok.
3. To determine the incentive of the direction customer purchasing decisions food in TikTok.

Significance of the Study

Academic Aspects

Academic exposure to online food platforms like TikTok can increase public awareness and drive the online food market. This study benefits entrepreneurs, helps entrepreneurs market their products, and directs customer purchasing decisions regarding food on TikTok.

Practical Aspects

This study aims to improve TikTok's marketing strategy for entrepreneurs to enhance their products and attract consumers to purchase food online. By understanding the increasing number of customers, entrepreneurs can promote their products and ensure they go viral on social media. Promotions should be welcomed by customers to attract more customers.

LITERATURE REVIEW

PURCHASE DECISION

The process of making a purchase decision is a critical step in the consumer buying journey. It involves carefully assessing various options and considering factors such as price, quality, features, brand reputation, and personal preferences. This decision-making process can be influenced by marketing messages, recommendations, online reviews, and past experiences. Nobel laureate Herbert A. Simon argued that economic decision-making is a complex process, influenced not only by rational considerations but also by emotions and non-rational factors. He suggested that the assumption of perfect rationality should be replaced with a more realistic framework that accounts for the cognitive limitations of individuals. Cognitive effort and decision-making time also come into play as factors affecting the decision-making process.

The amount of time and effort invested in each stage of the decision-making process depends on the perceived risk and motivations of the consumer. In instances of impulse purchases, consumers may spend minimal time on information search and evaluation, resulting in spontaneous buying decisions. This study aims to examine the factors that influence customer purchasing decisions, with a particular focus on attractiveness, confidence, and incentives.

ATTRACTIVENESS

Viral message content on TikTok is a powerful public marketing strategy that influences buyers' choices by delivering humour and uplifting messages. Creative product marketing videos that catch viewers' attention and make them want to buy products are also effective. Videos with specific themes, viral music, and trademarks can make them stand out from the competition. Continuous promotion of products through TikTok, such as discounts and freebies, increases sales and attracts buyers, even if they initially don't intend to buy.

CONFIDENCE

Confidence is a belief in one's abilities, qualities, and judgments, characterized by self-assurance and confidence in one's abilities and abilities. It is a state of confidence that stems from a deep sense of self-worth and self-belief. Building and maintaining confidence can vary from person to person and is influenced by factors like past experiences, achievements, support systems, mind set, and personal growth.

Developing confidence involves setting goals, embracing failure as learning opportunities, recognizing strengths and weaknesses, and engaging in self-care and self-reflection. Confidence is crucial for personal and professional success, empowering individuals to express themselves, pursue opportunities, and reach their full potential. It is also beneficial for businesses, as it helps customers trust and engage with products, especially through viral marketing on social media platforms like TikTok.

INCENTIVE

An incentive is a motivating factor that encourages specific behaviour or action. It can take various forms, such as monetary rewards, discounts, bonuses, gifts, recognition, or privileges. Incentives are used in various contexts, such as business, economics, psychology, education, and marketing, to create a perceived value for individuals. They can encourage productivity, increase sales, boost performance, foster loyalty, promote behaviour change, or achieve specific goals. Effective incentives are tailored to the target audience, perceived as valuable and attainable, and the timing and delivery of incentives play a crucial role in their effectiveness.

Research Hypothesis

In this study, there were four hypotheses that have been indicated to study the research objectives as following:

H1: Increase the rate of exposure to the buyer's decision related to food product.

H2: Consumer choice for food products is influenced by how attractive the message is to influence the buyer's decision.

H3: Incentives used to determine the buyer's decision about food products have an effect on consumers buying these products.

H4: Consumers' decision to buy food products is influenced by their confidence in the facts that go viral in this industry.

Research Framework

To completing the analysis, a conceptual framework will be used to gathering the data in research. This framework describes the relationship between independent variable and dependent variable.

Figure 1: Conceptual Framework

METHODOLOGY

Research Design

A research design is a strategy for answering research questions using empirical data. A well-planned design ensures methods align with objectives and appropriate data analysis. Research designs can be divided into quantitative, qualitative, and mixed method research. In this study, a quantitative research method will be used, which is the most selective and selective approach. This method measures and collects data from various sources, using statistical and mathematical tools to determine results.

Quantitative research designs are fixed and deductive, with variables and hypotheses clearly defined in advance. This study uses both quantitative methods and questionnaires, allowing for easy dissemination through an online platform.

Data Collection

The data collection procedure is a systematic process for gathering, recording, and acquiring data for research, analysis, or informational purposes. It involves planning, designing instruments, selecting methods, collecting data, and ensuring quality. Data collection is divided into primary and secondary methods, with primary data collected through interviews, surveys, questionnaires, and experiments. This study uses data to induce up to data-supported objectives and topics.

Using social media platforms like Instagram, Telegram, and What, researchers use Google Forms to collect information efficiently and cost-effectively. The form is divided into three sections: Part A, Part B, and Part C. Part A questions respondents about demographic segmentation, while Part B discusses dependent variables and the stage of purchase decisions. Part C discusses the independent variables of attractiveness, confidence, and incentive, which influence customer purchasing decisions on TikTok.

Sampling

This study uses probability sampling techniques, including simple random sampling, systematic sampling, stratified sampling, and cluster sampling, to ensure the population resembles the research. Simple random sampling is the most fundamental method, as it ensures equal probability of being selected from a sampling frame for customer purchasing decisions on TikTok food. The questionnaire includes essential questions and demographics, allowing respondents to easily answer and collect data.

Data Analysis

Data analysis involves inspecting, cleansing, transforming, and modelling data to discover useful information, inform conclusions, and support decision-making. It involves drawing inductive inferences and distinguishing signals from noise. Analytical data is crucial for researchers to understand the study, particularly in directing customer purchasing decisions on TikTok.

FINDINGS

DEMOGRAPHICS ANALYSIS

GENDER					
		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Female	169	55.8	55.8	55.8
	Male	134	44.2	44.2	100.0
	Total	303	100.0	100.0	

The table presented the gender distribution of the participants. Out of the total of 303 respondents, 134 were male and 169 were female. This means that men accounted for 44.2% of the respondents, while women constituted the remaining 55.8%.

AGE					
		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	18-20	42	13.9	13.9	13.9
	21-23	193	63.7	63.7	77.6
	24-26	33	10.9	10.9	88.4
	27-29	12	4.0	4.0	92.4
	30 and above	23	7.6	7.6	100.0
	Total	303	100.0	100.0	

The table displayed the distribution of respondents based on their age. The respondents were categorized into different age ranges: 18-20 (42 respondents), 21-23 (193 respondents), 24- 26 (33 respondents), 27-29 (12 respondents), and 30 and above (23 respondents). The largest percentage of respondents fell within the 21-23 age range, accounting for 63.7% of the total respondents. Following that, 13.9% of respondents were in the 18-20 age range, 10.9% were in the 24-26 age range, 7.6% were in the 30 and above age range, and the smallest percentage, 4%, consisted of respondents aged 27-29.

RACE					
		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Chinese	38	12.5	12.5	12.5
	Indian	29	9.6	9.6	22.1
	Malay	216	71.3	71.3	93.4
	Other	20	6.6	6.6	100.0
	Total	303	100.0	100.0	

The table provided an overview of the respondents' racial distribution. A total of 303 individuals participated in the survey, representing different races. Among them, there were 38

Chinese respondents, 29 Indian respondents, 216 Malay respondents, and 21 respondents from other racial backgrounds. The largest proportion of respondents belonged to the Malay race, comprising 71.3% of the total. Following that, the Chinese respondents accounted for 12.5%, the Indian respondents made up 9.6%, and the lowest percentage of respondents came from other racial backgrounds, amounting to 6.6%.

LEVEL OF EDUCATION					
		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	DEGREE	224	73.9	73.9	73.9
	DIPLOMA	12	4.0	4.0	77.9
	MASTER	3	1.0	1.0	78.9
	SPM	34	11.2	11.2	90.1
	STPM	30	9.9	9.9	100.0
	Total	303	100.0	100.0	

The table presented data on the distribution of respondents based on their level of education. A total of 303 individuals participated in the survey, with varying educational backgrounds. Out of these respondents, 224 held a degree, 12 had a diploma, 3 had a master's degree, 34 had completed SPM (Sijil Pelajaran Malaysia), and 30 had completed STPM (Sijil Tinggi Pelajaran Malaysia).

The highest percentage of respondents, accounting for 73.9% of the total, had a degree. Following that, 11.2% of the respondents had completed SPM, 9.9% had completed STPM, 4% had a diploma, and the lowest percentage, 1%, had a master's degree.

MONTHLY INCOME					
		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	BELOW RM 1000	246	81.2	81.2	81.2
	RM 1000-RM 2999	45	14.9	14.9	96.0
	RM 3000-RM 4999	12	4.0	4.0	100.0
	Total	303	100.0	100.0	

The table provided an overview of the respondents' monthly income distribution. Among the participants in the survey, the data revealed that 246 individuals had a monthly income below RM1000. Additionally, 45 respondents reported a monthly income between RM1000 and RM2999, while 12 respondents fell within the income range of RM3000 to RM4999.

The highest percentage, representing 81.2% of the total respondents, had a monthly income below RM1000. The next highest percentage, 14.9%, belonged to those with a monthly income between RM1000 and RM2999. The lowest percentage, at 4%, consisted of respondents with a monthly income within the range of RM3000 to RM4999.

DESCRIPTIVE ANALYSIS

Descriptive Statistics					
	N	Minimum	Maximum	Mean	Std. Deviation
Attractiveness	303	1.43	5.00	4.8581	.35224
Confidence	303	1.00	5.00	4.8432	.37826
Incentive	303	1.00	5.00	4.8375	.39839
Purchase Decision	303	1.00	5.00	3.8713	.74135
Valid N (listwise)	303				

The table displays the data regarding the number of respondents, mean rankings, and standard

deviations for both the independent and dependent variables. Among the independent variables, attractiveness had the highest mean ranking at 4.8581, closely followed by confidence at 4.8432, and incentive at 4.8375. On the other hand, the dependent variable, purchase decision, had a mean ranking of 3.8713..

REABILITY ANALYSIS

Variable	Number of item	Cronbach's coefficient	Alpha Strength of Association
Attractiveness	7	0.932	Very strong
Confidence	8	0.943	Very Strong
Incentive	8	0.950	Very Strong
Purchase decision	5	0.841	Strong

To assess the attractiveness variable's impact on purchase decisions related to food on TikTok, a set of seven questions was utilized. The Cronbach's Alpha coefficient for this section's questions yielded a result of 0.932, indicating a very strong level of internal consistency. Similarly, for the confidence and incentive variables, a set of eight questions was employed. The Cronbach's Alpha coefficients for these questions were found to be 0.943 and 0.950, respectively, signifying a very strong level of internal consistency as well.

In the measurement of purchase decisions concerning food on TikTok, five questions were used. The Cronbach's Alpha coefficient for this section's questions was 0.841, indicating a strong level of internal consistency. This suggests that the coefficient obtained for these questions in measuring purchase decisions regarding food on TikTok is also reliable.

PEARSON CORRELATION

		Correlation	
		Attractiveness	Purchase Decision
Attractiveness	Pearson correlation	1	.948**
	Sig. (2-tailed)		.000
	N	303	303
Purchase Decision	Pearson Correlation	.948**	1
	Sig (2-Tailed)	.000	
	N	303	303

H1: There is a significant relationship between confidence and purchase decision regarding food in TikTok

The table shows relationship between attractiveness and purchase decision regarding food in TikTok . The p-value of this variable shows 0.948, which means that it is very strong. It also indicates that there is a positive and significant relationship between both variables. Therefore, the hypothesis is accepted since there is a significant relationship between attractiveness and purchase decision regarding food in TikTok.

Correlation

		Confidence	Purchase Decision
Confidence	Pearson correlation	1	.956**
	Sig. (2-tailed)		.000
	N	303	303
Purchase Decision	Pearson correlation	.956**	1
	Sig. (2-tailed)	.000	
	N.	303	303

H2: There is a significant relationship between confidence and purchase decision regarding food in TikTok

The table depicts the relationship between confidence and purchase decision regarding food in TikTok. The p-value of this variable shows 0.956, which means that it is very strong. It also illustrates that there is a positive and significant relationship between the variables. Thus, the hypothesis is accepted since there is a significant relationship between confidence and purchase decision regarding food in TikTok.

Correlation

		Incentive	Purchase Decision
Incentive	Pearson correlation.	1	.967**
	Sig. (2-tailed)		.000
	N	303	303
Purchase Decision.	Pearson correlation	.967**	1
	Sig. (2-tailed)	.000	
	N	303	303

H3: There is a significant relationship between incentive and purchase decision regarding food in TikTok

The table shows the relationship between the incentive and purchase decision regarding food in TikTok. The p-value of this variable shows 0.967, which means that it is very strong. It illustrates that there is a positive and significant relationship between the variables. Therefore, the hypothesis (H3) is accepted since there is a significant relationship between incentive and purchase decision regarding food in TikTok.

DISCUSSION & RECOMMENDATION

Attractiveness is important to customer purchasing decisions regarding food in TikTok based on the study hypothesis. the p-value is 0.000, which is smaller than the 0.01 significance level. While the correlation coefficient between attractiveness and purchasing decisions shows 0.948, there is a

moderate positive and significant relationship between the variables. Therefore, hypothesis (H1) is accepted. It can be shown that the results of the literature review can be trusted with the results of this study.

Next, confidence is also significant to customer purchasing decisions regarding food in TikTok based on the study hypothesis. the p-value is 0.000, which is smaller than the 0.01 significance level. While the correlation coefficient between confidence and purchasing decisions shows 0.956, there is a positive and significant relationship between the variables. Therefore, hypothesis (H1) is accepted. It can be shown that the results of the literature review can be trusted with the results of this study.

Lastly, incentive is also significant to customer purchasing decisions regarding food in TikTok based on the study hypothesis. the p-value is 0.000, which is smaller than the 0.01 significance level. While the correlation coefficient between incentive and purchasing decisions shows 0.967, there is a positive and significant relationship between the variables. Therefore, hypothesis (H1) is accepted. It can be shown that the results of the literature review can be trusted with the results of this study.

There are a number of restrictions to take into account when conducting research on "The Viral Marketing Role in Directing Customer Purchasing Decision Regarding Food in TikTok." First off, there may be a gender imbalance in the results due to the male respondents' lesser sample size (134) compared to the female respondents' larger sample size (169). This disparity might have an impact on how well the findings apply to the wider population. Second, the findings' application to other age demographics may be constrained by the substantial concentration of respondents (64%) in the 21-to-23 age range. Furthermore, the distribution of respondents by race is unbalanced, with a higher percentage of Malay respondents (71%) compared to other races, which could affect how broadly the research findings can be applied to various ethnic groupings.

it's critical to overcome the gender gap in the responder sample. Compared to male respondents, there were more female respondents in the survey. To provide a thorough knowledge of

the relationship between viral marketing and customer purchasing decisions in the context of TikTok, future study should try to attain a more equal representation of genders.

CONCLUSION

Overall, the research highlighted the significant role of viral marketing in shaping customer purchasing decisions regarding food on TikTok. The findings provide valuable insights for businesses and content creators to effectively engage TikTok users and influence their purchasing decisions in the context of food marketing. Individual tastes and personal preferences continued to play a significant role in the decision-making process because various consumers had varying preferences for particular foods or flavours. Additionally, it has been discovered that providing viewers with incentives like discounts, coupons, and promotional offers will encourage them to try or buy the advertised food items.

ABSTRACT

Intention of usage of online delivery services has emerged as one of the most significant issues affecting student's behavior today since it necessitates a high level of engagement between contact personnel and specific clients and is largely dependent on meeting intangible requirements. Additionally, the degree of client satisfaction with a company's services may directly correlate with the degree to which workers are content with the responsibilities that have been given to them. This research intends to determine the indicator of intention of usage of online delivery services in student's daily life by using factor which is time saving orientation, convenience and peer influence. This study employed quantitative method which is using questionnaire surveys which were distributed to all university students in Malaysia. Based on the questionnaire distributed, a total of 384 respondents had been obtained and the data gathered had been analyzed for descriptive, reliability and correlation by using Statistical Package for the Social Sciences (SPSS) version 26. The discussion is due to the outcome of a survey in public institutions of higher learning (IPTA) in Malaysia.

Keyword: *Intention of usage, online, food delivery services, public institutions, higher learning institutions (IPTA)*

INTRODUCTION

Online food delivery service is actually a combination of the online platform nowadays in meals and drinks sector. Online food delivery service is one of the classifications from e-commerce that uses the method of online to offline business that means the consumers ordered their product of food or drinks through the online platform and earn the product physically. According to Purvis, Mao and Robinson (2019), they said that the rise of the online service methods had change the world of the food industry in the aspect of the communication of the customers and the food suppliers. This factors could make the food industry sustain such as

economic, social, and also environmental. Also, the market of the e-commerce has experienced rapid growth because of a number facets that impact customers to implement e-commerce tools. As a precedent, the factor that plays the role is the work style of the consumer that consumes a lot of time, the increase of the number of the retailers that use the online platform and the awareness of the e-commerce application by the consumers nowadays.

Food delivering service started in 1995 in northern California by the company World Wide Water also known as Waiter.com. According to Dosas and Samosas (2017), this service expanded to several additional cities in the United States quickly after their first launching in that year. By the late 2000s, many pizza chains had created the same mechanism in order of the increase of smartphone usage among people. In 2015, the service grew to its highest level when online ordering began taking phone orders, and today online ordering has started to become the norm.

According to Pang (2017), in Malaysia, online food delivery service started in 2012 with the Food panda's platform, followed by Grab in 2018 and so on. The food delivery businesses now have an easier time connecting with customers and promoting themselves, notably through social media platforms like Facebook, Instagram, and Twitter, which is in accordance with Malaysia's booming e-commerce sector. In this context, people can choose whether they want their restaurant to be mentioned on one of the many independent websites that offer restaurant reviews.

There are three objectives of this research:

- To identify factors influencing the university student to use online food delivery service:
 - I. To identify the relationship between time saving orientation and the usage of online food delivery service.
 - II. To identify the relationship between convenience and the usage of online food delivery service.
 - III. To identify the relationship between peer influence and the usage of online food delivery service.

SIGNIFICANCE OF THE STUDY

Food Delivery Service Company

From the food delivery service company point of view, this research can provide a significant benefit which is the key factor of why university students are mostly using their online service every day. By conducting this study, the potential companies can use this opportunity to grow their business and may offer some deals to make sure their service offered every day for the society and especially to the students.

University Student

Students can gain the benefits from this study especially the students that are using the online food delivery service. With this study, the university student can identify the main factors of why they are using this service and know the benefit of it. The students also will have an awareness about the facilities of the service provided.

Future Researcher

From this survey, the future researchers can refer to this study as a guide to do better research and advance what the researcher have done for this research. With all the points and explanations, the future researcher can use it as a reference and expand the knowledge on the area of study regarding on online food delivery service.

LITERATURE REVIEW

The Usage of Online Food Delivery Service

The most popular reason given by Chai and Yat (2019) for the apparent demand for quick meals during or after a long workday is the use of online food delivery services. A variety of readily available food delivery services save consumers from the stress of having to consider about meals, beverages and snacks. Additionally, ordering food online can save time over going to the restaurant. Online meal delivery services are quietly but steadily transforming the food and beverage industry due to a number of factors, including the potential for business expansion, increased employee efficiency, order accuracy, and the creation of enormous client databases (Moriarty, 2016).

Fast food is typically served ready to be consumed and has expanded to constitute a considerable proportion of overall nutritional intake (Burgoine et al., 2019; Mackenbach et al.,

2019). A different ordering method that appears to be gaining popularity is using third-party online ordering and delivery services, or online meal delivery companies (Maimaiti et al., 2018). Online platforms are used by customers to make orders, which are then sent to restaurants where the food is prepared and delivered to customers by couriers employed by the restaurant or the online food delivery service (Yeo et al., 2017). However, the majority of the food cooked for online food delivery services is done so at already-existing food outlet facilities (Allen et al., 2020).

Time Saving Orientation

When using online FDI, clients' wants and needs vary. In context of technology adoption, some studies found out that significant relationship among disposition and behavioral intention to use online services (Ingham, 2017; Chang, Yan & Tseng, 2015). Particularly, as it addresses in efficient analysis, consumers often to have "purchase time" during they purchase on the internet (Jensen, 2012; Settle, 2002). The need to save time is an immensely significant dimension on buyers' proclivity to use technology based on self-service (Meuter et al., 2003). Most consumers desire to minimize their time commitments so that they can complete other vital responsibilities promptly.

People occasionally explore themselves in short time based on routine consist of duty and amusement, forcing them to seek solutions to circumvent time (Bashir et al., 2015; Settle & Alreck, 1991). A lot of people detest the exertion necessary to get meals also need to queue in eateries since of the contemporary hectic style of life. They ought to anticipate nourishment to be handed over swiftly (Yeo et al., 2017) through the most essential elements that affects individual's behaviour in purchasing any item on internet (Khalil, 2004).

Internet shopping is supposed to conserve time because clients not required physically forsake their homes to finalize a deal. As stated by Sultan and Uddin's (2011), time savings have a positive impact on behavior demand for online purchasing. According to the study, a substantial percentage of respondents said that internet shopping because they did not have to squander hours like offline shopping while travel (which they should literally arrive at the store). Alreck and Settle (2002) emphasized that physical buyer longer than online shopping since they do not have to stand throughout the line. Based on Alreck (2009) observed that numerous clients wished they can save more time in different research. Time savings have a highly beneficial impact on behaviour intention to embrace online purchasing (Ganapathi, 2015; Zendehdel et al., 2015).

Convenience

By utilizing goods and services or making purchases, reduced non-monetary transaction expenses are regarded as being more convenient, including time, energy and money (Chang & Polonsky, 2012). Hours of operation, location, and phone, internet, or in-person accessibility all affect how convenient something is (Meuter, Ostrom, Roundtree & Bitner, 2000; Seiders, Berry & Gresham, 2000). Additionally, the most significant factor and benefits of convenience in internet business services are exploring and possessing comfort (Hanus, 2016). When people need to make an order, it is the most convenient since it saves them time from having to travel to the location (Verhoef & Langerak, 2001).

Consumer convenience will be concluded because it will impact customer loyalty (Dhurup, 2006). Consumers are bound to get inspired to use the composition on a regular basis once it meets their convenience expectations. Users can employ the new, simple, and secure electronic technologies, in line with the current trends (Kimes, 2011). Due to the flexibility of placing orders and receiving delivery at any time, many prefer ordering food online versus doing it in-person. Making takeout orders online offers various benefits, including preventing inadequate client service and reducing in-store traffic (Chen & Hung, 2015; Katawetawarakas & Wang, 2011).

Both time and diligence convenience are important factors in influencing consumer adoption of OFD services (Collier & Kimes, 2013). Customers that prioritize convenience would constantly invest taking time and diligence into account (Zhou et al., 2007). They desire to purchase at home to conserve time. Food delivery services are considerably safer and more convenient for customers since they have the ability to place an order anywhere and anytime. The distribution platform will be designed to work with any mobile device, including smartphones and tablets.

Peer Influence

Peer influence is established as occasions where only a person has an impact on or is impacted by one or more persons at their age. Consumers adapt in reactions to their close companions and colleagues, which is a prevalent concept in influence definitions. People can evolve as a result of peer pressure, for better or worse. Peer influence is a meaningless concept that can relate to any kind of change (Laursen & Veenstra, 2021). Thus, peer influence can be viewed as an instance in which one person inspires or is influenced by others in their own circle. A recurring theme in definitions of influence is change people adjust to their acquaintances and associates. Peer pressure has the power to either improve or damage individuals. Any kind of

transformation might be referred to as peer influence, which is a general understanding. Society pressure and socialization, which describe (respectively) peer impact is different from adaptive and maladaptive change in this sense (Laursen, 2018).

Peer pressure implies coercion or persuasion, as opposed to socialization is an expression with positive connotations that is meant to be the passing of knowledge and abilities. Influence encompasses both concepts but is not the same as either. Influence presumes a shift in direction. The study discovered that peers can play a more important effect in meal choice than calorie labels. By virtue of peer pressure, FDA use has a significant impact on friends' social interactions (Li, Miroso & Bremer, 2020). The characteristics of the connection or group dictate the direction of change as it aim. Peer influence almost often amplifies similarities between friends and associates. Despite the likelihood of complimentary (Kindermann & Gest, 2018), there is no significant prove that peer interaction while adolescence supports divergent roles and/or strengthens distinctions. In fact, youth join groups of people who are similar to them and make friendships this is known as selection similarity.

Research Hypothesis

From this study, the variables such as Time saving orientation, Convenience and Peer Influence was determined as independent variables, while the Usage of Online Food Delivery as dependent variable. Based on the variable cited above, these hypotheses are created:

HYPOTHESIS 1:

- H0: There is no relationship between time saving orientation and the usage of online food delivery service among university students.
- H1: There is a relationship between time saving orientation and the usage of online food delivery service among university students.

HYPOTHESIS 2:

- H0: There is no relationship between convenience and the usage of online food delivery service among university students.
- H1: There is a relationship between convenience and the usage of online food delivery service among university students.

HYPOTHESIS 3:

- H0: There is no relationship between peer influence and the usage of online food delivery service among university students.

- H1: There is a relationship between peer influence and the usage of online food delivery service among university students.

Research Framework

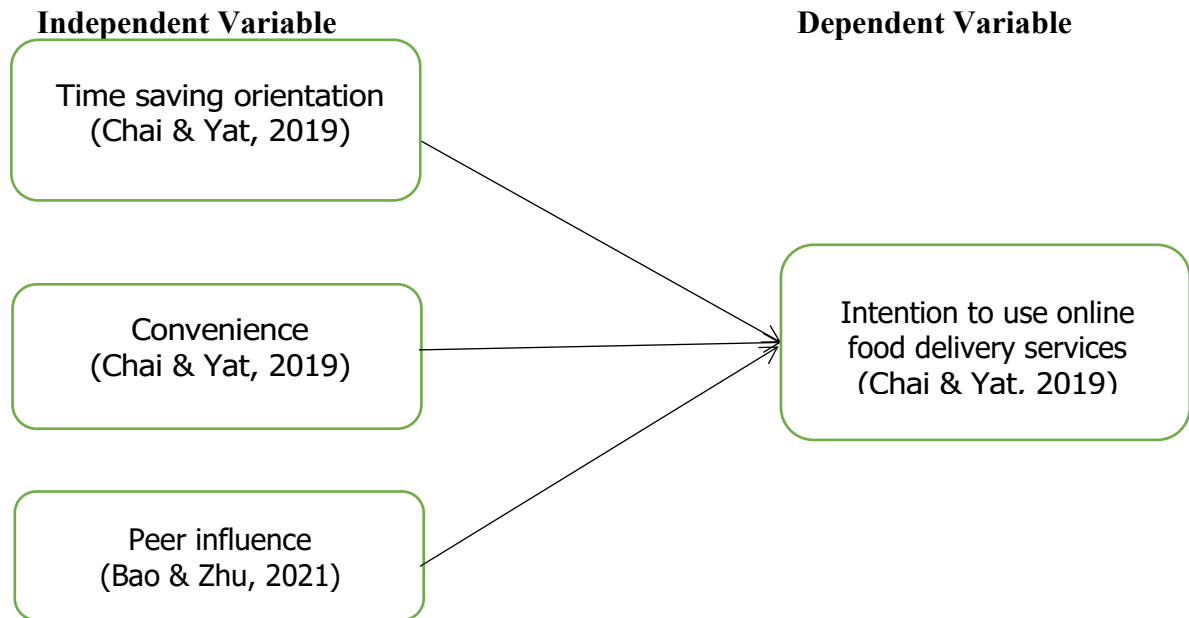

Figure 1: Conceptual Framework

METHODOLOGY

Research Design

A specific study design will be carried out by the researchers using a strategy and framework called research design. A quantitative research approach will be applied in this study's research design (Torchim, 2015). In addition, the quantitative methodology is the most appropriate for carrying out this study. As a result, this strategy uses mathematical and statistical method to determine results. This quantitative technique can be created through a questionnaire survey or in-person interviews, according to Oxford Fajar (2013). This study employed quantitative techniques and questions in order to distribute its large-scale research survey through an internet platform.

Sampling Method

The sampling method is an approach that aids researchers in learning more about a population from a sample of their findings by concentrating on a single individual. Instead, the

researcher will choose sample by using probability random sampling from a whole sampling frame of all eligible people. It is a sampling strategy in which the researcher chooses population members depending on their evaluation (Saunders, 2019). Simple random sampling is a non-probability sampling strategy. The main goal of the data collection phase is to distribute the questionnaires created during the pilot phase to a sample of university students who were representative of those who used online food delivery services.

Sample Size

The concept "sample size" refers to the small portion of the population that has been chosen for a given study. To obtain information on the group, the researcher chooses and contacts a representative group of people or components that fall inside the target demographic. Based on the results, the researcher groups the characteristics of the population into features they wanted. The word "sample survey" refers to the practice of surveying to collect data from a sample.

The sample size for this study will be stated on the percentage of Malaysian university students who used online food delivery services. This study's population of 1,000,000 users of university students will be focused on (Hennink, Kaiser & Weber, 2019). The study will decide on the sample size by using the formula from Krejcie and Morgan (1970). According to chart in Table 1, 1,000,000 people used the online food delivery services which are among university students. This study therefore includes the largest sample, 384 respondents. Finally, 384 surveys had been distributed to respondents to get their opinions.

Research Instrument

Research instrument is a device to measure and analyze data for a research. This study used several past questionnaires in order to create a sound and solid research instrument. In this questionnaire, there are several section. Section A is a survey question that asks about the demographic profile. It asks about the details of the demographic for example gender, race, religion, age range and educational attainment.

Next is Section B. In this section the questions asked are related to the dependent variable that is the usage of online food delivery services. This dependent variable is being measured by these survey questions and the outcome will be evaluated using a five-point Likert scale. 1 denoting "strongly disagree", 2 denoting "disagree", 3 denoting "not at all", 4 denoting "agree", and 5 denoting "strongly agree".

Then, Section C represented the independent variables that consisted of time saving orientation, convenience and peer influence. To ascertain the link between all those independent variables and online food delivery services, the researchers used studios, a tool created by Daffodil International University and used by other scholars. These questionnaires employ a five-point Likert scale with 1 denoting "strongly disagree", 2 denoting "disagree", 3 denoting "not at all", 4 denoting "agree" and 5 denoting "strongly agree" to measure the first independent variable.

Each of the dependent variable and independent variables in this study are related and had been measured by using the 5 point Likert scale of “1 = Strongly disagree”, “2 = Disagree”, “3 = Not at all”, “4 = Agree” and “5 = Strongly agree”.

Data Collection Method

This method is used to generate the data received into a numerical form and is being used because the scale of the research is large. This study technique was chosen by the researcher for a number of reasons, including its affordability, and ease of use. The researcher had distributed the questionnaire to the targeted respondent by using Google Form. The researcher utilized the online platform to collect all the data.

Data Analysis

Analysis of data is the process of evaluating data by carefully examining each component of the information presented. Information from different sources are collected, inspected, and broken. Next, the researcher used descriptive statistics, reliability statistics and Pearson's correlation to evaluate the quantitative data. The data had been analyzed by using the Statistical Package for the Social Sciences (SPSS) version 26.

FINDINGS

Descriptive Analysis

According to Kenton (2019), a descriptive statistic is a details that summarizes certain data set, that signify a population or sample. In descriptive statistics, measurements of central tendency and measures of variability (expansion) are separated. Measurement unit such as mean, median, and mode are used, while to measure variability it used standard deviation and variance.

Reliability Test

The reliability experiment use non-biased (error-free) and to ensure the accuracy of calculation in different part of instrument (Kumar, 2013). Measurements are accurate to the degree that they produce clear outcomes. Reliability is a critical contribution to validity, but it is not an adequate term of rationality. The relationship between reliability and validity can be demonstrated by a basic example of a weighing instrument. If the apparatus calculates erratically from time to time, it is not correct and cannot be accurate. The reliability calculation is the way instrument being calculated in achieving accurate measurement. Total of values is close to the value (Cronbach, 1951).

Table 1.0: Score of Reliability Test

Variable	Number of items	Reliability Cronbach's Alpha	Comment
Online Food Delivery	5	0.746	Excellent
Time Saving	5	0.796	Excellent
Convenience	5	0.836	Excellent
Peer Influence	5	0.823	Excellent

Table 1.0 of the SPSS findings highlighted the importance of both independent and dependent variables in this investigation. The Cronbach Alpha results for all variables are Online Food Delivery (0.746). Time saving (0.796), Convenience (0.836) and Peer Influence (0.823).

Demographic Profile

The online platform had assigned a total of 353 questionnaire sets. In this portion, respondents' contextual profiles were presented. This section is on the respondent's demographic profile and background: gender, race, religion, age, and educational background. According to Table 1.1, 61.8% (n=218) of respondents are female and 38.2% (n=135) are male. According to the table, the majority of the race's respondents are Malay, with 199 (56%) followed by Chinese, with 60 (17%). Also, 48 respondents (14%) are Indian, while 46 (13%) are from other races.

According to the data, the majority of religion among those who responded is Islam,

which has a frequency of 225 respondents (63.7%), followed by Christian, which has a frequency of 50 respondents and a percentage of (14.2%). Furthermore, Buddhism had 49 respondents (13.9%), followed by other religions with 29 respondents (8.2%).

Based on Table 1.1, the respondents to this survey are mostly between the ages of 21 and 30, with a total of 261 (74%). This is followed by respondents under the age of 20 years old, with 58 (16%). While the age group 31-40 years old had 23 replies (7%) and the age group 41-50 years old had three respondents (1%). The age group over 51 years old has the fewest respondents (8%).

Finally, Table 1.1 demonstrates that the majority of respondents (73.7%, n=260) had a degree. This was followed by 73 respondents (20.7%) receiving a diploma. While 16 of the respondents (4.5%) have a Master's degree. Last but not least, four respondents (1.1%) have a PhD.

Table 1.1: Respondent Demographic Profile – Gender

Category	Respondent's Profile	Frequency N= 353	Percentage (%)
Gender	Male	135	38.2%
	Female	218	61.8%
Race	Malay	199	56%
	Chinese	60	17%
	Indian	48	14%
	Others	46	13%
Religion	Islam	225	63.7%
	Christian	50	14.2%
	Buddhism	49	13.9%
	Others	29	8.2%
Age Group	Less than 20 years old	58	16%
	21-30 years old	261	74%
	31-40 years old	23	7%
	41-50 years old	3	1%
	51 years old and above	8	2%

Education	Diploma	73	20.7%
Level	Degree	260	73.7%
	Master	16	4.5%
	PHD	4	1.1%

Hypothesis Testing

In this part, three (3) possibilities were provided. The first hypothesis establishes a favorable association between university students' time-saving orientation and their use of online meal delivery services. The second hypothesis investigates the association between convenience and university students use online food delivery services. The third hypothesis looks into the relationship between peer influence and university students use of online meal delivery services.

Table 1.2: Summary result of Spearmen Correlation Coefficient.

Hypothesis	Result	Findings of Data Analysis
H1: There is a relationship between time saving orientation and the usage of online food delivery service among university students.	$r = 0.622, p = 0.000$	H1: Accepted
H2: There is a relationship between convenience and the usage of online food delivery service among university students.	$r = 0.677, p = 0.000$	H2: Accepted
H3: There is a relationship between peer influence and the usage of online food delivery service among university students.	$r = 0.600, p = 0.000$	H3: Accepted

The table above summarize the findings of this research. Following are some of the hypotheses that have been tested for this study:

Hypothesis 1 (H1) proposed that time saving have relationship with the usage of online food delivery service among university students. The finding shows in table where it stated the

value of Spearman Correlation Coefficient, which is $r = 0.662$, $p = 0.000$. Thus, the result accepts hypothesis 1 (H1), whereby time saving is positively significant with the usage of online food delivery service among university students.

Furthermore, Hypothesis 2 (H2) proposed that convenience have relationship with the usage of online food delivery service among university students. The finding reported in Table 1.2 revealed that the recorded value of Spearman Correlation Coefficient, which is $r = 0.677$, $p = 0.000$. Thus, the result accepts hypothesis 2 (H2) whereby convenience is positively significant with the usage of online food delivery service among university students.

Lastly, Hypothesis 3 (H3) anticipated that peer influence has a relationship with the usage of online food delivery service among university students. According to the finding stated in Table 1.2, the findings demonstrated that the value recorded in Spearman Correlation Coefficient, $r = 0.600$, $p = 0.000$. Thus, the result accepts hypothesis 3 (H3), whereby peer influence is positively significant with the usage of online food delivery service among university students.

DISCUSSION AND RECOMMENDATION

The initial goal of this research is to investigate the variables impacting the use of online food delivery services. It can be concluded that there is a considerable correlation among university students' preference for time savings and their use of online food delivery services. Encouragement for using an online food delivery service is provided by the first independent variable. The effect of the correlation between the independent and dependent variables stated that hypothesis H1 is reflected. The majority of respondents agreed that the person delivering meals should not be very busy because this may cause a delay in delivery.

Next, objective is focuses on identifying the connection among convenience and the usage of online food delivery service. The results show that convenience positively relates to the usage of online food delivery services. The result of the relationship between the independent and dependent variables reveals the H2's reflection. The majority of responders concurred that they are certain that timely deliveries of meals will win them over and keep them using the online food delivery service. They also agreed that their expectation that online food delivery services would cover a large area will increase their purpose to use online food delivery services. The respondents acknowledge that relationship between convenience and the usage of online food delivery service among university students.

The third goal of the research is to discover the relationship between peer influence and the usage of online food delivery services. Based on the data analysis, both peer influence and

the usage of online food delivery services have beneficial relationship. It displays how H3 captures that there is a positive relationship between peer influence and the usage of online food delivery services.

Some empirical elements have been identified and can have a bearing on university students in Malaysia's use of online food delivery services. For the sake of progress, the research for further studies, certain recommendations were made. The researchers might do additional research into the variables affecting university students' usage of online food delivery services. This is a crucial topic of research because it can provide light on how university students' behaviours are evolving and how they are adjusting to the digital world.

The current study has identified several factors influencing university students' usage of online food delivery services, such as time saving orientation, convenience and peer influence. However, there are likely to be other factors that have not been identified in this study. For instance, the impact of social media on the usage of online food delivery services could be further explored. Additionally, the impact of cultural and regional differences on the usage of online food delivery services could be investigated.

Furthermore, the current research has focused on university students in one country. It seems to be intriguing in extend the research to other nations to see if the same factors influence the usage of online food delivery services. Additionally, the study could be extended to other age groups to see if the same factors influence the usage of online food delivery services among them.

In a nutshell, it is thought that additional investigation into the variables affecting university students' usage of online food delivery services is necessary. Such studies might offer insightful information about how university students are changing their behaviour and adjusting to the digital era.

CONCLUSION

This study examines the factors influencing the usage of online food delivery services among university students. It looks at the motivations and preferences of university students when it comes to online meal ordering, as well as the variables that affect their choice to use online food delivery services. The research looks at the effects as well of time saving orientation, convenience and peer influence on the usage of online food delivery services. Finally, the study looks at the potential implications of the usage of online food delivery services for university students. The results of the study suggest that time saving orientation, convenience and peer

influence are the main factors influencing the usage of online food delivery services among university students.

The entire goal of this study has been accomplished, in summary of the reliable knowledge. Nearly all of the respondents stated that they intended to use an online food delivery service as the outcome of experiences, which were mostly influenced by time saving orientation, convenience and peer influence. When they used the internet for food delivery services, they delighted and loved it.

This study's sample size is rather small because the researcher simply used a Google Form to collect responses from Malaysian public university students. An accurate message could be delivered quickly to a large number of the intended audience by a Malaysian public university student. In order to get over this problem, a future study in this area needs to increase the sample size, conduct a more thorough analysis of the factors impacting university students' usage of online meal delivery services, and produce a more accurate study conclusion.

Considering the previous chapter's recommendations, several empiric factors have been established that decide there are likely to be other factors that have not been identified in this study. For instance, more research may be done on the impact of social media on the usage of online food delivery services. Additionally, it may be studied how cultural and regional variations affect people's usage of online food delivery services.

Latest research has also concentrated on university students in a single nation. If the same characteristics affect the usage of online meal delivery services, it would be fascinating to expand the study to other nations. The study might also be expanded to other age groups to see if the same criteria apply to how often other ages use online meal delivery services.

ABSTRACT

This study examines the relationship between service quality, fast food restaurant, tangibility, reliability, assurance, empathy and responsiveness which is the main factor that plays an important role in ensuring customer loyalty towards fast food restaurants among Malaysians. We are using quantitative methods which is using questionnaire surveys were distributed to all layers of Malaysians regardless of race and age. Based on the questionnaire provided, we obtained a total of 384 respondents and the data gathered and analyzed for descriptive, reliability and correlation using SPSS version 26. In this study, the reliability test is one option to discuss the pilot test which is to know that the question is valid for the variables. Next, the Pearson correlation identifies the relationship between tangibility, reliability, assurance, empathy, responsiveness and customer loyalty in Malaysia's fast-food restaurants.

Keywords: Service Quality, Fast Food Restaurant, Tangibility, Reliability, Assurance, Empathy, Responsiveness

INTRODUCTION

Fast food restaurant is a type of restaurant that serves food and drinks that are ready to be served quickly. Fast food generally has a standardized preparation and cooking process, so it can be served quickly to customers. Fast food outlets, sometimes referred to as quick service restaurants (QSR) in the business. This restaurant has certain features in its business which are specialising in fast meal fare and providing scant table service. Fast food companies typically serve cuisine that is "sweet meat diet" friendly and has an affordable menu.

Fast food restaurants are typically a part of a chain of eateries or franchise businesses that supply each restaurant with standardised ingredients or partially produced food and supplies via a controlled supply system. There are many fast food restaurant companies today such as KFC, Mc Donald, Subway and others. Those fast food companies are the largest and most numerous in the world. Every country in the world, including Malaysia, has its franchise and restaurants are multinational corporations.

There are objectives of this research:

This research is aiming to accomplish the following objectives:

1. To identify the attribute of service quality in influencing customers to visit fast food restaurants.
 - a. To identify the relationship between tangibility and customer loyalty towards fast food restaurants in Malaysia.
 - b. To identify the relationship between reliability and customer loyalty towards fast food restaurants in Malaysia.
 - c. To identify the relationship between assurance and customer loyalty towards fast food restaurants in Malaysia.
 - d. To identify the relationship between empathy and customer loyalty towards fast food restaurants in Malaysia.
 - e. To identify the relationship between responsiveness and customer loyalty towards fast food restaurants in Malaysia.

SIGNIFICANCE OF THE STUDY

Researchers

This study explores the importance of the service quality toward fast food restaurants surrounding Malaysia people. This part uses five dimensions which are tangibility, reliability, assurance, empathy and responsiveness to take out the perceived service quality of fast food. Researchers use a lot of material like media social, and technology to investigate customer satisfaction which will lead to customer loyalty.

Owners

This study will provide information about the customer's loyalty in fast food restaurants in Malaysia. The study clarified the problems that fast food restaurants faced. Fast food restaurants are one of the main choices where a million people use to get some food. Indeed, fast food restaurants have numerous advantages and disadvantages for everyone. Therefore, fast food restaurant operators can use the information obtained from this study to ensure customer loyalty towards their restaurant.

LITERATURE REVIEW

In order to present a balanced perspective that contains conflicting evidence, discrepancies, established and latest thinking, a literature review must be an insightful, unique, and yet objective summary of the data (Catherine L Winchester, 2016). The systematic literature research goes beyond a quick evaluation of literature and requires more than just a few succinct bullet points. It is an extension of the information gathering that may be done to obtain a personal viewpoint into the history of a topic. Performing a literature review is essential for coming up with research ideas, incorporating what is known about a subject, finding potential knowledge gaps, and determining how the study could contribute to a deeper understanding of the subject (Mark Salji, 2016).

Service Quality

Measure of how well a company meets consumer expectations in terms of the services it provides. In comparison to their consumer's expectations, customers purchase services. The level of service in fast food restaurants can vary depending on a multitude of variables, such as the restaurant chain, the location, the management style, and specific staff members. In fast

food restaurants, there are some common elements that contribute to the overall service quality. One of the key elements in determining an organization's performance and greater efficiency is customer happiness in general. The SERVPERF instrument's definition of customer satisfaction is used in this essay. (Cronin and Taylor, 1992)

Fast Food Restaurant

An industry term for a specific kind of the term "quick-service restaurant" (QSR) refers to a restaurant that sells fast food and provides minimal table service. These places often of a set menu and limited table service, which encourages guests to place their orders, pay, and get their food quickly. The fast food restaurant business is growing rapidly in this decade. Example for fast food restaurants is McDonald's, KFC, Pizza hut, and Subway.

Tangibility

What is meant by "tangibility" is the outward look of physical facilities, including the equipment, personnel, and written materials offered by the service provider. (Blose & Tankersley, 2004). For instance, the appearance of the staff and the hygiene of fast food restaurants. Tangibility is a term frequently used in business and marketing to refer to a product or service's tangible qualities that buyers can actually experience.

Reliability

In a fast food restaurant, reliability refers to the business's dependable and constant performance in providing its goods and services. It includes a number of crucial components that provide a dependable client experience. The way a service provider responds to a customer's issue and provides the appropriate service as requested and at the scheduled time are all factors in reliability (Blose & Tankersley, 2004). For example, customers will believe what they see in the advertisement and they will accept that they can get the same as the advertisement.

Assurance

Described as the extent to which service providers are knowledgeable, courteous, and able to engender confidence. Restaurant customers feel secure when transacting in money there since the staff members are kind, informed, and welcoming. Additionally, the assurance dimension comprises the following: customers feel secure in their transactions; employees regularly show consideration for customers; and staff are knowledgeable enough to respond to customers' inquiries (Parasuraman et al., 1988).

Empathy

Empathy is the staff members' tenderness and love for the client (Zeithaml et al., 1990). Empathy is important because the staff needs to understand the customer's thoughts and emotions. In addition, by filling in knowledge gaps, empathy enables businesses to engage with their customers more effectively.

Responsiveness

Refers to how quickly and attentively a business responds to customer requirements, requests, and concerns. Responsiveness is depending on how ready the service provider or its staff is to satisfy the expectations of their customers (Saghier & Nathan, 2013). It entails taking the initiative to deliver effective and beneficial customer service. Customer satisfaction and referrals are both positively correlated with responsiveness.

Research Hypothesis

A hypothesis ought to be reasonable, testable, and take into consideration the most recent findings and research techniques. A forecast or a hypothesis is also a statement of the relationship between two variables. It suggests that an independent variable and a dependent variable are causally related. As a result, the research suggests:

H1o: There is no relationship between tangibility and customer loyalty towards fast food restaurants in Malaysia.

H1a: There is a relationship between tangibility and customer loyalty towards fast food restaurants in Malaysia.

H2o: There is no relationship between reliability and customer loyalty towards fast food restaurants in Malaysia.

H2a: There is a relationship between reliability and customer loyalty towards fast food restaurants in Malaysia.

H3o: There is no relationship between assurance and customer loyalty towards fast food restaurants in Malaysia.

H3a: There is a relationship between assurance and customer loyalty towards fast food restaurants in Malaysia.

H4o: There is no relationship between empathy and customer loyalty towards fast food restaurants in Malaysia.

H4a: There is a relationship between empathy and customer loyalty towards fast food restaurants in Malaysia.

H5o: There is no relationship between responsiveness and customer loyalty towards fast food restaurants in Malaysia.

H5a: There is a relationship between responsiveness and customer loyalty towards fast food restaurants in Malaysia.

Research Framework

Figure 1 shows the conceptual framework about measuring perceived the service quality toward customer loyalty in Malaysia fast food restaurants. The dependent variable for this research is customer loyalty in Malaysia fast food restaurants, and this is 5 dimensions of independent variable in service quality that conclude which are tangibility, reliability, assurance, empathy and responsiveness.

Figure 1 : Conceptual Framework

METHODOLOGY

Research Design

In this study, the researcher used a quantitative research method. In addition, the quantitative approach is the most appropriate research method to conduct this research. This method is an organized way to measure and gather data from different sources. While this method also has statistics and mathematical tools to determine the results. In addition, quantitative can be determined by the relationship between the cause of the issue and the factors affected by the issue. Based on Oxford Fajar (2013), this quantitative method can be developed through questionnaires or face-to-face interviews. In this study, the researcher will make more use of online platforms to conduct questionnaires and quantitative methods because they can be disseminated on a large scale.

Data Collection

The researcher used the main data approach for this investigation. Data that has never been seen or that has never existed before is referred to as primary data. Primary data is the outcome of the initial investigation. Primarily, primary data collection and analysis take more time. Primary data collection techniques come in two flavours: quantitative and qualitative. The researcher then used a questionnaire to gather data. This is due to the researcher's employment of a quantitative research methodology. Additionally, because they are standardised, surveys are less expensive than other approaches and simpler to manage. Data concerning numerical variables make up quantitative data, used to verify or put to the test theories and premises. A subject's generalizable facts can be established using this research technique. Common quantitative techniques include experiments, observations that are recorded statistically, and thorough investigations. Finally, the researcher uses Google Forms to implement data gathering through internet channels.

Sampling

Sampling is a research strategy in which data is collected from a segment of the population in order to make conclusions about the entire population. A "population" in this sense is often referred to as a "universe." According to Sedgwick, 2013, to describe study participants, there are two different sampling techniques that might be utilised: Random samples (sometimes called probability samples) and non-random samples (sometimes called non-probability

samples). Therefore, the number of people is large, the technique used by the researcher in the survey, and the population is a random sample that is not a probability sample.

Researchers utilise convenience sampling as a technique to get information for market research from a preexisting pool of respondents.. The data collected using this sample is used exclusively for scientific research purposes. This sampling approach relies on criteria such as ease of contact, ease of contacting the group, willingness of respondents to participate, low cost, inexpensive method, and ease of conducting the survey. In addition, a questionnaire should be prepared for all individuals who participate. This sample is conducted for 384 respondents where everyone can participate because the researcher wants to collect data from everyone throughout Malaysia. The target population is Malaysians. Overall, this method is related to surveys.

Data Analysis

Data analysis is a method for assessing information using intellectual and scientific thought to investigate all aspects of the provided information that must be resolved. Information from various sources is collected, reviewed and categorized to determine the final outcome or type. With the sophistication of the computer, the researcher's information collected in this analysis will be analyzed using the Social Science statistical package Version 24 (SPSS). IBM SPSS version 24 is a set of comprehensive statistical tools to process statistical data and generate various results to answer research objectives. Next, the researcher used descriptive statistics, reliability statistics and Pearson's correlation to evaluate quantitative data.

FINDINGS

The Respondent's Demographic Profile

Table 1: Demographic Profile of Sample

Characteristic		Frequency	%
Gender	Male	123	32
	Female	261	68
Age	20 – 25 years old	326	84.9
	26 – 30 years old	25	6.5
	31 – 35 years old	11	2.9
	35 – 40 years old	10	2.6
	Above 40 years old	12	3.1
Race	Malays	341	88.8
	Chinese	29	7.6
	Indian	9	2.3
	Iban	5	1.3
Marital Status	Married	40	10.4
	Single	344	89.6
Education Level	SPM / STPM	49	12.8
	Diploma	67	17.4
	Degree	262	68.2
	Master	6	1.6
Occupation	Full-Time Employee	72	18.8
	Part-Time Employee	24	6.3
	Unemployed	4	1
	Self – employed	13	3.4
	Student	271	70.6

Table 1 presents an overview of the responder profile. First of all, look at the gender of the respondent. As humans know that there are only two genders, male and female. The total number of male respondents is 123, while the total number of female respondents is 261. A total of 384 respondents participated in this study, with 32% of them being male and the remaining 68% being female.

Next, also look at the age of the respondents found in the study. There were 384 respondents which consisted of 326 respondents from the category 20 - 25 years old respondents equal to 84.9%, respondents from the category 26 - 30 years old respondents equal to 6.5%, respondents from the category 31 - 35 years old respondents equal to 2.9%, respondents from the category 35 - 40 years old respondents equal to 2.6% and respondents from the category 40 years old and above respondents equal to 3.1% had responded to questionnaire. Then, went to the race and the researcher found that there were 384 respondents who consisted of 341 respondents equal to 88.8% for the category of Malays, 29 respondents equal to 7.6% for the category Chinese, 9 respondents equal to 2.3% for the category Indian and 5 respondents equal to 1.3% for the category Iban had responded to the questionnaire.

After that, the data was shown that the single status consumes more fast food which is 344 respondents equal to 89.6% compared to the married status which is only 44 respondents which is equal to 10.4%. Besides, the educational level shows there were 384 respondents who were consisted of 49 respondents equal to 12.8% for the category SPM / STPM, 67 respondents equal to 17.4% for the category Diploma, 262 respondents equal to 68.2% for the category Degree and 6 respondents equal to 1.6% for the category Master had responded to questionnaire. Finally, Table 1 shows the respondents by occupation. The total number of respondents is 384 respondents. Respondents for full - time employee is 72 respondents equal to 18.8%. Then, respondents for part - time employee is 24 respondents equal to 25.0%. Next, respondents for unemployed is 4 equal 1.0%, and respondents for self - employed is 13 respondents equal to 3.4%. The last respondents are students with the 271 respondents equal to 70.6% who contributed to this study.

Reliability Test

Reliability analysis was used to measure the reliability of questionnaires. Before discovered the actual questionnaire, researcher had performed in pilot test section, which is conduct 30 respondents to test before the questionnaire was distributed to 384 respondents. This is to know, that the questionnaires are reliable and validity of the variable. Cronbach's Alpha analysis was used to evaluate the data in order to guarantee the reliability and coherence of information.

Table 2: Result of Reliability Test

Variable	Number of Item	Cronbach's alpha coefficient	Strength of association
Customer loyalty in Malaysia's fast-food restaurants	4	0.841	Very good
Tangibles	4	0.853	Very good
Reliability	4	0.874	Very good
Assurance	4	0.858	Very good
Empathy	4	0.825	Very good
responsiveness	4	0.865	Very good

Table 2 above is a measure for the dependability of dependent and independent variable analyses in pilot tests. The questionnaire has a Cronbach's alpha more than 0.6, which is over the threshold for good and dependable reliability. As a result, the test can be applied and accepted in this study, according to the results. Next, there were four questions in the dependent variable, which is customer loyalty in Malaysia fast food restaurants. This section's the Cronbach's Alpha coefficient result is 0.841, which is considered to be very

good. As a result, the responses to the variable's questions' coefficients were valid and supported. There are five independent variables in a reliability analysis. The quantifiable variable was measured using four questions.

Table 2 also showed that, this question had a very good Cronbach's Alpha score of 0.853. Then, the coefficient obtained for the questions in personal variable were reliable. The second variable in Independent Variables is reliability and have four questions correctly, thus the Cronbach's Alpha value for these sections is 0.874 and the remark is very good. The other Independent Variables is assurance and empathy which also have four questions. Therefore, the coefficient obtained for these questions were also reliable. The result in Cronbach's Alpha is 0.858 and 0.825, and it is very good. Responsiveness was identified as the last item in the Independent Variables and has four questions in this section. Besides, the coefficient obtained from the result is 0.865 and it is very accepted. Last, all of the response was very well comprehended and accepted in this study, as shown by the reliability,

Descriptive Analysis

The mean and standard deviation of this study have been examined in section C, which includes all the research questions presented to the respondents

Table 3: Descriptive Statistic

Variables	N	Mean	Standard Deviation
Tangibility	384	1.83	0.65
Reliability	384	2.10	0.75
Assurance	384	1.95	0.68
Empathy	384	1.95	0.66
Responsiveness	384	1.89	0.68

Table 3 displayed the total number of responses, as well as the mean value and standard deviation for both independent and dependent variables. Reliability, with a mean of 2.10% for independent variables, had the highest mean. The second highest variable was assurance and empathy with the same score 1.9%. Next, responsiveness mean score is 1.89% and the lowest score is tangibility which is 1.83%.

Pearson's Correlation

The Pearson Correlation Coefficient analysis is a crucial tool for finding the statistical correlation or relationship between independent variables (IV) and dependent variables (DV). The objective of this analysis is to identify whether the independent variables are correlated, which is Tangibility, Reliability, Assurance, Empathy and Responsiveness and Dependent Variable which is customer loyalty toward fast food restaurants in Malaysia. If a correlation was found, the strength and direction of the relationship between the variables needed to be determined.

Hypothesis 1

H1a: There is a relationship between tangibility and customer loyalty towards fast food restaurants in Malaysia.

Table 4: Correlation coefficient for Tangibility and customer loyalty towards fast food restaurants in Malaysia.

		Customer	Tangibility
Customer	Pearson Correlation	1	.630**
	Sig. (2-tailed)		0
	N	384	384
Tangibility	Pearson Correlation	.630**	1
	Sig. (2-tailed)	0	
	N	384	384

Table 4 shows the significant value, the overall response rate (384), and the Pearson correlation coefficient. The p-value was 0.000, which was below than the significance level of 0.01. With a correlation value of 0.630, the tangibility item and customer loyalty towards a fast food restaurant in Malaysia shown a strong positive relationship.

Hypothesis 2

H2a: There is a relationship between reliability and customer loyalty towards fast food restaurants in Malaysia.

Table 5: Correlation coefficient for Reliability and customer loyalty towards fast food restaurants in Malaysia.

		Customer	Reliability
Customer	Pearson Correlation	1	.483**
	Sig. (2-tailed)		0
	N	384	384
Reliability	Pearson Correlation	.483**	1
	Sig. (2-tailed)	0	
	N	384	384

Table 5 shows the total number of respondents (384), the Pearson correlation coefficient, and the significant value. The p-value was 0.000, below the level of significance of 0.01. With a correlation value of 0.438, the reliability item and customer loyalty towards a fast food restaurant in Malaysia showed a high positive relationship.

Hypothesis 3

H3a: There is a relationship between assurance and customer loyalty towards fast food restaurants in Malaysia.

Table 6: Correlation coefficient for Assurance and customer loyalty towards fast food restaurants in Malaysia.

		Customer	Assurance
Customer	Pearson Correlation	1	.552**
	Sig. (2-tailed)		0
	N	384	384
Assurance	Pearson Correlation	.552**	1
	Sig. (2-tailed)	0	
	N	384	384

Table 6 shows the total number of respondents (384), the Pearson correlation coefficient, and the significant value. The p-value was 0.000, below the level of significance of 0.01. With a correlation value of 0.552, the assurance item and customer loyalty towards a fast food restaurant in Malaysia showed a strong positive relationship.

Hypothesis 4

H4a: There is a relationship between empathy and customer loyalty towards fast food restaurants in Malaysia.

Table 7: Correlation coefficient for Empathy and customer loyalty towards fast food restaurants in Malaysia.

		Customer	Empathy
Customer	Pearson Correlation	1	.565**
	Sig. (2-tailed)		0
	N	384	384
Empathy	Pearson Correlation	.565**	1
	Sig. (2-tailed)	0	
	N	384	384

Table 7 shows the total number of respondents (384), the Pearson correlation coefficient, and the significant value. The p-value was 0.000, below the level of significance of 0.01. With a correlation value of 0.565, the empathy item and customer loyalty towards a fast food restaurant in Malaysia showed a strong positive relationship.

Hypothesis 5

H5a: There is a relationship between responsiveness and customer loyalty towards fast food restaurants in Malaysia.

Table 8: Correlation coefficient for Responsiveness and customer loyalty towards fast food restaurants in Malaysia.

		Customer	Responsiveness
Customer	Pearson Correlation	1	.599**
	Sig. (2-tailed)		0
	N	384	384
Responsiveness	Pearson Correlation	.599**	1
	Sig. (2-tailed)	0	
	N	384	384

Table 8 shows the total number of respondents (384), the Pearson correlation coefficient, and the significant value. The p-value was 0.000, below the level of significance of 0.01. The responsiveness item and customer loyalty towards Malaysia's fast food restaurant exhibited a strong positive relationship with a correlation value of 0.599.

DISCUSSION AND RECOMMENDATION

The first recommendation of study is a perspective study on the importance of ensuring customer loyalty in business. This is because the importance of ensuring customer loyalty is that it can help a business grow more rapidly. In addition, research related to this topic will also give awareness to entrepreneurs to focus on customer loyalty. In addition, they can also do

research on customer loyalty not only in the field of fast food. They can also do research related to other businesses such as hospitality, transportation and telecommunications. Researchers can also conduct a study to open the eyes of entrepreneurs about the importance of providing good products and services to their customers in order to ensure that their customers will be loyal to the products and services they run. In addition, the researcher can also provide some of the best steps in ensuring customer loyalty. For example, giving promotions to customers, creating a member card system, and so on.

Therefore, customers will be more interested in choosing the products or services provided because they feel valued and get various benefits when they are loyal to the products and services offered. For the second recommendation, future research needs to use appropriate methods to obtain information related to customer loyalty. Researchers can obtain information by using quantitative methods, which is by conducting surveys. This will help the researcher in obtaining data about the research being conducted. In survey questions, researchers need to prepare questions that are appropriate to the study being conducted to facilitate respondents to provide accurate information to help them complete the study. In addition, the survey questions also need to be disseminated well in order to obtain a sufficient number of respondents to conduct their research. Researchers can use google form to prepare their questions. This is easier and more productive to make it convenient for responders to respond to the questions provided. Therefore, we hope that future researchers will use the suggestions given to help them in conducting research in ensuring customer loyalty.

CONCLUSION

Finally, based on data collected from 384 respondents using Google Form, the researchers had successfully finished this research, which was titled "Measuring Perceived Service Quality Towards Customer Loyalty in Malaysia's Fast Food Restaurant.". The researcher identified the most important elements as follows for study objectives: tangibility, reliability, assurance, empathy and responsiveness as an important factor that must be present in ensuring customer loyalty in fast food restaurant services. Based on the statement of problems found in this study, there are several things that fast food restaurant operators need

to do in order to overcome this problem in order to increase customer loyalty to their products and services. The first problem statement is that fast food operators find it difficult to ensure that products and services produced are always in the best condition because this plays a major role in attracting the interest and loyalty for their customers. In addition, the quality of the food provided must also be constantly monitored to ensure that the quality of the food is always in a satisfactory condition to prevent customers from making complaints about the food provided.

ABSTRACT

The goal of this study is to look at the elements that influence consumer visit intention to food and beverage outlets in Malaysia. Hence, this study investigates the factors that affecting the customer visit intention towards food and beverage establishment in Malaysia. To perform this analysis, a quantitative approach was used, and the questionnaire were distributed to collect the required information. The sample size of this study was conducted on 384 respondents who have visited the food and beverage establishment in Malaysia through online surveys which is Google form. For data analysis, reliability testing and Pearson correlation had been used by using the Statistical Package for the Social Sciences (SPSS) version 26. As a result, the analysis shows that the number of reviews, content of reviews and online rating have a significant relationship with customer visit intention towards food and beverage establishment in Malaysia.

Keywords: Number of Reviews, Content of Reviews, Online Rating

INTRODUCTION

Background of the Study

Online reviews are important components nowadays for consumers to decide to choose a suitable restaurant. Consumers rarely have access to direct information about product quality when they are making infrequent or distant purchases. They frequently rely on outside sources as a result (Browning, 2010). So, consumers can check the food and beverage establishment social media or look at the online reviews at the food and beverage establishment website. Online reviews have also improved as individuals can easily share their opinions with other internet users. Many of these social media platforms allow users to publish and share travel-related comments, ideas, and personal experiences, which are then shared with others. Consequently, a restaurant's impact from online reviews is significant. Reviews are crucial since 59% of prospective clients look at least 2-3 reviews before making a choice. Online reviews are crucial as they boost company reputation, drive sales, and improve the website's search engine rankings. The reputation may suffer if the website is empty of reviews. People believed that customer reviews are more reliable than what a local business may say about itself, which explains why (Kruessel, 2021). In this context, online reviews have a big impact whereby they can eliminate the potential conflicts of interest. This study tries to demonstrate how internet user reviews affect the profitability of food and beverage establishment in Malaysia.

In addition, on the study have several problems that should be solved it is an online customer review which is a type of consumer feedback or review of a good or service on different ecommerce websites by a customer who has bought and used the product. Due to non-restrictive websites and consumer reviews that are anonymous, the legitimacy and logic of these reviews have always been called into doubt. Because they are seen to be an inaccurate comment about a product or service, reviews might occasionally be in doubt. Then it is important to read restaurant online reviews as it provides the overview of the restaurant. Entrepreneurs need to understand how online reviews affect dining establishments since these reviews might make or ruin a company. Positive reviews increase a restaurant's revenue and patronage. As an alternative, having negative online rating, reviews, and content could affect how customers in Malaysia perceive food and beverage businesses.

This study is aiming to achieve several objectives as followed:

1. To identify the relationship between number of reviews and customer visit intention towards food and beverage establishment in Malaysia.
2. To identify the relationship between content of reviews and customer visit intention towards food and beverage establishment in Malaysia.
3. To identify the relationship between online rating and customer visit intention towards food and beverage establishment in Malaysia.

Significance of the Study

According to the topic chosen from the influencing factors of online reviews affecting customer visit intention towards food and beverage establishment in Malaysia, Researchers investigate the relationship between independent variables (IV) and dependent variables (DV). which involved a number of reviews, content of reviews and online rating. The parties involved which can get advantages are food and beverage establishment operator restaurants, customers, and the future researchers. Food and beverage establishment operator is the company will in the end know what the important strategies are to improve their quality to attract more customer based on the online reviews they received. Customer is they will know which restaurant that have good feedback. Future researchers are aimed to contribute the clear information and address all new researchers on the information related to the factors of online reviews affecting customer visit intention towards food and beverage establishment.

LITERATURE REVIEW

Number of Reviews

Getting as many reviews as possible is simply beneficial to any company. Several favourable evaluations can overshadow a few unfavorable ones. In general, more positive evaluations will result in more sales, which in turn generate more feedback and put the company on the path to success. Accordingly, customers frequently use information from others to guide their decisions (Mitchell & McGoldrick, 1996; Zhang et al., 2010). In fact, 57% of consumers, according to Godes (2004) highlighted that customer tend to read online customer evaluations before making a purchase decision. The amount and quality of online customer evaluations have a significant impact on consumer information processing. Since it can be assumed that

the number of reviews is proportional to the number of consumers who have purchased or plan to visit the product. As a result, from the standpoint of message quantity, the more messages processed, the more favorable connections to its promotion are created (Petty & Cacioppo, 1984). The number of online customer reviews for a product shows the popularity of the product as online word of mouth. . When people want to know a nice spot to visit, for example, a food and beverage outlet, the more reviews there are, the more popular and significant the product is. In addition, the number of reviews is likely to cause consumers to reconsider their purchasing decisions.

Content of Reviews

The content of reviews is a form of digital feedback that customers provide online about products and services. A customer review website provides an opportunity for customers to independently rate the business. For this era of technology, customers can share their feedback or opinion about the product with other people by writing their reviews on the online website of the respective restaurant. Customers reviews are very important in food and beverage establishment because the other potential customers tend to rely on the online comments which will allow them to obtain more information about the restaurant that they are interested (Ye, Law, Gu & Chen, 2011). Customers review or feedback are very essential since the customers' reviews can help the operator to improve what are the restaurant are lacking in the future. The content of reviews or feedback has a great influence on customers visit intention towards food and beverage establishment in Malaysia.

Online Ratings

Online reviews consist of voluntary, user-generated evaluations of a company, product or service by Internet users who have purchased, used, or experienced the product or service in question. This online rating is the overall rating which the consumers give to the business they are visiting. Ratings or feedback given on content in the review area consist a positive and negative comments through social media. Online reviews have replaced and supplemented older types of word-of-mouth regarding the quality of services, such as hotels and restaurants, as an essential source of information for consumers. In general, positive comments are more likely to create emotional trust in consumers, increase their confidence in the product, and be

more persuasive. Conversely, negative comments can reduce emotional trust formation and discourage consumer purchase intentions (Archak et al., 2010). Nowadays, people are more likely to shop on websites and the first thing they see before deciding on a menu and buying a menu is first the rating of the restaurant and then the rating of the menu that they want to buy. Ultimately, 86% of people would balance to do business with a company that has negative reviews online.

Research Hypothesis

The study hypothesis is based on the impact of online reviews, such as number of reviews and online rating that affect the customer visit intention towards food and beverage establishment in Malaysia. Based on this study, the following hypotheses were developed and tested:

H1a: There is a relationship between number of reviews and customer visit intention towards food and beverage establishment in Malaysia.

H1o: There is no relationship between number of reviews and customer visit intention towards food and beverage establishment in Malaysia.

H2a: There is a relationship between content of reviews and customer visit intention towards food and beverage establishment in Malaysia.

H2o: There is no relationship between content of reviews and customer visit intention towards food and beverage establishment in Malaysia.

H3a: There is a relationship between online rating and customer visit intention towards food and beverage establishment in Malaysia.

H3o: There is no relationship between online rating and customer visit intention towards food and beverage establishment in Malaysia.

Research Framework

There are three independent variables (IV) which are the number of reviews, content of reviews and online rating. The dependent variable for this research is customer visit intention towards food and beverage establishment in Malaysia.

FIGURE 1: CONCEPTUAL FRAMEWORK

METHODOLOGY

Research Design

A study design is the framework of research methods and techniques chosen by researchers to conduct research (Bhat, 2018). Study design is also the process of collecting, analyzing, interpreting and reporting data in research studies (Creswell, 2015). In this research, the researchers used the quantitative approach to conduct this study. Quantitative research design involves measurable numerical data that researchers collect using surveys or questionnaires with multiple-choice questions (Houston, 2022). The quantitative research design such as questionnaire is the most used technique to collect data from the respondents for the research

questions. The aim of the study is to determine the influencing factors of online reviews affecting customer visit intention towards food and beverage establishment in Malaysia.

Population

A populace is a finished gathering of people, whether that gathering incorporates a country or a gathering with normal qualities. In measurements, a populace is a gathering from whom a factual example is taken for research purposes. The study subjects consisted of all ethnic groups in Malaysia. The researcher also got a high level of diversity in the responses from the respondents because Malaysia has a diverse racial and cultural identity. Therefore, this study is very helpful and good because they are answers and views from different races and different ages. Nowadays, more and more people surf the internet and use social media regardless of age.

Sampling

Sampling is a process in statistical research that collects a certain number of findings from a broader population. The technique utilised to survey a broader population is determined by the sort of study, which can be simple random sampling or systematic sampling (Boyle,n.d.). Sampling is a statistical analysis strategy that draws a defined number of outcomes from a larger population. According to Sedgwick (2013), there are two types of sampling procedures for recruiting research participants: random sampling (also known as probability sampling) and non-random sampling (also known as non-probability sampling). Researchers employ random sampling in non-probability sampling by considering the time factor for both the survey and the population. In non- probability sampling, researchers use random sampling by considering the time factor for both the survey and the population. A random sample is a type of non-probability sampling method in which the sample is drawn from a group of people who can be easily reached or contacted. The only requirement for the sampling approach is that participants are accessible and willing to participate (Nikolopoulou, 2022). Thus, the sample size for this study is targeted for 384 respondents where everyone can participate because the researchers aim to collect data throughout Malaysia since the target population is Malaysians.

Data Collection

The data collection method employed for this study is through an online survey (Google form). Participants who lived in Malaysia are the target audience. There are no limitations on the age, gender, or ethnicity of customers. Participants were kindly asked to take this survey. The link to a survey page was built on a Google form, along with an explanation of the study's objectives, was sent via a personal account to respondents living in Malaysia through Facebook, Instagram, and WhatsApp to get the actual data.

Research Instrument

Multiple-choice questions in the form of questionnaires are being used in this study. Options are presented to respondents for them to pick from. This questionnaire has the benefit of being swiftly and simply examined, either manually or digitally. Additionally, a number of higher-order thinking skills and a wide range of research subjects can be covered and evaluated by the test. The languages that were used to create this questionnaire were English and Malay. The goal of using this bilingual language is to make it easier for them to comprehend the questions and topics under investigation. Utilising Google Form, the survey will be created and circulated through all social media platforms, but particularly WhatsApp.

The survey questionnaire for this study was broken into three sections. Section A will ask for demographic information such as age, gender, , status, ethnicity, and income. The questions pertaining to the dependent variables, such as the variables impacting online reviews on customers' visit intent to Malaysian food and beverage establishments, will be the main emphasis of Section B, the second section. The questionnaire will then be connected to independent factors highlighted by researchers for Section C, such as the quantity of reviews, their substance, and internet ratings. The researchers incorporate information regarding the dependent variable, which is Malaysian consumers' desire to attend restaurants and bars, in this part.

Data Analysis

Data analysis involves modifying, processing, and cleaning raw data to yield useful and relevant information that supports economic decision-making. This process provides useful

insights and data that reduce the risk associated with decision-making, often displayed in charts, graphs, tables and graphs (Kelley, 2022). To analyze the collected data and interpret the results of research the researcher had used the spreadsheet to organize and analyzing the responses. To make things easier to organize, they used the features in Google Sheets. It has a few practical tools that may use to examine data. Calculations like addition and subtraction are performed using formulas, whereas averages and counts are handled using functions. The data analysis in this study comprised of descriptive analysis reliability test.

RESULTS

In this part, analysts talked about dependability examination, recurrence investigation, elucidating investigation, and Pearson connection coefficient investigation. Information results were acquired from 384 respondents. In this review, the analysts examined information gathered involving the Factual Bundle for the Sociologies (SPSS) adaptation 26.

Results of Reliability Analysis

Before conducting actual data collection, the researchers conducted a pilot test with 30 respondents before distributing the questionnaire to 384 respondents. The results of the pilot test show that the reliability test is used for validation of variables. Questionnaire reliability was measured using reliability analysis. Data were tested using Cronbach alpha analysis to ensure information reliability and internal reliability. The table below shows the rule of thumb (2007) for the size of the Cronbach alpha coefficient.

Alpha Coefficient Range	Strength of Association
< 0.6	Poor
0.6 to < 0.7	Moderate
0.7 to < 0.8	Good
0.8 to < 0.9	Very Good
0.9	Excellent

Table 1: Rules of Thumb of Cronbach's Alpha Coefficient Size (2007)

The table above shows the general consistency (pilot trial) of the reliant and autonomous factor. The credibility Cronbach alpha value of the questionnaire should not be less than 0.6 as it is considered unreliable. The nearer the worth is to 1, the more dependable the inward consistency of the component.

Variable	Number of Item	Cronbach Alpha Coefficient	Strength of Association
Customer Visit Intention Towards Food and Beverage Establishment in Malaysia	5	0.863	Very Good
Number Of Reviews	5	0.838	Very Good
Content Of Reviews	5	0.902	Excellent
Online Rating	5	0.712	Good

Table 2: Result of reliability coefficient Alpha for the Independent Variables and Dependent Variable

The summed Cronbach alpha coefficients for the independent and dependent variables in this study are displayed in the table above. We can infer from the table that every variable is more than 0.6. As a result, the results can be used in this study and are trustworthy.

Demographics Characteristic of Respondent

The fundamental examination of this study included recurrence investigation. Information in Segment An of the poll included inquiries regarding different segment factors of respondents, including orientation, age, race, conjugal status, and pay level.

The segment profiles of the 384 respondents are summed up in the table underneath.

Table 3:Demographics Characteristic of Respondent

Gender	Frequency	Percentage
<input type="checkbox"/> Male	163	42.4%
<input type="checkbox"/> Female	221	57.6%
Race		
<input type="checkbox"/> Malay	325	85%
<input type="checkbox"/> Chinese	23	6.0%
<input type="checkbox"/> India	15	3.9%
<input type="checkbox"/> Others	21	5.5%
Age		
<input type="checkbox"/> 18-20 years old	28	7.3%
<input type="checkbox"/> 21-30 years old	331	86.7%
<input type="checkbox"/> 31-41 years old		
<input type="checkbox"/> 41 years old and above	16	4.2%
	7	1.8%
Marital status		
<input type="checkbox"/> Single	251	91.4%
<input type="checkbox"/> Married	29	7.6%
<input type="checkbox"/> Others		
	4	1.0%
Income level		
<input type="checkbox"/> RM1,000RM2,000	330	85.9%

□ RM2,001RM3,001	28	7.3%
□ RM3,001RM4,001	11	2.9%
□ RM4,001RM5,000	10	2.6%
□ More than RM5,000	5	1.3%
TOTAL	384	100%

Descriptive analysis

This study has examined the mean and standard deviation for segment B, C and D of questionnaires.

Table 4 : Mean and Standard Deviation

VARIABLE	N	MEAN	STANDARD DEVIATION
Number Of Reviews	384	3.8891	0.56262
Content Of Reviews	384	4.4099	0.60907
Online Rating	384	4.0891	0.53268
Customer Visit Intention	384	3.9720	0.59493

Table 4 shows the number of respondents, the means and standard deviations of the independent and dependent variables. Among the independent variables, content of reviews had the highest average of 4.4099, followed by online reviews with 4.0891 for him and number of reviews with 3.8891. The mean of the dependent variable was 3.9720.

Result of Correlation Coefficient

An important analysis that measures the statistical correlation or relationship between a independent variable (IV) and a dependent variable (DV) is the Pearson correlation coefficient study. Researchers need to determine the degree and direction of association between variables before finding correlations. Pearson's correlation coefficient indicates the strength of the relationship between two variables. A popular correlation in linear regression is Pearson's correlation, usually referred to as Pearson's R correlation. The goal of this research was to see if there was any relationship between the dependent variable customer visit intention towards Malaysian food and beverage establishments and the independent variables review quantity, review quality, and online rating.

Table 5:Result of Correlation Coefficient

Correlations

		customer	Number	Content	Online Rating
customer	Pearson Correlation	1	.724**	.179**	.615**
	Sig. (2-tailed)		.000	.000	.000
	N	384	384	384	384
Number	Pearson Correlation	.724**	1	.345**	.682**
	Sig. (2-tailed)	.000		.000	.000
	N	384	384	384	384
Content	Pearson Correlation	.179**	.345**	1	.615**
	Sig. (2-tailed)	.000	.000		.000
	N	384	384	384	384
Online Rating	Pearson Correlation	.615**	.682**	.615**	1
	Sig. (2-tailed)	.000	.000	.000	
	N	384	384	384	384

** . Correlation is significant at the 0.01 level (2-tailed).

Data analysis showed that content of reviews had the highest average value of 4.4099 among other variables. The highest Pearson correlation coefficient between factors influencing customer visit intention towards food and beverage establishment in Malaysian was number of reviews with 0.724, followed by 0.615 for online rating, and finally 0.179 for content of reviews. In summary, significant relationship were found between the independent variables, number of reviews, content of reviews, online rating, and the dependent variable, which is the customer visit intention towards food and beverage establishment in Malaysia.

Finding and Discussion

30 respondents were used for reliability testing before the Google Forms online survey method used to collect a data from 384 respondents. A range of Cronbach alpha coefficients from 0.7 to 0.9 was tested, and good results were shown when the highest Cronbach alpha value was 0.902, followed by the customer visit intention towards food and beverage establishments in Malaysia with 0.863, followed by the number of reviews at 0.838, and lastly was online ratings at 0.712. Therefore, all variables met the minimum requirement as all Cronbach alpha coefficients were significantly greater than 0.6 for all variables.

In the descriptive analysis of the independent variables, content of reviews had the highest mean score of 4.4099, followed by online rating with the second highest mean score of 4.0981, followed by the dependent variable, customer visit intention towards food and beverage establishment in Malaysia with scored 3.9720. The lowest mean for the independent variable was the number of reviews at 3.8891. From this, we can conclude that content of reviews was the biggest factor influencing customers visit intention towards food and beverage establishment in Malaysia. The study's three objectives were three variables, and the researchers used a correlation analysis to determine the linear relationship between them. The correlation study is summarised in

Table 6, which reveals a strong association between the quantity, quality and intention of online reviews and consumer visits to Malaysian restaurants and bars.

Table 6: Summary of Correlation Analysis

Hypothesis	Significant Value	Conclusion	Correlation Value	Conclusion
1	0.000	Accepted	0.724	High positive correlation
2	0.000	Accepted	0.179	Negligible correlation
3	0.000	Accepted	0.615	Moderate positive correlation

Table 6: Summary of Correlation Analysis

Limitations

Like different examinations, this concentrate additionally had own limits made it challenging for analysts to finish this review. This study had a few limits, one of the impediments was factors. The review zeroed in just on three autonomous factors, number of surveys, content of audits, and web-based rating, and one ward variable, client visit aim towards food and refreshment foundation in Malaysia. This was on the grounds that analysis had restricted assets and references to concentrate on other free factors. The next limitation in this study is the data collection method. Only online surveys were employed by the researchers in this study to gather data. The fact that researchers cannot verify the accuracy of the data provided by respondents when utilizing online surveys presents a problem. Additionally, the number of respondents is one of the limitations of this study. Not all Malaysians can participate in this study by answering questions or receiving questionnaires from researchers and think if they answer will waste their time. The last limitation in this research is relying on the research design which employed quantitative approach. There is no study extension as this study focuses only on quantitative studies. Unless further research, especially qualitative research, is

conducted on this study, other researchers will not be able to know more about the influencing factors of online ratings for Malaysian food and beverage companies.

Recommendations

In conducting this research, the researchers discovered several things that could be improved through online ratings that influence customers visit intention towards food and beverage establishment in Malaysia. Recommendation for food and beverage establishment operator, restaurants can enhance their food rating system by adding a comment section to each menu item in their restaurant. The Chicken Chop menu, for example, has a comment section and Likert scale that customers can fill in after the meal and give help to other customer by reading their comment and can fulfil their desires. Additionally, restaurants can harness the power of virality to promote their restaurants on social media. Recommendation for future researcher the study suggests that further research could be conducted for those wishing to follow relevant studies focused on establishing specific food and beverage. For example, they can focus on the elements of online reviews for restaurants that only serve western food. Researchers can get more detailed answers about all kinds of food, whether it is western or traditional cuisines.

Conclusion

This study explores the relationships between the number of reviews, content of reviews and online rating variables that influence customer visit intention towards food and beverage establishment in Malaysia. There were 384 respondents had partaken in this study through a web-based overview technique. Information were gathered and investigated by involving the Measurable Bundle for the Sociologies (SPSS) adaptation 26 in view of graphic, dependability and connection examination. The aftereffects of the dependability examination showed that the outcomes introduced in this study were solid.

ABSTRACT:

This study investigates the influence of deviant workplace behavior, namely organizational justice, organizational constraints, trust in the organization, and work autonomy, on employee performance within the Malaysian hotel industry. This study employed a quantitative approach where 140 questionnaires were distributed to individuals working in hotels in Kota Bharu, Kota Kinabalu, Kuantan, and Georgetown. Data collection was conducted through convenient sampling using an online survey. The findings of this study indicate that organizational justice, organizational constraints, trust in the organization, and work autonomy significantly impact employee performance within the hotel industry. By offering a comprehensive understanding of the factors influencing employee performance in the hotel industry, this research contributes to existing theories and practical applications.

KEYWORD: Deviant Behaviour, Organisational Justice, Trust in Organisational, Work Autonomy, Employee Performance.

INTRODUCTION

Hotel businesses' success heavily relies on their employees' performance, mainly due to the emphasis on service as the primary product. Employees providing exceptional service to guests increases guest satisfaction and generate more income for the business. Malaysia's hotel industry employed approximately 196.4 thousand people in 2021 (United Nations World Tourism Organization [UNWTO]). However, the prevalence of high crime rates in Asia, including the Philippines, has escalated deviant behavior from minor to severe forms, observable in various locations. In recent years, the rates of reported bad behavior among adolescents have reached alarming levels, prompting concerns from the Department of Social Welfare and Development (DSWD) in the Philippines. Notably, deviant behaviors with negative impacts on others, such as lawbreaking, rape, robbery, theft, murder, juvenile delinquency, assaults at school, bullying,

vandalism, addictions, and substance abuse, have gained particular attention, as highlighted by articles in the Philippines Crime and Safety Report published in 2017 (Psychol, 2021).

Furthermore, the issue of workplace deviance has received considerable attention in Malaysia, as evidenced by frequent reports of dishonesty, absenteeism, accidents, employee turnover, bribery, poor work attitudes, and industrial accidents in newspapers and other public media sources. The gravity of workplace deviant behavior has captured the interest of relevant government bodies and the local media, which have highlighted these problems. Consequently, this study explores the relationships between organizational justice, organizational constraints, trust, and work autonomy, with employee performance in the Malaysian hotel industry. By examining these factors, the study seeks to contribute to understanding the impact of workplace deviance on employee performance and provide insights for effective management strategies in the hotel industry.

The findings of this research will be beneficial to hotel practitioners and operations, as it will provide valuable insights into the strategies necessary to enhance service quality and attract a more extensive customer base based on online reviews. Furthermore, hotel employees can benefit from this study by gaining awareness of the consequences of engaging in deviant behavior within the hotel industry. This knowledge can serve as a deterrent, encouraging employees to refrain from harmful actions. Additionally, the Ministry of Human Resources and labor departments can utilize the findings of this study to improve employee behavior and promote positive work environments. Future researchers can also build upon this study by further investigating the impact of online reviews in related fields.

LITERATURE REVIEW

Organizational Justice

Organizational justice is a critical area of study that explores the psychological processes underlying individuals' fairness judgments and their subsequent effects. It encompasses two primary dimensions: distributive justice and procedural justice. Job satisfaction among employees is closely linked to their perception of organizational justice. Employees who perceive fairness in their workplace are likelier to experience heightened engagement and commitment to their work.

Conversely, cynical employees who perceive corporate injustice and a lack of ethical norms are more inclined towards deviant behavior, including tardiness, absenteeism, theft of company property or information, sabotage, and dishonesty. The influence of organizational justice extends beyond job satisfaction, as it significantly impacts employees' overall attitudes, either positively or negatively.

Employers are vested in comprehending the dynamics within their workplace and implementing strategies to mitigate employee deviant behavior. However, it is worth noting that Rowland and Hall (2012) discovered a negative direct relationship between organizational justice and employee performance. This discovery suggests that certain factors influence the link between organizational justice and performance, warranting further investigation and analysis in this area.

Organizational Constraints

Organizational constraints refer to the factors within the immediate work environment that hinder the translation of motivation and skills into effective job performance. These situational limitations impede employees from carrying out their responsibilities in line with organizational expectations, resulting in turnover, dissatisfaction, and negative emotions. In the hotel industry context, organizational constraints may encompass inadequate training, excessive workloads, unsocial work hours, and job overload. Employees who perceive themselves as restricted by these circumstances are more prone to engage in illicit behaviors at work, which can harm the company and its stakeholders.

Workplace deviance encompasses a broad range of behaviors impacting individuals and organizations. It can be categorized into four main types: production deviance, property deviance, political deviance, and employee aggression. Interpersonal deviance pertains to deviant behaviors targeting individuals, while organizational deviance focuses on actions that undermine the organization. Previous research on organizational constraints has primarily focused on assessing variables associated with these constraints rather than establishing causal relationships. However, interruptions from others are more specific and readily understandable, and they are more likely to impact customer satisfaction due to their uncontrollable nature.

Organizational constraints influence two key aspects: employees' perceptions of the limitations and the overall work environment. Personality traits such as negative affectivity, anger,

and agreeableness demonstrate the strongest relationships with perceived constraints from colleagues, supervisors, and inadequate resources. However, the literature has yet to extensively explore the causal relationships between organizational constraints and related variables. Further investigation is needed to understand better these relationships' intricacies and their implications for employee attitudes and behaviors in the hotel industry.

Trust In Organization

Trust can be defined as the willingness of one party to place themselves in a vulnerable position, relying on the actions of another party. It entails an expectation that the other party will undertake specific activities that are crucial for the trustor's benefit, irrespective of their ability to monitor or control these actions and the inherent uncertainties surrounding the motivations, intentions, and potential behaviors of the other party. In the organizational context, organizational trust refers to an employee's belief that the organization will engage in actions that are advantageous to them or, at the very least, not detrimental.

Various contextual factors influence the development of trust within an organization. These factors shape the perceptions and beliefs of employees regarding the organization's trustworthiness. Understanding the contextual factors that impact organizational trust is vital for comprehending workplace confidence dynamics.

Work Autonomy

Workplace autonomy refers to the extent to which employees have the freedom to carry out their job responsibilities. It encompasses the rate at which work is completed, the sequence in which tasks are undertaken, and the degree of independence from micromanagement. Existing research has highlighted a positive association between deviant behavior, such as fraud and theft, and the level of opportunity or autonomy granted to employees. Job autonomy empowers employees to make decisions and exercise discretion most properly. The interplay between job stress, job autonomy, and employee behavior is significant, as it can lead to feelings of frustration, aggravation, irritation, impatience, and intolerance. Employees' confidence in executing their tasks also influences the relationship between job factors and deviant behavior in the workplace.

Employers need more job autonomy to ensure employees utilize legitimate means to regain power and resources. Lawrence and Robinson (2007) demonstrated that reduced autonomy is a source of frustration, ultimately leading to deviant behavior. Conversely, individuals who experience high job satisfaction show elevated enthusiasm, reduced exhaustion, and a sense of significance and engagement in their work. By fostering an organizational environment that allows for reasonable autonomy, the organization can effectively mitigate deviant behavior.

Employees Performance

The purpose of this literature review is to offer an overview of available research on employee performance in Malaysia's hospitality sector. It looks at motivation, training and development, leadership, organizational culture, and work satisfaction as elements that impact employee performance. The evaluation also emphasizes the particular issues that the Malaysian hotel business faces, as well as the consequences for staff performance. These findings highlight the significance of addressing these elements in order to enhance staff performance and, as a result, the competitiveness and success of the Malaysian hotel business. This literature study, by exploring the numerous dimensions of employee performance in the Malaysian hospitality sector, gives a helpful insight into the elements that drive employee performance and exposes the industry's issues. These findings can help hotel managers and policymakers establish effective ways for improving employee performance, increasing work satisfaction, and maintaining a competitive edge in Malaysia's dynamic hospitality industry.

RESEARCH HYPOTHESIS

Organizational justice, organizational constraints, trust in the organization, and work autonomy are independent variables influencing employee performance in the Malaysian hotel industry. So, this research will investigate the following hypothesis for this study.

H1 : There is a relationship between organizational justice and employee performance in Malaysia hotel industry.

H2 : There is a relationship between organizational constraints and employee performance in Malaysia hotel industry.

H3 : There is a relationship between trust in organization and employee performance in Malaysia hotel industry.

H4 : There is a relationship between work autonomy and employee performance in Malaysia hotel industry.

CONCEPTUAL FRAMEWORK

This study used a conceptual framework to analyze the relationship between independent and dependent variables in research. The conceptual framework for this study is shown in Figure 2.1 below.

Figure 2.1: Conceptual Framework

Organizational justice, organizational constraints, trust in the organization, and work autonomy are the four independent variables in this study, which significantly impact employee performance in the Malaysian hotel industry.

METHODOLOGY

Research Design

The research design encompasses the methods and procedures employed to gather and analyze data related to the specified variables within the research problem. This study adopted a quantitative approach, utilizing a cross-sectional design where the researchers' collected data at a

single point in time. This research focused on investigating employee performance's influence on workplace deviant behavior within the Malaysian hotel industry.

Data Collection

This research employed standard and validated data collection techniques to gather, measure, and analyze precise information relevant to the study. The primary data was collected through a questionnaire designed for this study, titled "The Influence of Workplace Deviant Behavior on Employee Performance in the Malaysian Hotel Industry." The researchers used online platforms such as Google Forms to collect the data, and suitable respondents were selected for the survey. The research employed a simple random sampling strategy, utilizing straightforward survey instruments to enhance the ease of response for the participants.

Sampling

This study employs a non-probability convenience sampling technique to select participants from a readily accessible group of individuals employed in the Malaysian hotel industry. Convenience sampling is utilized as a time and cost-efficient method of participant selection, as it allows for the inclusion of easily reachable individuals. The questionnaire is administered in specific locations, namely Kota Bharu, Kelantan, Kota Kinabalu, Sabah, Kuantan, Pahang, and Georgetown, Pulau Pinang. Respondents are required to complete the questionnaire and provide statistical data based on their responses.

Data Analysis

The Statistical Package for the Social Sciences (SPSS) is a widely utilized computer program for quantitative data analysis. It provides the capability to generate tabular reports, charts, and visual plots and employs the Pearson Correlation Coefficient method to analyze the collected data. This investigation aims to assess the relationship between the independent variables (IV) and the dependent variables (DV), specifically exploring the associations among organizational

fairness, organizational constraints, organizational trust, work autonomy, and employee performance.

FINDINGS

Demographic Analysis

Table 1: Demographic frequency (n) and percentage (%)

Demographic	Category	Frequency (n)	Percentage (%)
Gender	Male	50	35.7
	Female	90	64.3
Race	Cina	11	7.9
	India	8	5.7
	Melayu	84	60.0
	Others	37	26.4
Religion	Buddha	8	5.7
	Kristian	18	12.9
	Islam	106	75.7
	Others	8	5.7
Age Group	21 – 30 years old	127	90.7
	31 – 40 years old	12	8.6
	Below 20 years old	1	.7
Education Level	Degree	92	65.7
	Diploma	47	33.6
	Doctor Of Philosophy	1	.7
Income Level	Below RM 1,000	37	26.4
	RM 5,000 and above	2	1.4
	Rm 1,000 – RM 2,000	46	32.9
	RM 2,100 – RM 3,000	49	35.0
	RM 3,100 – RM 4000	6	4.3

The online platform collected a total of 140 sets of questionnaires from participants. This section presents the demographic profile and background of the respondents. Regarding gender, 35.7% (n=50) identified as male, while 64.3% (n=90) identified as female. Most respondents identified as Malay, accounting for 84 respondents (60.0%), followed by other races with 37 respondents (26.4%). The Chinese ethnicity was represented by 11 respondents (7.9%), while eight respondents (5.7%) identified as Indian. Islam was the predominant religion among the respondents, with 106 participants (75.7%), followed by 18 (12.9%) who identified as Christian. Eight respondents (5.7%) reported practicing Buddhism or other religions. Most respondents were 21-30 years old, with a frequency of 127 (90.7%). This category was followed by 12 respondents

(8.6%) in the age range of 31-40 years and one respondent (0.7%) below 20. Furthermore, Table 1 indicates that the highest educational attainment among respondents was a degree, accounting for 65.7% (n=92). This group was followed by 47 respondents (33.6%) who had completed a diploma and one respondent (0.7%) who held a Doctor of Philosophy (Ph.D.) degree. Lastly, regarding income level, the highest number of respondents, 49 (35.0%), reported an income range of RM 2,100 – RM 3,000. This group was followed by 46 respondents (32.9%) in the income range of RM 1,000 – RM 2,000. Thirty-seven respondents (26.4%) reported an income below RM 1,000. Six respondents (4.3%) reported an income range of RM 3,100 – RM 4,000, while the remaining two (1.4%) reported an income of RM 5,000 and above.

Descriptive Analysis

The researchers employed descriptive analysis to describe the relationship between variables in a large sample or population, as Chapman (2017) suggested. The result of the descriptive analysis for this study is summarized in Table 2 below.

Table 2: Descriptive Analysis Independent variable and Dependent variable

VARIABLES	MEAN	STANDARD DEVIATION
DV: Employee Performance	4.5857	0.52180
IV 1: Organizational Justice	4.1893	0.64865
IV 2: Organizational Constraints	4.3411	0.61764
IV 3: Trust in Organization	3.7143	0.88022
IV 4: Work Autonomy	4.0500	0.79409

Table 2 presents the mean and standard deviation for independent variables (IV) and dependent variables (DV). Among the independent variables, organizational constraints obtained the highest mean score of 4.3411, followed by organizational justice with a mean of 4.1893, work autonomy with a mean of 4.0500, and trust in the organization with the lowest mean of 3.7143. The mean for the dependent variable, employee performance in the Malaysian hotel industry, was 4.5857. The analysis of mean and standard deviation for the dependent variable, employee performance, suggests that workplace deviant behavior can have a negative impact on employees' performance.

Reliability Analysis

Table 3 shows the aggregate reliability for both the dependent and independent variables.

Table 3: Result of Reliability Coefficient Alpha for the Independent Variables and Dependent Variable

Variable	Number of Item	Cronbach's Alpha Coefficient	Strength of Association
Organizational Justice	4	0.802	Very Good
Organizational Constraints	4	0.794	Good
Trust in Organization	4	0.721	Good
Work Autonomy	4	0.947	Excellent

The Cronbach's Alpha coefficients for the independent and dependent variables in this study are presented in Table 3. As indicated in the table, all variables had coefficients exceeding 0.7. Therefore, it can be inferred that the results presented are trustworthy and acceptable for further analysis, as Hair et al. (2017) suggested.

Four questions were utilized to assess organizational justice's influence on employee performance. According to Table 4.2, Cronbach's Alpha coefficient for these questions was 0.802, indicating an outstanding level of reliability. Hence, the coefficients obtained for the organizational justice variable were deemed reliable. Similarly, four questions were employed to evaluate the organizational constraints variable's impact on employee performance. The Cronbach's Alpha value for this section was 0.794, indicating good reliability. Thus, the coefficients derived from the organizational constraints factor queries were considered reliable. Furthermore, four questions were used to measure the trust in the organization variable, which influenced employee performance. The Cronbach's Alpha coefficient was 0.721, suggesting good reliability. Therefore, the coefficients calculated for the trust in the organization factor queries were deemed reliable.

Lastly, four questions were employed to assess work autonomy and its relationship with employee satisfaction. This section's Cronbach's Alpha coefficient was 0.947, indicating good reliability. Therefore, the coefficients calculated for these questions in evaluating employee performance in the Malaysian hotel industry were also reliable.

Given that Cronbach's Alpha coefficients for these variables exceeded 0.7, the questionnaires demonstrated high reliability, indicating that participants understood the questions well. Consequently, the questionnaires were suitable for this investigation, and the research can proceed accordingly.

Pearson Correlation Analysis

Table 4: Pearson’s correlation between Organizational Justice, Organizational Constraints, Trust in Organizational and Work Autonomy toward Employee Performance in Malaysia Hotel Industry

Variable		Employee Performance
Organizational Justice	Pearson Correlation	.279**
	Sig. (2 tailed)	<.001
	N	140
Organizational Constraints	Pearson Correlation	.581**
	Sig. (2 tailed)	<.000
	N	140
Trust in Organization	Pearson Correlation	.114
	Sig. (2 tailed)	<.178
	N	140
Work Autonomy	Pearson Correlation	.244**
	Sig. (2 tailed)	<.004
	N	140

**Correlation is significant at the 0.01 level (2-tailed).

Table 4 presents the results of the Pearson correlation coefficient, significant values, and the number of responses (N=140) for this study. The findings revealed a strong positive correlation between organizational justice and employee performance in the Malaysian hotel industry. Organizational justice demonstrated a moderate positive relationship with employee performance in the Malaysian hotel industry, with a p-value of 0.000 and a correlation coefficient of 0.581. Furthermore, the Pearson correlation coefficient, significant values, and the number of 140 responses indicated a high significance level (p-value = 0.178) but a negligible correlation between trust in the organization and employee performance in the Malaysian hotel industry. Additionally, the Pearson correlation coefficient, significant values, and 140 responses showed a p-value of 0.004 and a correlation coefficient 0.244 between work autonomy and employee performance.

DISCUSSION AND RECOMMENDATION

Based on the data collected and the findings presented in Table 4, a significant relationship between organizational justice and employee performance in the Malaysian hotel industry has been established. The results align with hypothesis H1, indicating that the perception of organizational justice significantly influences employee performance related to deviant behavior. These findings are consistent with existing research that consistently demonstrates organizational justice's impact on individual workplace behavior (Collquit, 2013). When employees perceive the evaluation outcomes or the decision-making processes for allocating outcomes to be unfair, they are more likely to exhibit negative behaviors, as Priesemuth (2013) suggested.

The findings from the data analysis in Table 4 reveal a positive correlation between organizational constraints and employee performance. These results support hypothesis H2, indicating that organizational constraints significantly impact deviant behaviors exhibited by employees that subsequently affect their performance. The responses collected from participants in the study largely agree that organizational constraints within the hotel industry, such as inadequate training, excessive workloads, unsocial work hours, and role overload, contribute to the manifestation of deviant behaviors. This finding is consistent with previous research conducted by Kim and Miao (2015), which established the presence of situational constraints within the hotel industry.

The results from the data analysis in Table 4 indicates a positive correlation between trust in the organization and employee performance within the Malaysian hotel industry. This finding aligns with hypothesis H3, which posits a relationship between the independent variable of organizational trust and employee performance. Trust in organizations is rooted in the framework of integrated social attachment exchange, wherein an employee's level of trust is influenced by past interactions with their employer and the expectation of future interactions being similar to those in the past. If an employee encounters negative interactions with the organization, it is anticipated that their trust in the organization will diminish, subsequently impacting their engagement in deviant behaviors. This notion is supported by Thau and Bennet (2007), who assert that a lack of organizational trust among workers influences their inclination toward engaging in deviant behaviors. Marasi (2016) also found a negative correlation between organizational trust and workplace deviance.

The findings in Table 4 reveals a positive correlation between trust in the organization and employee performance within the Malaysian hotel industry. This finding is consistent with hypothesis H3, which posits a relationship between the independent variable of organizational trust and employee performance. Trust in organizations is grounded in the framework of integrated social attachment exchange, where an employee's level of trust is shaped by their past interactions with the employer and their expectations for future interactions to resemble those in the past. When employees experience negative interactions with the organization, their trust in the organization is expected to diminish, subsequently influencing their inclination towards engaging in deviant behaviors. This notion is supported by Thau and Bennet (2007), who suggest that a lack of organizational trust among employees influences their propensity to exhibit deviant behaviors. Furthermore, Marasi (2016) found a negative correlation between organizational trust and workplace deviance. These findings collectively highlight the significance of trust in the organization as a determinant of employee performance and its implications for mitigating deviant behaviors in the workplace.

Regarding recommendations, future studies should encompass a broader context beyond the four countries in this research conducted in Malaysia. Expanding the scope of the study would enhance the understanding of the findings and allow for better generalization of the results. Additionally, while this study primarily focuses on the four aspects of organizational justice, organizational constraints, trust in the organization, and work autonomy, it is important to acknowledge that other influential factors may have been overlooked. These additional aspects may significantly impact employees' performance in the hospitality industry in Malaysia. Therefore, it is recommended that future researchers consider incorporating additional factors or elements to ensure a comprehensive analysis and obtain accurate results in their research endeavors.

CONCLUSION

In conclusion, the primary objective of this empirical research was to explore the correlation between employee performance in the Malaysian hotel industry and several independent variables, namely organizational justice, organizational constraints, trust in the organization, and work autonomy. The study sought to contribute to the existing body of

knowledge by comprehensively understanding the factors influencing deviant workplace behavior and its impact on employee performance in the Malaysian hotel industry.

The research findings are expected to serve as a valuable resource for researchers and practitioners. By shedding light on the relationships between organizational justice, organizational constraints, trust, work autonomy, and employee performance, this study offers clear insights into the dynamics at play within the hotel industry. Furthermore, the findings will contribute to developing future research endeavors, particularly those investigating the influence of online reviews and related factors on employee performance.

The implications of this research extend beyond academia and hold practical value for hotel management and employees. By gaining a better understanding of the factors that contribute to deviant behavior in the workplace, organizations can develop effective strategies and policies to prevent and address such behaviors. These strategies, in turn, can foster a healthier and more productive work environment, benefiting both the organization and its employees. In conclusion, this empirical study provides significant contributions to understanding deviant workplace behavior and its impact on employee performance in the Malaysian hotel industry. The findings have implications for further research and practical applications, ultimately guiding efforts to mitigate deviant behavior and enhance employee performance in the hospitality sector.

ABSTRACT

“The hospitality industry now includes self-service kiosk (SSK) technology. This study attempted to examine how self-service kiosks: ease of use, speed of delivery, and monetary promotion influence customer satisfaction in Genting Highlands hotel. The study also examined the link between customer satisfaction and future self-service kiosk usage intentions. The study's aims to investigate how ease of use, delivery speed, and monetary promotion affect customer satisfaction with SSK. The data was analyzed using descriptive statistics and Pearson correlation analysis. Respondents were given 384 questionnaires. In the study's findings, there was no significant relationship between monetary promotion and customer satisfaction, showing that ease of use and delivery speed influenced customer satisfaction positively. The likelihood of using self-service kiosks in the future was positively connected to customer satisfaction. The study validates the elements required for effective SSK customer satisfaction at the Genting Highlands hotel. It provides significant details on the variables that impact satisfaction.”

Keywords: Hotel Industry, Customer Satisfaction, Ease of Use, Speed of Delivery, Monetary Promotion.

1.0 INTRODUCTION

The fastest-growing sector of the global economy is technology in the hotel sector. In Malaysia, it is quickly expanding (Euromonitor International, 2019). Self-service technology (SST) adoption is an unfamiliar experience for its users. The Department of Statistics Malaysia (2019) reports that the number of accommodation facilities increased with a total annual growth rate of 6.7% from RM13.9 billion in 2015 to RM15.8 billion in 2017. Given that it has accelerated change and has business implications in numerous industries, technology is one of the most important forces in the world today (Michelle Evans, 2019). Work is now simpler, more adaptable, and more satisfying for employees thanks to technology (Casado, 2014).

Self-check-in and self-check-out kiosks are uncommon at hotels in Malaysia. The three-star First World Hotel and Plaza, Genting Highland, is one of the incredibly few hotels that uses these kiosks. The goal of this study is to understand how satisfied and eager customers are to use self-service kiosks in Genting Highlands. The study's findings are extremely important given Malaysia's rapid growth in the use of self-service kiosks. This study, however, focuses

on how likely it is for customers to use self-service kiosks in a select number of Genting Highlands locations.

Significance of the Study

According to the study's title, "Customer Satisfaction Towards Self-Service Kiosks in Genting Highlands Hotel," the researcher has examined how changes in the independent variables, which are the factors that determine ease of use, speed of delivery, and monetary promotion of self-service kiosk in Genting Highlands hotel, affect the dependent variable, which is customer satisfaction.

In the present study, the researchers were able to gain a deeper understanding of how the self-service kiosk at the Genting Highlands hotel's ease of use, speed of delivery, and monetary promotion affected customer satisfaction. Additionally, this study gave researchers the opportunity to pinpoint significant, previously studied components that have an impact on the customer satisfaction process. Future researchers might benefit by referring to the study's topic.

The research paper is important to the hotel industry since it gave the sector information on how customers felt about using self-service kiosks at the Genting Highlands hotel. As a result, it will offer a reliable foundation of knowledge that will make evident the relevance of offering great services and their impact on customer satisfaction. Hotels become increasingly prevalent in the market as a result of this factor. The hotel industry gets competitive advantages through better decision-making, which benefits in terms of generating more profit.

Future customers may profit from the research topic because it offered advice on how to thoroughly understand consumer satisfaction when using self-service kiosks at the Genting Highlands hotel. The research that has given prospective customers important data demonstrates the real customer satisfaction of using self-service kiosks at the Genting Highlands hotel.

2. LITERATURE REVIEW

2.1 Ease of Use

According to Yen HR (2005), ease of use relates to both the effort needed to use innovation and the complexity of the method used to provide services. This would apply to both hotel workers and visitors utilizing the software while giving or receiving services inside the property. According to Bilgihan et al. (2016), systems that are simple to use and don't place customers under time constraints will result in a better cognitive experience. In light of this, it is essential for hospitality service providers, especially those working in the hotel sector, to evaluate and consider the value of incorporating SST into their everyday business practises. The ease of use of a system is a sign that a company values, cares for, and comprehends its customers. (Egger and others, 2001) While simplicity of use may improve service delivery for service providers and increase extrinsic advantages for customers, it prevents consumers from interacting with service providers, which may disappoint their desire to do so (Ko, 2017). In contrast, Kim and Qu (2014) assert that perceived use has no impact on consumer satisfaction with SST.

2.2 Speed of Delivery

Speed delivery is a value-added service that refers to the time between an item's replacement and real delivery to the customer's location (Myriam Ertz, 2021). Today's consumers are incredibly demanding when it comes to how quickly services are provided, and they usually underestimate how long it will take. When customers want to make bookings, the responsiveness of the kiosks for delivery is the first impression of hotel service, which today frequently begins online before the guest stay (Mok et al., 2013). Customers are satisfied when service delivery meets or surpasses expectations, according to the service quality hypothesis. However, dissatisfaction happens when the opposite is true and the customer's expectations are higher than what is provided. As a result, they acknowledged SSTs as a practical tool that allows them to save time while producing the least amount of waste. Increased service delivery speed, flexibility, and control are acknowledged as major factors in customers' decisions to use SSTs (Hilton et al. 2013).

2.3 Monetary Promotion

Monetary promotion is a sort of sales promotion that directly influences the price of the product that the buyer pays. According to this study, since self-ordering kiosks and apps are both made available for free, people view them as extra advantages in addition to the benefits of utilizing them. Consumers' usage intentions are greatly influenced by the self-ordering kiosk's free-to-download feature. For instance, by merely emphasizing specific discounts, keyless systems, and rewards, hotels can raise awareness of the self-ordering kiosks used in administration. With these efforts, it will benefit the active promotions for customers, giving them the opportunity to fully utilize the available app. We propose that service excellence can account for the beneficial impact of promotions that are in line with consumers' spending and financial objectives on customer satisfaction (Ratneshwar et al., 2001).

2.4 Customer Satisfaction

According to the hospitality perspective, customer satisfaction as measured by the service may have an impact on their future loyalty to the service provider (RA Rather, 2021). The biggest predictor of a hotel's future profits is how happy its customers are. Khan, S., and N. N. Abdullah (2019). However, in a purchase transaction, consumer contentment in exchange for a specific price is referred to as satisfaction. Additionally, it is essential to measure customer satisfaction in order to establish the discrepancy between expected and actual performance. This is also known as a consumer's judgement of how satisfied they are with the level of consumption-related fulfilment offered by the good or service. In light of what the customer has purchased, consumed, and compared, contentment is defined as a "pleasant reaction" of the consumer (Hamid. R, et al. 2022).

2.5 Research Hypotheses

The hypothesis tested are:

H1: There is a significant relationship between ease of use and customer satisfaction towards the hotel industry in Genting Highlands.

H2: There is a significant relationship between speed of delivery and customer satisfaction towards the hotel industry in Genting Highlands.

H3: There is a significant relationship between monetary promotion and customer satisfaction towards the hotel industry in Genting Highlands.

2.6 Research Framework

Figure 1: Conceptual Framework

Source: Framework adopted from Chanmi Hong and Lisa Slevitch (2018)

Figure 1 was used by the researcher to establish the relationship between independent variables and dependent variables. Easy of use, quickness of delivery, and financial promotion are the independent variables. Customer satisfaction with the hotel's self-service kiosks in Genting Highlands is the dependent variable. The framework demonstrates that consumer satisfaction with self-service kiosks at Genting Highlands hotel depends on a number of important aspects, including ease of use, delivery timeliness, and financial incentives.

3. METHODOLOGY

Research Design

The customer who uses the self-service kiosks in the hotels in Genting Highlands will be the focus of the analysis. Rahi (2017) claims that while using survey questionnaires for research, a quantitative method is employed for data collecting, pre-defined instruments, and sample population searching. In order to conduct this study, self-service kiosk users at hotels in Genting Highlands were selected. Descriptive research is used to gather data through questionnaires completed by respondents and then used to characterize the data.

A study design's goal is to provide an explanation of the data collected to help researchers provide a clear response to the original inquiry (Da De Vaus, 2001). Descriptive research can also provide answers to the what, when, who, where, and how of an issue because it typically involves a wider population.

Data Collection

The researcher employed a questionnaire and secondary data to gather data for this study. Sections A, B, and C make up the three sections that make up the questionnaire. surveys All were given out to guests who had used the self-service kiosks at hotels in Genting Highlands. The questionnaire given to the respondents is multilingual and contains questions in both Malay and English. Before distributing the questionnaire, the researcher first got the target respondent's permission to go around Genting Highlands and gather data. Respondents who work in Genting Highlands hotels with guests who frequently use self-service kiosks received surveys. After the respondent has completed the entire questionnaire, data is gathered. To ensure the accuracy of the data acquired, researchers personally collected the surveys from the respondents.

Sampling

Purposive sampling was utilised in this study as a sample strategy to gather informational data. This purposive sample is one whose characteristics are predetermined for a particular research objective. C. Andrade (2021). Purposive sampling is used to examine consumer satisfaction with the self-service kiosks in the hotel in Genting Highlands as a reflection of the population. Each region has its own autonomous study locations. Customers who have checked into Genting Highland hotels solely are the research's target group. According to Krejcie and Morgan (1970), the sample size was 384 people, and the population was 1,678,700 people with experience checking into Genting Highlands Hotel.

Data Analysis

In order to analyses the data gathered for this study, the Statistical Package for Social Science (SPSS), version 26 was used. A programme called SPSS uses statistical statistics and correlation to explain the relationship between independent and dependent variables. The data collected from guests who responded and checked into the Genting Highlands hotel can be transformed into useful information using SPSS.

4. FINDINGS

Table 1: Demographic Analysis

Item	Frequency (n)	Percentage (%)
Gender		
<i>Female</i>	229	59.6
<i>Male</i>	155	40.4
Age Group		
<i>18-25 years old</i>	161	41.9
<i>26-35 years old</i>	86	22.4
<i>36-45 years old</i>	98	25.5
<i>46-55 years old</i>	34	8.9
<i>56-65 years old</i>	5	1.3
Level of education		
<i>SPM</i>	41	10.7
<i>STPM/STAM/Diploma</i>	61	15.9
<i>Degree</i>	181	47.1
<i>Master/PhD</i>	49	12.8
<i>Others/Lain-lain</i>	52	13.5
Household Income (per month)		
<i>RM0</i>	111	28.9
<i>< RM1000</i>	57	14.8
<i>RM1500-RM2500</i>	133	34.6
<i>RM3000-RM4500</i>	56	14.6
<i>>RM50000</i>	27	7.0
Race		
<i>Malay</i>	168	43.8
<i>Chinese</i>	71	18.5
<i>Indian</i>	77	20.1
<i>Others</i>	68	17.7
Do You Have Experienced Using An SSK in Genting Highlands Hotel		
<i>Yes</i>	228	59.4
<i>No</i>	156	40.6
Hotel Type		
<i>Luxury</i>	38	9.9
<i>Mid-price</i>	83	21.6
<i>Budget</i>	76	19.8
<i>Not Applicable</i>	31	8.1
Total	384	100

The female gender is the highest than male with 59.6% of those surveyed. The majority are aged between 18-25 years old (41.49%). 47.1% had a bachelor's degree as their minimum qualification and 34.6% has a household income for RM1500-RM2500. Next, 43.8% is Malay. 59.4% of respondents who answered yes for customer have an experienced using Self-Service Kiosks in Genting Highlands hotel. The last one is hotel type is mid-price which is 21.6%

Table 2: Descriptive Analysis

Variable	Items	Mean	Standard Deviation
Ease of Use	Using a self-service kiosk for check-in was complicated	2.69	1.112
	Using a self-service kiosk for check-in was confusing	2.77	0.963
	Using a self-service kiosk for check-in took a lot of effort	3.82	1.139
	Using a self-service kiosks for check-in required little work	4.00	1.074
Speed of delivery	Using a self-service kiosk for check-in allowed me to save time during check-in/out	4.76	1.049
	Using a self-service kiosk for check-in made my check-in/out takes a lot of time to check-in or check-out in the room hotel	3.46	1.500
Monetary Promotion	Self-service kiosk's monetary promotion were attractive	4.19	0.992
	Self-service kiosk's monetary promotion like coupons or promotional deals caused me to use an self-service kiosks	3.94	0.856
Customer Satisfaction	My choice to use a particular self-service kiosk for check-in/out was a wise one	4.72	0.988
	I was happy with the usage of the self-service in that particular instance	4.58	0.901
	Overall, I was satisfied with using the hotel self-service kiosk	4.68	0.939

Reliability Analysis

The results of the reliability analysis for the study variables were shown in the table. The data indicates that Customer Satisfaction towards self-service kiosks in Genting Highlands hotel is 0.816 (Dependent Variable), Speed of Delivery is 0.397, Monetary Promotion is 0.764, and Ease of Use is 0.627. Additionally, all of the Independent Variable items—Ease of Use, Speed of Delivery, and Monetary Promotion—were acceptable; however, only Speed of Delivery is unacceptable because the results for H1 and H2 were over 0.6 while H3 did not yield a score. Customer satisfaction with the hotel's self-service kiosks, the dependent variable, has a value of 0.816, indicating that the variables used were adequate and accurate in assessing this variable. In summary, Cronbach's Alpha reliability coefficients for the study's independent variables were satisfactory and correlated with one another; the only variable that wasn't correlated with another was delivery speed.

Table 3: Cronbach's Alpha

No of items	Study variable	Cronbach's Alpha	Remarks (acceptable/not acceptable)
4	Ease of Use	0.627	Acceptable
2	Speed of Delivery	0.397	Not Acceptable
2	Monetary Promotion	0.764	Acceptable
3	Customer Satisfaction	0.816	Acceptable

Pearson's Correlation

Table 4: Correlations between Ease of Use and Customer Satisfaction towards self-service kiosks in Genting Highlands hotel

Correlations			
		Ease Of Use	Customer Satisfaction
Ease Of Use	Pearson Correlation	1	.009
	Sig. (2-tailed)		.896
	N	228	228
Customer Satisfaction	Pearson Correlation	.009	1
	Sig. (2-tailed)	.896	
	N	228	228

Based on finding, Table 4 show that positive value of correlation coefficient is .009 which is indicates that the relationship between ease of use and customer satisfaction is positively negligible.

H1: There is significant relationship between ease of use and customer satisfaction towards self-service kiosks in Genting Highlands hotel.

Table 5: Correlations between Speed of Delivery and Customer Satisfaction towards self-service kiosks in Genting Highlands hotel

Correlations			
		Speed of Delivery	Customer Satisfaction
Speed of delivery	Pearson Correlation	1	.354**
	Sig. (2-tailed)		.000
	N	228	228
Customer Satisfaction	Pearson Correlation	.354**	1
	Sig. (2-tailed)	.000	
	N	228	228

** . Correlation is significant at the 0.01 level (2-tailed).

Based on the finding on Table 5, it shows that positive value of correlation coefficient is .354** which indicates that the relationship between speed of delivery and customer satisfaction is positively weak. Therefore, speed of delivery has a weak relationship in determining customer satisfaction towards self-service kiosks in Genting Highlands hotel. H2: There is significant relationship between speed of delivery and customer satisfaction towards self-service kiosks in Genting Highlands hotel.

Table 6: Correlations between Speed of Delivery and Customer Satisfaction towards self-service kiosks in Genting Highlands hotel

Correlations			
		Monetary Promotion	Customer Satisfaction
Monetary Promotion	Pearson Correlation	1	.348**
	Sig. (2-tailed)		.000
	N	228	228
Customer Satisfaction	Pearson Correlation	.348**	1
	Sig. (2-tailed)	.000	
	N	228	228
**. Correlation is significant at the 0.01 level (2-tailed).			

Based on the finding on Table 5, it shows that positive value of correlation coefficient is .348** which indicates that the relationship between monetary promotion and customer satisfaction is positively weak. Therefore, monetary promotion has a weak relationship in determining customer satisfaction towards self-service kiosks in Genting Highlands hotel. H3: There is significant relationship between monetary promotion and customer satisfaction towards self-service kiosks in Genting Highlands hotel.

5. DISCUSSION & RECOMMENDATION

As a result, the study's conclusions may not necessarily represent the entire population, particularly Malaysian hotel customers. To successfully achieve the research objectives, a 6-point Likert scale was used in this study. The data discovered for monetary promotion and customer satisfaction signal positive significant results since the level of reliability from Cronbach's Alpha exceeds the amount than 0.7, which implies that monetary promotion was the most prominent element in this study. In contrast, the reliability test for ease of use and speed of delivery was unable to obtain a positive result, it was significantly lower than 0.7. As a result, ease of use and speed of delivery are not the variables with the greatest impact in customer satisfaction.

Implication of The Study

First and foremost, this research study provided all the essential information that a new researcher or new businessperson interested in this topic could possibly need, particularly regarding how the ease of use, speed of delivery, and ease of use affect customers' satisfaction with self-service kiosks in the Genting Highlands hotel. With the use of this information, the researcher will look into the variables influencing patron satisfaction with self-service kiosk check-in and check-out at local hotel Genting Highlands. The new researcher was also able to pinpoint significant, little-studied characteristics that may influence whether or not hotel guests use self-service kiosks for check-in and check-out.

Second, this study is advantageous to the hotel sector since it sheds light on the factors that influence customer satisfaction towards the self-service kiosks in Genting Highlands hotel. Hotel operators can determine if customers plan to better use self-service kiosks in hotels by adjusting to their expectations for the factors of ease of use, speed of delivery and monetary promotion. In order to properly satisfy the customer's desire, hotel industry managers should do in-depth research into customer satisfaction for returning, especially for those who do so frequently. Thus, a kiosk can make a major impact in how the hotelier handles their customers and how their customers use services. It provides the hotelier with a reasonable opportunity to enhance hotel revenue through upsells and elevate their guest experience in the hotel industry.

Thirdly, future customers who plan to use self-service kiosks check-in and checkout at hotels in Genting Highlands will benefit from the examination of these findings. This study could help broaden our understanding and tell potential customers about the variables that lead to a desire to use the technology right now. By outlining the factors that should be taken into account when customers decide to choose the kiosks technology to check-in and checkout services at a hotel, this study helps readers understand which factors led the kiosks technology to integrate it into service producers especially in the hotel industry.

Recommendation

This study employs a purposive sample and quantitative technique, which allows the researcher to find and maximize the number of respondents who respond determined by the questionnaire they accomplish. To accurately assess each acquired data set, the reviewer will consistently keep up and track rightfully on every occasion.

In this study, the researchers focused only on three variables that can affect Genting Highlands Hotel guests' satisfaction with self-service kiosks. However, there may be additional important factors that influence how a researcher determines if customers are satisfied with the self-service kiosks in the Genting Highlands hotel. Therefore, it is advised that future researchers conduct more research into additional factors including time management, machine facility, and machine speed while employing with the aim of enhancing the study's findings, which truly affect customer happiness.

Furthermore, further research should take consideration of the survey respondents' experiences, as customers in Malaysia may have varied experiences when utilising self-service kiosk machines due to different demographic characteristics. It can assist future researchers understand the pattern of occurrence of customer satisfaction with self-service kiosks at Genting Highlands hotel.

6. CONCLUSION

This chapter's conclusion looked at the key findings of the customer satisfaction survey conducted at the Genting Highlands Hotel. The examination of 385 complete questionnaires revealed that the study's goals were met, its questions were answered, and its hypotheses were confirmed as reasonable. Overall, there is a strong favorable relationship between financial advertising and client satisfaction. However, because it falls short of 0.7, the association between ease of use and delivery speed is weak, demonstrating that Genting Highlands Hotel's financial promotion plays a significant role in the significance of customer satisfaction.

ABSTRACT

In Malaysia, the impact of COVID-19 had put management in the business industry under pressure. The prolonged spread of the coronavirus had caused business in Malaysia to not grow. This study combined the characteristics of restaurant hygiene such as hygiene of customer-use, personal hygiene of staff and hygiene of workspaces. The purpose of this study was because not many studies had been conducted to investigate the perception of risk in doing business following the health crisis and customers' fear of the virus. Therefore, this study was designed to examine the influence of cleanliness on customers' fear of COVID-19 on businesses in Malaysia. This study had been a questionnaire as a method to collect data and it would be analyzed using SPSS. This study was believed to give good insight to academics and practitioners in preparing them for the post-corona field for the new normal after the limited life experience during the unprecedented epidemic.

Keywords :

Hygiene attributes, Fear of COVID-19

1. INTRODUCTION

The COVID-19 pandemic was initially identified in mid-December 2019, with the first case reported in Wuhan, China (Wang et al., 2020 & Yuki et al., 2020). The COVID-19 virus is an infectious disease caused by the SARS-CoV-2 virus (Shereen et al., 2020). This virus can cause infections such as cough, fever, cold, lung infection and shortness of breath that can cause death (Boyras et al., 2020). Anyone infected with COVID-19 can spread it to others, even if the infected person has no symptoms (Katella, 2022). This outbreak of COVID-19 can be classified as a pandemic because this epidemic has spread massively and rapidly throughout the world (Cucinotta et al., 2020). COVID-19 is a highly contagious and pathogenic viral infection produced by the severe acute respiratory SARS-CoV-2 virus, which caused a global pandemic and a significant loss of human life globally (Sheree et al., 2020).

Restaurants are one of the industries dealing with various issues related to COVID-19 and there is no denying that the COVID-19 pandemic is affecting almost all F&B businesses. The recent global COVID-19 epidemic has had a considerable influence on the restaurant business (Gossling et al., 2020). This industry's high vulnerability to the outbreak has been universally recopredignised as a result of the worry that it creates in customers about social

exception (Gossling et al., 2020). Restaurant owners feel it is vital to provide measures for client safety and security to encourage repeat business since customers' regular visits to restaurants may be threatened by potential exposure to COVID-19 dangers (Sharma A. et al., 2020). However, if customer worries regarding the potential of COVID-19 grow, major changes in customer behavioral intentions are predicted. Because it directly affects restaurant operations, customer retention is important for restaurant success (Yan et al., 2015). In this context, it is necessary to investigate the variables that affect repeat restaurant customer intentions in context of the developing situation due to COVID-19.

Unhygiene customer-use can make customers afraid to visit the restaurant. Customers are worried about whether the facilities or equipment provided are in a clean condition or not. This is because the COVID-19 virus can easily spread even if it is only through contact. According to (Delea et al., 2020; Yu et al., 2021b), customer interaction can be direct or indirect. Moreover, the COVID-19 virus can also spread through personal hygiene of staff. This is because, they are among the groups that communicate a lot with customers. The spread of the Covid-19 epidemic between staff and customers, whether directly or indirectly, has the potential to increase viral infections, according to (Boyras et al., 2020). The way workers do not follow SOP such as not wearing a face mask and wearing dirty clothes can be one of the factors to spread viral infections. In addition, the problem of contagion of COVID-19 can also occur when hygiene at the workplace is not clean. It is well known that the COVID-19 virus can spread through the air. According to Jamaludin, when the environment is not clean, the restaurant staff become uncomfortable and afraid to go to work because they are worried if they get infected with this virus. This situation not only creates fear in employees but it also creates fear in customers to visit the restaurant.

1.1 Significance of The Study

In this research article, it helps researchers to find out how the quality of environmental cleanliness and service influences customers and customers to revisit the restaurant. Additionally, this research enables researchers to identify favorable features that also have a good impact on restaurant management and customer satisfaction with the hygiene of the restaurants during the COVID-19 outbreak. The title of this study may provide future scholars with an idea. Future customers may benefit through the research topic because the research provides guidance to fully understand the relationship between hygiene that needs to be taken care of especially in running a business such as food which is also where it should be acted to all restaurant owners about hygiene that has been made. This research paper is important to customer health and insight to the food and beverage industry where customers can learn about the cleanliness and quality of workers during the COVID-19 outbreak.

2. LITERATURE REVIEW

2.1 Personal Hygiene of Staff

According to Munguti (2022), personal hygiene involves cleanliness of the body and clothes, healthy eating, proper living habits, exercise and rest. Good personal hygiene means keeping all parts of the physical body clean and healthy. It is an important part of mental health and maintaining physical. Ford mentioned that personal hygiene is a personal care routine to ensure that one's whole body is clean, fresh, and healthy. One of the most effective ways to protect against infectious diseases is to have good personal hygiene such as frequent hand washing, showering, and using protection such as wearing gloves. For people with poor personal hygiene, this may leave a person exposed to germs and viruses (Ames, 2020).

In closed environments like hotels, aeroplanes, and restaurants, there will inevitably be employee-customer interaction, whether direct or indirect (Yu et al., 2021a). Infectious infections are more likely to be caught and disseminated due to the nature of interactions with customers and handling their belongings (Zhang et al., 2020).

2.2 Hygiene of Customer-use

According to Humanitarian Global (2021), the term "hygiene" is derived from the Greek word "hygieinos," which meaning healthy or everything connected to health and cleanliness. Generally, the term hygiene is used to indicate 'the act of maintaining personal hygiene and environmental conditions, especially to avoid disease or the spread of infectious disease outbreaks. Many infectious infections, including the COVID-19 virus, can be avoided by maintaining good hygiene. It is essential for achieving greater health and well-being. The World Health Organisation (WHO) defines hygiene as the conditions and practises that support maintaining health and preventing the spread of disease.

A customer is an individual or business that buys goods or services from a business or company. Customers are important because they drive the country's income. Without them, the business cannot continue to thrive and grow. All businesses compete with other companies to attract customers, either by aggressively advertising their products, by lowering prices to expand their customer base, or by developing unique products and experiences that customers love.

2.3 Hygiene of Workspace

According to Hung et al. (2018), a restaurant's workstation that isn't hygienic can contribute to the spread of infectious diseases and raise customer anxiety. In order to stop this pandemic from spreading and draw consumers to the restaurant, the work environment must be kept clean. When regular cleaning and sanitation are performed to stop the spread of epidemics in every location made available to consumers, the cleanliness of the workplace may be maintained.

Customers believe that the degree of cleanliness of the workspace is vital in lowering the likelihood of the virus infection from spreading further in the wake of the COVID-19 epidemic. Customers will harbor reservations about a workspace that is not perfectly cleaned, per (Park et al., 2019).

2.4 Customers' Fear of COVID-19.

Customer behaviour during COVID-19 is affected by fear, anxiety, lockdown, stocking, panic buying, stress due to loss of control, loss of personal freedom, hygiene measures, spending patterns, routine changes, and earning capacity (Kavya Satish et al., 2021). Fear is a very strong emotion in a person which is often triggered by a perceived threat and it can make a person feel afraid, anxious or panic (Jenkins P., 2022). According to Fritscher (2022), fear is also said to be a symptom of several conditions such as mental health problems including social anxiety, phobias, panic disorder, and post-traumatic stress disorder (PTSD).

Schimmenti A., et al. (2020) believes that fear is a basic emotion that arises in reaction to a perceived threat. The psychological organisation of the three concerns related to the COVID-19 pandemic revolves around four interconnected dialectical domains. dread of the body is the first type of dread, followed by fear of significant people or fear of important people, fear of not knowing or fear of knowing, fear of taking action or fear of inaction, and fear of key people. However, it depends on the interpersonal, cognitive, and behavioural aspects of fear. The four fear categories identified during the COVID-19 epidemic reflect important psychological perspectives on reality.

2.5 The Relationship Between Personal Hygiene of Staff, Hygiene of Customer-use, Hygiene of Workspace With Consumers' Fear of COVID-19.

The relationship between personal hygiene of customers uses with consumers' fear of covid19. Customers typically think that visiting establishments, interacting with staff, and eating at restaurants is risk-free and secure (Choi et al., 2010). However, it has recently been noted (Delea et al., 2020; Yu et al., 2021b) that customer encounters, whether direct (such as a service encounter or shaking hands) or indirect (such as using a room at a restaurant), tend to increase the risk of infection. The restaurant cleanliness practices, hygiene issues, and strict SOP processes, according to (Peng and Chen, 2021), would make the COVID-19 scenario worse.

The relationship between personal hygiene of staff and consumers' fear of covid-19. Employees may be more susceptible to contract and spread infectious diseases due to the way they contact consumers and handle their belongings (Zhang et al., 2020). Yu et al. (2021a) assert that staff will inevitably have direct or indirect contact with clients, particularly in service-related industries like hotels, airlines, and restaurants. Additionally, undercooked food, contaminated equipment, incorrect storage temperature, hazardous food sources, and inadequate personal hygiene are listed as the top five causes of food safety problems in food service establishments by FDA (2017). Customers are more likely to dread COVID-19 if restaurant employees maintain poor personal cleanliness, according to research.

And the relationship between hygiene of workspace and consumers fears of covid-19. according to (WHO, 2020b), has raised awareness of restaurant cleanliness. Because of this, restaurant owners only clean the kitchen area when there are illness outbreaks (Sifuentes et al., 2014). The author understood that filthy eateries with plenty of germs can serve as a cause of infection, according to (Park et al., 2019). Customers choose restaurants that offer indoor and outside service and follow regular sanitation and cleanliness procedures, per the research

described above. But infrequent hygiene inspections can make people worried about the COVID-19 epidemic.

2.6 Research Hypothesis

A hypothesis must be testable and realistic, taking current knowledge and methodologies into account. Furthermore, a hypothesis is a forecast or explanation of a link between two variables. It suggests that an independent variable and a dependent variable have a systematic connection. As a result, the research suggests:

H1: There is a favorable correlation between patrons' use of restaurant cleanliness and their concern for COVID-19.

H2: Restaurant patrons' concern of COVID-19 is positively connected with restaurant staff members' personal hygiene.

H3: Restaurant workplace hygiene is positively correlated with customers' fear of COVID-19.

2.7 Conceptual Framework

The conceptual framework for this research is seen in Figure 2.1. The three factors that make up the independent variable that will be proposed are hygiene of customers use, hygiene of workspace, and personal hygiene of staff. Consumers' fear of covid-19 is the dependent variable.

Figure 1: Conceptual Framework of the relationship between independent variable and dependent variable

Source : Adopted from Siddiqi et. al., (2022)

3. METHODOLOGY

3.1 Research Design

The strategy for responding to the research question can be referred to as the study design. It covers the examination of numerical data using particular statistical approaches in order to respond to questions like who, how much, where, what, how many, and how many. Science, social science, and numerous other fields all place a high priority on research design (Abutabenjeh et. al, 2018). All of the data will be collected for this study using a quantitative approach and questionnaires. Quantitative research is a systematic way to collect and analyse data from multiple sources (SIS International, 2018). Making predictions, determining patterns and averages, testing causal theories, expanding results to larger populations, and determining patterns and averages are all possible with it (Bhandari, 2021).

The purpose of this study is to determine the influences of restaurant hygiene attributes toward customers' fear of COVID-19. The data will then be collected using questionnaires given to respondents as part of descriptive research, which may then be used to explain the data.

The aim of a study design is to ensure that the evidence obtained from the data can address the research question. Therefore, descriptive research would be able to address the questions of who, what, when, where and how, when it comes to a certain issue or situation. A sort of study called descriptive research seeks to give the most precise account of phenomena that already exist (Atmowardoyo, 2018).

3.2 Data Collection

An online survey was used to collect data in order to decrease in-person interaction and keep to social distance standards. As a result, researchergathered data online using platforms like Google Form, a trusted survey tool for social sciences. Respondents were given a brief explanation of the research, the way the data was collected, and the legally essential data protection information. So, over the 20 days, 384 replies were gathered. Researcher used a total sample size of 379 replies after excluding 5 responses that were unsuitable for data processing.

3.3 Sampling

Researcher choose convenience sampling to conduct research. It is a sampling method that can get information easily, quickly and effectively. This simple sampling is always used in the exploratory phase of a study or when the researcher needs a sample immediately or in the near future.

Based on the population estimate of the Department of Statistics Malaysia (in 2022), Kota Bharu has the largest population of 1,536,516 people or 89% of the 1,720,694 total population of Kelantan. Therefore, this simple sampling method is very useful in this research because the high number of the population gives us the potential to get enough respondents.

3.4 Data Analysis

Researcher examined the data using IBM SPSS 26.0 in order to verify the correlations in the suggested hypotheses. Researcher used the following quantitative analytic methods, such as variance inflation factor (VIF), common method variance estimation, structural model assessment, measurement model assessment, and structural model assessment. Researcher also determined the effect size and variation of natural factors.

4. FINDINGS

Table 1:
Demographic Analysis

Respondent Profile	Frequency n = 379	Percentage (%)
Gender		
Male	149	39.3
Female	230	60.7
Age		
18 – 23	135	35.6
24 – 29	105	27.7
30 – 35	45	11.9
36 – 41	30	7.7
42 and above	64	16.9
Races		
Chinese	48	12.7
Indian	50	13.2
Malay	280	73.9
Other	1	0.3
Frequency of visiting Thai restaurant in a week		
1 – 2	263	69.4
3 – 4	88	23.3
5 – 6	17	4.5
Everyday	11	2.9

This study had collected data from 379 respondents who answered this questionnaire. Table 1 had shown that there were more female respondents than male respondents, with 230 female respondents or 60.7%, while 149 male respondents or 39.3%.

Next, Table 1 also showed the age range of the 379 respondents who answered this questionnaire. The higher respondent age group that answered this questionnaire were respondents aged between 18 and 23 years old which was 135 people or equivalent to 35.6%. The second highest age group of respondents were respondents aged 24 to 29 years old or equivalent to 27.7%. The third highest age group of respondents was respondents aged 42 and over, which was a total of 105 people or equivalent to 16.9%, followed by respondents aged 30 to 35 years which was a total of 45 people or equivalent to 11.9%. Meanwhile, the lowest age range of respondents who answered this questionnaire were respondents aged 36 to 41 years, of which the number of respondents was only 30 people or equal to 7.7%.

Not only that, Table 1 also showed the race category through data obtained from 379 respondents. Out of that number, the majority of respondents who answered this questionnaire were Malay respondents, that was 280 people (73.9%). The second highest race was Indian respondents, which was 50 people (13.2%). Meanwhile, there were 48 Chinese respondents (12.7%). However, there was also one respondent (0.3%) who was of another nationality, the data obtained showed that the respondent was of Siamese nationality.

Lastly, Table 1 showed the frequency of 379 respondents who visit a Thai restaurant in a week. Out of that number, 263 respondents (69.4%) visit Thai restaurants only between 1 to 2 times a week, followed by 88 respondents (23.2%) who visit Thai restaurants 3 to 4 times a week. A total of 17 respondents (4.5%) who visit Thai restaurants 5 to 6 times a week. Meanwhile, only 11 respondents (2.9%) visit Thai restaurants every day in a week.

Table 2 :
Descriptive Analysis

Section	Dimension	N	Mean	SD
B	Customers' Fear of COVID-19	375	3.5062	1.1644
C	Hygiene of Customer-use	375	3.6653	1.0130
	Personal Hygiene of Staff	375	3.7370	0.9978
	Hygiene of Workspaces	375	3.6500	0.9655

The mean score for all the three independent variables which were hygiene of customer-use, personal hygiene of staff and hygiene of workspaces 3.6653 (SD = 0.130), 3.7370 (SD = 0.9978) and 3.6500 (SD = 0.9655) respectively. The mean score for dependent variable, customers' fear of COVID-19 score was 3.5062 (SD = 1.1644).

Table 3 :
Reliability Analysis

Section	Dimension	Cronbach's Alpha	Number of Items
Dependent Variable	Customers' fear of COVID-19	0.919	5
Independent Variable	Hygiene of customer-use	0.848	3
	Personal hygiene of staff	0.885	3
	Hygiene of workspaces	0.861	3

N of respondents (n) = 379

Table 3 shows the reliability of the analysis for all variables that include dependent variables and independent variables. Cronbach's alpha coefficient value for customer fear of COVID-19 is 0.919. The value shows that the reliability of this dependent variable is at an excellent level. Meanwhile, all independent variables show reliability at a good level. Cronbach's alpha coefficient value for hygiene of customer-use is 0.848, personal hygiene of staff is 0.885 and hygiene of workspaces is 0.861.

Table 4 :
Pearson Correlation Coefficient

		IV1	IV2	IV3	DV
IV1	Pearson Correlation	1	.725**	.675**	.041
	Sig. (2-tailed)		.000	.000	.427
	N	379	379	379	379
IV2	Pearson Correlation	.725**	1	.765**	.067
	Sig. (2-tailed)	.000		.000	.191
	N	379	379	379	379
IV3	Pearson Correlation	.675**	.765**	1	.077
	Sig. (2-tailed)	.000	.000		.132
	N	379	379	379	379
DV	Pearson Correlation	.041	.067	.077	1
	Sig. (2-tailed)	.427	.191	.132	
	N	379	379	379	379

** . Correlation is significant at the 0.01 level (2-tailed).

Table 4 shows a positive (r) value of 0.041 which showed that the relationship between hygiene of customer-use and customers' fear of COVID-19 was at a positive level of correlation that could be ignored. Therefore, hygiene of customer-use had a correlation relationship that could be ignored in determining customers' fear of COVID-19 at a Thai restaurant in Kota Bharu, Kelantan. Meanwhile, the significant level (p) for this variable was 0.427 which was more than 0.10. In conclusion, hypothesis H1 stated that there was no relationship between hygiene of customer-use and customers' fear of COVID-19 was considered insignificant and it was considered a null hypothesis.

The relationship between personal hygiene of staff and customers' fear of COVID-19 showed a positive value of 0.067 which indicated that was at a positive level of correlation that could be ignored. Therefore, personal hygiene of staff had a negligible correlation in determining the customer's fear of COVID-19 at a Thai restaurant in Kota Bharu, Kelantan. Meanwhile, the significant level of this variable was 0.191 which was more than 0.10. In conclusion, hypothesis H2 stated that there was no relationship between personal hygiene of staff and customers' fear of COVID-19 was considered insignificant and it was considered a null hypothesis.

The relationship between hygiene of workspaces and customers' fear of COVID-19 showed a positive value of 0.077 which indicated that was at a positive level of correlation that could be ignored. Therefore, the hygiene of workspaces had a negligible correlation in determining the customer's fear of COVID-19 at a Thai restaurant in Kota Bharu, Kelantan. Meanwhile, the significant level of this variable was 0.132 which was more than 0.10. In conclusion,

hypothesis H3 stated that there was no relationship between hygiene of workspaces and customers' fear of COVID-19 was considered insignificant and it was considered a null hypothesis.

5. DISCUSSION & RECOMMENDATIONS

Since the COVID-19 pandemic, many industries had prioritized cleanliness, particularly in dining rooms and food equipment. Customers believed that food handlers prioritized sanitizing their equipment daily. However, closed spaces in service industries like restaurants, hotels, and airlines increased the risk of acquiring and spreading infectious diseases. The Malaysian government had introduced a vaccine to prevent the virus from worsening, and food operators must also take typhoid injections. The temporary closure of premises had caused significant losses for the food and beverage industry, highlighting the importance of hygiene in all aspects of the workplace. Customers trusted food operators to take initiative to prevent the spread of the epidemic and attract customers.

5.1 Implication of The Study

This research study explores the impact of restaurant hygiene on customers' fear of COVID-19 at Thai restaurants in Kota Bharu. The study aims to investigate the factors influencing customers' fear of COVID-19 and provide insights for future research. The study highlights the negative impact of unsatisfactory cleanliness on customers' decision to visit Thai restaurants, particularly in areas like the dining room, prayer room, food equipment, and kitchen. Improving cleanliness in these areas can help customers feel less afraid of the virus and encourage them to visit Thai restaurants with confidence. The findings can help potential customers in Kota Bharu by easing their fears about visiting Thai restaurants due to their high level of cleanliness.

5.2 Recommendations of The Study

Future studies should consider educating staff about personal and hand hygiene standards, glove use, proper work clothes, hair and jewelry, and sick leave policies. Maintaining good hand hygiene is crucial for reducing the risk of foodborne illness outbreaks. However, restaurants still have low compliance rates with FDA hand hygiene standards. Future studies on the association between customer usage and COVID-19 should use hygiene of customer use as an independent variable. Quantitative techniques were used to collect data from respondents, allowing for more efficient and targeted responses.

This research can help the food preparation service industry improve operations and productivity, allowing entrepreneurs to retain existing customers and attract new ones. Additionally, developing a restaurant hygiene checklist can help maintain hygiene standards and improve the overall cleanliness of the restaurant.

6. CONCLUSION

The present study outlined its shortcomings and provided recommendations for further research. The researcher's sample was only restricted to people of Kelantan, particularly in Kota Bharu, but it would be possible for future researchers to broaden the investigation into restaurant hygiene and customers' concern of COVID-19 in other states. The study also only examined restaurant cleanliness during the COVID-19 pandemic, but subsequent studies could assess the situation even after COVID-19. In conclusion, the broad COVID-19 outbreak may affect diners' capacity to frequent restaurants. One body of literature examined many facets of COVID-19, however it contained no research on restaurant sanitation during the COVID-19 outbreak. As a result, the researcher looked at restaurant cleanliness factors such personal hygiene of staff, hygiene of workplace, and hygiene of customer-use while also examining consumers' fear of COVID-19. The results showed that even after the Movement Control Order was relaxed, customers' fear of COVID-19 made them less likely to attend restaurants.

ABSTRACT

This study uses Starbucks as a case study to look at how consumer preference and brand loyalty are impacted by coffee quality. Research is also done into the elements that influence how healthful coffee is. Convenience, price equity, flavour, and customizability are all indicators of food quality. Hygiene and nutrition disclosure were the determining aspects of food healthiness. The most prominent food quality traits were brand admiration and brand loyalty. The results demonstrated a positive correlation between wellbeing and cleanliness and nutritional openness. Brand loyalty is significantly influenced by factors including flavour, customization, fairness of price, and healthfulness. Furthermore, it was discovered that fairness in terms of taste and cost were crucial elements in determining Starbucks brand loyalty. This investigation on food quality in the context of the coffee market offered useful business-related information. The study's findings highlighted the qualities of high-quality coffee and the factors that influence them, as well as the close relationship between brand love and loyalty, brand quality, and coffee food quality.

Keywords:

Healthiness, price fairness, nutrition disclosure, brand love

1. INTRODUCTION

Coffee has long been a significant global commodity crop and a substantial export for a number of nations. Coffee culture has evolved into a trend and way of life in today's societies, regardless of age (Nurhasanah & Dewi, 2020). This is so that young people can interact with one another through such culture. Seattle's Pike Place Market served as the site of the first Starbucks opening in 1971. It began modestly by offering some of the greatest coffee beans in the world for sale. Starbucks Coffee Company and Berjaya Group Berhad have partnered to

manage Starbucks in Malaysia through Berjaya Starbucks Coffee Company Sdn Bhd. It was founded on December 17th, 1998 in Kuala Lumpur and has since started to spread to Sabah and Sarawak.

Espresso, latte, and cappuccino are just a few of the coffee-containing beverages that Starbucks is renowned for offering. Customers are able to select their own drink based on preferences thanks to this. Because Starbucks gives customers a lot of options, this circumstance will boost customer happiness. Because the brand evokes for consumers symbolic attributes including social feelings, beauty, and status, consumers will grow acclimated to it (Gajic et al., 2022). But excessive coffee consumption increases the chance of developing chronic illnesses like diabetes, obesity, heart disease, and other conditions. This is due to the high sugar content of the beverages sold at Starbucks and the detrimental effects of excessive caffeine use on health (Lacap & Sicat, 2022). Because the cost of each menu item or dish at the Starbucks café is incredibly high and unattainable, the price justice of this study is another important consideration. When compared to other coffee shops or cafés, the price of each menu item or dish at Starbucks is prohibitively expensive. The purpose of this study was to look into the nutritional transparency, pricing justice, and healthiness of Kuala Lumpur consumers' brand loyalty to Starbucks.

Significance of The Study

The researcher has examined the reaction on the dependent variable, which is brand love, by changes on the independent variables, which are the determinants consisting of the healthiness, price fairness, and nutrition disclosure of Starbucks in Kuala Lumpur, in accordance with the study's title, which examines the antecedents of brand love towards Starbucks in Kuala Lumpur. The researcher, the food and beverage industry, and potential customers now have a clear image of brand loyalty to Starbucks in Kuala Lumpur thanks to the research's findings.

2. LITERATURE REVIEW

2.1 The Antecedents of Brand Love Toward Starbucks in Kuala Lumpur.

The word "healthiness" is more frequently used as a synonym for health or wellness. From a range of scientific perspectives, including medical, nutritional, social, and psychological ones, health may be explored. Dietary factors and issues with food safety can be seen as the two main components of health. (Petrescu, Vermeir, & Petrescu-Mag, 2019).

Food health is also recognized as a crucial element in evaluating the calibre of food (Yoo, Lee, & Jeon, 2020). A healthy diet should be consumed by everyone. This is as a result of its ability to maintain a healthy heart. Heart disease is one of the leading causes of mortality for individuals in the US. A balanced diet can reduce your risk of getting heart disease, according to multiple studies. Oats and fruits are two examples of meals that are high in fibre and good for the heart. Studies claim that Starbucks coffee is nutritious and that they provide an environmentally friendly product. (Azriuddin, et al., 2020). In contrast, earlier research revealed that Starbucks-brand coffee had a low pH level, which suggests that it is acidic. The acidity in caffeine will cause tooth sensitivity (McDonagh, 2021). Healthy living has nothing to do with brand loyalty.

2.2 The Relationship Between Price Fairness and Brand Love of Starbucks in Kuala Lumpur.

There are several studies that look at how people perceive prices in social science disciplines like marketing and economics. The meaning of price fairness is the user's assessment and feelings regarding whether the disparity between the seller's pricing and the comparable price of other parties is reasonable or acceptable (Xia, Monroe, & Cox, 2004). Depending on how the customer feels about the price, client satisfaction may go up or down. customers recognize price unfairness when they pay prices that are higher than rivals (Ting, 2013). Price fairness promotes increased sales because a fair price is very important to convince customers. According to studies, providing more satisfaction to customers will lead to higher customer loyalty (Kaura, Prasad, & Sharma, 2015).

2.3 The Relationship Between Nutrition Disclosure and Brand Love of Starbucks in Kuala Lumpur.

Studies on the perception of pricing have been conducted in a variety of social science disciplines, including marketing and economics. The meaning of price fairness is the user's assessment and feelings regarding whether the disparity between the seller's pricing and the comparable price of other parties is reasonable or acceptable (Xia, Monroe, & Cox, 2004). Depending on how the customer feels about the price, client satisfaction may go up or down. customers recognize price unfairness when they pay prices that are higher than rivals (Ting, 2013). Fair pricing encourages improved sales since it's crucial to persuade buyers that a product is worth the price. According to studies, providing more satisfaction to customers will lead to higher customer loyalty (Kaura, Prasad, & Sharma, 2015). Everyone in the world is familiar with the Starbucks Coffee brand, including Malaysians. Although many individuals are willing to pay the high rates for the drinks, food, and merchandise offered at Starbucks, the demand for these items is always growing despite the perception that they are expensive. It is believed that fairness in terms of pricing is unimportant while making purchases of items.

However, given Starbucks brand loyalty in particular, this study and pricing fairness are closely related.

2.4 The Relationship Between Nutrition Disclosure and Brand Love of Starbucks in Kuala Lumpur.

The concept of "nutrition disclosure" describes the information provided or printed on each food and beverage package that details the numerous nutrients, calories, and food components that are present in the item. According to US Food and Drug Administration requirements, dietary information such as the amount of fat, calories, cholesterol, carbohydrates, sugar, protein, and vitamins present in each food package must be provided. It is also possible to think of nutrition disclosure as the labelling of inexpensive items that have the potential to encourage or support healthy eating habits. However, there are systematic variations that imply customers could not always use food labels while selecting foods. Given the poor dietary quality exhibited by many young adults, measuring the use of dietary facts among them is particularly important (Harris, Larsen, Chantala, & Udry, 2006). User traits, product type, and buying context are all related to how food labels are used. Users' capacity to interpret food labels may vary depending on where their nutritional education is at. Self-efficacy and trust are effective predictors of eating knowledge, attitudes towards food labels, and usage of food labels.

Conceptual Framework

Figure 1 below has demonstrated how this study's conceptual framework worked. The dependent variable in this study was the factors influencing brand loyalty to Starbucks in Kuala Lumpur, while the independent variables were healthfulness, pricing fairness, and nutrition transparency. The relationship between the independent variables and the dependent variable was depicted in the image below.

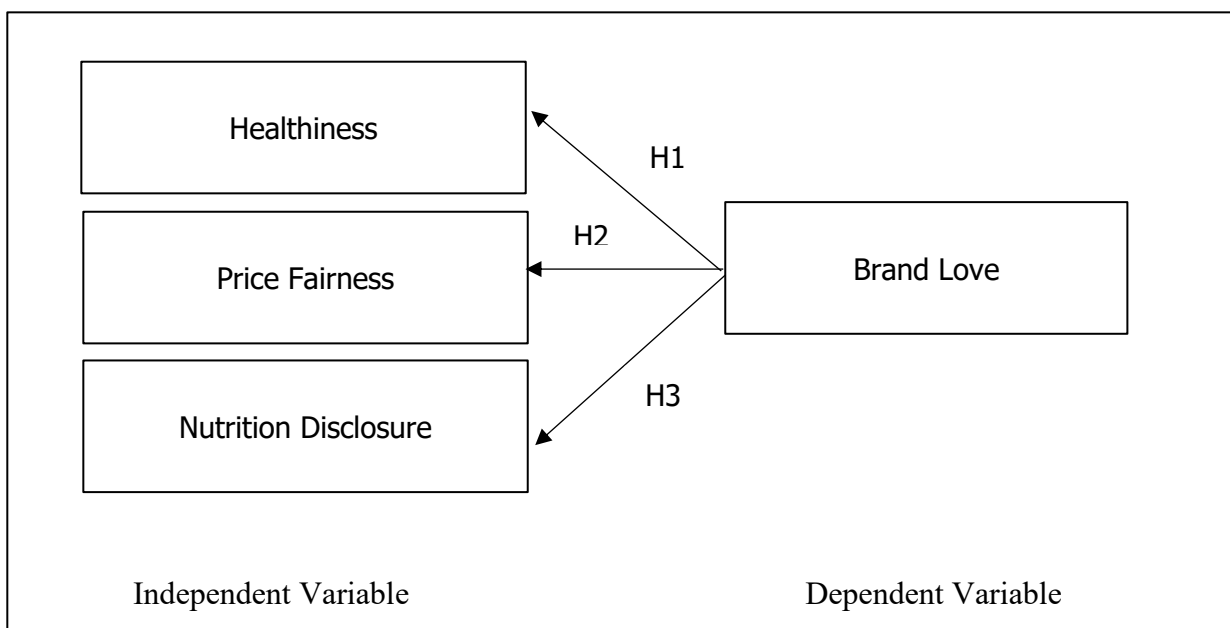

Figure 2.1: Conceptual Framework

Sources: Lee, Jung and Moon (2021)

3 METHODOLOGY

Research Design

The overall framework and methods the researcher selects for doing market research make up the research design. The chosen layout will allow the researcher to use the most appropriate research methods. This study used quantitative research as its primary research strategy. Data will be gathered from a representative sample of Starbucks patrons in Kuala Lumpur. In order to investigate and quantify the link between the independent and dependent variables, a descriptive methodology was adopted in this study. The researcher uses questionnaires that were obtained from respondents to explain the data.

Population

Ethnic	Year 2020 ('000)
Bumiputera	47.7%
Chinese	41.6%
Indians	10%
Others	0.7%

Table 3.1 Population by Ethnic Group in Malaysia

Sampling Size and Sampling Technique

The Department of Statistics Malaysia (2020) estimates that the sample size for the Malaysian population will be 33 million based on the table above. However, 384 respondents in total were chosen for this study's respondents based on the hypothesis from Krejcie and Morgan (1970).

For this investigation, the researcher's choice of sampling strategy was the convenience sampling approach. Non-probability sampling technique called convenience sampling includes taking samples from a particular group.

Instrument Development

Instrumentation

The questionnaire is divided into three parts, which are part A, B and C. Part A includes questions related to demographics. In part B, the researcher asked questions related to the chosen topic. It is closely related to the relationship between Starbucks and the factors of healthiness, price fairness and nutrition disclosure. The questions in part C discuss how often customers visit Starbucks.

Sections	Variables	Items	Authors
A	Demographic profile	5	Omar, Jamal & Nami (2017)
B	Healthiness	5	Lee, Jung & Moon (2021)
	Price Fairness	5	Lee, Jung & Moon (2021)
	Nutrition Disclosure	5	Lee, Jung & Moon (2021)
C	Frequency to Starbucks	5	Othman, Anuar, Izat & Fahmi (2019)

Table 3.2 : Overview of Research Instrument

The questionnaire's structure for both the independent variable and the dependent variable was a 6-point Likert scale for the sake of simplicity. From "Disagree very strongly" to "Agree very strongly," the 6-point Likert scale will range.

Data Collection and Data Analysis

For this study, the researcher collected data using surveys and secondary sources. Malay and English-language questionnaires were distributed to respondents. The Statistics Package for Social Science (SPSS) will be used to analyse all of the data once data collecting is finished. The research's analytical process is broken down into two steps: preliminary data analysis and Pearson Correlation.

4 RESULT

Table 1

Demographic Analysis

Item	Frequency (n)	Percentage (%)

5 DISCUSSION & RECOMMENDATIONS

This study looked into whether factors like price equity and nutrition information had an impact on how healthy a food was. According to this survey, food quality, flavour, and price equity were crucial components for consumers to enjoy the Starbucks brand. Customers may prefer a brand because it offers wholesome, delectable food and has prices that are reasonable for their means. This survey also showed that fair pricing and healthfulness were important motivators for Starbucks patronage. Customers at Starbucks were less likely to be loyal to the brand. In terms of fostering brand love and loyalty, competition and convenience are no longer relevant. Additionally, convenience might have less of an impact on market evaluation than other suggested criteria. Additionally, the findings indicated that healthiness was not essential for brand love, which may have been caused by the healthiness of Starbucks' products. Even though Starbucks goods listed their nutritional information and that they were made in a clean environment, they still contained dangerous substances like sugar and caffeine. Starbucks products were prepared in sanitary conditions and included nutrition information, but they still contained unhealthy ingredients like sugar and caffeine. Through the analysis of descriptive data for wellness, this can be concluded. The results supported previous finding that contentment had a positive effect on brand love. (Sallam's, 2015)

Implication of The Study

First of all, this research study gave any new researcher or entrepreneur interested in this topic all the pertinent information, particularly regarding how healthiness, pricing fairness, and nutrition disclosure influence brand love of Starbucks in Kuala Lumpur. The researcher will be able to better investigate the causes of brand loyalty to Starbucks in Kuala Lumpur with the aid of this information. In addition, this study enabled the new researcher to identify crucial, understudied factors that may contribute to Kuala Lumpur consumers' love of Starbucks. From

here, this study may help upcoming researchers locate research findings with a higher likelihood of being effective in this research area. Additionally, by consulting this research article, a future researcher may develop the instinct necessary to carry out the research. In the meanwhile, our study can serve as a template for future literature reviews. Our study can now be used as a model for further literature reviews.

Second, this study is advantageous to the food and beverage sector since it sheds light on the causes of brand loyalty for Starbucks in Kuala Lumpur. The food and beverage sector can pinpoint consumer drivers of brand loyalty expectations on health, price equity, and nutrient disclosure. In order to fully satisfy customer purpose, the food and beverage business must do in-depth research into the causes of brand love for Starbucks in Kuala Lumpur. As a result, the food and beverage business can profit by making better decisions and gaining competitive advantages.

Third, this study will be useful to customers who want to go to the Kuala Lumpur Starbucks. Customers will be made aware of the availability of diet-friendly and nutritional food options. Before purchasing food and beverages at Starbucks Kuala Lumpur, customers can prepare their menu in advance. They are also aware that Starbucks charges a price commensurate with the quality of service it offers its consumers. Premium ingredients are used to prepare the meals and beverages at Starbucks. Customers will also be more aware of their right to know the nutritional information for every product they purchase. Customers can choose to love the Starbucks brand in this way. The customer will become a wise consumer of goods and services as a result of this study.

Recommendation of The Study

There are numerous suggestions for more consumer revisit intention research. Therefore, questions in future study should be intriguing and acceptable to everyone so that respondents will consent during the questionnaire. As a result, the researcher can give respondents to future studies questionnaires that are easier to understand and more engaging.

For every purpose, not every research methodology is adequate. For instance, it is important to carefully examine the type and length of interviews while conducting research with unique populations. The intended user group should be taken into consideration while creating the test tasks for a usability test. You must look at the group you are looking at, the objective of the research, and the likely result you want from it.

The researchers only looked at three criteria that could impact customers in this study. However, the researchers may have overlooked some crucial characteristics that play a vital role in defining the antecedents of brand love for Starbucks in Kuala Lumpur. As a result, future research is advised to undertake further research into other characteristics such as location, pricing, and amenities in order to improve the study's results.

6 CONCLUSION

In conclusion, there are still has some few steps to investigate the antecedents of brand love toward Starbucks in Kuala Lumpur. The selected independent variables are well suited to be combined with the dependant variable.

The study has effectively shown that the majority of respondents cited brand loyalty as the main reason they kept coming back to Starbucks. Since every Starbucks offers virtually the same food and service, business owners must concentrate on providing food that meets consumer demands and create remarketing plans to bring in new clients. Profits may also rise as a result of this.

People frequently go to cafes before work or to hang out with their closest friends. Starbucks coffee is always in demand. Starbucks should maintain growing their product line and keep a close eye on emerging technological developments because their target customer expects this. Starbucks must maintain the distinctive customer approach that makes their brand so recognised and encourages repeat business despite an expanding client base.

Abstract

This study aims to evaluate the physical, operational environment, food and service quality, and customer satisfaction in Kota Bharu, Kelantan. For this study, any kind of fast-food establishment was considered to be quick. In order to better understand the relationship between factors and customer re-intention, the survey uses a quantitative technique to collect relevant data in the form of a questionnaire. Data came from patrons who frequented randomly chosen fast food outlets in Kota Bharu. To analyse the collected data, descriptive statistics and Pearson correlation analysis were employed. Respondents received a total of 384 questionnaires. Customer retention is strongly correlated with the three factors of food quality, service quality, and physical and operational environment. However, according to the study's findings, food quality has a moderate relationship. These results demonstrate that the environment affects customer intentions, consistent with earlier research. This study has given the industry knowledge on the re-intention of customers to fast food restaurants in Kota Bharu. This knowledge will help the industry adapt to the re-intention of customers and gain a competitive advantage. Finally, it is suggested that additional factors be considered in future studies to investigate and uncover other causes.

Keywords: *food quality, service quality, physical environment, customer re-intention, questionnaire*

INTRODUCTION

The worldwide fast-food market has been expanding consistently at a rate of 4.2% since 2017 (Becker, Lee & Nobre, 2018; Cho, 2021), and the industry's net worth was predicted to be far above US\$690 billion in 2022 (Zion Market Research, 2019). Urbanization and the development of busy lifestyles and technology have drastically changed how many people live, including those in developing countries. Eating habits have also shifted simultaneously with this rapidly developing technology. People rely more on ready-to-eat foods to sustain their livelihoods supported by businesses (Mehdi, Raza & Riza, 2022). Iqbal (2020) asserts that although the globalisation of food and cuisine is primarily a twentieth-century event, there have been clear trends towards proto-globalization in the production, distribution, and consumption of food across earlier historical eras.

Fast food is defined by Shaban and Alkazemi (2019) as food that is consumed quickly and comes from global fast-food chains. Kee et al. (2012), on the other hand, define fast-food

establishments as those that provide speedy service of meals. Malaysia's fast-food restaurant market is growing and being adapted to suit regional dietary requirements. Fast-food restaurants set themselves apart from other kinds of eateries because to their unique characteristics, which include quick service, minimal customer interaction, and affordable costs. (Chian, 2020).

In Malaysia, fast food chains, including Marry Brown, McDonald's, Pizza Hut, and Subway, are highly known. Each year, the overall number of fast-food outlets has dramatically expanded. The first fast-food restaurants in Malaysia opened in the 1970s and early 1980s. With a capital of RM 24,300.00, A&W was the first fast-food chain to be introduced in Malaysia in 1963. KFC began operations in Kuala Lumpur in 1972 with a capital investment of RM 60,000.00 and quickly expanded, eventually having 11 locations as opposed to A&W's six at the time (Kee et al., 2021). The largest restaurant chain in Malaysia is run by QSR brands, the master franchise of KFC and Pizza Hut, based on market share and the number of locations (The Malaysia Reserve, 2018). According to market share, KFC (45%) and Pizza Hut (23%) lead Malaysia's fast-food retailing and quick-service segments (QSR Brands, 2018).

The hospitality sector is now regarded as successful, especially as more and more customers value quality over quantity. In a customer-focused industry like the hospitality sector, service is essential. It was asserted that the hospitality industry's service quality was fiercely competitive in achieving client happiness. Customer pleasure has been linked to success and superior service. A corporation's two most crucial components are service quality and client pleasure. Thanks to its way of joy, the business may precisely and successfully boost its reputation (Yee, 2021). Zhong and Moon (2020) contend that in order to compete with local eateries and increase profits, Western fast-food companies must focus more on price, service quality, food quality, and physical environment. Customer satisfaction is significantly impacted by a restaurant's level of service, food, and ambiance. It's important to keep customers happy because doing so can lead to repeat business and bigger sales.

This study intends to bridge the gap by examining the impacts of the three components of restaurant service quality (food quality, service quality, and physical environment quality) on patron satisfaction in fast-food outlets (Simpong et al., 2022).

LITERATURE REVIEW

1.1 Factors That Influence Customers Satisfaction

1.1.1 The Relationship between Food Quality and Customers Satisfaction

The definition of fast food differs from person to person, but most agree that the foods are mass-produced and made available in a short window, cutting the time lost from cooking meals at home. This makes fast food popular among youngsters, but families may also find themselves buying the products occasionally. However, fast foods usually have high fat and may cause dietary illnesses. Cheong Siew Man and Lim Kuang Hock (2021) said that sociodemographics is important to see which generation consumes fast food the most to prevent dietary illnesses.

For food quality, Liu and Jang (2009) argued that food quality must include food safety, which is the practice of handling raw food and ingredients, food preparation, food freshness and food tastiness. This was backed up by Violetta Njunina (2021), who asserted that harnessing the

five senses of the human body to prepare meals and attract clients is crucial. According to Abd Ghoni et al. (2021), there is a proven link between the calibre of the cuisine and patron pleasure at fast food establishments.

1.1.2 The Relationship between Service Quality and Customers Satisfaction

Zeithaml et al. (1988) stated that service quality is a form of review by customers while being in or served at a restaurant, saying that there are five major aspects to be evaluated; those are reliability, tangibility, responsiveness, assurance and empathy which lead to a procedure scale named SERVQUAL. Although SERVQUAL was no longer used in the current era, its influence on measuring customer satisfaction remains important.

Nikolich (1995) further explained that the interaction between service providers of a restaurant and customers would result in service quality evaluation, to which Brady and Robertson (2001) agreed. This is demonstrated by the fact that patrons who are pleased with the restaurant's service will frequently return to make more purchases. The argument was further reinforced by Abd Ghoni et al. (2021), who claimed that there is a strong link between customer satisfaction and service quality.

1.1.3 The Relationship Between Physical Environment Quality and Customer Satisfaction

According to Othman et al. in 2009, the physical condition of a restaurant's working environment is crucial for achieving customer satisfaction. They claimed that although the building appearance and colors were not as important, customers became conscious of food-borne illnesses, became more cautious in buying fast food, and thought that fast food restaurants should be more than a place for a quick dine-in.

Customers will be glad to be greeted by great qualities including a broad area, eye-catching designs, and cleanliness of the premises, according to Abdul Rahman et al. (2019). After that, Nawi et al. (2022) concurred that there is a connection between fast-food businesses' physical operational environments and patron pleasure.

Conceptual Framework

The conceptual structure of this study is displayed in Figure 1 below. The dependent variable in this study was consumer satisfaction with Kota Bharu fast food establishments. The meal quality, service quality, and physical environment quality, in contrast, were the study's independent factors. The relationship between the independent variables and the dependent variable is depicted in the image below.

Independent Variables

Dependent Variable

Figure 1.1: Relationship between the Independent Variables and Dependent Variable

Sources: Framework adopted from Zhong & Moon (2020)

METHODOLOGY

Research Design

The quantitative analysis used in this study is the most effective method for achieving the research objective. In this study, quantitative research uses questionnaire surveys to gather data.

Population

Table 3.1: Population by Gender Group in Kota Bharu

	Year 2023
Total	1741597
Men	893847
Women	847749

Source: Department of Statistics Malaysia (2023)

Sampling Size and Sampling Technique

From the table above, the sample sizes for all customers who are satisfied with fast food restaurants in Kota Bharu have been selected, with a total population of 1741597 respondents; 384 respondents were chosen as respondents in this study based on the theory from Krejcie and Morgan (1970).

Convenience sampling is being used by the researchers as their sample strategy for this investigation. Non-probability sampling, or convenience sampling, includes selecting a sample from a particular group. The respondents are easily accessible at the appropriate time and location, it just takes a short amount of time to collect the data, and it is reasonably expensive.

Instrumentation Development

Instrumentation

There will be three sections to the questionnaire. The demographic information is in Section A, the factors are discussed in Section B, and the link between the factors and the dependent variable is examined in Section C. The nominal scale, which is used to name variables without any quantitative value, is the initial measurement that is applied. The second measurement that is being used is the ordinal scale. Rating scales are used to measure the statements in the questionnaire, such as Likert scale.

The framework of the questionnaire, which includes both independent and dependent variables, is a five-point Likert scale for simplicity's sake. A seven-point Likert scale with "Strongly Disagree" at one extreme, "Strongly Agree" at the other, and "Neutral" in the middle would be used.

Data Collection and Data Analysis

In order to gather quantitative data for this study on the patrons of fast-food restaurants in Kota Bharu regarding their satisfaction with elements like food quality, service quality, and physical environment quality that will impact their ability to fulfil demand, a questionnaire was used. Following data collection, the IBM Statistical Package for Social Science (SPSS) will be used to evaluate all of the collected data. The descriptive data analysis and Pearson Correlation techniques make up the research's analytical process.

CONCLUSION

This chapter contains the results of the essential study on the variables affecting patron satisfaction with fast food establishments in Kota Bharu. The study's goals have been achieved, its questions have been answered, and its hypotheses have been accepted based on the examination of 384 valid questionnaires.

Overall, there is a modest association between customer satisfaction and service quality as well as a large positive relationship between food quality and customer contentment.

The meal quality correlation value, which influences consumers' intent to return, is the highest of the study's variables. The survey has effectively demonstrated that the majority of participants think that the quality of the food is the primary element deciding whether or not they will visit a fast-food restaurant again, with the environment having the least bearing on their choice. Since the majority of fast food establishments in Kota Bharu offer comparable goods and services, their owners ought to start putting more of an emphasis on serving meals in a welcoming and welcoming setting to draw repeat customers and boost revenues.

ABSTRACT

Traditional food is food passed down from generation to generation. This traditional food symbolizes an ethnic group in Malaysia. This research focuses on the intention to eat Kelantan traditional food among UMK students, which is closely related to taste, family practice and convenience. In carrying out this research, quantitative methods were used as a tool to collect data from the respondents. To analyze and identify the data of this study, descriptive analysis, reliability test and Pearson Correlation were used. This study found that taste, family practice and convenience are closely related to the intention to eat Kelantan traditional food among UMK students. The researcher used primary data for data collection, including a simple sampling method to select 361 respondents from students at UMK City Campus. There are 361 respondents from students at UMK City Campus who have participated in this study.

Keywords: Intention to eat, traditional food, taste, family practice and convenience

INTRODUCTION

Traditional food or local cuisine is something which past generations have consumed, and which has been around for a long time. There is no doubt that traditional cuisines and dishes have a rich history as national, regional, or local dishes. Traditional foods and beverages can be made at restaurants, small production facilities, big food processing plants, or even at home. Traditional foods are viewed as a focal point of one's cultural heritage, which may be recognized by the origin because they are important in bringing back memories, identities, and authenticity to every culture, race, religion, and country (Perry, 2017).

Based on the statistics released by the Department of Statistics Malaysia (DOCM) (2022) has shown that the Malays show the highest percentage of (69.6%), Chinese (22.8%), Indians (6.6%) and other races (0.7%). Malaysian cuisine and food are known for their rich and unique flavor. Malaysian traditional food is produced ingeniously using the finest and freshest local products, and the subsequent generation receives the recipes (Salleh, 2006). Malaysia, which has a cosmopolitan culture because it has inherited and maintained the identity of various types of traditional food, has developed its combination of mixes to give birth to traditional Malaysian cuisine that appeals to all groups of people. Every culture, ethnicity, religion, and nation need to evoke memories, identity, and validity.

There are three objectives of this research:

1. To identify the relationship between taste towards intention to eat Kelantan traditional Kelantan food among UMK students at City Campus.
2. To identify the relationship between family practice towards intention to eat Kelantan traditional food among UMK students at City Campus.
3. To identify the relationship between convenience towards intention to eat Kelantan traditional food among UMK students at City Campus.

SIGNIFICANCE OF THE STUDY

The subsequent researcher's future efforts to learn more about traditional foods will benefit from this study's result as well. It also intends to teach the next generation about the necessity of preserving this old culinary history and learning about traditional dishes. According to study and information on this Malaysian Traditional Food, it can and will continue to help the expansion of our country's tourist business. The results of this research will also help the young generation of new eateries, street food vendors, and food trucks by educating them about heritage foods and enhancing their appreciation of the importance of proper food handling techniques. Additionally, it would allow the younger generation to improve the quality of traditional foods in a clean and uncontaminated state.

Traditional Food

Traditional foods are those that have been consumed for generations and have been handed down. Malaysia is native to numerous ethnic groups, each with its own traditional cuisine. Malaysia, particularly in Kelantan has a distinct traditional cuisine from other nations because of interaction and integration between various ethnic groups because it has been a melting pot of numerous cultures for so long. However, the younger generation particularly those in the generation Z has gradually rarely eaten traditional food because of the influence of information technology.

Student

The knowledge of young people, particularly students can be improved by this research, as students are increasingly engrossed in information technology (IT). So, this research will guide them to try traditional food, particularly Kelantan traditional food. This research will provide useful information about traditional foods allowing students to become more acquainted with the environment.

Intention

Traditional foods are significant because they provide better immunity to illness, and nutrient-dense traditional foods may also contribute to weight control and wellness. For

instance, heart health, bone health, and mental heart health. So, eating with a purpose or goal is choosing a wise food choice to fuel whatever you want to achieve with your meal. As a result, your intentions provide you with the guidance you require to achieve your objectives. Setting intentions in the morning may assist you in achieving any objective, such as starting a life coaching company or finding a new relationship.

LITERATURE REVIEW

Intention To Eat Kelantan Traditional Food

Eating with intention entails making a strategy that goes beyond simply deciding what to cook and eat. It is also about achieving a goal and making decisions that will benefit your work-life balance and healthy nutrition. Intention also gave you the attention you required to advance toward your goals. Eating with intention also means eating in a way that helps your body, mind, and spirit stay clear, energized, and at their best. It is eating from a position of self-love and genuine nutrition. Intention theories aim to capture the unique features of intentions. Historically, the belief-desire hypothesis has been the prevailing method. The desire to execute a certain action and the conviction that one will perform that action are two simple definitions of having an intention. As several counter examples show, belief-desire theories are widely questioned since neither beliefs nor wants to require a real commitment to acting. The evaluation theory, which explains intents in terms of unconditional assessments, addresses this issue. In other words, unlike wants intentions show the desired path of action as being beneficial in all aspects.

TASTE

Taste and food quality are influenced by a few factors, including food presentation, variety, healthy options, freshness, taste, temperature, and portion size. These factors can improve dining experiences and, as a result, influence customer behaviour, such as their intention to return. In terms of food taste, food quality, and food serving style, Kelantan's traditional local cuisine provides a genuinely satisfying dining experience (Nguyen et al., 2019). A few of the traditional foods from Kelantan are still popular with people today, including Nasi Kerabu, Laksam Kelantan, Ayam Percik, Kerabu Sare, Kuih Akok, Bahulu, and others. Due to the culture of Kelantan is known as a state that likes to eat sweet food, sweet cakes like Kuih Akok are famous in Kelantan and loved. The sweetness of Kuih Akok has attracted the interest of both locals and visitors from outside Kelantan to the point where they are willing to come to Kelantan just to get it. Food preferences and perceptions are influenced not only by the taste, aroma, or texture of foods but also by eating habits (Drewnowski, 1997). This demonstrates how unique the eating patterns of Kelantanese are, who love sweet foods like Kuih Akok. Furthermore, "natural taste" refers to a food taste that has not been altered by artificial aromas and flavour enhancers (Commission, 2007).

Family Practice

A family is a group that contributes to an important social norm for the young generation. According to (Muhammad Shahrin Ab Karim,2015), when it comes to nutrition, the family is the most important group that significantly affects how adolescents behave. It was shown from several previous studies that the result will vary depending on the structure of the family itself. The parents are typically the main factors in determining how their children will eat and will shape and determine that behavior. There are two possible motivating factors for people to follow the eating norm (Higgs, 2015). Second, maintaining a healthy diet may be made easier by adhering to the rules. Malay traditional nutrition and practices for children begin at home since eating routines and practices learned as children must have the highest likelihood of remaining in place as adults (Bava et al., 2008; Kimura et al., 2010; Pedersen, Gronhoj, and Thogersen, 2015; Videon and Manning, 2003).

CONVENIENCE

Daniels and Glorieux (2015) define convenience foods as any fully or partially prepared foods whose preparation time, knowledge, culinary expertise, or energy inputs have been transmitted from the home kitchen to the food processor or other food distributors. In other words, both the transmission of culinary skills and the saving of time and energy are directly related to convenience meals. In addition, it seeks to simplify meal selection and preparation for the public. According to Boer, McCarthy, Cowan, and Ryan (2004), convenience food is typically associated with minimizing the amount of effort required to acquire food, prepare, cook, or clear up after a meal. Contrary to prevalent belief, eating away from home is not equivalent to consuming fast food. Eating out can be viewed as a social occasion, whereas convenience foods are typically associated with meals and snacks consumed to provide individuals with time and opportunity to pursue other activities.

Relationship Between Taste, Family Practise And Convenience Toward Intention To Eat Kelantan Traditional

According to (Spence, Smith, and Auvray, 2015)There is a distinction to be made between the term's "taste" and "flavour". Everyone has varied tastes, which impact the numerous facets of picking anything in everyday life. The flavour of traditional Malay food depends on traditional food production and the Malay community's acceptance of their location, even if the name or shape of the dish remains the same in principle (Sharif, Zahari, Nor, and Muhammad, 2013). The secret to creating uniquely flavorful Malay dishes is to use a wide variety of spices and other ingredients. The cooking equipment used in creating Malay traditional food is also a key component in distinguishing it from the traditional food of other state groups.

A family is a group that contributes to an important social norm for the young generation. According to Muhammad Shahrin Ab Karim (2015), when it comes to

nutrition, the family is the most important group that significantly affects how adolescents behave. It was shown from several previous studies that the result will vary depending on the structure of the family itself. The parents are typically the main factors in determining how their children will eat and will shape and determine that behaviour. There are two possible motivating factors for people to follow the eating norm (Higgs, 2015). Second, maintaining a healthy diet may be made easier by adhering to the rules. Malay traditional nutrition and practices for children begin at home since eating routines and practises learned as children must have the highest likelihood of remaining in place as adults (Bava et al., 2008; Kimura et al., 2010; Pedersen, Gronhoj, and Thogersen, 2015; Videon and Manning, 2003).

According to Daniels and Glorieux (2015) convenience is define as foods any fully or partially prepared foods whose preparation time, knowledge, culinary expertise, or energy inputs have been transmitted from the home kitchen to the food processor or other food distributors. In other words, both the transmission of culinary skills and the saving of time and energy are directly related to convenience meals. In addition, it seeks to simplify meal selection and preparation for the general public

Research Hypothesis

- H1: There is a significant related between taste toward intention to eat Kelantan traditional food among UMK students at City Campus.
- H2: There is a significant related between family practice toward intention to eat Kelantan traditional food among UMK students at City Campus.
- H3: There is significant related between convenience toward intention to eat Kelantan traditional food among UMK students at City Campus.

Research Framework

METHODOLOGY

Research Design

The research design is a strategy for logically connecting study components and ensuring effective problem-solving. This study aimed to determine if students at UMK City Campus intended to eat traditional food from Kelantan. Researchers used quantitative methods, including online surveys, to collect core data on taste, family practice, and convenience. The questionnaire-based survey included 361 students, utilizing mathematical and statistical methods to identify patterns and measure prevalence. The research design aimed to provide a methodical and transparent approach to addressing study issues.

Population and Sample Size

UMK students at City Campus has a total population of 6775 students. The respondents are from various courses in UMK City Campus will participate in this research study. According to Krejcie and Morgan (1970), the sample size of 361 respondents will be determined in the study.

S = sample size

X^2 = the table value of chi-square for 1 degree of freedom at the desired confidence level (361)

N = the population size of students UMK at City Campus

P = the population proportion (assumed to be 0.5 since this would provide the maximum sample size)

d = the degree of accuracy expressed as a proportion (0.5)

The exact amount of sample size for the population are 361 but the return of the questionnaire answered by respondents collected the data for 361 respondents.

Sampling Method

The method used to choose the subset of a population to participate in a study is called sampling. a technique for selecting many participants for a study in a way that makes sure they accurately reflect the big group from which they were selected. Two basic sampling approaches are used in the research. Non-probability sampling is a method for picking samples that are statistically reliable representations of a larger population. Non-probability sampling strategies choose participants based on their convenience, availability and whether they display a characteristic the researcher is interested in examining. For this analysis, the researchers used non-probability sampling procedures. The target demographic for the collection of samples was the younger generation. The samples were chosen at random by researchers from students UMK at City Campus from difference courses. Besides that, we use convenience sampling in conducting the research because it more suitable for this study.

Data Collection Procedure

The study utilized a questionnaire to gather primary data from respondents about their plans to consume traditional food from Kelantan. A quantitative methodology was used, involving closed-ended and open-ended questions. The survey was divided into three parts: demographic information, Likert Scale, and dependent variable (DV). The third question, Part C, divided respondents' plans into taste, family practices, and convenience. The results will be made public to demonstrate students' desire to eat traditional Kelantan food.

DATA ANALYSIS

Data analysis is the process of gathering, interpreting, and evaluating information to provide insights that may be used to make decisions. There are different ways and tactics for doing analysis, depending on the sector and the goal of the study. These methodologies are all founded on two types of study in both quantitative and qualitative research.

FINDINGS

Result of Frequency Analysis

Demographics Profile of Respondent

The frequency, percentage, and cumulative percentage were all included in this study's analysis. Questions about the respondents' gender, race, and state were among those from the questionnaire's Section A that provided the data.

Table 4.1 Statistic table on the (gender)

	Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Female	239	66.2	66.2
	Male	122	33.8	33.8
	Total	361	100.0	100.0

Figure 4.1 The percentage of gender

The percentage of male and female respondents was displayed in table 4.1 and figure 4.1 respectively. From the data, researcher found the majority of respondent is female for this survey. Male respondents only consist of 33.3% while female respondents consist of 66.2% respectively of the total respondents.

The Number Of Race

Table 4.2 Statistic table on the (race)

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Chinese	37	10.2	10.2	10.2
	Indian	31	8.6	8.6	18.8
	Malay	277	76.7	76.7	95.6
	Others	16	4.4	4.4	100.0
	Total	361	100.0	100.0	

Figure 4.2: Percentage of race

Table 4.2 and figure 4.2 showed the percentage of the respondent based on race. From the total 361 respondents, the percentage shows that Malay was the higher with 76.7%, Chinese carry out with 10.2% while Indian 8.6% and others is 4.4%.

The Data of State

Table 4.3: Statistic on the (State)

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Johor	20	5.5	5.5	5.5
	Kedah	19	5.3	5.3	10.8
	Kelantan	161	44.6	44.6	55.4
	Kuala Lumpur	13	3.6	3.6	59.0
	Melaka	6	1.7	1.7	60.7
	Negeri Sembilan	4	1.1	1.1	61.8
	Pahang	37	10.2	10.2	72.0
	Penang	9	2.5	2.5	74.5
	Perak	11	3.0	3.0	77.6
	Perlis	4	1.1	1.1	78.7
	Sabah	14	3.9	3.9	82.5

Sarawak	6	1.7	1.7	84.2
Selangor	28	7.8	7.8	92.0
Terengganu	29	8.0	8.0	100.0

Figure 4.3: Percentage of state

Table 4.3 showed the percentage of the respondent based on the state. Based on the data frequency of 361 respondents, Kelantan are the majority respondents and follow by others state. From the total respondents of 14 state in Malaysia, the four highest score percentage is Kelantan itself with 44.6%, the second highest is Pahang with 10.2%, thirdly is Terengganu with 8.0%, next is Selangor with 7.8% and the rest of the percentage 29.4% are from others state.

Result of Descriptive Analysis

Descriptive statistics indicate how the variables in Parts B and C of the survey were distributed on average. It aids researchers in fully comprehending the experiment or data supplied and provides all necessary context information.

Independent Variable (Iv1)

TASTE	MEAN	STANDARD DEVIATION
Question 1: Kelantan traditional food suits with my taste.	3.83	.959
Question 2: Kelantan traditional food contributes to my eating pleasure.	3.88	.923
Question 3: Kelantan traditional food is different from other states.	4.09	.824
Question 4: Kelantan traditional food has a good taste.	3.92	.906
TOTAL	3.9273	.77956

According to the table above, the questionnaire for Independent Variable 1 (IV1) contains four questions. The four involvement questions have a mean score that spans from 3.83 to 4.09. Question 3 received the highest score (M=4.09 and SD=.824), and 166 respondents said that they "agreed" with the survey's findings. Secondly is question 4 with the (M=3.92 and SD= .906) whereas 153 respondent "agreed" that taste of the food is good. Besides that, for question 2 with the (M=3.88 and SD=.923) whereas 152 respondent was "agreed" this food contribute their eating pleasure and the lowest is question 1 with the (M= 3.83 and SD= .959) whereas 150 respondents "agreed" that the food suit with their taste because majority of the UMK student is from Kelantan and followed by other respondents that come from other state that interested with the food that had a unique taste that set it apart from other states.

Independent Variable (IV2)

FAMILY PRACTISE	MEAN	STANDARD DEVIATION
Question 1: My family prepare a variety food of Kelantan traditional food.	3.36	1.263
Question 2: My family show how much they enjoy the traditional food of Kelantan.	3.73	1.063

Question 3: My family allow me to involve in preparing Kelantan traditional food.	4.00	.872
---	------	------

Question 4: My family encourage me to eat Kelantan traditional food.	3.83	1.011
TOTAL	3.7313	.91657

Based on the table above, there are four questions about independent variable 2 (IV2) in the evaluation. The mean score of the four questions in involvement ranges from the lower 3.36 until the highest 4.00. Question 3 with the (M= 4.00 and SD=.872) whereas the respondent chose “agreed” for this survey question, followed by the second highest score, question 4 with the (M=3.83 and SD= 1.011) whereas the respondents “agreed” that their family encourage them to eat Kelantan traditional food. Meanwhile, question 2 (M=3.73 and SD= 1.063) whereas the respondent was “agreed” that their family enjoy with this traditional food and the lowest score is question 1 with the (M= 3.36 and SD= 1.263) whereas the respondents “agreed” that their family also prepare a variety of Kelantan traditional food because most of the respondent come from Kelantan itself.

Independent Variable (Iv3)

CONVENIENCE	MEAN	STANDARD DEVIATION
Question 1: Kelantan traditional food is easily to prepare.	3.63	1.000
Question 2: I can be bought in shop close that where I live or study.	4.24	.785
Question 3: Kelantan traditional food easily available in shop or supermarket.	4.06	.902
TOTAL	3.9760	.70975

According to the data in the table above, the third independent variable (IV3) questionnaire has three questions. The mean score of the three questions in involvement ranges from the lower 3.63 until the highest 4.24. Question 2 with the “M= 4.24 and SD= .785) whereas the respondent “agreed” that they can bought the Kelantan traditional food, followed by question 3 with the (M= 4.06 and SD= .902) where the respondent “agreed” with the question survey. The lowest is question 1 with the (M 3.63 and SD1.000) whereas the respondents “agreed” they have experience in preparing the traditional food especially with their family.

Dependent Variable (DV)

INTENTION	MEAN	STANDARD DEVIATION
Question 1: I am satisfied with the overall quality of traditional Kelantan food.	3.95	.865
Question 2: I intend to purchase the food again in future.	3.95	.907
Question 3: The look and texture made me want to eat Kelantan traditional food.	3.99	.843
Question 4: I will promote about Kelantan traditional food to others.	4.16	.845
TOTAL	4.0104	.77955

There are the table of Dependent Variable (DV) for descriptive analysis. The mean score of the four questions of (DV) are involvement ranges from the lower 3.95 until the highest 4.16. The highest mean score is question 4 with the (M= 4.16 and SD= .845), followed by the second highest which is question 3 with the (M= 3.99 and SD .843) where the respondent “agreed” the look and texture influence them to eat the food and the rest of question are question 1 and question 2 got the same score which the Mean (3.95) but different standard deviation where the question 2 got S.Deviation (.907) and for question 1 (.865).

Result of Reliability Analysis

For this survey, there were three independent variables and one dependent variable. The dependent variable is intention to eat Kelantan traditional food, and the independent variables are the taste of food, the family practice, and the convenience. Four questions were created for the dependent variable, and 11 were created for the independent variable.

Reliability Test	N	Cronbach’s Alpha	N Of Items
TOTAL	361	.948	15

According to the reliability results shown above, the researcher has checked all both dependent and independent variables. Cronbach's Alpha was 0.948 for all independent and dependent variables of reliability. The coefficient values of the variables

have been found to be excellent in terms of reliability level. The table below shows the Cronbach's Alpha rule of thumb for describing internal consistency.

Result of Pearson Analysis

	Taste	Family practice	Convenience	Intention to eat Kelantan traditional food
Taste	1			
Family practice	0.814**	1		
Convenience	0.585**	0.629**	1	
Intention to eat Kelantan traditional food	0.819**	0.745**	0.631**	1

		IV 1
DV	Pearson correlation	.819**
	Sig. (2-tailed)	.000
	N	361

** . Correlation is significant at the 0.01 level (2-tailed)

Table shows a significant relationship between taste (IV 1) and intention to eat Kelantan traditional food (DV) ($r = 0.819$ $p < 0.01$). A correlation between taste and intention to eat Kelantan traditional food has been shown by the positive Pearson Correlation value of 0.819. At the same time, the 0.000 level of significance for both variables showed that they are highly significant, with a strong level of significance. The researcher concluded from the results that there is a positive relationship between taste and intention to eat Kelantan traditional food. As a result, the researcher accepted the alternative hypothesis and rejected the null hypothesis.

e

According to the table, there is a significant correlation between family practice(IV 2) and intention to eat Kelantan traditional food (DV) ($r = 0.745$, $p < 0.01$). The positive Pearson Correlation value of 0.745 indicates a correlation between familypractice and intention to eat Kelantan traditional food. At the same time, the 0.000 level of significance for both variables indicated that the two are both highly significant, with a moderate level of significance. As a result, the researcher accepted the alternative hypothesis and rejected the null hypothesis.

	N	361

Correlation is significant at the 0.01 level (2-tailed)

According to the table, there is a significant correlation between convenience (IV 3) and the intention to eat Kelantan traditional food (DV) ($r = 0.631$ $p < 0.01$). Convenience and intention to eat Kelantan traditional food was shown to be related by the positive Pearson Correlation value of 0.631. At the same time, the 0.000 level of significance for both variables indicated that both are highly significant, with a moderate level of significance. As a result, the researcher accepted the alternative hypothesis and rejected the null hypothesis.

DISCUSSION AND RECOMMENDATION

This study aimed to determine the correlation between flavor and the desire of University of Malaysia (UMK) students to consume traditional food from Kelantan. It also examined the relationship between convenience and the intention to eat traditional food. The study involved 361 questionnaires and 361 respondents, with Cronbach's Alpha values ranging from 0.737 to 0.837. The results showed a moderately positive correlation between taste and the intention of UMK students to eat traditional Kelantan food ($r = 0.819$, $p < 0.01$), and a moderately positive correlation between family practice and the intention of UMK students to eat traditional Kelantan food ($r = 0.745$, $p < 0.01$). Convenience was also found to have a substantial positive link with the intention of UMK students to consume traditional food from Kelantan.

Future research should continue using quantitative approaches, such as Google Forms and online questionnaires, to improve respondents' understanding and save time. Additionally, qualitative studies could be considered for better realism and wider

applicability. Finally, future researchers could use interviews or open-ended questions to gather high response rates, better explanations, and better comprehension of respondents' viewpoints, potentially yielding superior research findings.

CONCLUSION

Finally, a survey was conducted to ascertain the intention of UMK City Campus students to enjoy Kelantan traditional food. According to the study's findings, all independent criteria such as taste, family practice, and convenience influence people's inclination to consume Kelantan traditional meals. Consequently, students at the UMK City Campus represented the intention to enjoy traditional Kelantan food. Overall, the study's findings give vital insight into the link between Independent Variable and Dependent variables and demonstrate the need for future research in these areas of Kelantan traditional foods.

ABSTRACT

Customer satisfaction is one of the most important aspects of any business, particularly in the fast-food industry. Because of market competition and the abundance of firms, an organization must prioritize the degree to which a consumer is satisfied with the organization's products and services. The purpose of this research is to aim customer satisfaction towards the service quality in the fast-food industry at Kota Bharu, Kelantan. Clarifying the significance of service quality in customer satisfaction is the study's main goal. An organized questionnaire will be utilized to gather the majority of the study's data, and SPSS Version 20 was used for analysis. Through the use of social media, online questionnaires were used to contact the participants and collect data. 384 randomly selected individuals from Kota Bharu, Kelantan, were given the survey to complete. The findings indicate a favorable correlation between customer happiness and service quality in Kota Bharu, Kelantan's fast-food industry.

Keywords: Customer Satisfaction, Service Quality, Fast-food industry, Social Media.

INTRODUCTION

The sensation of pleasure and expectation fulfilment, according to Zairi (2000), is what is meant by the term satisfaction. If a customer's needs aren't met by a product, they'll be unsatisfied; yet, if they are, they will be happy with the product or brand and stay loyal to it. The word "customer satisfaction" refers to the degree to which a company's products or services meet or exceed the needs of its customers. It is among the most important determinants of customer loyalty and purchase intention.

Customer happiness, according to Oliver (1981), is a part of marketing and has a significant impact on the market. Customer pleasure was not always respected, and quality was not as important. However, due to education and learning environments, customers are now taught about the competition and are aware of all products and businesses. As a result, every firm is concerned with correctly meeting its customers' needs and wants.

Fast food is an economical, quick, accessible, and convenient substitute for home-cooked meals, according to the National Institutes of Health (NIH). They also have a lot of calories, sugar, salt, and saturated fat. The way of life of people in Kota Bharu, Kelantan, has substantially benefited the fast-food business lately.

There are three objectives of this research:

1. To identify the relationship between tangible in service quality towards customer satisfaction in the fast-food industry.
2. To analyze the relationship between tangible in service quality towards customer satisfaction in the fast-food industry.
3. To explore the relationship between responsiveness in service quality towards customer satisfaction in the fast-food industry.

Significance of the Study

Worldwide, the fast-food industry has become extremely profitable. Good service quality contributes to client happiness and increases the firm's market competitiveness. The goal of this research is to explain how tangible factors such as responsiveness and assurance affect customer satisfaction at fast-food restaurants in Kota Bharu, Kelantan. The study's significance for the community is to achieve consumer happiness, which leads to company loyalty and product repurchase. Customers will acquire things that are worth their money and will perceive the purchase to be worthwhile. Not only that, but the findings of this study can be used to help new fast-food restaurant owners develop their enterprises.

Furthermore, the government can use the findings of this study to enhance fast food and encourage Malaysia's economy in the future. Malaysia's GDP can be expanded in the long run, leading to tremendous expansion in the fast-food business.

LITERATURE REVIEW

Customer Satisfaction in the Fast Food Industry

The extent to which products, services, and interactions with customers live up to expectations is viewed as a positive influence in the fast-food sector. Enjoyment and wellbeing are components of customer satisfaction. By comparing the level of performance, quality, or other results that the user encounters to an assessment criteria, one can determine how much of a user experience generates positive feelings. Customer satisfaction is calculated by comparing the level of performance, quality, or other results that the user experiences to an evaluation criteria. Customer satisfaction is a result of a product meeting the needs, aspirations, and expectations of the customer (Yuniarti 2015).

Businesses may attract customers and gain their loyalty by providing high-quality products and services. One of the company's important goals to reach in order to win back customers is customer

satisfaction (Han 2019). Customers who are happy with a product are more likely to repurchase it and stick with it. They are less price sensitive and can positively influence other customers by recommending it to them.

Tangible

Tangible reduces the customer's risk and ambiguity while assessing the quality of the offering (Miller and Foust, 2003). In the literature on marketing, for instance, emphasis has been placed on researching the tactics that marketers might use to improve customers' perceptions of the tangibility of their experiences.

The definition of tangible is the physical features of the service being provided. It includes the menu's appearance and design as well as attire (Kassie,2017). In contrast, (Akroush,2015) the research shows that all observable elements of service quality should receive special consideration because they affect customer loyalty and have the potential to boost business profits. To ensure the smooth operations of the fast food industry they should have a clear plan and employ a particular strategy while carrying out facility maintenance.

Responsiveness

Responsiveness, ability to help customers, and good services. Response time is still necessary even if the customer declines to contact you. Respond as soon as you can to at least inform the client that their request is being processed. Being responsive can show your clients that you care about their issue and are actively looking for a solution. (Feriors, 2021) Responsive to customers' needs makes them feel at ease, impresses them, and focuses their attention on the specific fast-food industry. However, customer responsiveness is highly valued and will provide any fast-food firm an advantage over its rivals and other market participants.

Assurance

Monitoring the caliber of customer interactions is known as customer service quality assurance. They may measure and enhance the performance of your team and the entire support process by conducting regular conversation reviews. Making it simple to please consumers is a key component of customer service quality assurance. When 50% of customers think that the customer experience is more important to them now than it was a year ago, making customers happy should be a top priority.

Relationship between Tangible, Responsiveness and Assurance Towards Customer Satisfaction in Fast Food Industry

Tangible

The five categories of tangible property used in the fast food industry are: items, furniture and fixtures, electronic equipment, signage, and packaging. Customer satisfaction with the fast-food restaurant's service quality industry is very important to improve their company to higher quality. Everyone's first sight when they come to the fast-food industry is the physical look of buildings, machinery, people, and communication tools or tangibility. When everything looks good, customers will be happy to go around to the company. Besides, well-groomed and tidy workers in producing products also influence customer satisfaction either positively or not. The customer's priority is that the things they want and need are guaranteed in all respects, especially cleanliness and quality. Therefore, paying attention to appearance is the most important thing to looking up the values of consumer comfort.

Responsiveness

The term "responsiveness" refers to a service provider's capacity to assist customers and offer prompt service. This illustrates the staff's propensity for timely and effective programme delivery. Previous studies have shown that being responsive means being ready to help customers and offer quick service. It is a process-established logically formed, defined, and clarified association connectivity among variables considered important to the problem situation. Every fast-food industry must be responsive toward customers in giving satisfaction to them. These fast-food industries are prepared in a short time and of course, customers need fast delivery service. Staff must respond to the customers' issues and complaints immediately, especially in a hectic environment.

In another case, if customers are hesitant to respond, staff must still be responsive. For example, after an order is taken, staff must respond as soon as possible to inform customers that their request is being processed. This can show the clients that the company cares about their problems and is actively seeking solutions by being responsive. So, it will increase customer satisfaction by being responsive throughout the work.

Assurance

Customers will be satisfied when you offer them safe, high-quality products, and this will definitely lead to good reviews, a rise in demand, more sales, and more profits. On the other hand, poor quality can lead to complaints and permanent harm to one's reputation. A business runs less of a chance of being the target of scandals, bad news, and complaints if it can constantly guarantee quality. Employee knowledge, politeness, and the capability to inspire confidence or assurance are necessary for the fast-food industry. This is because customers consider the company that has assurance as a high performer in providing their services.

Customers place their trust in assurance because they have many options when making a purchase. For example, if they want to buy something online but no assurance is provided, they run the risk of being duped. Thus, customers will be satisfied after they know about the company's assurance.

Hypothesis

In accordance with the conceptual framework, the independent variables for this study were service quality in tangibility, assurance, and responsiveness of the fast-food industry. There are three independent variables that have been presented. Customer satisfaction is the dependent variable.

Hypothesis 1: There is a relationship between the tangibility in service quality towards customer satisfaction in the fast-food industry.

Hypothesis 2: There is a relationship between the responsiveness in service quality towards customer satisfaction in the fast-food industry.

Hypothesis 3: There is a relationship between the assurance in service quality towards customer satisfaction in the fast-food industry.

Research Framework

The conceptual framework for this research is seen in Figure 1. The three factors that make up the independent variables that will be proposed are tangible, responsiveness and assurance. Customer satisfaction is the dependent variable.

Figure 1 : Conceptual Framework of the relationship between tangible, responsiveness and assurance with customer satisfaction.

METHODOLOGY

Research Design

The design of the study considers the variables that affect the dedication of fast-food industry services. In this study, a self-directed questionnaire will be used to collect data from participants

utilizing a quantitative methodology. A descriptive study on the connection between tangible, assurance and responsiveness for the fast-food industry can be considered.

Population and Sample Size

Malaysia has a total population of 32.7 million people living there. Kelantan's overall population is expected to be 1,792,501 in 2020. This study's research population is limited to Kota Bharu, Kelantan. Kota Bharu has a population of 555,757 people. In this investigation, the Krejcie and Morgan (1970) sample was used to calculate sample size. Morgan and Krejcie (1970):

S = sample size

X^2 = the table value of chi-square for 1 degree of freedom at the desired confidence level (3.841)

N = the population size of domestic tourist in a year

P = the population proportion (assumed to be 0.5 since this would provide the maximum sample size)

d = the degree of accuracy expressed as a proportion (0.5)

The exact amount of sample size for the population is 384 and the return of the questionnaire answered by respondents collected the data for 384 respondents.

Data Collection

In the first stage, the data collection method that had been used in this study is online surveys that used Google form. The reason why the researcher used this platform of technology tools is because it is free and friendly to users. It also makes it easier for the researcher to collect all the data from the local population. The second stage of data collection was fieldwork. In this study, questionnaires also had been used as the instrument for primary data collection. There are 5 parts of the section that respondents need to answer. The questionnaire was distributed to the population to collect the data, which is the local population in Kota Bharu, Kelantan.

In the first stage, the data collection method used in this study was online surveys using Google forms. The researcher chose this platform of technology tools because it is free and user-friendly. It also makes collecting data from the local populace easier for the researcher. Fieldwork was the second stage of data collecting. In this study, questionnaires were also used as the primary data gathering instrument. The section requires respondents to answer five inquiries. The questionnaire was distributed to the local populace in Kota Bharu, Kelantan, in order to collect data.

Sampling

Sampling is a technique for obtaining data in academics to learn regarding a particular population by studying the findings of a sample of people rather than focusing on some specific individuals (Turner, 2020). Probability sampling and non-probability sampling are the two major sample methodologies used in this study. Random samples are used in probability sampling, enabling

important inferences more about overall demography to be drawn (Stratton, 2021). Non-probability sampling is frequently related with qualitative research and the construction of research articles (Taherdoost, 2016). The non-probability approach, for example, a simple sampling method, was chosen as the sample design in this investigation.

Facility sampling is a non-probability or non-random sampling strategy in which participants from a target group who satisfy the study's requirements, such as easy accessibility, geographic location, capacity at a given time, or desire to participate, are included (Etikan et al., 2016)

Research Instrument

Table 1: Overview of Research Instrument

Sections	Variables	Item	Authors
A	Demographic profile	6	Omar, Juhdi, Ahmad & Nazri (2014)
B	Tangible	5	A Parasuraman, Valarie A Zeithaml, L Berry 1988 64 (1), 12-40, 1988;
	Responsiveness	5	Parasuraman, Zeithaml, and Berry (1988)
	Assurance	5	Cronin J. Joseph Jr. and Taylor Steven A. (1992)
C	Customer satisfaction	5	Pizam A, Shapoval V, Ellis T (2016)

Data Analysis

Researchers used the Statistical Programmers for Social Science (SPSS) version 20 to examine the primary data. SPSS is a program-based data processing and analysis window that allows you to create tables and pie charts. Computers aided researchers in lowering the effort required to determine information and making quantitative analysis easily and quickly. The researcher uses descriptive statistics, reliability statistics, Pearson's correlation, and regression to evaluate quantitative data.

FINDINGS

Result of Frequency Analysis

Tabel 2 shows the results of the frequency analysis

Table 2 : Frequency Analysis

Respondent Profile	Classification	Frequency	Percentage
		n = 384	(%)
Gender	Male	161	41.9
	Female	223	58.1
Age	18 – 25	134	34.9
	26 – 35	104	27.1
	36 – 40	87	22.7
	41 and above	59	15.4

Status	Married	164	42.7
	Single	190	49.5
	Others	30	7.8
Race	Malay	215	56
	Chinese	83	21.6
	Indian	57	14.8
	Others	29	7.6
Frequency of customer visit at fast food restaurant	Once a week	101	26.3
	2 – 3 times a week	89	23.2
	More than 3 times in a week	53	13.8
		141	36.7
	Once a month		

A total of 384 respondents were gathered for this study. From Table 2, there are 161 (41.9%) respondents representing men, and 223 (58.1%) respondents representing women. It demonstrates that there were more female respondents in this study than there were male respondents. Age is divided into 4 categories. A total of 134 (34.9%) respondents, or the majority of the sample, are

between the ages of 18 and 25. Meanwhile, there are 104 (27.1%) respondents who are under the age of 26-35 years. Next, there are 87 (22.7) respondents in the age range of 36 - 40 years. Finally, there are only 59 (15.4%) respondents in the age range of 41 and above years. Overall, 190 (49.5%) respondents are single, which represents the majority of respondents. Meanwhile, the respondents who are married are 164 (42.7%). Married respondents showed a total of 30 (7.8%) respondents who chose others not to tell their status. Next, the majority of respondents were reported to be Malay, totaling 215 (56%) respondents. For the Chinese and Indians, 83 (21.6%) respondents and 57 (14.8%) respondents respectively. Meanwhile, only 29 (7.6%) respondents reported being of a different race than Malay, Chinese or Indian. The table shows that among all the frequency groups of customers visiting fast food restaurants, respondents who visit fast food restaurants once a month are the highest, which is 141 (36.7%) respondents. A total of 101 (26.3%) respondents, or the second highest group, report eating out once every week. 2–3 times a week is the frequency of fast food restaurant visits reported by 89 respondents (23.2%). 53 (13.8%) respondents, representing a portion of the sample, reported eating at fast food establishments more than three times per week.

Result of Descriptive Analysis

The findings of the descriptive analysis are shown in Table 3.

Table 3: Descriptive Analysis

Variables	Statement	Mean	SD
Tangible	Is it easy for customers to park their vehicles in the parking lot provided?	4.49	0.719
	Are the toilets provided by the restaurant well maintained?	4.32	0.782
	Does the restaurant provide a comfortable place to eat for customers?	4.44	0.614
	Do fast food restaurants provide clean food to customers?	4.41	0.684
	Is the displayed menu list easy for customers to understand to order food?	4.49	0.587
	Does the process of ordering food save the customer's time?	4.37	0.677

Assurance	Do customers feel comfortable dealing in fast food restaurants?	4.50	0.600
	Are customers confident to order food at a fast food restaurant?	4.37	0.608
	Do customers feel safe making payment transactions at fast food restaurants?	4.35	0.661
	Are employees at fast food restaurants always polite to customers?	4.30	0.751
	Do employees follow the correct SOP as an employee at a fast food restaurant?	4.32	0.751
	Do fast food restaurant employees have good knowledge to answer customer inquiries?	4.32	0.662

Responsive	Can part-time workers in fast food restaurants help maintain the speed of service to customers?	4.52	0.625
	Can part-time workers in fast food restaurants help maintain the quality of service to customers?	4.40	0.614
	Are workers in fast food restaurants sensitive to customer needs?	4.34	0.741
	Will the workers at the fast food restaurant be able to meet the demands of the customers?	4.41	0.648
	Did the customer receive the food order within the specified time?	4.40	0.734
	Are customers satisfied with the service provided by the fast food restaurant?	4.40	0.621
Customer Satisfaction	Are customers satisfied with the problem-solving approach made by fast food restaurant employees?	4.50	0.697
	Is the time taken by employees very efficient in solving customer problems?	4.36	0.664
	Are employees quick to respond to customer problems?	4.36	0.691
	Do employees provide good customer service?	4.38	0.630

The results of the survey with 834 respondents' mean values and standard deviations for each variable are shown in Table 3. Question 1 and Question 5 had the highest mean scores for tangible, which was the first independent variable, with $M=4.49$ and $SD=0.719$ and 0.587 respectively. Given a score of ($M=4.32$, $SD=0.728$), question 2 had the lowest mark. According to the assurance

score for the second independent variable, question 1 had the greatest mean score ($M=4.50$, $SD = 0.600$), and question 4 had the lowest mean score ($M=4.30$, $SD = 0.751$). The item with the highest mean score for the third independent variable, responsiveness, was question 1, which had a mean score of ($M=4.52$, $SD=0.625$). Responsive received the lowest mean score for this ($M=4.34$, $SD=0.741$), nevertheless. Finally, the greatest mean score for the dependent variable for customer satisfaction question 1 was ($M=4.50$, $SD=0.697$) and the lowest mean scores were ($M=4.36$, $SD=0.691$) and ($M=4.36$, $SD=0.664$) for questions 2 and 3, respectively. In a fast food restaurant in Kota Bharu, Kelantan, the respondents who agreed on the dependent variable and dependent variable were the ones who influenced customer satisfaction.

Result of Reliability Analysis

The reliability analysis's findings are displayed in Table 4 below.

Table 4: Reliability Analysis

Variables	Cronbach's	Alpha	N of Items
Tangible	0.852		6
Assurance	0.861		6
Responsive	0.858		6
Customer Satisfaction	0.858		4

Results of the reliability analysis are shown in Table 4. An assurance score of 0.861, a responsive score of 0.858, and a customer happiness score of 0.858 for fast food restaurants follow Tangible, which has a Cronbach Alpha of 0.852. Because of this, the questionnaire is trustworthy and appropriate for use in research.

Result of Pearson Correlation Analysis

The results of the Pearson correlation analysis are shown in Table 5 below.

Table 5: Pearson Correlation Analysis

Hypothesis	p-Value	Result (Support/ Not Supported)
H1: There is a significant relationship between tangible service quality towards customer satisfaction in the fast food industry.	0.100	H1 is supported
H2: There is a significant relationship between assurance in service quality towards customer satisfaction in the fast food industry.	0.669	H2 is supported
H3: There is a significant relationship between responsiveness in service quality towards customer satisfaction in the fast food industry.	0.531	H3 is supported

Based on Table 5, it can be seen that Pearson's correlation analysis was used to assess the customer satisfaction hypothesis with the level of service quality in the fast food industry in Kota Bharu, Kelantan. All offered hypotheses were accepted at the 0.01 level of significance. Additionally, the conclusion demonstrated that tangible, assurance, and responsiveness, three independent factors, had a very strong and high positive association with customer satisfaction, supporting the entire hypothesis.

DISCUSSION & RECOMMENDATION

Discussion

This study's major goal is to identify and evaluate the connection between customer happiness and service quality in the fast-food sector. It has been discovered that customers are happy when they express a desire to frequent the fast food establishment again and a readiness to order food there frequently. According to the research, optimism is significantly correlated with existence, responsiveness, assurance, and customer happiness. Additionally, clients will be pleased if they believe that the meal they purchased was worth the money they paid for it. This is because they

frequently take price into account while making great-quality purchases. Therefore, service providers must ensure that they deliver excellent service quality to ensure that customers have a better experience, which can increase customer happiness. Customers at fast food restaurants in Kota Bharu receive a similar level of service, ensuring that those who have already eaten there won't recall anything different. In order to fulfill clients' requirements and desires, it is crucial for service providers to offer them high-quality services.

Research implication

The results of the study indicate that user happiness is most influenced by service quality. The study's consequence is that restaurant owners should be motivated to provide good service quality for the price of their menu items. This is due to the fact that this study's findings indicate that tangible, assured, and prompt service is the most important factor influencing customer happiness. In order for all customers to enjoy purchasing the goods, fast food businesses must uphold and provide good service to patrons. Furthermore, it could convince consumers that the item they are purchasing is worth their money. In order to compare products with those of other brands' competitors, consumers must consider excellent service.

Research Limitation

There are a few restrictions on how this analysis can be done. As a result of only being done in the Kota Bharu region, the study had some limitations. Due to the extensive scope of the research, the researchers must put in more effort and use their time more effectively in order to finish the project on schedule.

Then, limited access to journals and articles related to that topic. This is because some databases must pay to approach the articles that help with this research. Although, it was beyond the capabilities of a student. Moreover, there are only a few local articles linked to this subject published so this report needs to depend more on overseas articles.

Respondents who refused to answer the questionnaire. The researcher used a Web-based survey questionnaire. The researcher spread the google form link via. But not everyone cares to answer that question. Maybe because of a busy daily schedule or maybe there are people from multiple races who don't understand Malay. This has resulted in several respondents misunderstanding or misinterpreting the survey questionnaire.

Research Recommendations.

There are several research recommendations to improve this study for the benefit of future studies. First, future researchers are recommended to expand the study area where it is necessary to cover two places and maybe the researcher can make methods like face-to-face interviews that may allow respondents to be more involved and get a deeper insight from them for the study.

Moreover, future researchers need to learn technical skills to get free access to journals and articles. Future researchers must learn technical skills to gain free access such as attending seminars. Not only that, future researchers are suggested to provide language diversity in the questionnaire. The

survey instrument is available in Malaysian. In order to collect a more diverse sample, survey instruments may be designed in several languages such as English, Mandarin and Tamil. As Kelantan is a multi-racial country, a collection of responses from various ethnic groups will give more realistic results. This will help the respondents to understand all the questions carefully and provide more reliable results.

CONCLUSION

The fast food restaurant needs to look clean, is in a strategic location, serves high quality food and operates at the right time. In addition, fast and quick service, comfortable seating facilities, reliable delivery services and fast-food operators are performing well in providing new food for children. Although these attributes are seen positively, respondents still see other attributes such as price, friendliness, variety of menu and calorie/nutrition content as moderate qualities. The choice of a fast food restaurant is determined by the cleanliness of the restaurant and the menu items.

The findings of this study are discussed extensively in this chapter. Next, this chapter summarizes the tasks completed in this research by reporting the hypothesis test, answering the research questions and achieving the objectives of the research. Additionally, this chapter also outlines some limitations and recommendations. This study concludes with the contribution of the study and some recommendations for next research.

ABSTRACT

According to the trends and changes of modern life, the needing of fast food is one of our daily habits. Although it can be seen by young people, teenagers, the elderly and especially students, fast food is an easy option for them to find food. This study aims to examine the undergraduate student's behavior towards fast food restaurant in Universiti Malaysia Kelantan (City Campus). This study used quantitative research design approaches. Questionnaires administered to collect the required information where about 385 respondents of Universiti Malaysia Kelantan participated in this study. This study beneficial to the advent of changing lifestyles, the demand fast food products as it is enhancing day by day especially among the student fraternity and the trend is immensely increasing. The findings of this study shows that attitude have significant supports ($R = <0.762$). Meanwhile the result for the second hypothesis which is a subjective norm supports ($R = <0.672$). The last hypothesis is a perceived behavioral control that supports ($R = <0.724$). These indicated that Universiti Malaysia Kelantan students are prone to fast food of compared to other types of food.

Keywords: Fast Food, Attitude, Subjective Norm, Perceived Behavioral Control

INTRODUCTION

Indeed, fast - food is remarkably close to them, and it has become a habit when they have no choice but to eat fast food (Syafiqah et al., 2018). Even though the students are aware that eating fast food in excess might be dangerous, fast food marketing strategies that have been quickly picked up by the media have been effective in distracting them with eye-catching advertisements and tempting deals (Brindal et al., 2011). This is also evident when the fast food has its own draw, such as visually appealing, intriguing food like MCD, which is credited with giving it variety.

Fast food has also defined mainly food from fast food chains from all over the country for examples McDonald's, Domino's Pizza, Subway, Pizza Hut, Kentucky Fried Chicken and Texas Chicken and all these fast foods can be eaten there or taken away (Janssen et al., 2018). However, takeout certainly includes many definitions and comes from many sources, including vending machines, convenience stores, fast food stores, takeaways, coffee shops, schools., etc. The concept of fast food is often used to describe food that is prepared quickly and at a reasonable price. It is also commonly referred to as an alternative to home cooked meals. In restaurants, fast food is often offered in a package that makes it easy to take home (Hamrick & Okrent, 2016). Today's fast food is a choice, especially for college students. In fact, fast food is the kind of food that you can easily buy and carry anywhere because you do not have to think about anything other than cooking it at home. Eating out such as fast food, tends to be less healthy because it has more energy and fewer nutrients than cooking at home. This is evidenced by the fact that it often contains ingredients such as fat, salt, and sugar and from these ingredients are associated with weight gain and various adverse health effects that can affect an individual's health.

Hence, the focus of this study is to find out the student's behavior towards fast food restaurant at Universiti Malaysia Kelantan (City Campus). There are three objectives of this study:

2. To identify the relationship between the attitude and student's behavior towards fast food restaurant.
3. To determine the relationship between the subjective norms and student's behavior towards fast food restaurant.
4. To identify the relationship between the perceived behavioral control and student's behavior towards fast food restaurant.

SIGNIFICANCE OF THE STUDY

This research's objective is to inquire into the ways in which variables affecting student attitudes toward fast food businesses would affect respondents' perceptions. This is particularly corroborated by Benajiba (2016), who claimed that it was obvious that adults consume a lot of fast food, particularly college students. There is evidence that the same eating behavior exists in other nations.

LITERATURE REVIEW

Attitude

According to researchers (Ajzen, I., 1975), the nature of the relationship between beliefs and attitudes is specified by the theory of planned behaviour. Ajzen explains that an individual's evaluation or attitude toward a behaviour is determined by his or her accessible beliefs about the behaviour. In this theory, belief refers to the subjective that a given behaviour will result in a specific outcome. In particular, the evaluation of each outcome contributes to the attitude in proportion to the person's subjective probability that the behaviour produces the desired outcome.

The expectancy-value model gave rise to the concept of outcome expectancy. A belief, attitude, opinion, or expectation can all be categorised as outcome expectancy. (Fishbein, M., 1975) According to the theory of planned behaviour, a positive evaluation of one's own performance of a specific behaviour is analogous to the concept of perceived benefits. A positive evaluation is a belief in the effectiveness of the proposed behaviour in lowering the risk of negative outcomes. A negative self-evaluation, on the other hand, refers to a belief about the negative consequences of engaging in the behaviour. (Ajzen, I.,1975).

Subjective Norms

Subjective norms on customer intention are defined as the influence of outside factors and refers to significant individuals or groups that indicate the chance that carrying out a behavior will be accepted or rejected (Ajzen, 1991). According to Taylor (1999), when an individual's activities have an impact on another person's benefit, a subjective standard is an effective translator of behavior. On the other hand, when only one person is involved in the selection

process, the issue of subjective norms is irrelevant, according to Lapinski, Rimal, DeVries, and Lee (2007).

In addition, with the help of subjective norm and complying motivation, subjective norm is established. Normative belief was investigated by asking students three questions regarding how they perceived their parents', teachers', and friends' attitudes on eating fast food. By posing the students with three questions about how they perceived about their parents', teachers', and friends' perspectives on eating fast food, normative belief was examined. By asking the students how much they respected and concurred with the views of persons who were significant to them, the motivation to comply was examined. Since the beliefs of children's friends regularly differed from those of their parents and teachers, the internal reliability for the subjective norm was not as high as it could have been.

Additionally, in previous research on the planning and behavior of food purchases, the subjective norm influencing by behavior was not obvious. This is because, using customer motivation, subjective norms carry out a behavior to construct the initial moments of crucial individuals like family, friend, and significant others. Customers are driven to behave in a way that complies with the subjective standard to recreate the first moments of an important individual.

Perceived Behavioral Control

First and foremost, it was observed that perceived behavioral control over fast food consumption was significantly adversely linked with consumption intention and frequency. The inclusion of self-efficacy, characterized as confidence in one's ability to frequently consume functional foods, turned out to be the most important determining factor for intention (Nystrand and Olsen, 2020).

The accessibility of appropriate resources and the ability to handle behavioral challenges have an impact on behavioral performance. An individual seems to have more control over their actions and a stronger intention to carry them out the more resources they perceive and the fewer impediments they face. People who may have the intention to change and maintain certain health behaviors, but whose everyday environment may not encourage those behaviors by eating fast food frequently (Shantanam & MUELLER, 2018). Fast food's accessibility and price in community settings, as well as its convenience, have been identified as obstacles to regular, daily healthy eating.

Perceived behavioral control includes the ability to try new foods without worrying about leftovers, the ability to gradually introduce healthy foods into the family diet, and the ability to learn to use cooking utensils (Nystrand and Olsen, 2020). Food waste and food costs are major issues that adversely affect control of an individual's perception of healthy home cooking. Thus, for this reason will find it easier and more convenient to buy fast food, even if it costs money.

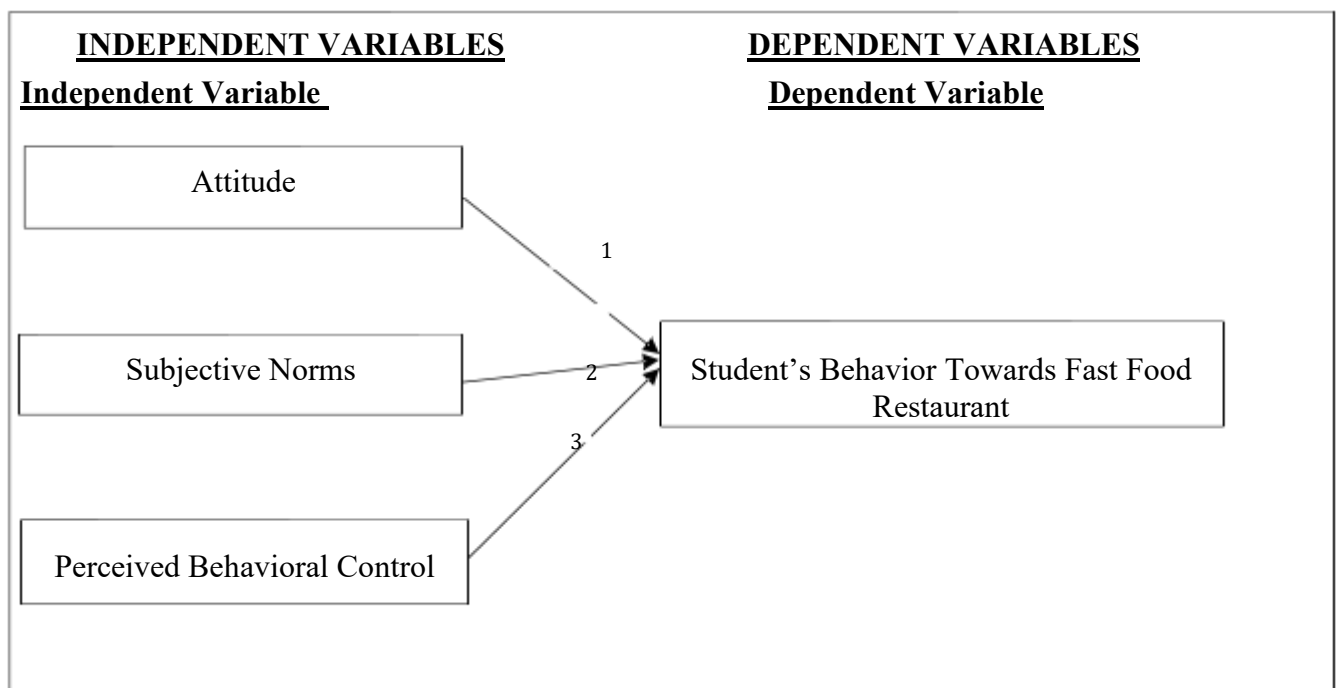

Research Hypothesis

The literature analysis showed that student's behavior towards fast food restaurant at Universiti Malaysia Kelantan (City Campus) include attitude, subjective norms, and perceived behavioral control. As a result, the study intended to look at the relative importance of these variables. This study's hypothesis outlined as follows:

4. There is significance relationship between the attitude and behavior towards fast food restaurant.
5. There is a significance relationship between the subjective norms and behavior towards fast food restaurant.
6. There is a significance relationship between the perceived behavioral control and behavior towards fast food restaurant.

Research Framework

The Figure 1 below shows the research framework use for this study.

METHODOLOGY

Research Design

The focus of Inaam Akhtar's covert investigation is problem distribution control, and data are measured and analysed using quantitative methods. Based on Oberiri Destiny Apuke's (2017) description of this method is appropriate for analysing issues and identifying phenomena. To precisely measure and analyse target concepts, clear up ambiguities, and spot business opportunities, quantitative research especially statistics is used. The difficulties that businesses face in the digital age can be particularly effectively addressed with this strategy.

This descriptive research at Universiti Malaysia Kelantan focuses on the relationship between attitude, subjective norms, and perceived behavioural control towards fast food in restaurants. Data will be collected through self-directed questionnaires and quantitative methods, aiming to understand students' attitudes and behaviours in this context.

Data Collection

Data collection is the process of gathering, measuring, and analysing precise insights for research purposes using standardised validated techniques, according to (Bhat, A, 2022). The data gathered can be used by the researcher to assess their hypothesis. The gathering of data is typically the first and most important step, regardless of the field of study. Depending on the information required, different fields of study employ different approaches to data collection.

The study used a quantitative method of data collection, gathering secondary data through surveys and questionnaires. Comparing this approach to qualitative data, it is thought to be more impartial and trustworthy. The questionnaires, which are broken up into five sections, are easier for respondents to complete because they are available in both English and Malay. The data collected using this method will be analysed and compared by the researchers to ensure a thorough understanding of the research topic.

Sampling

Fleetwood (2018) emphasises the value of the sampling method, which involves gathering people at their convenience, in market action research. There are two types of sampling: non-probability sampling, which randomly selects participants without a predetermined selection procedure, and probability sampling, which chooses participants from a population at random using a set of criteria. The distribution of study participants can be understood using either type of sampling technique.

According to Pelz (2022), sampling is a statistical procedure that entails choosing a subset of a population in order to draw observations and conclusions. A given population's behavioural trends are to be inferred using this process. It is impossible to study the entire population, though, due to practical and financial constraints. In order to observe and analyse the target group, a representative sample of that group must be chosen. To achieve a reliable and valid sample for this study, researchers used the equation from Krejcie & Morgan (1970) to determine the sample size. Based on the table of Krejcie & Morgan (1970) the appropriate sample size for this research is 384 respondents. The study population comprises students at UMK City Campus, University of Kelantan, Malaysia, including FPV, FHPK, and FKP. The campus has 6,237 students, with FKP having 3,495, FHPK 2,518, and FPV having 224.

Data Analysis

Zikmund (2003) analyzed statistical data using SPSS software version 20.0, focusing on detailed surveys. The study employed descriptive statistics and reliability tests, utilizing various steps to condense and restructure the data into relevant details.

Aaker, Kumar, and Day (2007) conducted descriptive analysis, identifying key characteristics of respondents' data. Frequency distribution, measures of central tendency, dispersion, and shape were discussed, as well as data transformations like skewness. Frequencies were derived from nominal factors like gender, education level, and fast food restaurant visits. Zikmund (2003) used nominal or ordinal scales for measurement. Malhotra et al. (2006) generated tables of frequency counts, percentages, and cumulative percentages for all values associated with the variable.

FINDINGS

Results of Frequency Analysis.

Table 1 shows the data for gender of respondents. From the total of 385 respondents, 142 respondents were male with the total percentage of 36.9 percent. For female respondents, there were 243 with the total percentage of 63.1 percent. From the 385 respondents have been collected, respondents who consists of 18 - 20 years old were 22 (5.7%) respondents followed by 21 - 23 years old were 279 respondents (72.5%), 24 - 26 years old were 73 respondents (19%), 27 - 29 years old were 11 respondents (2.9%) and other were no one. From the data, the highest age group who have been contributing to the research are from 21 - 23 years old were 279 respondents (72.5%) and the lowest age group are others.

Out of 363 respondents who are married status were 22 respondents with 5.7 % value. From 385 respondents have been collected, respondents who consist of Malay were 269 respondents followed by Indian and Chinese who have same total of respondents which is 51 (13.2%) respondents and other were 14 (3.6%) respondents. From the data, the highest race who have contributed to the research are Malay 269 (69.9%) respondents and the lowest race are other 14 respondents (3.6%) in Universiti Malaysia Kelantan (City Campus).

From the table ,272 respondents were Islam with a total percentage of 70.6 %. Next is Hindu were 51 respondents with a total percentage 13.2%, buddha were 30 respondents with a total a percentage of 7.8% and lastly where others were 32 respondents with a total percentage 8.3%, Through the data, the higher number of participants to answer the survey were from Islam 70.6 % and the lowest number of participants were from buddha 7.8%.

From the data it shows the various faculty that we have. Among these four faculties, the highest number of respondents were from the Faculty of Hospitality, Tourism and Wellness (180 respondents) with the number of percentages 46.8%. The second highest number of respondents were from the Faculty of Entrepreneurship and Business (113 respondents) with the number of percentages 29.4%. Followed by the Faculty of Data and Computer Science (48 respondents) with the number of percentages 12.5% and the lowest number of respondents were from the Faculty of Veterinary Medicine (44 respondents) with the number of percentages 11.4%.

From the data above, 234 respondents (60.8%) out of 385 respondents were from Year 3. This is because most respondents of this study were from Year 3, and they have many contacts and time to answer this survey. Hence, the respondents of years of study from Year 1 are not less high than others which is 55 respondents (14.3%), followed by Year 2 showing the number of respondents were 51 respondents (13.2%) and Year 4 showing the number of respondents were 41 respondents (10.6%). The lowest number of respondents for years of study from Year 5 were 4 respondents (1%).

The number of percentages 32.5% were from the East Region (Kelantan, Terengganu, and Pahang). The second highest respondents were from the West Region (Melaka, Perak, Selangor, and Wilayah Persekutuan) 115 respondents with the number of percentages 29.9% followed by the North Region (Perak, Kedah and Pulau Pinang) 64 respondents with the number of percentages 16.6%. Next, the state of origin from the South Region (Negeri Sembilan and Johor) were 56 respondents with the number of percentages 14.5% and the number of respondents from Borneo were 24 respondents at 6.2% while the lowest number of respondents were from overseas 1 respondent 0.3%.

Table 1 : Frequency Analysis

No	Socio -Demographic Characteristic	Frequency (n)	Percentage (%)
1.	Gender	385	100

	Male	142	36.9
	Female	243	63.1
2.	Age Group	385	100
	18-20 years old	22	5.7
	21-23 years old	279	72.5
	24-26 years old	73	19
	27-29 years old	11	2.9
3.	Marital Status	385	100
	Single	363	94.3
	Married	22	5.7
4.	Race	385	100
	Malay	269	69.9
	Indian	51	51
	Chinese	51	51
	Others	14	3.6
5.	Religion	385	100
	Islam	272	70.6
	Hindu	51	13.2
	Buddha	30	7.8
	Others	32	8.3
6.	Faculty	385	100
	Faculty of Hospitality, Tourism and Wellness.	180	46.8
	Faculty of Entrepreneurship and Business.	113	29.4
	Faculty of Veterinary Medicine	44	11.4
	Faculty of Data and Science Computer	48	12.5
7.	Years of study	385	100
	Year 1	55	14.2
	Year 2	51	13.2
	Year 3	234	60.8
	Year 4	41	10.6
	Year 5	4	1
8.	State of origin	385	100
	East Region (Kelantan, Terengganu & Pahang)	125	32.5
	West Region (Melaka, Perak, Selangor & Wilayah Persekutuan)	115	29.9 & 56
	South Region (Negeri Sembilan & Johor)	14.5	
	North Region (Perlis, Kedah & Pulau Pinang)	64	16.6
	Borneo (Sabah & Sarawak)	24	6.2
	Overseas	1	0.3

Results of Descriptive Analysis.

Table 2 : Descriptive Analysis.

No	Variables	Mean Score	Standard Deviation
1.	Attitude		
	I think fast food is very tasty.	4.23	0.858
	I think fast food is safe to eat.	3.62	0.958
	I think fast food has a lot of calories.	4.29	0.932
	I think fast food restaurant have a fast service.	4.19	0.850
	I think fast food restaurant are easily accessible near me.	4.29	0.819
	I think that fast food restaurant provided fun environment.	4.16	0.885
2.	Subjective Norms		
	If I were an easy-going person, I will be more easily convinced to eat fast food.	3.72	1.199
	I would visit fast food restaurants if I helped me fit in with my social group.	3.75	1.011
	I will follow those close to me to eat fast food regularly.	3.73	1.109
	I am interested in the menu promotions that are often posted on social media.	4.15	0.926
3.	Perceived Behavioral Control		
	I can take the decision independently to buy fast food.	4.26	0.854
	I have the financial capability to buy fast food.	3.99	0.829
	I have time to shopping to buy fast food.	4.04	0.884
	I have complete information and awareness regarding where to buy fast food.	4.14	0.864
	Fast food is readily available in the location where I reside.	4.28	0.779
4.	Behavior Toward Fast Food Restaurant		
	I think fast food saves a lot of time in meal preparation.	4.31	0.787
	I prefer going to fast food restaurant due to their proximity.	3.86	0.918
	I prefer choose fast food restaurant because it is open until late at night.	4.06	0.932
	I think fast food is preferred because of its very quick preparation.	4.17	0.898
	Fast food restaurants are very practical.	4.04	0.801

Results of Reliability Test.

Table 3: Reliability Test.

Variable association	Number of item	Cronbach alpha	Strength of Coefficient
Attitude	6	0.862	Very good
Subjective norm	4	0.810	Very good
Perceived behavioral control	5	0.887	Very good
Behavior toward Fast food Restaurants	5	0.884	Very good

Results of Pearson Correlation Analysis.

Table 4 shows the result of the correlation among independent variables and dependent variables by using Pearson’s correlation coefficient. the attitude and behavior toward fast food restaurants has a high association correlation, $r = 0.762$.

Table 4: Result of Pearson Correlation Analysis.

Attitude	Subjective Norm	Perceived Behavioral Control	Student Behavior Toward Fast
----------	-----------------	------------------------------	------------------------------

				Restaurant
Attitude	1	0.651	0.754	0.762
		1	0.679	0.672
Subjective norm	0.651			
Perceived		0.679	1	0.724
Behavioral	0.754			
Control				
Student Behavior		0.672	0.724	1
Toward fast food	0.762			
Restaurant				

Results of Hypothesis Testing.

Table 5 shows the hypothesis testing based on regression analysis. Between all hypothesis above, the attitude of the component states the highest at $r = 0.762$, $p = < 0.01$. Then, it is followed by perceived behavioral control at $r = 0.724$, $p = < 0.01$ and the subjective norm is the moderate in strength of association which is $r = 0.672$, $p = < 0.01$ that is related to student behavior toward fast food restaurants. As a result, at a 0.01 significance level, all hypothesis states were accepted.

Table 5: Hypothesis Testing.

Hypothesis	Pearson correlation result
------------	----------------------------

H1	There is significance relationship between the attitude and behavior towards fast food restaurant.	$r = 0.762, p = < 0.01$	Supported
H2	There is a significance relationship between the subjective norms and behavior towards fast food restaurant.	$r = 0.672, p = < 0.01$	Supported
H3	There is a significance relationship between the perceived behavioral control and behavior towards fast food restaurants.	$r = 0.724, p = < 0.01$	Supported

DISCUSSION AND RECOMMENDATION

In this section, the researcher will present some recommendations aimed at improving future research. These suggestions are intended to enhance the quality of research outcomes and assist students in the recruitment process for fast food restaurants.

In the current study, the researcher focused on three variables: attitude, subjective norms, and perceived behavioral control (independent variable), and behavior towards fast food restaurants (dependent variable). The findings revealed a moderate positive correlation between the independent and dependent variables. To advance the field, future researchers could explore the inclusion of different independent variables to generate new findings. Additionally, the study did not extensively address the design of fast food restaurant websites, which are available through various platforms such as GrabFood and Food Panda. Future research could investigate if respondents prefer booking directly from the official website, potentially yielding new insights.

For future studies, it is recommended that researchers continue using quantitative methods for data collection instead of qualitative approaches. However, the researcher suggests distributing face-to-face questionnaires to respondents. This is because the current study employed social media for questionnaire distribution, leading to biases in the results. Conducting face-to-face surveys would allow researchers to gather additional information from selected respondents and address any confusion or the use of jargon.

Lastly, the study's respondents were chosen based on their selection of a fast food restaurant. It is suggested that future studies consider including guests who have visited the restaurant and made reservations to purchase fast food. This would ensure that respondents have firsthand experience and can provide more detailed assessments. By selecting an appropriate sample of respondents, the study's results would be more accurate.

CONCLUSION

To conclusion this chapter, all the variables examined in relation to fast food restaurants showed a significant relationship. This indicates that these variables play a role in influencing students' consumption of fast food. Through descriptive analysis, reliability testing, and correlation analysis, the variables demonstrated values above 0.7, which is considered acceptable for this study. Despite the limitation of conducting the study online, it did not hinder the acquisition of data. Lastly, the suggestions provided in this chapter will be beneficial for future studies in this field.

ABSTRACT

This study aims to examine the acceptance of street food among university students at Universiti Malaysia Kelantan. Thus, the researcher wants to know the relationship between food price, attraction, and service quality with the acceptance of street food among university students in UMK City Campus. This study uses quantitative approaches. The questionnaire was administered to capture the necessary data. The evaluation has been completed on 370 total responses. The finding of this research showed that the whole hypothesis is accepted. Food price and quality of service got more responses and feedback. The two independent variables are positively associated with the acceptance of street food among university students in UMK City Campus. On the other hand, the attraction exhibited a weak link with the acceptance of street food among university students in UMK City Campus.

Keywords: hawker, price, attraction, service quality, food truck

INTRODUCTION OF THE STUDY

Research is essential for success in many professions, with action planning, gathering data to support theories, and advancing knowledge. This article explores university students' attitudes toward eating fast food.

Street food consumption habits have changed due to sociocultural changes, so states in Malaysia should brand their cities and market their street food to preserve their reputation and improve their tourism business. Street food acceptance towards university students plays a significant role.

People prefer street foods because of their variety, affordability, and accessibility in many nations. Therefore, eating these meals is widespread around the world. Numerous studies have been conducted on whether eating street food is associated with an increased risk of contracting a disease. This is primarily due to the lack of understanding that street food vendors have regarding sanitation and food safety, as well as the high quantities of infectious germs that have been detected in street food samples. This research has highlighted the significance of the issue.

Today, food-borne illnesses infect millions of people, resulting in thousands of fatalities worldwide (Pilling et al., 2016). One of the elements that contribute to the spread of diseases that are brought on by food sources is the lack of awareness about food safety among those who sell food on the street. Additionally, deficiencies were discovered in numerous studies conducted in some nations regarding the use of hygiene and sanitation, food preparation,

adherence to food safety regulations, and street food vendor knowledge. A lack of sanitation, challenges in obtaining clean drinking water, the inability to remove waste, and other environmental issues, and the fact that street food is not subject to legislation all contribute to increased risks associated with preserving the integrity of food safety standards.

In addition, food tourism is a growing category in the tourist industry, with local cuisine boosting the local tourism industry and customer loyalty. However, street food has become a concern due to the growth in food-borne illnesses in developing nations, with 691 incidents of food poisoning and 49 fatalities in Malaysia.

The four aspects of food quality essential to eating are food safety, nutrition, value, and packaging. Food quality is a critical component in the eating process. Customer expectations, product or service quality, and overall cost all play a role in overall satisfaction, which is determined by customer expectations. Customer satisfaction and acceptance are also key elements. Since it satisfies the requirements of the urban population, street food is an essential component of the food supply chain. Urbanization has increased the number of street food vendors, but the recession and high inflation rates have increased food insecurity.

Street food benefits hawkers and locals economically, but it is still a health risk if not prepared hygienically. The World Health Organization (WHO) proposes using the critical hazard control approach (HACCP) as the most practical and adaptable way to increase street food quality. Penang's street food is well-known among locals and visitors, but the location of the businesses raises concerns about its hygiene and safety. If vendors don't take safety precautions, they endanger the health and safety of the public.

There are three objectives of this study:

- i. To determine the relationship between food price and the acceptance of street food among UMK students.
- ii. To identify the relationship between attraction and the acceptance of street food among UMK students.
- iii. To determine the relationship between service quality and street food acceptance among UMK students.

SIGNIFICANCE OF THE STUDY

The outcomes of this survey will assist vendors in determining the level of demand for street food among UMK students while also providing additional helpful information to others interested in the topic. Street food offers affordable, quickly accessible food to urban residents, so it is important to research it.

1. Business operator/restaurant

Perhaps this study can assist them in determining how university students and the general public interpret street food. Therefore, business/restaurant operators can use this study as a reference in their respective businesses to increase sales and attract customers.

2. Economy

In addition to providing work for themselves, street vendors often generate jobs for others, such as porters, security personnel, transporters, and storage companies. Licensing and permit fees, fines and penalties, and taxes are common ways cities make money.

LITERATURE REVIEW

INTRODUCTION

A literature review is a piece of academic writing that contextualizes and evaluates the academic literature on a given subject, including university students' acceptance of street food.

ACCEPTANCE OF STREET FOOD

DEFINITION ACCEPTANCE OF STREET FOOD

Street food is a popular tourist attraction in developing nations due to its affordability, convenience, and accessibility. It is typically served in vans or kiosks and is popular with the middle and lower middle classes (R. A. (2014).

Street food is a popular option among university students due to its convenience and cost-friendliness. It is often provided in convenient takeaway packages for less money, and many nations promote it in various ways.

Street food is popular in Malaysia due to its affordability and convenience, making it a popular choice for middle-class consumers. It is prepared in front of the customer, allowing them to change spices and save time (Grover, N., 2012).

FOOD PRICE

Low-income consumers are more aware of the price and worth than higher-income consumers, and street food sales among university students are cheaper and more convenient due to time savings and convenient location.

Street food sellers need to find strategic sites that are easily accessible and affordable to attract low-income consumers in developing nations. Creativity in interacting with customers can help retain customers.

ATTRACTION

Street food attracts university students due to its cultural norms, environmental protection, traditional landscapes, and economic activity.

1. Cheap and inexpensive

Price is essential in determining a consumer's intention to purchase, and street food is widely accepted due to its cost-effectiveness.

2. Represents the local cuisine

Street food is a universal language that brings people of different cultures together through the mouth, deepening their connection and spreading the message that there is nothing wrong with being different. Street food is a great way to experience the

uniqueness of the cuisine of the country where you are studying, such as Nasi Kerabu and Budu.

3. Street food has a variety of foods to choose from
Street food is famous for university students due to its variety, peace of mind, and affordability. It offers authentic food and is prepared quickly, saving time and money.

QUALITY OF SERVICE

Street food owners must use marketing skills to become more competitive and ensure the success of their business. They must also provide the best customer service, as university students buy food on the street faster than at restaurants.

Street food is widely used and can be replicated without sacrificing additional benefits. It has valuable specialties to customers, a tacit understanding of products and creative cooking techniques, uniqueness, diversity, high-quality food, and good service that make it sustainable. It is also related to the relationship factor based on mutual benefit for both parties.

Relationship between food price, attraction and service quality and acceptance of street food among university students

Price is a key factor in determining customer happiness and satisfaction with dining hall services, as well as when choosing where to eat, as it can attract customers. Price has a significant influence on purchasing interest, with university students wanting food and beverages at affordable prices. Respondents compare prices of street foods before purchasing, believing that current prices are reasonable and lower-cost foods may have poorer nutritional value.

The relationship between attraction and the acceptance of street food among university students will benefit society by establishing a local culinary culture, creating employment, and boosting tourism. Street food is prepared food and beverages served by merchants on the street, which is convenient, delicious, and inexpensive. Street food is considered a meal replacement and an attractive component of night markets in Asian countries. Students' satisfaction is measured by evaluating their educational experiences in relation to available services and facilities.

The association between hawkers' focus on treating customers properly, answering their queries, and going above and beyond expectations and acceptability of street food among university students. Alexander (2006) asserts that providing services necessitates direct interaction with customer service representatives and, when done correctly, starts to develop relationships based on trust. Informing friends, family, and co-workers about a business increases consumer satisfaction.

Research Hypothesis

H1: There is a relationship between price and the acceptance of street food among university students.

H2: There is a relationship between attraction and the acceptance of street food among university students.

H3: There is a relationship between service quality and street food acceptance among university students.

Research Framework

Figure 1 shows the conceptual framework for this research. The three acceptance that makes up the independent variable that will be proposed are food price, attraction, and quality of service. The dependent variable is the acceptance of street food.

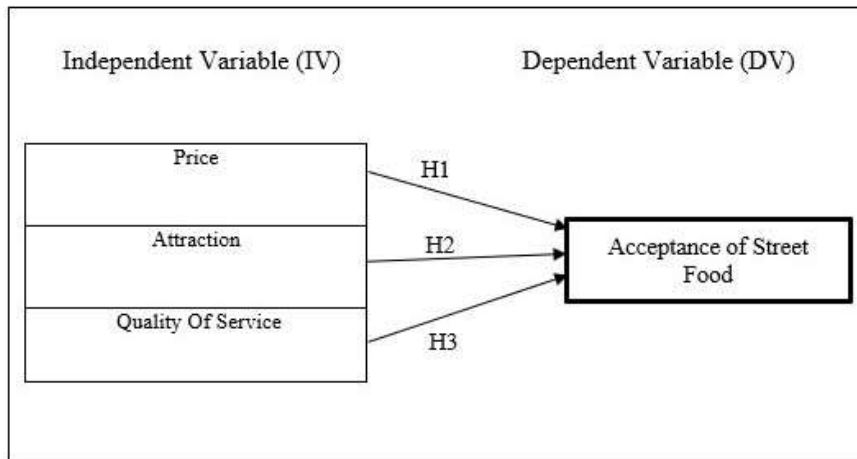

Figure 1: Conceptual Framework of the relationship between food price, service quality attraction

METHODOLOGY

Research Design

The research design is the framework that governs a researcher's approaches and actions in conducting a study. A descriptive study of students at the University of Malaysia Kelantan uses quantitative methodologies to solve research questions that require an explanation of patterns or the link between pricing, attraction, and quality of service. This design contributes to answering research questions and achieving research objectives.

Population and sample size

The total number of students at City Campus is almost 10,971 students. Researchers choose university students at UMK City Campus as population researchers. This might necessitate choosing s , a sample size of only 370 students at UMK, City Campus according to the sample size from a given population (Krejcie & Morgan, 1970). The population size, or n , in this scenario is 10 000.

190	127	950	274	50000	381
200	132	1000	278	75000	382
210	136	1100	285	100000	384

Note.— N is population size.
 S is sample size.

Table 1: Sample size Krejcie & Morgan, 1970

The population of this study is the number of university students at Universiti Malaysia Kelantan, City Campus, who embrace street food. The total of students at City Campus is almost 10,971 students. Researchers choose university students at UMK City Campus as population researchers because street food makes it more attractive for their categories to hang out with their friends or close friends on weekends. A sample is a representative selection of a population. It is a smaller community with characteristics drawn from the population. Assumptions and observations made in relation to the sample data result are reflected in the population. The population sample size is 370 questionnaire responses from respondents. We must focus on a subset of that wider population because they would randomly accept it. This

might necessitate choosing a sample size of only 370 students at UMK, City Campus according to the sample size from a given population (Krejcie & Morgan, 1970). The population size, or n , in this scenario is 10,000.

Data Collection

The method of data collecting utilized in the first step of this investigation was online surveys carried out with Google Forms. The researcher chose this collection of technological tools since it could be accessed without cost and was simple to operate. Additionally, it makes it simpler for the researcher to obtain data from students at the UMK City Campus. The questionnaire was likewise used as the primary data-gathering instrument in this study. A questionnaire is a tool used in research that consists of a series of questions to gather information from respondents through a survey. The respondents must respond to all three parts of this section. In order to obtain data from university students at the UMK City Campus, the questionnaire was made available to the general public.

The website's Google Form will contain the content of the research purpose for the respondents. There are four parts to the section that respondents need to tick for their answer, and the answer is the data that we collect for the research. The questionnaire is delivered to a number of university students in Malaysia about street food.

Sampling

Sampling is a statistical approach in which researchers select a random sample of observations from a larger population. The sampling or selection of the sample used for the study is aimed to ensure that the sample is sufficiently representative to identify its characteristics and analyze the data (Shiksha, 2020). Sampling aims to acquire information from a smaller group that represents the overall population. Two significant categories of sampling methods can use, which are probability sampling and non-probability sampling. But in this study, the researchers chose cluster sampling-based probability sampling approaches. UMK students were the target population for the samples.

Using probability sampling techniques, all potential sample subjects in the target population have an equal chance of being chosen (Wretman, 2010; Moorley, 2014). This investigation selected a probability sampling strategy, such as cluster sampling, as the sample design. Form the clusters – a crucial step in ensuring the study's validity due to the meticulous analysis that ensures the elements represent the entire population in each and across the groups (Thomas, 2020).

Data Analysis

The researcher gathered information from target respondents and analyzed it with the Statistical Package for Social Science (SPSS). SPSS is a data processing and analysis program that allows you to make tables and pie charts. The data analysis includes descriptive statistics, reliability tests, and Pearson correlations. All data analysis methods are discussed in the following subsection.

Descriptive statistics are used to explain the most important aspects of study data. The sample and measurements provided contain simple summaries and measures. They form the

basis for almost all quantitative data analysis and simple graphical analysis. In addition, descriptive data is used to convey information so that the research data generated can be used by others who need it. Test reliability is examined in terms of the items' general, group, and specific aspects, as well as the consistency scores in these factors, which vary from trial to trial. The degree of accuracy and reliability, or the consistency with which a test assesses a characteristic, is referred to as reliability. Moreover, according to (David Nettleton, 2014), the Pearson correlation method is the most popular technique for using numerical variables. It assigns a value between -1 and 1 , where 0 is no correlation, 1 is positive, and -1 is negative.

Pearson's correlation coefficient can be used to put to statistical test hypotheses because it is an inferential statistic. The test can also be used to determine whether or not there is a significant relationship between the two variables, which the researcher can determine.

FINDINGS

Result of Frequency Analysis

Table 2: Demographic Profile of Sample

Characteristics		Frequency	%
Gender	Male	78	21.08
	Female	292	78.92
Age	18 - 20	20	5.41
	21 - 23	283	76.49
	24 - 26	60	16.22
	27 and above	7	1.89
Race	Malay	325	87.84
	Chinese	18	4.86
	Indian	10	2.70
	Other	17	4.59
Marital Status	Single	362	97.84
	Married	8	2.16
Educational Level	Diploma	9	2.43
	Bachelor of Degree	344	92.97
	Master Degree	16	4.32
	Phd	1	0.27
Faculty	FKP	106	28.65
	FHPK	257	69.46
	FPV	7	1.89
Programme	SAB	35	9.46
	SAL	19	5.14
	SAR	25	6.76
	SAK	21	5.68
	SAE	6	1.62
	SAS	54	14.60
	SAP	69	18.65
	SAH	132	35.68
	SDV	9	2.43
Year of Study	Year 1	8	2.16
	Year 2	59	15.95
	Year 3	272	73.51
	Year 4	30	8.11

The age range of 21 to 23 years old had the most significant percentage of respondents, followed by the age range of 24 to 26 years old (16.22%), 18 to 20 years old (5.41%), and 27 years and older (1.89%). There were 370 respondents, with Malay people making up the majority (87.84%), followed by Chinese (4.86%), other races (4.59%), and Indians (2.70%). The most significant percentage of respondents with a Bachelor's degree was 92.97 percent, followed by 4.32 percent with a Master's degree and 0.27 percent with a PhD.

In addition, the Faculty of Hospitality, Tourism, and Wellness (FHPK) had the highest response rate (69.46%) with 257 respondents, followed by the Faculty of Entrepreneurship and Business (FKP) with 28.65 percent (106 respondents) and the Faculty of Veterinary Medicine with 1.89 percent (7 respondents). The Hospitality course had the highest percentage of respondents, followed by Islamic Banking and Finance, Logistics and Distribution, Retailing, Commercial, Wellness, Tourism, Veterinary, and Entrepreneurship. Overall, students in Year 3 had the most respondents.

Result of Descriptive Analysis

Within the scope of this study, the mean and standard deviation were computed for the questionnaire sections B and C.

Tables 3: Descriptive Statistics

Variable	Items	Mean Score	Std. Deviation
Food Price	Buying street food is much cheaper than buying food at a restaurant/café	4.42	.766
	Street food prices are more reasonable	4.31	.815
	The price of street food is according to the student's income	4.33	.782
	Students can save money if they purchasing for street food and drinks	4.23	.887
	I'm willing to pay for street food and drink	4.29	.769
	With the price that is said to be reasonable, I am satisfied with the street food and drink	4.30	.720
Attraction	Street food is an attraction for me and my friends on weekends	3.81	1.110
	There are many types of food at street food	4.28	.897
	I'm going to tell my friend if I found a viral food place	4.24	.936
	I'm going to eat at a viral place	4.01	.979
	The variety of food is the main reason I buy the street food	4.26	.904
	I spend a lot of time at street food	3.77	1.160
	The street food service is very quick	4.10	.962

Quality of Service	The time it takes for the street food hawkers to prepare your food is quick	4.07	.924
	You don't have to rush to line up	3.52	1.085
	Quick food preparation makes you interested in buying street food	4.09	.905
	The street food hawkers give good service	3.98	.933
	Street food hawkers always take care of their quality service	3.77	1.022
	The hawkers behave by being kind, friendly, and fast in the service	3.95	.931
Acceptance of Street Food	I am satisfied buying food from the street hawkers	4.01	.865
	I am willing to buy this food again because of the taste of the food	4.13	.807
	Street food is cheaper than restaurant food	4.26	.822
	You can experience new and different foods in one place	4.24	.770
	I recommend street food to other people	4.18	.848

Food price was used as the independent variable in a mean and standard deviation analysis. At a mean of 4.42, most respondents agreed that buying meals from street food is significantly less expensive than eating out at a restaurant or cafe.

The analysis of the mean and standard deviation of the respondents' highest independent variable of attraction yielded a mean score of 4.25, indicating that students find street food appealing due to the variety of food available.

According to the analysis of respondents' means and standard deviations for the independent variable of quality of service, item 3 had the highest mean value of 4.09, suggesting that students' interest in purchasing street food is related to the quickness of its preparation.

The dependent variable is the mean and standard deviation analysis of respondents' acceptance of street food among university students at the UMK City Campus. Item 3 has the highest mean score, 4.26, indicating that respondents prefer street food because it is the cheapest and most affordable compared to restaurants and cafés.

Result of Reliability Test

The purpose of a reliability system is to evaluate the overall stability and performance of a system over a specific time period and under various testing conditions. The result is being circulated to 370 students of UMK City Campus.

Table 4: Results of the Reliability Test

Variable	Number of items	Cronbach's Alpha coefficient	Strength of Association
Food Price	6	.920	Excellent
Attraction	7	.915	Excellent
Quality of Service	6	.922	Excellent
Acceptance of street food among university students	5	.918	Excellent

Cronbach's Alpha Coefficient values for the independent and dependent variables in this study are shown in Table 3. We may deduce from the table above that all the variables were more than 0.9. Consequently, the conclusion presented is reliable and may be accepted in this study. The food prices variable that influences university students' acceptance of street food on the UMK City Campus was measured with six items, and the Cronbach's Alpha for this section was 0.920, which is excellent. Therefore, the coefficients derived for the food price variable statement were trustworthy.

Following that, there were seven items in assessing an attraction variable that influences acceptance of street food among university students in UMK City Campus, and the result was .915, which is considered excellent. As a result, the coefficients calculated for attraction variables were reliable. In addition, the quality of service had the greatest impact on university students' acceptance of street food on the UMK City Campus, as measured by Cronbach's Alpha coefficient was .922. Consequently, the coefficients generated for the service quality variable item were reliable.

Finally, five items were utilized to assess the acceptance of street food among university students at UMK City Campus, and the Cronbach's Alpha result for this section was .918, indicating excellent. As a result, the coefficients are reliable. Since Cronbach's Alpha charge for the variables exceeded 0.7, it may be concluded that surveys are extremely trustworthy and that the study can proceed.

Pearson Correlation

Pearson's correlation analysis was one of the most important analyses that examined the linear relationship between the two variables. This study aimed to see if there were any relationship between the independent variables (food price, attraction, and quality of service) and the dependent variables (acceptance of street food).

Tables 5: Pearson Correlation Analysis

Hypothesis	P-Value	Result (Support/Not Support)
H1: There is a relationship between food prices and acceptance of street food among university students in UMK City Campus	.556	H1 is supported
H2: There is a relationship between attraction and acceptance of street food among university students in UMK City Campus	.494	H2 is supported
H3: a relationship between service quality and acceptance of street food among university students in UMK City Campus	.540	H3 is supported

Table 5 shows the result of the Pearson Correlation Analysis. For food prices, the significant value, and the total number of respondents (370). The p-value was 0.000, which was less than the 0.01 level of significance. Food prices and the acceptance of street food among university students exhibited a moderate positive (negative) correlation value of 0.556.

Besides that, the p-value for the attraction and service quality was 0.000, which is less than the 0.01 level of significance. The correlation value of 0.494 revealed a low positive (negative) correlation between attraction and acceptance of street food. In contrast, the correlation between service quality and street food acceptance is a moderate positive (negative) correlation value of 0.540.

DISCUSSION AND RECOMMENDATIONS

As a result of urban dietary trends, street foods are widely consumed and manufactured in practically every country across the world. Consumers, particularly students, prefer street food because of its great taste, accessibility, variety, and low cost. In one study, students like to eat street foods regularly for economical and fast service reasons, while knowing that these items are unhealthy and have little nutritional value—the study analyzed the relationship between food price, attraction and quality of service factors. This study aims to determine the relationship between food price, attraction, quality of service, and students' acceptance of street food.

According to this study, the majority of respondents between 21-23 years old consisting in Malay with a mean score of 4.42, agreed that purchasing meals from street food is much less expensive than eating out at a restaurant or café since it is the lowest and most economical option when compared to restaurants and cafés. According to consumer surveys on buying motivations, food price, flavour, and convenience are among the most important variables influencing their meal choices. This is especially true for students from low-income families. Several socio-anthropological research has found that food prices have a greater influence on student purchasing decisions. According to Tiwari and Verma (2008), the reasons for the expansion of the street food business include the low prices and convenience of producing routinely marketed food.

The analysis of the mean and standard deviation of the respondents' highest independent variable of attraction yielded a mean score of 4.25, and students enjoy street food because of the diversity of foods offered. This is because students like to choose the food they want when selecting street food according to their taste.

Students' interest in purchasing street food is also tied to the speed with which it is prepared had the highest mean value of 4.09. Understanding and defining the important features are critical to shed some light on consumer behavior (Ibáez Casanova, 2003). The quality of service's acceptance depends on how customers view and evaluate the service or product. According to Grunet (2010), quality is a criterion generated by the buyer before making the purchase and after consuming the products. The study went on to say that it is generally accepted that consumer perceptions of products. The quality of service provided is important for indoor and outdoor food, with the latter represented by street commerce. Customers' perceptions of ultimate quality are frequently the consequences of their decisions between their expectations before purchasing the goods and the performance (taste) (Tinoco & Ribeiro, 2008).

Because the study's population consisted of young consumers among university students, the findings cannot be generalized to all consumers or all ages. Conducting the study on a big sample of consumers of all ages would be beneficial. Although the reliability coefficient discovered was high, interpretation of the results is limited due to self-reported responses, which are vulnerable to subject bias. More testing and observational studies are required to validate instruments for consumers of all ages. The limitation of this research is the respondents. Even though this research collected 370 respondents, most answered the survey

by Malays, followed by Chinese, Indian, and others. Possibility factors influencing are not equally distributed to all races in Malaysia. So, it is suitable for future research to distribute the survey equally to all races. This research focuses on how exogenous variables (food price, attraction and service quality) influence street food acceptance among university students. Moreover, future research should focus only on specific groups of users.

CONCLUSION

The acceptance of street food among university students at the University Malaysia Kelantan City Campus was investigated in this study. As a result, the study's contributions stem from its theoretical addition to knowledge and practical application to street food. This study looks into the elements that influence food price, attraction, and service quality in the acceptance of street food. Even though many research has been conducted, it is uncommon to find particular types of street food. From a knowledge standpoint, this study will reveal the most prevalent element in university students' acceptance of street food. The research was carried out to gather fresh understanding and additional information. This study would also contribute to the theoretical perspective from what has been learned in research.

Moreover, through this study, the vision of acceptance of street food among university student in University Malaysia Kelantan, City Campus could be identified. This study's result can reveal why students will re-patronage the same street food all over again because of food price, attraction and quality of service. Thus, street food sellers should concentrate their efforts on personal hygiene and training - both related to the service component in the research - and should depict the image of their products as healthy because healthy items are associated with product quality.

ABSTRACT

The food delivery service business in Malaysia and globally is experiencing significant growth, with customers increasingly seeking takeaway food delivery. The study's objective is to identify variables influencing Malaysian consumers' preferences for food delivered online. This study examines factors affecting consumer preference for online food delivery services in Malaysia. A quantitative research approach, using 384 questionnaires distributed via social media and SPSS software, revealed a positive relationship between online food delivery services with convenience motivation, perceive risk and perceive ease of use. The investigation's design, population of interest and size of the sample, method of sampling, collecting data processes, instruments for research, and data analysis was covered. The findings provide implications and recommendations for future researchers to conduct similar studies in Malaysia.

Keyword: Online Food Delivery Service, Convenience Motivation, Perceive Risk, Perceive Ease of Use.

INTRODUCTION

Malaysia markets for food delivery services are currently expanding and has a high potential rate. The demand for online food delivery (OFD) services has expanded by bringing customers' food to their doorstep as businesses struggle to find strategies to survive (NPD, 2020). Online food delivery (OFD), as defined by Li et al. (2020), is the practise of having customers order food online and have it delivered to them by riders. Since 2012, Foodpanda has been the first OFD app in Malaysia, followed by DeliverEat, Honestbee, Dahmakan, Grab food, and Lala food (Pang, 2017).

These applications are all competitive in offering user delivery services (Kong & Bizhive, 2018). The demand for OFD increased especially in the new norm of the Covid-19 pandemic. In recent years, the Covid-19 pandemic has changed the landscape of business operations, which are heavily dependent on transactions and the use of the internet has increased rapidly. (Alaimo & Galati, 2020). The study's objective is to identify variables influencing Malaysian consumers' preferences for food delivered online.

The research objectives in this study are as follows:

1. To determine the relationship between the perceived risk towards consumer preference to use online food delivery services.
2. To determine the association between perceived ease of use and the preference of consumers for using online meal delivery services.
3. To determine the connection between consumer desire for using online meal delivery services and the motivation of convenience.

Significance of the Study

Consumer

This beneficial contribution can be interpreted as arguing that the majority of customer fulfilment has a favourable impact on delivery service because it is simple and easy for them, variety of options, and time saving especially in the present context where people are required to stay inside due to the emergency. This generation of customers is more likely to order a wide selection of instantly accessible dishes through food delivery services from their preferred eateries. And delivery companies are continuously creating new ordering channels to make things simpler and easier in an effort to keep the millennials interested and enticed.

Researchers

The findings of the study will benefit researchers who want to research and find more information about online food delivery (OFD) services in Malaysia because it provides knowledge and knowledge. As a result of online food delivery (OFD) is now a growing the Malaysian trend especially in the new norm of covid 19, it attracts many researchers to conduct research on this topic.

Online Food Delivery

The well-known Grab Company, which delivers e-hailing services, includes Grab Food. The Grab Food Delivery service enables customers to place online orders for delivery from restaurants that are close to the delivery address. Next, Food Panda because they provide food to practically everyone in the nation, this panda is quite well-known in Malaysia. For restaurants in the vicinity of the delivery address, the business offers food delivery services

LITERATURE REVIEW

Convenience Motivation

Compland (1923) and Kimes (2011) both found that One of the primary motivations for users to accept electronic technology is convenience. Online takeout ordering provides several benefits, avoiding bad customer service and lowering in-store traffic are two examples. Convenience of time and effort are important factors influencing consumer adoption of OFD services, and shoppers who prioritize convenience will always take their time and try to cut costs (Collier & Kimes, 2013). Therefore, convenience motive influences online food buyers' behavior in a good way.

Perceive Risk

Food safety risk perception (FSRP) is the term for the perceived danger connected to eating and is critical for customers' purchasing decisions (Nardi, Teixeira, Ladeira, & de Oliveira Santini, 2020).

Depending on the selling site, customers may have various FSRP. The food provided by OFD services can be contaminated because the delivery operation makes it difficult for this service to maintain the safety and cleanliness of the food for the consumer. Customers may therefore see a higher FSRP when utilising OFD because they cannot personally inspect the cleanliness of the restaurant and staff, which can be detrimental to CIU. The following theory is presented based on previous studies about FSRP and the characteristics of OFD services.

Perceive Ease of Use

According to Pinho and Soares, perceived ease of use (PEOU) refers to how much a person expects to have psychological or physical issues when using new technology. Studies have shown that PEOU significantly affects customers' propensity to use a range of technologies. Consumers are ready to accept purchases made online., according to Ignatius and Ramayah's 2005 research, if smartphone and web interfaces are simple to use and require minimal effort. Consumers are more inclined to use OFD services if their PEOU is higher, boosting their odds of success, according to Roh and Park's 2019 research. By highlighting the crucial roles that the ordering process, order tracking, and filtering options of the interface played in establishing CIU, Ray et al. 2019 emphasize the significance of PEOU of OFD services.

Online Food Delivery Services

Online food delivery is the procedure used to make and deliver the user's online-purchased meal (OFD) (Li et al., 2020). Using an OFD service platform on its website or mobile application, a customer can place meal orders from numerous restaurants. The market for OFD services is forecast to reach \$182.3 billion in 2019 and has gained greater attention since the COVID-19 outbreak due to its contactless ordering and delivery approach. OFD services' influence the ability of the food and beverage industry to expanding businesses, OFD is forecast to increase by RM599 million in 2019. This is due to the government's movement control order, the recent sickness issue, and countries opening for commercial activities. Online business has been booming, influencing customer satisfaction and experience. According to a study by the NPD Group, the number of

orders for off-road vehicles rose 67% in March 2020 compared to March 2019. Academics have studied how OFD customers make decisions and their behavioral goals (Yeo et al,2017).

Research Hypothesis

The purpose of the study is to determine whether dependent and independent variables have any correlations or relationships:

H1 : There is a significant relationship between the convenience motivation towards consumer preference to use online food delivery services.

H2 : There is a significant relationship between the perceived risk towards consumer preference to use online food delivery services.

H3 : There is a significant relationship between the perceived ease of use towards consumer preference to use online food delivery services.

Research Framework

This study highlighted a conceptual framework that examines what influences customers' preference for using online food delivery services. Three independent variables have been used in this study which are convenience motivation, perceive risk and perceived ease of use.

Figure 1 Conceptual Framework

METHODOLOGY

Research design

Data were collected for this study utilizing a quantitative method and questionnaires. 384 Malaysians in all responded to the survey. In addition, the research design gave a summary of the study and identified the data that was being examined. This approach was mostly used by the researcher to generate information through experiments, surveys, and data collection through preset instruments.

Data Collection

The data were gathered through field research. The Google online form tool were used to disseminate the surveys for this research. Every social media platform, including Instagram, Facebook, WhatsApp, email, received the link to the Google form. To gather the survey's data, a series of questionnaires were given to the 384 respondents. The questionnaire made use of modified 5-Likert scales and multiple-choice formats. The questionnaire included four sections and was written in both English and Malay. The questionnaires are divided into Sections A, B, and C. Section A were demographic profiles which are gender, age, marital status, occupation, and income. Independent variables made up Section B, whereas dependent variables made up Section C.

Sampling

The non-probability sampling technique was employed in this research. Since it was simple to use and included a quick research response, this kind of sampling approach was chosen. Non-probability sampling techniques like convenience sampling are affected by data collection from populations that are easily available and eager to take part in the research. The researchers calculated the sample size to obtain a representative sample that is both valid and trustworthy for this study. In a nutshell, 384 individuals would make up the sample according to the generalization made by Krejcie & Morgan (1970).

Data Analysis

Analysis by frequency, description, reliability, and the four data analysis techniques employed in this study were Pearson's correlation analysis. The data were examined using the Statistical Package for the Social Sciences (SPSS) that had been collected. The demographic information from the respondents was analyzed using frequency. In Malaysia, descriptive analysis is used to determine and look at customer preferences for using OFDS. The reliability test was performed to determine the extent to which an evaluation procedure produces reliable findings. The association between convenience motive, perceived risk, and perceived ease of use on consumer preference to use OFDS in Malaysia was investigated using Pearson's Correlation.

FINDINGS

Result of Descriptive Analysis

Table 1 below shows what examination of the descriptive data showed

Table 1: Descriptive Analysis

Variable	Items	Mean Score	Standard Deviation
Convenience Motivation	OFDS allow me to order food panda any time.	4.25	0.768
	OFDS allow me to order food panda any place.	4.23	0.816
	OFDS make my daily life easier	4.32	0.726

	I can get my food with (OFDS) without leaving home	4.40	0.720
	I like to order food without leaving home	4.18	0.882
Perceive Ease of Use	I would find that it easy to use OFDS.	4.24	0.686
	I believe that using OFDS requires minimum effort.	4.21	0.734
	I believe it's easy to learn about online food ordering.	4.33	0.671
	I think that is easy to navigate through online food ordering platform.	4.32	0.715
	I found the OFDS platform is easy to use everywhere.	4.36	0.716
Perceive Risk	I worried of (OFDS) online purchases and concern about my credit card security.	3.62	0.894
	I wonder if the product will be as good as it is advertised to be.	3.78	0.951

I wonder if the food doesn't reach my expectation.	3.85	0.964
I am concerned of using OFDS weither my information won`t be protected.	3.72	0.942
I am worried of using OFDS if my personal information will be hacked.	3.76	0.920

Table 1 show the mean and standard deviation for the used to measure the convenience motivation, perceive ease of use and perceive risk . There were 5 question measured for all variable. For variable convenience motivation had the highest mean, 4.40 on the statement “I can get my food with (OFDS) without leaving home”. However, it was measured with the lowest mean which is 4.18 on the statement “I like to order food without leaving home”. For variable perceive ease of use had the highest mean, 4.36 on the statement “I found the OFDS platform is easy to use everywhere”. However, it was measured with the lowest mean which is 4.21 on the statement “ I believe that using OFDS requires minimum effort”. For variable perceive risk had the highest mean, 3.85 on the statement “I wonder if the food doesn't reach my expectation”. Meanwhile , it was measured with th lowest mean which is 3.62 on the statement “I worried of (OFDS) online purchases and concern about my credit card security”.

Result of Reliability Analysis

Table 2 The results of the reliability analysis are shown in the section below.

Table 2 : Reliability Analysis

Variables	Number of Items	Cronbach's Alpha
Convenience Motivation	5	0.833
Perceive ease of use	5	0.893
Perceive risk	5	0.893
Online Food Delivery Services	5	0.803

According to Table 2 above, the results for the pilot test for each section of the questionnaire are acceptable because all the values are more than 0.800 Cronbach's Alpha. In this study, there were five questions used to measure the variables. The first independence variable, which Convenience motivation is 0.833 which resulted as good strength of association. The second independence variable, perceived ease of use is 0.893 which resulted in a very good strength of association. Next, perceive risk also 0.893 which is a good strength of association. Lastly, with regard to the dependent variable that is online food delivery services, is 0.803 which resulted in a good strength of association and all the variables had valid questions.

Result of Pearson Correlation Analysis

Table 3: Pearson Correlation Analysis

Hypothesis	P-Value	Result (Supported/Not Supported)
H ₁ : The connections between are highly significant. Convenience is a driving factor behind consumer intent to use online food delivery services.	0.459	H ₁ is supported

H₂: There is a significant relationship between perceived risk 0.535 H₂ is supported towards customer intention to use online food delivery services.

H₃: There is a significant relationship between perceived 0.055 H₃ is supported ease of use towards customer intention to use online food delivery services.

As can be seen from Table 4, the results of hypothesis testing are reported based on a significant relationship between the convenience motivation, perceived risk and perceived ease of use. overall, these results indicate that all the hypotheses were accepted at 0.001 significance level.

DISCUSSION AND RECOMMENDATION

Studies that have been implemented to some extents have presented challenges to researchers. One of the limitations of this study was that the researcher experienced problems in obtaining data from respondents. Not all residents know about OFDS, and online delivery services are usually available in cities. Consumers may show different attitudes, subjective norms, and perceptions governing their behavior compared to of purchase intent those living in urban areas. Therefore, the generalization of findings to wider populations across countries should be done with caution.

Researchers struggle with online data collection due to the fact that respondents who still have questions about the questionnaire are less likely to receive assistance. The questionnaire distributor was not physically there to assist respondents in seeking clarification if they had any questions, so many individuals will scan through the questionnaire on social media and disregard it. This is because if respondents are unsure about the questionnaire, they are unlikely to contact us or seek assistance, leading to erroneous data from respondents. Additionally, some respondents like in-person interviews with the interaction between the two parties or question-and-answer sessions.

The majority of people are not interested in responding to questions, so posting and sharing them online does not boost the response rate.

The limitation of the study was inaccurate and non-relevant data from respondents. The scope and generality of this investigation are too large. This is because the study doesn't concentrate on just one OFD platform. This makes it difficult to get data from consumers of OFDS. Some of the respondents are Foodpanda, GrabFood, and other OFD platform consumers, while others don't use any of these platforms at all. Due to issues with differing degrees of knowledge, the assessment offered by the respondents may not be correct. We still don't know how the questionnaire's questions were received by the respondents.

It is a non-random strategy that doesn't call for any fundamental ideas or a predetermined quantity of players. In short, researchers determine the information needed and then find people who can and will supply it based on their knowledge (Bernard et al., 2002).

To secure an adequate number of respondents, the researcher will advise future researchers to switch from convenience sampling to purposive selection. Purposive sampling, also known as probability sampling, is a deliberate selection of a person based on individual traits (Ilker Etikan, 2016). It is a non-random technique that does not require any fundamental principles or a specific number of participants. In summary, researchers identify the information that is required and then seek out people who can and will provide it based on their knowledge (Bernard et al., 2002). It is frequently used in quantitative research to identify and choose the most information-rich samples in order to make the best use of limited resources (Patton et al., 2002). This goal is mainly concerned with usage.

Another idea is to conduct this study over a longer period of time and to include more independent factors. This study will now concentrate on three independent variables: Convenience Motivation, Perceived Ease of Use, and Perceived Risk. better suggestions for improving the study can be made, such as having similar large organizations or those who operate online food delivery services explore rural areas to further grow this platform and make it better known to the public and those who reside outside of the city. This will aid in the collection of further data and the completion of a study on the factors influencing the adoption of online meal delivery services in Malaysia.

CONCLUSION

To conclude, these three elements that influence a consumer's decision to utilise Malaysian online delivery of food are perceived risk, perceived ease of use and convenience motivation. Researchers will gain a better understanding of Malaysian consumers' preferences for food delivered via the internet according to the study's findings. All the variables are related to each other that will bring effects in factor of consumers preference towards online food delivery services. Future studies should prioritize using a population sample that is fairly balanced. The results of an unbalanced sample will be inconsistent and will only favor one group. After that, the sample size must be increased to produce accurate, precise, and reliable outcomes. Researchers could look into incorporating other variables to uncover additional elements influencing Malaysian consumers' preference

ABSTRACT

Hipster food in Malaysia is a recent invention that has been adapted from diverse concepts, distinctive flavors, and culinary traditions of western nations that are currently popular among young people. The objective of this study is to identify the variables that influence young people towards hipster food in Kota Bharu, Kelantan. This study examines the factors of consumer satisfaction with, food quality, service quality and the environment of hipster food restaurants studied in this research. A quantitative research approach, using 384 questionnaires revealed through social media and SPSS software, revealed a positive relationship between young people's satisfaction with hipster food and food quality, service quality and environment of hipster food restaurants. The research design, population of interest and sample size, sampling method, data collection process, instruments for research, and data analysis were obtained. The researcher will then be able to determine the main influence of customer satisfaction, especially among young people, towards hipster food in Kota Bharu, Kelantan, using the survey data at the end of the research. Future research ideas will be presented.

Keywords: Youngster's, satisfaction Hipster food, Service Quality, Food Quality, Restaurant Environment

INTRODUCTION

The global food service is one of the fastest expanding markets in the world, with 167,490 food service establishments in 2015, up from 130,570 in 2010. This is due to positive socioeconomic conditions, demographic changes, alterations in consumer food preferences, and an increase in demand (Mohd Zahari et al,2011). Fast food and hipster cuisine have gained popularity due to the lack of time in the hectic, competitive, and fast-paced metropolitan life. The hipster food scene in Malaysia has given rise to a new obsession, and its influence on people's eating and lifestyle choices is not limited to food (Platania and Donatella,2003). In Kota Bharu, Kelantan, there are more than 15 hipster-themed eateries, cafes, and retail establishments that are distinctive and draw customers. Youngsters are more attracted to the development of the latest issues, especially in terms of cultural changes, food consumption, and the concept of constantly innovating the menu in order to make the dishes become popular and cool to attract customers. A study on the satisfaction of hipster food in the young generation in Kota Bharu, Kelantan was conducted, and young people who reside in and around Kota Bharu, Kelantan find it extremely rewarding and fascinating that the younger generation has accepted hipster food innovation. However, the purpose of this research is to measure the consumer satisfaction toward hipster food in Kota Bharu, Kelantan. The research objectives in this study are as follows:

1. To determine the relationship between food quality towards hipster food in Kota Bharu, Kelantan.
2. To examine the relationship between service quality towards hipster food in Kota Bharu, Kelantan.
3. To examine the relationship between restaurant environments towards hipster food in Kota Bharu, Kelantan.

SIGNIFICANCE OF STUDY

To entrepreneurs' café

This study provides information on the factors that motivate consumers, particularly the youngsters, to be satisfied with hipster foods. The result will enable the entrepreneurs to improve the second-rate of preparing the hipster food to the consumers. Data gathered will help the entrepreneurs to create a value for the customer in order to achieve customers' confidence and trust.

The consumers/customers

The results of the study will help the consumer evaluate the quality of service, food and the restaurant environment that is provided by the hipster cafes. This study could also represent the customers on what kind of expectation that should be standardized by the entrepreneurs when preparing the foods in order to build customers loyalty towards the new food innovation, food hipster.

The researchers

Through this study, the researchers were able to understand more about food innovation, food hipster. This study also helped the researchers to identify reasons on how entrepreneurship deals with consumers' preference. Besides, this study also could inspire other researchers to conduct a similar or additional research in a different geographical area.

LITERATURE REVIEW

Food Quality

Food quality is determined by appearance, size, shape, color, gloss and consistency, texture, and taste (Kisang, 2009). Restaurant experience depends greatly on the quality of the food (Sulek and Hensly, 2004). According to Bujisic et al. (2014) at both premium and quick-service restaurants, food quality, customer behavioral intentions, and word-of-mouth. Food quality has been viewed as the primacy criterion for guests to evaluate restaurant's performance and as the most significant aspect of restaurants (Ramanathan, 2015). Customer satisfaction is greatly influenced by food quality as well.

Shaharudin, Mansor, and Elias (2011) assert that food quality is increasingly important in determining how a consumer feels. Consumers today are well aware of the problems with food quality. In order to serve the demands and wants of their customers, all parties involved in the food industry should develop this competence, according to Whitehall et al (2006). Successfully presenting a visually beautiful meal can raise customer perceptions of quality and create a favourable impression in terms of how customers feel and behave when eating the food. (Shaharudin et.al, 2011).

Service quality

The total rating of a product or service that is dependent on the customer's first impressions of the restaurant has been termed as service quality (Hooper et al, 2013). Based on the Brady and Robertson (2001) claim that staff communicate with customers through their attentiveness, assurance and empathy.

Customers in the restaurant business assess the quality of the cuisine as well as the service they experienced during their meal (Kivela et al, 2000). According to Cronin and Taylor (1994) service quality significantly influences behavioral intentions. The most important factors that influence the caliber of restaurant service must be identified specifically for this study (Tripathi and Dave, 2016). Due to the fierce rivalry in the food service sector, restaurant owners who are able to deliver exceptional service to their patrons will have a significant edge over their competitors to keep patrons and to achieve survival and growth (Ryu and Han, 2010).

Restaurant environment

The atmosphere of a restaurant has emerged as one of the elements luring new customers while retaining existing ones. According to Han and Ryu (2009) when patrons eat in a restaurant, they may do it consciously before, during and after their meals. Previous research on the physical environment of the restaurant has emphasized the criteria of facility aesthetics, atmosphere, lighting, and table and pointed out that these components may affect customer satisfaction (Ryu & Jang, 2007).

The ambient aroma of a restaurant is important because it will be correlated with the emotional responses of customers, which can have an impact on how different levels of scent intensity affect shoppers' mood, behavior, and judgements in a retail space (Leeders Smidts and El Haji, 2016). As a result, the environment of a restaurant has a big impact on customers' happiness (Ryu and Jang 2008). In order to provide customers with a better experience while they are enjoying their dishes, it is crucial for the restaurateur to have a deeper awareness of what customers emphasize.

RESEARCH HYPOTHESIS

In this study, the following three hypothesis were indicated based on the research objectives:

H1 : There is a significant relationship between service quality and consumer satisfaction among towards hipster food

H2 : There is a significant relationship between food quality and consumer satisfaction among youngsters towards hipster food

H3 : There is a significant relationship between restaurant environment and consumer satisfaction among youngsters towards hipster food.

CONCEPTUAL FRAMEWORK

Figure 1 below has shown that the conceptual framework that was adapted from Sharee et al (2018) displays the independent variables (iv) and dependent variable (dv) of this research. The figure shows the relationship between service quality, food quality and restaurant environment influence customer satisfaction towards hipster food.

Conceptual Framework adapted by Sharee et al., 2018.

METHODOLOGY

Research Design

The term "research design" refers to the comprehensive method used to conduct research and describes a clear and logical strategy for addressing a predetermined research question through the collection, interpretation, analysis, and presentation of data. Descriptive studies are emphasized in this study. Data on perceived customer satisfaction among youngsters towards Hipster Food around Kota Bharu, as well as service quality, food quality, and restaurant environment have been collected through quantitative research in this study. Quantitative research is the process of collecting and evaluating numerical data. Patterns and averages can be found, predictions made, connections between variables verified, and results extended to larger groups. This is so that continuous and distinct numerical data can be generated using quantitative research techniques.

Data Collection

Data collecting is a technique for compiling and analyzing data from multiple sources to obtain thorough and accurate data. Answering pertinent questions, assessing findings, and speculating about possibilities and current trends are all made possible by data collection for people or organizations. Youngsters, locals or hipster food enthusiasts in Kota Bharu, Kelantan, between the ages of 18 and 30 will be asked to complete questionnaires that will be conducted and distributed online by researchers utilizing the "google form" technique.

Sampling

The sampling method was a statistical strategy in which a selection of observations was chosen from a broader population. Sample analysis and knowledge of its qualities or explanation would simplify the properties or characteristics of the population's rudiment for researchers. Due to the existing situation, a non-probability sampling technique called convenience sampling was chosen for this investigation. The questionnaire was created with Google Forms and distributed over social media platforms such as WhatsApp, Instagram and Twitter. Researchers could increase the number of respondents by using social media and google forms.

Data Analysis

A statistical tool, often known as the computer programmer Statistical Package for Social Science (SPSS), version 27 is used to analyze the data. The researcher can choose the most appropriate statistical method with the aid of the SPSS programmer. The statistics generated by SPSS include good percentage and cumulative percentage.

FINDINGS

Result of Frequency Analysis

Table 1

Characteristics	Frequency	Percentage (%)
Gender:		
Male	117	46.1
Female	207	53.9
Age:		
Below 18	44	11.5
19 - 24	161	41.9
25 - 29	112	29.2
30 above	67	17.4
Marital Status:		
Single	246	64.1
Married	138	35.9
Education Level:		
Non-Formal Education	4	1.0
High School	86	22.4
Collage	81	21.1
University	200	52.1
Doctorate	13	3.4
Source of Income:		
Pocket Money	133	34.6

Spare-Time Job	89	23.2
Saving	69	18.0
Scholarship	78	20.3
Other	15	3.9
Have visited a hipster food before this:		
Yes	318	82.8
No	66	17.2
I have been visited hipster food:		
Less than 1 month ago	104	27.1
Less than 2 months ago	92	24.0
Less than 5 months ago	74	19.3
More than 5 months ago	56	14.6
Never visited	58	15.1
I like take pictures of the food and design of the shop:		
Yes	262	68.2
No	122	31.8

Elaboration: The characteristics of respondents are gender, age, marital status, education level, source of income and other screening questions.

Table 1 of frequency analysis shows the 384 respondents' genders. Male respondents made up (177 respondents with 46.1%) of the total respondents, while female respondents made up (207 respondents with 53.9 %). Next, according to age, people under the age of 18 (44 respondents with 11.5%), respondents aged 19 to 24 years, (161 respondents with 16.1%) , while respondents aged 25 years to 29 years are (112 respondents with 29.2%) and finally, 30 and above are only (67 respondents with 17.4%). For marital status, the majority of the number of respondents that we got consisted of single status with a percentage of 64.1 percent (247 respondents) and for marital status, 35.9 percent with (138 respondents). Respondents with different levels of education, University education level is the highest number of respondents which is (200 respondents) with 52.1 percent. followed by high school which has respondents as many as (86 respondents) equal to 22.4 percent. The level of education for college is as many as 81 respondents with 21.1 percent.

The respondents for doctorate are as many as 13 respondents only. The very low level of education is no formal education which is as many as 4 respondents with 1.0 percent. Then, the percentages respondents by source of income are pocket money with 34.6 percent (133 respondents), spare-time job of 23.2 percent (89 respondents), scholarship as much as 20.3 percent (78 respondents), saving is as much as 18.0 percent (69 respondents) and lastly, other sources of income as much as 3.9 percent with (15 respondents). For example, salaries and PTPTN.

In addition, the screening question shows that most young people have been to hipster cafes, according to 82.8 percent (318 respondents) and only 17.2 percent (66 respondents) of young people had never been to a hipster cafe. The highest frequency of youngster's coming to Hipster Cafe is less than 1 month ago by 27.1 percent (104 respondents) followed by less than 2 months ago by 24.0 percent (92 respondents). Next, less than 5 months ago as much as 19.3 percent (74 respondents). The frequency of youngster's coming to Hipster Cafe, more than 5 months ago is as much as 14.6 percent (56 respondents) and lastly the frequency of youngster's coming to Hipster Cafe is never visited by 15.1 percent (58 respondents). Lastly, the majority of young people who like taking pictures and designs at Hipster Cafe are 68.2 percent (262 respondents) while 31.8 percent (122 respondents) who don't enjoy taking photos and designs when it comes to Hipster Cafe.

Result of Descriptive Analysis

Table 2

Variable	Items	Mean Score	Standard Deviation
Service	Hipster café provides good service.	4.31	0.682
Quality	I think hipster café workers usually provide a friendly customer service that suits my preference.	4.24	0.714
	I prefer hipster café due to decent offers such as free WIFI, good music and air conditioning.	4.31	0.729
	I am willing to spend my time in a hipster café even though the price offered is expensive as it is reasonable with my expectations.	4.22	0.864
	The hipster café provides the service on time.	4.25	0.757
Food	The hipster café has a variety of menu items.	4.39	0.695
Quality	The freshness of food in hipster café is good.	4.28	
	The food presentation in the hipster café is attractive.	4.35	0.664
	I think the food provided is sufficient and filling.	4.30	0.748
	Food is served at the appropriate temperature in a hipster café.	4.30	0.717
Restaurant Environment	The facility layout in the hipster café allows me to move around easily.	4.40	0.719
	The interior design hipster café is visually appealing.	4.25	0.736
	Colors used in hipster café create a pleasant atmosphere.	4.32	0.707
	Lighting in hipster café creates comfortable atmosphere.	4.45	0.706
	Background music in the hipster café is pleasing.	4.40	0.666
Youngster's Satisfaction Towards	The night time service rendered by the café employees is respectful.	4.35	0.711
	The service provider, the staff is friendly and very polite.	4.33	0.656

Hipster	I'm tempted by some of my favorite dishes.	4.38	0.663
Food	I am satisfied with the quality of the taste of hipster food.	4.37	0.685
	The price listed each meal are very cheap and satisfying.	4.29	0.773

Elaboration: The descriptive analysis of respondents are service quality, food quality, restaurant environment and the youngsters satisfaction towards hipster food.

Table 2 shows the descriptive analysis of the influence of youngster's satisfaction towards hipster food in Kota Bharu, Kelantan. The highest mean of 4.31 for two items of service quality SQ1 and SQ3 on the statement "Hipster café provides good service" with "I prefer hipster café due to decent offers" has strongly agreed as to its agreement level. Otherwise, the lowest mean with 4.22 was for item SQ4 on the statement "I am willing to spend my time in a hipster café even though the price offered is expensive as it is reasonable with my expectations". The mean values for the other two items for SQ2 "I think hipster café workers usually provide a friendly customer service that suits my preference" and SQ5 "The hipster café provides the service on time" were 4.24 and 4.25 respectively and strongly agree as to its agreement level. While the average mean for service quality is 4.27, the respondents strongly agree that service quality plays a significant role for hipster cafes to attract more customers.

Beside the mean values for food quality, one of the independent variables. The highest mean value of 4.39 for the item FQ1, "The hipster café has a variety of menu items" has a strong agreement as its level of agreement followed by the item FQ3 "The food presentation in the hipster café is attractive" with the mean value of 4.35. Both item of FQ4 (I think the food provided is sufficient and filling) and FQ5 (Food is served at the appropriate temperature in a hipster café) shared same mean value 4.30 meanwhile the lowest mean value of 4.28 for the item FQ2 "The freshness of food in hipster café is good".

Next, the highest mean of restaurant environment value was 4.45 for the item of RE4 (Lighting in a hipster café creates a comfortable atmosphere) which strongly agree as the level of agreement. Followed by that, both items of RE1 (The facility layout in the hipster café allows me to move around easily) and RE5 (Background music in the hipster café is pleasing) shared the same mean value 4.40 with strong agreement as the level of agreement. The item of RE3 (Colors used in hipster café create a pleasant atmosphere) and item of RE2 (The interior design hipster

café is visually appealing) was 4.32 and 4.25 respectively, which strongly agree as the level of agreement.

Lastly, the highest mean of youngster’s satisfaction towards hipster food value was 4.38 for the item YS3 “I’m tempted by some of my favorite dishes” has strongly agree, the following was 4.37 and 4.35 which is the item of YS4 and YS1 “I am satisfied with the quality of the taste of hipster food” and “The night time service rendered by the café employees is respectful” has strongly agree respectively. Next, the mean value of 4.33 and 4.29 for the items of YS2 and YS5 “The service provider by the staff is friendly and very polite” and “The price listed on each meal are very cheap and satisfying” has strongly agree respectively.

Result of Reliability Analysis

Table 3

Variable	Number of Items	Cronbach’s Alpha
Food Quality	5	0.837
Service Quality	5	0.834
Restaurant Environment	5	0.830
The influence youngster satisfaction towards hipster food	5	0.800

Elaboration: The influence of youngster satisfaction is lower than restaurant environment, service quality and the highest is food quality according to Cronbach Alpha.

The result of the reliability analysis by croncbach’s alpha, there are a total of three independent variables and the first one is food quality. This variable had a total of 5 items under it with Cronbach's alpha value of 0.837 with the reliability level of excellent (> 0.80). The second independent variable is service quality with 5 items used to test its reliability and validity. The Cronbach's alpha value for this variable is 0.834. This value falls under the reliability level of excellent (>0.80). The third independent variable used in this study is the restaurant environment with 5 items to test and Cronbach's alpha value is 0.830. This value is under the reliability level of excellent (>0.80).

Result of Pearson Correlation Analysis

Table 4

Pearson's Correlation between service quality, food quality and restaurant environment for youngster satisfaction towards hipster food.

Hypothesis	P-Value	Result (Supported/Not Supported)
H1: There is a poor positive relationship between service quality and consumer satisfaction among youngsters towards hipster food.	0.477	H1 is supported
H2: There is a poor positive relationship between food quality and consumer satisfaction among youngsters towards hipster food.	0.467	H2 is supported
H3: There is a poor positive relationship between restaurant environment and consumer satisfaction among youngsters towards hipster food.	0.513	H3 is supported

Elaboration: All three hypotheses are supported for the P-Value.

The table shows the Pearson correlation coefficient, significant value, and number of respondents (384). The P-value was 0.001, which was less than a significant level of 0.01. The correlation coefficient of 0.477 suggested a poor positive correlation between service quality and consumer satisfaction toward hipster food for hypothesis 1. Next for hypothesis 2, the correlation coefficient of 0.467 suggested a poor positive correlation between food quality and consumer satisfaction toward hipster food and 0.513 of hypothesis 3 suggested a poor positive correlation between restaurant environment and consumer satisfaction toward hipster food.

DISCUSSION AND RECOMMENDATION

The study's primary shortcoming is the large sample size of 384 respondents, particularly among young Kota Bharu hipster food-influenced individuals. Most participants ignored the survey or watched it, and some felt it was unimportant or helpful. The questionnaire was sent via social media, making it difficult for respondents to respond privately.

The study's limitations in independent variables, including environment, food, and service quality, hinder its effectiveness. The study's drawback is limited data collection due to the lack of knowledge about hipster food in Kota Bharu, Kelantan and the lack of information in previous publications. This situation makes it difficult to speak with young people who have a significant influence over hipster cuisine.

The study's limitations in getting data on hipster food in Kota Bharu, Kelantan due to limited knowledge and lack of information in previous publications. This makes it difficult to speak with young people who influence hipster cuisine.

This study used a quantitative approach to gather information from respondents, using a google form as a data collecting medium. However, face-to-face interviews can also be used to strengthen the result of the study. Google form allows respondents to answer questions with an unsure understanding of the question, while face-to-face interviews can help to enhance the respondents if they have any questions.

The researcher suggests that future studies should enhance data collection by giving respondents more time to complete a survey, making it easier for the researcher to complete the questionnaire and discover more responders. This will enable the researcher to obtain more accurate data.

Besides, the researchers suggest that the future researchers should conduct a study using observation surveys, which is the act of recognizing and noting facts or occurrences without asking questions. This approach can be used to study customers' motivation towards hipster food without the need for a large number of respondents.

CONCLUSION

The results of this study showed a relationship between customer satisfaction with hipster cuisine and the quality of the food, the quality of the service, and the atmosphere of the restaurant. Food quality was the most effective element influencing consumers' satisfaction with hipster food. This study may be applied to the food and beverage business in the tourist sector to improve the quality of its goods and as a reference for future research.

Furthermore, it can be inferred from the data from chapter 4's statistical package for the social sciences (spss) version 26 that there is a strong correlation between the quality of the food, the standard of the service, and the atmosphere of the restaurant—all of which have an effect on young people's satisfaction with hipster food. The information gathered from this study will enable related businesses and industries to generate income and profits, which will contribute to the expansion of the Malaysian economy.

ABSTRACT

This study discusses the factors influencing visitors motivations in attending food festival in Malaysia. Therefore, this study empirically also aims to identify perceived value, service quality, food and can identify visitors motivations in attending food festival. The research objectives is to determine the relationship between perceive value, service quality, food and visitors motivations in attending food festival in Malaysia. In addition, the method used to complete this report is through questionnaires. Google forms were distributed to 384 respondents. Using SPSS, the data from 384 respondents were analysed using descriptive, frequency, and inferential statistics. Results demonstrate a significant correlation between perceived value, service quality and food. The findings demonstrate that foods, with a mean score of 4.08, have a significant association with visitors motivations in attending food festival, but service quality, with a mean score of 4.00, has the least significant relationship with visitors motivations in attending food festival. Finally, implications and recommendations for more research in accordance with the findings were offered.

Keywords: food festival, visitors motivations, perceived value, service quality & food

INTRODUCTION

Typically, these events draw a sizable number of food-related exhibitors who are engaged in the creation and marketing of distinctive, frequently traditional products. Festivals give exhibitors the chance to market their goods, impart knowledge, and trade stories (De & Varley 2018). Some vendors sell their goods exclusively (or even exclusively) at the food festival. It's important to note that vendors at food festivals frequently represent tiny local businesses, such as tiny rural agribusinesses, that support widely acknowledged local development (Folado et.al, 2019)

Prioritise the experiential and environmental aspects of food festivals. However, few studies have examined the correlation between food festival attendance and food-centric tourist behaviour. The majority of research on food festivals has concentrated on event-related factors and outcomes such as service quality, customer's happiness, and loyalty intentions (Lee, Sung, Suh, & Zhao, 2017). Furthermore, recent study focuses on the quality and worth of festivals, which will improve the perception of destinations and strengthen travellers' commitment to certain destinations.

This study consists of three objectives:

1. To determine the relationship between perceived value and visitors motivations in attending food festival in Malaysia

2. To determine the relationship between service quality and visitors motivations in attending food festival in Malaysia
3. To determine the relationship between food and visitors motivations in attending food festival in Malaysia

Significance of the Study

Consumers

Future readers of this research paper will be able to learn more about the aspects of food festivals that draw tourists. In essence, food festivals can expose a lot of people to different countries and their culinary traditions. As a result, this study will demonstrate how well-liked the various delicacies present at the food festival are among the tourists. The qualities and properties of food that have evolved over time and with the rise in living standards in current contemporary era can also be shown to future consumers by this research report.

Industry of Tourism

The tourism industry could benefit from a better understanding of the types of reasons why tourists opt for local fare by learning more about the factors influencing local food consumption. The travel industry should be able to better serve both domestic and international visitors as a result.

Researchers

This study is significant for the tourism sector since local food intake has become one of the reasons why visitors go. This study will aid scholars in understanding what draws people to food festivals, what keeps them coming back, and how the local population generally feels about trying new types of food. Following that, this study will enable researchers to pinpoint significant visitor-influencing factors and previously unresearched reasons why people attend food festivals. The subject of this journal article might be useful to future scholars.

Food vendor

This research paper can provide future sellers with information about the factors that attract buyers to food festivals.. Basically, food festivals can give vendors a chance to showcase the variety of cuisine styles and tastes from different nations. The qualities and properties of food have changed throughout time as a result of the advancement of living standards in the modern era, and this research article can help future vendors understand these changes.

LITERATURE REVIEW

Perceived Value

Perceived value, according to the definition, is the individual's appraisal of the difference between the benefits and the expenses. Four factors may be used to determine value: "Value is (1) cheap price, (2) having what one wants in a product, (3) the quality one obtains for the money one spends, and (4) what one receives in return for what one contributes. According to the equity theory, a consumer considers what is fair, acceptable, or warranted for the perceived cost of the service, which includes monetary payments as well as non monetary sacrifices such as time, energy, and stress borne by consumers (Akhoondnejad, 2016). Perceived value is a

crucial aspect in developing long-term client connections and achieving a competitive advantage. In the case of festivals, participants weigh the advantages they get against the sacrifice they make in terms of time, money, and effort (Akhoondnejad, 2016). However, if you're only interested in the food, these festivals are rarely worth the money or time (Dai serena, 2017) .

Service Quality

Service quality is frequently the kind of customer perception throughout the purchasing process when the good or service being delivered is characterised as a gap model, which is a difference between the customer's view of the service and their expectations (Parasurama et.al, 1998). In addition, service quality measures how well the level of service provided fulfils consumers' expectations (Lewis & Boom, 1983). The degree of service quality that goes along with a company's offers may be a key element for differentiating between performing and non- performing business establishments, according to Eresia-Eke et.al, (2018). The contact between a client and components in the service organisations also produces service quality, according to Lethinen & Lethinen's, (1982). It could result in an emotional response that shows up as happiness or discontent with the goods or services bought (Woodruff. et al, 1983). In order to keep their consumers, internet meal delivery businesses need pay attention to the quality of their services. If the value of the services they receive is perceived to be significantly superior than what is anticipated from competitors, customers may continue to be loyal to a service provider (Zeithaml & Bitner, 1996). Customers frequently want deep, individualised ties with service providers and value the advantages of sustaining relationships (Zeithaml et.al, 1996). As a result, service clients are crucial to preserving clients' loyalty (Parasuraman et.al, 1991).

Food

Based Sharina Osman & Norwani Nazari (2020), one of the reasons people now travel is for the food, which has a significant multiplier impact in tourist places. food has always been a major draw to any location and is frequently highlighted in marketing materials by numerous locations. This occurrence is one of the indications that food has to offer as a travel item.

Food consumption becomes a crucial component of tourism as it becomes an essential component of the tourist experience Hall & Mitchell (2000). For some people, food means different things. According to Ab Karim (2010), a destination's food reputation and the nature of its information sources have a significant role in influencing tourists' desire to visit that location. According to this perspective, Malaysia conjures up ideas of Malaysian cuisine and tourism. Although tourists are pleased with the food photos, there is certainly room for improvement. Additionally, they stated that eating contributes to overall pleasure, which will also impact their behavioural intentions.

Dependent Variable

Visitors Motivations in Attending Food Festival

Many authors have characterized motivation in many ways Inkson & Minnaert (2018). As the main cause and driving force underlying all human behavior, for example (IsoAloha, 1982) an awakening, guiding, and integrating physiological and psychological desire that awakens, directs, and integrates a person's conduct and activities (Pearce & Lee, 2005).

Their attitudes, perceptions, and motivations have a big impact on the decisions they make about their journey. In addition to more basic tourism-related motivations, research has been done to identify what motivates people to attend festivals.

The three factors that influence motivation are perceived value, food, and service quality. On the other hand, perceived value is essential for building strong relationships with customers and gaining a competitive advantage. When evaluating the value of a festival, attendees compare the benefits they receive with the time, money, and effort requirements (Akhoondnejad, 2016). Next, service quality, which is polygonally organized and emphasizes tangibles in addition to efficacy, responsiveness, assurance, and empathy. When the product or service being provided is categorised as a gap model, which is a discrepancy between the customer's perception of the service and their expectations (Parasuraman & Berry, 1998), service quality is frequently the type of client impression during the purchasing process. The last is location's food has a big impact on its reputation and desirability. Eating has become a significant part of tourism due to how crucial it is to the overall tourist experience (Mitchell & Hall, 2000).

Research Hypothesis

The hypothesis of this research is to determine if there are any correlations or relationships between dependent variables and independent variable:

H1: There is a strong correlation between perceived value and visitors motivations in attending food festival in Malaysia.

H2: There is a connection between service quality and visitors motivations in attending food festival in Malaysia.

H3: There is significant relationship between food and visitors motivations in attending food festival in Malaysia.

Research Framework

For the purpose of investigating the connection between visitors motivations in attending food festivals in Malaysia, a research framework has been given. Then, the food, the perceived value, and the service quality influence the visitor's motivation in attending food festival in Malaysia, which was used to put the hypothesis to the test.

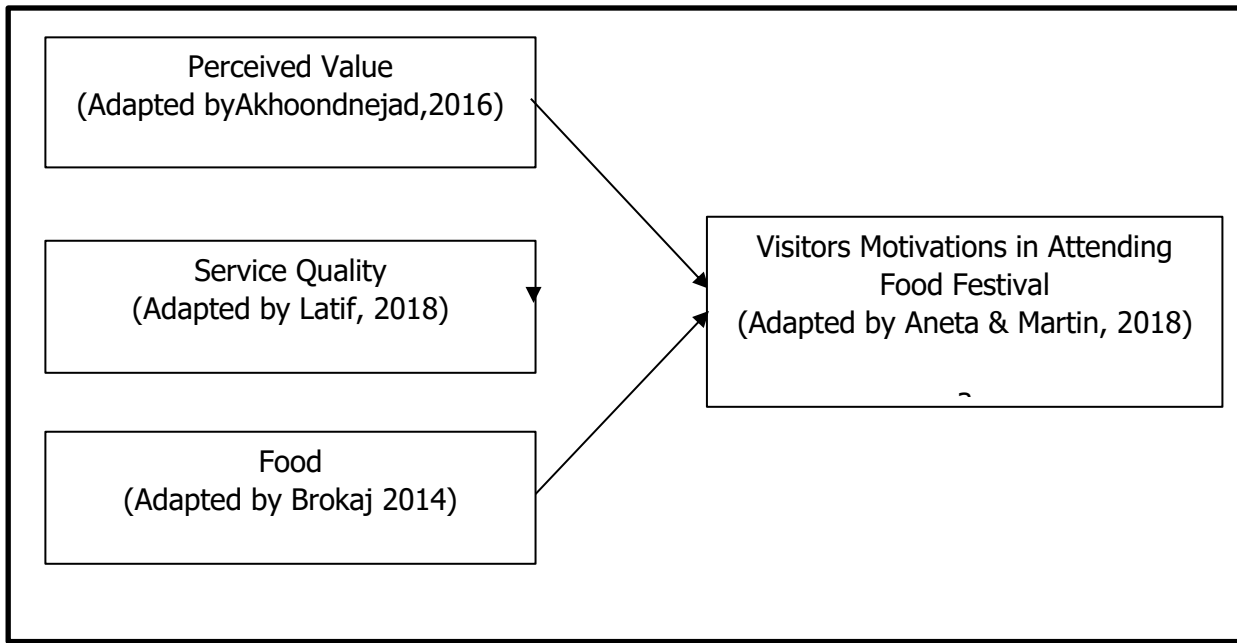

Figure 1: Conceptual Framework

METHODOLOGY

Research Design

In this quantitative study, 384 customers who attended a Malaysian food festival were given questionnaires. The people of Malaysia will serve as the subjects for this study. The questionnaire was split into three parts by the researcher: sections A, B, and C. The demographics of the respondents are presented in Section A. In Sections B and C on independent factors and dependent variables, five items using a five-point Likert scale ranging from 1 (Strongly Disagree), 2 (Disagree), 3 (Neutral), 4 (Agree), and 5 (Strongly Agree) were utilised. The purpose of the study design is to identify the variables that affect why people choose to attend the food festival and to ensure that the evidence derived from the data can address the issue under investigation. To understand perceived value, service quality, and food for food festivals in Malaysia, it is crucial to use a quantitative approach.

Data Collection

Primary data is collected using suitable methods for current study challenges, while secondary data is obtained from other researchers. Data can be used for comparative research, replication, data reanalysis, research design, methodological advancement, learning, teaching, and describing current and historical traits. This study employs quantitative data gathering through surveys and questionnaires, utilizing mathematical computations for objective and trustworthy data. The data includes 384 participants, divided into sections A, B, and C, in both English and

Malay. This approach simplifies participant completion and enables researchers to compare and analyze collected data.

Sampling

This research utilised a non-probability sampling method known as convenience sampling. Convenience sampling is the practise of collecting samples based on the availability of elements and their ease of acquisition. This sample was chosen because it occurred at the appropriate location and time. The benefit of convenience sampling is that it is quick and simple. Because the researcher can select respondents at random, he or she has the freedom to determine the sample, select it, and produce accurate data using this method. The survey is created with Google Forms and distributed via social media. Using Google Forms and social media, WhatsApp and Telegram researchers can attract more participants.

Data Analysis

Data analysis involves organizing, describing, representing, evaluating, and interpreting data using statistics. SPSS, version 24, is used in this study to analyze data using descriptive analysis and correlation. It allows researchers to conduct intricate statistical analysis on large datasets, aiding in reliability analysis, descriptive analysis, and Pearson's correlation coefficient.

FINDINGS

Demographic Analysis

Table 1: Demographic Analysis

Characteristics	Frequency	Percentage(%)
Gender:		
Male	96	25.0
Female	288	75.0
Age:		
Below 18	41	10.7
18 - 23	240	62.5
24 - 29	58	15.1
30 above	45	11.7
Marital Status:		
Single	290	75.5
Married	68	17.7
Others	26	6.8
Occupation:		
Student	257	66.9

Employee	74	19.3
Unemployed	79	7.6
Others	29	6.3
Do you familiar with food festival ?:		
Yes	339	88.3
No	45	11.7
Why do you choose to buy food at food festival?:		
Reasonable price	91	23.4
Fast service	81	21.1
Many options	141	36.7
Others	72	18.8
How many times do you visit food festival in a year:		
Once a month	49	12.8
Once every 3 months	71	18.5
Once every 5 months	130	33.9
Others	134	34.9

Table 1 showing the summarize of demographic analysis totalling the male respondent was 96 respondents with the percentage 25.0% while the female respondent is 288 respondents with the percentage 75.0%. Meanwhile the highest range of the age respondent participating was 18 to 23 years old 240(62.5%) follow for the second highest was 24 to 29 years old 58 (15.1%) , third is range for 30 and above 45(11.7%) and the slightest range is below 18 years old 41(10.7%). Other than that, the majority of respondents marital status is single that consist of 290 respondents with the percentage 75.5% and the second highest is married respondent which is 68 respondents equal to 17.7% while the minor respondent who answering is other 26 respondent with 6.8%.

Next, the total number of students was 257 respondents and 66.9% for employed was 74 respondent and 19.3% followed by Unemployed 29 respondent with 7.6% and others 24 respondent and 6.3%. As for the screening question the respondent who is familiar with food festival was 339 respondent and 88.3% while 45 respondents equal to 11.7% were not familiar with food festival. Therefore, respondents who choose to buy food at a food festival found that it had many option was 141 respondent and 36.7% and as for the reasonable price was 90 respondent with 23.4% , fast service fall to third highest why visitor choose to buy at food festival which was 81 respondent and 21.1% and least was others with 72 respondent with the percentage of 18.8%.

Furthermore, the highest respondents visiting food festival was others where 134 respondent and 34.9% and for once for every 5-month respondent that visit food festival was 130 and 33.9% followed by once every 3-month 71 respondent and 28.5% followed by once a month 49 respondent and 12.8%.

Descriptive Analysis

This study has analysed the mean and standard deviation for section B and C of the questionnaires.

Result of Descriptive Analysis

Table 2

Table 2: Descriptive analysis

Variable	Items	Mean Score	Standard Deviation
Perceived Value	The prices at the food festival are reasonable	3.77	1.170
	I believe the food at the food festival is good quality	3.55	0.803
	I acknowledge that various foods that I want to buy are available at food festivals	3.99	0.978
	I believe the vendors at the food fair are keeping clean	3.83	1.002
	Food festival provides a lot of convenience	3.85	1.037
Service Quality	The sellers at the food festival have friendly treatment for visitors	3.94	0.972
	The seller is aware of food hygiene when serving, wearing gloves, mesh, and apron	3.80	1.027
	I think the food at the food festival are served quickly	4.01	0.930
	The seller makes a detailed menu of each dish available or visible to the visitors	4.02	0.927

	I believe the seller at the food festival takes the order by following the correct order to the visitors	4.01	0.928
Food	I believe food involvement play a crucial part in food festival	4.07	0.950
	foods that serve in food festival come from different culture	4.11	0.928
	Enjoying food in food festival giving a pleasurable experience	4.10	0.917
	visitor satisfaction will be accomplished with the food taste in food festival	4.07	0.948
	Going to food festival allow to have a good meal and beverage	4.16	0.885
Visitors motivations in attending food festival	Going to food festival can satisfy my curiosity about viral food	4.31	0.959
	Going to food festival can support the local community	4.33	0.889
	I go to the food festival to escape daily routine	3.84	1.082
	I think going to food festival can spend time with family or partner	4.00	0.930
	I go to food festival to gain new experiences	3.92	1.031

The mean and standard deviation analyses on the independent variable, perceived value. The maximum mean value was 3.99, where respondents thought that acknowledge that various foods that want to buy are available at food festival.

The mean and standard deviation analyses of respondents on the independent variable, service quality where it had the highest mean score of 4.02, indicating the seller makes a detailed menu of each dish available or visible to the visitors.

The mean and standard deviation analysis of respondents on the independent variable, food, where item 1 had the highest mean value of 4.16, indicating that respondents consented to going to food festival allow to have a good meal and beverage.

The mean and standard deviation analysis of respondents on the dependent variable, is Visitor motivation in attending food festival service where the item 5 shows the highest mean value of 4.33, indicating that respondents Going to food festival can support the local community.

Reliability Analysis

It was decided that reliability analysis would be utilised to assess the questionnaires' dependability. It was also utilised to gauge how steady and reliable the produced assessment tools were. When measuring internal consistency and reliability scales, Cronbach's Alpha analysis was used to determine the instrument's reliability based on the data. The table below displays the size of the Rules of Thumb Cronbach's Alpha coefficient, according to George & Mallery (2016).

Table 3 : Cronbach's Alpha Coefficient Range. Sources: Adopted from George & Mallery (2016).

Cronbach's Alpha Range	Level of Reliability
$\alpha > 0.9$	Excellent
$\alpha > 0.8$	Good
$\alpha > 0.7$	Acceptable
$\alpha > 0.6$	Questionable
$\alpha > 0.5$	Poor
$\alpha < 0.4$	Unacceptable

The range of Cronbach's Alpha coefficient values was displayed in table 3. Internal consistency is deemed excellent when the value is greater than or equal to 0.90, with a maximum value of 1. Moreover, a Cronbach's Alpha value of less than 0.4 is deemed unacceptable.

Table 4 : Result of Reliability Coefficient Alpha for the Independent Variable and Dependent Variable

Variable	Number of items	Reliability Cronbach's Alpha	Level of reliability
Perceived value	5	0.913	Excellent
Service quality	5	0.940	Excellent
Food	5	0.959	Excellent
Visitors motivation in attending food festival	5	0.906	Excellent

Table 4 displays the results of the reliability analysis using Cronbach's Alpha for each independent and dependent variable. The first item, perceived value, had a Cronbach's Alpha score of 0.913 and an outstanding reliability level (> 0.9) out of a total of five. The following independent variable is service quality, which consists of five elements. Cronbach's Alpha is 0.940 for this variable. This rating corresponds to an extremely high degree of dependability (0.9). The dependent variable, which measured visitors' motivations for attending a food festival, contained five items. This variable's Cronbach's Alpha score is 0.906, which is below the level of excellent reliability. The Cronbach's Alpha for the three-food test utilised in this study is 0.959. This is below what we consider to be an excellent level of dependability (0.9).

Pearson Correlation Analysis

Pearson's correlation analysis was one of the most important analyses that looked at the linear relationship between the two variables. The purpose of this study was to examine if there were any links between the independent factors (perceived value, service quality and food) and the dependent variable (visitors motivations in attending food festival). If the relationship is significant, the researchers must decide the acceptable level of association strength.

Result of Pearson Correlation Analysis

Table 3: Pearson Correlation Analysis

Hypothesis	P-Value	Result (Supported/Not Supported)
H₁: There is strong correlation between perceived value and visitors motivations in attending food festival in Malaysia	0.583	H ₁ is supported.
H₂: There is a connection between service quality and visitors motivations in attending food festival in Malaysia	0.664	H ₂ is supported.
H₃: There is significant relationship between food and visitors motivations in attending food festival in Malaysia	0.722	H ₃ is supported

Table 3 displays the results of the Pearson Correlation Analysis. For the statistically significant value, the total number of respondents (384), and the perceived value. The p-value was 0.000, which was less than the threshold for statistical significance of 0.01. The correlation between perceived value and visitors motivations to attend a food festival was moderately positive, with a value of 0.583.

In addition, for the service quality level, the significance, and the total (384) respondents. The p-value was 0.000, which was less than the threshold for statistical significance of 0.01. The correlation coefficient of 0.664 indicates a moderately positive relationship between service quality provided and visitors motivations to attend a food festival.

Next, the food's significant value and total of 384 are presented. The p-value was 0.000, which was less than the threshold for statistical significance of 0.01. The correlation between food and visitors motivations to attend a food festival was moderately positive, with a value of 0.722.

DISCUSSION & RECOMMENDATION

The study analysing the relationship between perceived value, service quality, food and visitors motivations in attending food festival. The purpose of this study is to determine the relationship between perceived value, service quality, food and visitors motivations in attending food festival.

Recommendations are ideas for upcoming research projects that address the shortcomings of the current study. The results of this study could therefore be applied to future research to enhance data collection techniques. Formal interviews are highly recommended. In a structured interview, each respondent is asked the same questions in the same order from a well-crafted, pre-planned list of questions. Due to the fact that a primary focus of quantitative research is the statistical analysis of numerical data collected through general survey research techniques such as questionnaires or structured interviews, this is the case. While questionnaires are useful for acquiring data, face-to-face interviews give the researcher clear, accurate information.

To confirm that the data obtained is accurate and legitimate, it is also advised to choose local communities close to the research area. The information provided by the community as a respondent may not be accurate because of limited exposure to the particular research area selected.

CONCLUSION

In conclusion, the researcher clarifies whether all the research findings implemented can address the chapter's research objectives. This study aims to determine the relationship between the independent and dependent variables. The three independent variables are perceived value, service quality, and food, while the dependent variable is visitors motivation in attending food festival Utilising Pearson's Correlation Analysis, the relationship between the independent and dependent variables was determined. This demonstrates the effect of the independent variable on the dependent variable. Three independent variables, namely perceived value, service quality, and food, have a significant relationship with visitors motivations in attending food festivals in Malaysia, according to the findings of researchers. A total of 384 respondents were selected from the country on the east cost Malaysian states for this study. This study concludes that there is a positive correlation between the independent variables perceived value, service quality, and food. The data reveals the three factors influencing visitors motivations in attending food festivals in Malaysia.

ABSTRACT

This empirical study investigates the relationship between customer satisfaction and critical factors such as food quality, service quality, and price and value within the food truck industry in Kota Bharu, Kelantan. The emergence of a new food truck in Malaysia in 2014, offering menu items from restaurants at a lower and more affordable price, gained significant attention and popularity among the public. This research examines the drivers of customer satisfaction in this context. A quantitative research approach was employed, utilizing an online questionnaire to collect data from a sample of 384 respondents. The collected data was then analyzed using SPSS software. The study's findings revealed that customer satisfaction is influenced by three key factors: service quality, food quality, and the price and value of the food trucks offer. This research contributes to existing theory and practice by providing a comprehensive understanding of the factors that impact customer satisfaction regarding service quality, food quality, and price and value within the food truck industry in Kota Bharu, Kelantan.

Keywords: Customer Satisfaction, Food Quality, Service Quality, Price and Value, Food Truck

INTRODUCTION

This study examines the phenomenon of customer satisfaction within the context of food trucks. By the end of 2016, the number of food trucks in Malaysia had reached approximately 500, encompassing both government-affiliated agencies and independent operators (Ishak, 2016). Food Trucks (2014) defines the food truck business model as a mobile operation that moves from one location to another, preparing and selling meals from a specially equipped van. The growth of the food truck sector can be attributed, in part, to consumer demand for diverse food options at affordable prices (Yoon & Chung, 2018). Notably, Ibrahim (2011) asserts that food trucks offer advantages such as reduced hassle and costs compared to traditional dining establishments, as customers no longer need to worry about reservations or parking.

The advent of a new food truck in Malaysia in 2014, featuring menu items from established restaurants at lower prices (Durai, 2016), has significantly contributed to the rise in popularity of contemporary food trucks among customers in Kota Bharu, Kelantan. Consequently, this popularity has generated various effects and elicited feedback regarding customer satisfaction. Customer satisfaction, defined as the extent to which a product or service meets and exceeds customers' expectations (Homburg & Stock, 2004), is a crucial factor in assessing the performance of food trucks in meeting customer needs and preferences.

In this empirical paper, the researchers aim to explore and analyze the factors

influencing customer satisfaction within the food truck industry, focusing specifically on the context of Kota Bharu, Kelantan. By gaining insights into customer perceptions of food quality, service quality, and pricing and value, the researchers seek to enhance understanding of the

drivers of customer satisfaction and contribute to the existing body of knowledge in this area. The specific objectives for this study as listed below:

1. To identify the relationship between service quality and customer satisfaction towards the food trucks in Kota Bharu, Kelantan.
2. To examine the relationship between food quality and customer satisfaction towards the food trucks in Kota Bharu, Kelantan.
3. To identify the relationship between price and value and customer satisfaction towards the food trucks in Kota Bharu, Kelantan.

Significance of the Study

This study holds significant value for various stakeholders involved in the food truck industry. Firstly, it serves as a valuable resource for academic researchers seeking a comprehensive understanding of the intricacies of the food truck industry. This study offers a detailed overview of the sector by compiling and presenting available data, enabling researchers to delve into food truck-related research with greater insight.

For the food truck industry, this study's findings hold multiple benefits. Firstly, it sheds light on five key advantages the industry offers food truck entrepreneurs and consumers. By identifying these benefits, the study provides entrepreneurs with valuable insights to establish, develop, and sustain customer satisfaction. Additionally, the research findings can assist entrepreneurs and stakeholders in formulating effective marketing strategies that cater to the evolving needs of consumers.

From the consumer's perspective, this study is crucial in enhancing consumer understanding of the food truck industry. It is a guiding resource for prospective consumers, enabling them to make informed decisions and judgments when engaging with the food and beverage sector. Particularly for consumers in Kota Bharu, the study provides accurate and relevant data about food trucks, thus enabling them to assess and select options that align with their preferences.

In conclusion, this study contributes to the body of knowledge regarding the food truck industry and its impact on entrepreneurs, consumers, and researchers. By exploring the factors influencing consumer satisfaction within the food truck sector, the research provides valuable insights for entrepreneurs and assists consumers in making informed choices.

LITERATURE REVIEW

Food Quality

Food quality is a multifaceted aspect subject to individual preferences, evolving consumer demands, regulatory requirements, and advancements in quantitative measurement (Margherita, 2010). It encompasses various attributes or characteristics of a product that significantly influence its appeal to consumers. Seladorai and Zainol (2016) assert that internal and external factors influence food quality. External factors encompass size, color, texture, and flavor, whereas internal factors predominantly pertain to nutrition, chemical composition, and physical attributes.

Radzuan (2020) identifies these factors as the most influential in consumers' food selection and quality evaluation. Additionally, Ibrahim and Mustapha (2018) emphasize the importance of cleanliness, price, and value as essential determinants of food quality. Consequently, prioritizing quality becomes imperative to enhance customer satisfaction. Previous studies have explored numerous attributes associated with food quality, including flavor, healthiness, freshness, presentation, ingredient quality, safety, portion control, halal compliance, nutritional

value, menu variety, aroma, temperature, the introduction of new menu items, hygiene, authenticity, and texture (Zainol & Seladorai, 2016).

In summary, the concept of food quality encompasses a range of characteristics that influence consumers' perceptions and evaluations of food products. It requires consideration of external factors such as appearance and taste and internal factors such as nutritional content. Other essential elements, including cleanliness, price, and value, contribute significantly to overall food quality. Previous research has examined various attributes associated with food quality, revealing the multifaceted nature of this concept in the eyes of consumers.

Service Quality

The alignment between customer expectations and perceived performance influences client satisfaction. In the context of food trucks, service quality plays a crucial role in shaping customer reactions and overall satisfaction. It involves the processes of packaging, product creation, and the mechanisms employed in selling food items. Service quality refers to the ability of a business to meet the high standards set by its customers. Effective management and continuous improvement of service quality led to increased profitability and ensure customer happiness (Indeed Editorial Team, 2021).

Previous studies have highlighted the priority given by customers to the level of service provided by food truck vendors, as opposed to solely evaluating the visual presentation of the meal. The emphasis on high-quality service has become increasingly significant as it is vital in attracting new customers and retaining existing ones, resulting in profitability. It is through addressing customers' unique needs that food truck services can foster customer loyalty and enhance their overall experience.

In summary, customer satisfaction within the food truck industry depends on the congruence between customer expectations and perceived performance. Service quality, encompassing various aspects of packaging, product creation, and sales mechanisms, is pivotal in shaping customer reactions and overall satisfaction. The management and improvement of service quality contribute to business profitability and ensure customer happiness. Recognizing the importance of service quality over the mere visual appeal, food truck vendors can foster customer loyalty and drive success by addressing the specific needs of their clientele.

Price and value

Value-based pricing is a pricing approach that determines fees based on the consumer's perceived value of a product. This method prioritizes the needs and preferences of the consumer, leading businesses to set their prices based on what they believe customers should pay for a particular product (Bloomenthal, 2022). In the context of food service providers in cafeterias, students often seek affordable pricing due to their limited financial resources, which significantly influences their decision-making process. Nadzirah et al. (2013) similarly identified budget considerations as a crucial factor in the day-to-day operations of academic dining services, given the limited opportunities available to students. The provision of affordable pricing satisfies consumers in terms of the value they receive for their money and facilitates cost adjustments when necessary.

As defined by Kotler and Armstrong (2012), price refers to the charges associated with a product or service. It represents the total amount exchanged for the benefits derived from using or consuming the product or service. Ensuring an adequate pricing policy increases customer satisfaction and facilitates the flexibility to adjust costs as needed. In summary, value-based pricing considers consumers' perceived value of a product or service when determining fees. Students' limited financial resources drive their preference for affordable pricing in the context of cafeteria food service providers. This consideration significantly influences their decision-making process. By offering affordable prices, businesses can satisfy consumers in terms of the perceived value they receive, and it also allows for greater flexibility in cost adjustments. Price, as a concept, represents the total amount exchanged for the benefits derived from a product or service.

Customer Satisfaction

Client satisfaction evaluates whether a product or service meets or exceeds a customer's expectations (Homburg & Stock, 2004). In order to achieve the potential for customer satisfaction, service providers must deliver outstanding service quality, as emphasized by Rahim et al. (2015). Customer satisfaction plays a crucial role in the success of businesses, enabling them to maintain a competitive advantage in the market. It also significantly impacts repeat business, word-of-mouth advertising, and purchasing intentions (Zhang et al., 2013). Previous research has consistently highlighted the importance of high-quality products and services in satisfying customers (Padma & Austuti, 2016). Consequently, when consumers derive satisfaction from products and services, and a company's performance aligns with their expectations, both parties' benefit (Santouridis & Trivellas, 2010).

Hypothesis

The research hypothesis of this study focuses on the factors that contribute to customer satisfaction in the context of food trucks in Kota Bharu, Kelantan. Specifically, the hypothesis looks at how customer satisfaction is affected by the quality of the food, the quality of the service, the quality of the physical environment, and the pricing and value. In light of the research objectives, the formulated hypothesis is as follows:

H1: There is a relationship between food quality and customer satisfaction toward food trucks in Kota Bharu, Kelantan.

H2: There is a relationship between service quality and customer satisfaction toward food trucks in Kota Bharu, Kelantan.

H3: There is a relationship between pricing and value and the customer satisfaction toward food trucks in Kota Bharu, Kelantan.

Conceptual Framework

A research framework has been developed to identify the relationship between the food quality and service quality, price, and value with customer satisfactions toward food trucks in Kota Bharu, Kelantan.

METHODOLOGY

Research Design

To effectively meet the research objectives, this study used a quantitative research technique that focuses on gathering precise and quantifiable data. A questionnaire approach was used as part of the study procedure to gather primary data. A preset series of questions intended to collect information from respondents made up the questionnaire, which was used as a research instrument. Respondents could choose between agreeing or disagreeing with statements pertaining to the survey's study goals using a Likert scale with five response possibilities. The researchers wanted to learn more about the dynamics of the food truck market, therefore they investigated the correlations between these factors.

Data Collection

The researchers focused on collecting primary data for this empirical study. Primary data refers to original and firsthand information gathered by the investigator to meet the research requirements. The data was sourced from authentic and reliable sources, including the study participants' and the researchers' perspectives. In order to collect the necessary data, The researchers employed survey and questionnaire methods. Specifically, this project used a Google Form as the data collection tool. The Google Form link was disseminated through various online platforms such as WhatsApp, Instagram, and Facebook to ensure a broad range of respondents. Additionally, the questionnaire was posted on survey websites to attract a broader range of participants.

Sampling

A non-probability sampling method was employed for the empirical study on consumer satisfaction with food trucks in Kota Bharu, Kelantan. Specifically, convenience sampling was emphasized as the chosen approach for data collection. Convenience sampling is selected for its efficiency and simplicity, offering various options for participant selection (Etikan, 2016). The study focuses on customers using food truck services to purchase meals in Kota Bharu, Kelantan, making convenience sampling an appropriate sampling technique.

Data Analysis

Statistical Package for Social Sciences (SPSS) version 26.0 was used to analyze the data acquired from the Google Form. Descriptive statistics including mean, median, mode, and frequencies were used to analyze the data. Using Pearson correlation analysis, the relationships between the variables in the dataset were also looked at.

FINDINGS

The demographic profile of the respondent was summarized in the Table 1 below.

Table 1: The Demographic Characteristics of the Respondents

Demographic/ Characteristic	Category	Frequency	Percentage (%)
Gender	Male	178	46.4
	Female	206	53.6
Age	< 20 years	26	6.8
	31 – 30 years	346	90.1
	31 – 40 years	2	0.5
	> 41 years	10	2.6
Income	< RM 600	299	77.9
	RM 600 – RM 1000	29	7.6
	RM 1001 – RM 2000	32	8.3
	RM 2001 – RM 3000	11	2.9
	RM 3001 – RM 4000	4	1.0
	> RM4000	9	2.3

Level of Education	SPM	25	6.5
	STPM	14	3.6
	DIPLOMA	45	11.7
	BACHELOR DEGREE	299	77.9
	POSTGRADUATE	1	0.3
Do you have any experience buying food at food truck	YES	382	99.5
	NO	2	0.5

Table 1 presents the demographic characteristics of the respondents in this empirical study. Most of the respondents, constituting 91% of the total, fell within the age range of 21 to 30 years. Among the respondents, 53.6% identified as female, while 46.4% identified as male. Furthermore, a significant proportion of the respondents (77.9%) reported earning less than RM600 monthly. Regarding educational attainment, 77.9% of the respondents held bachelor's degrees. Notably, only a small percentage (2%) of the respondents reported did not having any experience purchasing food from a food truck, thus was discarded from the study. Next, the descriptive analysis was presented in the Table 2.

Table 2: The Descriptive Statistics of Independent Variables and Dependent Variable.

Item	Mean score	Standard deviation
IV 1: Service Quality		
7. Knowledge and attentive food truck staff is a valuable asset for one's success.	4.31	
8. Immediate responses to customer needs are paid attention to by the entrepreneur's food truck.	4.24	
9. The employees are able and willing to give the detailed information about the menu, ingredients and method of preparation.	4.31	0.682 0.714 0.729
10. The friendly and welcoming service is essential to attract more customers.	4.22	
	4.25	0.864 0.727
IV 2: Food Quality		
2. The freshness of food truck is nice.	4.40	
3. The food presentation in the food truck is attractive.	4.25	
4. Tasty and delicious food is factor that is very important for food truck customers.	4.32	0.719 0.736
5. The freshness of ingredients and ingredients is concerns	4.45	0.707 0.706
IV 3: Price and Value		
3. The food provided must be worth the value of money paid.	4.31	
4. The cost in the food truck seems appropriate for what I get.	4.24	
5. Cheap prices for food are important even if it doesn't taste good.	4.24	0.682 0.714 0.729 0.864 0.729
6. Menu in food trucks must be easily readable and detailed.	4.24	
7. Possible and affordable prices enable us to meet customer's expectations and needs.	4.22	
	4.25	

Table 2 presented the mean scores and standard deviations of each variable in the study. The variable "Service Quality" obtained a mean score of 4.266. The highest mean score within this variable was attributed to knowledgeable and attentive food truck staff, regarded as a valuable asset for success. The employees' ability and willingness to provide detailed information about the menu, ingredients, and preparation methods also received a high mean

score of 4.31. As opposed to that, the item "The friendly and welcoming service is essential to attract more customers" obtained the lowest mean score of 4.22. Most respondents emphasized the importance of attitude in determining consumer acceptance of changes in food trucks. Respondents believe that creatively prepared food from food trucks saves time and provides a sense of familiarity.

The mean score for the variable "food quality" was higher at 4.355. The freshness of ingredients emerged as a significant concern among respondents when considering food truck options, with a mean score of 4.45. Conversely, the attractiveness of food presentation in food trucks obtained the lowest mean score of 4.25. When evaluating food quality, various material and immaterial product aspects, including the product itself, production environment, product-packaging system, and product market system, need to be considered (Margherita, 2010).

Lastly, the variable "Price and Value" obtained a mean score of 4.252. The highest mean score of 4.31 was associated with the perception that the food provided by food trucks must be worth the value of the money paid. As opposed to that, the lowest mean score of 4.22 was linked to the expectation that menus in food trucks should be easily readable and detailed. Value pricing, which prioritizes consumer needs, allows businesses to set prices based on what they believe customers should pay for a product (Bloomenthal, 2022). When the price is reasonable, customers are satisfied with the quality of the product and the value of their purchase. Additionally, a fair pricing strategy facilitates adjustments to prices when necessary. Customers experience satisfaction when the value-to-price ratio meets or exceeds their expectations.

The result for reliability test was summarized in the Table 3 as below.

Table 3: Reliability of statistics of the Independent Variable (IV) and Dependent Variable (DV).

Item	Number of Item	Cronbach's Alpha Coefficient	Strength of Association
Service Quality	5	0.832	Very good
Food Quality	4	0.797	Good
Price and Value	5	0.832	Very Good
Customer Satisfaction	4	0.758	Good

Table 3 provides the reliability and validity of the questionnaire used in the study. The Cronbach's Alpha coefficient was calculated to assess the internal consistency of the items. For the Service Quality and Price and Value items, Cronbach's Alpha coefficient yielded a value of 0.832, indicating an excellent and outstanding result. Similarly, for the item of Food Quality, the Cronbach's Alpha coefficient was 0.797, and for Customer Satisfaction, it was 0.758. Both coefficients indicate a "good" level of strength of association. The different number of items in each variable should be noted, with Service Quality and Price and Value comprising five items, while Food Quality and Customer Satisfaction have four items.

Overall, the coefficients obtained for the variables demonstrate acceptable and reliable results. The high Cronbach's Alpha values suggest the questionnaire consistently measured the constructs under investigation. Consequently, the questionnaire administered to the 384 respondents can be deemed trustworthy and suitable for conducting the research. These findings indicate that respondents understood the questions and responded acceptably, confirming the questionnaire's reliability.

Pearson correlation analysis was employed to examine the statistical significance or strength of the relationship between the independent variable (IV) and dependent variable (DV). The results of the Pearson correlation analysis are presented in Table 4.

Table 4: Pearson’s correlation between Service Quality, Food Quality and Price and Value on Customer Satisfaction.

		Customer Satisfaction
Service Quality	Pearson Correlation	.519**
	Sig. (2-tailed)	<.001
	N	384
Food Quality	Pearson Correlation	.584**
	Sig. (2-tailed)	<.001
	N	384
Price and Value	Pearson Correlation	.584**
	Sig. (2-tailed)	<.001
	N	384

** . Correlation is significant at the 0.01 level (2-tailed).

Table 4 presents the Pearson correlation coefficients for the variables under investigation. All correlation coefficients reported in the table are statistically significant at the $p < .001$ level, indicating a high confidence level in the observed relationships. The results reveal that Food Quality and Price and Value share a Pearson correlation coefficient of .584**, while Service Quality has a correlation coefficient of .519** with the other variables. These findings suggest a positive association between the variables, with moderate positive correlations observed. The positive values indicate that the other variables also tend to increase as one variable increases. The magnitude of the correlation coefficients implies a moderate strength of the relationships between the variables. Overall, the analysis highlights significant positive correlations among the variables, underscoring the interconnectedness and interdependence of Food Quality, Price and Value, and Service Quality in the study context.

DISCUSSION AND RECOMMENDATIONS

According to the study's results, a moderate strength of the relationship was found between customer satisfaction and service quality ($r = 0.519$, $n = 384$, $p 0.001$). This finding indicates that employing food trucks, service quality and customer satisfaction have a positive and substantial link in Kota Bharu, Kelantan. When the performance of the food truck meets or exceeds customer expectations, it leads to customer satisfaction. This findings is supported the previous study by Kataria and V.Saini (2019). Furthermore, the study also found evidence supporting H2, it suggests a connection between the calibre of the cuisine and client happiness. The findings showed a moderately strong correlation between customer satisfaction and meal quality ($r = 0.584$, $n = 384$, $p 0.001$). This finding suggests that there is a significant and positive relationship between customer satisfaction and the caliber of food served by food trucks in Kota Bharu, Kelantan. This finding validated from the previous scholar research by M. Henchion et al. (2014).

Additionally, the study examined the relationship between price and value of food and customer satisfaction, as suggested by H3. The analysis revealed a similar strength of the relationship between price and value and customer satisfaction as the service quality relationship ($r = 0.519$, $n = 384$, $p < 0.001$). This result indicates that the price and value of food served by food trucks also significantly influence customer satisfaction. This finding is supported by the previous study by Shin et al. (2018). Overall, the findings support the hypotheses and demonstrate the importance of service quality, food quality, and price and value in determining customer satisfaction when using food trucks in Kota Bharu, Kelantan.

This study has certain limitations that should be acknowledged. Firstly, the research was limited to respondents residing in Kota Bharu, Kelantan, which may restrict the generalizability of the findings to a broader population. Therefore, it is recommended to include participants from various locations across Malaysia rather than focusing solely on one specific region as to enhance the comprehensiveness and representativeness of future studies. This strategy would provide a more comprehensive understanding of consumer satisfaction with food trucks in the country.

Secondly, data was collected through a Google Form distributed via social media platforms. While this method offers convenience and wide accessibility, it poses potential challenges regarding respondent comprehension of the survey questions. Respondents may need help navigating the lengthy questionnaire, leading to potential response biases or incomplete data. In order to mitigate these limitations, future studies could consider conducting face-to-face interviews or surveys in an actual setting. This method would allow respondents to seek clarification or ask questions in real time, ensuring a better understanding of the questionnaire and improving the quality of the collected data.

By addressing these limitations in future research, a more comprehensive and robust understanding of consumer satisfaction with food trucks can be achieved, encompassing a broader population and employing data collection methods that promote more transparent comprehension and greater respondent engagement.

CONCLUSION

In conclusion, this study explored the factors influencing consumer satisfaction with food trucks in Kota Bharu, Kelantan. The findings revealed valuable insights into the key determinants of customer satisfaction in this context. The results demonstrated that service quality, food quality, price, and value significantly influence customer satisfaction. Specifically, factors such as knowledgeable and attentive staff, detailed information about the menu and ingredients, freshness of ingredients, and reasonable pricing were found to impact customer satisfaction positively.

The study's findings add to the body of research by offering concrete proof of the elements that influence consumer happiness in the food truck sector. The results emphasize the importance of delivering high-quality services, ensuring the freshness and presentation of food, and offering competitive pricing to meet customer expectations. These findings can guide food truck operators, policymakers, and industry stakeholders in enhancing their strategies and practices to maximize customer satisfaction and loyalty. Overall, this study contributes to the body of knowledge on customer satisfaction in the food truck industry and provides practical implications for food truck operators and policymakers to enhance the overall dining experience and meet customers' evolving expectations.

ABSTRACT

Food safety is a great concern to consumers in terms of the nature of the food that allows consumers to have negative health effects. There are many cases related to food poisoning that happen due to poor hygiene practice and lack of understanding about food safety. The goal of this study is to examine the relationship between the food quality, service quality and restaurant ambience among consumer perception of food safety. The questionnaire is distributed to the 384 respondents at Kota Bharu, Kelantan. The analysis for this study is using SPSS software version 2.4. This study analyzed the descriptive analysis, reliability test, and Pearson's correlation analysis. This empirically finding service quality and consumer perception is good to support the hypotheses for this study. Therefore, food quality, service quality, and restaurant ambience can influence the customer perception of the casual dining restaurant.

Keywords: Food Safety, Consumer Perception, Food Quality, Service Quality, Restaurant Ambience, Kota Bharu, Casual Dining Restaurant

INTRODUCTION

Food safety is of great concern to consumers in terms of the nature of the food that allows consumers to have negative health effects. Therefore, food safety is an important consideration while handling it, especially in settings where it is served, such as street food. To avoid exposing consumers to foodborne pathogens that can cause food poisoning and negatively impact human health, food safety is a crucial issue that must be treated carefully (Fatin et al,2021). This study intends to investigate the consumers' perception of food safety at restaurants in Kota Bharu, Kelantan. In addition, consumers care about how well they grasp hygienic procedures and food safety. Furthermore, food safety not practiced correctly when food handlers do not comply with personal hygiene such as washing hands before preparing food will cause-contamination through direct contact between raw materials and cooked food, and unsanitary food preparations place (Chang et al., 2014). During the Covid-19 pandemic, the number of incidents of food poisoning decreased by 31.6%, from 288 cases in 2020 to 197 cases in 2021. But the number of food poisoning cases during Ramadan increased from 22 cases in 2020 to 39 cases in 2021 because them not washing their hands before and after preparing food, using the same utensils for raw food, and not following standard operating procedures and adopt a new norm in the bazaar (Abdullah, 2022).

There are three objectives of this research:

1. To examine the relationship between food quality and the consumer perception of food safety.
2. To examine the relationship between service quality and consumer perception of food safety.
3. To examine the relationship between restaurant ambience and consumer perception of food safety.

Significant of the Study

Community

Information on consumer perception about food safety can bring benefits for the surrounding community and will continue to be aware of food safety in the future.

Restaurant Industry

The benefits and disadvantages of the emerging industry must be evaluated against potential difficulties, one of which is identifying potential food safety issues that can affect consumer health.

Food Handling Practice

The cleanliness of the food prepared in restaurants nowadays and how to handle the food is important. Poor personal cleanliness among food handlers, incorrect refrigerator temperatures, lack of understanding about food safety, and faulty cooking all increase the risk of foodborne illness in restaurants (Collins, 1997).

LITERATURE REVIEW

Food Quality

Food quality must be consistent and reliable when providing to consumers in terms of freshness, temperature, taste, and presentation (Namkung & Jang, 2007). When choosing a restaurant to eat, consumers are more likely to think about the food's quality because it will help them form a favorable impression.

Based on a study conducted by (Sulek & Hensley, 2004), the most crucial element that might affect consumer impression and the reason why people choose a restaurant, they discovered is the food quality. Additionally, it is backed by (Ha & Jang, 2010), which found a connection between customer loyalty and food quality.

Service Quality

Service is an intangible or performance that one party offered to consumers. Service quality is a valuable characteristic and features which are important such as reliability, responsiveness, and empathy. For example, for tangibility it can provide a physical facility and facilitating goods. Consumers who always look in a product such as food to know how the service that will provide in restaurant.

Therefore, a restaurant who given a good service quality in terms of food safety will be able to maintain a loyal consumer. While poor service quality can lead the consumers to choose the other restaurant.

Restaurant Ambience

Restaurant ambience plays an important role in creating a restaurant's reputation and luring diners in. Customers will visit restaurants if the exterior and interior are appealing. (Omar et al., 2015). A clean and safe ambience will guarantee food safety in the restaurant.

Customers might not come to a restaurant just for the cuisine on their first visit, but additional elements like an appealing exterior design, favorable media coverage, or word-of-mouth recommendations. The customer's view of the eating experience must be influenced by the decor, atmosphere, and service standards. The environment affects how diners react and judge a restaurant (Lim, 2010).

Consumers Perception of Food Safety

Perception is a major psychological factor influencing people's purchase decision (Kotler & Armstrong, 2011). It is described as the act of seeing and understanding environmental information via the use of the four senses of vision, listening, tasting, and touching. Consumers' perception of food safety and their inclinations to purchase as well as their understanding of how high food hygiene standards affect the environment and society.

Research Hypothesis

In this study, there are three hypotheses that have been tested:

H1: There is a significant relationship between food quality and consumers perception of food safety at restaurants in Kota Bharu, Kelantan.

H2: There is a significant relationship between service quality and consumers perception of food safety at restaurants in Kota Bharu, Kelantan.

H3: There is a significant relationship between restaurant ambience and consumers perception of food safety at restaurants in Kota Bharu, Kelantan.

Research Framework

The relationship between the study's variables has been investigated using a research framework. The independent variables that have been proposed

consist of three which are food quality (Huang et al., 2004; Mohi, 2012; Shaharudin et al., 2011), service quality (Parasuraman et al., 1985 & 1988), and restaurant ambience (Heung & Gu, 2012; Jalil et al., 2016; Kement et al., 2021; Stroebele & De Castro, 2004; Wu & Mohi, 2015). On the other hand, a dependent variable is consumer perception of food safety.

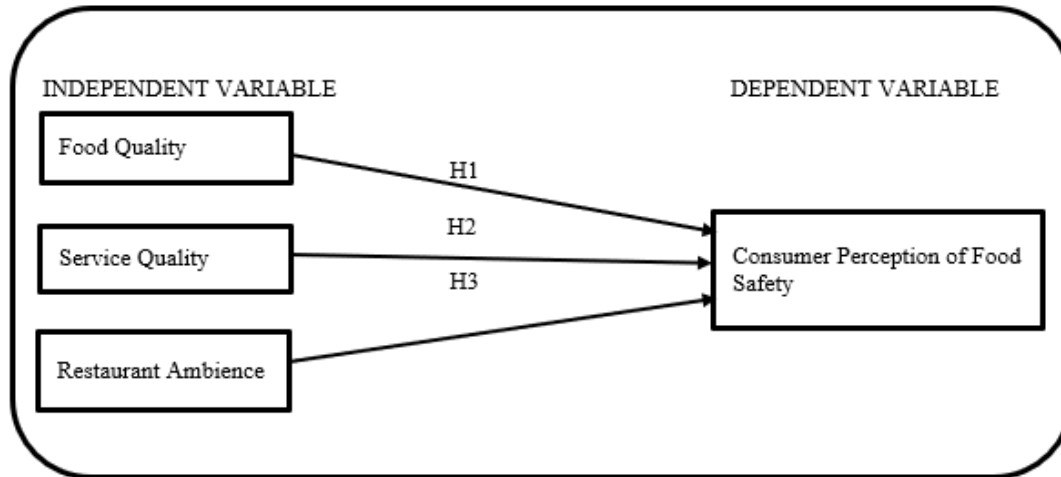

Figure 1: Conceptual Framework Consumer Perception of Food Safety at Restaurant in Kota Bharu, Kelantan

METHODOLOGY

Research Design

The quantitative research method will be used in this study. This research utilized a questionnaire to perform the survey. The questionnaire was created to elicit all data relevant to the objectives of the study. The survey was divided into six sections: section A covered demographic background; section B covered frequency and reasons for dining at casual dining establishments; section C covered food quality; section D covered service quality; section E covered restaurant ambience; and section F covered consumer perceptions of food safety. In the section, the Likert Scale was used to calculated on a 5-point scale (1 strongly disagreed to 5 strongly agreed).

Data Collection

Primary data is the use for this research. Primary data are those gathered by the researcher directly from sources like questionnaires. The questionnaire will be conducted online for respondents. In addition, this research provides 20 questionnaires. The pilot study was also used for testing the questionnaire to get useful feedback from respondents and the researcher can revise and improve the questions before publication.

Sampling

In this study, convenience sampling was used. Because not everyone has an equal chance of getting chosen, it will be chosen using non-random criteria in a convenience sample. The targeted population are the consumers who eat at casual dining restaurants around Kota Bharu, Kelantan. Sample size is a subset of the population needed to ensure that information is sufficient. Due to the large number of people in Kota Bharu, Kelantan which are 363,000 persons (DOSM, 2023). Therefore, 384 participants from the table in (Krejcie & Morgan's, 1970) constitute the proper sample size for this investigation. Convenience sampling is a technique used to collect data from a group of readily accessible respondents. Due to its speed, simplicity, and low cost, it is the most popular sampling technique (Sukhtatme, 2008).

Data Analysis

In this study, three different forms of data analysis were used: descriptive analysis, reliability analysis, and Pearson correlation. The results were examined using SPSS version 24, a Statistical Programme for Social Science, to analyze the information collected from the questionnaire.

The descriptive analysis includes the central tendencies and the measure of variability. Standard deviation, variance, minimum and maximum variation, kurtosis, and skewness are among the measurements of variability, whereas mean, median, and mode are among the indicators of central tendency. Researchers can understand the data more efficiently by using descriptive analysis. The average was evaluated as Strongly Disagree 1.00–1.80, Disagree 1.8–2.60, Neutral 2.6–3.40, Agree 3.4–4.20, and Strongly Agree 4.21–5.00.

Reliability analysis means the verifying the general, group and specific factors among the items, as the consistency of the result in the factors from test to test. In this study, Cronbach's Alpha was utilised to evaluate the questionnaire's reliability. The association's strength is classified as follows: <0.6 poor, 0.6 to <0.7 moderate, 0.7 to <0.8 good, 0.8 to <0.9 very good, and 0.9 excellent.

The Pearson Correlation method, which was the most widely used method for analyzing numerical variables, was given values between 0 and 1, with 1 signifying total positive correlation and 0 denoting total negative correlation (Boslaugh et al., 2008). In the following interpretation, a correlation value of 0.7 between two variables indicates a significant and positive relationship between them (Steven Nickolas, 2021).

FINDINGS

Table 1: Demographic Analysis

Demographic	Categories	Frequency (N)	Percentage (%)
Gender	Male	156	40.6
	Female	228	59.4
Age	Below 18	16	4.2
	18-24	267	69.5
	25-34	70	18.2
	35-44	21	5.5
	45 and above	10	2.6
Race	Malay	269	70.1
	Chinese	55	14.3
	India	58	15.1
	Others	2	0.5
Marital Status	Married	52	13.5
	Single	332	86.5
	Others	0	0
Education Level	Primary School	5	1.3
	Secondary School	57	14.8
	Diploma	66	17.2
	Degree	243	63.3
	Masters	8	2.1
	PhD	5	1.3
Occupation Level	Students	169	44.0
	Employed Part Time	105	27.3
	Employed	93	24.2
	Unemployed	16	4.2
	Retired	1	0.3
	Income Level	Below RM2000	176
RM2001-RM3000		145	37.8
RM3001-RM4000		42	10.9
Above RM4000		21	5.5

The demographic analysis of the respondents is shown in Table 1. That show that out of 384 respondents, there were 59.4% more female respondents than male respondents 40.6%. The age group with the greatest percentage, 18 to 24 years old, had a rate of 69.5%. The second largest percentage, 18.2%, was among those between the ages of 25 and 34. The third age group, 35 to 44, has 5.5%. 4.2% of people are below 18 in the fourth age group. The lowest percentage, 2.6%, was found in people over the 45 and above. Most of the respondents that were involved were Malay, which consists of 70.1%. The second highest was Indian, which made up 15.1%. The remaining respondents were Chinese and other races, which consists of 14.3% and 0.5% respectively. For marital status, 86.5% were single. 13.5% were married, and 0% were others. For education level, the highest 63.3% degree. Diploma 17.2%. Secondary school which is 14.8%. Master which is 2.1%. Primary school and PhD have the same percentage which is 1.3%. Meanwhile, for occupation level, the largest percentage with 44.0% which is students compared to retired which the lowest with 0.3%. In between, employed part time is 27.3% and employed is 24.2%. The unemployed, which is next lowest with 4.2%. For income level, 45.8% of

the respondents gain salary below RM2000. 37.8% gain salary between RM2001-RM3000. 10.9% gain salary between RM 3001-RM4000. While only 5.5% gain salary above RM4000. This statistic represents the actual demographic consumer perception of food safety at casual dining restaurants in Kota Bharu, Kelantan.

Table 2: Descriptive Analysis

Variables	N	Mean	Standard Deviation
Food Quality	384	4.39	0.602
Service Quality	384	4.14	0.495
Restaurant Ambience (Casual Dining)	384	4.34	1.488
Consumers Perception of Food Safety	384	4.25	0.474

Table 2 displayed the total number of respondents, the mean and standard deviation of the independent and dependent variables, respectively. Food quality had the highest mean among the independent (4.39), followed by service quality (4.14), and restaurant ambience (4.34; casual dining). Furthermore, 4.25 was the dependent variable's mean.

Table 3: Reliability Analysis

Variable	Number of Item	Cronbach's Alpha Coefficient	Strength of Association
Food Quality	5	0.700	Moderate
Service Quality	5	0.730	Good

Restaurant Ambience (Casual Dining)	4	0.651	Moderate
Consumers Perception of Food Safety	4	0.704	Good

Table 3 demonstrates that the food quality Cronbach's Alpha coefficient was 0.700, indicating a moderate strength of association. The coefficient found for the questions relating to the food quality variable is thus valid. Second, there is a good strength of association between service quality and the Cronbach's Alpha coefficient of 0.730. The coefficient found for the questions relating to the service quality variable is valid. Thirdly, the Cronbach's Alpha coefficient of restaurant ambience (casual dining) is 0.651 which resulted as moderate strength of association. Thus, the coefficient obtained for the questions of the restaurant ambience (casual dining) variable is valid. Finally, four questions were employed in this study to assess the consumer perception of food safety. With a Cronbach's Alpha coefficient of 0.704 and a good strength of association, consumers' perceptions of food safety are generally positive. The coefficient found for the consumer perception of food safety variable questions is therefore valid.

Table 4: Pearson Correlation Analysis

Variable		R- Value	N	Level
Food Quality	Pearson Correlation	0.416	384	Moderate
Service Quality	Pearson Correlation	0.643	384	Moderate
Restaurant Ambience (Casual Dining)	Pearson Correlation	0.561	384	Moderate

This research aims to identify relationships between the independent variables (food quality, service quality, and restaurant ambience) and the dependent variables (consumers' perception of food safety). Table 4 displays the significant value, number of responses which is 384, and Pearson correlation coefficient. The p-value was 0.000, which was below than the significance

threshold of 0.01. The association between food quality and consumer perceptions of food safety is moderate, with a correlation value of 0.416. The p-value was 0.000, which was below than the significance threshold of 0.01. A moderate association between service quality and consumers' perceptions of food safety was suggested by the correlation value of 0.643. The p-value was 0.000, below the threshold of significance of 0.01. The moderate association between restaurant ambience (casual dining) and consumers perceptions of food safety was shown by the correlation coefficient of 0.561.

DISCUSSION AND RECOMMENDATION

According to the findings, relationship between food quality and consumers perception is moderate ($r=0.416$, $n=384$, $p<0.01$). As a result, food quality plays an important role in consumer perception of food safety at restaurants in Kota Bharu, Kelantan. A study conducted in a restaurant in Spain demonstrates that the people agree that food quality is the most crucial factor in ensuring the safety of food for consumers (Authors, 2012). Second, the finding shows a moderate significant relationship ($r=0.643$, $n=384$, $p 0.01$) between the service quality and consumers perception of food safety in Kota Bharu, Kelantan. In influencing consumer purchase decisions, service quality is a major factor. This is reinforced by a study conducted in an eating area on the island of Mauritius, which found that consumers in Mauritius value this component of service quality more than others, making it the primary factor in determining whether or not they are satisfied with their purchases (Ramseook-Munhurrin, 2012).

The results also show a moderate significant correlation ($r=0.561$, $n=384$, $p 0.01$) between restaurant ambience (casual dining) and consumers' perceptions of food safety. The ambience of a restaurant is crucial to creating a positive first impression and luring diners into impression (Mehrabian et al., 1974). An international study that supports restaurant ambience was conducted in a restaurant in Hong Kong and states that the restaurant's marketing strategies depend not only on the quality and style of the food but also on other attributes like the restaurant ambience created by that restaurant (Chow et al., 2007). This is supported by the fact that the restaurant's marketing strategies depend on these other attributes as well. Based on the results of the data analysis and the preceding case study, it can be said that all the independent variables in Kota Bharu, Kelantan, have a moderate impact on consumers' perceptions of food safety, but the service quality has the greatest impact.

In this study also has its own limitations. The first limitation that had been discovered was the lack of study in this especially in Kota Bharu, Kelantan. Even though there were a lot of restaurants that had been open, it was still hard for this research to be conducted. It was hard for the researcher to collect the data and not all of them were concerned about answering the questionnaire.

In any researcher has their own limitations. Therefore, this study is essential for continuation in future research. The findings reveal that the

independent variable which is service quality was one of the most reasons the respondent goes to the restaurant. Therefore, it is recommended the theoretical for the restaurant to improve the service quality to attract more customers. Furthermore, it is recommended methodologies for future researchers to conduct a systematic review to identify and evaluate the methodological tactics utilized in training programs. Additionally, it is also recommended the practical for the future researchers to develop a safe food handling which is include maintaining personnel cleanliness, preventing cross-contamination, heating the food properly, maintaining food at proper temperature and avoiding consumption of risky food.

CONCLUSION

The purpose of this study is to find out about consumers perception of food safety in Kota Bharu, Kelantan and to see if these variables (food quality, service quality and restaurant ambience) can influence the consumers perception. This finding provides extension information to some antecedent predictions that related to consumer perception of food safety in restaurants. Considering this finding, all independent factors have a marginal impact on the dependent variable, with service quality having the largest impact. To secure the long-term viability of the food industry, knowledge is crucial in the decision-making process.

ABSTRACT

Universiti Malaysia Kelantan gave us the opportunity to conduct research, which satisfies a subject requirement for the Bachelor of Entrepreneurship (Hospitality). Our manager, Mr. Abdullah Bin Muhamed Yusoff, and everyone in our group collaborated to complete the research, and our family was our biggest asset. The data collection has been done through a structured questionnaire and analyzed with SPSS data analysis software.

Keywords: Consumer Knowledge, Perception of Food Image, Acceptance, Traditional Food

INTRODUCTION

Food-related consumer behavior is influenced by personal, cultural, and religious values, and is seen as a symbol of social personality. Malaysia is a multicultural and multiracial country, with over half of the population being Malay. By presenting regional cuisine, it helps to preserve dishes' heritage. Malay cultures adhere to traditional cultural customs, and food neophobia is the inability to ingest or reject novel foods. Fear of having inferior taste may also be related to psychological resistance to change, which has an impact on food availability. Traditional foods are food varieties

enjoyed over a long period of time and by many generations. By preserving cultural legacy, traditional food knowledge transfer (TFKT) could bolster national integrity. Our senses are roused by food, from the flavor to the aroma, presentation, sensation, and crunch. Food follows us everywhere we go, and our memories and digestive systems are affected by our lives. The human senses of taste and smell are intertwined. Traditional food knowledge is the sharing of information, expertise, and culinary skills among family members. Cultural awareness has a big impact on a community's quality of life by boosting a sense of identity, fostering positive relationships, and fostering a stable, peaceful environment. Food literacy is essential to maintaining the unique identity of our food heritage. Perception is the process through which people identify and interpret sensory stimuli. Customers who consumed traditional food in this study were the ones who determined how people perceived the dish's image. Karim and Chi (2010) and Chi et al. (2013) have produced research in this specific area. Malaysian cuisine is varied and influenced by culture, values, and beliefs. Consumers favor high-quality food and are taught about nutrition from a young age. Information about traditional foods is passed down from generation to generation.

There are three objectives in this research:

1. To determine the consumer knowledge towards Kelantan traditional food image.
2. To identify the consumer perception towards Kelantan traditional food image.
3. To analyze the consumer acceptance of Kelantan traditional food image.

SIGNIFICANCE OF STUDY

This study aimed to understand the customer knowledge, food image perceptions and acceptance of traditional Kelantan food. This study provided all communities with useful knowledge of how important traditional food is in each state, as the uniqueness of traditional foods differs from other states. Consumers have learned more about the uniqueness of Kelantan's traditional food. They also learn about introducing food to taste, use of ingredients and how to cook it. This consumer has been known and has an attempt to try the food even if it is not their normal food. Next, the results of this study have helped universities improve their literature on expected outcomes. It helps consumers learn more about traditional foods in terms of taste, types of foods,

cooking methods, etc. This is because different states have different tastes and peculiarities of food. Finally, the study has also informed other researchers on the taste, novelty and consumer attitudes of traditional foods. The results of this study are of particular interest to researchers studying the traditional foods of Kelantan.

LITERATURE REVIEW

PERCEPTION OF TRADITIONAL FOOD

Perceptions characterized as the interaction by which consumers perceive and decipher tangible upgrades. The picture of Kelantan is as yet that of an eco the travel industry objective, not standing endeavors to elevate and draw in individuals to visit Kelantan to advance social the travel industry, including food the travel industry. The perception of traditional food picture not entirely settled by purchasers who devoured food legacy in this review. These consumers perceptions were connected to both worth and quality. Basically, consumers have been more disposed to buy and devour food that is great, solid, and protected to eat. Consumers are more positive about purchasing and devouring solid and great foods. Therefore, the food picture is basically attempting buyers to eat the food.

ACCEPTANCE OF TRADITIONAL FOOD

Malaysia's traditional foods reflect its rich culture, and Kelantan's food is better than Terengganu's. Traditional food data is passed down from one age to another, and past feast encounters familiarize consumers with the food available at an objective. Health conscious consumers are changing their purchasing propensities and looking for items with medical advantages.

KNOWLEDGE OF TRADITIONAL FOOD

The capacity to understand consumer conduct, for example, data search was basic. Information additionally impacts food inclinations on the grounds that social qualities impact information. Traditional food information as trading information, experience, and food abilities between relatives. Traditional food instruction should start from adolescence and go on over the course of life, as it has a critical connection between generations and food legacy. It helps

consumers learn and arrange their social distinctions, and is essential in safeguarding our food's traditional character.

KELANTAN TRADITIONAL FOOD

Kelantan is known as the "Cradle of Malay Culture," on account of its unmistakable social traditional, indigenous habitats, the unmatched neighborliness of local people, as well as its unique foods, all of which impact the state's travel industry improvement. Among popular dishes in Kelantan, for example, are Nasi Kerabu, Laksam Kelantan, Ayam Percik, Kerabu Sare, Kuih Akok, Bahulu, and many others. Besides, a few foods have been assigned as legacy foods by the Jabatan Warisan Negara gateway, including Nasi Kerabu, Nasi Tumpang, Kuih Lompat.

Research Hypothesis

Three hypothesis have been tested in this study, namely:

1. H1: There is a significant relationship between consumer acceptance and traditional food image among consumers in Kota Bharu.
2. H2: There is a significant between relationship between consumer perception and traditional food image among consumer
3. H3: There is significant between consumer knowledge and traditional food image among consumer in Kota Bharu

Research Framework

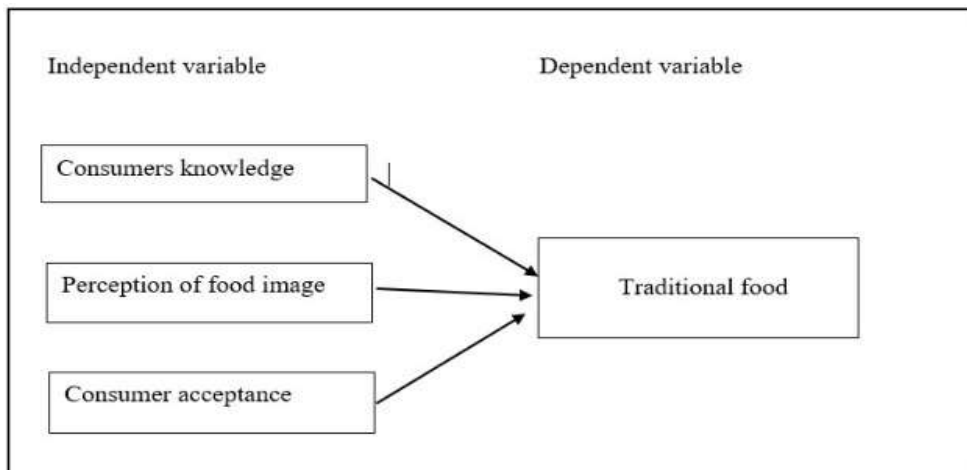

Figure 1: Consumer knowledge, perception of food image and acceptance towards Kelantan Traditional food

The conceptual framework of the study. This conceptual framework presents the independent variables (IV) and dependent variables (DV) of this study. The independent variables were consumer knowledge, perceptions and acceptance of Kelantan traditional foods. On the other hand, the dependent variable (DV) is traditional food. There are three independent variables (IV): consumer knowledge, food image perception, and consumer acceptance, and the dependent variable (DV) is the ratio of Kelantan traditional food to consumers.

METHODOLOGY

Research technique is defined as a highly intelligent movement used to examine nature and matter that controls how information is obtained, analysed, and described (Hernandez, Rangel, & Arandia, 2016). This study aims to better understand consumer knowledge, culinary perception, and acceptability of traditional foods from Kelantan. It is the study of using unbiased and accurate analysis to find solutions to scientific and societal problems. This chapter will address the study's research design, target population, sample size, sampling strategy, data collecting, research instrument, data analysis, and chapter summary.

Research Design

This study design has been carried out to give researchers the proper recommendations for achieving the research objectives or testing the made hypothesis. It is important to certify that the sources used to collect the data are capable of fully answering the study questions. Quantitative research approaches collect data in numerical form and analyze it using mathematical structures, particularly statistics, to shed light on a problem or phenomenon. Quantitative mining uses research methods and uses numeric models as an information retrieval system.

Data Collection

Primary data is gathered from real resources, such as users or other respondents, on the people who make up the target audience for the given review. Data collecting methods include using surveys, one-on-one meetings, Google forms, and review techniques to collect data. In the

interim, all secondary data can be checked from public sources or internal documents, such as books, papers, magazines, and so forth. In addition, it is possible to use review forms, Google forms, and questionnaires for secondary data collecting. This study uses a questionnaire as its primary method of data collection. The researcher used the web (online platform) to adapt the questionnaire and for the data gathering method.

Sampling

Population Size	Variance of the population P=50%					
	Confidence level=95% Margin of error			Confidence level=99% Margin of error

1000000	384	1066	9513	660	1831	16244

The researcher is applying the convenience sampling for this study to select respondents for this survey. Convenience sampling is a non-probability sampling technique in which subjects are chosen based on their ease of access and proximity to the researcher. Using this sampling technique, every person in the selected areas of Kelantan had a chance to be chosen for this study. This type of sampling made it easier for the researcher to collect data, and the data was more reliable. This study's data was gathered from respondents in three different areas of Kelantan. The data was gathered using a questionnaire form. During the sampling procedure, the researcher stayed near the respondents to ask if they had any queries about the questionnaire. The respondent must be familiar with Kelantan's traditional food.

Data Analysis

This survey is analyzed by the Social Science Statistics Package (SPSS) version 23.0. Reliability and validity tests are used in research to measure the strength of questionnaires. Descriptive analysis helps measure the results of this study and answer the research objectives and research questions for which hypothesis testing is performed in this study.

Descriptive tests were used to determine consumers' level of knowledge of Kelantan food heritage, perception of food images, and acceptance of Kelantan food heritage. The data obtained in this study were not normal after analysis by normality test. Users can make tables and pie charts using the program-based data processing and analysis windows known as SPSS. Researchers' use of computers helped them reduce the amount of time and effort needed to gather data and perform quantitative analysis swiftly and simply. To assess quantitative data, the researcher uses Pearson's Correlation, regression, the descriptive statistic, reliability statistic, and more.

FINDINGS

Table 1: Demographic Analysis

Demographic	Categories	Frequency (N)	Percentage (%)
Gender	Male	239	59.8
	Female	163	40.3
Age	Under 20	39	9.7
	20-35	288	71.5
	36-50	68	15.9
	50-65	10	2.5
	Over 65	2	0.5

Race	Malay	222	55.1
	Chinese	43	10.7
	Indian	112	27.8
	Other	26	6.5
Level of Educations	SPM	47	11.7
	STPM	45	11.2
	DIPLOMA	54	13.4
	DEGREE	241	59.8
	MASTER/PHD	11	2.7
	OTHER	5	1.2
Working Status	Full Time	63	15.6
	Part Time	42	10.4
	Self Employed	49	12.2
	Student	249	61.8
Monthly Income	Below RM 1000	279	69.2
	RM 1000-RM 2999	77	19.1
	RM 3000- RM 4999	33	8.2
	ABOVE RM 5000	14	3.5

Table 1 portrays the profile of the respondents. Out of 403 respondents, most of respondents were male which represented 59.8% of the complete example. As far as the respondents age, 9.7% were under 20 years of age, 71.5% were 20-35 years of age, 15.9% were 36-50 years of age, 2.5% were 50-65 years of age and 0.5% were north of 65 years of age. In the mean time, as far as race, the larger part were Malay which is 55.1% trailed by Indian which is

27.8%, Chinese which is 10.7%, and different races which is 6.5%. In terms of respondents by level of education, out of 11.7% were SPM, 11.2% were STPM, 13.4% were DIPLOMA, 59.8% where DEGREE is the highest level. 2.7% were MASTER/PHD, and 1.2% were others of education level. In terms of working status, 15.6% were Full time, 10.4% were Part time, 12.2% were Self employed and 61.8% is the highest working status by Student. In terms of monthly income, 69.2% is the highest by below RM1000, 19.1% were RM1000-RM2999, 8.2% were RM 3000-RM4999 and 3.5% were above RM5000. This statistics nearly represents the actual demographic consumer knowledge, perception of food image and acceptance towards Kelantan Traditional Food.

RESULT OF RELIABILITY TEST

Reliability analysis was utilized to gauge the unwavering quality of the survey. The pilot test has been finished with 30 respondents before the poll was circulated to the 384 respondents through an internet based overview strategy.

Table 2: Result of Reliability Test

Variables	Number of items	Cronbach's Alpha
Consumers knowledge	4	0.619
Perception of food image	4	0.859
Consumers acceptance	4	0.880

Table above shows the general worth of Cronbach's Alpha for the autonomous and subordinate variable in this review. It shows the worth of the survey in the middle of between the

scope of low acknowledgment level (0.619) to extremely high acknowledgment level (0.880). A complete number of three free factors and one ward variable has been tried utilizing Cronbach's Alpha. The primary free factor is consumer knowledge viewed as in moderate stage (4 things; $\alpha = 0.619$). In view of a review that has been finished by Williamson and Hassanli (2020), the examination results on consumer knowledge have viewed as in moderate strength connection ($\alpha = 0.469$).

Pearson Correlation

Pearson's Connection Coefficient is a technique to distinguish the force of affiliation and critical connection between the IVs, middle person, and DV. Pearson's relationship coefficient is the two factors that are partitioned by the result of their standard deviations. Finding the straight connection between two constant variables is utilized.

Table 3: Pearson's Correlation Coefficient

SIZE OF CORRELATION	INTERPRETATION
0.90 to 1.0 (-0.90 to -1.0)	Very high positive (negative) correlation
0.70 to 0.90 (-0.70 to -0.90)	High positive (negative) correlation
0.50 to 0.70 (0.5 to -0.70)	Moderate positive (negative) correlation
0.30 to 0.50 (-0.30 to -0.50)	Low positive (negative) correlation

0.00 to 0.30 (-0.0 to -0.30)	Little if any correlation
------------------------------	---------------------------

Source: Hinkle, Wiersma, & Jurs (2003).

Table 4 : Results of Pearson Correlation Analysis.

	Traditional Food	Consumers Knowledge	Perception of food image	Consumers Acceptance
Traditional Food	1			
Consumers Knowledge		1 0.569**		
Perception of food image			1 0.683**	
Consumers Acceptance				1 0.735* *

****Correlation is significant at the 0.01 level (2-tailed).**

By utilizing Pearson's Relationship examination, it likewise can test the multicollinearity issue between the factors. It typically happens when the connection between's IVs is high. Thus, to keep away from this issue, the coefficient worth shouldn't surpass 0.90. In the event that r is more prominent than 0.00 however under 1.00, there is a positive connection between two factors. The greater the number, the more grounded the relationship. It implies the greater the number can

get the better expectations. Because of the assessment of the strength of straight by utilizing a solitary number that falls inside the scope of ± 1 , Pearson Relationship was liked.

DISCUSSION & RECOMMENDATION

This study discussed consumer knowledge, food image perception, and acceptance of traditional Kelantan food. All data was collected through an online survey using Google Forms, as this study is based on quantitative methods and is more practical in today's context. Google Forms were distributed to her 384 respondents to fill out the Google Forms and collect data for analysis. During the data collection process, researchers faced several challenges.

Most consumers are unaware of the special importance of traditional Malaysian food. Today, the majority of people are turning their attention to viral cuisine, which is growing in popularity. Fast food is preferred over traditional Malay food, especially in Kelantan. Some consumers ignore this Google Form because Malaysians do not know the value of preserving traditional foods. They are more focused on foods that are currently popular and include a variety of viral foods. Therefore, they do not care about the peculiarities of traditional foods, especially Kelantan. Examples of traditional Kelantan dishes include budu, kuih akok, nasi kerabu, and laksam.

The majority of today's young people are unaware of historical and traditional foods. It is due to lack of information about local Kelantan cuisine. They are reluctant to eat this traditional meal until they learn its specialties. Most of them can only appreciate the taste of traditional Kelantan food after trying it for themselves. Nevertheless, the researchers were able to gather his 384 respondents to complete the questionnaire.

Future studies may use this work as a guide and improvement. The study should be strengthened and more useful information should be obtained, according to several recommendations. The

investigation could be carried out utilizing qualitative techniques on certain of them. This will make it simpler for researchers to get information that is more precise and accurate. The respondents are more likely to provide a clear and accurate response during a structured face-to-face interview.

The researcher must next clearly identify the intended target respondent. The targeted target should correspond to the study's title since if the responder is familiar with the topic, it may be easier and faster to find relevant material. If the respondents are still unaware of the sophisticated nature of the study's topic, the researcher would be advised to select a suitable target responder for the study.

Additionally, initial measures include attempting to join active groups associated with the study's subject. In order to help with the search for accurate information, groups can be handed questionnaires and questions pertaining to the research topic can be posed in the 70 group. This is because group members are already aware of the study and could potentially assist in filling out the necessary information.

Finally, the researchers could take into account more factors for future research. The three variables that this study focuses on: customer acceptance, perception of food image and consumer knowledge have only a moderately positive connection with the dependent variables.

Future studies should use this work as a guide and improvement. Qualitative techniques should be used to obtain more precise and accurate information. Target responders should be familiar with the study's topic. Groups should be given questionnaires and questions pertaining to the research topic. Finally, more factors should be taken into account, such as customer acceptance, perception of food image and consumer knowledge.

CONCLUSION

This chapter summarizes the findings of the previous analysis, focusing on the research objectives of determining consumer knowledge towards Kelantan traditional food, identifying consumer perception towards traditional food, and analyzing consumer acceptance of Kelantan traditional food. The study found a moderately positive correlation between consumer knowledge and traditional food in Kelantan, with knowledge influencing food preferences and exchanging knowledge about foods, experiences, and tastes. The perception of food image also showed a positive relationship with traditional food in Kelantan, with sensory evaluation being a crucial parameter. The study also answered the research questions of "What is the consumer perception toward Kelantan traditional food?" and "Does the Kelantan traditional food is accepted among the consumer?". The conclusion of the study is that the perception of Kelantan traditional food is positively correlated with consumer knowledge, perception of food image, and acceptance of traditional food.

FACTOR INFLUENCING CUSTOMER SATISFACTION AMONG MILLENNIALS TOWARD HOMETGROWN CAFE IN KOTA BHARU

Shaza Shahirah, Siti Ainsyah, Siti Mas Ayuni & Siti Nabihah

Faculty of Hospitality, Tourism, and Wellness, Universiti Malaysia Kelantan

Corresponding email:abdullah.my@umk.edu.my

ABSTRACT

A cafe is considered a "third space" in urban life, distinct from work and home, offering a location for individuals to socialize, unwind, and form relationships. However, as coffee shops become more prevalent in metropolitan areas, they are increasingly playing a more comprehensive range of responsibilities and serving as places of business and pleasure, providing social spaces where people may connect and form communities. This study aims to look at the effect of the physical environment, fair pricing, and service quality on millennial customer satisfaction. This study was conducted at a homegrown café in Kota Bharu, Kelantan. Data for this study was gathered online via a Google form. The data gathered from this study was analysed using SPSS software version 26. This study analysis carried out for this study. By using descriptive analysis, reliability testing, and Pearson correlation. The finding of this research showed that all the hypothesis is accepted.

Keywords: Homegrown café, service quality, fair price, physical environment, customer satisfaction

INTRODUCTION

Restaurants are establishments where food is made and provided to patrons. Additionally, the food service facility comprises the location where individual portions are served, whether consumption takes place on or off the premises, and where food is made and intended for individual portion service. A cafe is a small business that offers drinks as well as small meals or snacks. Cafe is a charming establishment that offers quick service and simple cuisine (Andrews, 2009). Nowadays, there is a rapidly expanding interest in and demand for cafes from various groups, including businesses holding meetings, families enjoying valuable time together, and the millennium generation, particularly university students working on assignments and participating in group discussions. In the present, a cafe is seen as a welcoming environment for people to meet and socialize as well as a place that sells hot drinks, snacks, and meals.

At the moment, the millennial generation determines customer volume. According to Kueh and Boo (2009), young adults regularly eat out and order takeaways, making millennials the key target in the food service industry (Gale, 2007; Hume, 2007). Furthermore, millennials have shown to be more adventurous when it comes to trying new foods and restaurants. Millennials tend to be more neophile than previous generations, as well as searching for goods and services that could satisfy their demands (Gale, 2007; Hume, 2007). Moreover, due to the technology-driven society of millennials, they tend to rely heavily on digital information for reviews of restaurants and food items (Kueh and Boo, 2009). As a result, they are likely to be influenced by the content published online and the recommendations of their peerpublished online and their peers when deciding where to dine or what food items to purchase. Therefore, restaurant owners and food companies restaurant owners and food companies need to keep up with the latest trends and technologiesto ensure that their products and services remain

attractive to millennials. In this sense, the locally owned cafe in Kota Bharu pays closer attention to customer satisfaction to build strong customer loyalty.

This study investigates the factor influencing millennials' customer satisfaction toward homegrown cafes in Kota Bharu. This research has targeted millennials who have already come homegrown at Kota Bharu. This research precisely aimed at the responses from millennials about their customer satisfaction at Kota Bharu.

Hence, there are three (3) objectives to investigate the customer satisfaction towards homegrown café among the millennial generation.

1. To examine the physical environment of the Homegrown Café at Kota Bharu, Kelantan affecting customer satisfaction.
2. To examine the relationship between satisfaction service quality toward customer satisfaction
3. To examine the relationship between satisfaction fair price toward customer satisfaction.

Significance of the Study

Customer

As a customer, they need satisfaction toward the food and beverage establishment. Hence, this study can help the customer to become more alert about eating food and concerned about the condition of the dining area and its environment.

Foodservice

Cafés offer various services and matters, affecting patrons' preferences and actions differently. The story of the café, including its lower, middle, and upscale parts, may impact several aspects of young people's intentions.

Future researcher

This study can help the future researcher in comprehending and overcoming the challenges that patrons of food and beverage (F&B) enterprises will confront. They can utilise it as important information as well. As a result, the client may appreciate the value of food, which can also help them appreciate the significance of understanding food quality. Additionally, anyone who desire to launch a food and beverage business will benefit from this study's expertise and recommendations. This research compares cultural variations in consumer intents, values, reasons, and may also include other areas.

LITERATURE REVIEW

Physical environmental

To make structures more environmentally friendly the physical environmental variables have always been significant in building design (Esin & Yüksek, 2008). Despite countless research on how the physical environment of contemporary commercial places influences consumers' perceptual-behavioral performance, it is still a crucial issue (Sun & Yazdanifard, 2015; Yldrm et al., 2020a, 2020b; Wang et al., 2020). According to a study by Yldrm et al. (2019), customer behaviour and perceptual evaluations are directly correlated. This study is study demonstrates the significance of purposeful design employing proper space design concepts demonstrates the significance of purposeful design employing proper space

design concepts. Studies by Mihi et al. (2018), Sun and Yazdanifard (2015), and Yldrm et al. (2015) have found that when the physical environmental characteristics of interior spaces are regarded and valued favourably, individuals may stay in the same place for a longer time. The study by Wang et al. (2020) also focused on a number of physical environmental aspects, including the size and form of the space, the colour, materials, and texture utilised, as well as their impact on people's behaviours and the level of their physical, emotional, and mental well-being.

Service quality

According to a recent study, there is a link between satisfied customers and high-quality services. Orel and Kara (2014) looked into the effect of Turkish customers' loyalty to a supermarket chain in addition to the discussion highlighted above. We utilised functionality, fun, security/privacy, assurance, design, simplicity of use, and personalisation as metrics for evaluating the quality of the services. These researchers discovered that customer happiness and loyalty are both highly impacted by service quality was validated by earlier research from Djatmiko et al. (2015). According to reports, service quality significantly affects price, reputation, customer satisfaction, switch intention, and product quality (Peng et al,2014).

Fair price

Numerous aspects must be considered when determining how prices impact consumer satisfaction. For instance, studies have looked at how elements like fair pricing, price knowledge, and perceived price impact consumer satisfaction. Consumer satisfaction may be influenced by various variables, including product and service quality, price, and personal and environmental situations, according to a study by Wilson, Zeithaml, Bitner, and Gremler (2008). The study's authors place a strong emphasis on cost. Price may influence customer happiness, service quality, product quality, and trust (Adi & Yoestini, 2012; Haghghi, Dorosti, Rahnama, & Hoseinpour, 2012; Kusumanegara & Sutopo, 2012; Runtunuwu et al., 2014). The current investigation found a connection between pricing and consumer satisfaction. Haghghi et al. (2012) determined the degree of restaurant patron loyalty. In their study, food was connected to customer happiness. Customer satisfaction was linked in their study to food quality, price, and service quality.

Customer satisfaction

Customers' experiences after trying out a product or service are used to compile a summary of their comments, known as customer satisfaction. According to Yan and Chau's (2013) research, a customer's satisfaction can also be described as a compilation of their opinions on various aspects of the services they receive, with the customer weighing the difference between the benefits they receive and the costs they pay against the benefits they expected to receive. The significance of measuring and tracking customer satisfaction since doing so can yield essential and crucial information for determining a customer's purchase intention as well as forecasting the customer's propensity to return and make more purchases (Baker & Crompton, 2000. (Petrick, Morais, & Norman, 2001; Jang & Feng, 2007). The positive relationship between customer satisfaction and the intention to return was noticed by Oliver and Burke (1999). As a result, a customer's degree of satisfaction plays a crucial role in determining whether or not they will return to a restaurant. The likelihood of recurring business and product returns is closely correlated with the customer's level of satisfaction.

Research Hypothesis

Three hypotheses have been tested in this study, namely:

H1: There is a significant relationship between the physical environment on customer satisfaction among millennials toward Homegrown Café at Kota Bharu.

H2: There is a significant relationship between service quality on the level of satisfaction of customers among millennials toward Homegrown Café at Kota Bharu Kelantan.

H3: There is a significant relationship between fair prices on the level of satisfaction of customers among millennials toward Homegrown Café at Kota Bharu Kelantan.

Research Framework

A research framework has been conducted to investigate the connection between the variables of the study. The study's dependent variable is the factor influencing customer satisfaction among millennials toward homegrown cafes in Kota Bharu. On the other hand, independent variables included physical environment, service quality, and fair price.

Figure 1: Factor influencing customer satisfaction among millennials toward homegrown café in Kota Bharu

METHODOLOGY

Research Design

This study uses a quantitative approach, and 384 respondents from the millennial generation were given a questionnaire on a locally owned café in Kota Bharu, Kelantan. Young adults in Kelantan are the focus of this investigation. This study was carried out to ascertain the factors impacting millennials' satisfaction with a locally owned café in Kota Bharu, Kelantan. Parts A, B, C, D, and E were used by the researcher to split the questionnaire into four sections. The questionnaire's Part A asked for general information on the respondents' demographic profile, including their gender, age, marital status, and occupation. The questions for Sections B, C, D, and E provide further information on the independent and dependent variables, which are (i) the physical environment, (ii) service quality, (iii) fair price, and (iv) customer satisfaction. This survey has a 5-point Likert scale of agreement and a multiple-choice style.

Data collection

To fill out the data requirements for a non-probability sample with gathers the information utilizing an online questionnaire like Google Forms. Using an online questionnaire and social media platforms that randomly distributed assignments. The intended respondents are both genders and are at least 18 years old.

Sampling

The convenient sampling method were chosen for this study. This sampling method allows every member of the population to have an equal opportunity to be selected. The target population in this research are millennial in Kota Bharu, Kelantan. Based on Krejcie and Morgan (1970) the appropriate sample size for this study is 384 people from a total of 131471 millennials in Kota Bharu, Kelantan. The total number of populations have been derived from the statistic released on millennial in Kota Bharu, Kelantan.

The study's second objective is to investigate factors influencing millennials' usage of a locally owned café in Kota Bharu. Therefore, the study's respondents would be those who had dining experiences at locally owned cafés in Kota Bharu, Kelantan. It employed a Likert Scale to simplify the survey question for responders. It is a 5-point scale inquiry that runs from one extreme attitude to another and is occasionally called a satisfaction scale.

Data Analysis

This study uses four data analysis types: descriptive statistics, reliability statistics, and Pearson's correlation. The data obtained were analyzed by using SPSS version 26. The use of SPSS in the study helps to achieve the research objectives and helps to process the data that obtained.

FINDINGS

Result of Demographic Analysis

Table 1: Frequency Analysis

Demographic	Frequency	Percentage
Gender		
Male	115	29.9
Female	269	70.1
Age		
18- 21 years old	52	13.5
22 - 26 years old	164	42.7
27 - 30 years old	104	27.1
31 - 34 years old	64	16.7
Martial status		
Married	122	31.8
Single	262	68.2
Occupation		
Government sector	41	10.7
Private sector	101	26.3
Self-employed	86	22.4
Student	156	40.6

The gender distribution of the 384 respondents that participated in the data collection is shown in Table 1. Both depict how the respondents in this study were split by gender. Among

the responders, women comprised 70.1% of the total (N=269) while men comprised the remaining 29.9% (N=115).

Table 1 presents the age distribution of a total of 348 respondents collected from the data collection. It show that there were a total of four age groups. The findings showed that, of the 384 respondents, 13.5% (N=52) were between the ages of 18 and 21, which represents the majority of respondents. The age group between 22 and 26 years old came in second with 42.7% (N=164). While 27.1% (N=104) of the population are minors, they are in the 27–30 age range. Next, 16.7% (N=64) of the population are in the 31–34 age range.

The marital status distribution of a total 384 of respondents collected from the data collection. Based on Table 4.3 and Figure 4.3, a total of 98.2% (N=262) reported that they were single. While a small percentage which is 31.8% (N=122) of the total respondents were reported married at the time of the survey.

According the table 1 that represent the occupation distributions of a total of 384 respondents. The highest occupation among the respondents was student with 40.6% (N=156) respondents. The private sector was the second highest number with 26.3% (N=101) respondents. Self-employed represented 22.4% (N=86) of respondents. While there were 10.7% (N=41) of respondents were Government sector.

Result of Descriptive Analysis

Table 2: Descriptive Analysis

Variable	Items	Mean Score	Standard Deviation
Physical environment	The lighting of the cafe while dining in	4.03	0.836
	The decoration of the cafe and the facilities provided	4.13	0.790
	Ambience condition that refers to the music, temperature, and scent	4.02	0.816
Service quality	The responsive provide to the customer by the staff	4.13	0.782
	The staff provide knowledge and help to customer based on the menu	4.14	0.727
	The staff shows the intention of caring with understanding what customers need and wants	4.20	0.717
	The cafe produce promised service	4.27	0.685
Fair price	The food and beverages have good values of money	4.31	0.650

Customer Satisfaction	The price for food and beverages is reasonable	4.28	0.662
	The price provided is acceptable	4.25	0.671
	The food and beverages served fulfilled my satisfaction	4.12	0.746
	Homegrown cafe is the best place to try homemade coffee and food	4.06	0.752
	I will recommend my family, friend, and others to go to the homegrown cafe	4.09	0.738
	I will share my experience through the homegrown cafe	4.10	0.815
	The food quality, service quality, and fair prices in homegrown cafes influence my satisfaction	4.14	0.815
	Homegrown can fulfill the millennial's needs and wants	4.10	0.801

The descriptive analysis that showed independent variables was moderate, with a mean of physical environment, service quality and fair price and the dependent variable was customer satisfaction.

Result of Reliability Analysis

Table 3 below shows the result of the reliability analysis

Table 3: Reliability Analysis

Table 3 shows the results of the reliability test. High internal consistency for all questionnaires used for this study had demonstrated (Cronbach's α ranging from 0.855 to 0.914 alpha coefficients). Reliability analysis ranged by the physical environment, service quality, fair price, and customer satisfaction (0.890, 0.855, 0.858, and 0.914). In measuring the variables that influence customer satisfaction, the result of Cronbach's Alpha has shown reliably that coefficient obtained from the Likert- Scale.

Variables	Cronbach's Alpha	No of items
Physical environment	0.890	3
Service quality	0.855	4
Fair price	0.858	3
Customer satisfaction	0.914	6

Result of Pearson Correlation Analysis

Table 4 below shows the Pearson Correlation Analysis

Table 4: Pearson Correlation Analysis

Hypothesis	Result	Findings of Data Analysis
H1: Physical environment has a moderately positive relationship with customer satisfaction among millennial toward homegrown cafe in Kota Bharu, Kelantan.	$r = <0.635, p <0.00$ Moderate	H1: Supported
H2: Service quality has a moderately positive relationship with customer satisfaction among millennial toward homegrown cafe in Kota Bharu, Kelantan.	$r = <0.577, p <0.00$ Moderate	H2: Supported
H3: Fair price has a moderately positive relationship with customer satisfaction among millennial toward homegrown cafe in Kota Bharu, Kelantan.	$r = <0.595, p <0.00$ Moderate	H3: Supported

Hypothesis 1 the physical environment had positive correlation between customer satisfaction and the physical environment at substantial correlation ($r=0.635, p0.00$). As a result, this study accepts the alternative hypothesis H1a for Hypotheses 2 while rejecting the null hypothesis H0a.

Hypothesis 2 the service quality there is a positive correlation between customer satisfaction and the physical environment at substantial correlation ($r=0.577, p0.00$) As a result, this study accepts the alternative hypothesis H1a for Hypotheses 2 while rejecting the null hypothesis H0a.

Hypothesis 2 the fair price there is a positive association between customer satisfaction and fair price at substantial correlation ($r=0.595, p0.00$). As a result, the researcher accepted the alternative hypothesis and rejected the null hypothesis.

DISCUSSION & RECOMMENDATIONS

The first hypothesis (H1) said that there significant relationship between the physical environments on customer satisfaction among millennials toward homegrown café in Kota Bharu. Table 4.11 shows that the physical environment recorded value of the Pearson correlation is $r = 0.635, p = 0.000$. So the results support the first hypothesis (H1) which says that the physical environment positively affects customer satisfaction.

Also, Hypothesis 2 (H2) said there is a strong positive relationship between service quality and customer satisfaction. Table 4.11 shows that the service quality recorded value of the Pearson correlation coefficient is $r= 0.577, p = 0.000$. So, the result's hypothesis 2 (H2) says that the physical environment positively affects customer satisfaction.

The third hypothesis (H3) said there is a significant relationship between fair prices and customer satisfaction. Based on what was found in Table 4.11 the Pearson correlation coefficient for fair price was found to be $r = 0.595$, $p = 0.000$. So, the result supports hypothesis 3 (H3), which says that fair price is related to customer satisfaction. The study found that all of the variables passed the test of reliability test. As a result of the online survey on Google form, the majority of respondents were between 22 to 26 years old, which is 164 people (42.7%).

The first limitation is that some responders were unaware of the questionnaire. Therefore, the researcher should explain the questionnaire and how it is asked. In addition, some respondents said it took too long to complete the questionnaire. Since it takes between ten and fifteen minutes.

Additionally, quite a few target respondents declined to respond to the questionnaire. Some of them may not be interested in the survey's topic and may believe that participating in the survey will be a waste of time as a result, which might be one of the possible explanations. In addition, some of them may not want to divulge the information and believe that there is no benefit to them in responding to the questionnaire, so they choose not to respond. The other limitation of the study is the limited independent variables that are being tested. Other variables that can have an impact on customers' satisfaction with locally owned cafés are not taken into account in this study. The only three variables under test are fair pricing, physical environment, and service quality. This demonstrates that the research was not carried out completely and properly because it only pays attention to three variables.

CONCLUSION

This study also proposed to examine the factor influencing customer satisfaction (physical environment, service quality, and fair price) among millennials toward homegrown cafes in Kota Bharu. Based on the results, almost all the respondents. Most respondents are very interested in homegrown cafes around Kota Bharu. Respondents also agree that physical environment, service quality, and fair price) have a significant relationship with their satisfaction. They also enjoy the food provided at the homegrown cafe.

ABSTRACT

This study aims to examine the factors affecting student satisfaction in visiting the cafeteria at University Malaysia Kelantan, Bachok. This study focuses on how satisfied students are with their cafeteria experiences. The researcher wants to know the factors affecting students' satisfaction with visiting the University Malaysia Kelantan, Bachok cafeteria. A questionnaire was designed to collect the information. A total of 375 respondents were students from the University Malaysia Kelantan, Bachok, while conducting the research. As for the result, all of the independent variables studied in this research had significant relationships with the dependent variable. The finding of this research showed that all the hypothesis is accepted.

Keywords: Food Quality, Cleanliness, Price Fairness, Facilities, Student Satisfaction, Cafeteria

INTRODUCTION

According to the Euromonitor International report (2019), the food industry is one of the fastest-growing industries in the global market, and it is growing rapidly in Malaysia. Malaysia is quickly advancing in food service, along with developed and emerging countries worldwide. According to the Malaysian Bureau of Statistics (2017), there were 167,490 food service establishments in 2015, up from 130,570 in 2010, representing a 5.1% annual growth rate. Due to the restaurant industry's two fast expansions, dietary preferences and consumer needs are changing.

The food service providers must strategize their operations to increase competition among the university's cafeteria proprietors. The university has made the space available and permits businesses to participate in the cafeteria. Along with offering education, schools also provide a wide range of services for the convenience of their students, including cafeterias, stationery shops, bookstores, and stores that sell computers (Jung, 2013). Universities and colleges are primarily concerned with keeping students with a number of options available to them, making the demands of university students particularly important. Even while offering top-notch instruction is very important to these universities and colleges, some university administrators are starting to understand and value the idea of providing full services on campus, with culinary services having the potential to play a key role. However, due to improvements in the food sector, college students today have experienced far better environments than they did in the past. As a result, the student cafeteria has changed from the past. In addition, the national income has increased.

Higher education institutions offer one of the best chances to change people's eating habits. Mei (2017) reports that 93% of the students he studied said they would purchase their food and beverages at the university. The factors that most impact students' food purchasing decisions are taste, value, cost, and convenience. According to frequent suggestions, the cafeteria can

benefit from lower food prices and a wider choice of foods. According to the student-as-customer (SAC) paradigm, students are the primary consumers of higher education institutions (Kotler & Clarke, 2012). The research of Tekle and Ruth (2007), students place importance on the food's quality, presentation, and cost at their campus café. It is also evident that while choosing a cafeteria, students emphasize their pleasure with the selection of amenities, the environment, and the food's quality. The attention here is also on food selection, food quality, pricing, available facilities, and operation hours. A food service management evaluation at the university cafeteria can be put into place to see the quality of the services offered to satisfy the students' tastes and increase overall satisfaction. Students can use this to evaluate their degree of satisfaction in relation to their goals.

The purpose of this research study is:

1. To investigate student satisfaction with food quality factors at the cafeteria of University Malaysia Kelantan, Bachok.
2. To analyze student satisfaction with cleanliness at the cafeteria of University Malaysia Kelantan, Bachok.
3. To measure student satisfaction with price at the cafeteria of University Malaysia Kelantan, Bachok.
4. To identify student satisfaction with facilities at the cafeteria of University Malaysia Kelantan, Bachok.

Significance of The Study

This study identifies the satisfaction of students using the cafeteria at the university. In industrial services, perceived quality is considered one of the most important predictors of customer satisfaction. Perceived quality can be further divided by restaurant environments, such as food, cleanliness, price and convenience. This study aims to understand how students buy products and services and what factors can influence them when purchasing products or services. This study also found a relationship between product availability and purchase on student satisfaction.

LITERATURE REVIEW

Food Quality

According to the STANDS4 LLC (2022) research, food quality is referred as a characteristic of food quality that consumers feel is acceptable. These include extrinsic qualities like look, texture, flavor, and internal and external grade standards. The Food Safety Act of 1990 regulates food quality in the United States. Many customers depend on manufacturing and processing standards to determine what ingredients are present for dietary, nutritional, or medicinal reasons.

Based on their distinctive color and appearance, caterers decide which food products to display and sell in the food service sector. This helps catch the user's attention, influencing their decision on whether or not to buy. A good predictor of whether or not a customer will return to a particular restaurant is the quality of the food, which is regarded as one of the important aspects in influencing customer happiness. Research by Lee (2004) and Andaleeb and Caskey (2007) found that the majority of students claimed they would utilize the on-campus food service more frequently if the meal quality improved. In order to influence student happiness, food service administrators, especially those in the institutional food service sector, must have

a deep awareness of students' needs and preferences. as in university dining halls (Ng, 2005; Xi & Shuai, 2009).

A competent food service system can reportedly make students more comfortable and can also reflect well on an institution, according to research by Nuzul and Nor Afini (2016). The cleanliness of the cafeteria itself is the primary aspect of providing quality meal service. While the findings of Jian and Sameeha's (2014) study show that the cafeteria's expanding food selection will result in greater student satisfaction with food service. For instance, if students rate the cafeteria's quality of food service, the satisfaction level is likewise very high. From this, it is clear that maintaining and raising the caliber of the service will result in customers being satisfied with the meal they receive.

Cleanliness

In the course of this study, which was carried out in the cafeteria of the UKM residential college, the researcher discovered that there was unpacked equipment that was not being utilized by the cafeteria, uncovered garbage cans, a dirty floor, and no insect deterrents. This is due to the fact that it is the primary cause of foodborne illness transmission. In order to ensure that the food served must be pure, clean, and safe to eat in order to prevent this foodborne illness, the researcher believes cafeteria owners need to strengthen personal and environmental hygiene protocols and impart knowledge to each of their personnel. The researcher concluded that the personal hygiene practices of food handlers and the cleanliness of the cafeteria has a moderately strong, statistically significant, and beneficial link.

The health status of students or users is positively correlated with the cleanliness of the environment and the equipment, according to Mohd Said et al. (2008). According to the study, cafeteria managers need to be aware of how crucial good hygiene is to students' health. Employers must also ensure no animals are allowed to roam around the cafeteria. According to a study by Mohd Rizal and Nurulaini conducted at the UTM Campus Cafeteria, Skudai, some participants report feeling uneasy when animals roam the dining area since it can impair their appetite. This study used a quantitative research design and a survey approach to collect data using an online questionnaire. The study results found that the most dominant factor is personal hygiene, controlling food and the environment that affects food hygiene.

Based on research conducted by Mohamed et al., (2022) prove that environmental hygiene factors are found to have a significant relationship with students' health levels. Suppose a place that prepares food or drinks is clean and has a welcoming ambiance, such as a cafeteria, restaurant, or similar establishment. In that case, it will significantly impact the people that enter it. As a result, a venue that produces, serves, and sells wholesome, hygienic food or beverages in a setting that adheres to excellent hygiene guidelines is referred to as a clean and healthy site. According to a study done at Awan University, it is important to take cafeteria hygiene factors seriously because they significantly impact students' health when they are served food and beverages. These factors include the food handlers' personal hygiene, the cafeteria's cleanliness, and the knowledge of the food handlers.

Price Fairness

Bowen & Makens (2013) state that one of the key elements influencing how consumers perceive a product's price in terms of quality and value for money is its cost. Price is the amount paid for products or services or the value customers pay for owning or utilizing a good or service. According to a study by Mursalina and Simanjuntak (2021), pricing perceptions, which include affordability, price appropriateness, excellence, and quality that is judged acceptable by consumers, must consider customer buying interests. For instance, price influences the

decision-making process for food services and is also considered once a decision is made, allowing for comparing the many features.

Price is the top student issue in a university food service because students buy meals on a tight budget. Additionally, they stated that if on-campus eating costs were too high for students, they would buy food off-campus instead, where it would be a lower price. In addition, the price offered with a fair and fixed pricing significantly impacts student satisfaction, and it makes sense for customer satisfaction if the price provided is appropriate and fair.

Facilities

Facilities are products or services that help a business achieve its objectives. Most organizational structures provide amenities that help tenants accomplish their business goals (Amilia Hasbullah, 2011). Most faculty canteens still don't meet the physical requirements to be able to offer food services that can satisfy students since the criteria include building and facility components that don't match the standards. Similar to the canteen, several areas still have low ceilings, dim lighting, and few dining areas with tables and chairs.

The cafeteria's primary purpose is to give students and lecturers a place to eat and relax between lessons. Therefore, the cafeteria should first and foremost offer a range of seating. While comfortable sitting is preferred to maximize the user's safety, this can be in the shape of stools, benches, or chairs.

Student Satisfaction

The areas of satisfaction that have received the most attention regarding food service include food quality, cleanliness, price fairness, and amenities. The study's results were thought to help other university administrations include more indicators to boost student satisfaction with their cafeteria services (Chang et al., 2014). The research varies from most others in that it focuses on students' satisfaction from the standpoint of consumer satisfaction rather than providing a standard definition of students' pleasure (Hom, 2002).

In addition to presenting a selected and adjusted definition of student satisfaction, it also presents the client's viewpoint. The current environment of the tertiary education marketplace, where their views on services have to be taken into account and acted upon since they are also fee payers, has created a trending moral prerogative for students who are viewed as customers, despite the risks associated with doing so (Imran, 2018). Customer satisfaction is a customer's view followed by expectations and the experiences of post purchases as per the research conducted by Suchanek and others (Suchanek et al., 2017).

Research Hypothesis

The hypothesis is a prediction or explanation of the relationship between two variables. It implies a systematic relationship between an independent and dependent variable exists. Thus, these are the proposed hypothesis:

H1: There is a relationship between food quality of student satisfaction at the cafeteria of University Malaysia Kelantan, Bachok.

H2: There is a relationship between cleanliness of student satisfaction at the cafeteria of University Malaysia Kelantan, Bachok.

H3: There is a relationship between price fairness of student satisfaction at the cafeteria of University Malaysia Kelantan, Bachok.

H4: There is a relationship between student satisfaction facilities at the University Malaysia Kelantan, Bachok cafeteria.

Research Framework

Figure 1 below shows the research framework used for this study

Figure 1: Relationships between the Independent Variables and Dependent Variable

Sources:

There were four independent variables (IV) determined by this study which are food quality, cleanliness, price, and facilities. The dependent variables (DV) include student satisfaction visits to the cafeteria at University Malaysia Kelantan.

METHODOLOGY

Research Design

This study uses a quantitative method where a questionnaire was distributed to 375 respondents who used the cafeteria at University Malaysia Kelantan, Bachok. This study's target population is all University Malaysia Kelantan, Bachok students. This study was conducted to determine the factors that affect students' satisfaction in the cafeteria. The researcher divided the questionnaire into four parts, namely parts A, B, C, D, E and F. For Part A, the questionnaire asked for general information about the demographic profile of the respondents, such as gender, age, race, year of study and faculty. For Sections B, C, D, E and F, the questions elaborate on the dependent and independent variables, which are (i) Food Quality, (ii) Cleanliness, (iii) Price Fairness, (iv) Facilities, (v) Student Satisfaction. This questionnaire uses a multiple-choice format and a 5-point Likert scale of agreement.

Data Collection

Data collection is the most essential analysis to determine the problems. Data collection aids a person or organization in answering essential questions, evaluating outcomes, and forecasting future probability and trends. Data collection is taken online only. The online questionnaire has been sent via WhatsApp to all students of UMK Bachok. It can save time, energy and is easily accessible in all locations with an internet network.

Sampling

The sampling method used in this study was the probability sampling technique which was simple random sampling. The study uses this method because questionnaires are prepared and distributed online to collect information from respondents. Questionnaires were allocated randomly to all Universiti Malaysia Kelantan, Bachok students who use the cafeteria.

Data Analysis

This study uses four data analysis types: descriptive statistics, reliability statistics, and Pearson's correlation. The data obtained were analyzed by using SPSS version 25. The use of SPSS in the study helps to achieve the research objectives and helps to process the data that has been obtained.

FINDINGS

Result of Demographic Analysis

Table 1: Frequency Analysis

Demographic	Frequency	Percentage
Gender		
Male	163	43.5
Female	212	56.5
Age		
18-20 years old	28	7.5
21 - 23 years old	250	66.7
24 - 26 years old	85	22.7
27 - 29 years old	12	3.2
Race		
Malay	217	57.9
Chinese	64	17.7
Indian	88	23.5
Other	6	1.6
Year of Study		
Year 1	59	15.7
Year 2	115	30.7
Year 3	148	39.5
Year 4	53	14.1
Faculty		
Faculty of Creative Technology Warisan (FTKW)	139	37.1
Faculty of Architecture and Economics (FSE)	124	33.1
Faculty of Language Studies and Human Development (FBI)	112	29.9

A total of 375 questionnaire sets were assigned through the online platform. This portion contained the respondents' contextual profiles. This section focuses on the demographic profile and background of the respondents, including gender, age, race, year of study and faculty.

Table 1 shows the summarized demographic results of the respondent's profiles. The total number of male respondents is 163, while the total number of female respondents is 212. Male respondents comprised 43.5% of the total 375 respondents, while female respondents comprised 56.5%.

As shown by Table 1, the data revealed that the majority of those who answered the questionnaire were between the ages of 21-20 years old, with 250 people answering and a response rate of 66.7%. Then came the 24-26 age group, which had 85 responders and a 22.7% response rate. The age group of 18-20 years old had 28 respondents and a response rate of 7.5%. Finally, 12 people in the 27-29 age group answered the survey, accounting for 3.2% of all respondents.

With 217 responses, the data shows that Malays form most of those who participated in the race (57.9%). Indians came in second with 88 replies, accounting for about 23.5%. The Chinese were next, with 64 answers representing 17.7 percent of the total and six respondents representing 1.6 percent of the total from other races.

At an educational level, most respondents are studying in year 3, with 148 respondents and a value of 39.5%. Respondents from studying in year 2 came in second with 115 respondents and a value of 30.7%, followed by respondents from the study in year 1 with 59 respondents and a value of 15.7%. Finally, studying in year 4 had the lowest response rate, with 53 people responding for a total of 14.1%.

According to the table, the total number of Faculty of Creative Technology Warisan (FTKW) respondents is 139, while the total number of Faculty of Architecture and Economics (FSE) respondents is 124, and the Faculty of Language Studies and Human Development (FBI) is 112 respondents. Faculty of Creative Technology Warisan (FTKW) respondents comprised 37.1% of the total 375 respondents, while the Faculty of Architecture and Economics (FSE) respondents comprised 33.1%, and the Faculty of Language Studies and Human Development (FBI) respondents comprised 29.9%.

Result of Descriptive Analysis

Table 2: Descriptive Analysis

Variable	Items	Mean Score	Standard Deviation
Food Quality	The appearance of the food is good.	4.10	0.793
	The taste of the food is good.	4.06	0.830
	Food quality is always the same.	4.04	0.896
	Variety of food on display.	4.12	0.784
Cleanliness	The dining area in cafeteria restaurants is virtually clean.	4.04	0.868
	The staffs are clean and neat.	4.06	0.831
	Cleanliness is good.	4.06	0.884
	Food cleanliness.	4.10	0.844
	Eating utensils' cleanliness.	4.07	0.871
Price Fairness	The price of food is written clearly on the menu.	4.10	0.892

	The price is reasonable for the portion served.	4.06	0.837
	I consider the food's price acceptable.	4.12	0.800
	The quality of food is suitable for the price paid.	4.11	0.803
Facility	I always have a place to sit.	4.14	0.752
	The seats are comfortable.	4.13	0.789
	Physical environment.	4.10	0.826
	I like the decorations in the cafeteria.	4.07	0.891
Student Satisfaction	I am pleased with what I get and what I pay.	4.14	0.779
	The staff are friendly.	4.17	0.772
	I feel easy to talk with staff when I'm served.	4.17	0.784
	The serving line move fast.	4.07	0.836

The descriptive analysis that showed independent variables was moderate, with a mean of food quality at 4.083, cleanliness at 4.066, cleanliness at 4.2682, price fairness at 4.0975 and facilities with a 4.112 mean. Furthermore, the means dependent variable verified student satisfaction of 4.1375 as a sub-variable.

Result of Reliability Analysis

Table 3 below shows the result of the reliability analysis

Table 3: Reliability Analysis

Variable	Number of Items	Cronbach Alpha
Food Quality	4	0.765
Cleanliness	5	0.797
Price Fairness	4	0.817
Facilities	4	0.826

In this variable, the number of items is as follows: food quality (4), cleanliness (5), price fairness (4), and facilities (4). The reliability analysis was conducted in this analysis to determine Cronbach's Alpha values for all variables. The values are as follows: food quality (0.765), cleanliness (0.797), price fairness (0.817), and facilities (0.826). All the reliability was above the 0.9 average, usually considered excellent (Matkar, 2012).

Result of Pearson Correlation Analysis

Table 4 below shows the Pearson Correlation Analysis

Table 4: Pearson Correlation Analysis

Hypothesis	Result	Findings of Data Analysis
H1: Food quality has a moderately positive relationship with turnover students' satisfaction in visiting the cafeteria at University Malaysian Kelantan, Bachok.	$r = <0.765, p <0.01$ Very high positive	H1: Supported

H2: Cleanliness has a moderately positive relationship with turnover students' satisfaction in visiting the cafeteria at University Malaysian Kelantan, Bachok.	$r = <0.797, p <0.01$ Very high positive	H2: Supported
H3: Price fairness has a strong positive relationship with turnover students' satisfaction visiting cafeteria at University Malaysian Kelantan, Bachok.	$r = <0.817, p <0.01$ Very high positive	H3: Supported
H4: Facilities have a strong positive relationship on turnover students' satisfaction visiting cafeteria at University Malaysian Kelantan, Bachok.	$r = <0.826, p <0.01$ Very high positive	H4: Supported

Hypothesis 1 (H1) proposed that food quality is a positive relationship with students' satisfaction. The finding reported in this study revealed that the reliability recorded value of Pearson Correlation, which is $r = <0.765, p <0.01$. Thus, the result accepts hypothesis 1 (H1), whereby reliability is positively significant with students' satisfaction.

Hypothesis 2 (H2) proposed that cleanliness is a positive relationship with students' satisfaction. The finding reported in this study revealed that the responsiveness recorded value of Pearson Correlation, which is $r = <0.797, p <0.01$. Thus, the result accepts hypothesis 2 (H2), whereby cleanliness is positively significant with students' satisfaction.

Hypothesis 3 (H3) proposed that price fairness is a positive relationship with students' satisfaction. The finding reported in this study revealed that the price fairness recorded value of Pearson Correlation, which is $r = <0.817, p <0.01$. Thus, the result accepts hypothesis 3 (H3), whereby price fairness is positively significant in students' satisfaction.

Hypothesis 4 (H4) proposed that facilities are a positive relationship with students' satisfaction. The finding reported in this study revealed that the empathy recorded value of Pearson Correlation, which is $r = <0.826, p <0.01$. Thus, the result accepts hypothesis 4 (H4), whereby facilities are positively significant in students' satisfaction.

DISCUSSION AND RECOMMENDATION

The discussion aims to resolve the questions and address the hypotheses as stated in the first chapter of this study. In general, this study has extensively studied the factors affecting student satisfaction visit cafeteria at University Malaysia Kelantan, Bachok that have a substantial relationship.

Based on the study's findings, facilities had a statistically significant strong positive and significantly affected student satisfaction when visiting the cafeteria at University Kelantan Malaysia, Bachok. As a result of this gap, it is clear that student satisfaction is satisfied.

This study puts its own set of limits on how the test can be carried out. This is because multiple other institutions are scattered across the country, so the study's research is limited to just one. The results of this poll may not be totally generalized to other campuses. As a result, the results do not accurately reflect all Malaysian students' pleasure. This study could be expanded by including all cafeterias at University Malaysia Kelantan, including the Campus Jeli cafeteria.

Furthermore, the researcher has a limited quantity of samples. Only 375 surveys were successfully distributed to University Malaysia Kelantan Bachok students through Google Forms. The limited sample size is unlikely to apply to a larger population. It is recommended that future research should expand the number of respondents from the University Malaysia Kelantan, Bachok students to other diverse categories, such as faculty members and administrative personnel, to ensure that the study's conclusions are more representative.

In addition, these four factors can influence whether students are satisfied when they visit the cafeteria. This is because the researcher concentrates on a limited number of issues, this investigation cannot be completed correctly and extensively. Several cafeterias have experienced various problems due to differing degrees of student satisfaction and affecting factors. As a result, it is recommended that any other factors that may influence students' happiness with the cafeteria be evaluated. Other issues may be investigated in future research.

CONCLUSION

In conclusion, this study has discovered the factors affecting student satisfaction visit cafeteria at University Malaysia Kelantan, Bachok. Four independent variables, food quality, cleanliness, price fairness and facilities been chosen to examine their relationships with the dependent variable, which is the student satisfaction visit cafeteria at University Malaysia Kelantan Bachok. A total of 375 respondents were selected from all students at campus Bachok. Based on Pearson's correlation analysis, the food quality scored a value of *0.765, followed by cleanliness with *0.797, price with *0.817, and facilities with *0.826. Lastly, this research has determined the relationship between factors affecting university students' satisfaction at the cafeteria.

ABSTRACT

The purpose of this study is to identify various problems found in various sectors of ecotourism. Most of them are problematic about community thinking, lack of understanding about ecotourism activities, lack of facilities, and so on. The objective of this study is to study the influence of ecotourism according to perception, knowledge, and acceptance on the intention to revisit Malaysia. Concerning that, the quantitative philosophy is utilized in this review. The straightforward size inspecting is utilized as an examining outline. The absolute number of 150 respondents were designated and examined utilizing the Measurable Bundle. The result from this study is to measure eco tourist perception, knowledge, acceptance, and revisit intention in Malaysia. The finding from this exploration is believability to draw in for the future examination. This study will be beneficial to appreciate the nature and knowledge while research has been done. Practitionery among people can be gained to appreciate the nature place when they can get knowledge and acceptance towards to take care eco-tourist place in Malaysia.

Keywords: Eco-Tourism perception, Knowledge, Acceptance, Revisit intention.

INTRODUCTION

This research would be beneficial to the Malaysian's Eco-Tourism because they will know the perception, knowledge, acceptance, and revisit intention among tourist in Malaysia. In this study the Malaysian's Eco-Tourism can alert in the performance part of the tourism in Malaysia. The research would also be beneficial to the economy because the profit of the country will be able increase for better future for Malaysian's people. Government can easily to detect the problem occur and any step could be taken to make sure the Eco-Tourism in Malaysia run smoothly in every year. This research would be helping the local people who

work in this field to know the perception, knowledge and more to attract the local and international tourist in Malaysia. Another that, this exploration would be useful to the future specialist since they can get some data that could require in their examination and a portion of their inquiry may conceivably be responded to by this exploration.

Significant of Study

This research would be beneficial to the Malaysian's Eco-Tourism because they will know the perception, knowledge, acceptance, and revisit intention among tourist in Malaysia. In this study the Malaysian's Eco-Tourism can alert in the performance part of the tourism in Malaysia. The research would also be beneficial to the economy because the profit of the country will be able increase for better future for Malaysian's people. This research would be helping the local people who work in this field to know the perception, knowledge and more to attract the local and international tourist in Malaysia. Satisfaction among tourist is the key word to success in any business when the needs of them be fulfilled. Another that, this exploration would be advantageous to the future specialist since they can get some data that could required in their examination and a portion of their inquiry may conceivably be responded to by this examination.

LITERATURE REVIEW

According to the guidelines, chapter two refers to several parts starting from the literature review, which is to describe the perception, knowledge, and acceptance, and review the intentions related to ecotourism. next is to explain the three hypotheses in this study. Besides that, the conceptual framework shows the connection between the free factor (IV) and the reliant variable (DV) and closes with a rundown. This study aims to measure eco-tourists' perception, knowledge, acceptance and intention to revisit in Malaysia.

Perception

The perception of tourist on eco-tourism is very important to the nature conversation. As previously mentioned in the chapter 1 where eco-tourism extremely provides a huge revenue to the community and the country specially to set up and develop the nature conversation schemes. Ecotourism promotes the stewardship of natural and cultural resources while also

assisting in their conservation (Kasalak & Akinici ,2015). However, achieving the stated objectives is difficult without the strong support and participation of the local population. The purpose of this study was to comprehend how the local population saw the benefits and significance of ecotourism (Figueroa-Domecq & Segovia-Perez ,2020).

Knowledge

According to the definition that academics, professionals, and private conservation organisations have worked to develop since 1960, ecotourism emphasises the development of environmental conservation behaviour and thought patterns in addition to the enjoyment of the stunning ecological landscape found within tourism areas (Gupta. G, 2014). The objective is to guarantee that tourist-related activities persist for a long time and can preserve social, ecological and more as well as a balanced growth of sustainable tourism. Ecotourism serves to preserve the environment and promote local development that is sustainable and can benefit all stakeholders (e.g., regional ecological managers, community residents, local tourism operators, and tourists) (Niñerola, A, 2019).

Acceptance

Acceptance among tourist that involving them to more get knowledge in eco-tourist make this sector getting bigger in every year. The knowledge and promoting about this tourism sector especially in the online platform, can spread it to other people in different generation. (Ulfy, 2021). Acceptance means fully acknowledge the facts of a situation and not fixating on how it should not be that way. The participation local community to joining and supporting this park especially who live near the tourism areas can together to protect it. The present study determines the local communities to participate in ecotourism development at the tree National Parks, specifically Taman Negara Kuala Koh, Taman Negara Kuala Tahan, and Taman Negara Merapoh. (Hui, 2020)

Revisit Intention

Intention to travel again before the tourists decide to go again, the place they have visited must have several factors that make them feel impressed and interest them to visit the area again. Factors that can attract tourists to travel in ecotourism areas are largely the awareness

of tourists towards the environment mass tourism" to special interest tourism "ecotourism" (Agarwal et al., 2018). Now there are trends that are always followed in social media that encourage doing good activities that do not have a negative impact on the environment of the thing they will choose is to participate in eco-tourism activities. Tourism is an interesting activity because they can visit interesting areas to get beautiful scenery.

Research Hypotheses

H1: Eco-tourist perception is positively related to revisit intention.

Eco-tourist is recognized as the important thing to know if can affects local communities' perception of natural resources and be important determinants of conversation behaviour. Moreover, it is encouraged positive experiences for visitors and as well as hosts. (Waylen, 2019) The positive perception that has been given make the other people involve them in positive vibe on how important the nature place must be protected from any harm to make sure of future generation can try to visit this beautiful scenery in their own country beside improve the economy. They will revisit and visit any nature place to make sure they can get experience again how to appreciate the nature beside helping the local ecotourism agency.

H2: Eco-tourist knowledge is positively related to revisit intention.

Knowledge about the exploring nature place would increase beside to know well about different species plants and animal in that place who is very difficult to find it in certain place. Beside that, it is also encouraging the tourist to get the knowledge to encourage them to protect the nature place in Malaysia. Such as mountain, forest, beach and more that provide the local community with jobs. Awareness would be spread, if the visitor visits that place to increase more awareness and avoid causing destruction to the living things around them beside revisit intention would be focusing on this topic. According to the Brooking (2022) responsible travel to natural areas that conserves the environment, sustains the well-being of the local people, and involves interpretation and education. They would revisit the place because the attractiveness knowledge and want to gain more about it.

H3: Eco-tourist acceptance is positively related to revisit intention.

As indicated by the Global Ecotourism Society, ecotourism is characterized as capable travel to regular regions that preserves the climate and further develops the prosperity of nearby individuals. Malaysia has huge biodiversity, to gives the travel industry area to push ahead and drawing in guests to encounter it. From that, the advertising in social media is updated continuously to ensure the people can get information about eco-tourist in online platform and make more of them more accept the uniqueness natural areas surrounding them to visit. (Ulfy, 2021).The increasing acceptance among tourist, the higher number of revisit attention would be if they accept and appreciate the beautiful nature place in Malaysia.

Research Framework

Figure 1: Research Framework

Based on figure 1 above, independent variables are the parameters that impact the revisit intention in Malaysia. The dependent variable (DV) is revisit intention in Malaysia. In this analysis, three independent variables (IV) determined measuring eco-tourist perception, knowledge and acceptance. The independent (IV) and dependent variable (DV) that will be

used in this study are seen in figure 1. This figure demonstrates the relationship between tourist perception, knowledge and acceptance impact with revisit intention in Malaysia on eco-tourist.

METHODOLOGY

Research Design

Research configuration is a technique for responding to address utilizing experimental information. Making an exploration configuration implies coming to conclusions about in general examination targets and approach, the kind of exploration configuration will be use, information assortment techniques, information examination strategies and that's only the tip of the iceberg. A well-planned research design may help ensure the methods match with research objectives and the right kind of analysis data. (McCombes, 2021). There are few elements of good research design that incite great results, for examples data collection methods, techniques of research data analysis, types of research methodologies and more. (Damera, 2022).

Data Collection

The definition of data collection as a method for acquiring, measuring, and assessing accurate insight into an investigation uses standard, verified techniques. (Kumar ,2018). The researchers would test their theory using the data they had gathered. Information assortment is likewise the most common way of social event and estimating data on factors of interest, in a laid out methodical design that empowers one to respond to expressed research questions, test speculations, and assess results. For this research, the data has been collected through using online questionnaires and face to face questionnaires. The respondents were named anonymously to an anonymous questionnaire.

Sampling

According to Wilson (2010), convenience sampling is the most suitable survey strategy. So, this sampling is chosen depending on the characteristics of the population and the objectives of the study. Convenience sampling will be selected by state and district; 150 participants will be selected to answer the questionnaire. The method of research is using a questionnaire through Google Forms. The researcher needs to ensure that this sample is typical for studying tourists who visit ecotourism places in Malaysia.

Data Analysis

After the data collection completed, all the data gathers will be analysed using by the IBM Statistical Package for Social Science (SPSS). The analyses procedure for the research is divided into three procedures: descriptive statistics, reliability test and Pearson Correlation. According to LeCompte and Schensuly, Researchers (2003) utilize research data analysis as a method for transforming data into a narrative and then evaluating it to draw conclusions. It seems OK that the information examination strategy supports separating a major measure of information into more modest valuable substance. There are various data analysis processes where it will filter the useful information and data from overall findings.

FINDINGS

Demographic Analysis

Table 4.1: Respondents' Gender

Gender	Frequency	Percentage (%)
Male	37	24.7
Female	113	75.3
Total	150	100.0

The table above displays the frequency and percentage of respondents by gender. 150 respondents provided responses to the questionnaire. There are 37 of them, or 24.7% of the total, who are men. The remaining 113 people, or 75.3 of the totals, are female. This finding demonstrates that male and female respondents' proportion is nearly equal, increasing validity of the research.

Table 4.2: Respondents' Age Group

Age	Frequency	Percentage (%)
18-22 years old	52	34.7
23-27 years old	54	36.0
28-32 years old	30	20.0
33 years old and above	14	9.3
Total	150	100.0

The age range of each responder who filled out our questionnaire is represented in this table. Five groups have been created based on the ages of all responders. 52 respondents (30.9%) in the 18 to 22 age group fell into this category. Following that, 54 was the highest frequency of all with (36.0 %) of those questioned were between the ages of 23 to 27 years old. The third largest number of respondents to our poll belonged to this age bracket. The following group of 30 responders (20.02%) fell within the 28 to 32 age range. In addition, 33 years old and above with 14 (9.3 %) of respondents completed this questionnaire.

Table 4.3: Respondents' Marital Status

Marital Status	Frequency	Percentage (%)
Single	101	67.3
Married	49	32.7
Total	150	100.0

This table displays the respondents' marital status. The percentage of singles who are married (67.3%) and have 101 frequencies. This marital status for singles is the highest compared to married status. Following by marital status for married is 49 (32.7%).

Table 4.4: Respondents' Occupation

Occupation	Frequency	Percentage (%)
Student	81	54.0
Self Employed	20	13.3
Private sector	24	16.0
Government sector	23	15.3
Retired	2	1.3
Total	150	100.0

The occupation for all the respondents has been shown in the table 4.4. The frequency with 81 (54.0%) is for the student occupation level. Which is the highest of all. Next, 20 (13.3%) for the self-employed occupation level for the respondent. The private sector with 24 frequencies with (16.0%) is the second highest compared to student occupation. Followed by the government sector with 23 frequency (15.3%). Lastly, retirement is the least frequency level of all which is 2 (1.3%).

Table 4.5: Respondents' Monthly Income

Monthly Income	Frequency	Percentage (%)
Below RM1500	78	52.0
RM1600- RM2500	17	11.3
RM2600-RM3500	23	15.3
RM3500 and above	32	21.3

Total	150	100.0
-------	-----	-------

Table 4.5 displays the monthly pay grades for each respondent. 78 people, or 52.0% of those making less RM1500. In terms of the total number of questionnaires, this is also the largest category. Then, 17 (11.3%) of the respondents stated that their monthly income ranged from RM1600 to RM2500. Furthermore, 23 respondents (15.3%) stated that their monthly income ranged from RM2600 to RM3500. After that, 32 (21.3%) respondents reported having a monthly salary of RM3500 or more. These numbers demonstrate that the respondents who filled out the survey were fairly evenly dispersed across a range of income levels.

Descriptive Analysis

Data sets that gather information can be summarized in simple terms narratively or quantitatively. With this overview, you can contextualize the data collected and turn it into useful information that facilitates understanding of your research.

Table 4.7: Descriptive Analysis Statistic of Perception

No	Item Description	N	Mean	Level of Agreement
1.	Ecotourism contributes to the effort of saving the forests	150	3.74	Agree
2.	Ecotourism improves the quality of life of the local communities	150	3.67	Agree
3.	Ecotourism helps in improving visitor awareness on the importance of conservation	150	3.86	Agree

The mean of each query in the first independent variable on average, which is perception, displayed in this table. The thing with the next-highest average level is “Ecotourism contributes to the effort of saving the forests”, with the mean 3.74 score and the level of the agreement was agreed. Follow by, the least score among other perception is “Ecotourism improves the quality of life of the local communities”, with the mean of 3.67 with the level of agreement was agreed. The highest result is 3.86 for the item ‘Ecotourism helps in improving visitor awareness on the importance of conservation’ with agreement level was agreed.

Table 4.8: Descriptive Analysis Statistic of Knowledge

No	Item Description	N	Mean	Level of Agreement
1.	Contemporary philosophy and ethics toward ecotourism.	150	3.72	Agree
2.	Basic ecological and geomorphological principles.	150	3.70	Agree
3.	Wildlife and vegetation dynamics and interrelationship.	150	3.80	Agree
4.	Environmental impact occurrence and management relating to ecotourism.	150	3.64	Agree
5.	Ecologically sustainable development and environmental management principles.	150	3.75	Agree
6.	Cultural heritage and cultural heritage management principles.	150	3.95	Agree

This table displays the average mean for each question in the knowledge-related second independent variable. The thing that has the greatest mean level is “Cultural heritage and cultural heritage management principles” with the mean 3.95 score and the level of the agreement was agreed. Follow by, the least score among other knowledge with the mean of 3.64 with the level of agreement was agreed. The rest of the item was count as moderate with the mean 3.72 and with the mean 3.70 which both items were agreed. The other item which is the mean 3.80 and 3.75 respectively also was agreed.

Table 4.9: Descriptive analysis of Acceptance

No	Item Description	N	Mean	Level of Agreement
----	------------------	---	------	--------------------

1.	I am accepted to receive ecotourism.	150	3.76	Agree
2.	I accepted to support the protection of natural resources and the environment.	150	3.86	Agree
3.	I accepted to participate in ecotourism development.	150	3.84	Agree
4.	I accepted ecotourism gives benefit to local.	150	3.91	Agree
5.	I accepted ecotourism is necessary in protected areas.	150	3.88	Agree

The acceptance-related second independent variable's average mean for each question is displayed in this table. The statement "I accepted ecotourism gives benefits to locals" has the greatest mean level, with a mean 3.91 score, was agreed. Lowest rating among the other acceptances is then "I am accepted to receive ecotourism", with the mean of 3.76 with the level of agreement was agreed. The rest of the item was count as moderate which is "I accepted to support the protection of natural resources and the environment" with the mean 3.86 and "I accepted to participate in ecotourism development" with the mean 3.84 which both items were agreed. The item which is "I accepted ecotourism is necessary in protected area" with the mean 3.88 also was agreed.

4.10: Descriptive analysis of Revisit Intention

No	Item Description	N	Mean	Level of Agreement
1.	Facilities at the entertainment areas are well maintained.	150	3.68	Agree
2.	The staff provide prompt, reliable, and friendly service.	150	4.02	Agree
3.	I feel relaxed to visit here.	150	4.08	Agree

4.	I feel peaceful to visit here.	150	4.07	Agree
5.	Local residents are responsiveness.	150	4.00	Agree

Table below shows the average mean for each question in the second dependent variable, which is revisit. "I feel relaxed to visit here" has the greatest mean level, with a mean 4.08 score, and the degree of agreement was agreed upon. The lowest rating among the subsequent visits is "Facilities at the entertainment areas are well maintained", with the mean of 3.68 with the level of agreement was agreed. The rest of the item was count as moderate which is "The staff provide prompt, reliable, and friendly service" with the mean 4.02 and "I feel peaceful to visit here" with the mean 4.07 which the both items were agreed. The item which is "Local residents are responsiveness" with the mean 4.00 also was agreed.

Reliability Analysis

Consistent measurement of a specific spectacle is one that is reliable and yields reproducible results. Additionally, it relates to occurrences of consistency. Piece of research is regarded as trustworthy if the outcomes of repeated measurements with constant variables are the same. Cronbach's alpha was used to evaluate the validity of the study. Cronbach's alpha is a scale from 0 to 1 that represents the degree of internal consistency.

Table 4.12: Results for Reliability Analysis

Item Description	N.	No. of items	Cronbach's Alpha
Perception	150	3	0.800
Knowledge	150	6	0.882

acceptance	150	5	0.877
Revisit intention	150	5	0.802

Table 4.12 lists the results of the reliability analysis with respect to each independent and dependent variable. The first of the three independent components overall is perception. With a Cronbach's Alpha of 0.800 and a total of three entries ($0.9 > 0.8$), this variable exhibit respectable internal consistency.

Reliability and validity of knowledge, the following independent variable, are assessed using six questions. Cronbach's Alpha for this variable is 0.882. Internal consistency is good for this figure ($0.9 > 0.8$). Acceptance serves as the final and third independent factor in the investigation. This variable also has strong internal consistency with a Cronbach's Alpha value of 0.877 and five items below it ($0.9 > 0.8$). This independent for variable is hence sturdier compared to the other two.

There are four items below the dependent variable, revisit intention, that cast doubt on its validity. This variable is 0.802, which indicates that it has good internal consistency ($0.9 > 0.8$). This suggests that respondents had comparable viewpoints regarding revisit intention. All of the studies in this study are said to be reliable, but their reliability varies from good to poor ($0.9 > 0.8$). At last, the absolute unwavering quality test for all factors is 0.940, which is viewed as really great for dependability.

Pearson Correlation Analysis

Finding variances and/or correlations between variables using inferential analysis (also known as correlation analysis) is a common practise in research and studies. The independent variables are the perception of eco-tourists, their knowledge and acceptance, and their willingness to return to Malaysia.

Table 4.14: Related Factors Affecting Revisit Intention

		MEAN_Perception1	MEAN_Knowledge1	MEAN_Acceptance1	MEAN_Revisit1
MEAN_Perception1	Pearson Correlation	1	.621**	.703**	.551**
	Sig. (2-tailed)		.000	.000	.000
	N	150	150	150	150
MEAN_Knowledge1	Pearson Correlation	.621**	1	.683**	.612**

(2-tailed).

Hypothesis 1

H1o: Eco-tourist perception is negatively not related to revisit intention.

H1a: Eco-tourist perception is positively related to revisit intention.

The relationship between eco-tourist perception and intention to return is seen in the table above for Malaysia. There is a significant positive correlation between the two variables, which is the explanation for the results of 0.551. This demonstrates that a significant portion of respondents believe that Malaysian tourists' perceptions of ecotourism will affect their decision to return.

Hypothesis 2

H2o: Eco-tourist knowledge is negatively not related to revisit intention.

H2a: Eco-tourist knowledge is positively related to revisit intention.

The relationship between the dependent variable (intention to return to Malaysia) and the independent variable (eco-tourist knowledge) is shown in the table above. The result of 0.612 is explained by the two variables' significant positive correlation. This reveals that many respondents believe there is a significant relationship between third variables, acceptance of eco-tourists return to Malaysia. The independent variable will therefore have an impact on the dependent variable.

Hypothesis 3

H3o: Eco-tourist acceptance is negatively not related to revisit intention.

H3a: Eco-tourist acceptance is positively related to revisit intention.

The relationship between the dependent variable (intention to return to Malaysia) and the independent variable (acceptance of eco-tourists) is seen in the table above. The result of 0.784 can be explained by the two variables' significant positive correlation. This reveals that many respondents believe the third variables which is acceptance of eco-tourists have significant relationship to return in Malaysia. The independent variable will therefore have an impact on the dependent variable. This makes it possible to demonstrate how all independent variables are related to dependent ones.

DISCUSSION & RECOMMENDATIONS

Among the problems is that many attractions are not ready to accommodate tourists due to a lack of facilities and perfect management. ecotourism destinations must be comprised of services and facilities which cater to visitor needs. According to Norlalle (2020), Tourism Malaysia has implemented various tourism promotions. However, there are a few tourists centre that do not maintain the facilities well, causing inconvenience to tourists. Ecotourism places are mostly located in remote areas and close to hills or forests with the geographical conditions of some ecotourism places that have more mountains and beaches, it is necessary to use the appropriate vehicle to reach the tourist destination.

The next problem is the deviation of tourists' perception of ecotourism. Tourists do not deeply understand the concept of ecotourism. Mostly, tourists want to do tourism activities in an environment-themed area, but they do not comply with some rules set by the authorities. The main goal of ecotourism is the process of communication with nature, granting a minimum load on ecological systems (Dzhandzhugazova et al., 2019a). There are eight basic principles that need to be followed to protect the importance of ecotourism. These include reducing the impact on the environment, minimizing the impact of development, increasing respect for the country being visited, optimizing economic profits for the country as well as increasing satisfaction for tourists.

Based on the study found that revisit intention among ecotourists is involving with three factors which is perception, knowledge, and acceptance among them. Revisit intention can

make the tourist come again to visit the ecotourism place in Malaysia if they impress with the services and facilities in that place. Great facilities and services can gain positive perception, knowledge, and acceptance among ecotourist to have better future in ecotourism fields especially in Malaysia.

CONCLUSION

In conclusion, this research was carried out to examine the perception, knowledge, and acceptance related to the desire to visit Malaysia again in Malaysia. In addition, this study can be used as a reference by other academics who conduct studies on ecotourism attractions in Malaysia. Further research was done on the results from Chapter 4's use the results using the Social Science Statistics Package (SPSS). Based on research factors, it can be said that the factors that encourage tourists to return to ecotourism areas are awareness, knowledge and acceptance. Therefore, all the data collected for this study are expected to further increase tourist interest in traveling to ecotourism areas and benefit stakeholders to promote ecotourism in Malaysia. increase.

The Role of Service, Restaurant Environment, Food Quality, Food Hygiene, and Food Pricing Toward Customer Satisfaction On Fast Food Restaurant.

Teng Hui Yi, Tengku Nur Atiqah Binti Tengku Haimi, Tengku Nurhusna Fatma Binti Tengku Utama & Tuan Nor Nazieyatulwafa Bt Tuan Wil

Supervisor : Dr. Ataul Karim Patwary

Faculty of Hospitality, Tourism and Wellness, University Malaysia Kelantan

ABSTRACT

This study tries to identify the customer satisfaction at fast food restaurants in Malaysia is influenced by role of service, restaurant environment, food quality, food hygiene and food pricing. The top customer satisfaction component is also examined in this study. Respondents received an online questionnaire from the researchers. The goal of this study is to examine the elements that influence patron satisfaction at fast food restaurants. Data from respondents was gathered utilising a quantitative method by approaching physically. In order to get more comprehensive results, it is advised that the study area be broadened to include several population samples in subsequent research with customer's experience in Malaysia on fast food restaurant. The sample size of this study is to distribute at least 153 data respondents. A comparable research with other variables that affect customer satisfaction in fast food restaurants might be added in order to get more accurate and trustworthy results.

Keywords : Service, Restaurant environment, Food quality, Food hygiene, Food Pricing and Customer Satisfaction

INTRODUCTION

This study aims to investigate the factors that influence customer satisfaction in fast-food restaurants, such as the role of service, restaurant environment, food quality, food hygiene, and food pricing. However, the introduction to this study included several sections on the study's background, research objective, literature review, methodology, discussion, recommendation and conclusion..

The breadth and extent of the American restaurant industry affect nearly every home in the country (Andaleeb et al., 2006). According to the National Restaurant Association, the

restaurant industry, the second-largest private employer in the United States, is expected to generate sales of \$709.2 billion in 2015, have over 14 million employees, and have one million locations (NRA, 2015). Additionally, according to the NRA, the restaurant industry in the US will create 1.7 million additional jobs over the next ten years, increasing the total number of employees to 15.7 million by 2025. (NRA, 2015). Due to its size and substantial effect, the restaurant industry is examined in the current study regarding consumer satisfaction.

The 1980s witnessed a growth in casual dining establishments, making them one of the industry's most common types of restaurants (Rivera et al., 2008). This category provides upscale dining in an inviting setting at pricing lower than any fast food establishment while also providing outstanding service and fast food (Arora, 2012). Fast-service restaurants and quick casual restaurants both have similar designs. However, they focus on delivering superior culinary options and an atmosphere more appropriate for the casual dining market (Ryu et al., 2010). Because they focus on providing meals quickly and reasonably priced, fast food places are sometimes known as quick-service restaurants (Arora, 2012). The present study's focus is on the fast-food restaurant industry. Consider the current state of the fast food sector to understand it better. The fast food business has a long, colorful history and impacts many facets of our society, including politics, pop culture, and nutritional trends (Aronica, 2014).

OBJECTIVES OF THIS STUDY

1. To examine the influence of service on customer satisfaction in fast food restaurant.
2. To examine the influence of restaurant environment on customer satisfaction in fast food restaurant.
3. To examine the influence of food quality on customer satisfaction in fast food restaurant.
4. To examine the influence of food hygiene on customer satisfaction in fast food restaurant.
5. To examine the influence of food pricing on customer satisfaction in fast food restaurant.

LITERATURE REVIEW

1.1 The Relationship Between Role of Service and Customer Satisfaction

According to Lovelock et al., (2004), restaurant service quality has recently emerged as a global research topic, with researchers and experts attempting to determine the best method of measuring or improving service quality in the food service industry from various perspectives, such as customer expectation vs. perception, managers, and service providers. A service is a transitory and intangible act or performance offered by one party to another that does not usually result in ownership of any of the factors of production. Service is classified into two types which are tangibles and intangibles. Reliability, empathy, responsiveness, competence, courtesy, credibility, security, access, and communication are the ten tangible domains of service quality. Likewise, role of food quality is thought to be an important determinant of customer satisfaction and loyalty. The satisfaction and loyalty of young customers who most likely like delicious meal options be enhanced by offering higher food and beverages. Per the research, consumers' intent to eat at a restaurant is dependent on the quality of the menu items (Kivela et al., 2000)

Recent years have seen an increase in the amount of study being done on the subject of restaurant service quality. Researchers and industry professionals are striving to ascertain the best way to gauge or enhance service quality in the food service sector from a variety of angles, including management and service provider perceptions, customer expectation, and managers' perceptions. Anything that one person can do for another that is essentially immaterial and doesn't lead to the acquisition of property. Its creation may or may not be connected to a tangible good (Dudovskiy et al., 2012). Service is classified into two types which are tangibles and intangibles. Reliability, empathy, responsiveness, competence, courtesy, credibility, security, access, and communication are the ten tangible domains of service quality

1.2 The Relationship Between Restaurant Environment and Customer Satisfaction

Restaurant environments are created by social influences, including traditions, conventions, social trends, values, and societal expectations of businesses. The word "fast meals" certainly doesn't have a single, agreed definition. It can be interpreted broadly and

informally to describe meals that are prepared quickly and supplied upon request (Ali et al., 2016). Fast meals are frequently preferred over dishes made at home because of the quick pace of modern life, simple access to fast food, and increased exposure to its marketing and promotion. Fast food is frequently higher in calories, fat, and sugar. It might be challenging to define fast food or take-away food establishments. Many studies and policies in this field solely take particular items into account.

The physical environment's excellence both satisfies and draws in new consumers. Restaurant surroundings increase revenue and provide patrons a memorable dining experience. Customers evaluate a restaurant's quality based on its cleanliness, unique, inviting ambience, environmental quality, and other ambience-creating features (Adam et al., 2015). In service sectors like restaurants, the influence of physical environment quality on behaviour may be observed.

1.3 The Relationship Between Food Quality and Customer Satisfaction

According to Boo et al., (2012), consequently, food quality is thought to play a vital impact in determining customer experience and loyalty. By delivering enhanced food and beverages, businesses may improve early adolescents' satisfaction and loyalty as they most probably prefer delicious meal possibilities. In accordance with the research, a restaurant's capacity to draw customers is contingent on the quality of its menu items. Food quality is critical for maintaining and increasing profits by ensuring customer satisfaction.

Food quality is seen as a crucial component of the total dining experience. The most crucial consideration when choosing a restaurant is the food, which has a direct impact on patron pleasure. Customers rate restaurants depending on the quality of the cuisine, and this determines their loyalty to such establishments. The calibre of the cuisine has an impact on diners' decisions to return to a restaurant (Jin et al., 2012).

1.4 The Relationship Between Food Hygiene and Customer Satisfaction

Food hygiene, also known as food safety, that defined as handling, making preparations, and storing food or beverages in a manner that reduces the risk of foodborne diseases (Kamboj et al., 2020). The food safety chain begins with raw materials and ends with finished

products, with challenges such as microbial, chemical, physical, personal, and on-site hygiene (Fung et al., 2018).

According to Hwansuk et al., (2010), there are two primary categories of this study determining the selection characteristics and their amount of influence on the customer's choice in the restaurant between hygienic and non-hygienic. A restaurant's infrastructure, equipment, silverware and, and food quality are all considered hygienic considerations. Pricing, menu selection, cuisine kind, atmosphere, convenience, location, friendliness of the employee, operation hours, and service are non-hygienic criteria. A restaurant's infrastructure, equipment, silverware and dishes, staff, and food quality are all considered hygienic considerations (Hwansuk et al., 2010).

1.5 The Relationship Between Food Pricing and Customer Satisfaction

Price is "what the buyer paid to receive the product or services." According Zeithaml (1985). Offering fair rates and deals might help a restaurant get a competitive edge over its competitors. Through price, consumers determine the worth of a good or service. The pricing would draw them in and inform them of the value of the item or service. Customers anticipate fast food businesses to have cheap for moderate prices. Therefore, this factor is crucial and could convince them to choose fast food over alternative options.

One of the significant factors that affect consumer happiness is known to be pricing (Saxena et al., 2020). Price is an antecedent of consumer pleasure. Recent research on fast food businesses shows that the price considerably benefits consumer happiness. Additionally, the cost or value for money while purchasing fast food helps consumer satisfaction. According to Qin & Prybutok (2008), pricing does not significantly affect consumer satisfaction in fast-food restaurants. Fast food meals are considered less expensive than other eateries, making them negligible, even if the results are conflicting.

Conceptual Framework

This framework can also be used to describe the relationship between independent and dependent variables in research. Figure 1 depicts the conceptual framework for this study. The researcher in this study will use the figure to determine the relationship between independent and dependent variables.

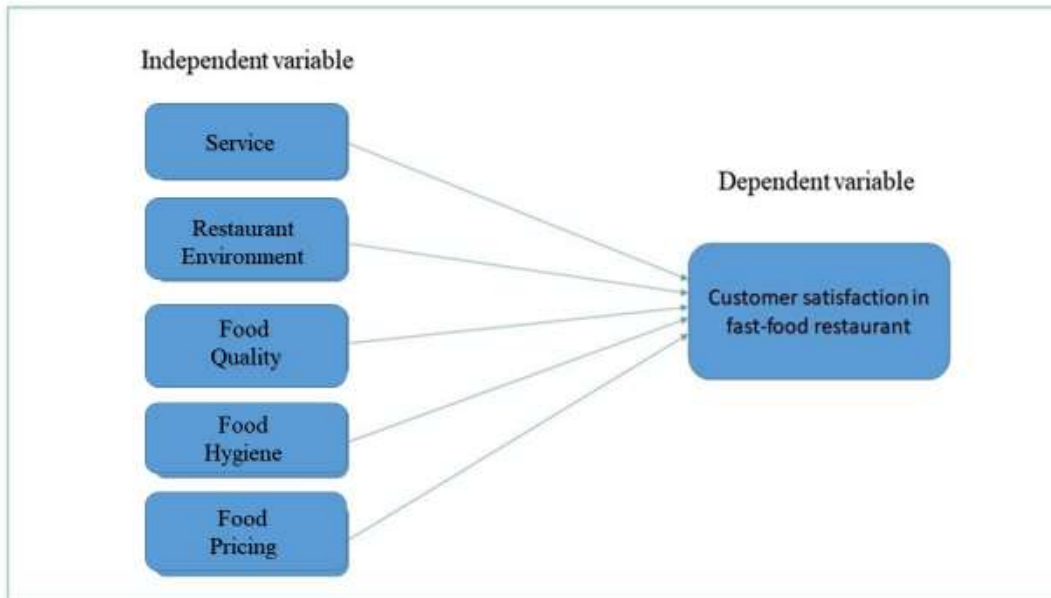

Figure 1 : Conceptual Framework

METHODOLOGY

Research Design

A research design's objective is to make sure that the data collected enables you to address the research topic as clearly and efficiently as feasible quantitative. Data will gather using a quantitative research approach in order to properly accomplish the study's goal. It included implementing the survey technique, which will use to gather statistical data about the subjects. As permitted by the subject, information was only gathered once at each place, which is dispersed throughout the fast food restaurant in Malaysia.

Population

In this study, the researcher's target population will focus on customers in Malaysia who make purchases at fast food restaurants. Based on the sample size and sampling method, researcher will collect data and information about customer satisfaction by approach. So, the total population for number of adult Malaysian are 22.73 million.

Sample Size

For this research, the study sample consisted of customer satisfaction on fast food restaurants in Malaysia. This survey will be carried out at random among the people in Malaysia. Therefore, it is crucial to make sure that the sample size chosen for this study is sufficient to produce precise and trustworthy data. For the purpose of obtaining a proper

sample size, this study employed the table created by Krejcie and Morgan Table (1970). Therefore, 384 respondents will be recruited from selected customer experience to provide an appropriate level of confidence for the study. However, the researcher needs to collect data from at least 153 respondents

Sampling Technique

In this part, researcher will use convenience sampling for complete the research. Convenience sampling are a group of samples are selected from the population only. This is because it will be more easy for collecting the data and handling by the researcher. But it cannot represent all whole group of population. The advantages of convenience sampling are saving more time, save money, easy for available and information can be more and specific.

Data Collection Procedure

Primary data source is a questionnaire in which respondents tick the questions they believe are relevant. In quantitative method, the researcher will use the primary data to collect the information from respondents. The questionnaire is being distributed to all people or customer in Malaysia regarding their satisfaction with fast food restaurants. So, the researchers may print out the questions to pass to the respondents.

Instrument

The questionnaire will be divided into three sections. For the section A is consists of the demographic, section B is about the consideration of the factor, and section C is to see how the relationship between the factors. To measure the independent variable and dependent variable the questions will be adopted from previous studies. The first measurement that is being used is nominal scale, which is used for labelling variables without any quantitative value. The second measurement that is being used is ordinal scale, rating scales is the method that use to measure the statements in the questionnaire such as Likert scale. For simplicity, the questionnaire is used Five-Point Likert scale as the structure for both independent variables and dependent variable.

Data Analysis

After the data collection completed, all the data gather will be analysed using by the IBM Statistical Package for Social Science (SPSS). The analyses procedure for the research is divided into three procedures; descriptive statistics, reliability test and Pearson Correlation.

FINDINGS

Result of Frequency Analysis

Table 1 : Result of Demographic Analysis

Characteristics		Frequency	Percentage (%)
Gender	Male	44	28.8
	Female	109	71.2
Age	18 – 22	32	20.9
	23 – 27	84	54.9
	28 – 32	12	7.8
	33 – 37	13	8.5
	38 – 42	6	3.9
	43 and above	6	3.9
Race	Malay	32	86.3
	Chinese	19	12.4
	Others	2	1.3
Marital Status	Married	38	24.8
	Single	115	75.2
Occupation	Government Sector	14	9.2
	Public Sector	18	11.8
	Self-employed	30	19.6
	Student	91	59.5
Educational Level	SPM	16	10.5
	STPM	13	8.5
	Diploma	26	17.0

	Degree	94	61.4
	Master	3	2.0
	PhD	1	0.7
Monthly Income	Less than RM 1500	115	75.2
	RM 1501 – RM 3500	29	19.0
	RM 3501 – RM 5500	0	0
	RM 5501 – RM 7500	3	2.0
	RM 7501 – RM 9500	4	2.6
	More than RM 10000	2	1.3

Table 1 show that the gender of female got more percentage for this study which is 71.2% due to 109 questionnaires while male get 44 respondents with 28.8%. Next, the most significant percentage of questionnaire for this study is age group of 23 to 27 years with 54.9%. Following that, the age group of 18 to 22 years with 32 (20.9%). In addition, there were 32 questionnaires that filled out by Malay people. Its mean that are they making up majority with 86.3% and followed by Chinese with 19 (12.4%) and other with 2 (1.3%). Furthermore, according the result, total of 94 respondents possessed a Degree. This group responded to the most questionnaires with percentage of 61.4%. Following that, 26 persons with a Diploma completed this questionnaire with 17.0%.

For occupation, the student had the highest response which is 91 questionnaires due to 59.5%, followed by self-employed with 30 respondents (19.6%) and public sector with 18 (11.8%). Lastly, for the overall monthly income of all respondent who filled out the questionnaire, a total of 115 with 75.2% of those questioned were less than RM 1500. This is the highest group in terms of total respondents, followed by 29 respondents have filled out the questionnaires regarding monthly income of RM 1501 to RM 3500. This shows a percentage of 19.0% and it is in the second highest place.

Table 2 : Result for Reliability Analysis

Item Description	N	No. of Items	Cronbach's Alpha
Service	153	4	0.913

Restaurant Environment	153	5	0.926
Food Quality	153	3	0.910
Food Hygiene	153	4	0.898
Food Pricing	153	4	0.948
Customer Satisfaction	153	3	0.942

The study examines the reliability of various variables, including service, restaurant environment, food quality, food hygiene, food pricing, and customer satisfaction. The Cronbach's Alpha results show inconsistent internal consistency (0.9), possibly due to researchers improving questionnaire tools and questions. The restaurant environment has low internal consistency (0.9), possibly due to respondents' ethnicity or diverse backgrounds. Food quality has acceptable internal consistency, while food hygiene has good internal consistency, with respondents being the only reliable source of information. Food pricing has four elements with a Cronbach alpha of 0.948, and customer satisfaction has three elements with a Cronbach alpha value of 0.948. Overall, the study is considered reliable, with low stability, and the overall reliability test is excellent at 0.980.

Result of Inferential Analysis (Correlation Analysis)

Table 3 shows the association between customer satisfaction and independent variables such as service, restaurant environment, food quality, food hygiene, and food pricing. Service has a strong positive correlation with customer happiness, while the restaurant environment affects satisfaction. Meal quality is crucial for customer pleasure, and food hygiene has a strong correlation with satisfaction. Food pricing is also strongly correlated with satisfaction, with many respondents believing it strongly correlates with customer satisfaction.

Framework Analysis

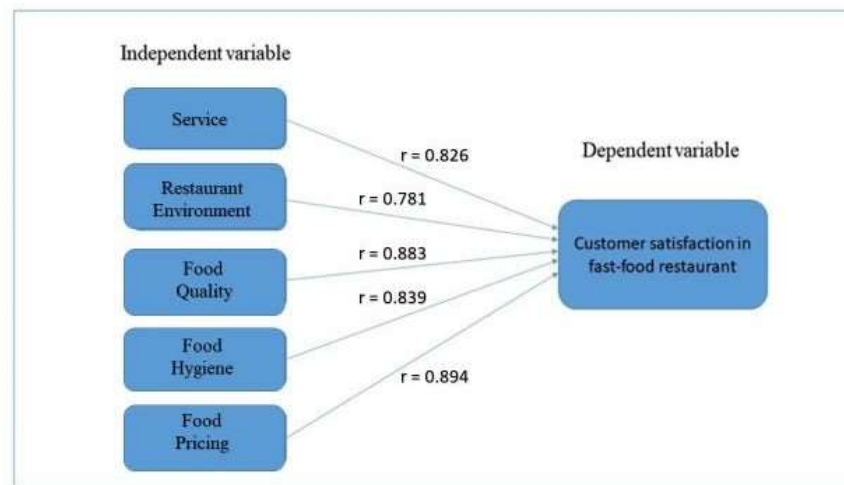

Figure 2 : Correlation between service, restaurant environment, food quality, food hygiene, food pricing and customer satisfaction in fast food restaurant

Figure 2 shows that customer satisfaction is significantly related to five independent variables: service, restaurant environment, food quality, food hygiene, and pricing. Food pricing has the highest Pearson correlation, followed by food quality, food hygiene, service, and restaurant environment. These factors are crucial for customer satisfaction in fast food.

DISCUSSION AND RECOMMENDATION

The researcher will provide some suggestions in this area to enhance subsequent study. These recommendations are meant to improve the calibre of study findings and help students get hired by fast food chains.

In the current study, the researcher focused on five variables: service, restaurant environment, food quality, food hygiene, and food pricing (independent variable), and customer satisfaction in fast food restaurant (dependent variable). A moderately positive correlation between the independent and dependent variables was found by the findings. Future studies could investigate the addition of various independent factors to produce novel findings to progress the discipline. All generations still enjoy eating fast food. The study looks at elements that affect patrons' satisfaction with fast food restaurant services. If respondents prefer to dine at fast food restaurants, further research might look into it.

Limitation that are face by researcher are not all Malaysian will be willing for giving the time and energy for answering it. Only youngsters will cooperate for giving back the feedback to this study. While other respondent thinking it was a wasting time activity. Moreover, the information has a high similarity. This is because they are sharing a same viewpoint in this study. Lastly, ways of the respondent getting the data also one disadvantages. Some fast-food restaurant's location are not specific which make researcher failure for getting respondent for answering the question of this study.

Recommendations are what is the suggestion that can be improved in this study. Firstly, searching more respondent for getting more authentic information to improve the report. Secondly, define the meaning of the review and rewrite it. Each terms have a different meaning and explanation on it. Lastly, doing more research about the background of the respondent. Respondent that are answering the question of the study have different religion, races and states. Researcher will getting more accurate result or information for completely the report.

CONCLUSION

This chapter comes to a close with an analysis of all the variables in relation to fast food establishments, which reveals a strong correlation. This demonstrates that these factors have an impact on how much fast food is consumed by students. The identified variables were subjected to descriptive analysis, reliability testing, and correlation analysis before being accepted for this study. Even though it is restricted to online and in-person research, it facilitates data collection. Finally, the suggestions made in this chapter will be valuable for further research in this area.

Abstract

The determination of this study is about the factor influencing customer satisfaction to the restaurant which is the role of food safety, online review, attitude of restaurant staff, and cleanliness on customer satisfaction among restaurants in Kelantan. Various issues are encountered in restaurant management with regard to customer service in order to ensure customer satisfaction to convert customers into returning customers, we need to give them satisfaction that is, make sure they are happy and always offer them a perfect experience. The objective of this study is to examine the role of food safety, the attitude of restaurant staff, online reviews, and cleanliness on satisfaction among customers in Kelantan. Data will be collected through a questionnaire survey using convenience sampling and will be analyzed by the IBM Statistical Package for Social Science (SPSS). The findings of this study will indicate the customer attribute that focuses on food safety, the attitude of staff, online reviews, and cleanliness as the key decision variables used for customer satisfaction toward restaurants in Kelantan.

Keywords: Food Safety, Online Reviews, Attitude of Restaurant Staff, Cleanliness

INTRODUCTION

Based on an assessment of the relationship between customer expectations and product or service delivery, customer satisfaction was long examined as a one-dimensional notion (Susskind et al., 2018). On the contrary, in the harsh hospitality sector, client happiness has emerged as a crucial element of corporate strategy (Chun & Nyam, 2020). Numerous academics have investigated consumer happiness in the travel, tourism, and food and beverage (F&B) sectors (Uslu & Eren, 2020). Like other industries, the food service sector has also seen a significant rise in the importance of customer happiness as a business concern. Today, in a world where competition is fierce, maintaining a competitive advantage requires offering top-notch customer service (Mmutle & Shonhe, 2017). Additionally, a good balance between the tangible, such as the food and physical facilities, and the intangible, such as the interaction between

employees and customers, are some factors that should affect how customers perceive the quality of restaurant service, resulting in customer satisfaction and constructive behavioral intentions in the restaurant industry (Hussein, 2018).

The food, ambiance, and services at the fancy restaurants (Paulose & Shakeel, 2021), and customers are willing to spend more for these upmarket amenities and exceptional offerings (Gupta et al., 2022; Paulose & Shakeel, 2021). Physical characteristics are very crucial for restaurant establishments. Customers can have a suitable distance between them at tables, for instance, and artwork like paintings can assist create a certain vibe (Elite, 2017). It is impossible to overstate the value of the restaurant's menu. Before opening for business, a restaurant should decide on a solid menu selection and create the menu itself. The restaurant's physical structure, interior design, and service philosophy are all held together by the

menu, which also, and perhaps more crucially, shapes how diners view the establishment. Customers' opinions of the restaurant and their spending at the restaurant may be impacted by the menu's layout and style, order of food items, and level of detail (Schjll & Alfnes, 2017).

Many firms in the restaurant sector use this paradigm to forecast the effectiveness of employee development programs, especially those that deal with the safe handling of food (Food Safety Magazine eDigest (FSME), 2018; National Restaurant Association, 2017). Farmers, food transportation companies, food suppliers or vendors, and restaurants, to name a few, are all equally responsible for making sure that staff members obtain the necessary training and have the tools they need to perform professions involving the safe handling of food (FDA, 2018). To meet requirements for safe food handling and maintain a sanitary workplace, restaurants are required to interact with local health officials. This is done to protect the public's safety. The Food and Drug Administration (FDA) (2017) recommends that the criteria be based on the Food Code, but agencies have the freedom to create their own review rules, forms used during inspections, and particular criteria that meet or exceed the requirements stated in the Food Code. A restaurant's operating license must be maintained in accordance with these requirements, and employee training must be planned to fulfill the inspection requirements set forth and compulsory by local health officials (Food and Drug Administration (FDA), 2017).

User-generated online reviews are becoming more and more common since they can affect service businesses' business performance and service revolution in addition to customers' product/service evaluations and purchase decisions (Yang et al., 2017). Online hotel and restaurant review sites like Trip Advisor and Yelp are regarded as trustworthy sources of information about products and services

that have developed with customer social involvement over the past ten years (Kesgin & Murthy, 2019). However, recent studies have shown that businesses and customers publishing online reviews can risk the legitimacy and openness of these review platforms, posing serious problems for businesses, customers, and review platforms themselves (Lo & Yao, 2019).

The purpose of this research study is:

1. To examine the role of food safety on satisfaction among customers in Kelantan.
2. To investigate the influence of online reviews on satisfaction among customers in Kelantan.
3. To identify the role of the attitude of restaurant staff on satisfaction among customers in Kelantan.
4. To determine the role of cleanliness on satisfaction among customers in Kelantan.

Significant of the Study

At the end of this research, it will support us better understand how to meet customer satisfaction through food quality, online reviews, the attitude of restaurant staff and cleanliness, and how to get that quality. The researchers are trying to identify whether food safety, online reviews, the attitude of restaurant staff, and cleanliness effect on customer satisfaction. This study is able to provide benefits and knowledge to the food and beverage community and all individuals involved in business hospitality. This will be able to help others to meet customer satisfaction by using the information from this study. This study can also provide new findings and help restaurant operators know about food safety, online reviews, the attitude of restaurant staff and cleanliness can affect customer satisfaction in fine dining restaurants in Kelantan.

LITERATURE REVIEW

Food Safety

Food handling, processing, and distribution procedures are referred to as "food safety" to ensure that there are no contaminants present that could cause food-borne illnesses. Food safety mentions to the proper food management methods used during food preparation, processing, storage, and circulation when you work with products in the food industry. Customers frequently worry about the safety of the food when dining out. The safety of a restaurant was evaluated based on the following factors: staff presentation, observed cleanliness, inspection results, and overall impression. Customers, particularly in developed nations, have become picky about the food products they purchase; they prefer fresh, healthy foods that need to be handled properly from production through ingesting (Moslehpour et al., 2014; Savelli et al., 2017). The most fundamental standard for assessing food quality is food safety. Additionally, the cleanliness of the restaurants reflected the quality of the food being served. They also based their choice to go back to the restaurant on these various factors. Functional, mechanical, and human clues were proposed as three indicators to evaluate restaurant cleanliness and diners' dining experiences in earlier literature. Food temperature and freshness are relevant functional clues. These hints are essential to ensuring client satisfaction and a company's viability.

Online Reviews

Since the invention of the Internet, consumers have used online platforms more frequently. Customer satisfaction is frequently well-defined as a client's general opinion of the caliber of a service or product. Before buying a good or service, customers frequently read numerous

reviews (Thomas et al., 2019). Reviews, in particular, frequently disclose details about the caliber of the service and the safety of the food, allowing potential customers to more accurately predict their own upcoming experiences based on the experiences of others who have used the service or purchased the invention (Beneke et al., 2016). While factors influencing the usefulness of reviews have been discussed in previous research on online product review content (Hong et al., 2017), as well as how analysis of textual content can be used to predict product ratings (Lei et al., 2016), there has been relatively little research on how the online of custom review affect customers.

Attitude of Staff Restaurant

Service value is one of the big issues that will affect all businesses. Among the service quality that is meant is employee attitude towards the customer. The success of businesses in the hospitality sector can be directly impacted by motivating frontline staff to deliver high-quality customer service (Chen et al., 2017). Employees are inconvenienced by problematic, annoying, or rude customers. On the other hand, a cheerful and enthusiastic attitude is more prospective to produce courtesy, emotional involvement, and sincere concern for the happiness and well-being of customers. From the restaurant context, good behavior or treatment from employees will have a good effect on customer satisfaction.

Cleanliness

Cleanliness of service environments plays a significant role in determining general customer satisfaction, perceived service quality, and customer intention to use a particular service provider again (Pizam & Tasci, 2018). The FDA Food Code provides guidelines for restaurant cleaning. According to the FDA Food

Code, sanitization is necessary for surfaces that originate into contact with food and should be cleaned thoroughly in restaurants. According to the FDA Food Code, "sanitization" is as follows: (FDA, 2017). According to research on restaurant cleanliness, Chow et al. (2019) discovered that customers' satisfaction was significantly impacted by a customer's expectation of cleanliness. Cleanliness is an important analyst of customer satisfaction. Customers are more likely to make additional purchases when they are pleased with the performance of a product or service because it meets their expectations.

Customer Satisfaction

Customer satisfaction is a crucial business concern because business owners have discovered that receiving favorable client feedback is necessary for a long-term sustainable operation. If a restaurant's patrons have a wonderful dining experience, they might recommend it to others, come back often, or both. Customer satisfaction is a crucial business concern for restaurants, just like it is in other sectors. Restaurants want customers to have the best experience possible to increase the likelihood that they will return. Positive customer feedback is crucial for creating a long-term sustainable company, entrepreneurs have discovered (Chun & Nyam-Ochir, 2020). In order to avoid product contamination, cleanliness is

crucial in the food sector. Production is safer in a clean environment since there is less chance of cross-contamination between products or contamination from raw materials.

Research Hypotheses

The following hypothesis was developed and was to be tested based on the study:

H1: Food safety is positively related to customer satisfaction.

H2: Online review is positively related to customer satisfaction.

H3: Attitude of restaurant staff is positively related to customer satisfaction.

H4: Cleanliness is positively related to customer satisfaction.

Research Framework

Figure 1 below had shown the conceptual framework of this study. Customer satisfaction toward restaurants in Kelantan was the dependent variable in this research while food safety, online review, attitude, and cleanliness were the independent variables of this research of study. The figure below had shown a linkage of the relationship between the independent variables and the dependent variable.

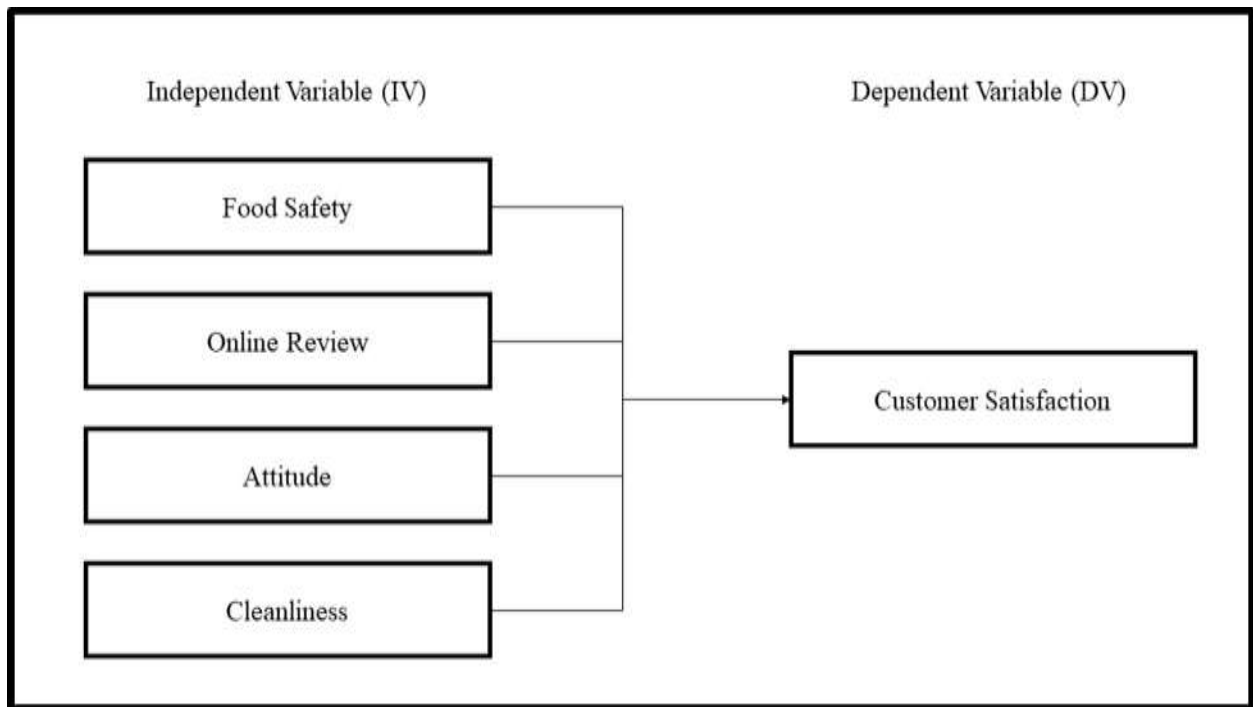

Figure 1 Relationships between the Independent Variables and Dependent Variable

Sources : Food Safety (Mekimah & Sayad, 2020); Online Review (Bi et al., 2019) ; Attitude (Ribeiro & Prayag, 2019); Cleanliness (Pizam & Tasci, 2018).

METHODOLOGY

Research Design

For this study, the researcher will use a quantitative method. Every organization needs quantitative analysis to design ways to grow. The population that the researcher will use in this study is customers in Kelantan. Population mentions to the entire group of people who share particular traits and characteristics. The population can be thought of as the study's intended audience or community of individuals who share the same trait. The process of selecting a statistically representative sample of people from an interested population is known as sampling. This study is being carried out in Kelantan and the researchers are choosing customers who currently there to take some time to answer the survey. This survey takes about 229 out of 384 customers.

Data Collection

Quantitative research was chosen for this research. This research survey used a self-service data collection mode, where respondents were asked to complete the questionnaire themselves. A total of 384 respondents will be selected to answer the questionnaire in person. They will be given an online questionnaire. After the respondents agree to fill out the questionnaire, the researcher will explain the questionnaire to them. Respondents have no obligation or compulsion to complete the research questions provided. The questionnaire emphasizes the intention of the study, and the goal of the study, and acknowledges the confidentiality of the respondent's information.

Sampling

In this study, the researchers selected non-probability sampling techniques which are convenience

sampling technique because it is used to select a predetermined number of respondents and very easy to reach them. This study sample is customers who have been to the restaurant. Researchers choose convenience sampling at few restaurants in Kelantan.

Data Analysis

This study uses four data analysis types which are descriptive statistics, reliability statistics, and Pearson's correlation. The data obtained were analysed by using SPSS version 25. The use of SPSS in the study helps to achieve the research objectives and helps to process the data that has been obtained.

FINDINGS

Table 1: Demographic Analysis

Item	Frequency (n)	Percentage (%)
Gender		
<i>Male</i>	171	52.0
<i>Female</i>	158	48.0
Age Group		
<i>18-21 years old</i>	46	14.0
<i>22-25 years old</i>	248	75.4
<i>26-29 years old</i>	19	5.8
<i>30 years old and above</i>	16	4.9
Race		
<i>Chinese</i>	30	9.1
<i>Indian</i>	15	4.6
<i>Malay</i>	282	85.7
<i>Others</i>	2	0.6
Status		
<i>Married</i>	27	8.2

<i>Single</i>	302	91.8
Occupation		
<i>Employed</i>	135	41.0
<i>Others</i>	3	0.9
<i>Student</i>	186	56.5
<i>Unemployed</i>	5	1.5
Total	329	100

The totals of 329 respondents which are 100% were Malaysian food consumers. The majority of the respondents 52.0% were male. It is because men prefer to eat at restaurant since it is more convenient and faster. Women eat less at restaurants because they prefer to prepare their meals at home. In the sample, 75.4% were in the 22-25 years old age bracket. People between the ages of 22 and 25 prefer to dine at restaurants since they are already aware of the aspects that can provide them with satisfaction as restaurant consumers. 85.7% were Malay. It is because when compared to other races, the majority of people in Kelantan are Malays. 91.8% were single and 56.5% were students. The majority of single persons will eat in restaurant. This is because they believe that eating in restaurant is preferable to cooking at home. It can help to save time and energy. Because most students are unable to cook, they dine at restaurants. They are unable to cook because they are students. For example, the university may not permit cooking in the college or may not have culinary equipment.

Table 2: Descriptive Analysis

Variable	Items	Mean Score	Standard Deviation
Food Safety	Serving utensils are clean.	4.69	0.62
	Restaurant serves food at the appropriate temperature (i.e., hot food hot and cold food cold).	4.59	0.66
	Restaurant uses fresh ingredients (i.e., no off-flavor or off-color foods).	4.56	0.78
	Tableware is clean.	4.59	0.67
	Restaurant provides information about ingredients and food allergy	4.36	1.09
Online Reviews	I believe that online customer reviews are informative.	4.61	0.74
	I will search for information about the restaurant after reading online customer reviews.	4.52	0.76
	Customer online reviews help me to compare restaurant.	4.58	0.76
	I think the restaurant is worth trying after reading the online customer reviews.	4.55	0.73
	The online review makes me confident in picking the restaurant.	4.57	0.76
Attitude of Staff Restaurant	The staff can handle customer's special needs effectively.	4.57	0.58
	The staff can accommodate customer complaints professionally.	4.61	0.60
	The staff has effective communication skill.	4.61	0.61
Cleanliness	Restaurant cleanliness is important to me evaluating overall restaurant quality.	4.85	0.39
	A dirty restaurant will decrease my overall level of satisfaction.	4.80	0.42
	A clean restaurant will increase my overall level of satisfaction.	4.83	0.38
	I high expectations of cleanliness for high-budget restaurant.	4.81	0.41
Customer Satisfaction	I would return to this restaurant in the future.	4.57	0.64
	I am satisfied with the restaurant's service quality.	4.57	0.65
	I am very satisfied with my overall experience at this restaurant.	4.53	0.70
	Overall, this restaurant puts me in a good mood.	4.56	0.64
	I will recommending the restaurant to others.	4.58	0.70

Food safety, item one score the highest mean value which was 4.69, where

the respondents strongly agree that clean utensils are important to customer

satisfaction. The lowest mean is item five, with the mean value of 4.3617, where the respondent somewhat strongly agree that customers would like to know the ingredient about the food they are consuming. Online review, item one score the highest mean value which was 4.61, where the respondents strongly agree that online review will strongly effect customer satisfaction and influence their decision to visit the restaurant. The lowest mean is item two, with the mean value of 4.52, where the respondent somewhat strongly agree that customers will absolutely do some research about the restaurant depend on the previous customer reviews. Staff attitude, item two and three has the same score highest mean value which was 4.61, where the respondents strongly agree that effective communication skills and ability to professional accommodate customers complain are one of the important aspects in restaurant. Meanwhile the lowest mean is item one, with the mean value of 4.57 and it indicates that customers also strongly agreed that to be able to handle customers special need are essential part of the restaurant. Cleanliness, item one score the highest mean value which was 4.85, where the respondents strongly agree that customer will give good rating if the restaurant is clean. The lowest mean is item 4, with the mean value of 4.81, where the respondent somewhat strongly agree that customers will be satisfied if a high budget restaurant has a high level of cleanliness. Customer satisfaction, item five score the highest mean value which was 4.58, where the respondents strongly agree that satisfied customers will recommend others to come to the restaurant. The lowest mean is item three, with the mean value of 4.53, where the respondent somewhat strongly agree that customers satisfied. The scale for the intention of the hotel workers in Kota Bharu to turnover is derived from the table above by adding the means and standard deviations for the five components. The measuring items' averages ranged from

3.53 to 4.58, and their standard deviations were between 0.637 and 0.699.

Table 3: Reliability Analysis

No of items	Study variable	Cronbach's alpha	Remarks (acceptable/not acceptable)
5	Food Safety	0.909	acceptable
5	Online Reviews	0.951	acceptable
3	Staff Attitudes	0.873	acceptable
4	Cleanlines s	0.871	acceptable
5	Customer Satisfaction Toward Restaurants	0.958	acceptable

The reliability analysis findings for the study variables were displayed in the table. The table shows that Food Safety is 0.909, Online Reviews is 0.951, Staff Attitudes is 0.873, Cleanliness is 0.871 and Customer Satisfaction Toward Restaurant is 0.958 which is Dependent Variable. In addition, all of the independent variable items which is Food Safety is 0.909, Online Reviews is 0.951, Staff Attitudes is 0.873 and Cleanliness is 0.871 were acceptable because the score result was over 0.70. Dependent variable, Customer Satisfaction Toward Restaurants, has a value of 0.958 indicating that the variables employed were appropriate and accurate in measuring this variable. In the nutshell, the reliability coefficients for the independent variables in this study according to Cronbach's Alpha were satisfactory and correlated with one another.

Table 4: Pearson Correlation Analysis

Hypothesis	Result	Finding of Data Analysis
H1: Food safety is positively related to customer satisfaction.	r = 0.791, p = 0.000 High positive	H1: supported
H2: Online review is positively related to customer satisfaction.	r = 0.616, p = 0.000 High positive	H2: supported
H3: Attitude of restaurant staff is positively related to customer satisfaction.	r = 0.651, p = 0.000 High positive	H3: supported
H4: Cleanliness is positively related to customer satisfaction.	r = 0.363, p = 0.000 High positive	H4: supported

Hypothesis 1 (H1) p-value was 0.001, which was less than a significant level of 0.01. The correlation coefficient of 0.791 suggested a high positive correlation between food safety and customer satisfaction.

Hypothesis 2 (H2) p-value was 0.001, which was less than a significant level of 0.01. The correlation coefficient of 0.616 suggested a moderate correlation between online reviews and customer satisfaction.

Hypothesis 3 (H3) p-value was 0.001, which was less than a significant level of 0.01. The correlation coefficient of 0.651 suggested a moderate correlation between staff attitude and customer satisfaction.

Hypothesis 4 (H4) p-value was 0.001, which was less than a significant level of 0.01. The correlation coefficient of 0.363 suggested a weak correlation between cleanliness and customer satisfaction.

DISCUSSION & RECOMMENDATION

Cleanliness gives a low effect on customer satisfaction because through the result we can see the majority of the respondents are male. And most of the young people especially the male were not taking cleanliness as an important thing. Food safety got a higher result because most of the respondents are students. Most of the students have some knowledge about food safety and they are concerned because they are away from family. As a student, they cannot use ill as a reason to take the medical certificate. It is because they are busy to complete the assignment. After that, online reviews and staff attitudes give a positive impact on customer satisfaction. Most people will judge attitudes when they are dine-in.

Customer satisfaction can be better evaluated through data analysis, such as surveys, feedback forms, and customer reviews. Advances in data collection techniques, as well as emerging technologies such as natural language processing and sentiment analysis, will enable researchers to gain vital information directly from customers. Additionally, advanced analytics can go beyond simple metrics and into contextual analysis to better understand customer behavior related to restaurant recommendations. Data on customer preferences, location, time of day, and other pertinent aspects can be combined to gain a better understanding of how swift service affects customer satisfaction. Insights can be extracted from consumer reviews, social media posts, and online debates using natural language processing and sentiment analysis techniques. Cultural and regional differences may influence customer behavior, so researchers must account for these variances in future data collecting and analysis.

<https://doi.org/10.1080/09593969.2015.1068828>.

CONCLUSION

Customer satisfaction has a substantial impact on overall contentment when choosing a restaurant, with food safety, online reviews, attitude, and cleanliness all playing a factor. According to the data, practically all respondents completed the survey questions on their satisfaction with restaurants in Kelantan. The majority of respondents firmly agreed that customer satisfaction has a significant impact on their satisfaction while selecting a restaurant. Respondents also agreed that food safety, online reviews, staff attitude, and cleanliness all played a role in their overall happiness.

ABSTRACT

The hotel industry is one of the most important components of the wider service industry, catering to customers who require overnight accommodation. It is closely associated with the travel and hospitality industries, although there are notable differences in scope. Succeeding the issue of labor shortages in the hospitality sector related to job satisfaction, we investigate two factors that may be contributed to this problem which are reward and recognition and workplace environment. So, this study was done to examine the influence of reward and recognition, and workplace environment on job satisfaction among hotel employees' Malaysian hotel industry. In particular, there are two objectives to identify which are the influence of reward and recognition on job satisfaction and to find the relationship between workplace environment on job satisfaction. To complete the study, we distributed the questionnaire containing three parts and 20 questions to four hundred respondents, the hotel employees. This study is quantitative and has been analyzed using descriptive analysis and using the SPSS software.

Keywords: hotel industry, reward and recognition, workplace environment, job satisfaction, descriptive analysis, and quality employees.

INTRODUCTION

The segment of the service sector that deals with guest accommodations is the hotel business. The term "hotel industry" is used to describe a variety of lodging options, including hotels as well as inns, motels, hostels, and guest homes. It typically excludes long-term or permanent accommodation though. One of the areas with the quickest growth in the twenty-first century is the hotel industry. In this field, hotel management is essential, and running a hotel is a demanding job. Such positions can only be filled by the most competent candidates, therefore if you are prepared for this exciting work opportunity, it will help you advance both personally and professionally. The world hotel sector has recently encountered a number of difficulties and problems. The issue includes a labor and talent deficit. That is what is currently taking place in Malaysia. The travel sector became the third highest contributor to the country's gross income following the country's economic recovery process. The Malaysia hospitality sector is currently faced with a critical problem in that the development of the hospitality industry is growing slowly despite the increasing demand at the moment. Persatuan Hotel Malaysia (MAH) Pahang chairman, Patrick Tee, said a shortage of about 15 percent of the workforce with a budget of about 15,000 people across the country, led to hotel management only being able to operate at 85 percent level only including in Pahang. He said hotel management needs manpower especially in the room packing and food preparation sections but failed. "Since the government

announced the country is now in the endemic transition, people have been moving here and there and the tourist center becomes a crowded focus especially during weekends or public holidays. "The unfortunate shortage of hospitality sector workers may have caused the services to be affected and this will give us a bad image. "Foreign tourists are also increasingly coming to our country, but the rooms provided cannot be fully opened following the shortage of workers," he said.

BACKGROUND OF STUDY

The hotel industry in Malaysia is experiencing increasing profits and job satisfaction, making it one of the most popular tourist destinations in the world. However, the industry faces challenges such as high turnover rates, lack of motivation, and poor employee training. The Malaysian Employers Federation reports a 65.7% turnover rate, highlighting the need for improvements. The hotel industry faces labor shortages and unstable appraisals, leading to increased turnover rates. To maintain stability, employers must identify employees' strengths and place them in the right positions to improve themselves. By addressing these issues, the hotel industry can continue to grow and thrive in Southeast Asia.

PROBLEM STATEMENT

This study looked into the relationship between job training and job happiness in industrial hotels. Today, one of the biggest employers in the nation is the hotel sector. This is due to the large number of tourists and travelers both domestically and internationally who attempt to escape the stress of work-related obligations by travelling. As a result, it's critical for industrial hotels to hire personnel who are capable in both personality and job.

The hotel sector has experienced recent job losses (Nazaraly, 2022). This is due to the likelihood that employees may become involved in a variety of issues brought on by a variety of causes. Among the potential factors in the workplace. The setting in which a person pursues a profession is their workplace. The term "working environment" can be used to describe both the location and the circumstances under which people carry out their duties and earn a living. The working environment has a direct impact on job satisfaction. Labrague and others, (2022) Relationships with the workers are fostered over the long term through a positive workplace culture. Job satisfaction is significantly impacted by the workplace.

The absence of employee rewards and recognition could be the second cause. Either internally or publicly, awards and recognition are offered to those who do successfully. There is a presence of recognition and reward in the workplace when employees' achievements are fairly and immediately recognized. This includes paying employees fairly and consistently, celebrating teams or employees, and acknowledging years of service or successes (Darwinbox, 2019). Human resource management should incorporate components of reward and recognition since

they can boost employees' productivity. Additionally, it develops a more reliable employer brand. Employees talk and swap tales with counterparts from different companies.

The purpose of this study is to experimentally evaluate the relationship between reward and recognition, work environment, and job satisfaction among hotel employees in Malaysia based on the aforementioned topics. The following immediate goals help to support the main goals:

1. To examine the influence of workplace environment on job satisfaction among hotel employees
2. To examine the influence of reward and recognition on job satisfaction among hotel employees in Malaysia

SIGNIFICANCE OF THE STUDY

1. Academic Aspect

From a theoretical standpoint, despite the growing interest in hotel industry employee satisfaction, there has been very little research on hotel employee satisfaction in Malaysia since the Covid-19 pandemic. It is also anticipated that the contribution this study makes to the Malaysian hotel sector will be used to determine how original the study is. In light of the theoretical underpinnings of this study, which are founded in past study, it is clear that this the result of past study is capable of guiding us to get the results. The novelty of this research work will contribute to a deeper understanding of the hotel business with the help of pertinent literature. This methodology is anticipated to make understanding employee happiness more straightforward.

2. Practical Aspect

Practically speaking, market research is absolutely necessary to assist owners of companies that offer services to the food sector in creating effective and long-lasting marketing plans. Additionally, this study can draw in more patrons for the food industry. The results of this study may be helpful to both the business and food industries. In particular, they offer business owners customer suggestions, which are crucial for developing competitive food industry business strategies that will market the food industry. In other words, this study offers a chance to learn more about SME businesses in the food sector of the business world.

LITERATURE REVIEW

Reward And Recognition

Rewards and recognition are important for companies to motivate employees and keep them interested in their work. Companies use incentives and recognition to help employees motivate and perform better. There are many

types of recognition, such as regular recognition events, monthly or annual employee awards, and annual reports or yearbooks that highlight employee achievements. Rewards and recognition have been proven to strengthen teamwork, increase customer satisfaction, enhance company value, and encourage specific employee actions. Everyone in the company has the opportunity at any time to show recognition, a personal appreciation for a job well done.

Workplace Environment

The key detail of this paper is that organizations should provide a healthy work environment to ensure that the environment is conducive to employees, thereby increasing their job satisfaction and quality of work. A positive work environment is one characterized by trust, collaboration, safety, support for risk-taking, accountability and equality. Research shows that workers' decision to stay in their current job is influenced by the work environment, and employers should provide psychosocial support and serve as role models in counseling. Leadership support can also reduce work-family friction, emotional exhaustion, and turnover intentions.

Job Satisfaction

Job satisfaction is defined as a person's positive emotional response to a particular job that results from the person's positive comparison of actual results with those expected, expected, or deserved. Has been shown to have a positive relationship with employee retention, and it has been suggested that when employees stop working due to factors such as unsafe working conditions, uncooperative colleagues, or managers who make poor decisions They leave the fabric. To reduce these costs, organizations must provide a flexible work environment where employees feel that their ideas are valued and that they are part of the company. Additionally, previous research has shown that managerial communication has a significant impact on job satisfaction and that high levels of manager-employee communication are associated with happier employees.

HYPOTHESIS

H1: Workplace environment is significantly related to the job satisfaction of hotelemployees in Malaysia.

H2: Reward and recognition are significantly related to the job satisfaction of hotel employees in Malaysia.

CONCEPTUAL FRAMEWORK

METHODOLOGY

To get the raw data for this investigation, researchers will employ quantitative methods. The researchers can learn more about these aspects' effects on Malaysian hotel employees' job satisfaction in the workplace by employing this approach to their research. We will use primary data from the questionnaire we will hand out to Malaysian hotel staff members in this study. We will first employ a sample random sampling technique. We shall start by listing the hotels that are currently open in the state. The questionnaire will then be distributed at a few of the hotels that we will choose at random. Then, based on the modest number of hotels, we will gather 25 hotel employees to serve as our respondents and provide us with accurate data. Since we have a population of more than a million, Krejcie et al. (1970) determined that 384 respondents must complete the questionnaire as a minimum.

Systematic random sampling is the type of sampling technique we shall utilise in this study. We will obtain random data from the respondents by using a systematic random sample, which will increase the veracity and viability of the research findings. Data organization, modification, inspection, and transformation are all parts of data analysis. This would offer test findings as well as interviewee responses to the conducted survey instrument based on this analytical data. Statistical Package for Social Science, or SPSS, was used to analyse the survey's questions. The data will next be subjected to a descriptive analysis. This allows the data to be divided according to the research criteria. Following the data's classification, we will follow it with a Pearson Correlation analysis to make sure the

static data we collected is connected to the dependent variable. The Pearson Correlation coefficient is used to examine the relationships between the study's variables.

FINDINGS

Result of frequency analysis.

NO.	BACKGROUND CHARATERISTIC	FREQUENCY	PERCENTAGE (%)	
1	Gender	Male	164	41.0
		Female	236	59.0
2	Age	20 - 30 years old	130	32.5
		30 - 40 years old	184	46.0
		40 years old and above	86	21.5
3	Marital	Single	137	34.3
		Married	234	58.5
		Divorced	23	5.8
		Others	6	1.5
4	Education Level	SPM	110	27.5
		Diploma	148	37.0
		Degree	89	22.3
		Master	18	4.5
		Phd	7	1.8
		Other	28	7.0
5	Income	RM 1000 and above	240	60.0
		RM 2000 and above	123	30.8
		RM 3000 and above	37	9.3

Table of Analysis Respondent Background Information

Analysed by gender of the respondents, there were a total of 400 respondents in this survey. Of the 400 respondents, 59.0% female respondents are higher than male 49.0%. Respondents were divided into three age groups by age distribution. The largest number of respondents came from one of the younger age groups at 30 years old to 40 years old, with 184 people equal to 46.0%. Then, the marital distribution of the respondents is then shown, the largest marital distribution participating in this study is married status at 58.5% of 400 respondents. While divorce status marital got the low rank in the data at 5.8% equal to 23 people from total number of respondents. People came from diploma eligibility are equivalent to 37.0% equal to 148 respondents. SPM level are as many as 110 people equal to 27.5%. The Degree level has a total of 89 people equivalent to 22.3%. Master's level is as many as 18 people equal to 4.5%. The PhD level which is 7 people equivalent to 1.8% and other levels 28 people equivalent to 7.0%. Analysis of respondents based on monthly income showed that 240 respondents or 60.0% had a monthly income of RM 1000 and above. The monthly income is between RM 2000 and above is 123 people or 30.8%. Next, respondents with a monthly income of RM 3000 and above 37 respondents or 9.3%.

Result of descriptive analysis.

Variable	Items	Mean score	Standard Deviation
Workplace environment (IV)	Hotel with clear vision, mission, organization structure, and policies.	3.84	0.961
	Have right tools or equipment for the job.	3.94	1.077
	Better occupational health and safety at work.	3.49	1.21
	Good location of workplace.	3.8	0.875
	Good coworkers and managers.	3.77	1.157
Reward and Recognition (IV)	Receive thanks and appreciation for job well done	2.87	1.397
	Freedom of creativity and judgement at work	3.26	1.068
	Receive service charge, bonuses, tips, and cash prize for job well done	3.7	1.189
	Good system of promotion	3.17	1.342
	Understanding of personal problems by management and help solving it	2.91	1.069
	Job matched with skills and knowledge	3.4	1.001
	Receive respect and value by the management	3.31	1.158
Offer trust and ownership at work	3.04	1.295	
Job Satisfaction among hotel employees (DV)	The hotel is able to listen to your problem with work	4.12	1.776
	The hotel briefing you completely about your task	4.94	1.773
	You have chances to talk about future opportunities in your hotel	4.17	1.662
	The hotel gives an additional benefit to their employee in healthcare.	4.74	1.82
	The hotel put you in a suitable place for you to do the work	4.9	1.592
	The decision issued by the hotel toward employees will refer to the employees' opinion first	4.89	1.723
	Overall, you are satisfied with the hotel where you work	4.95	1.963

Table of Result of descriptive analysis.

There were five (5) item questions that related to the work environment in the hotel industry. For the work environment, Cronbach’s Alpha was 0.886 which is very good. Based on the descriptive analysis that we have done; the highest average mean was WE2 as much as 3.94 and 1.077 for the standard deviation. Next, the second highest mean recorded was WE1 as much as 3.84 and for the standard deviation was 0.961. Followed by WE4 that recorded the mean as much as 3.80 and 0.875 for the standard deviation. Thus, is WE5 that the mean was as much as 3.77 and 1.157 for the standard deviation. Lastly, the lowest mean for the first independent variable in our research was WE3 which the mean recorded was as much as 3.49 and 1.210 for the standard deviation. Analysis of Reward Recognition the highest mean among eight types of items is the RR3 at 3.70. RR3 talks about the receive service charge, bonuses, tips, and cash prize for the good work. Next, the second highest mean for item in reward recognition analysis is the RR6 at 3.40 and the third highest followed by RR7 at 3.31. These two items are pinned about the job matched with skills learning and for the item RR7 is feel valued by management. Then, the item for RR2 is bigger than RR4 that stated the mean at 3.26 compared to 3.17. This proves that the employee feels the hotel management gives them more freedom at the workplace than improve the good system in promotion. After that, the item RR8 is rated at the sixth places with the 3.04 mean and its talk about the offering the trust and ownership at work. Moreover, the items RR1 is placed at the last and it follows the item RR5. Both of these items stated the mean at 2.87 and 2.91. There were seven (7) item questions that related to hotel employees job satisfaction in hotel industry. For the hotel employees’ job satisfaction, Cronbach’s Alpha was 0.917, which is very good. Based on the descriptive analysis that we have done; the highest average mean was HEJS7 as much as 4.95 and 1.963 for the standard deviation. Next is, the second highest mean recorded was HEJS2 as much as 4.94 and for the standard deviation was 1.773. Moreover, HEJS5 recorded the third highest mean as much as 4.90 and 1.592 for the standard deviation followed by HEJS6 that recorded the mean as much as 4.89 and 1.723 standard deviation. Furthermore is, HEJS4 which that the mean as much as 4.74 and 1.820 for the standard deviation. The lowest mean for dependent variable in our research was HEJS3 as much as 4.17 and 1.662 for the standard deviation. The second lowest mean recorded was HEJS1 as much as 4.21 and 1.776 for standard deviation.

Pearson Correlation Analysis

Variables	Number of Items	Cronbach’s Alpha Coefficient	Strength of Association
------------------	------------------------	-------------------------------------	--------------------------------

Independent Variables (IV) Workplace Environment	5	0.886	Very good
Independent Variables (IV) Reward and Recognition	8	0.919	Excellent
Dependent Variables (DV) Hotel Employees Job Satisfaction	7	0.917	Excellent

Table for Result of reliability Cronbach's Alpha Coefficient for the Independent Variables (IV) and Dependent Variables (DV)

According to the results of the reliability test, these variables were the strongest for Cronbach Alpha coefficients which is the first variable (Hotel Employees Job Satisfaction) got 0.917 for result. The highest variable is the Reward and Recognition which started at 0.919 while the third variable which is the workplace environment is listed at 0.886 and was lower than these two variables. It also shows that the dependent variable the excellent for the strength of association. In conclusion, having the Cronbach Alpha analysis able to prove the acceptable of our survey towards the respondent which is the hotel employees. The quantitative descriptive method approach has described how workplace environment and reward and recognition can improve job satisfaction among hotel workers in Malaysia. The descriptive analysis in this part includes dependent variables (hotel employees' job satisfaction) as well as independent variables (workplace environment, reward, and recognition). SPSS software was used to analyze the data that were gathered via an online survey that was circulated. A 5-point Likert scale is used to evaluate Section B of the questionnaire: 1 = strongly disagree, 2 = disagree, 3 = slightly agree, 4 = agree, and 5 = strongly agree. Additionally, the questionnaire's Section C is evaluated using a 7-point Likert scale, where 1 = strongly disagree, 2 = disagree, 3 = slightly disagree, 4 = NATURAL 5 = slightly agree, 6 = agree and 7 = strongly agree. The findings of the analysis are depicted in the table below.

DISCUSSION AND RECOMMENDATION

Appreciation towards hotel employees is a crucial thing that needs to be concerned among hotel management or employer. The findings of this study also prove that the hotel employees got less appreciation from their employers. It can be seen in section two findings at the reward and recognition variable rated the appreciation by employers to hotel employees is very low. Hotel management needs to respect their employees too by encouraging the managers to have a good understanding of their staff. Makes them feel that there are valuable to the hotel. Giving the gift to the hotel employees manages to make them loyal to the hotel too. Showing the hotel employees, positive vibes at the workplace like always saying thank you and well done after they're done their jobs also help increase their job satisfaction. In the end, showing appreciation towards the hotel employees help them in increasing job satisfaction.

Managing the hotel employees is also hard work to be done by a manager. Moreover, when it comes to choosing them to increase their positions among hotel employees. Hotel management must identify the few candidates among

hotel employees that are worth that position. To make it become fairer the hotel management needs to appoint two or three managers to become the judges. By doing this, employees will be satisfied with the choices that are made by them. Hotel management can create a list of criteria for the person that increases the positions in the workplace. The judges must be strict in picking the employee who is suitable to take the positions. Having fair competition will make the hotel employees accept the final decisions that are made by their managers.

Every human needs to be good to another for reaching peaceful conditions. The person who works at the hotel needs to interact with the humans. As we know, humans have many criteria and various behaviors. Facing different people with different behaviors will make the hotel employee become more stressed in doing their jobs. Plus, the complaints and harsh words that they face will reduce their job satisfaction. People around them should use appropriate words and suitable communication to talk with the hotel employees. It will make them happy and enjoy keeping doing their work. Get a smile from the guest and thank you will make their days as the hotel employees. Guests also can show some respect to the hotel employees by talking politely when dealing with them. Increasing the appreciation to the hotel employees manages to increase their job satisfaction in the workplace. It also creates a profit to the hotel as the employer because they do not spend their resources to train new employees every time.

Conclusion

Based on the results of the study, this research has been carried out to analyze whether reward and recognition and workplace environment are affecting job satisfaction among hotel employees in Malaysia. Moreover, this study explains more about job satisfaction among hotel employees from their perspective. The result that has been gained in Chapter Four using the Statical Package for Social Science (SPSS) has been analyzed and further discussed in Chapter Five. As a result, we can conclude that is a significant relationship between job satisfaction among hotel employees with reward and recognition and the workplace environment. Therefore, it is hoped that all the information provided by this research will help the hotel management to solve the turnover rates among hotel employees and at the same time manage the hotel employees to work in a comfortable and appropriate workplace.

ABSTRACT

Most students who wanted to studied hospitality and hotel management in Malaysia did not knew how this subject was taught in universities. In summary, hotel management combines business, tourism, and culinary skills. University Malaysia Kelantan was one of the universities that presents hospitality costed to students in Malaysia. This studied was conducted to found out and studied the influencing factors in persuading to continue a career in the hospitality industry. A total of 118 university Malaysia Kelantan students in the hospitality sector, especially final year students, was sampled to answered random questionnaires to complete this studied. This question focuses on factors that had influenced in pursuing a career in the hospitality industry. Furthermore, the questions also focus on several factors which were related to social status, salary/benefit, and nature of worked. This studied was conducted because many students had taken the costed of hospitality, but they felt doubtful about the journey of this costed. There were also post-graduate students who felt that after graduation, there were no bright job opportunities for their careers. Furthermore, the main data for the studied collected by used a structured questionnaire, and the analysis was made by used SPSS software. The surveyed was distributed to 123 respondents of final year students in university Malaysia Kelantan. In this studied, descriptive, reliability tests, and correlation analysis was utilized to process the data. So, this studied enables researchers to knew more the factors that had influenced final year students in the university Malaysia Kelantan regarding careers in the hospitality industry.

Keywords: Hospitality Industry, University Students, Social Status, Salary/Benefits, Nature of Work.

INTRODUCTION

Readers should be given the background knowledge necessary to comprehend the studied's goals and the rationale for this experiment when introducing. The primary goal of this study was to identify "the factors that have influenced final year students' university Malaysia Kelantan in choosing to pursue a career in the hospitality industry." This was done because generation Y students' perceptions of seniors at all universities had changed and been slightly modified from those of the generation that came before them. According to morton (2002), generation y workers had a propensity to valued equality in the workplace and looked for jobs with competitive pay and decent training chances. According to morton (2002), they valued managers who gave their staff the freedom to made decisions and who was straightforward with them.

The scope of the hospitality sector was considerable. It includes worked at establishments including hotels, eateries, casinos, theme parks, cruise lines, and other leisure and recreation-related services. Dealing with customers face-to-face in a variety of ways was a major component of many employments in the hospitality sector. However, there was some tasks

that was done in secret, such as those in accountancy, marketing, and sales. Additionally, there was many employments in the hospitality sector related to food services, such as waiter and cooked positions. Every university's final-year students, who would shortly entered the workforce, needed to underline how tightly related these topics was. For individuals had been more motivated to pursue a profession in the hospitality business, they also needed to had optimistic attitudes or viewpoints. There was therefore many factors that encouraged students to choose employment in the hotel industry.

Solved problems in determining a career in the hospitality industry was very important and allows graduates to decide whether they wanted to be continued in this field or not, in other words, students who did internships should did the job as well as possible carefully and asked more questions about the career field in hospitality (wang, 2021). Undoubtedly there was several aspects, including income, advancement prospects, and relations between managers that must been addressed by the sector to guaranteed that students had a favourable experience while working for their degree. Industry would continue to lost these qualified and trained workers if it could not provided better job opportunities and greater compensation for its graduates (s. Richardson, 2009). To avoided missing out on knowledge about a promising career for the future, all students who wanted to major in hospitality should commit to pursue a career in this sector, in addition to the students at the university Malaysia Kelantan. A good perception would gave good factors and would gave progress to the hospitality students themselves. This studied aims to improve the current understanding of the factors that have influenced final year students' university Malaysia Kelantan in pursuing a career in the hospitality sector and beyond because they was seen as future workers and managers of the industry.

Significant of The Study

Based on this studied, the perception of graduates in this field of choosing a career in hospitality had been a topic of discussion among hospitality students. After high school, many students decided to enrol in colleges, but they must first decide what they wanted to be studied. In conclusion, there had not been much researched on why students chose to enrol in tourism or hospitality courses, yet some still did. Another crucial choice that students in this course must made was whether they wished to be worked in the hotel business after graduation. In this researched, the hospitality education was playing an important role in supporting the industry's human resource demands and development in Malaysia. It oversaw ensuring a steady flow of graduates with the necessary qualifications to meet the industry's expanding demand. Enrolments in the hospitality programme were anticipated to rise due to the increased need for professional and qualified professionals in all sectors of the hospitality industry. The importance of this studied was as a form of appreciation and support that the responsible parties listened to the problems of university students. This was because they had carried out their responsibilities as students by following the decisions or planned of the university or faculty and many more. In addition, the writing of this studied was also to give a suitable assessment to the students because they had tried to pursue their dreams and ambitions, but they had not yet determined what job to pursue in more detail because many hospitality industries currently wanted employees who had worked experience in this industry.

The existence of this research platform may have in part assisted in identifying students' dedication to pursue a career in the hospitality sectors while also suggesting solutions to the issue, as was covered below. This was intended to improve the current grasp of the factors that have influenced final year students' university Malaysia Kelantan in pursuing a career in the hospitality industry and beyond since they were seen as future industry workers and managers. In addition, this studied could also been used as a reference material for future researchers. For

future researchers, this studied was likely have been a second tool with other methodological methods in signalling determination to pursue a profession in the hospitality sector among hospitality students at university Malaysia Kelantan. The results of this study may also be used to inform instruction and learning at all societal levels, notably for university students considering a future in the hospitality sector.

LITERITURE REVIEW

Nature of Work

One of the variables that contributes to students' unfavourable opinions of the sector is work pressure. In other words, when students assume that careers in the hospitality industry are stressful and demanding (Grobelna & Dollot, 2018; Kulsuvan, 2000). Today's students choose a relaxed and enjoyable work environment rather than one that is pressure-filled and unpleasant. (Le, Mcdonald & Klieve, 2018; Ashton, 2017; Richardson, 2009). While working as casual employees in a particular industry, they look for a good manager or leader to help them make the task simple and understandable. However, because a leader's qualities aren't present, they are automatically put in a stressful situation where they must work under pressure. Instead of working under pressure and being tough, a positive work atmosphere made undergraduates attached to their perception. (Ashton, 2017; Richardson, 2008). Nachmias and Walmsley's (2015) research indicated that the type of the employment and the working conditions are the main factors in why students haven't entered the workforce. Ahmad, Rashid, and Shariff (2014) said that the majority of students do not want to work in the hospitality business since the job is demanding and tiresome owing to lengthy working hours, such as those necessary while working shifts.

Salary/Benefit

The "total reward system" that characterises the compensation structure in the hotel sector is made up of several pay and non-pay components of remuneration. According to Boella and Goss-Turner (2013), a worker's basic wage pay earned while employed in the hotel business is not always reflective of his overall remuneration under this system. Free lodging is quite important to a hotel employee. According to Joo-Ee (2015), in some cases, minimum wage workers are better off with free housing than they are with pay as a benefit in kind. The minimum wage in the hospitality sector puts increasing pressure on overall salary levels. Up to 70% of hotel employees may be impacted by the Minimum Wages Order. Therefore, the salary gap between the rank and file and top-level workers will noticeably shrink if salaries are raised in compliance with the Minimum Wages Order. According to Suhaili (2012), many hotel operators are concerned that the widening salary disparity may demotivate senior-level personnel. Employers formerly provided compensation increases to represent the difference between the former and the latter in terms of abilities, experience, and responsibilities at work in order to sustain the wage disparity between these two types of employees (Joo-Ee, 2015).

Social Status

The term "social status" discusses a person's standing or significance in relation to other members of a society. The degree of prominence, privilege, and honour that someone is thought to possess in society is referred to as their "social status." Because of the odd hours worked, they felt that this industry was unsuitable for them to enter because they would be required to work past their regular hours, including on weekends and into the evening (Farmaki, 2018; Richardson, 2008). Additionally, the majority of students have had They gain a deeper

understanding of the corporate world through work experience, such as industrial training. Although pupils have finished their hands-on instruction and turned it into Their perceptions of the hotel industry are more negative as a result of their lack of the unreliable, long hours. (Brown, Thomas & Bosselman, 2015; Roney & Öztin, 2007).

Factors That Have Influenced in Pursuing A Career in The Hospitality Industry

Every industry has its own set of variables, and the hospitality sector is also affected by outside variables that have a direct impact on organisational behaviour and decision-making. For students, choosing a career can be a difficult decision because it affects the kind of employment they plan to follow in the future. Students struggle to match their profession choices with their skills and academic performance when they try to decide on a vocation.

According to (Kerka, S. 2000), The choice of a job is influenced by a wide range of factors, including personality, interests, self-concept, culture, globalisation, socialisation, role models, social support, and the accessibility of resources like information and money. (Bandura, A. Barbaranelli, C., Caprara, G., & Pastorelli, C. 2001). Mention that each person involved in the process is influenced by a variety of variables, such as their environment, personal traits, social connections, and level of education. The decision of a career is also impacted by internal or external forces. Many people are influenced by their parents' professional choices, whereas other people pick the careers that their educational choices have made possible for them to pursue. Some people choose to pursue their hobbies despite the possibility of financial gain. However, some people select prosperous professions. Students' opinions of their fitness for particular jobs have been found to be influenced by a variety of different factors, including their ethnic background, year in school, level of achievement, choice of science subjects, attitudes, and differences in work skills. (McQuaid and Bond, 2003). (Perrone, Zanardelli, Worthington, & Chartrand, 2001).

Research Hypotheses

The study's hypothesis is to determine whether dependent variables and independent variables have any correlations or links. This study's findings, such as social status, salary and benefits, and the nature of work, have inspired University Malaysia Kelantan final-year students to pursue a career in the hospitality sector. The research's hypothesis is:

H1: There was significant relationship between social status and factors that had influenced in pursuing a career in hospitality industry.

H2: There was significant relationship between salary/benefit and factors that had influenced in pursuing a career in hospitality industry

H3: There was significant relationship between nature of work and factors that had influenced in pursuing a career in hospitality industry.

Research Framework

With reference to the literature review, a studied framework had been sequentially developed to examine the relationship between the factors that had influenced in pursuing a career in the hospitality industry. The dependent variable consists of variables that had an impact on choosing to pursue a career in the hospitality industry. The independent variable the proposed consists of three was social status, salary/benefit, and nature of work. Therefore, below was a conceptual framework.

Figure 2.4: Conceptual Framework (El-Dief & El-Dief, 2019)

This shows through a summary related studied, the conceptual framework of factors that had influenced in pursuing a career in hospitality industry. This studied was determined by the social status, salary/benefit, and nature of worked.

METHODOLOGY

Research Design

In general, a strategic structure that links research themes to its execution is referred to as research design. Study design is a set of rules for configuring data collecting and analysis settings in a way that balances relevance to the investigation goal with the research's purpose (Durrheim, 2006). There are both quantitative and qualitative approaches. Quantitative approach is a technique of collecting, analyzing, interpreting, and writing the data that the researcher got for the study (Carrie, 2002). The approach of using quantitative will aid the research in obtaining data through the responding to relational questions of variables in study. Meanwhile, qualitative approach is entails gathering and analyzing narratives using methods such as interviews or group focus. Qualitative approach also used for researcher in-depth understanding about human behavior, experience, attitudes, and intentions (Shariques, 2019).

The study's main objective was to examine the factors that have influenced final year students' university Malaysia Kelantan in pursuing a career in the hospitality industry. The researcher utilized a quantitative strategy to gather data for this study, this is because, to predict the results based on the hypothesis and formulate a plan to test the research predictions which are factors that affect careers in the hospitality industry for final year students at UMK. Quantitative data was collected via a questionnaire. The quantitative approach to understanding behavior entails the use of mathematical techniques, measurement, and research. This design, on the other hand, uses a data point to explain a given reality. The data is collected to determine the link between the independent variable (social status, salary/benefit, and nature of work) and the dependent variable (factors that have influenced in pursuing a career in hospitality industry). Quantitative approaches are widely used to conduct studies that call for a description of trends or an explanation of the relationship between independent and dependent variables. The analysis

obtained will provide information among students at University Malaysia Kelantan in terms of gender, ethnic and socioeconomic status.

Data Collection

According to Shamoo & Resnik (2003), several analytical procedures provide data collection methods in research projects. Primary data are used in this study. The primary data, which is the best kind of data in the research, is often acquired from the source where the original statistics are received. Primary data is information that researchers have collected directly from the source through experiments, surveys, and interviews. The best type of data for the study is considered to be primary data, which is frequently obtained from the same sources as the original statistics.

A questionnaire administered via Google Form was utilized in this investigation. During this situation, questionnaire is used to collect information on the factors of the study such as social status, salary/benefits and nature of work that have influenced final year students in University Malaysia Kelantan (UMK) in pursuing a career in the hospitality industry. The questionnaire is supplied online and collects final year students in the hospitality industry data. Online surveys were conducted since it would be simpler for researchers to gather replies from University Malaysia Kelantan (UMK) final year student respondents about pursuing a profession in the hospitality sector.

Sampling

The sample size was employed in research to estimate the estimated number of participants and to represent a specific sample. The number of participants or observations that were included in a study can also be referred to as the sample size. Each person in the word "example" denotes a subject. The number of subjects in the example made up the test size, which was indicated by the letter "n."

The sample size for any relationship survey research project should not be less than 30. Then, for causal-comparative and experimental study, more than 50 samples were required. Each significant subgroup of the population should have 50 samples chosen, and each minor subgroup should have 20 to 50 samples chosen.

The term "sample size" in this research refers to the number of participants who were chosen from the general sample and considered based on the sample of a specific study. Following the selection of the population by the researcher, the necessary sample size was calculated using those tables. As a result, the sample size for this study was based on a 118-person sample of all hospitality final-year students at the University Malaysia Kelantan Campus Kota, in accordance with (Krejcie and Morgan's chart from 1970).

According to information from the Faculty Hospitality, Tourism, and Wellness, there were 170 students in the hospitality major who were in their last year. Consequently, a total of 170 students had been included in this studied as respondent. Consequently, the studies' sample size would only been 118 people from the total population. This was because according to the table below that was source (Krejcie and Morgan, 1970). As a conclusion, the importance of this sample size was that researched results were directly influenced by sample size calculations.

<i>N</i>	<i>S</i>	<i>N</i>	<i>S</i>	<i>N</i>	<i>S</i>
10	10	220	140	1200	291
15	14	230	144	1300	297
20	19	240	148	1400	302
25	24	250	152	1500	306
30	28	260	155	1600	310
35	32	270	159	1700	313
40	36	280	162	1800	317
45	40	290	165	1900	320
50	44	300	169	2000	322

200	132	1000	278	75000	382
210	136	1100	285	100000	384

Note: N is population and S is the sample size

Figure 1: Table for selecting the appropriate size of the population sample (Source Krejcie and Morgan, 1970)

Data Analysis

Data analysis is a mechanism for processing research data utilizing logical techniques to organize, systematize, and turn massive amounts of acquired data into understandable components that deduce a conclusion. The method employed by researchers to study the numbers in quantitative research, where the data is expressed as numerical figures, is a statistical analysis that aids in the development of crucial intuitions. When doing research trials, several stages must be followed. In a nutshell, it is a process that involves the use of statistical practices in the compilation, description, representation, evaluation, and interpretation of data. As a result, it is critical to have a clear knowledge of the research's objectives when doing the analysis. As a result, descriptive analysis is a frequently employed technique in quantitative approaches. The researchers also employed the SPSS version of the study to investigate statistical data analysis. When it comes to data entry and analysis, SPSS is a program-based window that allows you to generate tables and pie charts for data entry and analysis. Researchers collect data for this study's data analysis, including frequency analyses, descriptive analyses, correlation analyses, and reliability analyses, among other procedures.

FINDINGS

The respondents' background attributes make up the content of this distribution of respondents. Descriptive statistics that include frequency and percentage are used to analyse it. Table 1 show the result of frequency analysis:

Table 1 Frequency Analysis

Categories	Frequency(N)	Percentage (%)
Gender		
Male	95	76.7
Female	28	22.6
Race		
Chinese	5	4.0
Indian	5	4.0
Malay	109	87.9
Other	4	3.2
Age		
21 years old	3	2.4
22 years old	16	12.9
23 years old	45	36.3
24 years old	58	46.8
21-30 years old	1	0.8
Marital status		
Married	8	6.5
Single	115	92.7
Have you ever worked in hospitality industry?		
No	56	45.2
Yes	67	54.0

Demographic Analysis

Based on the result from table above, the table shows the gender distribution of the respondents. The total respondents are 124 respondents. In this study, the female respondents were higher with 76.7% (N=95) respondents as compared to 22.6% (N=28) for male respondents. The race distribution among the respondents is seen in table above with 87.9 percent (N=109) respondents, Malay is the race group with the most participants in the survey, followed by Chinese and Indian which share the same percentage which is 4.0% (N=5) respondents. And the last group race is other, that followed with 3.2% (N=4) respondents. Table shows the age distribution. The respondents were allocated into five age groups. The highest number of respondents were from the group age of 24 with 46.8% (N=58) respondents and then followed by the group age of 23 with 36.3% (N=45) respondents. The third highest group is 22 years old with 12.9% (N=16) respondents and then followed by group age 21 years old with 2.4% (N=3) respondents. And lastly is group age of 21-30 with 0.8% (N=1) respondents. The percentage of respondent's marital is shown in table 4.1. The highest percentage of respondents that is single is 92.7 percent (N=115). And the lowest percentage is married which is with percentage 6.5% (N=8) respondents. Based on the result from table 4.1, the table shows who's have ever work at hospitality industry of the respondents. The total respondents are 124 respondents. In this study, respondents that have worked is 54.0% (N=67) respondents as compared to 45.2% (N=56) for respondents who have never worked.

Descriptive analysis

Table 1 Descriptive Analysis

Variable	Items	Mean Score	Standard Deviation
Social Status	I talk to my friend with pride about my future career in hospitality industry	3.72	.854
	Working in hospitality industry is regarded as an important and beneficial service to society	2.95	1.360
	There are good opportunities for promotion and advancement in hospitality industry	3.12	1.265
	Hospitality staff are valued in the society	3.87	.757
	I believe that my personality and character fits well with the type of jobs in the industry	3.88	.685
	I believe that I will get an opportunity to use my skills and abilities working in the industry	4.05	.688
	Salaries and Benefits	Hospitality industry offering a good starting salary	3.86
Working hours are too long in the hospitality industry		3.09	1.201
Considering long hours worked pay should be higher		4.37	.729
Staff meals is an important in the salary package		4.21	.727
I can earn a high income during this hospitality career		3.91	.768
Nature of Work		I find jobs in hospitality industry interesting	4.07
	I think that jobs in hospitality are worth doing	4.00	.658
	Considering the working hours and workload pay is good in hospitality industry	3.93	.737
	Jobs in the hospitality industry are challenging	4.17	.686
	Am happy to tell other that I am training to work in hospitality	4.05	.711
	I believe that hospitality work is very stressful and pressured	3.91	.859
	I can make a friend easily with people working in hospitality	4.02	.741

	Physical working condition generally good in hospitality industry	4.00	.747
Pursuing a career in Hospitality Industry	I strongly believe that whatever I learn in this course will be useful in my future career	4.17	.721
	I strongly believe I knew enough about the hospitality industry before I chose this course	3.89	.777
	I think hospitality courses offer more practical skill training than academic work	4.08	.731
	I chose this industry because of the opportunities to travel overseas	3.83	.875
	One can get ahead in hospitality industry without having high level of education	3.81	.853
	Opportunities for employment in hospitality industry is high	4.07	.770
	Hospitality industries give opportunities to meet and communicate with different people	4.26	.571
	I believe that hospitality industry offers a flexible work	3.93	.856

Table 2 showed the analysis of the mean and deviation of the standard on independent and dependent variables. 'I believe that I will get an opportunity to use my skills and abilities working in the industry' scored the greatest mean value, which was 4.53, where the respondents agreed that social status of 'I believe that I will get an opportunity to use my skills and abilities working in the industry' motivated respondents in pursue a career in the hospitality sectors. Meanwhile, the lowest mean was 'working in hospitality industry is regarded as an important and beneficial service to society' with the mean value 2.95, where respondents slightly agreed that this 'working in hospitality industry is regarded as an important and beneficial service to society' motivated respondents in pursuing a career in the hospitality sectors. Next, 'considering long hours worked pay should be higher' has recorded the highest mean value, which was 4.37, where the respondents agreed that salaries and benefits of 'considering long hours worked pay should be higher' motivated respondents in pursue a career in the hospitality sectors. Meanwhile, the lowest mean was 'working hours are too long in the hospitality industry' with the mean value of 3.09, where the respondents agreed that salaries and benefits of 'working hours are too long in the hospitality industry' motivated respondents in pursuing a career in the hospitality industry.

Besides that, 'jobs in the hospitality industry are challenging' has recorded the highest mean value, which was 4.17, where the respondents agreed that nature of work of 'Jobs in the hospitality industry are challenging' motivated respondents in pursue a career in the hospitality industry. Meanwhile, the lowest mean was 'I believe that hospitality work is very stressful and pressured' with the mean value of 3.91, where the respondents agreed that nature of work of 'I believe that hospitality work is very stressful and pressured' motivated respondents in pursuing a career in the hospitality industry. Lastly, 'hospitality industries give opportunities to meet and communicate with different people' has recorded the highest mean value, which was 4.26, where the respondents agreed that nature of work of 'Hospitality industry give opportunities to meet and communicate with different people' motivated respondents in pursuing a career in the hospitality industry. Meanwhile, the lowest mean was 'One can get ahead in hospitality

industry without having high level of education' with the mean value of 3.81, where the respondents agreed that nature of work of 'one can get ahead in hospitality industry without having high level of education' motivated respondents in pursuing a career in hospitality industry.

Result of Reliability Analysis

Table 3 below shows the result of reliability analysis.

Table 2 Reliability Analysis

Construct	Cronbach's Alpha	No of Item	N
Social Status	0.876	6	30
Salaries and Benefits	0.954	5	30
Nature of Work	0.930	8	30
Factor that has Influenced a Career in Hospitality Industry	0.789	8	30
All Variable	0.910	27	30

This table shows evidence about the dependability of four factors. Cronbach's alpha was applied to investigate the consistency of the 27 items, which served as a measurement of the four different constructs. The coefficients of all the constructs from unacceptable to good according to the results. Furthermore, the result was above 0.7 indicating that this questionnaire could be disseminated, and the surveyed could proceed. According to the statistics, the coefficient for salaries and benefits had the highest coefficient with a result of reliability testing of 0.954 (excellent), while the coefficient for factor that had influenced a career in hospitality industry had been found have been the lowest at 0.789 (acceptable).

Result of Person Correlation Analysis

Table 4 below shows the Pearson Correlation Analysis.

Table 3: Pearson Correlation Analysis

Hypothesis	P – Value	Result (Supported/ Not Supported)
H ₁ : There is significant relationship between social status and factor that have influenced in pursuing a career in hospitality industry.	0.199	H ₁ is supported
H ₂ : There is significant relationship between salary/benefit and factor that have influenced in pursuing a career in hospitality industry.	0.000	H ₂ is supported
H ₃ : There is significant relationship between nature of work and factor that have influenced in pursuing a career in hospitality industry.	0.000	H ₃ is supported

The table showed the results of the correlation between the variables, DV which was pursuing a career in hospitality industry and IV which were social status, salaries and benefits and nature of work. The (p-value) of social status was 0.199, which is higher than the highly significant level .0001. In addition, with this hypothesis was accepted where there is a relationship between social status and factor that have influenced in pursuing a career in hospitality industry is significant. The (p-value) of salaries and benefits was 0.000, which was less than the highly significant level .0001. In addition, with this hypothesis was accepted where there is a relationship between salary/benefit and factor that have influenced in pursuing a career in hospitality industry is significant. The (p-value) of nature of work was 0.000 which was less than the highly significant level .0001. In addition, this hypothesis was accepted where there is a relationship between nature of work and factor that have influenced in pursuing a career in hospitality industry is significant. Based on the findings, every hypothesis was confirmed and turned into a factor that influenced the decision to pursue a career in the hospitality industry.

DISCUSSION & RECOMMENDATIONS

The reliability test was conducted about 123 respondents by using online survey method which is in google form. It has been tested with Pearson Correlation Coefficient that range between 0.117 for status value, followed by salary/benefit were the medium range which is 0.511 and nature of work reaches the highest range value of 0.709. all variables have reached a minimum of internal consistency because of a range of values greater than 0.6.

The nature of work had the highest mean value in the descriptive analysis for the independent variables, at 4.0184, followed by salary/benefits, at 3.8894. 3.5976 was the dependent variable's lowest mean value. The nature of work had the most influence on final-year students at University Malaysia Kelantan to pursue a career in the hospitality industry among the independent variables.

Only students in the last year of the hospitality programme at University Malaysia Kelantan (UMK) were the subject of this study. It is now possible to pinpoint the elements that motivated

people to pursue their career. Additionally, the research is an ongoing examination that might take place at the survey site, in several conditions, or with various goals. This is due to the likelihood that the investigation would produce unexpected findings.

The availability of a sample with a bigger size, on the other hand, suggests that it will be simpler and more likely to elicit a reaction from the public. Because of this, future researchers will need to expand their sample size to further boost the study's precision and dependability. In conclusion, adopting the interview method will increase the researcher's chances of receiving a high response rate. This approach therefore has the potential to less confusion and result in more precise study outcomes.

CONCLUSION

In conclusion, this study was conducted to find out the factor that have influenced final years student in University Malaysia Kelantan to pursuing a career in the hospitality industry. Three independent variables were studied that is social status, salary/ benefit and nature of work were selected to study their relationship with the dependent variable, pursuing a career in hospitality industry among final year student in University Malaysia Kelantan. A total of 123 respondents aged 21 years old and above were selected from FHPK in hospitality course students at UMK. Overall, based on Pearson Correlation analysis, nature of work has a value of *0.709, followed by salary/benefit which is *0.511, and status value at *0.117.

ABSTRACT

This study aimed to examine about customer satisfaction of Malaysia airlines industry. According to media sources and public knowledge, Kota Bharu Airport may suffer certain issues. Flight delays can be brought on by a few things, including inclement weather, mechanical issues with the aircraft, or logistical issues with the airport. The objective of the study in the research attempted, to examine the relationship between services quality of Malaysia Airlines Industry. According to Krejcie & Morgan (1970)'s sample size table 200 respondents will be chosen from the population. Most of the questions asked focus on the factors that have influenced in determining the level of customer satisfaction in terms of price, airport environment and service in influencing customer satisfaction towards airlines industry. All improvements also need to be taken seriously in terms of service and environment there. Finally, some other determinants are recommended to be included in the research and obtain further reasoning.

Keywords: Airlines Industry; identity: Customer satisfaction in the airlines industry.

INTRODUCTION

This study aimed to examine about customer satisfaction of Malaysia airlines industry. Making this study it started with basic information in chapter 1. This chapter has flow of the chapter such as background of the study, problem statement, research objective, research's question, significant of study, definition of terms and the last one is summary.

Chapter 2 gives a summary of earlier study aimed to examine about customer satisfaction of Malaysia airlines industry. This chapter has flow of the chapter such as background of the study, problem statement, research objective, research's question, significant of study, definition of terms and the last one is summary.

This chapter 3 discusses analysis methodologies. In general, describes the type of analysis needed to complete the case study. The research methodology used to complete this report includes research design, population, sample size, sampling method, data collection procedure, research instrument, data analysis, and summary.

SIGNIFICANT STUDY

Malaysia Airlines had been declared closed during the COVID-19 pandemic, but in 2022, it and MAS returned by offering affordable ticket prices for customers to fly abroad. This study offered advantages to future researchers to learn more about the Malaysia Airlines industry. The airline company expanded quickly, with a notable rise in worldwide airline profits from USD6.1 billion in 2011 to USD10.6 billion in 2012.

The dependent variable analyzed by the researcher was customer satisfaction in the Airlines industry. The dependent variable depended on other factors that were measured.

The independent variable, which was thought to have a direct impact on the dependent variable, included service quality, prices, and the environment of the airport. The experimenter manipulated or modified the independent variable, which was the cause.

To measure service quality thoroughly, the researcher created ten components of service quality, including tangibles, reliability, responsiveness, understanding of consumers, access, communication, and credibility.

LITERATURE REVIEW

Service Quality

The concept of service quality had been defined as the discrepancy between what customers expected from a service and how they experience it. Service quality had previously been defined as how well a service met the demands or expectations of customers. It could also be thought of as the consumer's general perception of the services' relative quality or inferiority. In recent years, it had become widely accepted that client ratings of a service determine its quality. The general rationale was cleared because the customer's opinion affects his or her future actions, such as returning the next time or giving favorable reviews to family members. This shows that service providers could not only provide services in accordance with internal standards, which may not meet customers' expectations.

Airport Environment

The airport environment refers to the physical and operational characteristics of an airport, including its facilities, infrastructure, services, and activities. The airport environment encompasses everything from the runways, terminals, and aircraft parking areas, to the security checkpoints, retail shops, and restaurants. It also includes the various operational components such as air traffic controller, baggage handling systems, fueling and maintenance facilities, and ground handling services. The airport environment was designed to ensure the safe and efficient movement of aircraft, passengers, and cargo, and to provide a comfortable and convenient experience for travelers.

Price

Price generally refers to the amount of money that was required to have been paid in order to acquire or use a particular product or service. It was the value assigned to a product or service in exchange for its perceived utility or benefit. Price could be influenced by a range of factors, including production cost, supply and demand, competition, and marketing strategies. A higher price may reflect a higher perceived value, greater quality, or scarcity of the product or service. Conversely, a lowered price may indicate lowered quality or lowered demand. In business and economics, pricing strategies played an important role in determining the success of a product or service. Pricing decisions were often based on a combination of market research, consumer behavior analysis, and competitive analysis, and could have had a significant impact on a company's profitability and market position.

Customer Satisfaction Towards Airlines Industry

Customer satisfaction towards the airline industry refers to the leveled of contentment or happiness that customers experience when used the services of airlines. It was a measured of how well the airlines met or exceed the expectations of their customers in terms of service quality, safety, comfort, convenience, reliability, and affordability. Customer satisfaction was a critical factor in the success of the airline industry. Satisfied customers were more likely to use the airline's services again, recommend it to others, and positively promote the airline's brand image. On the other handed, dissatisfied customers may lead to negative word-of-mouth, reduce customer loyalty, and ultimately harm the airline's reputation and revenue. To measured customer satisfaction, airlines may use various tools, including surveys, feedback forms, social media analytics, and customer service interactions. By understanding their customers needed and preferences, airlines could improve their services, enhance their customer experience, and ultimately achieve higher levels of customer satisfaction.

Research Hypothesis

The hypothesis of the researcher was made based from the factor that studied such as quality of service airlines, customer satisfaction and price towards mas and airasia at Pengkalan Chepa, Kota Bharu kelantan. The following hypothesis was developed and was have been evaluated based on the studied.

H1: There was significant relationship between social status and factors that had influenced in pursuing a career in hospitality industry.

H2: There was significant relationship between salary/benefit and factors that had influenced in pursuing a career in hospitality industry

H3: There was significant relationship between nature of work and factors that had influenced in pursuing a career in hospitality industry.

Research Framework

A conceptual framework shows how variables should be related to one another. It outlines how the researcher method' pertinent objectives fit together to provide logical findings. Based on the examination of the literature review, the researchers have put out a framework. Therefore, below is a conceptual framework

Table 2.4.1 Conceptual Framework (Suki, 2014)

Based on table 2.4.1 from conceptual framework, the researcher has studied the relationship between independent variable and dependent variable.

METHODOLOGY

Research Design

The research design is the overall approach that the researcher chooses to combine the many study components in a logical and cogent manner, as well as serve as the guide for the data gathering, measurement, and analysis processes. The questionnaire used in this study was created after a thorough examination of the literature review and based on data collected during focus group interviews. Quantitative is used in the study to gain all data through questionnaire, while qualitative is about describes attributes or features. The researcher has chosen the quantitative approach of their research to understand and determine between independent variable (service, airport environment and price) and dependent variable (customer satisfaction towards airlines industry). The survey Questionnaire was set the filling of the area around Pengkalan Chepa Kota Bharu, Kelantan, and respondents came from a variety of ethnicity, ages, genders, and marital statuses. This survey was conducted in the Kota Bharu, Kelantan using google form.

Data Collection

This study investigates how Malaysia Airlines' customer satisfaction levels are affected by service quality, targeting passengers who have recently travelled with the airline. (Farooq et al., 2018). Sultan Ismail Petra Airport Kelantan was chosen for a study on customer satisfaction towards the airlines industry due to its large population and stimulating and satisfying service offered to customers. The study was chosen to find out customer satisfaction in using airline industry services, as well as to find out customer satisfaction in using airline industry services.

The coronavirus pandemic has caused a 50% decline in worldwide aviation passenger volume, with just over 2.2 billion passengers on scheduled flights in 2021. This is compared to 2019, when the number of scheduled passengers handled by the world's airlines has climbed. The Asia Pacific region had the highest percentage of airline passenger traffic in 2019, with the busiest aviation routes found in this area.

Sampling

The sampling technique entails gathering individuals wherever they can be found, usually wherever it is convenient. The two categories of sampling techniques are probability and non-probability. Case study research design is typically associated with non-probability sampling, while probability sampling suggests that each item in the population has an equal chance of being included in the sample. The researchers chose the study participants using a convenience sampling technique, a non-probability. Examples of convenience sampling include simple accessibility, geographic closeness, availability at a specific time, or eagerness to participate. Additionally, the term "convenient sampling" can also apply to "accidental samples" since the sample's constituent parts could be randomly selected based on their proximity to the researchers undertaking the data collection or their administrative location. This approach is appropriate for this study since the respondents will provide the researcher with the unknown data.

Table 3.1: Sample Size of Known Population

N	S	N	S	N	S	N	S	N	S
10	10	100	80	280	162	800	260	2800	338
15	14	110	86	290	165	850	265	3000	341
20	19	120	92	300	169	900	269	3500	346
25	24	130	97	320	175	950	274	4000	351
30	28	140	103	340	181	1000	278	4500	354
35	32	150	108	360	186	1100	285	5000	357
40	36	160	113	380	191	1200	291	6000	361
45	40	170	118	400	196	1300	297	7000	364
50	44	180	123	420	201	1400	302	8000	367
55	48	190	127	440	205	1500	306	9000	368
60	52	200	132	460	210	1600	310	10000	370

95	76	270	159	750	254	2600	335	100000	384

Note: N is a population, S is a sample size.

Data Analysis

Correlation is a statistical term used to indicate a form of association between two variables. The most popular correlation statistic for determining how closely two variables is connected linearly is the Pearson correlation. The strength of the association between 36 two variables that are numerically assessed is studied using the statistical assessment technique known as correlation analysis. It is possible for the correlation coefficient to range from -1.0 to 1.0, and perfect negative correlation is represented by a value of -1.0, and perfect positive correlation is represented by a value of 1.0. Positive correlation is shown by a correlation coefficient over zero, but there is a negative association when the value is less than zero. There is no connection between the two variables if the value is 0.

FINDINGS

Table 1 below shows the result of frequency analysis.

Table 1 Frequency Analysis

CATEGORY	FREQUENCY	PERCENTAGE (%)
GENDER		
Male	83	58.5
Female	116	59.5
RACE		
Bajau	1	1.0
Brunei	1	2.0
Chinese	3	4.5
Iban	3	6.0
India	5	8.5
Jawa	1	9.0
Malay	178	98.0
Orang asli	1	100.0
AGE		
21 years old- 26 years old	144	72.5
27 years old- 32 years old	18	81.5
33 years old - 38 years old	18	90.5
39 years old - 44 years old	7	94.0
45 years old and above	12	100.0
OCCUPATION		
Civil servant	27	14.5
Sailor	1	16.0
Retired	1	16.5
Private staff	36	35.0

Self-employee	37	54.0
Student	90	99.0
Housewife	1	100.0
EDUCATION LEVEL		
Bachelor of degree	113	57.0
Diploma	46	80.0
Doctor of philosophy	1	81.0
Master degree	9	85.5
Secondary school	28	100.0
MONTHLY INCOME		
Below RM2,000	126	66.0
RM2,500 - RM3,500	41	87.0
RM4,500 - RM5,500	17	95.5
RM6,500 - RM7,500	7	99.0
RM8,500 - RM9,500	2	100.0
Above RM10,000	5	3.0
HOW OFTEN DO YOU FLY?		
Once a week	9	99.5
2 or 3 times a month	27	14.5
Once a month	22	95.0
Less than once per month	139	84.0

Demographic Analysis

4.1.1 Gender.

The total number of respondents for male was 83 respondents and for female was 116 respondents. Out of 200 respondents, 40.7% of total respondents were male and the remaining of 58.3% were female respondents who involved in study.

4.1.2 Age.

There were respondents who consist of age from 21-26 (144 respondents) (72.4%), 27-32 (18 respondents) (9%), 33-38 (18 respondents) (9%), 39-44 (7 respondents) (9%) and 45 and above (12 respondents) (9%) had responded 41 to the questionnaire.

4.1.3 Ethnic Origin.

There were 200 respondents who consist of Malay (178 respondents), Indian (5 respondents), Chinese (3 respondents), Iban (3 respondents), Native Sabahan (1 respondents), Brunei (1 respondents) had responded to the questionnaire. The highest percentage of respondents was Malay (89.4%) and followed by Indian which was (2.5%), and the lowest percentage respondents was Native Sabahan and Brunei which was (0.5%).

4.1.4 Occupation.

The total number of respondents for civil servant was 27 respondents equivalent to 13.6%. Total number of respondents for private staff was 36 respondents (18.1%). Total number of respondents for the self-employee was 37 respondents (18.6%). Total number of respondents for students was 90 respondents (45.2%). Total of sailor, retired and housewife were 1 respondent which is 0.5 %.

4.1.5 Education Level.

There were 28 respondents from secondary school (14.0%), 46 respondents from diploma (23.0%), 113 respondents from bachelor of degree (56.5%), 9 respondents from master degree (4.5%) and lastly 1 respondent from doctor of philosophy (0.5%). The highest respondent is bachelor of degree meanwhile the lowest respondent was doctor of philosophy.

4.1.6 Monthly Income.

There were 200 respondents who consist below RM2000 were 126 respondents (63%), RM2500-RM3500 were 41 respondents (20.5%), RM4500-RM5500 were 17 respondents (8.5%), RM6500-RM7500 were 7 respondents (3.5%), RM8500-RM9500 were 2 respondents (1.0%) and above RM10000 were 5 respondents (2.5%) had responded to the questionnaire.

4.1.7 How often do you fly.

Once a week had 9 respondents (4.5%), 2 or 3 times a month had 27 respondents (13.6%), once a month had 22 respondents (11.1%), less than once per-month 139 respondent (70.2%) and lasted of the once a week was 1 respondent (0.5%) who consist this study.

Descriptive Analysis

Table 2 below shows the result of descriptive analysis.

Table 2 Descriptive Analysis

Variable	Items	Mean Score	Standard Deviation
Service	Company airlines should take care on issue services about departure time	4.51	.814
	Airlines industry should assure on-time departure and arrival and provide consistent ground/in-flight services	4.42	.726
	Airlines company should ensure the efficiency of catering service, cargo handling and technical maintenance of aircrafts in order to build its image as a reliable and safe airline	4.48	.715
	Polite service and speech affect the quality of flight services.	4.49	.709
	The variety of rules in the plane can reduce the demand for flight	4.02	.910
	Value, brand, and image become an important focus in determining quality in service	4.16	.875
	You have always got help from the airline staff no matter what is the problem	4.12	.834
Airport Environment	Airport should modernize their facilities and High-quality physical airport environment to satisfy their customer	4.39	.782

	The airport must ensure has clean and comfortable interiors and seats	4.51	.757
	The airport has a large parking space and makes it easy for customers to park their vehicles and guarantee the safety of the vehicles	4.39	.873
	Management should consider how physical airport environment that can create favorable emotions so customer became happy passengers and more likely to spend in terminal	4.32	.807
	Airport should find distinctive way to provide service that may delight and satisfy passenger as example by greeting guest in many traditional ways	4.25	.842
	Airport companies need to provide a place to leave customers' belongings when they want to go to the toilet especially for solo travelers	4.41	.777
	The size of the airport in holding passengers is sufficient	4.08	.907
Price	Airlines company should ensure that ticket prices are maintain at the average price of ticket sold by other airlines	4.23	.808
	Airlines management should consider the income level of passengers and define their ticket price considering passenger's buying power	4.22	.771
	Considering in-flight services that this airline offers their best to the customer, they are thinks that they worth what their pay for overall in-flight service quality	4.14	.808
	I do not mind the price increase if the quality is high	3.91	.991
Customer Satisfaction Towards Airlines	The information quality of website has a positive effect on customer satisfaction toward purchasing the ticket	4.23	.776
	Are you satisfied with the quality of services provided from airlines company?	4.02	.811
	Price charging decisions in products or services affect customer satisfaction	4.24	.718
	Managers must understand their customers' needs and then set out to meet and recognize customer needs in order to fulfill	4.29	.692

	expectations to achieve high customer satisfaction during the service		
	I am very satisfying with the facilities provided by the airport	4.30	.962
	Prices offered to customers for products or services influence customer	4.24	.726

4.2.1 IV1- Services

The mean and standard deviation statistics of respondents regarding airline services in Kota Bharu, Kelantan. The most significant mean value was 4.51, indicating airlines should prioritize departure time services. The lowest mean value was 4.02, suggesting a variety of plane rules can reduce flight demand. The higher standard deviation indicates greater data spread.

4.2.2 IV2- Airport Environment

Displays respondents' mean and standard deviation statistics on the airport environment in Sultan Ismail Petra Kota Bharu, Kelantan. The highest mean was 4.51, suggesting clean and comfortable interiors. The lowest mean was 4.08, suggesting sufficient passenger size. The higher standard deviation indicates greater data spread.

4.2.3 IV3- Price

Displays the mean and standard deviation statistics of respondents regarding airline range prices in Sultan Ismail Petra Kota Bharu, Kelantan. The highest mean was 4.23, suggesting airlines should maintain ticket prices at the average price of other airlines. The lowest mean was 3.91, suggesting that customers do not mind price increases if the quality is high. The higher standard deviation indicates greater data spread.

4.2.4 DV- Customer Satisfaction Towards Airlines

Displays customer satisfaction statistics for airlines. The highest mean value was "very satisfied with airport facilities" (4.30), while the lowest was "satisfied with quality of services" (4.02). The higher standard deviation was "very satisfied with airport facilities" (0.962), indicating a wider range of satisfaction.

Result of Reliability Analysis

Table 3 below shows the result of reliability analysis.

Table 3 Reliability Analysis

Construct	Cronbach's Alpha	No of Item	N
Services	0.678	7	30
Airport Environment	0.712	7	30
Price	0.714	4	30
Customer Satisfaction Towards Airlines.	0.761	6	30
All Variable	0.781	24	30

Reliability is the degree to which results are constant over time and a precise representation of the entire population under study, and a research instrument is deemed reliable if the study's findings can be replicated using a similar approach. The term 'Reliability' is a concept used for testing or evaluating quantitative research, the idea is most often used in all kinds of research. The higher and closer the Cronbach's alpha value is, the greater the item's internal consistency is and the more dependable it is for survey purposes.

Pilot Test Result for illustration the overall consistency (pilot test) for the dependent and independent variable. The pilot test was done to 30 respondents before it was distributed to 200 respondents through an online survey method (google form). The pilot test result and showed the construct about the independent variable and dependability variable of four factors. Cronbach's Alpha was applied to investigate the consistency of the 24 items, which served as a measurement of the four different constructs. Furthermore, the result is above 0.7 indicating that this questionnaire can be disseminated and the survey can proceed. According, to the table 4.3.2, the coefficient is the highest value result which was 0.761 (acceptable) and the lowest result was 0.678 (acceptable).

The results of reliability statistics for services. Measuring the customer satisfaction towards airlines, 7 questions were used and analysis. There were shown, the Cronbach's Alpha result for this question was 0.678 which was resulted as acceptable. Therefore, the coefficients obtained for the variables on the social status question are not reliable.

The results of reliability statistics on airport environment at Sultan Ismail Petra, Kota Bharu Kelantan. 7 question was asked to obtain the customer satisfaction towards airlines. The table showed the result Cronbach's Alpha for this question is 0.712 which was acceptable. Therefore, the coefficients obtained for the questions in the ethnicity variables are not reliable.

The result of price 4 questionnaires was asked to the customer to filled up the customer satisfaction towards airlines. The results show that the Cronbach's Alpha for this question is 0.714 which also questionable. Therefore, the coefficients obtained for the questions in nature of work variables are reliable.

In measuring the customer satisfaction towards airlines in Sultan Ismail Petra, Kota Bharu Kelantan, 6 question were use for this section. The Cronbach's Alpha result for this question has got a total of 0.761 which yield as acceptable. Lastly, the coefficients obtained for the independent variable questions are reliable and research can be continued.

Result of Pearson Correlations

Table 4 below shows the result of Pearson correlation.

Table 4 Pearson Correlation Analysis

Hypothesis	Pearson's correlation results
H1: There is a significant relationship between services and customer satisfaction towards airlines.	r = 0.638, p < 0.01 Medium

H2: There is a significant relationship between airport environment and customer satisfaction towards airlines.	$r = 0.628, p < 0.01$	Medium
H3: There is a significant relationship between price and customer satisfaction towards airlines.	$r = 0.768, p < 0.01$	Strong

DISCUSSION & RECOMMENDATION

To improve customer satisfaction in the Malaysia Airlines industry, here are some recommendations. First, Improve Flight Schedules and On-time Performance. Next, Upgrade In-Flight Services. Then, Strengthen Communication Channels. Effective communication is key to any successful business, including the airline industry. Malaysia Airlines should strengthen its communication channels to keep customers informed about flight delays, cancellations, and other changes. Furthermore, Personalize Customer Experience, Malaysia Airlines should focus on providing a personalized experience to customers. It can be done by identifying customers' preferences, providing customized services, and personalized offers.

Next, Improve Baggage Handling. By improving consumer expectations on the assurances made by the industry, airlines may produce value and use resources more wisely, ultimately improving customer satisfaction.

This can be achieved in several ways, including by exceeding consumer demands for service, successfully resolving customer complaints, and favorably responding to customer complaints. Due to this, management will be able to set their brand different from that of other airlines in terms of customer service. By implementing these recommendations, Malaysia Airlines can significantly improve its customer satisfaction and attract more customers in the long run.

CONCLUSION

In conclusion, the relationship between service quality, airport environment, price, and customer satisfaction in the airline industry is complex and multi-faceted. While each of these factors plays a significant role in shaping customer perceptions and experiences, their impact on customer satisfaction can vary based on individual preferences and circumstances. Service quality, encompassing factors such as in-flight service, ground staff interaction, and overall customer service, is consistently identified as a critical determinant of customer satisfaction in the airline industry. Airlines that prioritize and deliver exceptional service are more likely to generate positive customer experiences and enhance overall satisfaction levels. The airport environment, including factors such as cleanliness, comfort, and efficiency of airport facilities, also influences customer satisfaction.

ABSTRACT

Malaysia's food and beverages sector is now increasingly active, with an increase in local customers. This will also make the food and beverages industry more vibrant. Many local customers make food like McDonald's as their leading food, such as breakfast, lunch, and dinner, especially for customers who work and students. This study aims to see the factors that affect customers' perception of McDonald's restaurant service quality in Kota Bharu, Kelantan. These factors are essential in making customers satisfied with service quality. The study's primary data was collected using a structured questionnaire and analysed using SPSS software. The survey was distributed to 348 respondents from McDonald's customers. The food and beverages industry, such as McDonald's, is overgrowing, providing a variety of menus with reasonable prices and convenience features when dining in. Through this study, the researcher sought to discover more about the factors influencing customers' perception of McDonald's restaurant service quality in Kota Bharu, Kelantan. All factors were significantly associated with service quality in McDonald's with a defined level of association ($r= 0.543, 0.544$ and 0.621 , respectively). The finding has shown a significant relationship between Empathy, Reliability, Tangibles and Customer Perception towards McDonald's in Kota Bharu, Kelantan.

Keywords: Service quality, Customer Perception, Tangible, Reliability, Empathy

INTRODUCTION

The issue, at hand is one of service quality in the fast food restaurant hospitality industry. The restaurant cleanliness had a major role in the decision to choose that establishment, followed by the attitudes of the staff and the calibre of the food on the menu. The issues, it seems that the atmosphere of McDonald's restaurants prevents client dissatisfaction. The expectancy-disconfirmation model states that a customer's perceptions are a function of their views. They consider customer perceptions to be transactional, meaning that customers are content with a single aspect of service, as opposed to perceived service quality, which is a general evaluation of a service. The customers won't be satisfied, or won't be as satisfied as they would have been, if the company's service quality expectations are higher than what it really provides if expectations had been met. This study aims to look at how customers perceive a restaurant's level of customer service. Then, a conceptual framework and hypothesis will be used to better explain the link between the independent and dependent variables. The summary will wrap up the discussion. The methodologies and procedures used to assess customer perception and service quality at a

McDonald's restaurant are described and examined in this study. The demographic, sample size, sampling technique, data collecting, research instruments, and data analysis for this study were all described. Therefore, the reliability test will be finished using the Cronbach's alpha approach. More research and analysis into the correlation between the variables will be done using Pearson's correlation test.

1. To determine the relationship between empathy and customer perception at McDonald's Kota Bharu.
2. To determine the relationship between reliability and customer perception at McDonald's Kota Bharu
3. To determine the relationship between tangible customer perception at McDonald's Kota Bharu.

SIGNIFICANCE OF THE STUDY

This study looked into how customers in Kota Bharu, Kelantan, perceived the quality of the service at McDonald's restaurants. This study also offers fresh information and sources for future studies on Malaysian consumers' perceptions of fast food restaurant services. For instance, in Malaysia, an organization's performance and profitability are built on the foundations of service quality and client perceptions. This research also calls attention to the McDonald's restaurant's flaws and offers suggestions to assist them fix them. The results from this study will be useful to the authorities since they need to be concerned about service quality if they want to draw in and keep clients. As a consequence of this study, the McDonald's restaurant will have a more thorough understanding of its customers' demands. Restaurants operating in a market with intense competition can enhance a variety of factors, including the fairness of service quality, service empathy, service tangibility, and service dependability, by using appropriate measures for the situation. The results of this study will help restaurant operators understand how customer perception, which in turn determines their behavioural intentions, is influenced by restaurant service quality.

LITERATURE REVIEW

Empathy

Empathy defined as caring, personalized attentions towards customers (Kassie, 2017). The concept of empathy is commonly heard but often misunderstood. This empathy is usually misunderstood by a few people because the word empathy for some of them is commonly used in terms of feeling, namely pity, sympathy, identification, and self-transfer (Carol M Davis, 1990). Empathy is about knowledge based on the customer's name, preferences, and needs, and thus was born the empathy shown in the above way (Kassie, 2017). According to Kassie (2017), to deliver a service of advantage this small and large business is personal in terms of service. Customer service requires empathy because it bridges knowledge gaps and improves interactions between businesses and their clients. Empathy is a great asset while socialising with other people. If customers feel heard

and appreciated, they are more likely to be satisfied with the responses given to them. Customers may have confidence in the company and understand that these issues will be addressed delicately and rationally.

Reliability

Reliability demonstrates the ability of the service provider to provide services in a dependable and accurate manner. In restaurants, reliability is defined as delivering service as promised, delivering meals on time, and charging fair prices for food. It has been observed that dependability is a very important attribute to possess, especially in the fast food industry. Reliability has to do with how a service provider handles a customer's issue, providing the correct service as requested and at the scheduled time. According to Parasuraman et al. (1985), reliability indicates that businesses provide services accurately the first time. Additionally, it demonstrates how firms try to keep their word and focus on the outcomes.

Tangible

The physical characteristics of the services being offered, such as the way a facility looks, how clean the facilities are, and how the staff members look, are known as tangibles. The term "tangibles" refers to the actual physical characteristics of buildings, machinery, people, and written materials. It includes the menu's appearance and design, as well as restaurant signs and marketing, as well as the condition of the cutlery, crockery, and staff attire (Kassie, 2017). Companies communicate visual and signal quality through tangibles. According to (Kassie 2017), amenities like a well-stocked welcome desk or knowledgeable staff might affect customers' perceptions of the tangible service quality.

Customer Perception

Customer perception refers to the thoughts, emotions, and assumptions that consumers have about your brand. Here's how you create, enhance, and exert control over it. (Inabo, S. 2021). It is crucial for increasing client retention and loyalty as well as brand recognition and reputation. Customers form opinions about products based on what people know in commercials, promotion, user reviews, social media comments, and some other more. Customer perception refers to the thoughts, emotions, and assumptions that consumers have had about the brand. It is crucial for fostering customer retention and loyalty while also increasing brand recognition and reputation. (Parasuraman et. Al 1985)

Research Hypothesis

The literature review made clear that independent factors like Empathy, Reliability, and Tangible have an impact on how customers perceptions. The study's hypotheses were outlined as follows in light of the literature review:

H1: There is a positive relationship between empathy and customer perception at McDonald Kota Bharu.

H2: There is a positive relationship between reliability and customer perception at McDonald Kota Bharu.

H3: There is a positive relationship between tangible and customer perception of McDonald Kota Bharu.

Research Framework

The Figure 1 below shows the research framework use for this study

Source: Parasuraman et al., (1985)

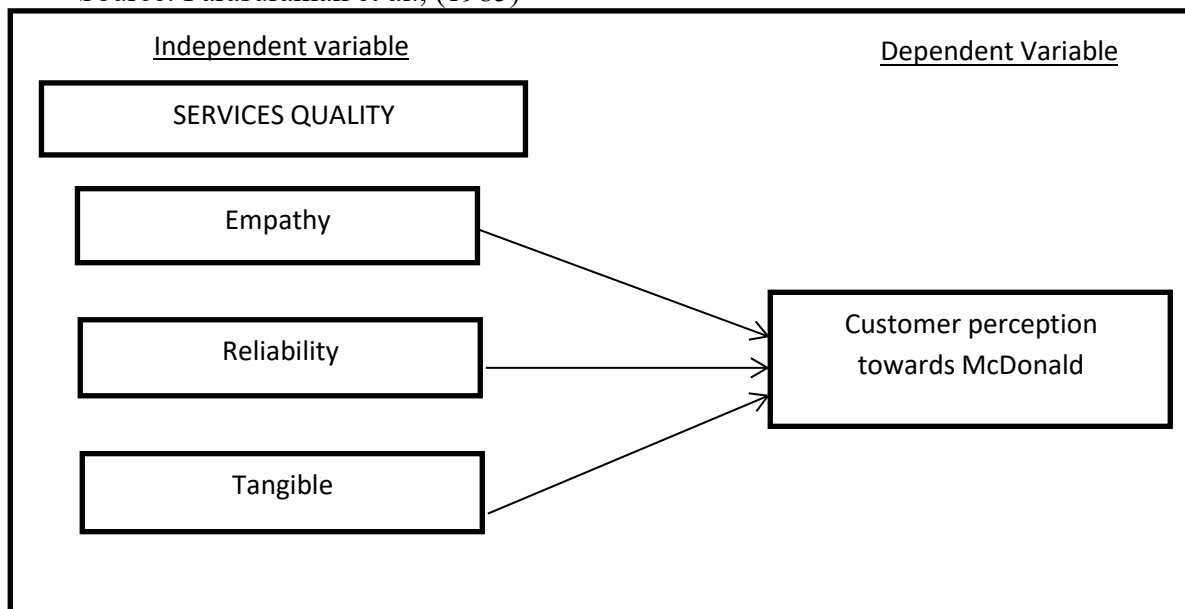

Figure 1: Research Framework

METHODOLOGY

Research Design

For this study's quantitative approach, 384 respondents who were dining at the McDonald's restaurant were given questionnaires. Malaysian citizens in Kota Bharu, Kelantan were the target populations in this study.

In addition, the population was given a set of questionnaires to complete in order to gather information about people who have dined in at a McDonald's restaurant. The questionnaire was separated into Sections A, B, and C by the researcher. The questionnaire's Section A asked for general information about the household demographics of Malaysian citizens, including the respondent's gender, age, race, level of education, occupation, and marital status. The questions in Sections B and C went into further detail on the survey's dependent and independent variables, which were (i) Empathy, (ii) Reliability and (iii) Tangible, Multiple-choice questions and 5-point Likert scales of agreement were employed in the design of this questionnaire.

Data Collection

Collecting data, analysing it, and combining it with data from other sources to generate a comprehensive and accurate picture of a subject. A person or organisation may estimate future probabilities and trends and evaluate results with the use of data collecting. To gather information for this inquiry, an online questionnaire will be used. The complete poll will be disseminated via social media sites including Facebook, Instagram, WhatsApp, and Google Forms. The ability to save costs and save time was incredibly convenient.

Convenience sampling, a non-probability sampling technique, was utilised in this investigation. This approach was adopted in the study since the questionnaires were created and disseminated online. Through internet and social media, the questionnaire was made available to the respondents in the Kota Bharu region of Kelantan.

Data Analysis

Computers made data collection easier for the researchers and made quantitative analysis simpler. Frequency analysis, descriptive analysis, reliability testing, and Pearson correlation analysis were the four methods of data analysis employed in this study. SPSS version 27 was used to evaluate the data that was acquired.

FINDINGS

Result of Frequency Analysis

Table 1: Frequency Analysis

Demographic	Frequency	Percentage
Gender		
Female	222	57.8
Male	162	42.2
Race		
Malay	162	42.2
Indian	118	30.7
Chinese	68	17.7
Others	36	9.4
Age		
Less than 20 years old	37	9.7
21 - 30 years old	191	49.7
31 - 40 years old	86	22.4
41 - 50 years old	38	9.9
51 years old above	32	8.3
Marital Status		
single	211	54.9
Married	173	45.1
Education Level		
Primary	2	0.5
Secondary	82	21.4
Diploma	80	20.8
Bachelor of Degree	163	42.4
Master	41	10.7
Doctor of philosophy	16	4.2
Occupation		
Student	143	37.2
Employed	185	48.2
Unemployed	26	6.8
Retired	30	7.8
Have you ever dined in at the McDonald's restaurant		
Yes	384	100.0
How often do you eat McDonald's on a monthly basic?		
1-2 times	131	34.1
3-4 times	169	44
5-6 times	42	10.9
7 times or more	42	10.9
Never	0	0
What time do you prefer to dine in at McDonald's		
Breakfast	44	11.5
Lunch	135	35.2
Dinner	175	45.6
Supper	30	7.8
Why do you choose to dine in McDonald's		
Fast service	125	32.6
Good ambience	43	11.2
Good quality as in visual materials	44	11.5
Reasonable Price	34	8.9
Tastes Good	113	29.4
Others	25	6.5

A total of 384 questionnaire sets were assigned through the online platform. This portion contained the respondents' contextual profiles. This section focuses on the respondents' demographic characteristics, including gender, race, age, marital status, level of education, employment, and whether they have ever eaten at a McDonald's restaurant. The profile of the respondent's demographic summary is shown in Table 1. Male respondents make up 162 of the total, while female respondents make up 222. Among the 384 responders, men made up 42.2% of the sample while women made up 57.8%. The statistics from the race, which received 162 replies, reveals that Malaysians (42.2%) make up the bulk of the participants. Indians received 118 responses, or around 30.7% of all responses, to place second. The Chinese were next, with 68 replies 17.7% representing 9.4 per cent of the total, and one respondent representing 36 replies of the total from other races.

As shown by table 1, the data revealed that the majority of those who answered to the questionnaire were between the ages of 21-30 years old, with 191 people answering and a response rate of 49.7%. Then came the 31-40 age group, which had 86 responders and a 22.4% response rate. Age group of 41-50 years old had 38 respondents answer response rate of 9.9%. Then, 37 people in the less than 20 years old age group answered to the survey, 9.7% of all respondents. Finally, 51 years old above is 32 and 8.3%.

According to the table, the total number of married respondents is 173, while the total number of single respondents is 211. Married respondents made up 45.1% of the total 384 respondents, while single respondents made up 54.9%.

In educational level, The primary level, is 2 with 0.5%, the most respondents are from the Bachelor of degree, with 163 respondents and a value of 42.4%. Respondents from the secondary education level came in second with 82 respondents and a value of 21.4%, followed by respondents from the postgraduate with 41 respondents and a value of 10.7%. Diploma with 80 and 20.8% finally, the doctor of philosophy with 16 people responding for a total of 4.2%.

According to the table, student respondents percentage of respondents (37.2%) with 143 respondents. Employed came in largest with 185 replies, accounting about 48.2% of the total. The Unemployed were next, with 26 replies representing 6.8% of the total.

Furthermore, all 384 respondents were had dine in at the McDonald's restaurant with 100 percent. How often do you eat mcdonald's on a monthly basic, 1-2 times is 131 with 34.1, Then, the largest is 169 with 44% percent. Moreover, 5-6 times is 42 and with the percent 10.9%. Next, 7 times or more is 42 with 10.9 and finally, never is 0 respondent.

Result of Descriptive Analysis

Table 2 : Descriptive Analysis

Variable	Item	Mean score	Standard Deviation
Empathy	- McDonalds gives you individual attention	4.0052	83960
	- McDonald's has operating hours convenient to all its customer	4.3594	78897
	- Best customer service offered at McDonald's restaurant?	4.1458	79133

	- McDonald's has the best interest of the customers	4.21	724
	- The employees of MacDonal'd's understand your specific needs	4.2292	70402
Reliability	- McDonald's promises to do something by a certain time, and it does so	4.1901	77345
	- McDonald's shows a sincere interest in solving it, when you have a problem	4.1693	74399
	- McDonald's performs the right service	4.2630	70883
	- McDonald's provides its service at the time it promises to do so	4.2109	72247
Tangible	- McDonald's has modern-looking equipment	4.3594	67093
	- McDonald's physical facilities are visually appealing	4.2995	68280
	- McDonald's reception desk employees are neat appearing	4.3099	67426
	- Materials associated with the service (such as pamphlets or statement) are visually appealing at McDonald's	4.2865	65135
Customer Perception	- I will recommend the McDonald's restaurant to other people	4.1875	74487
	- I will recommend others about the McDonald's restaurant experiences	4.1667	76703
	- Overall, I am satisfied with my experience in McDonald's restaurant	4.2995	64342
	- I am satisfied with the service provided by the McDonald's restaurant.	4.3359	62511
	- I am quite pleased with employees/ability of restaurants to clearly and thoroughly answer all of my inquires	4.2891	70232

The mean score for all dimensional variables was moderate, with Empathy at 4.1875 (SD = 0.74487), reliability at 4.1667 (SD = 0.76703), and tangible at 4.2995 (SD = 0.64342). Furthermore, the dependent variable verified the middle mean score (M = 4.3359, SD = 0.62511), with customer satisfaction.

In this variable, the number of items is as follow: Empathy (5), Reliability (4), Tangible (4), and customer perception (5).

Conducted in this analysis to determine Cronbach's Alpha values for all variables. The values are as follows Empathy (0.876), reliability(0.903), tangible (0.857), and customer perception (0.920).

Result of Pearson Correlation Analysis

The Table 5 below shows the Pearson Correlation Analysis

Table 4: Pearson Correlation Analysis

Hypothesis	Result	Finding of data analysis
H1- There is a significant relationship between Empathy and customer perception	$r = 0.543$, $p = 0.001$ Moderate positive	H1 - Accepted
H2- There is significant relationship between Reliability and customer perception	$r = 0.544$, $p = 0.001$ moderate positive	H2 - Accepted
H3- There is significant relationship between Tangible and customer perception	$r = 0.621$, $p = 0.001$ moderate positive	H3 - Accepted

Hypothesis 1 (H1) proposed that Empathy is a moderate positive relationship with customer perception. The finding reported in this study revealed that the empathy recorded value of Pearson Correlation, which is $r = 0.543$, $p = 0.001$. Thus, the result accepts hypothesis 1 (H1), whereby empathy is moderate positively significant with customer perception.

Hypothesis 2 (H2) proposed that reliability is a moderate positive relationship with customer perception. The finding reported in this study revealed that the reliability recorded value of Pearson Correlation, which is $r = 0.544$, $p = 0.001$. Thus, the result accepts hypothesis 2 (H2), whereby reliability is moderate positively significant with customer perception.

Hypothesis 3 (H3) proposed that tangible is a moderate positive relationship with customer perception. The finding reported in this study revealed that the tangible recorded value of Pearson Correlation, which is $r = 0.621$, $p = 0.001$. Thus, the result accepts hypothesis 3 (H3), whereby tangible is moderate positively significant with customer perception.

DISCUSSION AND RECOMMENDATION

The discussion aims to answer the queries and address the hypotheses raised in the study's first chapter. This study has looked at the association between customer perception of McDonald's restaurant and service quality in general. The current study would offer various recommendations for SERVQUAL (service quality) based on the study's findings in order to enhance all of the service quality characteristics and raise perceived service quality and customer perceptions.

Determining the link between tangibles and customer satisfaction with McDonald's in Kota Bharu is the third research objective. The data analysis findings in Chapter 4 demonstrate a favourable relationship between tangibility and customer satisfaction. The results of the correlation between the independent and dependent variables show that the H3 is reflected. The

majority of respondents concur that customer satisfaction can be influenced by how tangible a service's quality is.

The results of quantitative research are typically limited, which is the study's second problem. This is essentially the researcher's preferences mostly determine the outcomes. This constrained outcome can be ascribed to the systematic design of the surveys. Frequently, respondents to surveys are provided with little or no chance to explain their answers. As a result, answers can only address the question that was asked. Only three independent variables—service quality, empathy, dependability, and tangibles—are examined in this study. Customer perception is one of the dependent variables as well. Similar to the food and retail industries, there are a number of factors that have an effect on or interact with how people perceive a product or service. There are other crucial aspects of this study as well. This was caused by a dearth of resources and recommendations that would have allowed researchers to base their conclusions on other factors.

Additionally, respondents concurred that they liked the ambiance at McDonald's in Kota Bharu. The fast-food restaurant not only offers high-quality goods for sale, but it has also been set up and designed in keeping with the setting and theme. The supply of a favourable environment is one of the parts for the target company. As customers are drawn to an atmosphere or environment, it might be advantageous to have a positive atmosphere by producing an effective service.

CONCLUSION

In the conclusion of this chapter, the researchers must discuss the study's objectives in relation to the topic being investigated. In McDonald's in Kota Bharu, this study examines the connections between Empathy, reliability, tangible, and customer perception. Based on the examined literature, an analysis framework has been developed.

The link between the independent and dependent variables was the subject of the study. 384 participants completed an online survey for this study. Descriptive statistics, reliability analysis, and correlation analysis were used to collect and analyse the data using the SPSS software.. Overall, based on Pearson's correlation analysis, the Empathy scored a value of *0.543, followed by reliability with *0.544, and Tangible with *0.621.

ABSTRACT

With the increasing competitiveness in the hospitality sector, hoteliers face the challenge of differentiating their products and services. The primary objective of this study is to investigate the factors that influence guest satisfaction in the hotel industry, focusing on hotels in Kota Bharu, Kelantan. A quantitative research approach was employed, utilizing a questionnaire as the data collection instrument. The study collected data from 384 respondents via an online platform and analyzed using statistical techniques to determine the relationship between service quality dimensions (tangibles, reliability, and responsiveness) and customer satisfaction. The analysis revealed significant associations between tangibles, reliability, and responsiveness with customer satisfaction in hotels in Kota Bharu, Kelantan. These findings contribute to theoretical and practical perspectives by comprehensively understanding the factors that impact guest satisfaction in the local hotel industry and hence enabling the hoteliers to develop effective strategies to enhance service quality and improve overall customer satisfaction.

Keywords: Hospitality, Service Quality, Guest Satisfaction, Tangible, Reliability, Responsiveness

INTRODUCTION

As a diverse sector encompassing lodging, food and drink service, event planning, theme parks, and travel and tourism, hospitality management places great importance on customer satisfaction to deliver exceptional experiences. In an increasingly competitive environment, businesses and organizations in the industry strive to maintain customer loyalty and improve the quality of their goods and services. Various indicators have been developed and applied internationally to evaluate customer satisfaction over the past three decades. Clarity, tangibility, and empathy are crucial components for achieving successful customer satisfaction (Markovi, 2010), especially when assessing service quality in hotel settings.

Additionally, service responsiveness, transaction accuracy, and security features have gained recognition as factors influencing customers' service quality evaluations. Prior research has emphasized the significance of the five service quality attributes concerning customer satisfaction, emphasizing the provision of consistently high-quality services as the key to ensuring customer delight (Khan & Fash, 2014; Prahalad & Ramaswamy, 2004; Oluwafemi & Dastance, 2016). Nevertheless, more research must be conducted to establish a causal relationship between customer satisfaction and service excellence, necessitating further investigation into how service quality dimensions impact customer happiness.

While previous studies have identified a positive correlation between customer satisfaction and service quality, they have yet to thoroughly examine the specific connections between each aspect of service quality and customer satisfaction. Therefore, it is essential to investigate and define these relationships comprehensively. Furthermore, previous research has provided only a general overview of the relationships between service quality and dimensional parameters, needing more in-depth explanations of each factor's relationship with service quality.

In the context of hotels in Kota Bharu, customers have expressed concerns regarding cleanliness and tidiness despite positive overall ratings and reviews. This study aims to investigate the impact of service quality on customer satisfaction in Malaysia by examining the relationship between service quality dimensions (tangibles, reliability, and responsiveness) and customer satisfaction. By identifying and analyzing these relationships, this research aims to contribute to the body of knowledge in the field and provide insights for hotels in Kota Bharu to enhance service quality and improve customer satisfaction. The specific objectives for this study are as follow:

1. To examine the relationship between tangible with customer satisfaction in hotel.
2. To determine the relationship between reliability with customer satisfaction in hotel.
3. To identify the relationship between the responsiveness with customer satisfaction in hotel.

This empirical study makes a valuable contribution to the existing body of knowledge on customer satisfaction in the hotel industry. By investigating the factors influencing consumer satisfaction within the hotel sector, this research offers insightful findings that can inform and guide hoteliers in meeting customer expectations. Additionally, the study provides consumers with valuable information that can assist them in making informed decisions when choosing hotels.

LITERATURE REVIEW

In this chapter, the researchers briefly describe the literature review, hypothesis, conceptual framework and summary. This chapter will discuss the influenced satisfaction in hotel service quality in Kota Bharu, Kelantan. Tangible, reliability and responsiveness are independent variables while customer satisfaction is dependent variable. Based on the literature review that was discussed and the research problem, the analysis's hypothesis was presented in the manner that follows.

Tangible

Tangibles encompass various elements, such as the physical environment, personnel, and communication materials within a service context. These tangible components can create an impression or perception on customers without requiring monetary transactions (Asubonteng et al., 1996). Assessing perceived quality involves comparing customers' expectations with their actual experiences, as service quality is determined by the disparity between these two factors (Naik et al., 2010; Yesilada & Direktor, 2010).

Measuring perceived quality is essential as it comprehensively evaluates how well a service aligns with customer expectations. Businesses that meet or surpass customer expectations are considered to possess a high level of service quality. Furthermore, service quality directly impacts customer loyalty, as satisfied customers are more likely to remain loyal, attract new customers through positive word-of-mouth referrals, enhance the establishment's image, and ultimately increase profitability within the hotel industry.

Reliability

Reliability, as defined by Drost (2011), refers to the extent to which measurements exhibit reproducibility when performed by different individuals on separate occasions, under varying conditions, and using different tools to measure the intended construct or skill. It represents the consistency and dependability of measurement. For instance, when different individuals estimate a person's weight, the values obtained may not precisely match the actual weight, indicating an unreliable measurement. However, if multiple individuals use the same weighing scale to measure the weight, there is a higher likelihood of obtaining consistent results, thus enhancing the measurement's credibility. Bajpai and Bajpai (2019) also emphasize the importance of reliability and validity as two psychometric properties in measurement.

In the context of hotel service quality, service providers must have efficient means of tailoring their services to meet customers' specific requirements to some extent. This strategy often involves the development of computerized customer information systems that enable service providers to capture guest preferences and provide personalized and enhanced services. For example, in a hotel in Kota Bharu, Kelantan, an information system could be implemented to record and utilize guest preferences, allowing for the pre-assignment of preferred room types and stocking the room with requested whiskey brands from previous visits. As mentioned earlier, reliability refers to the stability of measurements across different scenarios where consistent results should be produced (Nunnally, 1978). It represents the ability to replicate or reproduce study findings. When a researcher conducts a study under specific conditions and obtains consistent results upon repeating the study, the data is considered reliable. Drost (2011) highlights that random and systematic errors can affect the trustworthiness of data derived from research instruments. Random error can be attributed to unknown and uncontrollable external factors that randomly influence specific observations but not others. For example, respondents in better moods may react more favorably to concepts such as self-esteem, contentment, and satisfaction than those in worse moods.

Responsiveness

Responsiveness, as related to the core tenets of general systems theory, pertains to a system event caused by another event occurring within the same system or its environment. Ackoff (1971) describes such an event, produced by another system or environmental stimulus, as a "response." Hence, a response is an event that the system contributes to causing. In hotel management, the perceived value is significant in achieving customer satisfaction. Moliner highlights that perceived value encompasses functional value (quality and price of a product or service), emotional value (associated with feelings), and social value (resulting from personal experiences and alternative options). Anderson et al. define value in business markets as "the perceived worth in monetary terms of the economic, technical, service, and social benefits received by a customer firm in exchange for the price paid, considering the offerings and prices of available suppliers." They consider economic, technical, service, and social benefits as integral components of value, in addition to price and the offerings and prices of suppliers.

Moreover, Gale et al. assert that customer value is "market-perceived quality adjusted for the relative price of the seller's goods." Monroe defines consumer perceptions of value as a trade-off between the perceived quality or benefits of goods and the sacrifice perceived in paying the price. These definitions align with the notion that value is a proportion between the price (monetary

and non-monetary) paid and the perceived quality attained by the customer, as stated by Gale et al. and Rust et al.

Perceived quality, customer expectations, and perceived value form the three primary pillars of customer value. Achieving a significant advancement in all three dimensions provides creative or breakthrough customer value. King highlights the unique connection between service providers and clients in the context of hospitality as a commercial activity. In this connection, the host attends to the needs and desires of guests, ensuring their satisfaction and a feeling of being at home. Satisfactory service quality is indispensable for the success of the hospitality business. Similar effects of service quality have been reported in the tourism, hospitality, and leisure industries, including enhancing guest convenience, improving the service provider's image, ensuring customer security, generating profitable traffic, cost savings, increasing market share, and establishing a competitive advantage and customer demand properties. The measurement scales used to assess these effects are crucial for determining the adequacy and accuracy of scientific research techniques when investigating the impact of hotel service quality on customer satisfaction at Hotel Kota Bharu, Kelantan.

Customer Satisfaction

The topic of total satisfaction has become a subject of extensive debate among researchers. Advocates of this concept often highlight the significance of meeting specifications, complying with regulations, and delivering high-quality services to customers (Anwar & Abd Zebari, 2015). In the present context, consumer happiness is of paramount importance. Customers are likely to utilize the service again or recommend it to others if they are satisfied. If a guest leaves a hotel unsatisfied, all the efforts invested in improving service quality would be in vain. Meeting consumer expectations remains a pressing challenge in the industry today (Anwar & Surarchith, 2015).

The focus of the hospitality business extends beyond the customer to encompass a small fraction of the actual consumption process, often accompanied by preconceived expectations of service and quality. Contemporary consumers in the hospitality industry are increasingly time-constrained, sophisticated, and demanding (Anwar, 2017). Understanding the customer base and the level of satisfaction they anticipate is crucial before implementing management strategies to enhance service quality. Anwar (2016) defines satisfaction as "an individual's experience of joy or disappointment resulting from comparing the perceived performance or outcome of a product to their expectations."

Research Hypothesis

F The literature review highlighted that independent variables such as tangible, reliability, and responsiveness are the factors that affect customer satisfaction in hotels at Kota Bharu, Kelantan. The hypothesis in the study is to find out whether there are any correlations or relationship between dependent variables and independent variables as follow:

H1: There is a relationship between tangible and customer satisfaction in hotel at Kota Bahru, Kelantan

H2: There is a relationship between realibility and customer satisfaction in hotel at Kota Bahru, Kelantan

H3 : There is a relationship between responsiveness and customer satisfaction in hotel at Kota Bharu, Kelantan

Research Framework

Figure 1 below shows the research framework used for this study.

Figure 1: Conceptual Framework

METHODOLOGY

Research Design

A research design plays a crucial role in organizing the methodology and processes of a study. To ensure the success of the research, it is essential for researchers to diligently execute their study and employ an established testing strategy. In the present study, the researchers collected data through the utilization of a questionnaire and employed a quantitative approach.

Data Collection

This research employed a survey method with questionnaires as the primary data collection tool. The questionnaires were administered using Google Form and distributed to respondents through popular social media platforms like WhatsApp and Telegram. The survey was conducted online to ensure convenience for the participants. The questionnaire was designed to gather data on independent variables such as tangible aspects, reliability, and responsiveness in relation to customer satisfaction in hotels located in Kota Bharu, Kelantan.

Sampling

In this study, the sampling method employed is non-probability sampling, specifically convenience sampling. Convenience sampling was utilized to gather information from respondents for the purposes of the research. The researcher aimed to investigate perspectives from a broad range of individuals, objects, or entities within the target population. According to Etikan, Musa,

and Alkassim (2016), convenience sampling involves selecting respondents who are readily available and willing to participate. Kumar et al. (2013) defines convenience sampling as the practice of gathering data from respondents who can easily be accessed and are suitable for the researcher's needs.

Data Analysis

Data analysis involves the systematic examination, cleansing, manipulation, and modeling of data to extract crucial information, facilitate decision-making, and offer recommendations (Pal, 2017). In the present study, the researchers utilized the SPSS software version 26.0 for conducting statistical data analysis. The survey data collected from the respondents were compiled and analyzed using the Statistical Package for Social Sciences (SPSS). SPSS is a software program that provides a user-friendly interface for data entry and analysis, allowing the construction of tables and pie charts. The analysis techniques employed in this study included frequency analysis, descriptive analysis, reliability analysis, and correlation analysis.

FINDINGS

Demographic Analysis

Table 1 below shows the results of frequency analysis

Characteristics	Frequency	Percentage
Gender		
Male	213	55.5
Female	171	44.5
Age		
20-25	130	35.5
26-30	120	25.5
31-35	60	18.0
35-40	60	18.0
40 and above	14	3.0
Occupation		
Government Sector	30	15.2
Private Sector	20	12.0
Unemployed	85	22.1
Self-Employed	25	13.9
Student	224	36.8
Income		
Below RM 1000	92	24
RM 1001- RM 2000	161	41.9
RM 2001-RM 3000	73	19.0
RM 4001 above	58	15.1

Marital Status		
Married	94	31.5
Single	290	68.5

Table 1 presents the results of the frequency analysis conducted on the gender, age, occupation, income, and marital status of the 384 respondents. The table indicates that male respondents accounted for 55.5% (n=213) of the sample, while female respondents comprised 44.5% (n=171). Among the different age groups, the highest number of respondents fell within the 20-25 years age bracket, constituting 35.5% (n=130) of the sample. The second highest number of respondents, 25.5% (n=120), belonged to the 26-30 years age group. The age groups 31-35 years and 35-40 years each had 18.0% (n=60) of the respondents, while the age group 40 and above accounted for 3.0% (n=14) of the sample.

Regarding occupation, respondents from the government sector represented 15.2% (n=30) of the sample, while those from the private sector comprised 12.0% (n=20). Unemployed respondents constituted 22.1% (n=85), and self-employed respondents accounted for 13.9% (n=25). Students made up the largest group with a total of 224 respondents, representing 36.8% of the sample.

In terms of income, respondents with an income below RM 1000 numbered 92 (24.0%), while those with an income ranging from RM 1001 to RM 2000 constituted 41.9% (n=161) of the sample. Respondents with an income between RM 2001 and RM 3000 represented 19.0% (n=73), and those with an income of RM 4001 and above totaled 58 (15.1%). Marital status included two categories: married and single. The total number of married respondents was 94 (31.5%), whereas the majority of respondents, 290 (68.5%), were single.

Descriptive Analysis

Table 2 below shows the results of descriptive analysis.

Variable	Item	Mean Score	Standard deviation
Tangible	The hotel provides clean and comfortable rooms	3.5885	1.37773
	The hotel has swimming pool, sauna and health club	3.5781	1.38215
	The hotel has appealing decorations	3.5521	1.34704
	The hotel has neat appearance staff	3.6380	1.35065
	The hotel has courteous and polite to the customers	3.5651	1.37715
Reliability	Staff at the hotel are able to provide service as promised	3.8620	1.36889
	Staff of the hotel are dependable in handling customers service problem	3.7943	1.37940

	The hotel keeps customers informed of the performance of services	3.7917	1.39126
	Staff of the hotel keeps confidential records of customers	3.8021	1.39091
	Staff of hotel is friendly and helpful for customer	3.7214	1.36076
Responsiveness	Staff at the hotel are ready to responds to customer request	3.94	0.859
	Staff at the hotel are always willing to help customers	3.86	0.929
	Staff at the hotel has some knowledge to provide to the guest	2.66	1.201
	Staff at the hotel has flexibility according to guests demand	2.74	1.133
Customer Satisfaction	I feel satisfied with the service of this hotel	3.8646	1.31962
	I feel I get more attention from the employees of this hotel	3.6250	1.38058
	Hotels ensure the safety of their customers by appointing guards in 24 hours inspection	3.8646	1.26920
	The guest feels safe and secure in their stay in the hotel	3.8698	1.32410
	Staff of the hotel have customers best interest at heart	3.9062	1.27910

Table 2 presents the mean and standard deviation for the items used to assess the factors of tangible, reliability, and responsiveness that influence customer satisfaction. Each variable was measured using five (5) questions. Regarding the tangible variable, the highest mean of 3.6380 was observed for the statement, "The hotel has appealing decorations." Conversely, the lowest mean of 3.5651 was recorded for the statement, "The hotel has appealing decorations."

For the reliability variable, the highest mean of 3.8620 was found for the statement, "Staff at the hotel are able to provide service as promised." On the other hand, the lowest mean of 3.7214 was obtained for the statement, "Staff of the hotel is friendly and helpful for customers." Regarding responsiveness, the highest mean of 3.7396 was observed for the statement "Staff readiness to respond to customers' inquiries." Conversely, the lowest mean of 3.6276 was recorded for the statement "Staff at the hotel are always willing to help customers." Lastly, the highest mean of 3.9062 was reported for the customer satisfaction variable for the statement, "The staff are courteous and polite to the customers." Conversely, the lowest mean of 3.6250 was obtained for the statement, "I feel I get more attention from the employees of this hotel."

Reliability Analysis

Table 3 below shows the result of reliability analysis

Table 3: Result of reliability analysis

Variables	Number of Items	Cronbach's Alpha
Tangible	5	0.774
Reliability	5	0.880
Responsiveness	5	0.706
Customer Satisfaction	5	0.709

Based on the findings presented in Table 3, the results of the pilot test for each section of the questionnaire are considered acceptable, as all the values exceed the threshold of 0.700 for Cronbach's Alpha. The questionnaire comprised five questions used to measure the variables in this study. The first independent variable, tangible, demonstrated a Cronbach's Alpha coefficient of 0.774, indicating a good strength of association among the items in this variable. Similarly, the second independent variable, reliability, exhibited a Cronbach's Alpha coefficient of 0.880, indicating a very good strength of association. The variable responsiveness yielded a Cronbach's Alpha coefficient of 0.706, signifying a good strength of association. Lastly, for the dependent variable, e-learning on academic performance, the Cronbach's Alpha coefficient was 0.709, indicating a good strength of association. It is noteworthy that all the variables consisted of valid questions. Overall, the pilot test results confirm the reliability and validity of the questionnaire items used to measure the variables in this study.

Pearson Correlation Analysis

Table 4 presents the findings of the Pearson Correlation Analysis conducted in this study.

Table 4: Pearson Correlation Analysis

Hypothesis	P-Value	Result (Supported/Not Supported)
H1 : There is a relationship between tangible and customer satisfaction in hotel at Kota Bharu, Kelantan	0.516	H1 is supported
H2 : There is a relationship between realibility and customer satisfaction in hotel at Kota Bharu, Kelantan	0.54	H2 is supported
H3 : There is a relationship between responsiveness and customer satisfaction in hotel at Kota Bharu, Kelantan	0.517	H3 is supported

Based on the results shown in Table 4, the hypothesis testing revealed significant relationships between the variables of tangible, reliability, and responsiveness and their impact on customer satisfaction in hotels at Kota Bharu, Kelantan. Consequently, all the hypotheses were accepted at a 0.01 significance level. These findings provide evidence that there is a statistically significant association between tangible aspects of hotel services, the reliability of hotel services, responsiveness of hotel staff, and customer satisfaction. This suggests that the tangible elements, reliability, and responsiveness play crucial roles in shaping customer satisfaction in hotels at Kota Bharu, Kelantan.

DISCUSSION AND RECOMMENDATION

From the findings, it is evident that there is a strong positive relationship between the tangible factors and customer satisfaction in hotels in Kota Bharu, Kelantan, as indicated by a correlation coefficient of 1. The p-value of 0.516 further confirms the positive relationship, providing support for H1. This finding suggests that customers in Kota Bharu, Kelantan place high importance on the tangible aspects of hotels and derive significant satisfaction from them. This aligns with previous studies conducted by Ali and Gardi (2021), which also identified tangible factors as influential determinants of customer satisfaction in the hotel industry.

Besides that, the analysis revealed a strong positive relationship between responsiveness and the factors influencing customer satisfaction in hotels in Kota Bharu, Kelantan, as indicated by a correlation coefficient of 0.706. The p-value of 0.517 further supports this positive association, providing confirmation for H3. This finding is consistent with the results of a previous study, which also found a positive relationship between responsiveness and customer satisfaction in the hotel industry. Future research should consider incorporating additional independent variables, such as students' attitudes, as these may have an impact on their satisfaction with hotels in Kota Bharu, Kelantan. The current findings suggest that students' attitudes towards customer satisfaction are relevant in this context.

Moreover, it is recommended that future studies employ a quantitative research methodology, as it enables faster data collection compared to qualitative approaches. Quantitative research allows for numerical data, facilitating the use of statistical tests to make meaningful statements about the data. Researchers can benefit from a diverse range of data collection techniques, from unstructured to semi-structured methods. Furthermore, it would be valuable for future studies to explore customer satisfaction in hotels across Malaysia. Such investigations may shed light on potential issues within the hospitality industry and offer insights that surpass the scope of the present study. By expanding the research to a broader context, researchers can generate a more comprehensive understanding of the factors influencing customer satisfaction in hotels, specifically in Kota Bharu, Kelantan.

CONCLUSION

The aim of this study was to investigate the factors influencing customer satisfaction in hotels located in Kota Bharu, Kelantan. Specifically, the study focused on the variables of tangibility, reliability, and responsiveness. Through the application of Pearson Correlation analysis, the research aimed to establish the relationships between these independent variables and customer satisfaction as the dependent variable.

The findings of the study revealed significant associations between the independent variables (tangibility, reliability, and responsiveness) and the factors influencing customer satisfaction in hotels in Kota Bharu, Kelantan. This suggests that these factors play a crucial role in shaping customer satisfaction within the hotel industry. The results support the notion that tangible aspects, such as appealing decorations, reliable services as promised, and responsive staff, contribute significantly to customer satisfaction in hotel settings.

In conclusion, this study emphasizes the importance of tangibility, reliability, and responsiveness in influencing customer satisfaction in hotels located in Kota Bharu, Kelantan. The findings provide valuable insights for hotel management and practitioners to prioritize and enhance these factors to meet customer expectations and ultimately improve overall satisfaction levels. Further research in this area could explore additional variables and extend the investigation to a wider range of hotels within the Malaysian hospitality industry, contributing to a more comprehensive understanding of customer satisfaction dynamics.

ABSTRACT

Hipster café has gotten a lot of attention from university students. Kota Bharu is also one of the district that has seen a increase in the number of hipster cafés, which has taken the populace by surprise. With the advent of hipster cafes in Malaysia's coffee industry, hipster cafe operators are strategically spreading their wings in order to capture market share and obtain a competitive advantage over competitors. Customers will favour a hipster cafe that can offer higher-quality items and customer service. This study investigated the impact of Hipster Cafe Services, Culture, and Café Environment on University Students' Perceptions Towards Hipster Cafes in Kota Bharu. The main data for the study will be collected using a structured questionnaire, and the analysis used SPSS version 27 software. The survey was distributed to 384 respondents of students perception towards hipster café. It is possible to conclude that cafe services, culture, and café environment have a considerable favourable impact on students' perceptions of hipster cafes.

Keywords: Hipster Café, Café Services, Hipster, Culture, Café Environment , Students Perception .

INTRODUCTION

Hipsters can be of any ethnicity or age, but they tend to be white and between the ages of 20 and 35. Hipsters like independently owned businesses, especially coffee shops and breweries, and are typically found in urban areas. Hipsters prefer independent music and performers that the general public hasn't yet found. Hipsters typically enjoy unique clothing, frequently donning vintage or thrift store finds as well as retro shoes or boots that look well-

worn. Hipsters typically come from middle- or upper-class backgrounds. They are known for their pursuit of authenticity as well as their goal to exude coolness and originality. For comedic irony, they might wear graphic t-shirts, moustache, or other body art. For hipsters, progressive politics are the norm.

The ambiance and overall impression that a space's design has on its users are heavily influenced by it. Ambiance is the general environment of a space that enables people to sense and become immersed in it. The aesthetics, interior design, and staff demeanor all contribute to the hipster cafe's ambiance. It wouldn't be otherwise, but the correct atmosphere has a strong impact on inhabitants' senses. By combining elements like colour, perfume, music, and lighting, the decor can enhance the ambiance. The aura of the environment, whether emotional or physical, has a significant impact on the clientele's mood.

Lastly, hipsters' food has become a new culinary culture, an array of fusion food outside the norm or mainstream. The identity attached to this has evolved into an influential factor that draws customers. Expectation of food quality at hipster cafes gradually increases with the growth of high income population in a town Chan Jess Min (2021). Beside that, Hipster cafes in Malaysia are typically identified by the inventive names given to foods and drinks, the products utilized, and the unusual presentation. According to Syakirah (2015), hipster food culture in Malaysia has generated a new obsession, and its effect not only influences their food preparation, consumption, or culinary ways, but also their lifestyles. People have been inspired to practise new eating habits as a result of the current waves of food trend changes in eating habits, dining place, eating time, and food types are related with social transformation in a community. As a result, the goal of this study is to look into the relationship between service quality, café culture, and café environment and satisfaction with hipster cafés.

There are three objectives of this research:

1. To examine the relationship between the service quality influence the satisfaction towards Hipster Café.
2. To examine the relationship between the café culture influence the satisfaction towards Hipster Café.
3. To examine the relationship between the café environment influence the satisfaction towards Hipster Café.

SIGNIFICANCE OF THE STUDY

Researchers

The result of the study helps the researchers evaluate the relationship between student perception of hipster cafe service, hipster cafe culture, customer satisfaction, and hipster cafe environment. The results help researchers aspire to understand much about the factors that influence customers' satisfaction with hipster cafes.

Customer satisfaction

This study provided information about customer satisfaction with hipster cafe services. This study evaluated a relationship between student perception of hipster cafe service, hipster cafe culture, customer satisfaction, and hipster cafe environment that relate to knowing the type of behavior that can be involved when going to a hipster cafe. Get to know the behavior of customers and the decision-making when an individual or group uses the services. Data gathered help owners know what factors influence them when dining in at hipster cafes.

Students perception

The data provide student perception towards hipster cafes with information on how student perception of hipster cafe service, hipster cafe culture, customer satisfaction, and hipster cafe environment. The result enabled the student's perception to improve their services in hipster cafes in persuading people to dine at hipster cafes. These studies also make the hospitality sector especially hipster cafes that students' or customers' perception is related to customer satisfaction and leads customers to come and dine at hipster cafes.

LITERATURE REVIEW

CAFE SERVICE QUALITY

Service quality measures the superiority of brands in the travel, retail, hotel, airline, and restaurant industries. The quality of restaurant service influences customers' dining experiences. Service quality makes an initial impression on customers and influences their perception of quality. To maintain a sustainable competitive advantage, the service industry provides high-quality services to customers. Service quality is a measure of how well an organization delivers its services in comparison to its customers' expectations. Customers buy services in order to meet specific needs.

HIPSTER FOOD & CAFÉ

As the popularity of hipster foods grows, increased, the number of hipster eateries increased as well. According to McCracken (2010), the hipster food culture retains characteristics that go far beyond popular cuisines. The study's findings will help us better understand the specific reasons that visitors from a hipster cafe choose to dine there on purpose.

FOOD QUALITY

Food quality is a critical condition for meeting the consumer's needs and expectations. Customer loyalty is affected by food quality, and customers evaluate restaurants based on food quality. Food quality includes food taste, presentation, temperature, freshness, nutrition, and menu variety. The quality of the food influences customers' decisions to return to the restaurant. Academic curiosity is increasing in restaurant menus, as variety of menu items is regarded as a critical characteristic of food quality. Taste is a sensual aspect of food. After eating, the taste is evaluated.

QUALITY OF THE PHYSICAL ENVIRONMENT

The quality of the physical environment both satisfies and attracts new customers. PEQ improves financial performance and provides customers with a memorable experience. Consumers judge a Cafe quality based on its cleanliness, quirky, comfortable welcome, physical environment quality, and other ambiance-creating amenities. The effect of physical environment quality on behaviour is visible in service businesses such as restaurants, hotels, hospitals, retail stores, and banks. Customer satisfaction is influenced by the physical environment. As a result, restaurants must create an appealing and distinct physical environment.

CUSTOMER SATISFACTION

The term "customer satisfaction" is defined" as the customer's subjective assessment of the consumption experience, grounded on certain associations between the perceptions of the customer and objective characteristics of the product". Customer satisfaction is essential the degree to which a consumption Experience makes one happy. Customer satisfaction is essential defined as "a comparison of a consumer's perceived level of product or service performance, quality, or other outcomes with an evaluative standard"

Research Hypothesis

The study hypothesis seeks to ascertain whether there is a relationship between dependent and independent variables based on university students' views and perceptions of hipster cafe in Kota Bharu :

H1

There is a relationship between the service quality and customer satisfaction towards Hipster Café in Kota Bharu.

H2

There is a relationship between food quality and customer satisfaction towards Hipster Café in Kota Bharu.

H3

There is a relationship between café environment and customer satisfaction towards Hipster Café in Kota Bharu.

Research Framework

The conceptual framework for this research is seen in Figure 2.4. The three factors that make up the independent variable that will be proposed are service quality, café culture, and café environment . The satisfaction towards Hipster Café is the dependent variable.

Figure 1: Conceptual Framework of the relationship between service quality, cafe culture, and cafe environment

METHODOLOGY

Research Design

The study's main objective is to determine the factors that influence university students views and perception towards hipster café in Kota Bharu, Kelantan. The primary objectives of description research as it described data associated with determinants of customer satisfaction in Hipster Café. Descriptive research is employed to collect information about the current state of a phenomenon in order to describe what exists in relation to variables in a given situation. Primary data refers to data that is gathered for the first time. Anderson (2006) stated that the data gathered must be unbiased, measurable, and statistically valid. It can obtain numerical data for data analysis by implementing mathematical models in this research by using quantitative research William (2007). A questionnaire is a series of questions or items used to gather

information about respondents' attitudes, experiences, or opinions. The questionnaire that was used has mostly shuttered questions that are easier for consumers to answer and multiple choice alternatives. Secondary data was gathered by consulting websites, articles, journals, and so on.

In general, there are three types of business research designs, exploratory research, descriptive research, and survey research. Descriptive research is used to describe a population in terms of important variables according to Zikmund, Babin, Carr and Griffin,(2013). This is done to investigate the relationship and impact of each variable. It donates data gathered for the purpose of description and interpretation. In fact, this design is frequently used to determine the relationship between independent variables and dependent variables. This is not direct evidence of causality because the outcomes are based on significant and appropriate information, which includes proper analysis, interpretation, comparison, and relationship Salaria, (2012).

Population and sample size

Overall, the population all university students in Kota Bharu is 9548 students. The research population of this study only involves university students in Kota Bharu. The target population for university students is 10,000 person. To determine the sample size, Krejcie and Morgan (1970) sample was used in this study. Krejcie & Morgan (1970):

S = sample size

X^2 = the table value of chi-square for 1 degree of freedom at the desired confidence level (3.841)

N = the population size of domestic tourist in a year

P = the population proportion (assumed to be 0.5 since this would provide the maximum sample size)

d = the degree of accuracy expressed as a proportion (0.05)

$$S = \frac{x^2 NP(1 - P)}{d^2(N - 1) + (x^2 P(1 - P))}$$

$$S = \frac{3.841(2054000000)(0.5)(1 - 0.5)}{(0.05)^2(2054000000 - 1) + 3.841(0.5)((1 - 0.5))}$$

$$S = \frac{1972353500}{5135000.958}$$

$$S = 384.099$$

$$S = 384$$

The exact amount of sample size for the population are 384 but the return of the questionnaire answered by respondents collected the data for 385 respondents.

Data Collection

Online surveys that used Google Forms were used as the initial data collection method in this study. The fact that this platform of technological tools is free and user-friendly is the reason why the researcher chose to use it. Additionally, it makes it simpler for the researcher to gather all the data from regional visitors. Fieldwork was the second stage of data collection. The questionnaire was also used as the primary data collection tool in this study. Respondents must complete all three parts of the section. To gather data, a questionnaire was given to the population of university students.

Sampling

Sampling is a technique for obtaining data in academics to learn regarding a particular population by studying the findings of a sample of people rather than focusing on some specific individuals (Turner, 2020). Usually sampling method have the types which are probability sampling that all respondents can participate as a sample, then non-probability sampling is the sampling that take respondents who are have connection with the study. In this research, researcher use the convenience sampling method. This is because this method is easy to accessibility, geographic closeness, and availability at a specific time. Beside that, the researcher also use the non-probability sampling. This is because it will help researcher get the specific answer and also will help in order to achieve the objective of the research.

Research Instrument

The items measuring the chosen research constructs were adopted from prior related research in the field of University students perception toward hipster cafe.

Table 1: Measurement items

Measurements	Number of items in the questionnaires	Scales used	Author

Section A: Demographic information	5	Adapt	Chia et al (2006)
Section B: Hipster Cafe Service, Hipster Cafe Culture, Customer satisfied	15	Adapt	Chia et al (2006)
(Dependent Variables) Section C: Hipster Cafe Environment	5	Adopt	Man et al (2019)

Data Analysis

For the purpose of analyzing the primary data, researchers used SPSS version 27 (Statistical Programmers for Social Science). You can make tables and pie charts using the program-based data processing and analysis window known as SPSS. Researchers were helped by computers in reducing the amount of work needed to gather information and in performing quantitative analysis quickly and easily. To analyse quantitative data, the researcher employs Pearson's correlation, regression, reliability statistics, descriptive statistics, and more.

FINDINGS

Result of Frequency Analysis

Respondents' Profile Of Gender

Respondent's Profile Gender	Frequency N=384	Percentage %
Male	181	47.1%
Female	203	52.9%
Total	384	100%

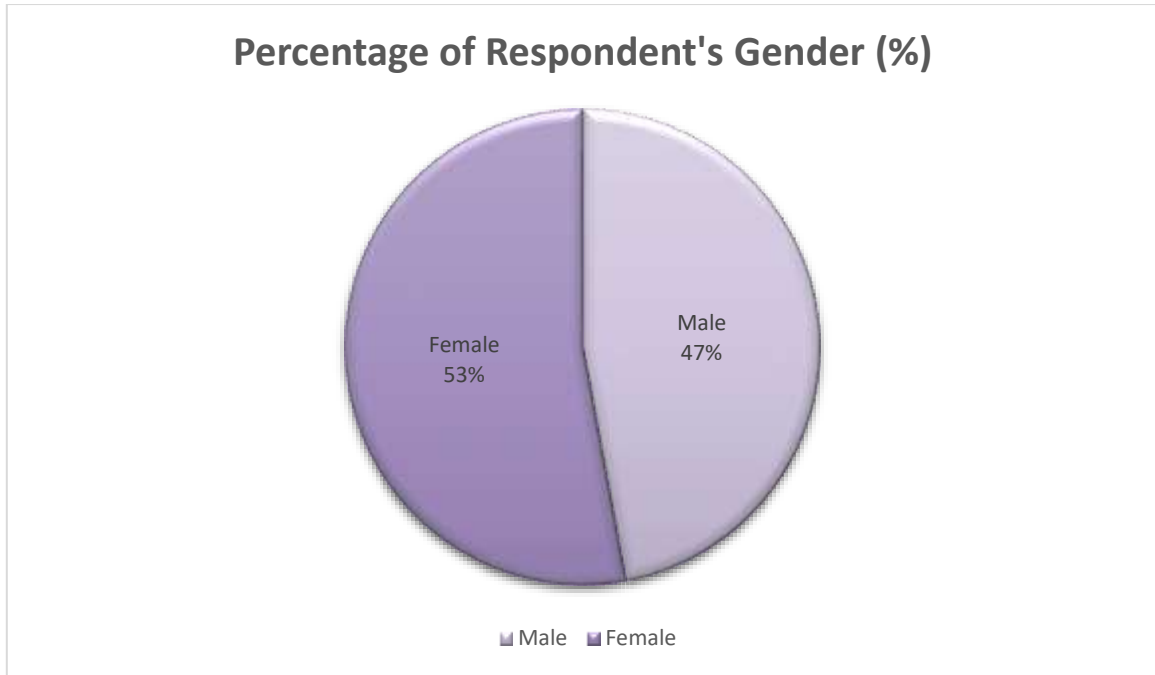

Figure 4.1 The Percentage of Respondent's Gender

Based on the demographic data from 384 respondents, a total of 203 respondents are female, accounting for 52.9% percent of the total, while male respondents account for 181 people, accounting for 47.1% percent of the total.

Respondent's Demographic Profile Of Age

Respondent's Profile Age	Frequency N=384	Percentage %
18-20 years old	41	10.7%
21-24 years old	268	69.8%
25-30 years old	58	15.1%
31-44 years old	17	4.4%

Figure 4.2 The Percentage Of Respondent's Age

According to Table 4.5, respondents aged 21 to 24 years old have the most respondents to the study (268), accounting for 69.8% of the total number of study participants, while those aged 31 to 44 years old have the fewest study participants (17), accounting for 4.4% of all study participants. The age range of 25 to 30 years old had the second highest overall number of survey participants, with (58) people, or 15.1% of all responses. There were (41) respondents aged 18 to 20 years old, accounting for 10.7% of the total.

Respondent's Profile Race	Frequency N=384	Percentages %
Malay	316	82.3%
Chinese	33	8.6%
Indian	20	5.2%
Others	15	3.9%

Respondent's Demographic Profile Of Race

Figure 4.3 The Percentages Of Respondent's Race

According to the data, Malay those who responded had the highest value of 316 (82.3%), while Others had the smallest value of 15 (3.9%). While the Chinese had the second-greatest number of respondents with 33 (8.6%), Indians came in third with 20 (5.2%).

Respondent's Profile Of Education Level

Respondent's Profile Education Level	Frequency N=384	Percentages %
Secondary School	14	3.6%
Diploma/ STPM	127	33.1%
Degree	233	60.7%

Master / PhD	10	2.6%
Total	384	100%

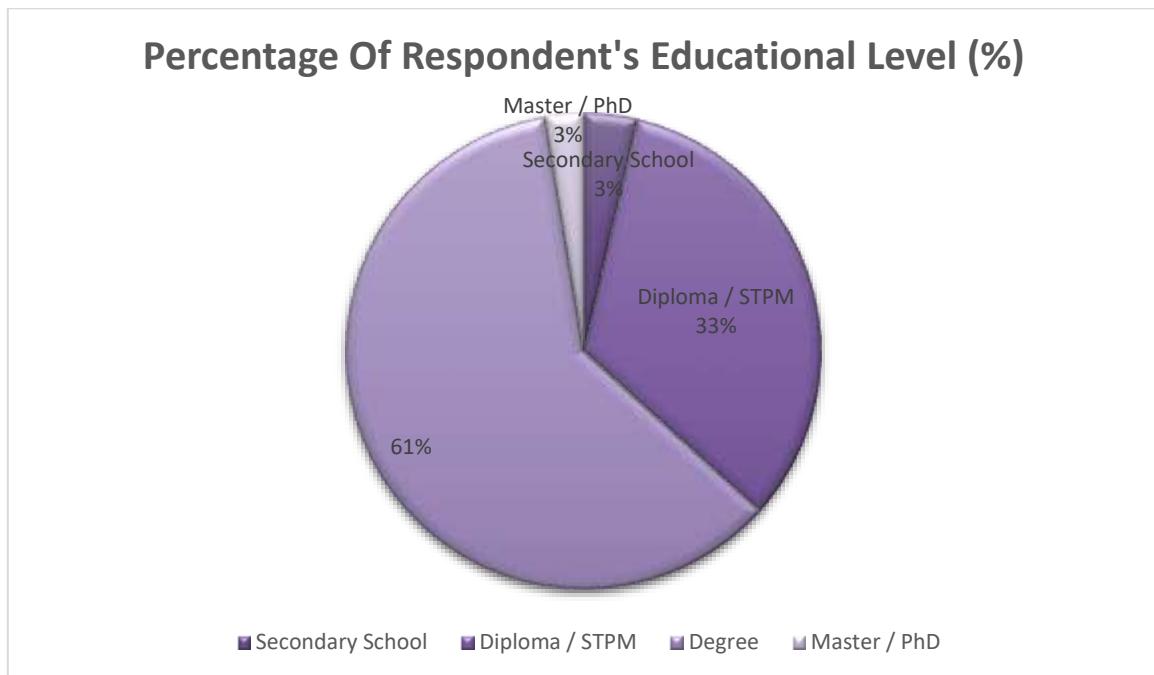

Figure 4.4 Percentage Of Respondent's Educational Level

The findings of table 4.7 show that the majority of respondents in this study have a degree and above, with a total of 233 people, or (60.7%). In addition, Diploma/ STPM recorded the second-highest value with 127 respondents (33.1%), followed by Master/PhD in the lowest place with 10 respondents, leading to a value of (2.6%) and secondary School with a total of 14 respondent's (3.6%).

Result of Descriptive Analysis

4.5.1 Variable No 1

Table 4.5.1 : Descriptive Analysis for Independent Variable (1) towards Hipster Café Service

No	Item for variable No 1	Mean	Standard deviation
1	Did the host greet you upon arrival?	4.09	0.949

2	Does the service provide by hipster cafe workers the best?	4.22	0.769
3	Was the table cleared between dishes by bussers ?	4.27	0.834
4	Does hipster cafe workers are always dressed according to procedure and wear gloves when preparing food?	4.25	0.833
5	Did the WiFi and internet provided fast?	4.20	0.872

The scale for the Hipster Café Service is derived from the table above by adding the means and standard deviations for the five components. The measuring items' averages ranged from 4.09 to 4.27, and their standard deviations were between 0.769 and 0.949. So, the mean for the variable number one is strongly agreed.

4.5.2 Variable No 2

Table 4.5.2 : Descriptive Analysis for Independent Variable (2) towards Hipster Café Culture

No	Item for variable No 2	Mean	Standard deviation
1	Do you think the existence of hipster cafes can influence food tourism among university students?	4.24	0.786
2	Do you think that outsiders or tourists will be more interested in visiting hipster cafes if they have viral food?	4.25	0.720
3	Is this hipster cafe culture suitable for all ages?	3.99	0.925
4	Does this hipster culture mostly emphasize unique and interesting store design?	4.35	0.704
5.	Has the increasingly popular hipster cafe culture in Malaysia influenced the interest of young people, especially university students, to make	4.40	0.694

	hipster cafes a place to meet friends or a place to study?		
--	--	--	--

The scale for the Hipster Café Culture is derived from the table above by adding the means and standard deviations for the five components. The measuring items' averages ranged from 3.99 to 4.40, and their standard deviations were between 0.694 and 0.925. Then, the mean for the variable number is agreed.

4.5.3 Variable No 3

Table 4.5.3 : Descriptive Analysis for Independent Variable (3) towards Hipster Cafe Environment

No	Item for variable No 3	Mean	Standard deviation
1	Can the atmosphere outside the hipster cafe attract the attention of customers?	4.32	0.761
2	Can the interior decoration of hipster cafe influence in creating a calm and comfortable atmosphere?	4.42	0.715
3	Does the hipster cafe care about cleanliness and customer safety?	4.44	0.660
4	Is the atmosphere calm and quit affect the environment of hipster cafe?	4.39	0.704
5.	Is concept of hipster cafe make them more recognizable?	4.41	0.676

The scale for the Hipster Cafe Environment is derived from the table above by adding the means and standard deviations for the five components. The measuring items' averages ranged from 4.32 to 4.44, and their standard deviations were between 0.660 and 0.761. Next, the mean for the variable number three is greatly agreed.

Result of Reliability Test

Table 4.2 The results of reliability analysis for the study variables

No of items	Study variable	Cronbach's alpha	Remarks (acceptable/not acceptable)
5	Hipster Café Service	0.877	Acceptable
5	Hipster Café Culture	0.813	Acceptable
5	Hipster Café Environment	0.870	Acceptable
5	Customer Satisfied	0.858	Acceptable

Pearson Correlation

Correlation between Independent Variable 1 and Dependent Variable (H1)

H1 : Hipster café service positively impact the customer satisfied.

In this hypothesis, hipster café service and customer satisfied are described as the independent and dependent variables. The outcome of the association between these two variables is provided in table below.

Correlations

		Hipster cafe Service	Customer Satisfied
Hipster Cafe Service	Pearson Correlation	1	.478**
	Sig. (2-tailed)		<.001
	N	384	384
Customer Satisfied	Pearson Correlation	.478**	1
	Sig. (2-tailed)	<.001	
	N	384	384

** . Correlation is significant at the 0.01 level (2-tailed).

** . Correlation is significant at the 0.01 level (2-tailed).

Table 4.1 Correlation between hipster café service and customer satisfied.

Table 4.1 shows that the correlation between hipster café service and customer satisfied is 0.478. This discovery reveals the existence of a relationship between the variables.

The positive correlation coefficient of 0.478 demonstrated that their relationship is small but defined relationship. As a consequence, the hypothesis H1, which is used to assess the association between hipster café service and customer satisfied, is regarded as reasonable or accepted.

Correlation between Independent Variable 1 and Dependent Variable (H2)

H2 : Hipster café culture positively impact customer satisfied.

In this hypothesis, hipster café culture and customer satisfied are described as the independent and dependent variables. The outcome of the association between these two variables is provided in table below.

Correlations

		Hipster Cafe Culture	Customer Satisfied
Hipster Cafe Culture	Pearson Correlation	1	.639**
	Sig. (2-tailed)		<.001
	N	384	384
Customer Satisfied	Pearson Correlation	.639**	1
	Sig. (2-tailed)	<.001	
	N	384	384

** . Correlation is significant at the 0.01 level (2-tailed).

** . Correlation is significant at the 0.01 level (2-tailed).

Table 4.2 Correlation between hipster café culture and customer satisfied.

Table 4.2 shows that the correlation between hipster café culture and hipster customer satisfied is 0.639. This discovery reveals the existence of a relationship between the variables. The positive correlation coefficient of 0.639 demonstrated that their relationship is moderate. As a consequence, the hypothesis H2, which is used to assess the association between hipster café culture and customer satisfied, is regarded as unquestioned.

Correlation between Independent Variable 1 and Dependent Variable (H3)

H3 : Hipster café environment positively impact customer satisfied.

In this hypothesis, customer satisfied and hipster café environment are described as the independent and dependent variables. The outcome of the association between these two variables is provided in table below.

		Hipster Cafe Environment	Customer Satisfied
Hipster Cafe Environment	Pearson Correlation	1	.633**
	Sig. (2-tailed)		<.001
	N	384	384
Customer Satisfied	Pearson Correlation	.633**	1
	Sig. (2-tailed)	<.001	
	N	384	384

** . Correlation is significant at the 0.01 level (2-tailed).

** . Correlation is significant at the 0.01 level (2-tailed).

Table 4.3 Correlation between hipster café environment and customer satisfied.

Table 4.3 shows that the correlation between customer satisfied and hipster café environment is 0.633. This discovery reveals the existence of a relationship between the variables. The positive correlation coefficient of 0.633 demonstrated that their relationship is relatively moderate. As a consequence, the hypothesis H3, which is used to assess the association between hipster café environment and customer satisfied, is regarded as has been approved.

DISCUSSION & RECOMMENDATION

The study analyzing the relationship between students perception with hipster cafe service, hipster cafe culture, hipster cafe environment and customer satisfied. The purpose of this study is to determine the relationship between students perception with hipster cafe service, hipster cafe culture, and hipster cafe environment in Kota Bahru, Kelantan.

This study suggests that more research on hipster cafes in Kelantan should be conducted because this research is limited to university students only, it cannot draw any conclusions. The results of this study may be different if extended to the entire population in Kota Bahru Kelantan. As a result, instead of only focusing on university students, residents are also expected to answer the survey.

Research limitations are the study's weaknesses, which are frequently brought on by events beyond the control of the researcher. Data and participants are just two examples of these factors. For instance, the generalization of the results would be compromised if we were unable to obtain a random sample of participants for the study and instead had to use a convenience sampling strategy, indicating a study limitation. As we all know, not all students are from Kelantan, and not all students enjoy eating at hipster cafes. As a result, some students may not be interested in participating in the survey because they may not be familiar with the hipster cafes in Kota Bahru.

Additionally, conduct interviews with respondents or create some open-ended questions instead of having them respond to a scale questionnaire online. With the interview method, researchers may get a high response rate and can immediately follow up on questions with ambiguous or incomplete answers. As a result, this approach can clear up misunderstandings and significantly enhance study findings.

Finally, because the factors that may affect customer satisfaction with hipster cafe services are subject to change, future research should be conducted to stay up to date on these variables. It is possible to evaluate the variables that affect consumer trust, which might help business owners implement more effective marketing strategies. Future academics could develop a special framework for evaluating customer satisfaction with hipster cafe services. Due to the unpredictable nature of customer satisfaction with cafe services, local surveys must be carried out to determine how customers view the cafes and how this influences their level of satisfaction.

CONCLUSION

In this research, all variables had significant and positively affecting the perception of university students towards Hipster Cafe at Kota Bharu . According to the result, all independents variable such as service quality, cafe culture and cafe environment caused influences to the dependent perception of university students. Future studies should start with a well-balanced population sample. An unbalanced sample will generate inconsistent results that favour only one group. The sample size should then be raised in order to obtain precise, accurate, and consistent results.

ABSTRACT

A study to identify factors that encourage University Malaysia Kelantan students to participate in cultural tourism activities. A better understanding of this topic is to find the truth as far as the factors that are likely to encourage student involvement in participating in cultural activities. Also, this research is to investigate what draws students from University Malaysia Kelantan to engage in cultural tourism. Study participants were college students interested in learning more about the potential, benefits, and impact of cultural tourism activities for themselves. This research is to compare student motivation at the university's three different campuses (Jeli, Kota, and Bachok). Students at the University of Malaysia Kelantan will be polled using a questionnaire, followed by data analysis and study-related issues. The results of the study found that student involvement was driven by motivation, education, and the influence of friends to experience the experience of participating in cultural tourism activities. The result of this work helps and persuades the situation in attracting students' interest in participating in cultural activities among the students of University Malaysia Kelantan.

Keywords: cultural tourism activities, students, motivation, youth, education, tourism

INTRODUCTION

Cultural tourism has gained significant attention as a dynamic and enriching aspect of the travel industry, allowing individuals to explore diverse cultural traditions, historical sites, and artistic expressions. For universities, cultural tourism presents a valuable opportunity to enhance students' academic experiences, promote cultural exchange, and foster personal growth. This research study aims to investigate the factors that motivate students from University Malaysia Kelantan (UMK) to actively participate in cultural tourism activities. Cultural tourism offers students a unique avenue to engage with different cultures, expand their knowledge, and develop a global perspective. UMK, situated in Kelantan, Malaysia, is a higher education institution that embraces a rich tapestry of cultural diversity within its student body. Recognizing the potential benefits of cultural tourism, it becomes essential to understand the factors that drive UMK students to participate in such activities and explore their motivations.

The exploration of the factors that motivate UMK students to engage in cultural tourism is crucial for developing tailored programs and initiatives that effectively capture their interest and encourage participation. By identifying these motivating factors, UMK can provide students with opportunities that align with their preferences, thereby enhancing their cultural tourism experiences and maximizing the benefits derived from these activities. The objective of this study is to identify the factors that motivate Universiti Malaysia Kelantan's students to participate in cultural tourism activities. This objective entails conducting comprehensive research to identify and understand the various factors that drive UMK students' motivation to engage in cultural tourism activities. By exploring these factors, the research aims to provide a comprehensive understanding of the underlying motivations behind students' participation. Besides, to examine the most effective factor that contributes to Universiti Malaysia Kelantan's students' participation in cultural tourism activities.

This objective involves evaluating the relative effectiveness of different factors in driving UMK students' participation in cultural tourism activities. By analyzing the data collected and assessing the significance of each factor, the study aims to determine the primary motivation behind students' engagement. By accomplishing these objectives and addressing the research questions, this study aims to contribute to the existing knowledge

based on student participation in cultural tourism activities at UMK. The findings will provide valuable insights for UMK administrators, tourism authorities, and relevant stakeholders in designing targeted strategies and initiatives that cater to students' motivations and promote active involvement in cultural tourism. Ultimately, this research aims to enhance the cultural tourism experiences of UMK students and foster a deeper appreciation for cultural diversity within the university community.

SIGNIFICANCE OF THE STUDY

LITERATURE REVIEW

Motivation

According to Dubin (2002) stated, motivation is the set of influences that initiate and maintain an individual work in an organization. Motivation is the set of influences that initiate and maintain an individual's work in an organization. It propels them to take action and keep moving forward toward their goals. Employees need to feel inspired to increase their drive and dedication to achieving company objectives. Motivation is essential for employees to stay motivated and committed to their goals.

Education

When comparing the many definitions of education, Scheffler (1960) finds that the descriptive definition is the most widely used. The concept of "education" is referred to through various interchangeable names and concepts to describe its meaning and impact on students' lives. A programmatic definition of education emphasizes ideal practices rather than phenomena or words, often resulting in eulogies or slogans rather than concrete guidelines. This approach helps to convey the general public's understanding of education and its role in shaping students' lives.

Youth

According to United Nations refers to the transitional period between utter reliance on one's parents and the emergence of a sense of self-determination and community

among adults as the period often known as "youth" (World Economic Forum, 2013). The term "youth" is fluid and does not specify a specific age range, but most people adhere to the United Nations' definition of "youth" between 15 and 24. However, not everyone agrees, and the UNESCO definition is contextually contingent. Research excludes people older than 26 to ensure a stable sample.

Tourism

Tourism is the act of traveling for leisure, business, or non-wage-related reasons, without considering compensated displacement. Studying tourism involves examining the traveler in a new setting, analyzing the industry's infrastructure and networks, and analyzing the complex dialectic between ordinary and remarkable. The tourist sector significantly impacts national and regional economies, boosting economies, creating jobs, improving transportation, and helping people from different backgrounds appreciate one another. Tourism professionals need a thorough understanding of a destination's tourism industry to find a balance that benefits the area's economy, environment, and culture. Many young people are participating in studying in other countries.

Culture Tourism

Cultural tourism encompasses various aspects of a country, region, city, or town, such as art, film, language, sport, religion, architecture, cuisine, the natural world, and folk culture. It includes study tours, performing arts, festivals, visits to sites, and pilgrimages. Inadvertent cultural tourism occurs when travelers are forced to interact with locals without actively seeking it out. The World Tourism Organization (WTO) defines cultural tourism as the movement of people who fulfill the human need for diversity, elevating the individual's cultural level and generating new knowledge, experiences, and encounters. The tourism industry offers valuable opportunities to study how culture is made, and exposure to new cultures, customs, and lifestyles is a priceless benefit of travel.

METHODOLOGY

In this study, the data were gathered using a One-on-one interview which is part of the qualitative. The researchers used interviews to collect data from the respondents on the factors that motivate University Malaysia Kelantan's students to participate in tourism and cultural activities. The goal of this research was to determine what drives students from University Malaysia Kelantan's to take part in tourism-related cultural activities.

Research Design

The research aimed to understand the factors driving students from University Malaysia Kelantan's to participate in tourism-related cultural activities. A qualitative research approach was used, focusing on participants' lived experiences, phenomena, grounded theory, case studies, and critical case studies. This approach allows for inductive data collection and better understanding of viewpoints. Researchers traveled to the research site to gather data, keeping track of interviews and observations. Thematic analysis was employed to characterize and name the phenomenon, allowing for a thorough investigation of the issue.

DATA COLLECTION

Information that cannot be quantified is referred to as qualitative information. Word clouds, idea maps, graph databases, timelines, and infographics are a few examples of data visualization techniques used to arrange and show information acquired from text, audio, and visual sources for end users. interviews with a single subject that the researcher chooses to employ for data collection. During the discovery phase of research, this style of interview is frequently utilized to ascertain needs, comprehend context, and elicit requests.

Sampling

In this investigation, sampling will be used. The choice of study subjects from the general community is left up to the researcher, who is allowed to exercise his best judgment in doing so. The participants were chosen because they were knowledgeable about the subject, had a clear and concise way of expressing themselves, and were willing to cooperate with the researcher in gathering data.

There are three University Malaysia Kelantan groups on the Kelantan selected which are University Malaysia Kelantan's Kota Bharu Faculty of Entrepreneurship and Business, University Malaysia Kelantan's Bachok Faculty of creative technology and Heritage, and last University Malaysia Kelantan Faculty of Basic Industry Jeli Agriculture.

DATA ANALYSIS

The data collection method will be followed by data analysis. The research's most crucial element was data analysis. Thematic analysis was utilized in this study because it offers a flexible strategy and allows for incorrect data interpretation. Also, it was acceptable to approach knowledge, people's perspectives, opinions, and experiences in order to get the facts. A technique for assessing qualitative data called thematic analysis involves looking through data collection to find, examine, and report recurring themes (Braun and Clarke 2006). It highlights the key points in the account of the phenomenon under investigation (Daly et al., 1997).

Table 1: Six steps of thematic data analysis (Michelle E. Kiger & Lara Varpio,2020)

Step 1: Educating Yourself About the Information
Step 2: Generating Initial Codes
Step 3: Searching for themes
Step 4: Reviewing themes
Step 5: Defining and naming themes
Step 6: Producing and report manuscript

FINDINGS

The study interviewed 6 University Malaysia Kelantan students, including 2 from Kota Bharu, 2 from Bachok, and 2 from Jeli, to analyze their opinions on cultural tourism participation. Demographic information included age, gender, race, and marital status. Participants answered ten questions about factors motivating them to participate in cultural tourism activities. The interviews were helpful in analyzing data.

Table 2: Respondent profile

Characteristics		frequency
Gender	Male	2
	Female	4
Race	Malay	6
	Chinese	0
	Indian	0
Marital status	21-30 years old	6
Educational level	Bachelor of degree	6

Summary of the respondent profile state in table 1. That have 6 respondents for this study, which included 2 students from campus Kota Bharu, 2 students from Campus Bachok and 2 students from Campus Jeli. The participant's demographic information is shown in table. This study focuses on opinions about the potential of University Malaysia Kelantan's participants in cultural tourism. The demographic information that

the researchers asked for were the participant's age, gender, race, marital status. Each participant was interviewed to answer ten questions regarding the factors that motivate University Malaysia Kelantan's students to participate in cultural tourism activities.

DISCUSSION AND RECOMMENDATION

Malaysia offers numerous tourist cultural activities for students from Kota Bharu, Bachok, and Jeli. These activities include architectural and archaeological treasures, culinary activities, festivals, historical sites, monuments, museums, national parks, wildlife sanctuaries, religious sites, temples, and churches. University Malaysia Kelantan has three campuses: Kota Bharu, Bachok, and Jeli. Kota Bharu's tourism faculty provides students with opportunities to enjoy recreation and study abroad. The campus's unique focus on business, architecture, and agriculture makes it an ideal location for activities tailored to UMK students.

Tourism-related cultural events encourage cross-cultural interaction, deepen awareness, and promote tolerance and respect among students. Educational activities like historical sites, museums, and performances broaden perspectives and enhance personal skills like communication, adaptability, teamwork, and problem-solving.

CONCLUSION

This research investigates Students University Malaysia Kelantan's participate in culture tourism activities. Data was collected from students University Malaysia Kelantan's, contributing many students to participate in cultural tourism activities. However, cultural tourism activity gives many benefits to the students to increase their knowledge and learn about the history of the past that made us free from the colonists of antiquity.

ABSTRACT

This study examines the perceptions of tourism employees in the state of Kelantan towards government policies for the COVID-19 recovery process. To obtain the best results in this study, the researchers stated two objectives: (i) To identify the government's policies regarding rebuilding the tourism industry post-COVID-19 and (ii) To examine the government's plans to promote digital transition in the tourism industry post-COVID-19. The researchers employed an in-depth interview technique with travel agency employees in Kota Bharu, Kelantan. This qualitative data collection method involved interviews with pre-set questions to gain rich data. As a result, the findings of this qualitative study highlight several main themes emerging from tourism staff's perception of government policies for the recovery process of COVID-19, including participants expressing mixed views, the significance of clear communication and direction, and concerns about the long-term sustainability of government assistance.

Keywords: COVID-19, government policies, tourism employee, travel agency

INTRODUCTION

Tourism has been one of the industries with the fastest economic growth due to factors that have an impact, such as sustainable economic growth, air transport liberalization, and regional cooperation. Next is the problem statement COVID-19 has significantly impacted many industries, but tourism and hospitality have been among the hardest hit globally. This research study aims to identify government policies regarding rebuilding the tourism industry after post-COVID-19 and examine the government's plans to promote digitalization in the tourism industry.

SIGNIFICANCE OF THE STUDY

Tourism is a cultural where people visit other nations or places outside their typical environment for personal enjoyment or business purposes. According to one the data we have gathered, the tourism industry was believed to be a vital point for many economies worldwide to have had success. Tourism has the potential to increase the economy's earnings and offers thousands of job opportunities, helping to develop the infrastructure of a country and exchanging culture between foreigners and citizens (Yehia, 2019). However, the tourism and hospitality industry has been severely affected worldwide due to COVID-19, which has had a significant impact.

LITERATURE REVIEW

Tourism is both a cultural and economic phenomenon. It involves people traveling to a place or country outside their usual environment for personal or business purposes. As customer satisfaction, safety, and enjoyment are especially important in tourism, tourism is a dynamic and competitive industry that must constantly adapt to changing customer needs and desires. The tourism industry has changed due to COVID-19. According to Dictionary (2022), Coronavirus disease 2019 is a possibly deadly coronavirus-related respiratory illness marked by fever, coughing, and shortness of breath. The industry is in disarray due to the COVID-19 pandemic, so the government needs to rebuild the tourism industry. Rethinking the future of tourism is a chance presented by the crisis. Policies implemented today will affect tourism in the future as the industry is at a crossroads. Governments must capitalize on digitalization, support the low-carbon transition, and promote the structural transformation necessary to create a stronger, more sustainable, and resilient tourism industry while considering the crisis's long-term effects. At the same time can help all travel agencies to increase business because they provide travel and travel-related services to the public on behalf of the accommodation or travel suppliers, offering different travel packages for each destination.

METHODOLOGY

Research Design and Strategy

A research design typically specifies how the information will be gathered, what tools will be used, how they will be used, and how the information will be interpreted. According to Creswell (2014), research design constitutes types of investigations using quantitative, qualitative, and mixed methods that allow for specific procedures targeting. However, in this research, the researcher only focused on qualitative methods for the data collection in this study.

Quantitative research is the procedure of gathering and analyzing numerical data. Current research design distinguishes three types such as descriptive, exploratory, and casual. Government policies response to COVID-19: Perception of travel agencies' employees will employ exploratory research. Exploratory research is defined as research done to investigate an ambiguous question. It is done to learn more about current issues but does not produce concrete outcomes. When conducting such investigations, researchers start with a broad idea and use the study to pinpoint problems that might be the subject of further investigation.

Sampling Strategy

Sampling is a technique used to select individuals or subgroups of a population to make statistical inferences and estimate population characteristics. In this study, the researchers chose snowball sampling. A non-probability sampling technique called snowball sampling can increase the sample size by persuading additional cases to participate in the study. When subjects are difficult to locate, researchers use snowball sampling. In such instances, researchers use the snowball technique to track numerous categories to interview and gather data. Researchers utilize this sampling strategy when the subject is highly sensitive and cannot be discussed openly (Fleetwood, 2018). Surveys, for example, can be used to gather policy information. Many governments are unlikely to respond to the questions. To learn more about the policies, researchers still can approach persons they know or volunteers involved in the cause.

Data Collection Method

The first step is to clearly define the target population. Next is, to select a sampling frame. The list of actual cases from which the sample will be taken is called the sampling frame. The sampling frame should reflect the population. The last step is, to choose a sampling technique. It is important to understand what sampling entails and the rationales behind why researchers are likely to choose a sample before examining the various sampling techniques. Non-

probability that is used in this study is snowball sampling. Defining a clear target population is the first step in the sampling process. In this study, the unit of study is a travel agency. We have to conduct face-to-face interviews, which is a cost-effective way to quickly obtain a significant volume of data gathered quickly from a large number of people. We need to spend time finding interviewees and conducting interviews. Data was collected via interviewing 3 different travel agencies' employees in the Kota Bharu area.

FINDINGS

The findings of this qualitative study highlighted several key terms that emerged from the perceptions of tourism employees toward government policies for the COVID-19 recovery process. Firstly, participants expressed mixed views regarding the effectiveness of government policies. Respondent stated that travel agencies did not conduct internet commerce or work from home during the pandemic. Instead, they paused operations until authorities permitted them to resume operations. The government helped by paying half of the employees' salaries and providing financial aid of RM3000 to keep the travel businesses operational. At the same time, the other respondents said, "During the pandemic, travel agencies are not closed and are usually online, so the company will promote working from home through social media, which as Instagram and WhatsApp. Next is the significance of clear communication and direction, which is the importance of timely and transparent communication. Third, employees expressed concerns about the long-term sustainability of government assistance. The respondent said, "This country's tourism blueprint needs to be changed by me. Because he doesn't support it. Not supporting entrepreneurs in tourism". The findings can be used by policymakers and industry stakeholders to improve policy formulation and implementation, ensuring that they address the concerns and needs of tourist employees.

DISCUSSION AND RECOMMENDATION

The previous study because it provides essential information regarding tourism employees' perceptions of government policies related to the COVID-19 recovery process. With this information as a guide, the present research further explores the perceptions of those same employees more precisely and sees if any additional factors, such as socioeconomic or cultural differences, play a role in how they perceive the policies resulting from research questions and research objectives.

A limitation is an act of something with limitations, such as a period. In conducting this research study, researchers have faced limitations such as limited time and limited respondents, and limited access to information. Researchers experience time constraints in getting feedback

from respondents because they have yet to answer the call or reply to our email after all the information or details were given to them. Some of the targeted respondents did not answer the phone call or respond through email, which caused researchers to waste their time making a phone call to replace and find another respondent. The researcher's targeted respondents are only owners and travel agency employees in Kota Bharu.

The first recommendation or suggestion is that the government should incentivize all travel agencies to revive the tourism industry. The government will extend the tax exemption for inbound tourism players in the upcoming budget. Other than that, the digital transition of the tourism industry can also be identified in the selection of smartphones as the tool of choice for tourists who want to go on vacation.

CONCLUSION

This study concludes that the government should take serious action to enforce effective policies to recover Malaysia from the Covid-19 condition. This is because the tourism industry is also a major contributor to the national economy.

ABSTRACT

Measuring food satisfaction among tourists has become more crucial since the gastronomic tourism sector involves travellers' desire to have authentic and unique eating experiences, which is presently a growing trend in the tourism business. As one of Malaysia's most well-known destinations for food tourism, Kelantan was chosen for the study. The purpose of this study is to identify the variables: food related motivation, involvement, perceived value, influencing satisfaction among domestic visitors visiting the state of Kelantan for culinary tourism. This study used a quantitative survey using questionnaires which were distributed among domestic tourists who have experienced tasting local foods in Kelantan. A total of 200 respondents participated to answer all questions in this survey and it was found that food related motivation, involvement, perceived value has effects on food satisfaction. Stakeholders such as the state government and businesses must continue to make efforts to create more appealing local food in order to make tourist destinations more attractive.

Keywords: Food-related Motivation, Local Food Involvement, Food Satisfaction, Perceived Value, Gastronomic Tourism

INTRODUCTION

Globally, tourism is one of the largest service industries in the world and the main source of income for the nation's economic expansion. According to the United Nations World Travel Organization (UNWTO), gastronomy tourism is a tourist activity that is defined by the visitor's experience associated with food and related products while travelling. Malaysian culture and lifestyle place a high value on food. As a result, there are many foods that are sold not only in restaurants but also many that are sold at the stalls on the sides of the road.

One of the states in Malaysia that is well-known for its food and local delicacies is Kelantan. The cost of living in Kelantan is quite low as compared to other states, which might indirectly satisfy tourists who eat food in this state. As a result, food in Kelantan can be described as delicious and cheap. However, in Kelantan, 1,079 incidents of food poisoning have been reported in all registered food facilities, including canteens and kitchens of school dormitories and higher education institutions (*17 Premis Makanan Kotor di Kelantan Diarah Tutup*, 2022). Additionally, there are street sellers who sell unhygienic food, and the standard of sanitation is very dubious (*17 Premis Makanan Kotor di Kelantan Diarah Tutup*, 2022). However, gastronomic tourism in Kelantan must be sustained at the highest quality. Ji et al. (2016) claims the use of food as a travel motive may affect their food preferences, which may result in satisfaction when they make the right choice. If these factors may increase satisfaction, more tourists will arrive since loyal visitors will come back and recommend the destination to others. Following that, it will promote the purchase of meals by domestic visitors to the state, increasing revenue for the state. Thus, this study is to identify the main factors that determine the food satisfaction among domestic tourists who consume local food in Kelantan. Several objectives of this study were established as follows:

1. To determine the relationship between local food involvement and food satisfaction in Kelantan.
2. To determine the relationship between perceived value and food satisfaction in Kelantan.
3. To determine the relationship between food-related motivation and food satisfaction in Kelantan.

Significance of The Study

1. Domestic Tourists (Demand Side)

The desire of visitors to enjoy original and distinctive eating experiences is only beginning to take off in the tourism sector (Smith & Costello, 2009). In the end, travellers that engage in and enjoy are satisfied with local cuisine in Kelantan will have unique travel experiences since local cuisine is strongly associated with regional cultures and history, which may result in lifelong memories (Tsai, 2016). This study will provide piece of valuable information to make them happy and enjoy when tasting and experiencing local foods in Kelantan.

2. Small and Medium Enterprise (Supply Side)

Small and Medium Enterprise (SME) is an important entity to provide information to determine food satisfaction among domestic tourists visiting Kelantan. It can be related to how far the food can fulfil the needs and expectations from customers. Lack of information causes a customer's perception of the food to differ from what is actually there. In addition, they must take into consideration making food that meets the standards expected by their customers. It will be evaluated in terms of quality through customization. How far the food can satisfy a customer completely. The quality of the food that a business offers to its customer can be seen from the perspective of the small and medium enterprise.

3. Sustainable Development Goals (SDGs)

Stability between environmental, economic, and socio-political sustainability can be achieved through sustainable development strategies. In order to create continuity between economic, social, and environmental growth for the purpose of a common peace without sacrificing the needs of future generations, sustainable development goals must meet both the demands of the present and the future. Sustainable development has 17 important goals in the concept of sustainable development goals. Based on goal number 1 and 2 is about no poverty and zero hunger. Furthermore, goal number 8, it aims to promote sustainable, inclusive and sustainable economic growth, full and productive employment and good work for all good work and economic growth. Hence, by improving the level of tourist satisfaction visiting Kelantan, they tend to purchase more food in Kelantan and the businesses will receive more income. It will provide more jobs to people. It will make them have stable jobs to feed their families and eradicate poverty among the people. This will stimulate economic growth. Therefore, it will achieve goals 1, 2 and 8.

LITERATURE REVIEW

Local Food Involvement

Involvement in the tourism industry has been used to gauge tourist experience (Green and Chalip, 1998; Laverie and Amett, 2000). Many national and local groups, such as the Green Restaurant Association (GRA), describe local food as being within a 100-mile radius of a business, but "regional" food can be defined as being within a 300-mile radius (Green Restaurant Association, 2012). The research claims that engagement is a type of attitude that manifests itself when a person engages with their social surroundings. In varying degrees, loyalty and satisfaction have an impact on involvement. The phrase "local food involvement" refers to the extent to which customers participate in a destination's food-related activities based on these relevant research and literature. The authors discovered that tourists' interest in local cuisine in China has little to do with their commitment to a particular location (Chen & Huang, 2018). Most importantly, involvement has a significant impact on tourist satisfaction (Biswas, Deb, Hasan, and Khandakar, 2021).

Perceived Value

Most tourism sites will require attractions that can draw visitors to the area. To accomplish this, it is necessary to bet on an original and creative gastronomic offer capable of attracting and retaining tourists motivated by culinary pleasures (Gonzalez Santa Cruz, Moral Cuadra, Choque Tito, Lopez-Guzman, 2020). It is also vital to gamble on the destination's gastronomic diversification, so that not all of its tourist attractions are concentrated around a single attraction. The gastronomic experience must be linked to other relevant activities that increase the perceived value of the tourist experience, such as wine tourism or oil tourism (Haven-Tang and Jones, 2005). All of this is possible provided the destination's public and private players allow and support the development of great restaurants, culinary routes, museums and interpretive centres, adequate infrastructure, and food markets (Dimitrovski, Crespi Vallbona, 2017). However, this must be supplemented by an adequate advertising plan in the issuing or potential markets, such as participation in specialised fairs (Ignatov and Smith, 2006). Moreover, Yuliantoro et al. (2019), claimed that perceived value has a significant impact on tourist satisfaction.

Food-related Motivation

Consumers' choices in food may reflect a variety of motives. According to prior study, affordability, convenience, healthiness, and sensory appeal are often the four most crucial criteria that determine what people choose to eat (Scheibehenne., Miester., and Todd., 2007). The word "motivation" refers to the reasons behind someone's actions. It is what motivates people to act in the way they do. The mechanism that starts, directs, and sustains goal-oriented activities is known as motivation (Cherry., 2022).

There are many different types of motivation that are effective in diverse situations, but they all have three characteristics, activation, persistence, and intensity, which may increase motivation in general. Most importantly, motivation influences tourist satisfaction (Bayih, & Singh, 2020).

Food Satisfaction

Food satisfaction is defined as "a good physical and psychological response after taking food and is linked to reported stomach emotions, energy levels, and a longer satiety period following consumption (Anderson and Hyldig, 2015; Lawless and Heymann, 2010). Additionally, vacationers' favourite feeling after exploring a tourist location is culinary pleasure. Satisfaction may be made up of two components. Chemical or emotional factors may be

involved, such as having adequate carbohydrates, protein, and fat. When assessing if we believe we have received what we need, factors including taste, texture, warmth, ambient experience, numbing of emotions, celebrations, social connections, and culture are taken into account (Rebecca Panzer Toutant, 2018). In other words, it is considered satisfactory when tourists' perceptions exceed their initial expectations. Food satisfaction can be measured using general satisfaction attributes such as "taste, appearance, good smell, availability of food, and environment". It is crucial to distinguish between overall contentment and happiness with various aspects of tourism since the distinctive quality of tourism has a significant influence on visitors' satisfaction with meals (Seaton & Benett, 1996; Boonsiritomachai, 2017). Tourists' satisfaction with food (food satisfaction) is important for the success of tourism destination marketing. It influences the decision to visit a certain area, the purchase of tourism-related products and services, and also the desire to go there again (Yoon & Uysal, 2005).

Research Hypothesis

- H1: There is a significant relationship between local food involvement and food satisfaction.
- H2: There is a significant relationship between perceived value and food satisfaction.
- H3: There is a significant relationship between food related motivation and food satisfaction.

Research Framework

Figure 1 shows the research framework used in this study.

Figure 1: Research Framework

METHODOLOGY

Research Design

According to Creswell & Creswell (2017), a study strategy, structure, and method known as research design. This study employed a quantitative approach. Three forms of study are distinguished by this design: causal, exploratory, and descriptive. This investigation employed causal analysis. Cross-sectional design has been used in this investigation. A cross-sectional investigation is a type of research design in which information is concurrently obtained from several people. Individual visitors, more particularly, domestic tourists who eat local cuisine in Kelantan are the study's unit of analysis.

Data Collection

The data collection method procedure is the compilation of data from respondents. When collecting data for this study, a questionnaire survey was used using google form. Respondents are required to answer a series of questions from the distributed questionnaire.

Sampling

Sampling is a statistical analysis technique in which a certain number of samples are selected from a large population or a sample survey (Poonam, 2022). Depending on the sort of study being undertaken, there are two types of sampling methods which are probability sampling and non-probability sampling. In this study, a non-probability sampling technique has been used. A convenience sampling strategy has been adopted in this study because it is simple to use and low cost.

Data Analysis

A method of assessing and understanding the information gathered from the respondents is data analysis.

Statistical Package for the Social Sciences (SPSS)

A statistical analysis application that has been used is SPSS. It is the most commonly used statistical tool, it is capable of evaluating and processing complex data using simple methods. SPSS is used to analyse various sorts of data. Frequency analysis, descriptive statistics and reliability analysis were used to analyse the data. Frequency analysis is used to determine the number of respondents who answer the questionnaire based on certain criteria. Descriptive analysis is used to summarise and characterised the data (Zikmund et al., 2013; Creswell & Creswell, 2017). Descriptive statistics were

generated in this study for each of the dependent and independent variable. To make the data easier to grasp, it uses metrics such as mean, and standard deviation. The reliability analysis whereby it is used to measure the internal consistency of items used to measure the variables. A straightforward metric for evaluating reliability is Cronbach's alpha. Values of true Cronbach's alpha of 0.70 and beyond are taken into consideration. The ideal score is 0.8 or higher, while an outstanding score is 0.90 or higher. Lastly, The Pearson correlation coefficient was used to analyse the data that had been obtained. It is used to evaluate the impact of the straight connection between the independent variables (IV) and the dependent variable. The Pearson correlation coefficient assesses the strength of a two-variable linear relationship. It has a value ranging from -1 to 1, with -1 indicating total negative linear correlation, 0 indicating no connection, and + 1 indicating total positive correlation. The correlation, like the Pearson correlation, assesses the strength of a monotonic relationship between two variables (Bonett & Wright, 2000).

FINDINGS

Profile of Respondents

Demographic	Categories	Frequency (N)	Percentage (%)
Age	18 - 20 years	10	5.0
	21 - 30 years	151	75.5
	31 - 40 years	10	5.0
	41 - 50 years	12	6.0
	51 years and above	17	8.5
Gender	Male	53	26.5
	Female	147	73.5
Race	Malay	188	94.0
	Indian	1	0.5
	Chinese	0	0
	Others	11	5.5
Travel Frequencies in a year	1-2 times	107	53.5
	3-5 times	50	25.0
	More than 5 times	42	21.0

Demographic	Categories	Frequency (N)	Percentage (%)
Travel Period	Public holiday	24	12.0
	School holiday	46	23.0
	Semester breaks	49	24.5
	Anytime	79	39.5
	Other	2	1.0

Table 1: Respondent Profile

Table 1 shows profiles of 200 respondents and most of them are at the age of 21-30 years old which is (75.5%) from the total of the sample. The lowest frequency respondents' age is 18-20 with (5%). The majority of the respondents are female, (73.5%), compared to male (26.5%). Meanwhile for race, the highest respondents are Malay with (94%). The race of Chinese has the lowest frequency since none of them responded to the questionnaires. As for the travel frequencies, (53.5%) of people travel 1-2 times and (21%) is the lowest frequency of the respondents that travel more than 5 times. In terms of travel period, people who travel anytime are the highest percentage with (39.5%) and the lowest are others with (1%). Thus, the data accurately reflect the real demographic compilation of the determine food satisfaction among domestic tourists visiting Kelantan, Malaysia.

Analysis for The Determinant of Food Satisfaction Among Domestic Visitors: The Case of Gastronomic Tourism in Kelantan

Variable	Items	N	Mean	Standard Deviation
Local Food Involvement	Food plays an important role in choosing the destination to visit.	200	4.29	0.727
	Prior to my trip, I planned food choices to experience local culture	200	3.95	0.858
	I decided on destinations to visit only based on the foods I wanted to experience	200	3.75	0.944
	I usually do some research about the local food or restaurants prior to my trip	200	3.91	0.830
	Prior to my trip, one thing I anticipate is eating the food there	200	4.12	0.818
	I like trying different styles or types of food during travel.	200	4.25	0.777
Perceived Value	Local Food Involvement is Interesting	200	4.22	0.694
	Local Food Involvement is Appealing	200	4.12	0.761

	Local Food Involvement is Valuable	200	4.13	0.736
	Local Food Involvement is Exciting	200	4.12	0.793
	Local Food Involvement is Desirable	200	4.17	0.737
	Local Food Involvement is Wanted	200	4.10	0.754
	Local Food Involvement Mean a lot	200	4.13	0.816
Food Related Motivation	I obtained good results from consuming food while visiting Kelantan	200	4.02	0.811
	Food in Kelantan makes it as a destination that I enjoy	200	4.01	0.891
	Consuming food in Kelantan gave me pleasure	200	4.04	0.858
	Compared to other tourism destinations, purchasing food in Kelantan is good value for money	200	4.05	0.881

	Compared to food expenses, I got reasonable quality food experience from visiting Kelantan	200	3.99	0.885
Food Satisfaction	The food experience in Kelantan gave me high satisfaction	200	3.98	0.894
	My choice to taste the local cuisine was a wise one	200	4.06	0.815
	The food experience in Kelantan gave me a sense of joy	200	4.05	0.846
	The food experienced in Kelantan met my expectations	200	3.89	0.918
	The food I experienced in Kelantan exceeded my expectations	200	3.86	0.965

Table 2: Descriptive Analysis for The Determinant of Food Satisfaction Among Domestic Visitors: The Case of Gastronomic Tourism in Kelantan.

Table 2 shows the mean and standard deviation of dependent variable and independent variable in this study. The highest mean value in dependent variable was obtained by Question 2 with 4.06 (SD= 0.815) where the respondents agreed that “choosing to taste local cuisine was a wise one”. Meanwhile, Question 5 has a lowest mean value with 3.86 (SD= 0.965) which means the respondents agreed that “food experience in Kelantan exceeds their expectations”. Independent variables for local food involvement had a highest mean value that belongs to Question 1 4.29 (SD= 0.727) which meant that the respondents agreed “food plays an important role in choosing the destination to visit”. After that, the lowest mean value was obtained by Question 3 with 3.75 (SD= 0.944) where the respondents agreed that “destinations to visit only based on the foods they want to experience”. Question 1 had the highest mean value for the independent variable of perceived value, with 4.22 (SD= 0.694), indicating that respondents admit that “local food involvement is interesting”. Question 6 has the lowest mean of 4.10 (SD= 0.754) meaning that respondents concede that “local food involvement is wanted”. The highest mean value for independent variable motivation is Question 4 with 4.05 (SD=0.881), meaning that respondents comply with the statement that purchasing food in Kelantan “is good value for money”. While the lowest mean for the motivation is Question 5 with 3.99 (SD=0.885) showing that respondents agreed that “it is a reasonable quality food experience from visiting Kelantan”.

Relationship between Local Food Involvement, Perceived Value, Food-Related Motivation among domestic tourists visiting Kelantan, Malaysia.

		Tourist Satisfaction using AirAsia as a preferred Airline to travel to the domestic destination	
Local Food Involvement	Pearson Correlation		.928
	Sig. (2-tailed)		.000
	N		200
Perceived Value	Pearson Correlation		.752
	Sig. (2-tailed)		.000
	N		200
Food-Related Motivation	Pearson Correlation		.628
	Sig. (2-tailed)		.000
	N		200

Table 3: Pearson's Correlation between Local Food Involvement, Perceived Value , Food-Related Motivation among domestic tourists visiting Kelantan.

The result in Table 3 indicates that local food involvement and food satisfaction among domestic tourists visiting Kelantan with 0.928 indicated strong positive correlation. Next is perceived value and food satisfaction among domestic tourists visiting Kelantan showed 0.752 indicating strong positive correlation. Following food-related motivation and food satisfaction among domestic tourists visiting Kelantan shows 0.628 indicated medium positive correlation. Therefore, all the three variables positively correlated with food satisfaction among domestic tourists visiting Kelantan ($p < 0.05$).

H1: There is a significant relationship between local food involvement and food satisfaction among domestic tourists visiting Kelantan, Malaysia.

The finding of this study is consistent with the study by Biswas, Deb, Hasan, and Khandakar (2021) whereby involvement is an important predictor of tourist satisfaction. Hence, H1 is supported.

H2: There is a significant relationship between perceived value and food satisfaction among domestic tourists visiting Kelantan, Malaysia.

The outcome of this study is consistent with the finding of previous study whereby perceived value has a positive relationship with satisfaction (Yuliantoro et al., 2019). Thus, H2 is supported.

H3: There is a significant relationship between food related motivation and food satisfaction among domestic tourists visiting Kelantan, Malaysia.

The study found that food related motivation is positively correlated with food satisfaction. This finding is supported by Bayih and Singh (2020). Hence, H3 is supported.

DISCUSSION AND RECOMMENDATION

Kelantan is a popular tourist destination, with a high number of domestic visitors. To sustain Kelantan's reputation as an attractive tourist destination, the Malaysian tourism industry's management must comprehend their needs and wants. One of the important tourism products in Kelantan is food. Tourism management in Kelantan should promote the local cuisine throughout Malaysia and let them get involved in selecting and purchasing local foods when they visit Kelantan. Moreover, the food stalls and restaurants should provide a variety of local food so that they are more motivated to visit Kelantan. This will help to generate income and encourage the growth of the state's economic development.

The current study has a significant weakness that needs to be improvised such as a limited time for data collection. Therefore, only 200 respondents responded to questionnaires which is less than the earlier total number of samples that the study expected. The researchers made every attempt to contact respondents as soon as possible. Things that may be changed or improved for future studies is that researchers can further diversify the data collection methods such as collecting data online and offline.

CONCLUSION

In conclusion, this study has achieved its main objective which is to discover the factors that determine the food satisfaction among domestic visitors that visit Kelantan. A total of 200 respondents from the age of 18 years old and above were selected from all states of Malaysia who had experience tasting local foods in Kelantan to determine food satisfaction using questionnaire surveys. As a result, three independent variables: food related motivation, local food involvement and perceived value have a significant relationship with food satisfaction among domestic tourists who have tasted local cuisine in Kelantan.

ABSTRACT

The study's main objective is to identify the effects of environmental sustainability, economic sustainability, socio-cultural sustainability and institutional sustainability on visitors' satisfaction during their visit to Kelantan's sustainable heritage tourism sites. The present study employs quantitative methods and 207 respondents participated in the survey. It was found that environmental sustainability, economic sustainability, socio-cultural sustainability and institutional sustainability have significant effects on visitors' satisfaction. Thus, all hypotheses are supported. This study provides information to tourism management in Kelantan on how sustainable tourism development can protect cultural heritage and also meet visitor demands and preferences.

Keywords: Tourist satisfaction, Environmental Sustainability, Economic Sustainability, Socio-Cultural Sustainability and Institutional Sustainability.

INTRODUCTION

Worldwide, one of the key industries that contributes to a country's development in terms of economy, society, and environment is tourism. There are various niche markets of tourism and one of them is heritage tourism. Heritage tourism is related to travelling with the main purpose of exploring the history and heritage of a place within one particular destination. Malaysia is a country that is rich with culture and physical heritage and is focusing on the sense of place on heritage sites to ensure the continuation of heritage tourism. Hence, it is crucial to maintain the sustainability of heritage tourism sites. The term 'sustainability' reflects both the needs of the current generation and the necessity of protecting resources for future generations (Rasdi, Som, Azinuddin, Nasir, & Khan, 2022). One of the states in Malaysia that should maintain its cultural heritage is Kelantan. For decades, the state has gone unnoticed, hiding a rich wealth of cultural jewels beneath its primarily Islamic, rural appearance. Kelantan, unlike most other regions in

Malaysia, is a time capsule that retains many types of Malay cultural history. However, the serious issue facing the by heritage tourism in Kelantan is the decline of cultural identity in historical sites due to a mass tourism that influences the level of satisfaction among tourists visiting Kelantan's sustainable heritage tourism development (Aizat, 2021). Hence, to resolve this issue, the main objective of the study is to investigate the factors that influence satisfaction among tourists visiting sustainable heritage tourism development in Kelantan.

There are several objectives have been established as follows:

1. To determine the relationship between environmental dimension and tourist satisfaction visiting sustainable heritage tourism development in Kelantan.
2. To determine the relationship between economic dimension and tourist satisfaction visiting sustainable heritage tourism development in Kelantan.
3. To determine the relationship between socio-cultural dimension and tourist satisfaction visiting sustainable heritage tourism development in Kelantan.
4. To determine the relationship between institutional dimension and tourist satisfaction visiting sustainable heritage tourism development in Kelantan.

SIGNIFICANCE OF THE STUDY

1. Kelantan Tourism Destination

Kelantan has many heritage sites that are tourist attractions. This heritage site needs to be maintained and beautified so that it remains an attraction for foreign tourists. This place gives a uniqueness that is different from other places. With that, it will increase the economy and the income of the people in that place. Kelantan can also open many tourist attractions to attract tourists visiting any state of Kelantan and the main advantages of tourism are that it increases national income and gives locals more job opportunities.

2. Sustainable Tourism Development Goals

We must protect the environment and natural resources while also bringing socioeconomic benefits to the local residents that reside inside the tourist area if we are to achieve our long-term development goals. This study shows that by maintaining a stable position in the tourism industry, it is possible to achieve many sustainable development goals, such as (1) no poverty, (2) no hunger, and (8) decent work and economic growth. In addition,

Kelantan's sustainable tourism development will allow for the preservation of both land-based and subaquatic life (objective 15).

3. Tourism Policy

Governments often work with private or social actors to implement a variety of tourism-related objectives through the use of discourses, decisions, and practices known as tourism policy. Hence, the result from this study will provide an avenue for policy makers to establish policy suitable with the current needs of tourists visiting Kelantan.

LITERATURE REVIEW

Heritage Tourism

According to Garrod and Fyall (2001), "heritage tourism" refers to all of the activities tourists engage in when visiting places with historical sites. Pedersen (2002) asserts that heritage tourism encompasses both cultural and natural tourism, with a focus on the protection of cultural assets. Rishter (1999) defined heritage tourism as including travel to historical places, monuments, shrines, and sculptures that all serve as reminders of past occurrences. Additionally, legacy tourism covers a wide range of sites and mostly focuses on the culture, natural beauty, and historical significance of the place.

Tourist Satisfaction

The concept of tourist satisfaction has been investigated thoroughly in the context of tourism marketing (Muhamad Nasir, Mohamad, & Ab Ghani, 2021a). In general, satisfaction occurs when a tourist's perception exceeds the initial expectation (Muhamad Nasir, Mohamad, & Ab Ghani, 2021b). To be specific, tourist satisfaction was defined by Servet et al. (2007) as the level of satisfaction that visitors felt during their travels in relation to qualities of a product or service that met the following criteria: Travel-related aspirations, requirements, and wants of tourists. Customer expectations before and after consumption are compared to determine customer satisfaction. Pre-trip anticipation and post-trip experiences are the two key factors that influence satisfaction. When the experience meets or surpasses expectations, visitors are happy. However, if tourists were unhappy, unhappiness would be the anticipated result (Chen & Chen, 2010; Reisinger and Turner, 2003). Understanding how suppliers in a specific destination recognise and address

visitor demands as well as identifying what aspects of the destination's current offering need to be improved are key to measuring and explaining the client's primary purpose satisfaction

Environmental Sustainability

Environmental sustainability is the obligation to protect natural resources and preserve global ecosystems for current and future health and well-being (Sphera, 2022). Many of us naturally go for a stroll when we are stressed. We seek out forests, parks, beaches, and country roads to feel more at ease with nature. Environmental sustainability seeks to improve the quality of human existence while minimising the strain on the planet's supporting ecosystems. It is about striking a balance between consumerism and the living world. We can achieve this without wasting or depleting natural resources unnecessarily (Inspire,2022). Fan et al. (2012) reported that environmental sustainability has a significant effect on tourist satisfaction.

Economic Sustainability

Economic sustainability refers to practises that promote long-term economic growth while minimising negative impacts on a community's social, environmental, and cultural components (University of Mary Washington 2015-2022). Economic sustainability is also the practice of safeguarding natural and financial resources in order to achieve long-term financial stability. In finance, this may imply lowering global consumption of valuable resources so that future generations can use them to build financial stability and wealth. Companies, governments, and consumers, for example, can assist minimise the global impact of fossil fuel emissions and pollution by lowering their usage of fossil fuels and focusing on alternative fuel sources. Most importantly, there is a positive correlated between economic sustainability and tourist satisfaction (Hsieh et al., 2016).

Socio-Cultural Sustainability

Socio-cultural sustainability is how we as a nation maintain the well-being of our communities now and in the future by recognising, developing, and preserving core human needs such as human rights, equality, health, culture, and religion (National Library of New Zealand, 2020). People are at the heart of society's long-term growth. It acknowledges that individuals and communities have needs, values, shared experiences, and so on, all of which must be considered when planning for sustainable development. Since ancient times, humans have been migrating from one location to another for a variety of reasons such as avoiding danger, getting resources, or finding a more suited

environment. People build communities everywhere they go, developing a shared identity and a distinct culture. According to Fan et al. (2012), socio-cultural sustainability has a direct impact on tourist satisfaction.

Institutional Sustainability

It is a novel approach for analysing sustainability in the environmental, social, and economic sectors. Furthermore, to support its main activities and to understand the stages of sustainable development within the three areas mentioned above, as well as matters in which leadership can be played in sustainable development by bridging the gaps that impede the process of achieving sustainable development (GDRFA, 2022). This is accomplished when institutions, structures, and procedures can continue to execute their functions across time. According to Fan et al. (2012), institutional sustainability has a major impact on tourist satisfaction.

Research Hypothesis

The hypothesis of this study is to determine whether or not there is a correlation or relationship between dependent and independent variables.

H1: There is a significant relationship between environmental sustainability and tourist satisfaction.

H2: There is a significant relationship between economic sustainability and tourist satisfaction.

H3: There is a significant relationship between socio-cultural sustainability and tourist satisfaction.

H4: There is a significant relationship between institutional sustainability and tourist satisfaction.

Research Framework

METHODOLOGY

Research Design

Research design is how the data to be collected, what instruments to be used as well as the intended ways on how to interpret the data collection. This study used causal research design to determine the effect of independent variables on dependent variables. Moreover, cross-sectional study is employed. The cross-sectional design is the data collection is collected at a single point in time. The unit analysis that has been used is individual. Surveys are arguably the most practical way to collect quantitative data. Therefore, this study used a self-administered questionnaire to collect data.

Data Collection

This study relies on original data. The instrument we used in our study is a self-administered questionnaire using Google form. The questionnaires have been disseminated online, and we have gathered data from Malaysian domestic visitors who have visited Kelantan heritage tourism sites in the last five years. The study began with a pilot study in which 30 people took part in the survey. After that, the researcher performed a field study, in which 207 visitors participated in the survey.

Sampling

For this investigation, the researchers used non-probability sampling. The technique of sampling employed is convenience sampling. Convenience sampling was used for this study because it is simple, inexpensive, and appropriate.

Data Analysis

The data for this study were analyzed using the Statistical Package for the Social Sciences (SPSS), and four different types of data analyses were used: frequency analysis, descriptive analysis, reliability analysis, and Pearson Correlation analysis.

FINDINGS

Profile of Respondents

Table 1: Respondent's Profile

Demographic	Categories	Frequency (N)	Percentage (%)
Gender	Male	74	35.7%
	Female	133	64.3%
Age	18-22 years old	86	41.5%
	23-27 years old	87	42%
	28-32 years old	30	14.5%
	33-37 years old	4	2%
Religion	Buddhist	27	13%
	Muslim	154	74.4%
	Hindi	10	4.8%
	Christian	14	6.8%
	Other	2	1%
Race	Malay	152	73.4%
	Chinese	30	14.5%
	Indian	23	11.1%
	Other	2	1%
Marital Status	Single	185	89.4%
	Married	22	10.6%

State of residences	Johor	27	13%
	Kedah	8	4%
	Kelantan	26	12.6%
	Melaka	17	8.2%
	Negeri Sembilan	5	2.4%
	Pahang	17	8.2%
	Perak	18	8.7%
	Perlis	4	1.9%
	Pulau Pinang	18	8.7%
	Sabah	3	1.4%
	Sarawak	4	1.9%
	Selangor	26	12.6%
	Terengganu	17	8.2%
	Wilayah Persekutuan Kuala Lumpur	17	8.2%

Table 1 depicts the demographics of the 207 respondents. The majority of responders (64.3%) are female, with only (35.7%) being male. Most of them are at the age of 23-27 years old (42%) and the lowest frequency respondents' age is 33-37 years old with (2%). Next, in terms of religion, the majority of the respondents are Muslim with (74.4%). Meanwhile, the majority of respondents (73.4%) are Malay, while the majority of respondents (89.4%) are single. In terms of the state of residences, Johor is the highest respondents with (13%) while Sabah is the lowest which is (1.4%).

Analysis for factor on satisfaction among tourist visiting sustainable heritage tourism development in Kelantan

Table 2: Descriptive Analysis for factor on satisfaction among tourists visiting sustainable heritage tourism development in Kelantan.

Variable	Items	N	Mean	Standard Deviation
Economic Sustainability	Question 1: ECS 1	207	3.22	1.023
	Question 2: ECS 2	207	3.26	1.041
	Question 3: ECS 3	207	3.21	1.029

	Question 8: SCS 8	207	3.56	0.922

	Question 9: SCS 9	207	3.60	0.944
	Question 10: SCS 10	207	3.70	0.903
	Question 11: SCS 11	207	3.68	0.932
	Question 12: SCS 12	207	3.24	1.038
	Question 13: SCS 13	207	3.58	0.920
	Question 14: SCS 14	207	3.59	0.935
Institutional Sustainability	Question 1: IS 1	207	3.54	1.032
	Question 2: IS 2	207	3.51	1.047
	Question 3: IS 3	207	3.49	1.047
	Question 4: IS 4	207	3.54	1.027
	Question 5: IS 5	207	3.56	1.055
	Question 6: IS 6	207	3.48	1.110
	Question 7: IS 7	207	3.57	1.040

	Question 8: IS 8	207	3.60	1.028
	Question 8: IS 8	207	3.63	1.080
Tourist Satisfaction	Question 1: TS 1	207	3.75	1.031
	Question 2: TS 2	207	3.70	1.056
	Question 3: TS 3	207	3.70	1.023
	Question 4: TS 4	207	3.68	1.018
	Question 5: TS 5	207	3.75	1.012
	Question 6: TS 6	207	3.68	1.046
	Question 7: TS 7	207	3.80	1.004

In this study, the mean and standard deviation of the dependent and independent variables are shown in Table 2. The highest mean value in independent variable for economic sustainability was obtained by Question 5 with 3.53 (SD = 0.999) where “seasonality level of heritage tourism”. Meanwhile, Question 3 has the lowest mean value with 3.21 (SD = 1.029) which means “percentage of quality (stable, high paid, permanent and full-time) tourism jobs”. Independent variable for environmental sustainability had a highest mean value that belongs to Question 4 with 3.66 (SD = 0.982) which mean “value to and protection of the natural environmen”t. After that, the lowest mean value was obtained by Question 7 with 3.34 (SD = 1.053) where “the amount of litter attributed to heritage tourism is low”. Question 10 had the highest mean value for the independent variable quality of socio-cultural sustainability, with 3.70 (SD = 0.903), indicating that “contribution of local cultural values for heritage tourism development”. Question 12 has the lowest mean value of 3.24 (SD =1.038) meaning that “the percentage of criminality, alcoholism, vandalism etc caused by heritage tourism is low”. The highest mean value for independent variable institutional sustainability is Question 9 with 3.63 (SD = 1.080), which is “the level of support for conservation of heritage sites at the local level”. "Implementation of land zoning practises in attraction sites" has the lowest mean score of 3.48 (SD = 1.110). Question 7 got the highest mean value for dependent variable access to tourist satisfaction, with 3.80 (SD = 1.004), which is “accommodation (quality of food and drinks, customer handling, price fairness) in service sectors”. Question 4 has the lowest mean value of 3.68 (SD = 1.018), which is “the reasonability of entrance fee to attraction sites”.

Relationship between economic sustainability, environmental sustainability, socio-cultural sustainability, institutional sustainability towards tourist satisfaction in Kelantan.

Table 3: Pearson's Correlation between economic sustainability, environmental sustainability, socio-cultural sustainability, and institutional sustainability in Kelantan and tourist satisfaction

		Tourist Satisfaction in Kelantan
Economic sustainability	Pearson correlation	0.235
	Sig. (2-tailed)	<.001
	N	207
Environmental sustainability	Pearson correlation	0.301
	Sig. (2-tailed)	<.001
	N	207
Socio-cultural sustainability	Pearson correlation	0.222
	Sig. (2-tailed)	<.001
	N	207
Institutional sustainability	Pearson correlation	0.388
	Sig. (2-tailed)	<.001
	N	207

Table 3 shows that the association between economic sustainability and visitor satisfaction in Kelantan is 0.235, indicating a high positive link. Next is environmental sustainability and tourist satisfaction in Kelantan showed 0.301 indicating moderate strong positive correlation. Following socio-cultural sustainability and tourist satisfaction with 0.222 indicated the moderate positive correlation. Meanwhile, institutional sustainability and tourists satisfaction shows 0.388, which indicates strong positive correlation. As a result, all four variables are positively connected with tourist satisfaction, and the relationship is statistically significant ($p < 0.05$). The studies findings are consistent with the past studies whereby Fan et al. (2012) claimed that environmental sustainability, socio-cultural sustainability and institutional sustainability have significant implication on satisfaction and Hsieh et al. (2016) claimed that economic sustainability has significant effect on tourist satisfaction. Thus, all hypotheses are supported.

DISCUSSION AND RECOMMENDATION

The study has examined the determining factors on satisfaction among tourists visiting sustainable heritage tourism development in Kelantan. Following the results of the study, some recommendations for tourism stakeholders and future academics to improve future research have been made.

Tour operators need to play an important role in attracting tourists to visit tourist destinations in an effort to revive tourism. To attract domestic tourists, they should examine their preferences. When tourism managers and operators focus solely on international visitors, they risk misinterpreting market shifts and allocating resources inefficiently. Tourists will be drawn to the gorgeous sites and will stay longer and spend more money in Kelantan if there are more attractive attractions. As a result, domestic travel agencies and small enterprises will benefit from increased sales and profits, resulting in higher income. This will likely have long-term consequences for the travel and tourism industry. Kelantan's heritage sites can also help the state's economic viability. Therefore, we need to improve the facilities and cleanliness of the surrounding area. We also need to beautify the heritage places in Kelantan so that they always attract domestic visitors.

This work is also necessary for the continuation of future research. It is suggested that future studies explore tourist satisfaction for the development of sustainable heritage tourism by integrating demographic features of more respondents. For example, race, religion, monthly income, marital status, occupation, and so on, in order to get distinct outcomes or conclusions from various perspectives. Researchers can gather more detailed data this way.

Future researchers could also improve data gathering for this study, particularly in terms of questionnaire dissemination. Future researchers could hand out questions in person rather than using Google Forms. This is because some respondents refused to answer the questionnaire, which the researchers submitted via Google Forms. As a result, when surveys are presented in person to potential responders, the response rate is higher.

CONCLUSION

Finally, this study was completed to determine the determining element of satisfaction among domestic visitors visiting Kelantan's sustainable heritage tourism development. The research presents the study's four objectives. Moreover, Economic sustainability, environmental sustainability, socio cultural sustainability and institutional sustainability have significant effects on satisfaction. These findings are based on 207 respondents who participated in the study. Hence, all hypotheses are supported.

Faculty of Hospitality, Tourism and Wellness, Universiti Malaysia Kelantan

marlisa@umk.edu.my

ABSTRACT

Revisit intention is expressed as the desire of the tourists to revisit the destination in another time period. A tourist's loyalty to a place is demonstrated by his or her desire to visit it again as well as by their willingness to suggest it to others. The goal of this study is to examine the variables that affect local visitors' intentions to return. The purpose of this study is to clarify the connection between memorable experiences, travel satisfaction, and tourist expectations on revisit intention among tourists in Malaysia. These factors are vital in making tourists in Malaysia have the intention to revisit a destination. The main data for the study will be collected by using a structured questionnaire, and the analysis will be done by using SPSS software. The survey will be distributed to 384 respondents of revisit intention in any destination in Malaysia. In this study, descriptive, reliability tests, and correlation analyses were utilised to process the data. Researchers want to get a deeper insight into the variables influencing local tourists' intention to return through this study.

Keywords: Revisit intention, memorable experiences, travel satisfaction, tourist expectation, tourist

INTRODUCTION

The phrase "revisit intention" refers to a subjective evaluation of how likely it was that mainland Chinese residents would return to Hong Kong. It is possible that the chance of accomplishing the targeted return behaviour was utilised to compute revisit intention (Zhang 2018). Tourism is described as "activities of persons who travel to and stay in places outside their usual environment for leisure, business, and other purposes not related to the exercise of an activity remunerated from within the place visited" (Messori, 2021).

The similar thing happened in Malaysia in terms of tourism interaction; if the locations could deliver enough memorable experiences, travel satisfaction, and outstanding tourist expectations, the likelihood of tourists returning to the place would grow. Repeat visitors are a desired market segment for many destinations because they tend to stay longer at the destination, are more satisfied as a result of experience and realistic expectations, spread positive word, participate in activities more intensively, and require much lower marketing costs than first-time visitors (Huang, 2009). According to Abubakar (2017), repeat users of tourist services who have previously encountered the real delivery of the service. The majority of those tested projected return intention as an extension of enjoyment acquired from the original encounter (Huang, 2009). On top of that, the destination would received a valuable income from the revisit tourists

based on their based on their expenditures on tourism products and services during their stay in a particular destination (Nasir et al., 2021)

Internal and external developments in the tourism business, as in other sectors, directly or indirectly created both benefits and risks in terms of tourist attractions. Successful tourist officials kept an eye on these trends and implemented safeguards ahead of time (Etinsöz, 2013). It stated that repeat tourists were more significant in providing a consistent source of income than the role they played in informing future visitors. Repeat visitors were unconcerned about competitor locations or price tactics. Repeat tourists are an important concept for maturing destinations, and their continuance was an essential element in an attraction remained competitive and growth in tourism. This the same according to Kozak (2001) the quality of local transported service and destination airport service affected tourists' intention to visited other placed in the same country, whereas destination satisfaction founded to been the strongest predictor of both intention to revisit the same holiday destination and other destinations within the country. Internal and external developments in the tourism business, as in other sectors, resulted in both benefits and challenges in terms of tourist attractions. Successful tourist authorities monitored these trends and made safeguards in advance (etinsöz, 2013). It suggested that repeat tourists were more significant in providing a consistent source of income than the role they performed in disseminating information to future visitors. Repeat visitors were unaffected by competitor locations or price initiatives.

According to the research, even the quality of service had a significant influence on attracting visitors to return to the same site. The aspect investigated in this study was memorable experiences, travel satisfaction, and tourist expectations. When determining target region and searching for travel information, people tended to recall prior experiences first (Gohary, 2019). When tourist expectations about the place were correct, this resulted in a pleasure to enjoy the attractions and had a fantastic unforgettable experience visitor, the intention to explore the destination again was high.

There are three objectives of this research:

1. To examine the relationship between memorable experiences and revisit intention among tourists in Malaysia.
2. To analyze the relationship between travel satisfaction and revisit intention among tourists in Malaysia.
3. To analyze the relationship between tourist expectations and revisit intention among tourists in Malaysia.

SIGNIFICANCE OF THE STUDY

Researchers

The findings of the study would have assisted the researchers in determining the relationship between tourist expectations, memorable experiences, and revisit intention among tourists in Malaysia. The studied could gave additional information to students and researchers about their academic studied. The studied helps researchers to did other researched in ordered to give factors, examples and references that influence the revisit intention among tourists in Malaysia.

Tourism Players

This studied would provided information about the individual's perspective about their reasoned to revisit again the placed to had been went. The studied could assist tourism players to improved their facilities and service to promote their business and attracted tourists. Travelled agencies, hotels, and restaurants improved their business by influenced tourists to revisit their placed and attracted old and new tourists.

Tourism Ministries

The data and statistics in the studied may benefit to guided tourism ministries to made a new improvement in tourism industries to attracted tourists in Malaysia. The tourism government could used this researched as an example to have done a researched about trend of tourist in Malaysia.

LITERATURE REVIEW

Revisit Intention

A visit intention is the tendency or desire to go back to a particular location or event in the future (Rasoolimanesh et al., 2021). It expresses a person's desire to go back to a particular place, be it a favourite vacation spot, a dining establishment, a shop, or any other special spot.

Positive past experiences, a feeling of pleasure or satisfaction, or a desire to learn more about and participate with the location or event can all have an impact on the intention to revisit (Torabi et al., 2022). It denotes the possibility of a return trip and illustrates the general allure and allure of the location or activity.

Memorable Experiences

A memorable experience is one that has a lasting impression on our thoughts, feelings, and recollections (Cho, 2022). These encounters are frequently distinguished by their singularity, intensity, and the breadth of their impact. They distinguish themselves from the commonplace and routine, grabbing our attention and leaving us with treasured memories that we keep with us over time. Significant adventures, life milestones, significant relationships with others, or encounters that arouse powerful emotions can all be considered memorable experiences. They have the capacity to alter our viewpoints, encourage personal development, and provide opportunities for enjoyment, introspection, and storytelling. These experiences, whether they are favourable or difficult, are crucial in determining who we are and how we view the world (Hosany et al., 2022).

Travel Satisfaction

The term "travel satisfaction" describes the general happiness and fulfilment people feel after finishing a journey or holiday (Abenzoza et al., 2018). It includes how much fun was had, how expectations were met, and how much the traveler's wants and needs were met or exceeded by the event. The standard of accommodation, transportation, attractions, customer service, cultural immersion, safety, and overall travel experience are some of the variables that can affect how satisfied travellers are with their trips. Due to the fact that every person has a varied set of

preferences and expectations, it is subjective and differs from person to person. Travel pleasure ultimately reflects how well a travel experience fits a person's preferences and adds to their overall happiness and sense of fulfilment (Yang et al., 2022).

Tourist Expectation

Tourist expectations are the hopes and wishes that people have before leaving on a trip or participating in a tourist activity. These expectations might be very different based on things like individual preferences, driving forces, life experiences, cultural background, and knowledge of the location or activity (Rangaiah, 2021). Tourists frequently have high expectations for things like the standard of the accommodations, attractions, food, transportation, safety, cultural authenticity, hospitality, and overall contentment. They act as a standard by which the actual experience is measured and have a big impact on how people view a place or activity. To provide great experiences and promote visitor satisfaction, it is essential to meet or exceed these expectations (Franklin, 2023).

The relationship between memorable experiences, travel satisfaction, and travel expectation on revisit intention among local tourists in Malaysia

Memorable experiences and revisit intention are closely related. A memorable experience leaves a powerful, favourable impression on people and has a long-lasting effect on their memories (Kane, 2018). These encounters frequently elicit positive emotions such as fulfilment, joy, and happiness. As a result of wanting to reproduce or relive that great experience, people are more likely to have a high revisit intention. A memorable encounter can create an emotional bond that can lead to a yearning to go back to the location or do the activity once more. Thus, as they foster a good association and a desire to go back, memorable experiences can considerably affect and raise the chance of revisit intention (Lu et al., 2022).

Travel satisfaction and revisit intention are tightly related. People are more pleased and fulfilled with their travels overall when they have a positive travel experience (Bayih, 2020). This happy feeling prompts a desire to return to the same location in order to repeat or lengthen the experience. Travel happiness is frequently influenced by elements like engaging activities, comfortable lodgings, excellent service, cultural immersion, and positive encounters. When these factors meet or even surpass visitors' expectations, they feel a stronger connection to the place and are more likely to want to go again. Because people are compelled to reproduce the pleasant experience and further explore or deepen their relationship with the destination, high levels of travel pleasure often correlate with an increased revisit intention (Chan, 2020).

Expectations of tourists significantly influence their intentions to return. When tourists have preconceived notions about a place or a tourism experience, it creates a standard by which their actual experience is measured (Jebbouri et al., 2021). If their expectations are met or surpassed, it leaves a favourable impression and raises the possibility that they may decide to return. Meeting or exceeding visitor expectations can promote a feeling of fulfilment, happiness, and satisfaction, which in turn increases the desire to return to the location. However, if the encounter falls short of expectations, it may cause disappointment and lessen the likelihood that the visitor will return. As a result, there is a significant link between visitor expectations and

intent to return, with the degree to which expectations are met directly influencing the desire to return to the destination (Culic et al., 2021).

Research Hypothesis

A hypothesis need to be plausible, testable, and take into account the most recent discoveries and methodologies. A forecast or an explanation of the relationship between two variables is also referred to as a hypothesis. It suggests that an independent variable and a dependent variable are related causally.

As a result, the research suggests:

H1: Memorable experiences have a positive relationship with revisit intention.

H2: Travel satisfaction is positively associated with tourist revisit intention.

H3: Tourist expectations have a positive relationship with revisit intention.

Research Framework

The conceptual framework for this research is seen in Figure 2.1. The three factors that make up the independent variable that will be proposed are memorable experiences, tourist travel satisfaction, and tourist expectations. Revisit intention is the dependent variable.

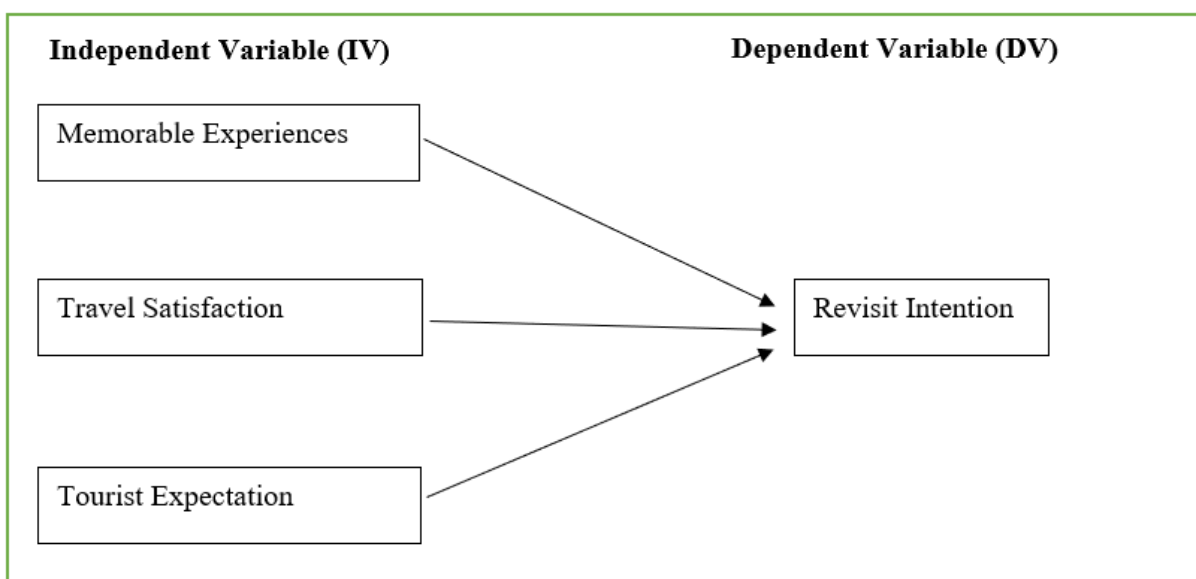

Figure 2.1: Conceptual Framework of Memorable Experiences, Travel Satisfaction, and Tourist Expectation towards the Tourists' Revisit Intention

METHODOLOGY

Research Design

The study's design incorporates the relationship between memorable experiences, tourist travel satisfaction, and tourist expectation on revisit intention among tourists in Malaysia. This study will use quantitative research among local tourists in Malaysia. A descriptive study design helps to address the research question and fulfill the research objectives.

Population and Sample Size

Overall, there are 66 million people in Malaysia's target market, including domestic visitors. This study only includes local tourists in Malaysia as its research population. In this study, sample size calculations were made using a table based on Krejcie & Morgan (1970) for a specific demographic. By Krejcie and Morgan in 1970:

S = sample size

X^2 = the table value of chi-square for 1 degree of freedom at the desired confidence level (3.841)

N = the population size of domestic tourist in a year

P = the population proportion (assumed to be 0.5 since this would provide the maximum sample size)

d = the degree of accuracy expressed as a proportion (0.5)

$$S = \frac{x^2NP(1-P)}{d^2(N-1)+(x^2P(1-P))}$$

$$S = \frac{3.841(2054000000)(0.5)(1 - 0.5)}{(0.05)^2(2054000000 - 1) + 3.841(0.5)((1 - 0.5))}$$

$$S = \frac{197235300}{5135000.958}$$

$$S = 384.099$$

$$S = 384$$

The precise sample size for the population is 384, but only 200 respondents' responses to the questionnaire were collected for data.

Data Collection

Online questionnaires that employed Google forms were used as the initial data collection technique in this investigation. Because it is free and user-friendly, the researcher used this platform of technological tools. Additionally, it makes it simpler for researchers to get all the information from regional tourists. Three components make up the questionnaire created to collect data from domestic tourists. Questionnaires were also used as the primary data gathering tool in this investigation. Respondents are required to answer three questions in each of the three sections. To gather information about the population of local tourists in Malaysia, a questionnaire was made available to them.

Sampling

Sampling is a technique for obtaining data in academics to learn regarding a particular population by studying the findings of a sample of people rather than focusing on some specific individuals (Turner, 2020). Probability sampling and non-probability sampling are examples of the types of

sample techniques employed in this study. Random samples are used in probability sampling, enabling important inferences more about overall demography to be drawn (Stratton, 2021). Non-probability sampling is frequently related with qualitative research and the construction of research articles (Taherdoost, 2016). The non-probability approach, for example, a simple sampling method, was chosen as the sample design in this investigation.

In this study, convenience sampling will be used. Convenience sampling will be helping researchers to collect data. It's the most commonly utilised sample technique because it's incredibly quick, simple, and cost-effective (Fleetwood, 2020). Because of the advantages and application of multiple sampling approaches in circumstances when there are big populations, this method was chosen for this investigation.

Research Instrument

The questions used to measure the selected research constructs were taken from earlier studies in the area of traveler behaviour.

Figure 2: Measurement of Likert scale

Table 1: Source of Measurement

Variable	Source of Measurement Items
Revisit Intention	Harun et al., (2018)
Memorable Experience	Amir et al., (2015)
Tourist Travel Satisfaction	Lee et al., (2011)
Tourist Expectation	Solis-Radilla et al., (2019)

Data Analysis

The programme Statistical Programmers for Social Science (SPSS) version 29.0 will be used by researchers to analyse the primary data. You can make tables and pie charts using the program-based data processing and analysis window known as SPSS. Computers aided researchers in

lowering the effort required to determine information and making quantitative analysis easily and quickly. The researcher uses descriptive statistics, reliability statistics, Pearson's correlation, and regression to evaluate quantitative data.

FINDINGS

Demographic Profile of Respondent

Table 2: Demographic Profile of Sample

Characteristics		Frequency	%
Age	18-30 years old	85	42.5
	31-40 years old	88	44.0
	41-50 years old	18	9.0
	51 and above	9	4.5
Gender	Male	68	34.0
	Female	132	66.0
Ethnicity	Malay	137	68.5
	Chinese	46	23.0
	Indian	15	7.5
	Others	2	1.0
Occupation	Civil Servant	11	5.5
	Enterprise Staff	11	5.5
	Freelancer	2	1.0
	Self-employed	11	5.5
	Student	158	79.0
	Others	7	3.5
Marital Status	Married	32	16.0
	Unmarried	168	84.0
Travel Frequencies	1-2 times	88	44.0
	3-5 times	32	16.0
	More than 5 times	80	40.0
Travel Period	Anytime	43	21.5
	Semester breaks	61	30.5
	Weekends or Public Holidays	96	48.0
Preferred Travel Spot	Beach Vacation	55	27.5
	Camping Vacation	30	15.0

	City Vacation	55	27.5
	Theme Parks	29	14.5
	Abroad	31	15.5

Table 2 presents an overview of the responder profile. The age group from 31 to 40 years old had the highest percentage of responders (44.0%), followed by the age group from 18 to 30 years old (42.5%), the age group from 41 to 50 years old (9.0%), and the age group from 51 years and older (4.5%). Male respondents made up 68 of the total respondents, while female respondents made up 132. 200 people replied to the survey, including 137 Malay, 46 Chinese, 15 Indian, and 2 others. Malay respondents made up the majority of the sample (68.5%), followed by Chinese respondents (23.0%), Indian respondents (7.5%), and other respondents (1.0%).

The majority of respondents, at 79.0% (158 respondents), were students. 5.5% (11 respondents) of the respondents worked as civil servants, 5.5% (11 respondents) as enterprise staff, 5.5% (11 respondents) as self-employed, 3.5% (7 respondents) worked in other occupations, and 1.0% (2 respondents) employed freelancers.

In addition, there were 32 respondents who were married, making up 16.0% of the 168 respondents who were unmarried overall. The questionnaire was completed by 44.0% (88 respondents) of those with 1-2 times for travel frequencies, 40.0% (80 respondents) of those with more than 5 times for travel frequencies, and the lowest proportion of respondents were those with 3-5 times, which is 16.0% (32 respondents).

Furthermore, the highest was 48.0% (96 respondents) who chose to travel during weekends or public holidays, followed by 30.5% (61 respondents) who chose to travel during the semester break, and the lowest were 21.5% who chose to travel anytime (43 respondents).

Moreover, there were 55 respondents who preferred to refer to beach vacation (27.5%), 30 respondents who chose to do camping vacation (15.5%), and 55 respondents who preferred to do city vacation (27.5%). Then, 29 respondents chose theme parks as their travel spot (14.5%), meanwhile 31 respondents chose abroad as their travel spot (15.5%).

Reliability Test

A reliability system is employed to evaluate a system's overall performance and stability over a specific time period and in various testing scenarios. Before being distributed to 200 respondents via an online survey, the pilot test was carried out with 30 participants.

Table 3: Results of Reliability Test

Variable	Number of items	Cronbach's Alpha coefficient	Strength of Association
Revisit Intention	5	0.934	Excellent
Memorable Experience	5	0.953	Excellent
Travel Satisfaction	5	0.923	Excellent

Tourist Expectation	5	0.947	Excellent
---------------------	---	-------	-----------

Table 3 displays the independent and dependent variable's Cronbach's Alpha Coefficient values. The table above shows that all of the variables were more than 0.9. As a result, the drawn conclusion can be trusted and used in this investigation. The Revisit Intention variable, which affected tourists' intentions to revisit Malaysia, was measured using five questions. Table 4.2 revealed that the question in this section had an exceptional Cronbach's Alpha score of 0.934. As a result, the coefficients found for the revisit intention variable's questions were accurate.

Following that, the Memorable Experience variable that influenced tourists to revisit intention in Malaysia was measured using 5 questions, and the Cronbach's Alpha score for the question in this area was an amazing 0.953. The coefficients obtained for the questions related to the memorable experience variable were therefore accurate.

Five questions were used to gauge travel satisfaction and revisit intention in Malaysia. The score was 0.923, which is outstanding. The coefficients determined for the travel satisfaction factors were therefore accurate.

Finally, in measuring the Tourist Expectations that influenced tourists to revisit intention in Malaysia, five questions were used and the Cronbach's Alpha result for this section's question was 0.947 which indicated excellent. Therefore, the coefficients obtained for these questions in measuring the Tourist Expectations that influenced tourists to revisit intention in Malaysia were also reliable. Since Cronbach's Alpha charge for the variables exceeded 0.8, it may be concluded that surveys are extremely trustworthy and that the study can proceed.

Descriptive Analysis

The mean and standard deviation for the questionnaire parts B and C have been examined in this study.

Table 4: Descriptive Statistics

Variables	N	Mean	Standard Deviation
Memorable Experience	200	8.0260	1.86822
Travel Satisfaction	200	8.4990	1.86844
Tourist Expectation	200	8.2400	1.96077
Revisit Intention	200	8.1990	1.94820

Table 4 shows the mean and standard deviation analysis for the independent and dependent variables. The dependent variable was the revisit intention in Malaysia. Memorable Experience, Travel Satisfaction, and Tourist Expectation were independent variables. Travel Satisfaction had the highest mean score, 8.4990, indicating that respondents were more in agreement with this characteristic. The variable with the lowest mean value in this study's respondents' agreement

was Memorable Experience, which has a value of just 8.0260. The data set that has more dispensing values has a standard deviation of more than 1 out of 200 respondents.

Pearson Correlation

Pearson's correlation analysis was one of the most significant analyses that looked at the linear relationship between the two variables. This study's objective was to determine whether there were any correlations between the dependent variable which is revisit intention in Malaysia and the independent variables which are memorable experience, travel satisfaction, and tourist expectation. The researchers must decide what level of association strength is appropriate if the relationship is significant.

Hypothesis 1

H₁: Memorable experiences have a positive relationship with revisit intention.

Table 5: Correlation coefficient for memorable experience and revisit intention among tourists in Malaysia

		Revisit Intention	Memorable Experience
Revisit Intention	Pearson Correlation	1	.835**
	Sig. (2-tailed)		<.001
	N	200	200
Memorable Experience	Pearson Correlation	.835**	1
	Sig. (2-tailed)	<.001	
	N	200	200

Table 5 showed the 200 examples, the significant value, and the Pearson correlation coefficient. The p-value was less than 0.01 and below the threshold of significance of 0.01. A strong positive association between a memorable experience and revisit intention may be seen in the correlation coefficient of 0.835.

Hypothesis 2

H₂: Travel satisfaction is positively associated with tourist revisit intention.

Table 6: Correlation coefficient for travel satisfaction and revisit intention among tourists in Malaysia

		Revisit Intention	Travel Satisfaction
Revisit Intention	Pearson Correlation	1	.867**
	Sig. (2-tailed)		<.001
	N	200	200
Travel Satisfaction	Pearson Correlation	.867**	1
	Sig. (2-tailed)	<.001	
	N	200	200

Table 6 showed the 200 examples, the significant value, and the Pearson correlation coefficient. The p-value was less than the significant level of 0.01 at 0.01, or 0.01. The 0.867 correlation value indicated a strong positive relationship between tourist satisfaction and revisit intention.

Hypothesis 3

H₃: Tourist expectations have a positive relationship with revisit intention.

Table 7: Correlation coefficient for tourist expectation and revisit intention among tourists in Malaysia

		Revisit Intention	Tourist Expectation
Revisit Intention	Pearson Correlation	1	.823**
	Sig. (2-tailed)		<.001
	N	200	200
Tourist Expectation	Pearson Correlation	.823**	1
	Sig. (2-tailed)	<.001	
	N	200	200

Table 7 showed the 200 examples, the significant value, and the Pearson correlation coefficient. The p-value was less than the significant level of 0.01 at 0.01, or 0.01. Tourist expectations and revisit intention were strongly positively correlated, according to the correlation coefficient of 0.823.

Table 8: Summary of Correlation Analysis

Hypot he sis	Significant Value	Conclusio n	Correlation Value	Conclusion
1	0.000	Accepted	0.835	High Positive Correlation
2	0.000	Accepted	0.867	High Positive Correlation
3	0.000	Accepted	0.823	High Positive Correlation

To ascertain the linear relationship between the two variables listed as the study's goals, researchers performed correlation analysis. The findings of the correlation analysis are presented in Table 8, which showed a very strong correlation between the memorable experience, travel satisfaction, and tourist expectation towards revisit intention among local tourists in Malaysia.

DISCUSSION AND RECOMMENDATION

The purpose of the study was to ascertain the connection between memorable experiences, travel satisfaction, tourist expectations, and revisit intention. The goal of this study is to understand the connection between memorable experiences, travel satisfaction, and tourist expectations on revisit intention among tourists in Malaysia.

Because this study was restricted to Malaysian tourists, it was unable to reach a respondent because not all local tourists in Malaysia can be respondents who wanted to answer questions or receive a questionnaire from the researchers. This study therefore suggests that more research on local tourist travel in Malaysia should be conducted. The findings of this study point to the need for additional research on foreign tourists visiting Malaysia because it only looked at local visitors to the country. Future research on foreign tourists visiting Malaysia could compare the results with those of this study. This research may produce different findings if it relates to overseas visitors to Malaysia.

The current study also only took into account three other variables or other types of characteristics that affect how Malaysian tourists behave as tourists. Other key elements that are relevant in influencing revisit intention among tourist in Malaysia may have been overlooked in this study. Such as, service quality, social influence, tourist motivation, and destination image. Variety of factors can create a variety of results for the research.

The investigation is then focused on Malaysian tourists. 200 out of the 384 total replies to the survey were useful and may be examined. According to Krejcie and Morgan (1970), larger sample sizes could be used to assess millions of Malaysian tourists if the number is sufficiently

dependable. Consequently, future researchers should increase their sample size in order to enhance the validity and reliability of their studies. As a result, this research limited the sample to 200. This amount is considered small and the range of respondents are limited. The further research should have a large sample size from 200 to 300. The size of respondent and answer will be varieties.

Furthermore, the use of a qualitative technique approach rather than having people respond to a scale questionnaire online. A study approach known as the qualitative method aims to gather and examine non-numerical data in order to better understand people's social reality, including attitudes, beliefs, and motivation. As a result, various method methods can produce various outcomes for future research.

Finally, future researchers should be undertaken up to date on variables that might impact revisit intention towards local tourists in Malaysia because the factors can fluctuate. The goal of the study is to understand how positive memorable experiences, tourist satisfaction, and tourist expectations relate to revisit intention among tourists in Malaysia. The findings of the research goals that look at the relationship between memorable experience, travel satisfaction, and tourist expectation that influence revisits intention among tourists in Malaysia is accepted. Meanwhile, such outcomes can be predicted regarding the factors of a memorable experience, travel satisfaction, and tourist expectation that influence tourist revisit intention in Malaysia.

CONCLUSION

In a nutshell, visitors' contentment and plans to return were thought to be impacted by pleasant, positive memorable experiences, travelling satisfaction, and tourist expectations. These three criteria were addressed simultaneously to increase the likelihood of tourist revisit intention, as this was one of the most important factors influencing tourist revisit intention. To improve Malaysian tourism, the tourism ministry, tourism players, and tourism agencies should collaborate to achieve memorable memories, high traveller satisfaction, and to meet tourist expectations. The tourism service and attractions must be in high condition, 5 star rated, and full of originality in order to attract local and international tourists who will revisit intention. Future studies should prioritise a well-balanced population sample. An unbalanced sample would result in inconsistencies in the results, favouring just one group. Then, in order to get precise, accurate, and consistent results, the sample size should be increased. Future research may also look into including additional factors to find more traits that encourage tourists to return to the same locations. Knowing additional elements that influence tourist return intention aided the tourism sector in upgrading its amenities in order to attract tourists and expand the tourism sector.

ABSTRACT

Tourist satisfaction measurement has become an important issue in the tourism industry because this industry necessitates a high level of interaction between contact personnel (frontline employees) and tourist, and because quality perceptions are primarily based on the performance of subjective (intangible) criteria. Thus, the amount of satisfaction with services provided by tourists may have a direct towards on the level of satisfaction with services provided by tourists. The purpose of this study is to assess the relationship between accommodation, food quality, customer relations and tourist satisfaction. The debate is based on the findings of a study of Malaysian tourists. The purpose of this research is to examine the relationship of accommodation, food quality, and customer relations between tourist satisfaction among local tourist in Malaysia. It is discovered accommodation, food quality, and customer relations were that affected tourist satisfaction among local tourist in Tourism Industry Malaysia. The local tourist around the Peninsular of Malaysia were targeted respondents and a total of 256 respondents were successfully responded through the online survey. Data collected was analysed by using Statistical Package for Social Science (SPSS) version 29.0.

Keywords: Tourist Satisfaction, Tourism Industry, and Local Tourist.

INTRODUCTION

Many countries rely on this thriving industry for money, jobs, private-sector growth, and infrastructure development. Tourism expansion is encouraged in developing countries when manufacturing or natural resource exporting are financially unfeasible.

There are various and diverse reasons why people wish to travel. The rising ease of access to the many components of the travel experience has led to tourism's fast development in a short period of time. Many countries now offer affordable transportation to, from, and within previously inaccessible regions. Major cities, resort areas, near airports and major thoroughfares, and rural areas offer high-quality lodging and food at various prices. The contemporary travel industry owes its ability to provide secure, agreeable, and gratifying travel experiences to

proficient travel enterprises and excursion organisers, promotional efforts by governmental tourism bureaus, and state-of-the-art technological advancements that expeditiously link tourism elements for prospective voyagers.

This study investigates the link between tourist satisfaction and accommodation, food quality, and customer relations. The growing prosperity of nations such as Taiwanese, S. Korea, and Malaysia, as well as the vast populations of China, India, and Indonesia, are driving the rapid growth of tourism in Asia. Verdict provides the top five tourism locations in Asia Pacific in 2022, according to Global Data, based on tourist arrivals, traveler demand, and flow databases.

According to Global Data, in 2022, China will receive 43.4 million international tourists, making it the most popular destination in Asia. According to Global Data's traveler demands and flows database, Hong Kong, Macao, and Taiwan are forecast to be China's most important source markets in 2022. According to Global Data's 2022 travelers demands and flows database, 26.6 million tourists will visit Thailand, the second-most popular Asia Pacific destination. Global Data predicts that China, Malaysia, and India will be the most significant source markets for the destination.

There are three objectives of this research:

1. To investigate the link between accommodation and tourist satisfaction in Malaysia.
2. To examine the connection between food quality and tourist satisfaction in Malaysia.
3. To examine the link between customer relations and tourist satisfaction in Malaysia.

SIGNIFICANCE OF THE STUDY

Researchers

The study's outcome will aid researchers in assessing the correlation between three factors - accommodation, food quality, and customer relations - and the satisfaction of local tourists in Malaysia. The findings of this study will assist researchers in gaining a better understanding of the factors that impact the satisfaction of local tourists with e-hailing services.

Owners

This study aims to gather information on individuals' satisfaction with services. This study aims to evaluate the quality of accommodation, food, and customer relations to understand the types of behaviours that may arise when using these services. It is important to understand the behaviour of customers and their decision-making process when using services, whether as individuals or as a group. Gathering data will help owners understand the factors that influenced their purchase of a service.

Tourism sector

The data will provide valuable insights to the tourism sector regarding how people make decisions when purchasing tourism products and services, as well as the factors that can influence their decision-making process. The outcome will allow the tourism sector to enhance their management and effectively convince people to buy their tourism services. These studies help the tourism sector understand what factors are important in making usage decisions. This study contributes to the development of tourism planning.

LITERATURE REVIEW

Accommodation

Accommodation pertains to the various lodging options that are accessible to tourists, such as hotels, motels, resorts, bed and breakfasts, and vacation rentals. The standard of lodging can greatly influence the overall experience of a tourist. Tourists are more likely to have a positive experience if the accommodations are clean, comfortable, and well-maintained. Conversely, if the lodging is unclean, uncomfortable, or inadequately maintained, it is probable that travellers will have an unfavourable experience (Gerwe et al., 2021).

Accommodation is supplied to meet the needs of tourist who are traveling, such as a place to stay or a temporary dwelling. Tourist accommodation is made up of two distinct components. Supply and demand are the two components. It demonstrates that tourist accommodation relates to who provides services to tourists or tourism customers (Silaban et al., 2019).

Food Quality

It is important to emphasise that food and drinks are essential components that tourists must consume. The quality of food can potentially enhance a tourist's interest in a particular location and prompt them to reevaluate their selection criteria. It has been discovered that the quality of food is a determining factor in the perceived value of tourism. This is because food quality affects not only tourist satisfaction, but also other aspects related to it (Richards et al., 2021).

The important factor in tourist satisfaction is the variety and quality of food provided by fast food businesses. Price and product quality are two criteria recognized as related to tourist satisfaction. Food quality towards tourist impressions of food and their purchasing decisions. The quality of food has been identified as the most important factor in determining the ratings of different types of establishments by tourists. To ensure that the expectations of tourists are met and that they are satisfied, it is essential to use high-quality food (Uslu et al., 2020).

Customer Relations

Customer relations are also a critical aspect of the tourism industry. Effective communication, responsiveness to customer needs, and providing a personalized experience can help create loyal customers who return time and again. Having staff members who are friendly, knowledgeable, and responsive to customers' needs can greatly contribute to establishing a positive reputation for a business. Establishing strong customer relationships can result in favorable reviews and recommendations, ultimately drawing in new customers (Stojiljkovi et al., 2019).

As the growth of tourism and customer relations has become a crucial aspect for all businesses, the marketing approach of customer relationship development has been extensively researched. The absence of hesitancy in delivering positive feedback to a product, the preservation of client connections, the convenience of sale, and the speed with which items are promoted all indicate a tourist loyalty to that product (Pambudi et al., 2021).

Tourist Satisfaction

The concept of tourism is commonly used in tourism marketing literature (Nasir et al., 2021). Definition of Tourist satisfaction Tourist satisfaction pertains to the degree of gratification or satisfaction that a tourist encounters during their travel experience. It is a subjective evaluation of the overall experience, including various factors such as accommodation, transportation, attractions, food, and customer service. The satisfaction of tourists is influenced by their expectations before travelling, the actual experience they have during their trip, and the comparison they make between the two. Tourist satisfaction is an essential measure of the success of the tourism industry, as it can impact tourists' decision to return to a destination or recommend it to others (Pai et al., 2020).

Accommodation is an essential element of a tourist's overall travel experience and can significantly impact their level of satisfaction. Room Quality. The quality of the room is a crucial factor that can significantly impact a tourist's satisfaction level. The level of cleanliness, comfort, size, and available amenities in a room can significantly affect a tourist's overall satisfaction. Staff Service. The staff's quality of service is also a crucial antecedent of tourist satisfaction. Friendly and helpful staff can make a significant difference in a tourist's experience, while rude or unhelpful staff can leave a negative impression (Nisar et al., 2020).

The relationship between accommodation, food quality, and customer relations toward tourist satisfaction in Malaysia

The correlation between accommodation and tourist satisfaction. The location of accommodation can also impact tourist satisfaction. Tourists may be more satisfied if their accommodation is conveniently located near tourist attractions or other amenities. Tourist satisfaction is the level of service provided by accommodation providers. Friendly and helpful staff, personalized attention, and efficient check-in and check-out processes can all contribute to a positive experience for tourists. On the other hand, poor service, rude staff, or long wait times can lead to dissatisfaction. The quality of accommodation can have a significant impact on tourist satisfaction. Tourism businesses should prioritize high-quality accommodation and customer service to ensure that tourists have positive experiences and are more likely to return in the future (Biswas et al., 2020).

The correlation between accommodation and tourist satisfaction. The quality of food is a crucial aspect that can significantly affect the satisfaction of tourists, especially in the tourism industry. Tourists often seek out local cuisine and dining experiences as an important part of their travel experience, and the quality of food and dining options can influence their overall satisfaction with their trip. When tourists have access to high-quality food options that meet their expectations, they are more likely to have positive feelings about their destination and their trip. Good quality food can enhance the overall experience of travel and create lasting memories for tourists (Kala et al., 2020).

The correlation between accommodation and tourist satisfaction. Effective customer relations can also impact tourist satisfaction in other ways. For example, businesses that actively seek feedback from customers and make changes based on that feedback are more likely to meet customers' needs and expectations, leading to increased satisfaction. Likewise, offering personalized experiences and creating a sense of community can help tourists feel valued and appreciated, which can contribute to higher levels of satisfaction (Khan et al., 2022).

Research Hypothesis

For a hypothesis to be considered valid, it must be both testable and realistic, while also considering current knowledge and methodologies. A hypothesis is a prediction or explanation of a relationship between two variables. It suggests that an independent variable and a dependent variable have a systematic connection. As a result, the research suggests:

H1: There is a relationship association between accommodation and tourist satisfaction.

H2: There is a relationship Food quality correlates positively with tourist satisfaction.

H3: There is a relationship Customer relations correlate positively with tourist satisfaction.

Conceptual Framework

The conceptual framework for this research is seen in Figure 2.1. The three factors that make up the independent variable that will be proposed are accommodation, food quality, and customer relations. Local tourist satisfaction in Malaysia is the dependent variable.

Figure 2.1: Conceptual Framework of accommodation, food quality, and customer relations toward Tourists' Satisfaction.

METHODOLOGY

Research Design

The study's design incorporates the factors that impact tourist satisfaction among local tourist in Malaysia. A quantitative technique will use in this study, and data will collect from individuals using a self-directed questionnaire. The relationship between accommodation, food quality, customer relations, and tourist satisfaction among local tourist in Malaysia is the subject of a descriptive study. The descriptive study design assists in answering the research questions and achieving the research objectives.

Population and sample size

Overall, the population including the international and domestic tourist is 231.3 million. The research population of this study only involves local tourist in Malaysia. The target population for local tourist is 131.66 million. To determine the sample size, Krejcie and Morgan (1970) sample was used in this study. Krejcie & Morgan (1970):

S = sample size

X^2 = the table value of chi-square for 1 degree of freedom at the desired confidence level (3.841) N = the population size of domestic tourist in a year

P = the population proportion (assumed to be 0.5 since this would provide the maximum sample size)

d = the degree of accuracy expressed as a proportion (0.5)

$$S = \frac{x^2NP(1-P)}{d^2(N-1) + (x^2P(1-P))}$$
$$S = \frac{3.841(2054000000)(0.5)(1-0.5)}{(0.05)^2(2054000000-1) + 3.841(0.5)((1-0.5))}$$
$$S = \frac{1972353500}{5135000.958}$$

$$S = 384.099$$

$$S = 384$$

The exact amount of sample size for the population are 384 but the return of the questionnaire answered by respondents collected the data for 256 respondents.

Data Collection

The data collection method utilised in the initial stage of this study involved online surveys administered through Google Forms. The researcher chose to use this platform of technology tools because it is both free and user-friendly. It also makes it easier for the researcher to collect all the data from tourists who are local to the area. The second stage of data collection involved conducting fieldwork. The questionnaire was utilised as the primary instrument for data collection in this study. There are six sections in the questionnaire that require respondents to provide answers. A questionnaire was distributed among the local tourists in Malaysia to collect data.

Sampling

Csikszentmihalyi et al., (2014) Sampling is a technique for obtaining data in academics to learn regarding a particular population by studying the findings of a sample of people rather than focusing on some specific individuals. Probability sampling and non-probability sampling are the two major sample methodologies used in this study. Random samples are used in probability sampling, enabling important inferences more about overall demography to be drawn. Non-probability sampling is frequently related with qualitative research and the construction of research articles. The non-probability approach, for example, a simple sampling method, was chosen as the sample design in this investigation. Facility sampling is a sampling strategy that involves selecting participants from a target group based on specific criteria, such as accessibility, geographic location, capacity at a given time, or willingness to participate. This method is non-probability or non-random in nature.

Research Instrument

The items measuring the chosen research constructs were adopted from prior related research in the field of tourism consumer behaviour.

Table 1: Measurement items

Measurements	Number of items in the questionnaires	Scales used	Author
Section A: Demographic information	6	Adapt	
(Dependent Variables) Section B: Tourist satisfaction	5	Adopt	Khan et al., (2020)
(Independent Variables) Section C: Customer Relations	5	Adopt	Stojiljkovi et al., (2019)
(Independent Variables) Section D: Food Quality	5	Adopt	Jeaheng et al., (2020)
(Independent Variables) Section E: Accommodation	5	Adopt	Gössling et al., (2021)
Total	26		

Data Analysis

The primary data will be examined by researchers using the Statistical Programmers for Social Science (SPSS) version 29.0. SPSS is a program-based data processing and analysis window that allows you to create tables and pie charts. Computers aided researchers in lowering the effort required to determine information and making quantitative analysis easily and quickly. The researcher uses descriptive statistics, reliability statistics, Pearson's correlation, and regression to evaluate quantitative data.

FINDINGS

Demographic Profile of Respondent

Research Instrument

The items measuring the chosen research constructs were adopted from prior related research in the field of tourism consumer behaviour.

Table 1: Measurement items

Measurements	Number of items in the questionnaires	Scales used	Author
Section A: Demographic information	6	Adapt	
(Dependent Variables) Section B: Tourist satisfaction	5	Adopt	Khan et al., (2020)
(Independent Variables) Section C: Customer Relations	5	Adopt	Stojiljkovi et al., (2019)
(Independent Variables) Section D: Food Quality	5	Adopt	Jeaheng et al., (2020)
(Independent Variables) Section E: Accommodation	5	Adopt	Gössling et al., (2021)
Total	26		

Table 2: Demographic Profile of Sample

Characteristics	Frequency	%	
Gender	Male	91	35.55
	Female	165	64.2
Age	18-20 years old	15	6.4
	21-30 years old	115	45.1
	31-40 years old	95	36.2
	41-50 years old	28	10.9
	51 and above	3	1.4
Race	Malay	157	61.4
	India	68	26.5
	Chinese	31	12.1
Occupation	Student	91	35.7
	Governments	13	5.1
	Private Sector	129	50.3
	Freelancer	8	3.1
Travel Frequencies	Self-employed	15	5.8
	1-2 Times	78	30.4
	3-5 Times	113	44
Travel Period	More than 5 Times	65	25.6
	Public Holiday	108	42.4
	Semester Break Weekends	42	17.9
	Anytime	102	39.7

The respondent profile is summarized in Table 2. The total number of respondents for male was 91 respondents while the number of females was 165 respondents. The highest percentage of respondents was age from 21-30 years old which have (45.1%), second highest is the age range 31-40 which have (36.2%), third is 41-50 years' old which has (10.9%), fourth is 18-20 years old which was (6.4%), and the last is age range below 50 years' old and above which have (1.4%).

There were 256 respondents who consist of Malay (157 respondents), India (68 respondents), and Chinese (31 respondents) had responded to the questionnaire. The highest percentage of respondents was Malay (61.4%) and follow by Indian respondents which have 26.5%, third is Chinese respondents who have 12.1%.

Next, the total number of respondents for student was 91 respondents and 35.7%, the respondent for governments was 13 respondents and 5.1%. The questionnaire was completed by 3.1 % of those is freelancer (8 respondents). 5.8 % (15 respondents) of self-employed have responded. The highest respondents were 50.3 % (129 respondents) is private sector.

Furthermore, there were 30.4 % (78 respondents) who had travel frequencies for 1-2 times who answered the questionnaires. The highest were 44 % (113 respondents) who had travel more, and the lowest were 25.6 % who had travel is (65 respondents). Moreover, public holiday had the greatest percentage of responders (42.4%). (108 respondents). The questionnaire was completed by anytime travel period by 39.7% (102 respondents). Semester break weekends had the lowest participation rate, at 17.9 % (45 respondents).

Reliability Test

A reliability system is used to assess a system's overall stability and performance over a particular period and under various testing situations. The pilot test was conducted with 30 people before being circulated to 256 people via an internet survey.

Table 3: Results of Reliability Test

Variable	Number of items	Cronbach's Alpha coefficient	Strength of Association
Accommodation	5	0.905	Excellent
Food Quality	5	0.917	Excellent
Customer Relations	5	0.904	Excellent
Tourist Satisfaction	5	0.905	Excellent

Cronbach's Alpha Coefficient values for the independent and dependent variables in this study are shown in Table 3. We may deduce from the table above that all the variables were more than 0.9. Consequently, the conclusion presented is reliable and may be accepted in this study. The accommodation variable that impacted tourist satisfaction among local tourists in Malaysia was measured using 5 questions, and the Cronbach's Alpha result for this section's question was 0.905, which was excellent. As a result, the coefficients derived for the accommodation variable questions were reliable.

Following that, there were five questions in assessing the food quality variable that affected tourist satisfaction among local tourist in Malaysia, and the result was 0.917, which is considered excellent. As a result, the coefficients calculated for the food quality variables were reliable.

Five questions were utilised to measure the dependability variable that affected customer relations among local tourist in Malaysia, and the outcome for this section's question was 0.904, which was outstanding. As a result, the coefficients produced for the reliability variable questions were reliable.

Finally, five questions were utilised to assess tourist satisfaction among local tourist in Malaysia, and the Cronbach's Alpha result for this section's question was 0.905, indicating excellent. As a result, the coefficients derived for these questions in assessing tourist satisfaction among local tourist in Malaysia were also reliable. Since the Cronbach's Alpha charge for the variables exceeded 0.7, it may be concluded that surveys are extremely trustworthy and that the study can proceed.

Descriptive Analysis

This study has analysed the mean and standard deviation for section C, D, E and F of the questionnaires.

Table 4: Descriptive Statistics

Variables	N	Mean	Standard Deviation
Accommodation	256	8.9695	1.42030
Food Quality	256	7.8672	1.65859
Customer Relations	256	9.0977	1.15904
Tourist Satisfaction	256	8.2695	1.42030

Table 4 displays on the independent variable and dependent variable, the mean and standard deviation analysis. Accommodation factor, food quality factor, and customer relations factor was independent variable while dependent variable was tourist satisfaction among local tourist in Malaysia. The highest mean value was customer relations, which is 9.0977, where respondents agreed more on this factor. Meanwhile, the lowest mean value was food quality factor, which is only 7.8672, where in this study the respondents agreed lower for that variable. The data set with the standard deviation of more than 1 out of 256 respondents shows the more dispensing values.

Pearson Correlation

One of the most important analyses that examined the linear relationship between the two variables was Pearson's correlation analysis. The goal of this study was to see if there were any relationships between the independent variables (accommodation, food quality, and customer relations) and the dependent variable (tourist satisfaction). If the relationship is substantial, the researchers must determine what degree of association strength is acceptable.

Hypothesis 1

H₁: There is relationship between accommodation factors and tourist satisfaction among local tourist in Malaysia.

Table 5: Correlation coefficient for accommodation factors and tourist satisfaction local tourist in Malaysia.

		Tourist Satisfaction		Accommodation	
Tourist Satisfaction	Pearson correlation	1		0.752**	
	Sig. (2-tailed)			0.000	
	N	256		256	
Accommodation	Pearson correlation	0.752**		1	
	Sig. (2-tailed)	0.001			
	N	256		256	

Table 5 shows the Pearson correlation coefficient, the significant value, and the total number of respondents (256). The p-value was 0.001, which was the same with the 0.01 level of significance. The accommodation and tourist satisfaction exhibited a high positive link with a correlation value of 0.752.

Hypothesis 2

H₂: There is relationship between food quality factors and tourist satisfaction among local tourist in Malaysia.

Table 6: Correlation coefficient for food quality factors and tourist satisfaction among local tourist in Malaysia.

		Tourist Satisfaction		Food Quality	
Tourist Satisfaction	Pearson correlation	1		0.778**	
	Sig. (2-tailed)			0.000	
	N	256		256	
Food Quality	Pearson correlation	0.778**		1	
	Sig. (2-tailed)	0.000			
	N	256		256	

Table 6 shows the Pearson correlation coefficient, the significant value, and the total number of instances (256). The p-value was 0.001, which was same with the 0.01 level of significance. The correlation value of 0.778 revealed a high positive relationship between food quality and tourist satisfaction.

Hypothesis 3

H₃: There is relationship between customer relations and tourist satisfaction among local tourist in Malaysia.

Table 7: Correlation coefficient for customer relations and tourist satisfaction among local tourist in Malaysia.

		Tourist Satisfaction	Customer Relations
Tourist Satisfaction	Pearson correlation	1	0.826**
	Sig. (2-tailed)		0.001
	N	256	256
Customer Relations	Pearson correlation	0.826**	1
	Sig. (2-tailed)	0.001	
	N	256	256

Table 7 shows the Pearson correlation coefficient, significant value, and case count of 256. The p-value was 0.001, which was same with the 0.01 level of significance. With a correlation value of 0.826, there was a high positive link between customer relations and tourist satisfaction.

Table 8: Summary of Correlation Analysis

Hypothesis	Significant Value	Conclusion	Correlation Value	Conclusion
1	0.001	Accepted	0.752	High Positive
2	0.001	Accepted	0.778	High Positive
3	0.001	Accepted	0.826	High Positive

Researchers used Correlation Analysis to determine the linear relationship between the two variables that were indicated as the study's goals. Table 8 shows the results of the Correlation Analysis, which revealed a strong positive association between accommodation, food quality, and customer relations. In addition, there is a strong link between accommodation, food quality, customer relations among local tourist in Malaysia.

DISCUSSION & RECOMMENDATION

The study analysing the relationship between accommodation, food quality, customer relations, and tourist satisfaction. The purpose of this study is to determine the relationship between accommodation, food quality, customer relations, and tourist satisfaction among local tourists in Malaysia.

This study suggests that more research on local tourist travel in Malaysia conducted, because this research was limited to Malaysian visitors, it was unable to draw any conclusions. The results of this study may differ if it is extended to international visitors in Malaysia. As a result, instead of focusing just on local tourists, other tourists were otherwise expected to answer out surveys.

Additionally, this study solely considers of three characteristics that influence tourist satisfaction with accommodation, food quality, customer relations, among local tourist in Malaysia. Nevertheless, this study may be overlooking other crucial aspects that impact tourist satisfaction among local tourist in Malaysia. Consequently, future researcher's may propose additional variables, such as transparency factors, to test their new discovery.

The study is then reduced to 256 samples, which may be utilised to define the target population. According to Krejcie and Morgan (1970), if the amount is sufficiently reliable, higher sample sizes might be applied to analyse millions of Malaysian tourists. Consequently, to improve the validity and reliability of their investigations, future researchers should raise their sample size.

Furthermore, rather than respondent responding a scale online survey questionnaire, uses an interview method construct open-ended questions to respondents. Researchers may receive a high interview response rate, and uncertainties or partial answers can be pursued on straight away. Consequently, these strategy will eliminate misunderstanding and considerably to improve study findings.

Finally, future researchers should be undertaken to remain up to date on variables that might impact tourist satisfaction with accommodation, food quality, and customer relations. It is feasible to assess the factors that influence tourist satisfaction, which may assist business owners in implementing more successful marketing tactics. Academics in the future might create a unique framework for analysing tourist satisfaction with tourism industry. Because client happiness with e-hailing services is variable, regional surveys must be conducted to measure customer satisfaction.

CONCLUSION

In conclusion, the researcher must clearly state the study's goal in relation to this chapter's problem. This study investigates how accommodation, food quality, and customer relations impact the satisfaction of local tourists in Malaysia. The research framework has been developed based on the literature that has been reviewed. The researcher wanted to see how each element related in the dependent variables and the independent variables.

This research examines the correlation between accommodation, food quality, and customer relations and how they impact the level of satisfaction among local tourists in Malaysia. Research goals have been accepted, it's aimed to examine the relationship between accommodation, food quality, and customer relations that influence tourist satisfaction among local tourists in Malaysia. The joy of local tourists in Malaysia can be affected by factors such as accommodation, food quality, and customer relations. Predictions can be made about the impact of these factors on tourist satisfaction.

ABSTRACT

The goal of this research is to investigate the relationship among reward, working conditions, motivation and employee satisfaction in the Malaysian hotel industry. It was discovered that reward, working conditions, and motivation all had an impact on employee satisfaction in Malaysian hotel industry while targeted 177 respondents proficiently finished that online survey. The details was evaluated via the Statistical Package for Social Science (SPSS) edition 24.0. SPSS Statistical covers the whole statistical evaluation approach to help make better decisions and perform better. Through the research, the Pearson correlation coefficient was utilised in order to explore the relationship among reward, working conditions, motivation, and employee satisfaction. The outcome shows the employee satisfaction has profound impact on hotel sector in Malaysia. This study can help to understand how reward, work conditions, and motivation affect employee satisfaction in the Malaysian hotel industry.

Keywords : Job Satisfaction, Hotel industry and Employee.

INTRODUCTION

The tourism market is now recognised as an essential component for worldwide growth in society and the economy. (Wakimin et al., 2018). Based on Camilleri, (2018) defines tourism as provisional individuals that stay in another place from their house for at least a day if they plan to travel for leisure, wellness or vacation. Meanwhile, according to Chin (2020), tourism can classified as an influx of human beings over regions in search of unique natural as well as cultural pleasures. Also the other hand, The World Tourism Organization (UNWTO)(2021), defines tourism that includes any activities that include a person visiting and residing at a spot other than their customary residence for fewer than 12 months in consecutive years for enjoyment, work or other reasons. Moreover, tourism industry includes several other industries that offer services and products to both international and domestic tourists to fulfill their needs during their vacation such as accommodation, air, travel agencies, food and road passenger transport, and travel agencies (Nasir and Wongchestha, 2022).

Due to by Report of International Tourism Highlights (2019 Edition) on worldwide scale, the World Tourism Organization was signed up to 1.5 billion international tourist travel globally and demonstrates a 4% increase in stead of 2018. The extension of similarity was expected around 2020 (World Tourism Organization (UNWTO) World Tourism Barometer, 2020). However, Covid-19 pandemic's occurrences significantly altered the state of global tourism at this time. The epidemic had detrimental influence over tourism segments (Gössling and Scott, 2020) inevitably led to months of industrial shutdown. Although attempts have been made to restart the business, most of the sectors are still having trouble, with tourism being one of the most severely affected (Dolnicar & Zare, 2020). The World Travel & Tourism Council (WTTC) encourages the tourist industry to expand sustainably by collaborating with governments and international organizations to boost exports, build wealth to create employment again. Hence, tourism plays a significant role in a nation, community, economy, nature and environment, and the world (Horaira, 2020).

Malaysia's hotel industry is rising because of tourism increasing economic impact. (Shamsudin et al., 2019). In other countries where tourist customer service is also advanced, it is also a growing trend (Aldaihani & Ali, 2018). Aside from its Shariah-compliant Hotels (SCH), Malaysia is also well-known for its Muslim tourism from the Middle East (Haque et al., 2019). The hospitality industry is service-oriented and highly dependent on the actions and attitude of employees to offer the customer pleasant and friendly services. The workforce in hospitality was a primary resource in the industrial sector. Customer satisfaction can only be attained in a sector where services are highly individualized when staff members are content with their work. A study by the University of Warwick shows that happy and satisfied employees are 12 percent more productive than unhappy employees (Chowdhury, 2019). This happens because satisfied employees are more inclined to be working at the maximum level. In order to improve work pleasure and mitigate employee turnover intentions, hoteliers must better understand what inspires and satisfies their staff.

There are three objectives of this study:

1. To examine the relationship between reward and employees satisfaction in the hotel industry.
2. To examine the relationship between working conditions and employees satisfaction in the hotel industry.
3. To examine the relationship between the work motivation and employees satisfaction in the hotel industry.

SIGNIFICANCE OF THE STUDY

Researchers

The study's outcome will assist researchers in determining the link between three variables which is reward and employee satisfaction, working conditions and employee satisfaction and work motivation employee satisfaction hotel industry in Malaysia. The result will help researcher aspire to understand much about the variables that influence employees satisfaction in hotel segment in Malaysia.

Owners

This research will assess a reward, working condition and also motivation factor to recognise the sorts of acts that can occur when use employee satisfaction. Get to know the behaviour of employee and the decision making when individual or group uses the employee satisfaction. The details acquired will conduct the proprietors in determining what elements have an impact employee satisfaction.

Tourism sector

The information will provide insight the tourist segment exactly how customers opted to obtain tourism products and services. As a consequence, the tourist industry will be able to strengthen its administration in persuade individuals to obtain a employee satisfaction. These studies also make the tourism sector know what is important in the using decisions. In advance, through this type of research also contributes to the progress of tourist planning in future.

LITERATURE REVIEW

Employee Satisfaction

A key component of an organization's success is employee satisfaction (Amburgey 2005). This issue has piqued the interest of researchers worldwide as well as organization personnel (Lu et al., 2005). The major reason this subject has to be brought up is that an organization's success depends on its committed, devoted, motivated, and contented employees. They are among the key factors influencing an organization's performance.

According to Bushra (2011), when a worker is content with their job, they are satisfied with it. It is an admiring and fulfilling sensation that a person has as a result of their professional success (Belias et al., 2014). Employee satisfaction is necessary for the workforce since it indicates how each employee feels about their position (Raja et al., 2014).

It is thought that if job satisfaction is lacking, it will lead to unhappy employees who will be unable to place as much effort as they can (Muhammad et al., 2009). In short, employee satisfaction may be defined as the employee's favorable attitude about their employment.

Reward Factor

Reward alludes to a range of benefits offered to employees, including both monetary and non-monetary (Armstrong, 2013). Total rewards are the term used to express an emphasis on the necessity of taking into account all aspects of job performance that are beneficial to employees. It seeks to combine the material and immaterial components of reward into a unified whole. Financial rewards include both person-based pay, which gives reward acknowledgment an individual's contributions and effort pay where will provides compensation linked to the worth of the task. (Armstrong, 2013). Non-financial rewards accentuate the varied degree to which people's desires for respects for accomplishment, room for personal development, and livable working circumstance (Armstrong, 2013).

Working Conditions Factor

The working environment is determined by the standards set by the organization such as the workplace, equipment and collaboration among supervisor and coworkers. The atmosphere of workplace has an influence on an employee's performance, protection, wellness, and psychological well-being. Comparing the workplace now to the past, it is distinct, diversified, and always evolving (Bhattacharjee et al., 2019). According to (Heap, 2001) shows that more than 90% of respondents said attitude toward their job and mood are influenced by the setting they work.

Work Motivation Factor

Motivation is determined by the passion or drives to achieve something, as well as the capacity to satisfy a few needs. Employers can motivate their employees by expanding the scope of the work and making it more intriguing, keeping them engaged, as well by improving their performance in the workplace. The achievement in achieving progressive targets and goals is probably one of the most crucial facets of their success. Motivation to work plays a central role in the presence of workers since they formulate the fundamental explanation of working for the duration of regulars day-to-day existence.

A high level motivation is an essential constituent of business exercises, whereby high motivation is correlated with work satisfaction, a sense of accomplishment and a profound attachment to the company, which affects performance and profit. "The predominance of the culture in the organisation has an enormous effect on motivating individuals in peak performance". (Garg & Rastogi, 2006). A Lean management approach would be very effective way to motivate all employees in an efficient manner.

The relationship between reward factor, working condition factor, motivation factor and employee satisfaction in hotel industry.

Compensation and reward are critical components of Humans Resource Management. An organization remuneration scheme for tis personnel is crucial in determining employees commitment and retention. According to Wills (2001), the most important issues in attracting and retaining talent in organizations is compensation. As they compete for required skills and human capital, organisations, whether public or private, governmental or nonprofit, are implementing incentive practises. Bowen (2000) argued, in an era where accomplishing more with less is the norm, incentive and recognition are essential.

The outcome of working conditions on job satisfaction comprises two kinds of group workers: those who operate in an integrated environment and those who operate in tough situation. Only employees who meet specific requirements with condition of gender, age, health, qualifications, physical and mental condition capabilities are suited for tasks with challenging working conditions. As the consequence, it is critical to minimise hazardous working circumstances and if required to establish appropriate safety measures. This is to avoid tragedies and keep sure that working conditions are appropriate for workers right.

It contains a connection among motivation and job satisfaction, which serves as the cornerstone for every company existence. Peretomode (1991) stated that there are linked between job satisfaction and motivation but not like to synonymous terms. Job satisfaction is a component of the motivational procedure but motivation mostly focused goal of company, job satisfaction is concerned

with enlightenment of rewards and job tasks. It is also conceivable where worker appreciates all aspects of his work but is yet unmotivated. This implies denotes a high level of job satisfaction.

Research Hypothesis

A hypothesis should be feasible, plausible, and also methodologies into account. Furthermore, a hypothesis is a forecast or justification of a link between variables. It suggests that an independent variable and a dependent variable have a systematic connection. As a result, the research suggests:

H1: There is a significant relationship between reward and employee satisfaction in hotel industry

H2: There is a significant relationship between working condition and employee satisfaction in hotel industry .

H3: There is a significant relationship between motivation and employee satisfaction in hotel industry

Conceptual Framework

The conceptual framework for this research is seen in Figure 2.1. The three factors that make up the independent variable that will be proposed are reward, working condition, and motivation. Employee satisfaction is the dependent variable.

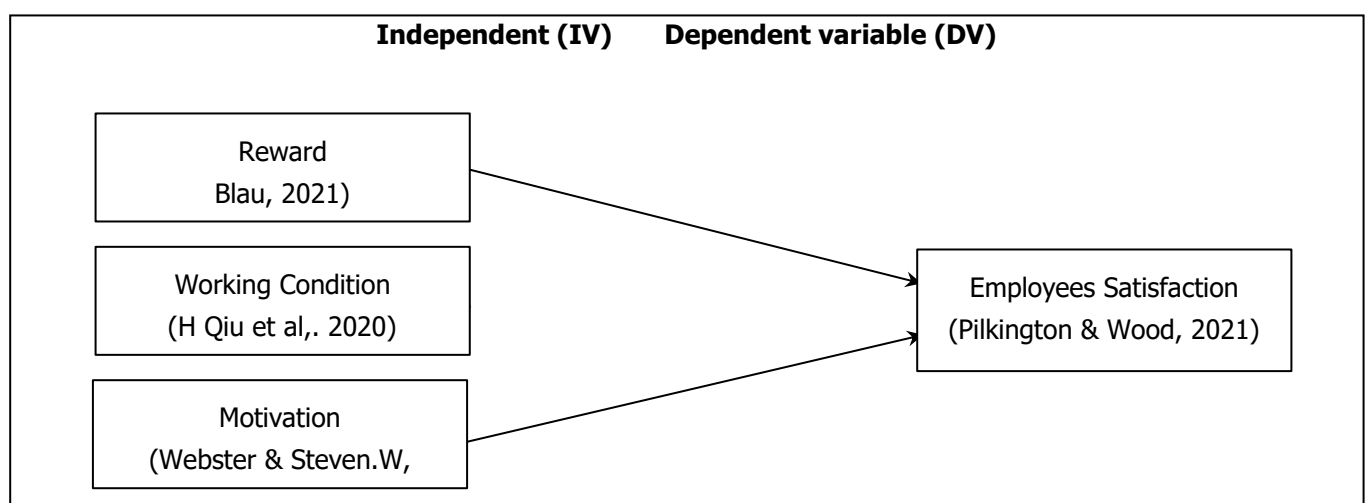

Figure 1: Conceptual Framework of the relationship among reward, working condition and motivation with employees satisfaction.

METHODOLOGY

Research Design

The study's design incorporates the factors that impact influence employee satisfaction among hotel industry in Malaysia. A quantitative technique will use through the research and details collected from individuals via self-directed questionnaire. The relationship between reward, working condition, and motivation among employee satisfaction is the subject of a descriptive study. The descriptive study design assists in answering the research questions and achieving the research objectives.

Population and Sample size

Overall, the sample size is 177 employee. The population and sample size study only involves among employee hotel industry in Malaysia. The target population or employee is 177 respondent . To determine the sample size, Krejcie and Morgan (1970) sample was employed in this study.

S = sample size

X^2 = the table value of chi-square for 1 degree of freedom at the desired confidence level (3.841)

N = the population size of domestic tourist in a year

P = the population proportion (assumed to be 0.5 since this would provide the maximum sample size)

d = degree of accuracy expressed as a proportion (0.05)

$$S = \frac{\chi^2 NP (1 - P)}{d^2 (N - 1) + (\chi^2 P (1 - P))}$$

$$S = \frac{3841 (2054000000)(0.5)(1 - 0.5)}{(0.05)^2(2054000000 - 1) + 3.841 (0.5)(1 - 0.5)}$$

$$S = \frac{1972353500}{5135000.958}$$

$$S = 384.099$$

$$S = 384$$

The precise value of sample size for the population are 300 but the return of the questionnaire answered by respondents collected the data for 177 respondents.

Data Collection

In the beginning phase, online surveys which is Google Form used to employed the data. The researcher utilised this structure of technological instruments because it is cost-free and straightforward to use. The fieldwork was the second phases of data gathering. Through this research, questionnaire was employed as the major source of information. The section has 6 components that declares ought to address. The questionnaire was handed out to the community, who are Malaysian tourists, with the desire to accumulate data.

Sampling

Each population has a chance of being elite if the first type of sampling method mentioned above is used. It is primarily employed in quantitative research. Quantitative analysis and non-probability sampling methods will be used in this study. Rather than testing a hypothesis of a few large populations, the goal of these types of analyses is to develop a better understanding of a community (McCombes, 2021). Whatever method is used, the people chosen for a sample must be representative of the entire population. This could imply focusing on hard-to-reach demographics.

Probability sampling and non-probability sampling are the two sorts of sampling techniques. Begin with an entirely representative data set of everyone who is eligible from which to draw your possibility sample. For the outcome, the measurement error is unable to constructed and a remarkable risk of obtaining a non-representative sample with non-generalize results exists. In contrast, non-probability sampling is better for developing hypotheses and exploratory research more practical. The method of convenience sampling shall be employed through the research. Convenience sampling will assist researchers in data collection. It's the most commonly used sample technique because it's quick, easy, and inexpensive (Fleetwood, 2020). This method was chosen for this investigation because of the benefits and application of multiple sampling approaches in situations with large populations.

Research Instrument

The substances applied to quantify the selected study components were taken from previous pertinent studies in the field of tourist purchaser habits

Data Analysis

Researchers will use the programme Statistical Programmers for Social Science (SPSS)

Table 1: Measurement items			
Measurements	Number of items in the questionnaires	Scales used	Author

information. SPSS is a program-based data processing and analysis window that allows you to create tables and pie charts. Computers aided researchers in lowering the effort required to determine information and making quantitative analysis easily and quickly. The researcher uses descriptive statistics, reliability statistics, Pearson's correlation, and regression to evaluate quantitative data.

FINDINGS

Demographic Profile of Respondent

Table 2: Demographic Profile of Sample

Characteristics		Frequency	%
Gender	Male	56	31.5
	Female	122	68.5
Race	Malay	137	77
	Chinese	3	1.7
	Indian	14	14
	Others	24	13.5
Age	21-30 year old	174	97.8
	31-40 year old	4	2.2
	41-50 year old	0	0
	51 years old and above	0	0
Marital Status	Single	173	97.2
	Married	5	2.8
Education Level	Secondary School	3	1.7
	Diploma	7	3.9
	Bachelor of Degree	162	91
	Master Degree	6	3.4
	Doctor of Philosophy	0	0
Occupation	Employee	7	3.9
	Part time	0	0
	Unemployed	3	1.7
	Retired	1	0.6
	Student	167	93.8

Table 2 will illustrate the respondent description. Male replies totaled 56, while female respondents totaled 122. The survey received responses from Malay (137 respondents), Chinese (3 respondents), Indian (14 respondents), and others (24 respondents). The Malay had the biggest percentage of replies (77%), followed by others with 13.5%, Indians with 14%, and Chinese with just 1.7%. The largest proportion of respondents was in scale of age from 21-30 years old (97.8%) and the second highest is the range 31-40 years old which have 2.2%.

The complete amount of responders for single was 173 (97.2%) and married was 5 (2.8 %). The highest respondents were 91 % (162 respondents) with a bachelor's degree level of education, followed by 3.9 % (7 respondents) with diploma, third is Master of degree stated 3.4% (6 respondents) and the lowest proportion of respondents were those with a secondary school, which is 1.7 % (3 respondents).

Last but not least is students made up the bulk of respondents 93.8% (167 respondents), while the employees stated 3.9 % (7 respondents). There were 1.7 % (3 respondents) for unemployed and retired only 0.6% for 1 respondent

Reliability Test

A reliability system is applied to gauge a system's entire resilience and efficiency beyond a specific time duration and across a variety of evaluation circumstances. It involved over 30 participants earlier than being distributed to 385 people by a digital survey which is Pilot Test.

Table 3 : Result of Reliability Test

Variable	Number of items	Cronbach's Alpha coefficient	Strength of Association
Employee satisfaction	5	0.820	Excellent
Reward	5	0.887	Excellent
Working condition	5	0.894	Excellent
Motivation	5	0.929	Excellent

Table 3 displays the Cronbach's Alpha Coefficient outcomes for independent and dependent variables in this research. We may deduce from the table above that all the variables were more than 0.8. As consequence, the offered conclusion is trustworthy and may be accepted in this probe. Employees satisfaction variable that influence employees satisfaction in the hotel industry was measured using 5 questions, and the Cronbach's Alpha outcome for this section query was 0.820,

which was excellent. For the outcome, the coefficients derived for employees satisfaction variable questions were reliable.

After that, five questions per section were submitted to analyze the incentive variables that affect employee satisfaction in the hotel business, and the results were for rewards (0.887), working conditions (0.894) and finally motivation (0.929). Every variable is considered excellent. Therefore, all the calculated coefficients are reliable.

Descriptive Analysis

The mean and standard deviation for sections C, D, E, and F of the questionnaires were evaluated in this research.

Table 4: Descriptive Statistics

Variables	N	Mean	Standard Deviation
Motivation	177	7.3314	1.6815
reward	177	6.766	1.6716
Working condition	177	7.017	1.5969
Employee satisfaction	177	6.644	1.619

Table 4 shows the independent and dependent variables, mean also standard deviation analysis. The

independent variables were motivation, reward, and working conditions, while the dependent variable was employee satisfaction in the Malaysian hotel industry. Motivation had the greatest mean score (7.3314), indicating that respondents satisfied most to this characteristic. Afterward, the lowest mean was employee satisfaction only 6.644 in this survey, indicating that respondents agreed less strongly on that dimension. The information collection with a standard deviation greater than one out of 177 respondents demonstrates the most prevalent values.

Pearson Correlation

Pearson's correlation analysis are most fundamental procedures that looked at the linear connection between the both variables. The purpose of the study was to determine if there any correlations among the independent variables (motivation, reward, and working condition) and the dependent variable (employee satisfaction in the Malaysian hotel industry). If the link is substantial, the researchers have to identify the acceptable level of association strengths.

Hypothesis 1

H1: There is relationship between motivation and employee satisfaction hotel industry in Malaysia.

Table 5: Correlation coefficient for motivation and employee satisfaction hotel industry in Malaysia

		Employees Satisfaction in Hotel Industry	Motivation
Employees Satisfaction in Hotel Industry	Pearson Correlation	1	0.929**
	Sig. (2-tailed)		0.000
	N	177	177
Motivation	Pearson Correlation	0.929**	1
	Sig. (2-tailed)	0.000	
	N	177	177

The Pearson correlation coefficient, significant value, and total number of responders (177) are shown in Table 5. The p-value was 0.000, less than the threshold of 0.01. Motivation component and employee satisfaction hotel industry in Malaysia exhibited a high positive link with a correlation value of 0.929.

Hypothesis 2

H2: There is relationship between reward and employee satisfaction hotel industry in Malaysia

Table 6: Correlation coefficient for reward and employee satisfaction hotel industry in Malaysia

		Employees Satisfaction in Hotel Industry	Reward
Employees Satisfaction in Hotel Industry	Pearson Correlation	1	0.887**
	Sig. (2-tailed)		0.000

	N	177	177
Reward	Pearson Correlation	0.887**	1
	Sig. (2-tailed)	0.000	
	N	177	177

The Pearson correlation coefficient, significant value, and total number of cases (177) are shown in Table 6. The p-value was 0.000, below than the significance threshold of 0.01. The correlation value of 0.887 revealed a very high positive relationship among reward and employees satisfaction hotel industry in Malaysia.

Hypothesis 3

H3: There is relationship between working condition and employee satisfaction hotel industry in Malaysia.

Table 7: Correlation coefficient for working condition factors and employee satisfaction hotel industry in Malaysia.

		Employees Satisfaction in Hotel Industry	Working Condition
Employees Satisfaction in Hotel Industry	Pearson Correlation	1	0.894**
	Sig. (2-tailed)		0.000
	N	177	177
Working Condition	Pearson Correlation	0.894**	1
	Sig. (2-tailed)	0.000	
	N	177	177

The Pearson correlation coefficient, significant value, and case count of 177 are shown in Table 7. The p-value was 0.000, below than the significance threshold of 0.01. With a correlation value of 0.894, there was very strong positive link among working condition and employees satisfaction hotel industry in Malaysia.

Table 8: Summary of Correlation Analysis

Hypothesis	Significant Value	Conclusion	Correlation Value	Conclusion
1	0.000	Accepted	0.929	High Positive Correlation
2	0.000	Accepted	0.887	Very High Positive Correlation
3	0.000	Accepted	0.894	Very High Positive Correlation

Correlation Analysis was employed by investigators in order to evaluate the linear relationship among the both variables identified as the research aims. Table 8 displays the outcomes of the Correlation Analysis, which demonstrated a strong positive relationship between motivation, reward and employees satisfaction in the Malaysian hotel industry. Furthermore, there is high positive correlation among working conditions and employees satisfaction in the Malaysian hotel industry.

DISCUSSION & RECOMMENDATION

The research analyzing the relationship among reward factors, working condition, motivation factors, and employees satisfaction hotel industry in Malaysia. The intention of this study is to find out the relationship among motivation factors, working condition factors, reward factors, and employee satisfaction hotel industry in Malaysia.

This study shows that more research on the employee satisfaction of the hotel industry in Malaysia should be carried out, as this research is limited to workers in Malaysia, it cannot draw any conclusions. The results of this study may vary if it is extended to the satisfaction of international workers in Malaysia. As a result, rather than focusing solely on local employee satisfaction, other employees are instead expected to respond to surveys.

Further, the most recent explore only looked at 3 criteria which affect the satisfaction of hotel industry workers in Malaysia. However, this study may overlook other important aspects that affect employees satisfaction among Malaysians. As this indicates, subsequent investigators might propose additional variables, such as disclosure components, to explore their new discoveries.

The research is then narrowed down to 177 samples, which may subsequently be used to identify the target population. According to Krejcie and Morgan (1970), if the amount is sufficiently reliable, larger sample sizes should leveraged to examine millions of Malaysian tourists. Consequently, to improve the validity and reliability of their investigations, future researchers should raise their sample size. Merely having respondents complete a scale questionnaire online, conduct an interview or pose open-ended questions. Using the interview strategy, researchers may get a great deal of response and incomplete replies could be picked up on instantly. This strategy can eliminate misunderstanding and considerably improve study findings.

Finally, future researchers should be taken to stay up to date on variables that may impact the satisfaction of hotel industry workers in Malaysia as these factors can vary. It is possible to evaluate the factors affecting the trust of employees, which can help business owners in implementing more successful marketing tactics. Academics in the future may create a unique framework to analyse employee satisfaction with the hotel industry in Malaysia. As workers' happiness with the satisfaction of hotel industry workers in Malaysia fluctuates, a regional survey must be conducted to measure employee satisfaction.

CONCLUSION

To conclude, these three factors must be addressed together to make the employee satisfaction more colorful and vivid with a diverse range of employee satisfaction, since this is one of the most effective marketing strategies. As a method to boost Malaysian tourism, employee satisfaction hotel industry in Malaysia providers and the government should work together to provide the finest service possible to employee satisfaction. The outcome of this research will aid researchers in better understanding employee satisfaction with hotel industry in Malaysia. Any subsequent research should start with a well-rounded population sample. Imbalanced sample c an inconsistency in the results, which will only favor one group. The sample size ought to be expanded to gain accurate, reliable, also uniform outcome. Researchers ought to think further dimension to identify other aspects that trigger Malaysian youth employees' enthusiasm to go to other areas. Consequently, to make the employee satisfaction hotel industry livelier by providing a variety of hotel industry services, DMOs and local governments must collaborate effectively and completely commit to providing reliable services.

ABSTRACT

The objective of this study is to analyse the correlation between the variables under consideration of quality of accommodation, uniqueness and service quality among tourist demand in Malaysia. It is discovered quality of accommodation, uniqueness and service quality were the major needs in tourism industry that effect tourist demand in Malaysia. The international tourist and local tourist subject matter at hand pertains to the act of being specifically singled out for a particular purpose or objective respondents and a total of 208 respondents were successfully responded through the online survey. The data that was gathered underwent analysis through the utilisation of the Statistical Package for Social Science (SPSS) version 26.0. Ladies and gentlemen, today we shall be discussing the SPSS Statistical software. This software is designed to cater to the entire statistical analysis process, from planning to data collection, analysis, and reporting. Its primary objective is to enhance decision-making and performance. In this study, the Pearson correlation coefficient was utilised to examine the correlation between the variables quality of accommodation, uniqueness and service quality towards tourist demand. The result shows a significance effect of quality of accommodation, uniqueness and service quality towards tourist demand. Through this study can understand, a tourism sector's reputation could be improved by improving its accommodations, uniqueness, and service quality. This would only lure more tourists to the same site.

Keywords: Tourism sector, tourist demand, accommodations, uniqueness, and service quality.

INTRODUCTION

Ladies and gentlemen, it is imperative to acknowledge that tourism plays a pivotal role in the economic growth and development of numerous nations across the globe. Ladies and gentlemen, it is my pleasure to discuss with you today the various benefits that tourism can bring to host cities. As per Yehia's research in 2019, tourism has been found to have a positive impact on a country's economy by increasing its revenue and creating numerous job opportunities. Additionally, it has been observed to enhance a nation's infrastructure and promote cultural exchange between its citizens and visitors from other countries. In recent decades, both international tourism and the importance of tourism to many nations' economies have grown. It is noteworthy that tourism has been incorporated into three of the seventeen universal goals. These goals include goal 8, which pertains to the attainment of decent employment and economic development, goal 12, which emphasises responsible consumption, and goal 14, which focuses on life below water. Good afternoon, class. Today, we will be discussing the work of Comerio and Strozzi in their 2018 publication. Tourism are often seen as the sector of the economy that will thrive in the years to come. It has been suggested by Chalupa that the worldwide phenomena of the present are an important carrier of globalization processes. The topic we are discussing here is the current global phenomenon (Pellešová, 2019).

Tourism promotes growth. It contributes 10% of global GDP and employment. Every other economic sector is tied to the industry. Its capacity to operate in several regions and provide entry level employment and beyond helps overcome development and income divides (Peng, 2019). The tourism industry has grown to become a significant global and national economic force. The industry has expanded rapidly and is now a force in promoting long-term, positive social and economic change across the world. Yet, tourism is a major contributor to environmental deterioration due to its impact on carbon dioxide emissions (GHG) (Wakimina et al., 2018). There are always plenty of difficulties for any given government in attempting to increase tourism. However, although numerous publications have verified that industry may aid in boosting tourism, very few studies have explored the function of both agricultural and manufacturing sectors in doing so, as was witnessed over the 2 previous decades. Second, there is a paucity of research linking political stability to tourist demand in the ASEAN area, even though this is the element with the greatest influence (Nguyen & Nguyen, 2020).

Malaysia's economy has seen tremendous development in the previous 10 years, notably in the domains of e-commerce and digital banking. E-commerce, in particular, has grown in importance. Digital technology has a significant impact on the running of economies due to its capacity to grow the size of firms, boost economic efficiency, improve user experiences, lower operational costs, and better manage financial risks (Mentek, 2022). Digital technology was critical in restoring economic stability during the Covid-19 pandemic. Accurately locating confirmed cases of the disease, moving many financial dealings online, and enabling local governments to provide vouchers for consumer purchases all contributed to this success. As a consequence of 5G and other technology advancements, as well as infrastructural upgrades, Malaysia's digital economy is expected to grow at a faster pace in the next few years, ushering in a higher number of major changes. To ensure that the program runs well, the authorities will need to handle some additional issues (Yipping. Et al., 2021).

This research highlights three criteria that influence tourist demand: quality of accommodation, uniqueness and service quality. Each variable has its explanation for how it might affect tourist demand. There are links between the tourist's selection and the tourist's desire to experience the product again. All of the elements in tourism have an essential part in influencing the number of tourists that visit the tourist site. If a tourist is happy with their experience in Malaysia, they would most likely return or suggest Malaysia to their friends and family members. Tourist satisfaction with Malaysia is critical since it will contribute to the growth of Malaysia's tourism business. Malaysia should understand what is on tourists' minds about Malaysia to meet their expectations and ensure that their perception matches what they will encounter. Thus, the purpose of this research is to look at the aspects that impact tourist demand in Malaysia, such as quality of accommodation, uniqueness and service quality. All of these characteristics will be examined to determine their link to tourist demand. The target of the study is the tourism demand in Malaysia. The focus of this research will be on the topic at hand quality of accommodation, uniqueness and service quality

The study was undertaken with the subsequent aims and objectives:

- a. To examine the relationship between the quality of accommodation and tourism demand in Malaysia.
- b. To investigate the relationship between uniqueness and tourism demand in Malaysia.
- c. To analyze the relationship between service quality and tourism demand in Malaysia.

SIGNIFICANT OF THE STUDY

The research study could offer details on how the quality of accommodations, uniqueness, and service quality can affect tourist demand to return to Malaysia.

In addition, this study will examine how to enhance Malaysia's image in order to attract more tourists, especially in the future. Due to the study's improvement of locals and tourists' knowledge of potential problems with the quality of accommodations, it will be beneficial to the country's tourism industry and cultural heritage.

Additionally, as this study will give the required details on the elements that influence a nation's uniqueness, it may be advantageous to both tourists and residents. This could alter tourists' perceptions of Malaysia and cause them to change their minds. This study can give future researchers a baseline understanding of the current state of tourist demand in Malaysia.

Researchers

The outcome of the investigation shall facilitate the assessment of the correlation among three variables by the researchers: quality of accommodation, uniqueness and service quality and tourist demand in Malaysia. The result will help researchers aspire to understand much about the factors that influence tourism demand in Malaysia.

Owners

This study will provide information about the individual's satisfaction with services. This study will evaluate a quality of accommodation, uniqueness and service quality to know the type of behavior that can be involved when using services. Get to know the behavior of customers and the decision making when an individual or group uses the services. Data gathered will help owners know what factor influent them when purchased a service.

Tourism demand

Today, we will be discussing the concept of tourism demand. As we delve into the topic of tourism, it is important to understand the concept of tourism demand. In essence, tourism demand refers to the desire and inclination of individuals to consume various travel-related products and services within a particular market or location, at a given time and for a specific cost. In essence, tourism demand refers to the desire for goods and services that are related to the tourism industry. As we delve into the realm of tourism, it becomes apparent that catering to the needs and wants of visitors and consumers alike is an integral aspect of the tourism demand. It is imperative to comprehend the intricacies of supply and demand within the purview of the business being scrutinised. As we delve into the intricacies of the tourism product, we come to realise that it is not a singular entity but rather a multifaceted amalgamation of numerous intangible services. This poses

an even greater challenge in the context of tourism. As we can see here, the authors Song et al. in 2019, Song and Li in 2008, and Wu et al. in 2017 have all contributed to this topic.

LITERATURE REVIEW

Antecedents of tourism demand

There are many variables or factors that contribute to tourist demand in the tourism sector. The first case study that have been chosen and examined was "The Impact of Accessibility Quality and Accommodation Quality on Tourists' Satisfaction and Revisit Intention to Rural Tourism Destination in Sarawak: The Moderating Role of Local Communities' Attitude "by Chee Hua Chin, Fung-Yee Law, May-Chiun Lo, T.Ramayah. The measured variables in this case study are the activity appeal, a consideration of the influence of the accessibility and accommodation quality.

Quality of accommodation

The idea of accommodation was initially used by renowned psychologist J.M. Baldwin 2010. He claims that the phrase refers to learned adjustments in people's behaviour that aid in environment adaptation. "The word accommodation has been used to designate the changes people in groups make to relieve the weariness and stress of rivalry and conflict,(Lundberg 2009). Sociologists use the term "accommodation" to refer to how hostile people or groups adjust (Nimkoff & Ogburn 2009). Conflict naturally leads to accommodation: Conflicts allow for accommodation because they cannot always persist. When parties or individuals engaged in a dispute do not enjoy the conflict's current state, they sit down to try to resolve it. These settlements, whether transient or permanent, may be referred to as 12 "accommodation." Conflicts do not exist when the issue of finding accommodations does not exist. Both the "condition" and the "process" of accommodation are universal. Conflicts are necessary since antagonistic elements make up human civilization. Accommodation becomes necessary since no community can exist in a condition of constant strife. As a result, accommodations can be found throughout all societies and sectors of social life. The process of accommodation is not limited to any one stage of a person's life. It is not constrained by any specific social circumstance either. On the other hand, one must learn to adjust to different conditions throughout life. Additionally, if and when conflicts arise, accommodation would follow sooner or later. The groupings that make up society must make accommodations for one another as well as for the individuals who belong to them. As a first step toward assimilation, it might act to lessen tension between individuals or groups. As in a treaty between nations or labour management pact, it may serve to temporarily put off outright conflict. It might make it possible for groups with pronounced sociopsychological gaps to get along.

Uniqueness

A person or object is said to be unique when it differs from everything else in comparison, or when it is noteworthy or exceptional. When used in reference to people, it frequently refers to a person's personality or certain aspects of it, indicating that they differ from the personality traits that are typical in their culture (Tayob,Abdulkador,2004).When the word "uniqueness" is used to

describe something, it's frequently in the context of a product (Strack, Stephen, 2006). The term is then used to promote or sell the product in an effort to set it apart from similar items in the same category (Baumol, William, 2008). The idea of American exceptionalism is based on the West's distinctiveness, especially its clearly defined secularism (Headley & John 2012).

Service quality

This notion of service excellence is founded on the expectancy-disconfirmation paradigm, which serves as the foundation for the framework. (Balakrishnan & Barry, 2007). A company that offers good service quality will continue to be economically competitive while meeting or exceeding customer expectations (Kenzelman 2008). As per empirical studies conducted by Parasuraman in 2008, it has been observed that there exists a correlation between enhanced service quality and increased profitability as well as long-term economic competitiveness. It is imperative to measure customer satisfaction and other performance outcomes in order to enhance operational procedures. By doing so, problems can be identified promptly and systematically, and service performance measurements can be established that are both valid and trustworthy. Ultimately, this leads to improved operational processes. (Oliver Joseph Brady, 2000). As a result of the intangible character of services and the fact that they are sometimes subjectively experienced, experts have historically regarded service quality as being particularly challenging to define and quantify (Barry 1985). The so-called Nordic School made one of the early attempts to address the idea of service quality. According to this method, there are only two fundamental dimensions for service quality (Oliver 2011).

Relationship between the quality of accommodation, uniqueness, service quality and tourism demand in Malaysia

Relationship between the quality of accommodation and tourism demand in Malaysia.

According to Chin et al., (2018), persons who evaluated a favorable level of accommodation quality would have more intent and be more satisfied with their conduct. It is now well-accepted that high-quality lodging is a crucial factor in boosting vacationers' happiness Shonk (2018).

Now, in the realm of tourism, the term "accommodation" encompasses a variety of premises, including but not limited to hotels and motels within urban areas. Conversely, in the context of rural tourism, accommodation may take the form of village stays or homestays. Among the most common options for visitors to rural tourist hotspots is a homestay Chin et al.(2018). According to the findings of previous research, the physical aspects do play a role in determining the quality of the accommodations in rural areas. In particular, the state of the facility, the furnishings, and the cuisine all play a role in determining the quality of the accommodations (Deshmukh) 2018. They will be more likely to visit Malaysia in the future if they have a positive experience with the service and quality of their accommodations, which can both meet the requirements of foreign visitors and keep them coming back.

When tourists from other countries go to Malaysia, the quality of their accommodations and the level of service they get are two of the most significant factors for them to consider. Therefore, the level of service provided by accommodation is taken into consideration to be a significant component that influences the level of satisfaction experienced by tourists. As tourists want to

guarantee that the quality of accommodation meets their expectations before traveling, it is critical that the host country's accommodation meets tourism demands (Deng et al, 2019).

Relationship between the uniqueness and tourism demand in Malaysia.

According to Karagoz et al. (2020), the individual's reliance on uniqueness is typically a psychological structure that examines the individual's reliance on uniqueness due to a personality attribute. When a person exhibits the need to seek items or services that exhibit distinction and achievement, uniqueness is required. The advertising firm will be asked to provide a variety of stunning, soothing, and aesthetically pleasing photographs. People nowadays often have preconceived notions of what they will see at a tourist attraction or trip (Hikmah et al., 2018).

Furthermore, Thai tourists who have a positive experience in Malaysia or who are drawn to the country by its distinctive tourism offerings will tell their friends and family back home about their travels. As a result, boosting the marketing of Malaysia's tourism is simultaneous with spreading knowledge about Malaysia's tourism to attract prospective Thai tourists. Promotion of Malaysian tourism at the right moment and with the right amount of information will attract Thai tourists and allay their fears about the country's security (Thien et al., 2018).

Malaysia cares about its multicultural community. Before Merdeka, numerous races lived in Malaysia. Malaysians are Malay, Chinese, and Indian, but there are also Iban, Dayak, and Kadazan. Everyone lives peacefully. Malaysians accept each other's culture and religion as evidence. Hari Raya, Chinese New Year, and Deepavali are also celebrated. Malaysia is distinct and powerful because all races stand together (Sutra, 2019).

Relationship between service quality and tourism demand in Malaysia.

When used in the field of tourism research, the term "destination service quality" refers to the degree of service performance achieved at each characteristic (Chen & Chen, 2019). In this age of increased competition in destination management, service quality has become critical. Tourist sites are more likely to attract both first-time and repeat tourists if they provide high-quality services. Tourists who had a positive experience are more inclined to tell their friends and family about it. This generates both recurring business and the possibility of new business Vassiliadis et al. (2018).

One of the most significant benefits that can be acquired via the efficient delivery of highquality tourist services and unforgettable experiences at a tourism destination is loyalty to the area. This may be accomplished in a number of ways Akroush et al. (2018). According to (Khan et al.,2013), vacation spots that provide higher-quality services are more likely to entice visitors and fulfill their expectations once they get there. In addition, a number of studies (Silvestri et al., 2017) amongst others, have revealed that the quality of the service provided is an important factor in determining the level of satisfaction experienced by tourists.

Research Hypothesis

A hypothesis must be testable and realistic, taking current knowledge and methodologies into account. Furthermore, a hypothesis is a forecast or explanation of a link between two variables. It suggests that an independent variable and a dependent variable have a systematic connection. As a result, the research suggests:

Taking into account the aforementioned factors, the following research hypotheses are developed:

H1: Quality of accommodation has a positive relationship with tourist demand.

H2: Uniqueness has a positive relationship with tourist demand.

H3: Service quality has a positive relationship with tourist demand.

Conceptual Framework

The suggested structural equation model of tourist demand intention is shown in Figure 1. The model reveals a direct causal-effect relationship between the variables that affect tourism demand in Malaysia. Previous research, including that done by Nagi Medai, Naoyuki Okamoto, Yu Ogasawara, and Katsuya Hihara (2022), supports this association. (In this study, three variables will be analyzed. Based on prior studies, quality of accommodation, uniqueness and service quality will expect to have relationships with tourism demand. The relationship of the variables shows in Figure 1.

Figure 1 : Conceptual Framework of Quality of Accommodation, Uniqueness and Service Quality towards the Tourist Demand

METHODOLOGY

Research Design

Research design is also important in determining a method to conduct research (Nusaibah, 2019). According to Willey, (2020) research is also an action plan in the collection, measurement and analysis of data that is implemented empirically in a research. The design of the study will be adapted as a maximum control over the factors that are problematic about the findings of the study. (Burns & Grove, 2002). Boris F.Blumberg's statement, (2011) stated that the plan in forming the answer to make the research design. Research design can also be categorized as research purpose, exploratory testing, descriptive or hypothesis (sekaran & bougie, 2010). According to Maxwell, (2005) states that the study design will also affect the research questions and research objectives. The research design also has a good measurement method in determining the research objectives, research questions and hypotheses.

Target population

As we delve into the realm of research, it is imperative that we establish a clear understanding of the term "population". In essence, population refers to the entirety of individuals, occurrences, or entities that are of relevance to the researcher's inquiry and warrant investigation (Sekaran and Bougie 2009). Population refers to the total number of people from whom samples will be drawn. The population is also the entire subject of the study while the sample is a part of the population. This study will focus on international tourists in Malaysia where the target population is 131.7 million (Domestic Tourism, 2020).

Sample Size

According to Boris F.Blumberg et al., (2011) stated that sample size is the total population that has been summarized into a small sample. The number of respondents selected to be a small population according to regulations (Sekaran and Bougie, 2009). The sample of this study consists of requests from overseas tourists who come to Malaysia. The minimum sample size of this study is 384 foreign tourists from various countries. Therefore, the total number of respondents of 384 tourists will be selected based on Krejcie & Morgan's table (Krejcie & Morgan 1970) as shown below.

S = sample size

X^2 = the table value of chi-square for 1 degree of freedom at the desired confidence level (3.841)

N = the population size of domestic tourist in a year

P = the population proportion (assumed to be 0.5 since this would provide the maximum sample size) d = the degree of accuracy expressed as a proportion (0.5)

$$S = \frac{x^2 NP(1 - P)}{d^2(N - 1) + (x^2 P(1 - P))}$$

$$S = 3.841(205400000)(0.5)(1 - 0.5) / (0.05)^2(205400000 - 1) + 3.841(0.5)((1 - 0.5))$$

$$S = 1972353500 / 5135000.958$$

$$S = 384.099$$

$$S = 384$$

It is important to note that the sample size for the population is precisely 384. However, it is worth mentioning that the data collected from respondents through the questionnaire return was based on a sample size of 204.

Data Collection

A collection of information called data may include words, numbers, measurements, observations, or merely descriptions of various objects. The information obtained from the data can be used to achieve various goals whether it's individual, group, company and so on.

Primary data is information regarding the factors affecting the study topic that has been gathered by researchers themselves or under their direction and supervision. Original, genuine, trustworthy, objective, legitimate, and most crucially unpublished, this data should be acquired by researchers themselves or under their supervision and assistance. (Ganesha & Aithal, 2022)

In this study, our group decided to use primary data as a source of data collection. The primary data we will use is through questionnaires and the questionnaire will be distributed online survey or in any other way to reach the respondents to get primary data.

A questionnaire is a tool consisting of a series of questions or items designed to collect data from respondents regarding their attitudes, experiences, or opinions. Questionnaires are a viable tool for gathering either quantitative or qualitative data. This study has decided to use close ended questions.

The purpose of this analysis will be displayed on the front page of the form that will be distributed to respondents. This is because it aims to tell the respondents the purpose of why this study was conducted so that they can provide more accurate information based on the correct perspective.

Sampling

Data collection should have a systematic process in providing good data based on questionnaires provided by the researcher. Data collection also has good knowledge from various aspects (Sekaran & Bougie, 2009). According to Kumar (2011) data collection can also go through the process of testing hypotheses according to certain phenomena. This study has evaluated three hypotheses based on the dependent and independent variables outlined in the preceding chapter.

Data collection methods need to have original sources in testing hypotheses. A good researcher will also develop a strong reputation to ensure that research methods can be organized according to logic and basis (Olsen, 2011). According to Al Mansor, (2012) he stated that the data collection method has been divided into two approaches namely quantitative approach and

qualitative approach. Quantitative approach is research that addresses the objective of the study through empirical assessors involving measurement and numerical analysis (Boris F.Blumberg et al., 2011). According to (Merrigan & Huston, 2004) the qualitative approach is an approach that does not involve the form of numbers or statistics. Usually, this data collection involves interviews or conversations. The questionnaire also has closed questions for non-involved respondents. This approach can also be measured by mathematical methods (Robert B.burn, 2008). For example, correlation, regression, chisquare, mode, median and mean approaches.

Quantitative analysis and non-probability sampling techniques will be used in this investigation. Instead of testing a hypothesis based on a small number of large populations, these analyses seek to better understand a community (McCombes, 2021). In this analysis, the nonprobability sampling methodology was selected as the best sample strategy. Convenience sampling will be used in this investigation.

Convenience sampling will aid in data collection for researchers. It is the most widely used sampling procedure since it is so quick, easy, and economical (Fleetwood, 2020). This methodology was chosen for this inquiry due to the benefits and practicality of using various sampling approaches in situations when there are large populations.

Research Instrument

A Research Instrument is a tool used to collect, measure, and analyse data related to your research interests. The Research Instrument is usually determined by researchers and is tied to the study methodology.

Table 1: Measurement items

Measurements	Number of items in the questionnaires	Scales used	Author
Section A: Demographic information	4	1-10	
(Dependent Variables) Section B: Factors influences tourism demand	5	1-10	Seyidov and Adomaitienė (2016)
(Independent Variables) Section C: quality of accommodation	5	1-10	Kamata and Misui (2015)
(Independent Variables) Section D: Uniqueness	5	1-10	Jafari (2000)
(Independent Variables) Section F: Service Quality	5	1-10	(Seo, Moon, & Lee, 2015)

Total	24		
-------	----	--	--

DATA ANALYSIS

Researcher will use the use the programmed Statistical Programmers for Social Science (SPSS) version 27 to examine the primary data. SPSS is a program-based data processing and analysis window that allows you to create tables and pie charts. Computers aided researchers in lowering the effort required to determine information and making quantitative analysis easily and quickly. The researcher uses descriptive statistics, reliability statistics, Pearson's correlation, and regression to evaluate quantitative data.

FINDINGS

• Demographic Profile of Respondent

Table 2: Demographic Profile of Sample

CHARACTERISTIC		FREQUENCY	PERCENTAGE (%)
Gender	Male	105	50.5%
	Female	103	49.5%
Age	20 years old and below	19	9.1%
	21 - 30 years old	109	52.4%
	31 - 40 years old	40	19.2%
	41 - 50 years old	33	15.9%
	50 years old and above	7	3.4%
Race	Malay	151	72.6%
	Chinese	15	7.2%
	Indian	42	20.2%
Religion	Islam	152	73.1%
	Buddha	14	6.7%

Hindu	38	18.3%
Christian	4	1.9%

The respondent profile is summarized in Table 2. The total number of respondents for male was 105 respondents while the total of female is 103 respondents. The highest percentage of respondents was respondents in range of age 21-30 years old (52.4%), the second highest is age range 31-40 years old (19.2%). The third one is age range 41-50 years old (19.2%) and the fourth one is age range 20 years old and below and the least total respondents is age range of 50 years old and above.

Besides, there were 208 respondents which consist of Malay with 151 respondents (72.6%), followed by Indian with 42 respondents (20.2%) and lastly Chinese with 15 respondents (7.2%). Meanwhile the highest total number of respondents based on religion is Islam with 152 respondents (73.1%). The second one is Hindu with the total of 38 respondents (18.3%).

RELIABILITY TEST

A reliability test is a method used to evaluate the stability and performance of a system over a specific period and under different testing conditions. It is a crucial tool for assessing the overall reliability of a system. Prior to its distribution through an online survey, a pilot test was administered to a cohort of 30 individuals. The subsequent sample size for the survey was 208 participants.

Table 3: Results of Reliability Test

Variable	Number of Items	Cronbach's Alpha Coefficient	Strength of Association
Quality of Accommodation	5	0.960	Excellent
Service Quality	5	0.963	Excellent
Uniqueness of Destination	5	0.958	Excellent

Tourism Demand	5	0.919	Excellent
----------------	---	-------	-----------

Cronbach's Alpha Coefficient values for the independent and dependent variables in this study are shown in Table 3. Based on the table above, it can be concluded that all the variables were more than 0.9. Consequently, the presented variable is reliable and may be accepted in this study. For dependent variable which is Tourism Demand was measured using five questions, and the Cronbach's Alpha result for this question section was 0.919 which was excellent. As a result, the coefficients derived for the Tourism demand variable were reliable.

Besides that, for independent variable which is Quality of Accommodation, there were five questions in assessing the quality of accommodation variable that affected tourism demand in Malaysia and the result was 0.960 which was excellent. As a result, the coefficients produced for the reliability variable questions were reliable.

Furthermore, there were five questions utilized to measure the service quality that affected tourism demand in Malaysia and the outcome of the result is 0.963 which was excellent. As a result, the coefficients for the safety variables were reliable.

Last but not least, there were five questions utilizes to measure the uniqueness of destination that affected tourism demand in Malaysia and the outcome of the result is 0.958 which was excellent. As a result, the coefficients for the safety variables were reliable.

DESCRIPTIVE ANALYSIS

The present study has conducted an analysis of the mean and standard deviation values pertaining to sections B, C, D, and E of the questionnaire.

Table 4: Descriptive Statistics

Variables	N	Mean	Standard Deviation
Quality of Accommodation	208	8.86	0.961
Service Quality	208	9.024	0.958
Uniqueness of Destination	208	8.826	0.963
Tourism Demand	208	8.95	0.958

Table 4 shows the dependent variable and independent variable, the mean and standard deviation analysis. The independent variable is Quality of Accommodation, Service Quality and Uniqueness of Destination while the dependent variable is Tourism Demand in Malaysia. The highest mean value was Service Quality which is 9.024 where respondent agreed more on this factor. Meanwhile, the lowest mean is Uniqueness of Destination, which shows that the respondents agreed lower for that variable. The data set with the standard deviation of more than 0.9 out of 208 respondents who's more dispensing values.

PEARSON CORRELATION

One of the most important analyses that examined the linear relationship between the two variables was Pearson's correlation analysis. The goal of this study was to see if there were any relationship between the independent variables (quality of accommodation, service quality and uniqueness of destination) and the dependent variable (tourism demand in Malaysia). If the relationship is substantial, the researcher must determine what degree association strength is acceptable

Hypothesis 1

H1: There is relationship between Quality of Accommodation and Tourism Demand in Malaysia

Table 5: Correlation coefficient for Quality of Accommodation and Tourism Demand in Malaysia

		Tourism Demand	Quality of Accommodation
Tourism Demand		.820	1
	Pearson Correlation		
	Sig. (2-tailed)	.000	
	N	208	208
Quality of Accommodation		1	.820
	Pearson Correlation		
	Sig. (2-tailed)		.000

Table 5 shows the Pearson correlation coefficient, the significant value, and the total number of respondent (208). The p-value was 0.000, which was less than 0.01 level of significance. The Quality of Accommodation component and Tourism Demand exhibited a high positive link with a correlation value of 0.820.

Hypothesis 2

H2: There is relationship between Service Quality and Tourism Demand in Malaysia

Table 5: Correlation coefficient for Service Quality and Tourism Demand in Malaysia

	Tourism Demand	Service Quality
Tourism Demand	1	.794
Pearson Correlation		
Sig. (2-tailed)		.000
N	208	208
Service Quality	.794	1
Pearson Correlation		
Sig. (2-tailed)	.000	
N	208	208

Table 5 shows the Pearson correlation coefficient, the significant value, and the total number of respondent (208). The p-value was 0.000, which was less than 0.01 level of significance. The Service Quality component and Tourism Demand exhibited a high positive link with a correlation value of 0.794.

Hypothesis 3

H3: There is relationship between Uniqueness of Destination and Tourism Demand in Malaysia

Table 5: Correlation coefficient for Uniqueness of Destination and Tourism Demand in Malaysia

		Tourism Demand	Uniqueness of Destination
Tourism Demand		1	.781
	Pearson Correlation		
	Sig. (2-tailed)		.000
	N	208	208
Uniqueness of Destination		.781	1
	Pearson Correlation		
	Sig. (2-tailed)	.000	
	N	208	208

Table 5 shows the Pearson correlation coefficient, the significant value, and the total number of respondent (208). The p-value was 0.000, which was less than 0.01 level of significance. The Uniqueness of Destination component and Tourism Demand exhibited a high positive link with a correlation value of 0.781

DISCUSSION AND RECCOMENDATION

The study analyzing the relationship between Quality of Accommodation factors, Service Quality factors and Uniqueness of Destination factor and Tourism Demand in Malaysia. The purpose of this study is to determine the relationship between Quality of Accommodation factors, Service Quality factors and Uniqueness of Destination factor and Tourism Demand in Malaysia

This study suggest that more research need to be conducted on tourists especially foreigner that has traveled in Malaysia. This because this research was limited to Malaysian visitors, which cause to unable to draw further conclusions. The result of this study may differ if its open to international visitors in Malaysia and it will surely could fill out the answers of important questions in surveys.

In addition, the current study is focusing limited to only three characteristics that influence Tourism Demand in Malaysia and potentially ignoring another crucial factor. Future researcher should

consider including additional variables such as economic factored to generate new findings in their research.

Furthermore, the current study also only limited to 384 respondents according the ratio of Krejcie and Morgan (1970) table. Higher sample sizes might be useful to applied to analyzed millions of local tourists to improve the validity and reliability of research data.

Finally, Future researcher could consider using interview methods or open-ended questions. This is because it may provide more specific answer to collect data than online scaling questionnaire. Interviews can yield a high respond rate and enable to clarify any ambiguities. This method could produce more accurate results.

CONCLUSION

In conclusion, these three factors must be addressed together to attract and increase the tourism demand in Malaysia, with more quality services, facilities and marketing strategies. One of method that could boost Tourism Demand in Malaysia is the government should focus more on providing quality services to local tourist, modify or create tourist attraction while following Sustainable Development Goal (SGD) because tourist love uniqueness and something different to experience. The result of this study will aid researcher in better understanding tourism demand in Malaysia. Future research should also consider doing research on well balance population and note solely focus only one group. Last but not least, larger sample size also helps to acquire more precise and accurate findings on this research. Researcher also should consider more variables that may affect more tourism demand in Malaysia.

ABSTRACT

This study intends to investigate how amenities, attractions, and destination perception affect traveller satisfaction among students at Universiti Malaysia Kelantan. Students at the Universiti Malaysia Kelantan city campus received surveys. Using SPSS version 25, 135 data points were collected and subjected to descriptive analysis, reliability testing, and correlation testing. According to the study, there was a strong relationship between tourist satisfaction and attractions, amenities, and destination image. Future research might explore different variables, employ qualitative methodologies, and broaden the population under study.

Keywords: Attraction, Facilities, Destination Image & Tourist Satisfaction

INTRODUCTION

The tourism sector is significant because it contributes significantly to the economies of both emerging and wealthy nations. The term "tourism" has undergone significant change over the past few decades (Vanhove, 2005). It is now widely acknowledged that it encompasses a dynamic transitory aspect (temporary travel), a static element (staying in a particular location aside from the tourist's regular place of employment and abode), and financial repercussions (facilities and services offered). According to a recent definition from UNWTO (2003), tourists are "people who travel to and stay in places outside their usual environment for more than twenty-four hours and not more than one consecutive year for leisure, business, or other purposes not related to the exercise of an activity remunerated from within the place visited."

Significant of The Study

The goal of this study is to examine the relationship between creative work behavior and satisfaction, specifically organisational citizenship behavior and satisfaction of tourists and innovative work behavior and performance at work. For tourist journeys, researchers have examined tourism satisfaction in a variety of ways. This study's primary objective is to find parameters that influence consumer satisfaction with pre-tourism product components. This study employs a quantitative approach, using several data processing tests to demonstrate the validity of the hypothesis. The study's findings also indicate that many travellers from all main groupings of nations find the service level adequate.

LITERATURE REVIEW

Attraction

According to Suanmali (2014), an attraction is anything or everything that pulls tourists to a certain location. Examples of tourist attractions include natural attractions, cultural attractions, and leisure pursuits. According to Lascu et al. (2018), a site's popularity in the eyes of visitors is influenced by its attractions. These attractions include features of the natural world, such as breathtaking river views, parks, roads, underground formations and tunnels, and picturesque mountain and valley panoramas. Another type of attraction is entertainment and events, such as Western musicals, plays,

exhibits, cultural events, festivals, nightlife, and entertainment. This category may also include historical landmarks like historical, heritage, and antique buildings (Rajesh, 2014).

Facilities

The broad variety of elements in a location that support and enable the expansion of the tourist business is referred to as facilities (Swarbrooke and Horner, 2001). Numerous viewpoints on the significance of infrastructure, tourist infrastructure, and recreational amenities have been highlighted in the literature. Hansen (1965) views infrastructure as a blend of economic and social overhead capital, much as Mera (1973). In contrast to economic capital, social capital emphasises developing human capital, particularly through publicly sponsored social services. Roads, bridges, and other productive endeavours are supported by economic capital. Using public health and education as examples. It refers to all the services visitors utilise before, during, and after their visits, according to Lohmann and Netto (2017).

Destination Image

They concluded that analysing images only in terms of lists of attributes would not accurately capture the multidimensionality of ideas, and they recommended understanding images as consisting of components from three categories: attribute/holistic, functional/psychological and common/unique. As a result, some include new image components and produce more thorough builds. For example, Baloglu and Brinberg (1997) use a broad term from several authors: Image consists of people's thoughts, ideas and impressions about places or travel destinations. Crompton's formulation (1979) includes aspects of the emotive component, cognitive awareness, and simple evaluation.

Tourist Satisfaction

Tourist satisfaction is often defined as travellers' favourable evaluations of their travel experiences, whereas travellers' irritation with their travel experiences is conveyed in negative reviews (Xu & Li, 2016). The outcome of a tourist's trip experiences at the destination is whether or not they met or exceeded their pre-trip expectations. Similarly, Chiu, Zeng, and Cheng (2016) asserted that "tourist satisfaction" relates to how visitors evaluate their prior views and expectations. When visitors' impression surpasses their initial expectations, they feel satisfied.

Research Hypothesis

There is no formal hypothesis, and it is possible that the study's goal is to explore a particular subject thoroughly to produce a particular hypothesis or prediction that can be verified in subsequent investigations. An investigation may contain one or more hypotheses. The hypothesis of this research:

H1: There is a relationship between attraction and tourist satisfaction among Universiti Malaysia Kelantan students

H2: There is a relationship between facilities and tourist satisfaction among students at Universiti Malaysia Kelantan

H3: There is a relationship between destination image and tourist satisfaction among students at Universiti Malaysia Kelantan

Research Framework

The three factors that make up the independent variable that will be proposed are attraction factor, accessibility factor, and destination image factor is a factor influencing tourist satisfaction while travelling among students at Universiti Malaysia Kelantan.

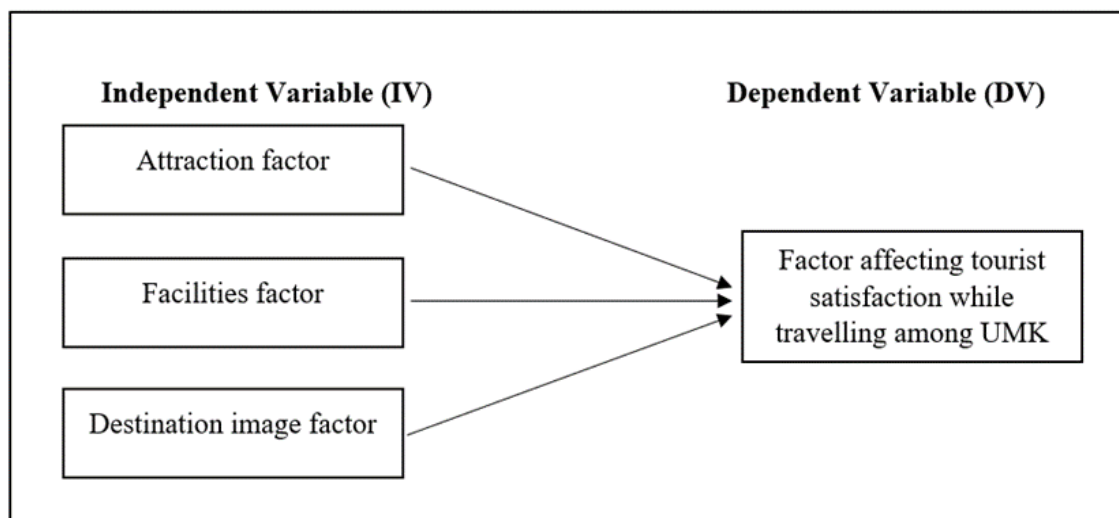

Figure 1: Conceptual Framework

METHODOLOGY

It is defined as using research information while applying something to a planned outcome. The research process, data collection techniques, sampling plan, and presented work form a large part of the analytical approach. From the above statement, it can be concluded that what conveys the definition of research is a methodical and objective effort to gather or collect correct and useful facts. The process of reviewing and researching studies systematically and fairly is known as methodology.

Research Design

The conceptual model that this study proposes adequately describes the perception of quality destinations in tourist satisfaction by combining multiple research models. The link between gender and visitation frequency will affect both of these characteristics, which is another crucial issue to take into account.

Data Collection

Primary data, or information acquired directly from sources by researchers utilising an online survey, will be used in the research project to gather data. In this study, respondents were given questionnaires to complete in order to gather primary data. The survey, usually referred to as an online questionnaire, will be disseminated online.

The purpose of this analysis was stated in the covering letter included with the form that was distributed to the respondents. As a result, respondents can understand the motivation and purpose of this study, allowing them to generate more accurate data. The questionnaire was distributed to 100-350 respondents of tourist satisfaction while traveling.

Sampling

This random sampling method refers to the collection of information to participate in research studies from members of the population (Sekaran, 2009). Therefore, by using random sampling, the number of people is large, including all individuals. Random sampling method was used for sampling in this study.

This study simulates the relationship between tourist satisfaction and destination attributes and looks at the extent to which emotional involvement mediates between tourist satisfaction and destination attributes. Studies have examined the antecedents of the consequences of tourists' satisfaction with their chosen destination.

Data Analysis

This study simulated the factor affecting tourist satisfaction while travelling among UMK students. The findings revealed that attraction factors, accessibility and destination image factor influenced tourist satisfaction directly and indirectly.

FINDINGS

Demographic analysis

Demography is the study of populations, including their size, composition, and changes across time. It is relevant in this context because it has to do with counting births, deaths, emigration, and other significant occurrences that directly affect population fluctuations and, in turn, have an impact on factors like age distribution and population size and composition. There are numerous ways to get information and data about visitor pleasure. The relationships between demographic characteristics like age and life-changing occurrences like births or socioeconomic variables that affect these occurrences like the effect of fertility rates on the degree of child dependence on the working population and demand for educational services are some other issues in demographic analysis.

GENDER/JANTINA

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Female/Perempuan	96	61.9	61.9	61.9
	Male/Lelaki	59	38.1	38.1	100.0
	Total	155	100.0	100.0	

RACE/BANGSA

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Chinese/Cina	5	3.2	3.2	3.2
	Indian/India	5	3.2	3.2	6.5
	Malay/Melayu	134	86.5	86.5	92.9
	Other/Lain-lain	11	7.1	7.1	100.0
	Total	155	100.0	100.0	

AGE/UMUR

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	21-25 year old/21-25 tahun	103	66.5	66.5	66.5
	21-30 year old/21-30 tahun	35	22.6	22.6	89.0
	26-30 year old/26-30 tahun	5	3.2	3.2	92.3
	31-35 year old/31-35 tahun	4	2.6	2.6	94.8
	31-40 year old/31-40 tahun	1	.6	.6	95.5

35 year old and above/35 tahun dan keatas	2	1.3	1.3	96.8
Less than 20 year old/kurang dari 20 tahun	5	3.2	3.2	100.0
Total	155	100.0	100.0	

MARITAL STATUS/STATUS PERKAWINAN

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Married/Berkhawan	11	7.1	7.1	7.1
	Single/Bujang	144	92.9	92.9	100.0
	Total	155	100.0	100.0	

EDUCATIONAL LEVEL/PERINGKAT PENDIDIKAN

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Bachelor of Degree/Sarjana Muda	133	85.8	85.8	85.8
	Diploma	15	9.7	9.7	95.5
	Doctor of Philosophy/Doktor Falsafah	5	3.2	3.2	98.7

Secondary School/Sekolah Menengah	2	1.3	1.3	100.0
Total	155	100.0	100.0	

Descriptive analysis

To highlight the most important aspects of the data in an organisation, a descriptive statistic is utilised. There are enthralling insights that are divided into proportions of local predilection and proportions of inconstancy. Local propensity proportions are made up of mean, median, and mode, whereas fluctuation proportions are made up of standard deviation, change, base and most extreme variables, kurtosis, and skewness.

Data must be studied with these purposes in mind since, in the eyes of the content analyst, they are representations of meanings expressed through texts, images, and other expressions rather than actual events (Krippendorff, 2004).

DV: Tourist Satisfaction

Descriptive Statistics

	N	Minimum	Maximum	Mean	Std. Deviation
I think there are a lot of tourism places around Malaysia/Saya rasa terdapat banyak tempat pelancongan di sekitar Malaysia	155	1	5	4.45	.968
I think the price of traveling is cheap for me/Saya rasa harga melancong adalah murah bagi saya	155	1	5	3.37	1.038

I prefer to use my time in good way like traveling/Saya lebih suka menggunakan masa saya dengan cara yang baik seperti melancong	155	1	5	4.05	.963
I travel because want to release stress/Saya melancong untuk menghilangkan rasa stress	155	1	5	4.20	.929
Information from mouth-to-words influences travel for me/Maklumat dari mulut ke perkataan mempengaruhi perjalanan untuk saya	155	1	5	3.94	1.064
Valid N (listwise)	155				

IV1: Attraction

Descriptive Statistics

N	Minimum	Maximum	Mean	Std. Deviation
---	---------	---------	------	----------------

Promoting attraction via social media such as Instagram, Twitter and WhatsApp attract me to travel/Mempromosikan tarikan melalui media sosial seperti Instagram, Twitter dan WhatsApp menarik saya untuk melancong	155	1	5	4.43	.868
Cultural differences make me want to know them and visit them/Perbezaan budaya membuatkan saya ingin mengenali mereka dan melawat mereka	155	1	5	4.27	.892
I choose the destination because of the high quality of the universe, which seems to be a big attraction for visitors when choosing a vacation spot/Saya memilih sesuatu destinasi itu kerana kualiti alam semesta yang tinggi, yang menjadi tarikan utama pengunjung apabila memilih tempat percutian	155	1	5	4.28	.930

I travel because i am attracted to historical places/Saya melancong kerana saya tertarik dengan tempat bersejarah	155	1	5	4.03	.980
I think food is one of the factors I prefer to travel/Saya rasa makanan adalah salah satu faktor saya lebih suka melancong	155	1	5	4.31	.951
Valid N (listwise)	155				

IV2: Facilities

Descriptive Statistics

	N	Minimum	Maximum	Mean	Std. Deviation
There are many good facilities for traveling/Terdapat banyak kemudahan fasiliti yang baik untuk melancong	155	1	5	4.04	.973
I did a survey for convenience in social media before traveling/Saya membuat tinjauan untuk kemudahan fasiliti pelancongan dalam media sosial sebelum melancong	155	1	5	4.26	.933

Facilities are important for comfort when on vacation/Kemudahan fasiliti di tempat percutian penting untuk keselesaan ketika bercuti	155	1	5	4.45	.913
I think a comfortable facility is one factor while traveling/Saya rasa kemudahan fasiliti yang selesa adalah salah satu faktor semasa melancong	155	1	5	4.43	.918
Various facilities make me attractive to travel/Pelbagai kemudahan membuatkan saya menarik untuk melancong	155	1	5	4.42	.829
Valid N (listwise)	155				

IV3: Destination Image

Descriptive Statistics

N	Minimum	Maximum	Mean	Std. Deviation
---	---------	---------	------	----------------

I would be proud to tell other people about Malaysia/Saya akan berbangga untuk memberitahu orang lain tentang Malaysia	155	1	5	4.52	.792
In general, i have a great perception of the value of my holiday in Malaysia/Secara umumnya, saya mempunyai persepsi yang hebat tentang nilai percutian saya di Malaysia	155	1	5	4.34	.877
Malaysia has clean and organized beaches/Malaysia mempunyai pantai yang bersih dan teratur	155	1	5	3.94	1.017
Malaysia has freash and oxygen-rich air/Malaysia mempunyai udara segar dan kaya dengan oksigen	155	1	5	4.08	.993
Good variety of plant and animals/Pelbagai haiwan dan tumbuhan yang baik	155	1	5	4.28	.881
Valid N (listwise)	155				

Reliability analysis

A reliability system is used to assess a system's stability and overall performance over a specified time frame and under various distinct testing scenarios. The Cronbach Alpha reliability coefficient, which estimates the Cronbach Alpha coefficient, is validated in order to obtain and gain the reliability of the tourist satisfaction measurement, indicating that an instrument is impartial and ensuring that it is consistent to measure various items at various times.

Variable	Cronbach's Alpha	No of Item	N
Tourist Satisfaction	0.828	5	155
Attraction	0.908	5	155
Facilities	0.906	5	155
Destination Image	0.893	5	155
All Variable	0.937		155

Pearson correlation

The temporary correlation coefficient of the product was also known as the Pearson correlation tourist attraction. It is represented by r in a sample. Following that, a sample of the population was taken and described. With a non-unit scale, a value between 1 and +1 will be utilised to determine the coefficient. When the positive correlation coefficient had a positive sign, the positive correlation was also present. If the correlation coefficient was negative, there would have been a negative correlation (Philip, 2012).

Hypothesis	Pearson's correlation results
H1: There is a significant relationship between attraction and tourist satisfaction.	$r = 0.652, p < 0.01$ Moderate
H2: There is a significant relationship between facilities and tourist satisfaction.	$r = 0.629, p < 0.01$ Moderate
H3: There is a significant relationship between food related motivation and food satisfaction	$r = 0.408, p < 0.01$ Low

DISCUSSION AND RECOMMENDATION

The facilities variable had the highest mean value in the descriptive analysis for the independent variables, at 4.3187, followed by the attraction variable at 4.2619. Destination image 4.2310 had the lowest mean value among the independent factors. The dependent variable's mean value was 4.0013. It may be concluded that amenities affected UMK students' traveller satisfaction.

The researchers used the Correlation Analysis to gauge the linear relationship between the two variables designated as the study's goals. The correlation for hypothesis 1, which refers to facilities, is 0.652 (moderately positive). The correlation value for proposition number two, which is about attraction, is 0.629, which is somewhat positive. The correlation result for hypothesis three, which is the destination image, is 0.408 (low positive).

Since this study solely focused on UMK students, it proposes that more research may be done generally on non-specialized visitors vacationing in Malaysia to determine if there are any common findings. If this study were to be conducted on international visitors to Malaysia, the findings could be different. Therefore, in addition to UMK students, there are international visitors who will respond to the questionnaire. Additionally, just three factors that affect how Malaysian tourists behave are the subject of the current study. Other significant factors do, however, illustrate how Malaysian visitors behave. Future researchers will be able to suggest new variables, such economic factors, to include fresh information into their research. There are just 155 samples in this study, hence the market can be deemed tiny. The amount will be enough and acceptable, and a bigger sample size can be utilised to organise the millions of domestic visitors from Malaysia, claim Krejcie & Morgan (1970). Therefore, future researchers should expand their sample size in order to improve the study's accuracy and dependability.

CONCLUSION

In order to better understand how students from Universiti Malaysia Kelantan perceive their travel experiences, this survey was done. Important variables (independent variable), such as attractions, amenities, and destination image, have an impact on tourist satisfaction (dependent variable) among students at Universiti Malaysia Kelantan. To gather all data and facts, researchers also employ a quantitative technique. The findings of the questionnaire survey were examined using a number of techniques, including frequency analysis, descriptive analysis, reliability analysis, and correlation analysis. The results from the previous chapter and all the data from the questionnaire were examined using the statistical programme SPSS 25 (Statistical Package for the Social Science). This programme was chosen by the researchers because it made it simple to obtain all the results. Additionally, this study offers shortcomings and suggestions that could be helpful for future investigations.

ABSTRACT

The development of information and communication technology (ICT), including social media, mobile technology, artificial intelligence, and the Internet of Things, has completely changed the tourism sector. Focuses on young tourists because they use the Smart Tourism Technology almost in their daily life and become a need for them. For example, when people travel to other places or destinations, the environment will be changed regarding the current destination. They have to adapt with the new environment and also new cultures depending on their location. Aims of study to examine the relationship between smart tourism technologies with accessibility, security and informativeness among young tourists in Kelantan. This study has used convenience sampling techniques which are quantitative studies to ensure the intention is guaranteed. A total 217 respondents participated to answer all the questions in this survey. As a result, the Accessibility variable had the highest mean value in the descriptive analysis and findings for the independent variables which is 4.1963, this can be seen that the most important factor among the other factors is Accessibility.

Keywords : Smart Tourism Technology, Smart Tourism, Intentions Towards STT, Security, Informativeness, Accessibility.

INTRODUCTION

The main goal of this study is to better understand how smart tourism technology may better serve young tourists in Kelantan by emphasizing accessibility, information, and security. The purpose of this study was to determine the extent to which smart tourism technology has an impact on young tourists from Kelantan. In fact, this study also aims to look into how participants use smart tourism technologies when traveling in Kelantan. The tourists of the study, statement of the problem, objective of the study, research question, importance of the study, scope of the study and chapter summary follow the chapter introduction in this study.

SIGNIFICANCE OF STUDY.

There is growing interest in the educational element of tourism as the field of study of tourism develops and as the number of higher education institutions devoted to tourism continues to grow globally. As the body of knowledge on the subject of tourism is now growing, research into education-related fields is also rising (D Airey, J Tribe, 2006). Information and communication technology (ICT)-based resources make it easier for students to access travel and hospitality-related goods, services, locations, and experiences. By enhancing and expanding these resources, urban intelligence is improved and student participation is raised. Title of the study is Factors that Influence Young Tourists' Intention to Use Smart Tourism Technology in Kelantan. Understanding how students use tourist technology as a platform to help them develop ideas and knowledge is the goal of this project. This study also examines how students respond while deciding to participate in services and physical activities. The results of this study show how important smart tourism technology is to youthful travelers in Kelantan.

LITERATURE REVIEW

1. Accessibility.

The term "accessibility" refers to how a person may use various types of SST to access and use the information offered at the destination. To be accessible or accessible, travelers and technologies must be able to interact with, reach, and be accessed by other organizations (Kim and Garrison, 2009).

2. Informativeness.

The extent to which a website offers users the information they require to be seen as knowledgeable and helpful is characterized as informativeness, according to Pavlou et al. (2007).

3. Security.

When doing different transactions, security refers to how private personal information is. (Park, YA; Gretzel, U., 2007). The protection of personal information when utilizing different forms of STTs is referred to as security.

4. Intention to use Smart Tourism Technology. (STT)

"Smart tourism technology" (STT), as defined by Yoo et al. (2017), is any interactive technology that is used by various tourists to gather data, carry out transactions, communicate, and create content. According to Neuhofer et al. (2015), "smart tourism" is a collection of applications that enhance the traveler's experience and offer value to customers.

Research Hypothesis

It implies that a relationship between an independent variable and a dependent variable is reliable. Therefore, according to the research:

H1 : To examine the relationship between informativeness with intention to use Smart Tourism Technology among tourist in Kelantan.

H2 : To examine the relationship between security with intention to use Smart Tourism Technology among tourist in Kelantan.

H3 : To examine the relationship between accessibility with intention to use Smart Tourism Technology among tourist in Kelantan.

Research Framework

Figure 1 below shows the conceptual framework that was used in this study.

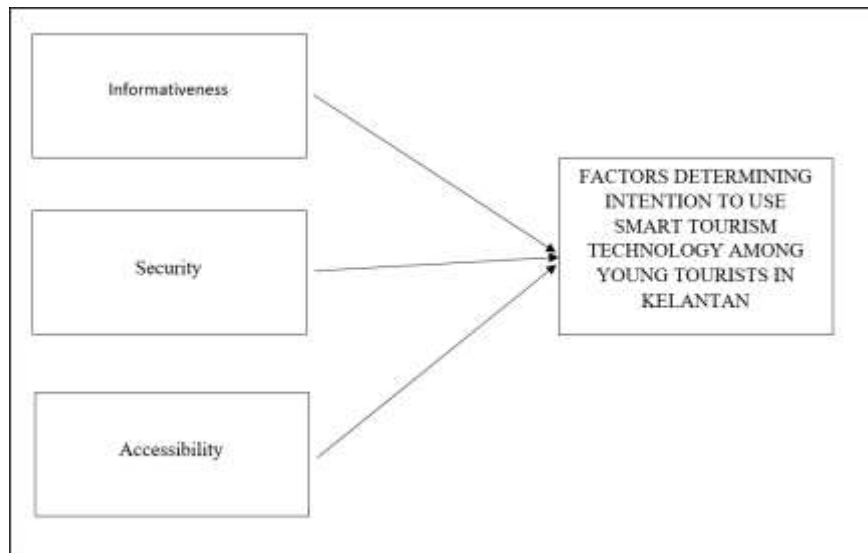

Figure 1 Conceptual framework of informativeness, security and accessibility toward intentions to use smart tourism technology among young tourists in Kelantan.

METHODOLOGY

It is described as the process of applying knowledge from research to a predetermined result. A significant portion of the analytical approach is formed by the study methodology, data gathering strategies, sample design, and presented work. As may be inferred from the aforementioned statement, research is an organized, objective activity with the goal of acquiring reliable information. The term "methodology" refers to the methodical, impartial procedure of evaluating and investigating studies.

Research Design

When conducting a study, a certain approach known as research design must be followed that specifies the time frame, the data sources, and the conditions under which the data will be acquired (Cooper & Schindler, 2008). Making sure that the data-based evidence can effectively and convincingly address the research topic is the goal of study design (Vaus, 2001). Because it is simple to get data from people based on our independent variable and dependent variables, we used a quantitative research design for our study.

Data Collection

The collection of data is essential to statistical analysis. As the primary technique of data collection for this research, respondents answered the questionnaires. The package of surveys will include a cover letter. The content of the respondent's research objective will be shown on the top page. This will inform the responder about the motivation behind and goal of our study. There are 5 checkboxes in the area that respondents must complete in order to provide a response, and the data they provide is what we use for the study. Young travelers in Kelantan get the questionnaire.

Sampling

Refers to (Alvi, 2016), sampling is the process of removing a sample from a population. Sampling can be used to infer a population or to generalize a theory (Hamed, 2016). Using this random sample approach, the information about the population that willing to participate in the research is acquired (Sekaran, 2009). Since there are several people, a random sampling is employed to ensure that each person is considered. Cluster random sampling was used for this study's sample selection.

Data Analysis.

The process of analyzing data entails meticulously scrutinizing each element of the information provided while using logic and science to the evaluation. Conducting an exploratory test

has a wide range of alternatives, including this form of inspection. Data obtained, reviewed, and then deconstructed from numerous sources are used to frame a finding or end type. Explicit information research techniques include information mining, content evaluations, business insight, and information perceptions. The data acquired were assessed using the Statistical Package for the Social Science Version 24(SPSS). A complete range of statistical tools, such as IBM SPSS version 24, is available for processing statistical data and producing a variety of outputs in order to respond to an objective investigation.

FINDINGS.

Demographic Analysis

The fundamental analysis of this investigation comprised a frequency analysis. The information from Section A of the questionnaire includes inquiries on the respondents' gender, age, race, status, level of education, and occupation. The respondents' race and ethnicity were two additional demographic characteristics. The respondents' demographic characteristics were shown using a table and a pie chart.

Table 1 : Descriptive analysis for Demographic Profile

		GENDER			
		Frequenc		Valid	Cumulative
		y	Percent	Percent	Percent
Valid	Female	178	82.0	82.0	82.0
	Male	39	18.0	18.0	100.0
	Total	217	100.0	100.0	

RACE

		Frequenc y	Percent	Valid Percent	Cumulative Percent
Valid	Chinese	2	.9	.9	.9
	Indian	2	.9	.9	1.8
	Malay	203	93.5	93.5	95.4
	Others	10	4.6	4.6	100.0
	Total	217	100.0	100.0	

AGE

		Frequenc y	Percent	Valid Percent	Cumulative Percent
Valid	21-30 years old	199	91.7	91.7	91.7
	Less than 20 years old	5	2.3	2.3	94.0
	More than 30 Years old	13	6.0	6.0	100.0
	Total	217	100.0	100.0	

MARITAL STATUS

		Frequenc y	Percent	Valid Percent	Cumulative Percent
Valid	Married	19	8.8	8.8	8.8
	Single	198	91.2	91.2	100.0
	Total	217	100.0	100.0	

EDUCATIONAL LEVEL

		Frequenc y	Percent	Valid Percent	Cumulative Percent
Valid	Bachelor of Degree	193	88.9	88.9	88.9
	Diploma	11	5.1	5.1	94.0
	Master Degree	9	4.1	4.1	98.2
	Primary School	1	.5	.5	98.6
	Secondary School	3	1.4	1.4	100.0
	Total	217	100.0	100.0	

OCCUPATION

	Frequency	Percent	Valid Percent	Cumulative Percent
Valid Employed	24	11.1	11.1	11.1
Student	192	88.5	88.5	99.5
Unemployed	1	.5	.5	100.0
Total	217	100.0	100.0	

Descriptive Analysis

A descriptive statistic is used in an organisation to highlight the most important aspects of the data. Remarkable reports are divided into proportions of local predilection and proportions of inconstancy. The components of local propensity proportions are mean, median, and mode, whereas the components of fluctuation proportions are standard deviation, change, base and most extreme factors, kurtosis, and skewness.

Table 2 : Descriptive analysis for Intention to Use Smart Tourism

DV: Intention to Use Smart Tourism

	N	Minimum	Maximum	Mean	Std. Deviation
I can easily find smart tourism technology	217	1	5	3.94	.803

I can easily use smart tourism technology apps and websites.	217	1	5	4.04	.741
I can access smart tourism technology apps and websites at everywhere and anytime	217	1	5	4.13	.711
I have quick access to smart tourism technologies from a number of other similar apps and websites	217	1	5	4.00	.782
I can search without a complicated sign-up process while using smart tourism technology	217	1	5	3.97	.841
Valid N (listwise)	217				

Table 3 : Descriptive analysis for Accessibility

IV1: Accessibility

	N	Minimum	Maximum	Mean	Std. Deviation
Do you use smart tourism technology while traveling	217	2	5	4.06	.780
Does smart tourism technology help in planning trip	217	1	5	4.24	.686
Using smart tourism technology help me reach my destination conveniently	217	1	5	4.24	.699
Using smart tourism technology increase my interest to visit the place	217	1	5	4.25	.677

Using smart tourism technology can prevent from congestion while traveling	217	1	5	4.05	.832
Valid N (listwise)	217				

Table 4 : Descriptive analysis for Informativeness

IV2: Informativeness

	N	Minimum	Maximum	Mean	Std. Deviation
I can find relevant information about the travel destination by using smart tourism technology	217	1	5	4.31	.675
Smart tourism and technology apps and website are helpful for evaluating the destination and the trip	217	1	5	4.23	.695

Smart tourism technology enable me to complete my trips with the full information that has provided	217	1	5	4.14	.739
I can reduce my concern about my trip by using smart tourism technology apps and websites	217	2	5	4.12	.707
It easy to share tourism information content on smart tourism application and website	217	2	5	4.19	.650
Valid N (listwise)	217				

Table 5 : Descriptive analysis for Security

IV3: Security

N	Minimum	Maximum	Mean	Std. Deviation
----------	----------------	----------------	-------------	-----------------------

When i use smart tourism technology, i believe my privacy is protected	217	2	5	3.73	.801
Smart tourism technology provides adequate security to protect my personal information	217	2	5	3.77	.759
I have doubt about how well my privacy is protected when i use smart tourism technology application and websites	217	1	5	3.87	.874
I am concerned with the security of sensitive information when i use tourism websites and application	217	1	5	4.18	.711

My personal information be misused to illegal access when using smart tourism technology	217	1	5	3.74	.947
Valid N (listwise)	217				

Reliability analysis

Utilizing reliability analysis, the surveys' dependability was evaluated. The reliability and internal consistency of the data were examined using Cronbach's Alpha analysis. According to Hair et al.'s (2007) Rules of Thumb for Cronbach's Alpha coefficient size, see the table below.

Table 6 : Result of Reliability analysis

Variables	Number of Item	Cronbrach's Alpha Coefficient	Strength of Association.
Accessibility	5	0.644	Moderate
Informativeness	5	0.608	Moderate
Security	5	0.551	Poor

Pearson Correlation

One of the key techniques for establishing a relationship between the variables was Pearson's correlation study. The goal of this research was to look at the data to see if there was any correlation between the dependent variable, which was the factor influencing young tourists in Kelantan's intention to utilise smart tourism technology, and the independent variables, which were informativeness, security, and accessibility. If the correlation is substantial, researchers must decide if the strength of the association is appropriate. The following information illustrates the general guideline for interpreting a correlation coefficient's size in order to support that assertion.

Table 7 : Summary of Pearson Correlation results

Hypothesis	Pearson's correlation results	
H1: There is a significant relationship between accessibility and intention to use smart tourism technology	r = 0.644, p < 0.01	Moderate
H2: There is a significant relationship between informativeness and Intention to use smart tourism technology	r = 0.608, p < 0.01	Moderate
H3: There is a significant relationship between security and Intention to use smart tourism technology	r = 0.551, p < 0.01	Low

DISCUSSION AND RECOMMENDATION

The accessibility variable had the highest mean value in Descriptive Analysis for the independent variables, 4.1963, then the security variable, 4.0175. The independent variable with the lowest mean value was informativeness (3.8571). The dependent variable's mean value was 4.1668. It is possible to conclude that accessibility has an impact on the intention to use smart tourism technology among young tourists in Kelantan, as well as satisfaction while traveling among UMK students.

This study advises that more research be done on foreign tourists because the study focused on young tourists in Kelantan to see whether there are any parallels in the findings. If this study is

applied to international tourists in Kelantan, the findings may alter. As a result, instead of focusing just on local visitors, other foreigners were asked to complete the questionnaire. Furthermore, the study focuses on the variables that influence young tourists' intentions to use smart tourism technology in Kelantan. However, this study may have overlooked other major elements that impact the factor among young tourists in Kelantan. As a result, future researchers suggested that other variables, such as economic characteristics, be included in their research to include new discoveries. There are only 217 samples in this survey. The number will be sufficient and suitable, according to Krejcie and Morgan (1970), and a bigger sample size may be employed to organize the millions of Malaysian domestic visitors.

CONCLUSION

This study's final objective was to look at the factors that affect young visitors' intentions to use smart tourism technology in Kelantan. Accessibility, informativeness and security are the independent variables that have an effect on the dependent variable among young visitors in Kelantan. The researchers take a quantitative strategy to gather all the data and information. The findings from the questionnaire survey were evaluated using a variety of techniques, including descriptive analysis, reliability analysis, and correlation analysis. The findings of the preceding chapter and all of the questionnaire data were examined using the Statistical Package for the Social Sciences (SPSS) 25 software. Additionally, this study provides recommendations and limits that may be helpful for future studies.

ABSTRACT

Adventure tourism is the migration of individuals from one place to another outside their comfort zone for exploration or travel to remote, exotic, and sometimes violent regions. Regardless of the poor economic circumstances that may be leading more young people to abandon adventure tourism. Since most of them are studying and some of it still new at work, they don't plan to spend their money on adventure tourism because there are more focused on saving money for their future, like buying a house, or car, or getting married and many more. This study aims to examine the relationship between place attraction, facilities and environmental education on youth's intention to do adventure tourism in Kelantan. To ensure the intention is guaranteed, a research method is conducted quantitatively. A total of 161 respondents participated to answer all question in this survey. Facilities received the highest mean score of 4.410 in data analysis and finding, indicating that this is the most important factor.

Keywords: Adventure Tourism, Place Attraction, Facilities, Environmental Education, Youth's Intention

INTRODUCTION

This study focused on the factors that build youth's attention to do adventure tourism activities in Kelantan. The first chapter comprises the study's context, problem statement, research aims and questions, scope of investigation, significance of study (including practical and theoretical contribution), definition of words, and a summary of the entire chapter one.

SIGNIFICANCE OF THE STUDY

Adventure Tourism

Adventure tourism, as defined by the Adventure Travel Trade Association (ATTA), refers to a type of vacation that incorporates physical activity, engagement with the natural environment, and cultural immersion. In contrast to previous definitions and debates, which focused on the notion of risk, the discussion on the importance of risk has been deemed unproductive. Although risk has been a

prominent aspect in earlier literature reviews, the argument regarding its role in adventure tourism experiences continues. In his work, Buckley (2012) suggests a conceptual approach that considers the concept of 'rush' to analytically demonstrate that while danger holds significance, it is not the primary factor in adventure tourism experiences.

LITERATURE REVIEW

Place Attraction

Place attractions play a crucial role in tourism as they serve as the driving factors that attract visitors. These attractions encompass a wide range of natural and cultural locations, historical sites, monuments, zoos, game reserves, aquaria, museums, art galleries, gardens, architectural landmarks, theme parks, sports facilities, festivals, events, wildlife, and people. According to Lew (2000), any element that is labeled and promoted as an attraction within a tourism system becomes one. There are three main types of place attractions: natural, man-made, and special events. Natural attractions are inherent features of a location that occur naturally and can be found worldwide (Boniface et al., 2020). On the other hand, man-made attractions are specifically designed for tourism purposes, either originally or repurposed from their original function (Camilleri, 2018). Purpose-built place attractions are designed explicitly with tourism in mind. Sports activities are highly popular tourist attractions, and they can be classified into three types: spectating, participation, and stadium tours. Special events come in various forms and sizes, offering limitless possibilities for creating unique experiences. Examples of special events include markets, festivals, parades, exhibits, and entertainment venues. For instance, an entertainment establishment that tourists enjoy visiting can be considered a special event (Pearce & Wu, 2018). These events can vary in size, ranging from large to small, and they can be permanent or temporary structures. Some entertainment venues may serve multiple purposes or have been repurposed for their current tourism-related function.

Facilities

Tourism is created when the service element is combined with one of the other three factors: attraction, housing, or transportation (Provotorina et al., 2020).). As a result, one of the fundamental components of tourism is facilities, including pull factors. In other terms, it is the spirit or core of tourism. Travelling by bus or train, for example, is not tourism. It includes the services of reservation, booking, ticketing, and information provision. Facilities are all of the services and facilities that are required to make guests feel at ease when travelling. These include lodging, various forms of entertainment,

picnic spots, leisure, information and communication, and sightseeing possibilities. They encompass a wide array of facilities, such as arts, music, dance, restaurants, bars, shopping outlets, sports facilities, swimming areas, relaxation spots, food options, healthcare services, and communication resources. These amenities contribute to the overall experience of travelers and facilitate their enjoyment during their journeys.

Environmental Education

Environmental Education (EE) is a transformative process that enables individuals to develop an awareness of their surroundings and acquire knowledge, skills, values, experiences, and the motivation to address current and future environmental issues (Hadjichambis & Paraskeva, 2020). It aims to foster attitudes, motivations, and commitments that lead to informed decision-making and responsible action-taking. This is achieved by enhancing people's understanding and awareness of the environment and its challenges, cultivating the necessary skills and expertise to tackle these challenges, and promoting attitudes, motivations, and commitments to take proactive measures. The goal of EE is to cultivate informed citizens who possess knowledge about the biophysical environment and its associated challenges. They are equipped with the capacity to contribute to the resolution of these problems and are motivated to work towards their mitigation. EE should provide a holistic, lifelong education that is responsive to the ever-changing world, providing an understanding of the critical issues facing the modern world. It also equips individuals with the necessary skills and qualities to make positive contributions to enhancing quality of life and safeguarding the environment, while upholding ethical principles.

Intention To Do Adventure Tourism

The intention is a good substitute for motivation-related factors, as it is a plan or motivation to act. According to Tapar, Dhaigude, & Jawed (2017) The likelihood of improved performance is determined by the degree of intent for a specific behaviour. It is a mental state where a person has chosen a course of action when they have an intention, and those that are successful carry through the planned course of action, while those that are failed do not. According to Sherran & Webb (2016) Intentions are what people tell themselves to do to get the desired results. Intentions are what people tell themselves to do in order to get the results they want, and interventions that support public health,

energy conservation, educational goals, and organisational outcomes typically rely on frameworks that view intentions as a key determinant of behaviour change.

Research Hypothesis

The hypothesis of this reserach is to find out whether there are any correlations or relationships between dependent variables and independent variables:

- H₁** There is a significant relationship between place attraction and youth's intention to do adventure tourism activities in Kelantan.
- H₂** There is a significant relationship between facilities and youth's intention to do adventure tourism activities in Kelantan.
- H₃** There is a significant relationship between environmental education and yout's intention to do adventure tourism activities in Kelantan.

Research Framework

Figure 1 below shows the research framework used for this study.

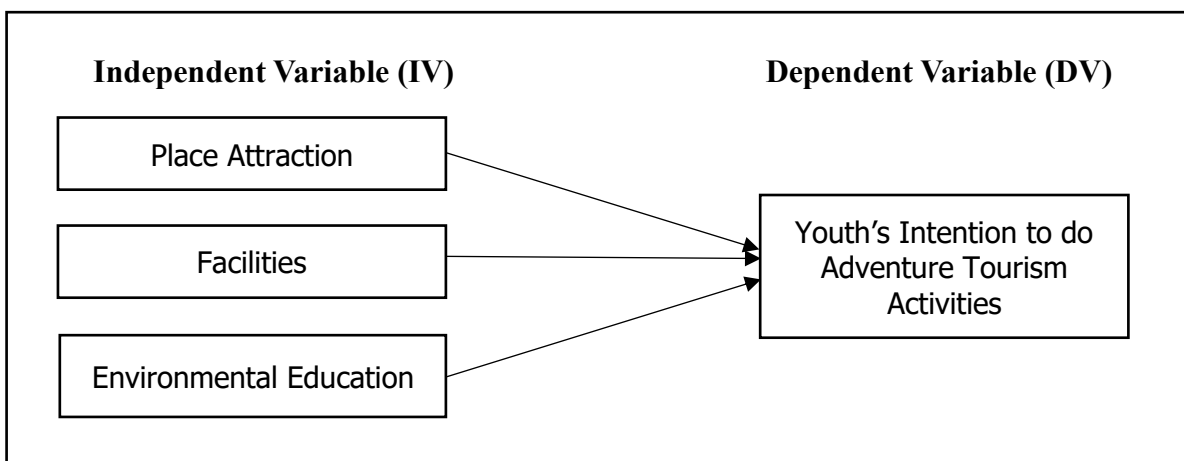

Figure 1: Research Framework

METHODOLOGY

Research Design

The development of the research design refers to the general strategy that the researcher selected to combine the study's various aspects in a logical and reasonable point. Descriptive analysis has been chosen to determine the components that contribute to the factors that build the youth's intention to do adventure tourism activities in Kelantan. It is also referred to as quantitative analysis, which

describes phenomena as they occur. This form of research describes social circumstances, social arrangements, social environments, etc. The observer follows and identifies what he/she discovered. The descriptive analysis intent on rendering the characteristics of a specific group or scenario closely may carry out a narrative review about the works in a company, their age circulation, their society-wise allocation, their educative status, and so on.

Data Collection

Data collection involves systematically gathering and analyzing relevant information on specific variables to address research questions, test hypotheses, and evaluate findings. In this particular study, data was collected through a survey that utilized questionnaires. Questionnaires serve as a tool for collecting data by posing a series of questions to respondents. The use of questionnaires in this study offers several advantages. Firstly, it is a standardized method, making it less expensive and easier to manage compared to alternative data collection methods. Additionally, due to the large number of participants in this study, questionnaires provide an efficient means of gathering data and information. Each survey will be accompanied by a cover letter that explains the research purpose to the respondents, ensuring they understand the motivation and goals of the study. The questionnaire consists of four sections that participants will need to complete by selecting appropriate answers. The responses provided by the participants will serve as the data collected for the research. The questionnaires are being distributed among the youth population in Kelantan.

Sampling

In this study, non-probability convenience sampling was utilized. Non-probability sampling, despite its limitations, can be valuable, particularly when dealing with large populations (Etikan et al., 2016). Convenience sampling is a straightforward and cost-effective method, as it involves selecting respondents who are readily available and accessible. Since the respondents play a key role in providing data, questionnaire results can be utilized for research purposes (Dudovskiy, 2018). This approach allows researchers to gather data from participants who are willing to participate, which can enhance the overall data collection process. In this particular study, the questionnaire will be distributed exclusively to young individuals throughout the state of Kelantan..

Data Analysis

This process involves reviewing, clarifying, and organizing the collected data. Before proceeding with data analysis, researchers should have a clear understanding of the purpose and rationale behind the study. The analysis includes descriptive data analysis, reliability analysis, and Pearson correlation. These statistical procedures are conducted using the Social Science Statistical Package Version 24 (SPSS), specifically IBM SPSS version 24. SPSS is a comprehensive software tool designed for processing statistical data and generating various outputs to address the research objectives.

FINDINGS

Profile of Respondents

Table 1: Respondent's Profile

Demographic	Category	Frequency (N)	Percentage (%)
Gender	Female	107	66.5
	Male	54	33.5
Age	15-20 years old	5	3.1
	21-25 years old	143	88.8
	26-30 years old	5	3.1
	31-35 years old	7	4.3
	36-40 years old	1	0.6
Race	Malay	150	93.2
	Chinese	4	2.5
	Indian	4	2.5
	Others	3	1.8
Marital Status	Single	148	91.9
	Married	13	8.1
Occupation	Governments staff	4	2.5
	Private sector	6	3.7
	Self- employed	4	2.5
	Student	142	88.2
	Unemployed	5	3.1

Table 1 presents the profiles of the 161 respondents in the study. The majority of the respondents are female, accounting for 66.5% of the total sample, while males represent 33.5%. Regarding age, the largest proportion of respondents falls within the 21-25 years old category, comprising 88.8% of the sample. The lowest frequency of respondents is found in the 36-40 years old category, with only 0.6%. In terms of ethnicity, the majority of the respondents are Malay, accounting for 93.2% of the sample. Other ethnicities have the lowest frequency, representing 1.8% of the total. As for marital status, the majority of respondents are single, making up 91.9% of the sample, while married respondents constitute only 8.1%. In relation to occupation, the largest proportion of respondents (88.2%) consists of students, indicating that they form the majority within the total sample. The lowest frequency of respondents (2.5%) is observed in the categories of government staff and self-employed. These demographic findings accurately reflect the actual compilation of factors that contribute to the intentions of young individuals to engage in adventure tourism activities in Kelantan.

Analysis for Factor That Builds Youth's Intention to do Adventure Tourism Activities in Kelantan.

Table 2: Descriptive Analysis for factor that build youth's intention to do adventure tourism activities in Kelantan.

Variable	Items	N	Mean	Standard Deviation
Youth's Intention to do Adventure Tourism Activities	I think adventure tourism can relieve stress and tension.	161	4.57	0.677
	I think to develop physical fitness.	161	4.32	0.762
	I think to discover new things.	161	4.40	0.674
	I intend to improve skill and ability in doing them.	161	4.30	0.749
	I want to satisfy my curiosity.	161	4.40	0.683
Place Attraction	Place attraction gained my attention to involved in adventure tourism	161	4.40	0.753
	I tend to participate in adventure tourism because of man-made attraction	161	4.07	0.877
	I tend to participate in adventure tourism because of neutral attraction	161	4.43	0.748
	I will consider place attraction more than other aspect to join adventure tourism	161	4.17	0.760

	Beautiful scenery can release my stress	161	4.60	0.635
Facilities	The facilities provided at the location attract me to join adventure tourism.	161	4.40	0.636
	Secure facilities that guarantee safety encourage me to join adventure tourism.	161	4.50	0.643
	Accommodation at the place motivate me to join adventure tourism.	161	4.35	0.702
	Secure equipment that provided attract me to join adventure tourism.	161	4.40	0.702
	Safety and emergency measures provided motivate me to join adventure tourism.	161	4.39	0.760
Environmental Education	The desire to experience the landscape and moods of nature motivate me to join adventure tourism.	161	4.35	0.692
	Desire to appreciate beautiful natural resources encourages me to join adventure tourism.	161	4.37	0.641
	The need to have a time for natural study motivates me to participate in adventure tourism.	161	4.27	0.740
	Desire to enjoy flora and fauna attract me to join adventure tourism.	161	4.40	0.693
	The need to find peace and quiet motivate me to join adventure tourism.	161	4.47	0.759

Table 2 presents the mean and standard deviation of the dependent and independent variables in this study. The dependent variable with the highest mean value is Question 1, scoring 4.57 (SD = 0.677), indicating that respondents agree that adventure tourism can alleviate stress and tension. On the other hand, Question 4 has the lowest mean value of 4.30 (SD = 0.749), suggesting that some respondents do not have the intention to enhance their skills and abilities. Regarding the independent variable of place attraction, Question 4 obtained the highest mean value of 4.60 (SD = 0.635), indicating that respondents agree that beautiful scenery can help alleviate stress. Conversely, Question 2 has the lowest mean value of 4.07 (SD = 0.877), indicating that respondents tend to participate in adventure tourism because of man-made attractions. For the independent variable of facilities factor, Question 2 obtained the highest mean value of 4.50 (SD = 0.643), suggesting that respondents believe secure facilities that ensure safety encourage them to engage in adventure tourism. Question 3 has the lowest

mean value of 4.35 (SD = 0.702), indicating that respondents agree that accommodation at the destination motivates them to participate in adventure tourism. In terms of the independent variable of environmental education, Question 5 has the highest mean value of 4.47 (SD = 0.759), suggesting that respondents agree that they need to find peace as a motivation to engage in adventure tourism. Question 3 has the lowest mean score of 4.27 (SD = 0.740), indicating that respondents agree that having time for nature study motivates them to participate in adventure tourism.

Reliability Analysis Coefficient Alpha for the Independent Variables and Dependent Variable

Table 3: Result of Reliability Coefficient Alpha for the Independent Variables and Dependent Variable

Variable	Number of Item	Cronbach's Alpha coefficient	Strength of Association
Youth's Intention	5	0.863	Very Good
Place Attraction	5	0.811	Very Good
Facilities	5	0.877	Very Good
Environmental Education	5	0.897	Very Good
Overall Variables	20	0.943	Excellent

Table 3 presents the Cronbach's Alpha coefficients for the independent and dependent variables in this study. The values for all variables exceeded 0.8, with an aggregate coefficient of 0.943, indicating high reliability and supporting the acceptance of the results. The measurement of youth's intention to do adventure tourism in Kelantan utilized five questions, and the Cronbach's Alpha coefficient for this section was 0.863, indicating very good. Similarly, the place attraction variable, assessed with five questions, yielded a Cronbach's Alpha coefficient of 0.811, also indicating very good reliability. The facilities variable, consisting of five questions, achieved a Cronbach's Alpha coefficient of 0.877, signifying very good reliability. Lastly, the environmental education variable, measured with five questions, obtained a Cronbach's Alpha coefficient of 0.897, also indicating very

good reliability. The Cronbach's Alpha coefficients exceeding 0.9 for all variables demonstrate that the questionnaires used in this study are excellent reliable. This suggests that the respondents understood the questions well, further supporting the suitability of the questionnaires for this study.

Relationship between Place Attraction, Facilities, Environmental education towards Youth's Intention to do Adventure tourism Activities in Kelantan.

Table 4: Pearson's Correlation between place attraction, facilities, environmental education towards youth's intention to do adventure tourism activities in Kelantan.

		Youth's Intention to do Adventure tourism Activities in Kelantan.
Place Attraction	Pearson correlation	0.548
	Sig. (2-tailed)	<.001
	N	161
Facilities	Pearson correlation	0.513
	Sig. (2-tailed)	<.001
	N	161
Environmental Education	Pearson correlation	0.555
	Sig. (2-tailed)	<.001
	N	161

The result in Table 4 indicates place attraction and youth's intention to do adventure tourism activities in Kelantan. 0.548 indicated a moderately strong positive correlation. Next are facilities and the youth's intention to do adventure tourism activities in Kelantan. 0.513 indicating a moderate positive correlation. Followed by environmental education and youth's intention to do adventure tourism activities in Kelantan with 0.555 indicated a strong positive correlation. Therefore, all three variables positively correlated with the youth's intention to do adventure tourism activities in Kelantan and the relationship is significant.

According to Lou (2014), the more interesting the place offers, the more people intend to do adventure tourism.

H1: There is a significant relationship between place attraction and youth's intention to do adventure tourism activities in Kelantan

Mahazir (2021) states that facilities are important to people before joining adventure tourism accommodation, secure equipment, especially safety and emergency provided at that place.

H2: There is a significant relationship between facilities and youth's intention to do adventure tourism activities in Kelantan

Environmental education is environmental awareness and knowledge. According to Mason (2016) stated environmental education is refer to people who participate the adventure tourism for natural study and enjoy the flora and fauna, and appreciate the beautiful natural study.

H3: There is a significant relationship between environmental education and youth's intention to do adventure tourism activities in Kelantan

DISCUSSION AND RECOMMENDATION

More research should be done to make the results more believable by balancing travel partners can be relatives and friends, friends and acquaintances, or even organisational packages. This is due to the fact that various people who participate in adventure activities may have opposing perspectives. Furthermore, the current study primarily focuses on three characteristic that build youth's intentions to do adventure tourism activities in Kelantan. However, this study may overlook other critical elements that build youth's intentions to do adventure tourism activities in Kelantan. As a result, future researchers might suggest additional variables, such as economic factors, to carry out new results in their study. This research uses qualitative approaches for this goal. Nonetheless, we all agree that future researchers should send out the Google form link as soon as possible. So that future researchers can collect a large number of responders in a short period of time. Furthermore, a future researcher can repeatedly click on the link. Researchers, for example, can distribute links using social media platforms such as WhatsApp and Telegram..

CONCLUSION

In conclusion, this study evaluated the factors that build youth's intentions to do adventure tourism activities in Kelantan. This study investigates the interaction between place attraction, facilities, and environmental education in youth's intentions to do adventure tourism activities in Kelantan. As mentioned in Chapter 3, researchers used a Google Form to distribute questionnaires to 161

respondents, asking them about the variables that influence their decision to participate in adventure tourism activities. These people were requested to fill out questionnaires. In addition, the researcher employs a quantitative technique to acquire all facts and information. The researcher employed Google Forms as the survey tool to reach respondents across Kelantan. This choice was made for its convenience, allowing respondents to easily complete the surveys and saving time and resources for the researcher. The questionnaire survey findings were analyzed using various techniques, including frequency analysis, descriptive analysis, reliability analysis, and correlation analysis. All data collected from the questionnaire, along with the results from the previous chapter, were examined using the statistical software SPSS 24 (Statistical Package for the Social Science). SPSS 24 was selected by the researchers due to its user-friendly interface and ability to generate comprehensive results. Furthermore, this study acknowledges its limitations and provides suggestions that could prove valuable for future research endeavors.

ABSTRACT

The current research aims to examine how social influence, performance expectations and price value influence the intention to use mobile applications among East Coast residents. This study focuses on the ease of use that leads to the intention to use smart mobile apps among consumers. Therefore, this research has used quantitative methods to achieve its objective. Researchers have examined 30 questions related to variables that have been established where all variables have a significant relationship with intention to use smart mobile apps among east coast residents using a "Google Form" or questionnaire. The results show that social influence, performance expectations and price value have a significant correlation between East Coast local travelers' intentions to use smart mobile applications. The findings obtained from this study will help smart mobile application developers in creating user-friendly applications, especially those on the east coast. In conclusion, all the data in this study can be used as a guideline for strategic planning in order to be able to use smart mobile applications on the east coast and especially in Malaysia.

Keywords: Intention to use smart mobile apps, social influence, performance expectancy, price value

INTRODUCTION

Travelling for pleasure, social, or business is the travel and tourism industry. The travel industry is tourism. It is closely tied to the hotel, hospitality, and transportation businesses and mostly focuses on keeping guests happy, engaged, and supplied while they are away from home. Mobile applications (apps) have grown exponentially in the digital media business. Mobile app usage intentions from functional, contextual, and motivational communication perspectives have received little investigation despite its rapid growth and diffusion. Understanding app use intention variables can teach app developers, marketers, and academics how people choose apps. Recent studies examined the effects of various mobile communication devices. However, the studies solely examined voice calling usage.

SIGNIFICANCE OF THE STUDY

This study looks into the variables affecting east coast residents' intentions to utilise smart mobile phone apps. This study can be used by developers of applications or mobile phone apps to improve their products and increase consumer happiness, particularly among east coast residents. We must utilise technology to make it simpler for tourists to survey and less likely that they would be taken advantage of by locals in order to strengthen Malaysia's economy. If they are informed enough to travel to Malaysia, they will promote it in their own nation. The study's findings can also be used to inform the tourism industry's efforts to develop innovative tactics for drawing in more domestic and international visitors.

LITERATURE REVIEW

An essential component of the electronic payment system is the electronic wallet (sometimes known as a "e-wallet"). Customers must link their debit or credit cards to their electronic wallets before they may make any transactions. When using electronic cards to make certain payments, users can save the details of their physical cards and bank account information. It is said that using an e-wallet saves time and money compared to using a traditional banking system. Payments can be made through cellular-based payment methods as well as mobile apps. E-wallet users appreciate ease, speed, and security while making payments. The six most well-known and frequently used e-wallets in Malaysia among the more than 42 that Bank Negara Malaysia (BNM) has legally authorized are AEON Wallet, Boost, BigPay, GrabPay, WeChat pay, and Touch'n Go eWallet.

Social influence

Venkatesh et al. (2012, p. 159) define social influence as "the extent to which consumers sense that significant persons (e.g., family and friends) believe they should use a specific technology." Interpersonal influence and media-related impact are the two main types of social influence, according to (Wei et al. 2009). While interpersonal influence often originates from social networks like classmates, friends, superiors, and so on, mass media influence encompasses publications like newspapers, scholarly journals, magazines, the internet, radio, and television (Park, et al. 2007). Furthermore, Lu et al. (2005) pointed out that social influence is only significant in situations where it is necessary. Chong (2013) found that System Integration is a significant driver of Business Intelligence in his study of m-commerce. Customers of mobile commerce are likely to take cues from their social networks, family, the media, and other mobile commerce users when making behavioural decisions. Chong et al. (2012) claim that social influence has a significant influence on consumers' intentions to use mobile commerce in Malaysia and China. Leong et al.'s (2013) 2013b study also validated the aforementioned conclusion. The aforementioned conclusion implies that in Chong's study on m-commerce, the integration of different systems (SI) significantly influences the effectiveness of business intelligence (BI). This suggests that a well-integrated system is crucial for collecting and analyzing data to make informed

business decisions in the mobile commerce domain.. Since they are available to all user groups and are required, mobile apps.

Performance Expectancy

Performance expectation is the idea that using a certain technology or method will, in some way, benefit the user or improve their performance (Mahmood, 2021). The degree to which a person expects that using the system would enable him to benefit from his activities is known as performance expectancy (Venkatesh et al. 2003). Performance expectancy, on the other hand, states that a person will use an information system if the system may assist in improving its performance.

Price Value

The majority of mobile applications are available for free download, but additional expenses such as Internet, mobile device, and device maintenance fees are associated with utilising them. Price value is defined as the cognitive trade-offs between the perceived benefits of the applications and the monetary cost of utilising them. According to Hanafizadeh et al. (2014), one of the factors that customers would take into account while deciding whether or not to use mobile banking services is the cost. Venkatesh et al. (2012) also concluded that a favourable pricing value could influence behavioural intention favourably. Price value follows the concept of perceived value, which compares and evaluates perceptions of relative rewards obtained and associated costs incurred. If the perceived benefits surpass the costs incurred for using IT applications, this may affect how people use technology.

Intention To Use Mobile Apps

The tourism and hospitality industries are big fans of smart travel apps (Lai, 2015). Customers can use mobile devices to organise their vacations with the help of smart travel apps (Anshari and Alas, 2015). Travellers utilise mobile devices to book excursions, hotels, and flights in addition to seeing well-known attractions. By adopting travel applications in response to demand, tour operators have improved client interactions and produced more memorable experiences (Lu, 2015). Many studies have looked at how mobile technology affects travellers' enjoyment (Cai, 2019). The consumer experience can be enhanced through mobile apps in the tourism industry (Liebana-Cabanillas 2020). This study analyses the elements of e-service quality

that influence app usage by users. E-service quality is determined by social influence, performance expectation, and price value.

Research Hypotheses

A hypothesis is a forecast or explanation of a link between two variables, suggesting the existence of a structured link between them. It must be testable and realistic, taking current knowledge and methodologies into account.

H1: There is relationship between social influence and Intention to use smart mobile travel apps among east coast resident.

H2: There is relationship between performance expectancy and Intention to use smart mobile travel apps among east coast resident.

H3: There is relationship between price value and Intention to use smart mobile travel apps among east coast residents

Research Framework

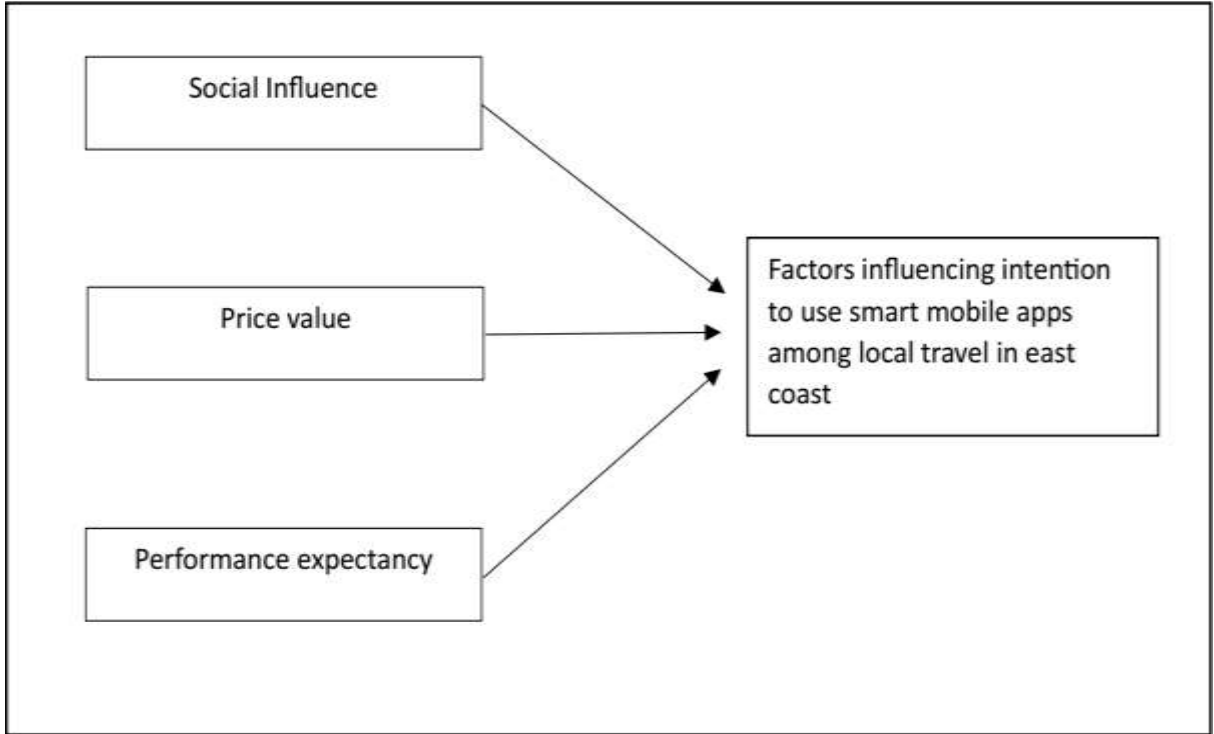

Figure 1: Research Framework

METHODOLOGY

The procedures of the study, including the study design, target population, sample size, sampling technique, data collecting, research equipment design, and data analysis, are the main topics of this chapter. It offers a summary of each stage as well as the statistical methods applied to evaluate the hypotheses. The research methodologies will be explained in this chapter. The steps and statistical methods applied to evaluate the hypotheses will be outlined. The chapter will decide which method of data collection is most efficient.

Research Design

A research design is a project plan for a study that specifies the steps researchers must take to test their hypotheses or reach their study objectives (McDaniel and Gates, 1999). Quantitative research is a quantifiable examination of numerical data obtained through broad inquiries using techniques like surveys and questionnaires. For the examination to have increasing factual power for hypotheses regarding the finds, an example size is necessary (Kumar, Talib, & Ramayah, 2013). The study's goal is to identify the variables that affect Malaysian local tourists' travel consumer behaviour. The right technique is to develop an expressive research plan after evaluating the situational, societal, and personal factors. The investigation had used a quantitative research strategy.

Data Collection

The major tool for gathering data in this study was a questionnaire. Information obtained for the first time with the goal of resolving a problem is referred to as primary data. Surveys are significant data sources because they provide respondents a variety of questions and allow them to mark the ones that they feel are relevant. Every set of questionnaires will be accompanied with a cover letter outlining the purpose of the study for the respondent. The data we compile from the responses is what allows us to arrive at the study's conclusions. Locals received the questionnaires by postal mail.

Sampling

A big population or a sample survey of variables is sampled as part of a statistical analysis (Poonam, 2022). There are two basic kinds of sampling techniques: probability sampling and non-probability sampling, depending on the sort of study being conducted. Non-probability sampling techniques will be applied in this investigation. Since convenience sampling is easy to use and moderately priced, it will be used in this study. To carry out this investigation, non-probability convenience sampling was employed. Despite these limitations, non-probability sampling is useful, according to Etikan et al. (2016). especially when there is a large population. Convenience sampling is very easy and affordable, because the respondents are readily available to finish the survey. Since the questionnaire is the primary source of data for the study, its results can be used (Dudovskiy, 2018). As a result, this approach can help researchers gather more data from participants who are convenient to reach.

Data Analysis

Data analysis is a method of assessing information by carefully examining each item of the data while applying logical, scientific reasoning. It can be done in many ways, such as information mining, content analysis, business insight, and information perception. SPSS is used to analyse statistical data and provide different outputs to respond to objective studies.

Findings

The findings showed that social influence, performance expectations, and price value are the most important behavioural intention antecedents. It was found that travellers' intents and habits for using technology (smart mobile apps) had an impact on their actual usage behaviour. The intention of tourists to utilise smart mobile apps while travelling was not significantly impacted by performance expectations, social influence, or price value, it was noted.

Table 1: Descriptive Statistics

	N	Minimum	Maximum	Mean	Std. Deviation
The use of smart mobile apps has influenced local travelers on the east coast to travel.	169	1	5	4.15	.974
Social influence has influenced local travelers on the east coast to travel.	169	1	5	4.29	.782
Performance expectancy has influenced local travelers on the east coast to travel.	169	1	5	4.19	.852
Price value has influenced local travelers on the east coast to travel.	168	1	5	4.23	.796
Valid N (listwise)	168				

The total number of respondents, the mean, and the standard deviation for the independent and dependent variables were displayed in Table 1. Social influence had the highest mean among the independent variables (4.29), followed by price value (4.23), and performance expectancy (4.19). The dependent variable's mean value was 4.15.

Table 2: Reliability Analysis

Variable	Cronbach's Alpha	No of Item	N
Factors Influencing Intention To Use Smart Mobile Apps Among Local Traveller In East Coast	0.874	4	169
Social Influence	0.828	4	169
Performance Expectancy	0.847	4	169
Price Value	0.845	3	169
All Variable	0.935		169

Reliability is the ability to judge a questionnaire's consistency and stability, which is essential for evaluating the importance and caliber of primary data. Researchers used measurements and tools developed by others with relevant interests.

Table 4: Correlation coefficient for social influence and factors influencing intention to use smart mobile apps among local traveller in east coast.

		IV1	DV
IV1	Pearson Correlation	1	.587**
	Sig. (2-tailed)		.000
	N	169	169
DV	Pearson Correlation	0.587**	1
	Sig. (2-tailed)	0.000	
	N	169	169

According to DeCoster & Claypool (2004), there is a continuous or linear relationship between the two constant variables. It will demonstrate that the data that was gathered will be related. The correlation lies in the range of -1.0 to 1.0. If it displays a positive mark, the range will expand and the other element will follow suit. The smaller the range, the lower the range will be for the other element if it displays a negative mark. If the range is zero, there is a relationship between the variables.

DISCUSSION AND RECOMMENDATION

This study focuses on those living on the East Coast and recommends further investigation on foreign visitors to Malaysia. It might ignore additional aspects, such as economic concerns, that influence local passengers' intents to utilise smart mobile apps. Academics can advise employing interviews or open-ended questions rather than online questionnaires to enhance study outcomes. This strategy can reduce misconceptions and enhance study results.

CONCLUSION

This study examines the impact of social influence, performance expectations, and price value on East Coast local travellers' intentions to utilise mobile apps with advanced features. 69 pieces of literature served as the foundation for a study framework. The online survey had 169 participants in total, and the reliability analysis showed a total variable of 0.935. According to the findings, social influence, performance expectations, and price value has a significant correlation between East Coast local travellers' intentions to utilise smart mobile apps.

ABSTRACT

This study is about the factors that influence the Malay community in using accommodation applications in Kota Bharu, Kelantan. Youth are a vulnerable group with the various technologies and applications available today. Therefore, this research is focused on the young people in Kota Bharu, Kelantan. This research is to identify the ease of use in simple accommodation applications and behavioural intentions. Second, to examine whether the facilities provided in the accommodation application and behavioural intention. Finally, to examine the relationship between the security provided in the accommodation application and behavioural intention. Quantitative methods were chosen and used in this study in the form of a questionnaire. Total of 120 Malay community respondents who use accommodation application facilities in Kota Bharu, Kelantan, Malaysia were selected in this study and from that number, a total of ten people respondents were interviewed in depth.

Keywords: Influence Malay Community, Technology Accommodation Application

INTRODUCTION

This chapter will discuss background of study, problem statement and follow by research objective, research question, significance of the study. definition of terms and lastly summary. All related above will be described in the title factors that Malay community in using accommodation applications in Kota Bharu, Kelantan.

The focus of the study is the accommodation application, a peer-to-peer short-term rental business that enables users to post and reserve rooms using a website and mobile application. Customers who have experience utilizing accommodation applications in order to create various marketing strategies. These studies' specific objectives were as follows: First, to determine the make-up of the elements that impact Malay community usage of the accommodation application, second, to determine if the accommodation application is user-friendly, and third, based on the findings of this study, to learn more about this study.

There were three objectives of this research:

1. To identify the between ease of use and behavioural intention in the usage of accommodation applications in Kota Bharu, Kelantan.

2. To examine the relationship between convenience and behavioural intention to utilise accommodation applications in Kota Bharu, Kelantan.
3. To investigate the relationship between security and behaviour intention to utilise accommodation applications in Kota Bharu, Kelantan.

SIGNIFICATION OF THE STUDY

Community

The purpose of this study is to evaluate the value and security of accommodation application services for the tourism industry. Based on this study, the information gathered will assist the community in evaluating the advantages and disadvantages of accommodation application. The neighbourhood can learn about the efficiency and safety of using accommodation application as a result, which may persuade the neighbourhood to be using accommodation application.

Competition Analysis

By analysing the relevant motivators and restrictions, the study offers greater insights into the decision-making process of both guests and hosts. It will also help the accommodation application platform determine how it differs from other vacation rental services and the conventional hotel business. The importance of the study will help policymakers better control the accommodation application phenomenon by giving them a thorough understanding of the micro and macro environments.

Intentions Of Young

This study can help to reveal the intentions of young people to engage in Airbnb apps. According to a study conducted by Assistant Professor Daniel Guttentag at Ryerson University's Ted Rogers School of Hospitality and Tourism Management, which was conducted in August 2016 and the findings of which were published, the straightforward response is, in fact, that it is inexpensive. Furthermore, the survey found that "convenient location" and "household amenities" were two other important driving factors for travellers.

LITERATURE REVIEW

Behavioural Intentions

Behavioural intentions refer to the perceived likelihood or subjective probability of an individual to engage in a given behaviour. In the context of retailing, this concept can be defined as the consumer willingness to develop some categories of behaviours such as referrals, price sensitivity, repurchase, complaining behaviour, loyalty and word of mouth (Zeithaml et al., 1996).

Ease Of Use

Ease of use is one of Airbnb's core values. As a result, they must ensure that users can easily use Airbnb's webpages and smartphone apps. We are all aware that the circulation of modern times is accelerating with the development of advanced technology.

Therefore, the use of accommodation applications is very necessary because it can make it easier for users to make any booking online. For example, users can find out information related to a place they want to go to. In addition, it is also easy for users to book the accommodation and they do not have to bother to go to the place. Clearly showing that it is easy to use is one of the factors that influence the attraction of users in using accommodation applications. Perceived ease of use refers to the user's belief that using an application or website is easy (cheema, 2009).the tendency to accept technology is strongly influenced by the perception of ease of use (juniwati, 2014).

Convenience

Everything nowadays centres around access. With a burgeoning millennial population, one factor driving ride sharing purchases is convenience. It is now possible because the sharing economy relies on real-time transactions via cell phones that connect providers and buyers. Consumers today expect everything to be speedy, and if they really do not acquire it on time, they assume the systems cannot be trustworthy. In order to achieve customer satisfaction, Habibi et al. (2017) emphasise the importance of convenience, efficiency, and, most significantly, accessibility.

Security

Security is a priority in technology. Identity fraud and credit card fraud are two common attacks that occur when customers provide data through websites. Security, often known as privacy risk, relates to the acquisition and use of users' personal details by crowdfunding platform providers in an unfavorable manner (Gao et al., 2015). Participation in the sharing economy requires the disclosure of personal information, which causes users tremendous anxiety (Ballus-Armet et al., 2014). Although this is an important barrier to the sharing economy, it has overcome the barrier of distrust, allowing users to continue using the sharing function by verifying and verifying its customers and providers to protect each other. Therefore, it is imperative to protect customer privacy. With the security provided, users do not need to worry about their safety. For example, personal information. According to researchers, effective security increases confidence (Alrawabdeh et al., 2012; Kima et al., 2010).

Research Hypothesis

The research's hypothesis is based on the study's elements, including economic, environmental, cultural, and community factors that influence the choice of domestic tourism destinations. The hypothesis had been developed and was going to be evaluated based on the investigation.

H1: Tourists' behavioural intention to utilise accommodation applications is significantly influenced by effort expectation.

H2: Tourists' behavioural desire to utilise accommodation applications is significantly influenced by performance expectation.

H3: The behavioural intention of travellers to utilise accommodation applications is significantly influenced by habit.

H4: Social conditioning has a considerable positive impact on travellers' behaviour intention to use accommodation apps.

H5: Hedonic motivation influences travellers' behavioural intention to utilise accommodation applications significantly.

Conceptual Framework

The conceptual framework displays the relationship between the independent variable and dependent variable used in the study. There are three independent variable (IV) have been used in this study which are easy of use the accommodation application, the convenience and also the security of the accommodation application. The dependent variable (DV) is behavioural intention.

METHODOLOGY

Research Design

Defined research design as procedures for collecting, analysing, interpreting, and reporting data in research studies (Creswell and Plano -Clark,2007). The study's design specifies how the relevant information will be obtained, analysed, and used to answer the research question (Grey, 2014). The subject of research design is the examination of a scenario or problem to discover if one item causes another (Creswell, 2003). There are three types of research methodologies: mixed methods, qualitative design, and quantitative design (Creswell & PlanoClark, 2007). According to Denzin and Lincoln (2008), qualitative research strives to give the researcher with a way of comprehending a phenomenon by seeing or interacting with study participants (Teddlie &Tashakkori, 2009).

Population

The phrase "population" refers to the entire group of individuals, occasions, or objects that researchers are curious about learning more about (Kumar, 2013). Local, malay community using the accommodation applications in Kota Bharu, Kelantan, which make up the study's population. The number youngster that uses the accommodation applications is about young people from 18 to 29 years old - 69 565 people.

Sample Size

The subset of a population that is necessary to ensure that there is enough information available to draw conclusions is known as the sample size (Sekaran & Bougie, 2010). The sample population for this study consists of local tourists who use lodging booking websites in Kota Bharu, Malaysia's Kelantan province. 120 respondents will be picked from the population of local visitors in accordance with Krejcie & Morgan's (1970) sample size table to provide.

Sampling Method

This is the method of figuring out how many elements should be included in a community (Kumar, 2013). The researchers choose certain subsets of the population to use as sample subjects for their sampling technique. Sampling techniques and non-probability sampling are the two available types of sampling procedures.

Data Collection Procedure

It is possible to collect data from both primary and secondary sources. Gathering information from real sources, such as customers, users or non-users, or other research participants, specifically for the topic at hand, is known as primary data research. "Secondary data research" refers to any published material that has been specifically acquired for the current study challenge. 364 respondents who are among those who have used accommodation applications in Kota Bharu, Kelantan will provide the primary information gathered from the questionnaires.

Research Instrument

In this study, we used the survey approach using online questions via Google Form to collect data in order to collect all of the necessary information to finish this research. Furthermore, because it is standardised, this type of research is typically less expensive than other ways and easier to maintain. Because this study included a high number of respondents, researchers used this strategy to collect data and information because it is an efficient way of collecting data and information.

Data Analysis

The data was analysed using descriptive language. Descriptive analysis will be used to characterise the demographic profile of the respondents, including the percentage, frequency, mean, and average mean. Inferential analysis is used to investigate the relationship between independent and dependent variables. Pearson Correlation is a statistical method for determining the strength of a link between independent and dependent variables based on the magnitude of the correlation coefficient. (Piaw, 2006).

FINDINGS

Results of Frequency Analysis

Most respondents were young adults in Malaysia; the majority were male (51%), and the remaining respondents (49%) were female. Regarding their age, the age of the respondents varied between 19 years below until 56 years and above. More than half of the respondents (67.5%) aged between 20-24 years, (13.3%) of them aged from 25-29 years, (8.3%) of them aged from 35-39 years, (6.7%) of them aged 30-34 years,(2.5%) of them aged 40 years above, (1.7%) of them are aged 19 years and below. As for the respondents, the status of married are the majority of respondent (75.8%), compared to single (21.7%) and others (2.4%). For highest education degree are the most (56.7%), (17.5%) diploma , (14.2%) STPM, (11.7%) SPM. The majority of income (66%) RM 0 – RM 1000, (23%) from RM 2001 – RM 2500, (13%) from RM 1001 – RM 2000, (11%) from RM 2501 – RM 3000, (5 %) from RM 3501 and above, (2%) RM 3001 – RM 3500. Most of respondent visit Kelantan (67.5 %) from 04, (22.5%) from 10 and above, (9.2%) from 5 – 7, while 8-9 (0.8%). Occupation for unemployed are the most (55.8 %), comparing (25%) for self-employed, government for (13.3%), non-government (5%), businessman (0.8%). Only (76.7%) who stay in hotel at Kelantan while (23.3%) say no. Meanwhile, (82.5%) using Air BnB app and (17.5%) not using the app.

Characteristics	Frequency	Percentage (%)
Gender		
Male	61	51
Female	59	49
Age		
19 years – below	2	1.7
20-24 years	81	67.5
25-29 years	16	13.3

30-34 years	8	6.7
35-39 years	10	8.3
40 years – above	3	2.5
Status		
Single	26	21.7
Married	91	75.8
Divorced man	1	0.8
Divorced woman	1	0.8
Widow	1	0.8
Highest Education

Degree	3	2.5
Degree	65	54.2
Spm	17	14.2
Stpm	14	11.7
Stay in Kelantan Hotel		
No	28	23.3
Yes	92	76.7
Use Air BnB App		
No	21	17.5
Yes	99	82.5
Income		
RM 0 - RM1000	66	66
RM1001 - RM2000	13	13
RM2001 - RM2500	23	23
RM2501 - RM3000	11	11
RM3001 - RM3500	2	2
RM3501 and above	5	5
How often visit Kelantan		
0 - 4	81	67.5
5 - 7	11	9.2
8 - 9	1	0.8

10 and above	27	22.5
Occupation		
Government	16	13.3
Non – government	6	5.0
Businessman	1	0.8
Unemployed	67	55.8
Self-Employed	30	25.0
TOTAL	120	100

Result of Descriptive Analysis

The mean score and standard deviation of the variable are shown in Table 2. The factors can be considered low if the mean score is from 1.00 to 1.99 and high if the mean score from 2.00 to 4.00. Table 2 shows result of descriptive analysis:

Table 2: Descriptive Analysis

VARIABLES	ITEMS	MEAN	STANDARD DEVIATION
Convenience	1. Where to stay plays an important role in choosing a destination to visit.	4.37	0.800
	2. Before the trip starts, I plan to choose a place to stay to immerse myself in the local culture.	4.17	0.863
	3. I decide which destinations to visit only based on where I want to stay.	4.08	0.881
	4. Usually, I do research about accommodation using an accommodation booking application before I start my trip.	4.27	0.710
	5. Before starting the trip, one thing I expect is to have a good environment.	4.37	0.744
	6. I want to try a new culture in the chosen accommodation.	4.27	0.827
	7. The involvement of the convenience application to book a place to stay is interesting.	4.26	0.750
Ease of use	8. Involvement of the convenience application to book a place to stay is easy to use.	4.27	0.742
	9. The engagement of the convenience app to book a place to stay is valuable.	4.25	0.781
	10. The involvement of the convenience application to book a place to stay is very meaningful.	4.36	0.754
	11. Involvement of the convenience application to book a place to stay is desirable.	4.33	0.735
	12. I obtained good results when using the convenience application to book accommodation when visiting the state of Kelantan.	4.14	0.725
Security	13. I feel safe when using the accommodation application to book accommodation in Kelantan.	4.17	0.781
	14. My personal information is protected if I use the convenience application when booking accommodation in Kota Bharu, Kelantan.	4.18	0.763
	15. Compared to other tourist destinations, staying in Kelantan is very worthwhile.	4.20	0.784

	16. I got the experience of booking a suitable place through the accommodation application when visiting Kelantan with reasonable expenses.	4.10	0.814
	17. The experience of staying in Kelantan gave me great satisfaction	3.92	0.816
	18. The experience of staying in Kelantan made me happy	4.06	0.823
	19. The experience of staying in Kelantan met my expectations.	4.06	0.813
	20. The experience of staying in Kelantan exceeded my expectations	4.04	0.893

Table 2 shows the mean and standard deviation 20 statements under three independent variables and four statements under the dependent variable based on the survey involving 120 respondents. The results in table 2 above shows that item of Convenience (Where to stay plays an important role in choosing a destination to visit.) has the highest mean score ($M = 4.37$, $SD = 0.800$) meanwhile item Convenience (I decide which destinations to visit based solely on where I want to stay.) has the lowest mean score ($M = 4.08$, $SD = 0.881$). As for the item of Ease of use (The involvement of the convenience app to book a place to stay is very meaningful.) has the highest mean score ($M = 4.36$, $SD = 0.754$). Meanwhile item of Ease of use (I got good results when using the convenience app to book accommodation when visiting the state of Kelantan.) has the lowest mean score ($M = 4.14$, $SD = 0.725$). Furthermore, for the item of Security (Compared to other tourist destinations, staying in Kelantan is very worthwhile) has the highest mean score ($M = 4.20$, $SD = 0.784$). Other than that, for the item Security (The experience of staying in Kelantan gave me great satisfaction) has the lowest mean score ($M = 3.92$, $SD = 0.816$).

Pearson Correlation Analysis

One of the important statistical methods for determining the linear relationship between two numerical variable is the Pearson correlation test. This study has two parts such as independent variables and dependent variables, which influence the Malay Community in the use of accommodation technology applications in Kota Bahru, Kelantan. The three factors that make up the independent variables are Easy of Use, Security and Convenience. Pearson's correlation is being used to provide a more accurate measure with the aim of determining whether the correlation coefficient is significant.

Table 3: Show the coefficient range, r

Coefficient range, r	Strength of association
0.91 to 1.0 / -0.91 to -1.0	Very strong
0.71 to 0.90 / -0.71 to -0.90	High
0.51 to 0.70 / -0.51 to -0.70	Moderate
0.31 to 0.50 / -0.31 to -0.50	Small but define relationship/weak
0.01 to 0.30 / -0.01 to -0.30	Slight, Almost negligible

Table 4.1: Correlation between independent variable and dependent variable.

Table 3 shows a significant relationship between each independent variable (Safety, convenience and Ease of Use, with the dependent variable, behavioural intention. Based on the results, there is a relationship between the independent and dependent variables. Therefore, the following hypothesis is accepted:

Correlations			
		Accommodation Application Involvement	Accommodation Application Related Motivation
Accommodation Application Involvement	Pearson Correlation	1	.776**
	Sig. (2-tailed)		.000
	N	120	120
Accommodation Application Related Motivation	Pearson Correlation	0.776**	1
	Sig. (2-tailed)	.000	
	N	120	120
**. Correlation is significant at the 0.01 level (2-tailed).			

Correlation

		Accommodation Application Related Motivation	Perceived Value
Accommodation Application Related Motivation	Pearson Correlation	1	.648**
	Sig. (2-tailed)		.000
	N	120	120
Perceived Value	Pearson Correlation	0.648**	1
	Sig. (2-tailed)	.000	
	N	120	120
**. Correlation is significant at the 0.01 level (2-tailed).			

Correlations			
		Accommodation Application Related Motivation	Satisfaction
Accommodation Application Related Motivation	Pearson Correlation	1	.494**
	Sig. (2-tailed)		.000
	N	120	120
Satisfaction	Pearson Correlation	0.494**	1
	Sig. (2-tailed)	.000	
	N	120	120
**. Correlation is significant at the 0.01 level (2-tailed).			

DISCUSSION & RECOMMENDATIONS

The findings of this study indicate that a variety of factors influence the Malay Community in the use of accommodation technology applications in Kota Bahru, Kelantan. The first research goal is language of the area. In order to interact with the community in an efficient manner, communicate in Bahasa Malaysia, the native language. Make sure that all of the promotional

materials, instructions, and user interfaces are provided in Bahasa Malaysia so that they are easier to comprehend and access.

The second goal is taking care of worries. It is important to address any worries or misunderstandings that members of the Malay community may have regarding the privacy, security, or dependability of accommodation technology applications. In order to foster trust and confidence, it is important to bring attention to the safety precautions, reviews, and suggestions contained within the applications. Other than that, work together with local accommodation providers including hotels, guesthouses, and homestays to encourage them to advertise their properties on the technological platforms. This may be accomplished by collaborating with these providers. Provide some sort of incentive or reward in order to encourage other suppliers to take part.

The third goal is partnerships with Accommodation Technology Application Providers. In order to give the Malay community in Kota Bharu with exclusive discounts, promotions, or special package deals, you should consider forming partnerships with accommodation technology application providers. Bring attention to the money-saving and other advantages offered by the use of these applications. We can also motivate contented users from the Malay community to spread the word about their great experiences using accommodation technology apps through word of mouth by encouraging them to do so. For the purpose of amplifying these testimonials, you should make use of social media platforms and local community networks. Lastly, we can offer the Malay community continual help and guidance in adopting and making use of accommodation technology applications. Create a dedicated hotline or customer support service in order to solve any questions or problems that they may experience.

CONCLUSION

In conclusion, all independent variables such as Security, Ease of Use and Convenience have a positive correlation with the dependent variable which is Behavioural Intention. As a result, the analysis revealed that security, ease of use and convenience have a positive influence on the Malay Community in the use of accommodation technology applications in Kota Bharu, Kelantan.

ABSTRACT

It is important to highlight ecotourism to the local community in Dabong. The level of knowledge of the local community in Dabong regarding ecotourism is low. This is because many do not know the meaning of ecotourism and this is very important to avoid environmental pollution. This study was conducted to try and evaluate the data obtained from the local community in Dabong to ensure whether this ecotourism has a positive impact whether politically, economically and socially in their lives. This study uses an quantitative method which is a questionnaire with 151 people from the local community who know about the surrounding area and have settled in Dabong with a projected number of years there. The information for this study was compiled after a detailed question and answer session.

Keywords: Ecoturism, Local community in Dabong.

INTRODUCTION

The title Impacts of Ecotourism development towards quality of life among local residents in Dabong, Kelantan, shall describe everything said above. However, following the storm, Dabong has become a popular destination for both domestic and foreign tourists. The structure of Dabong, which is more of a natural occurrence, has led to the area becoming a popular spot for ecotourism. The three main tourist attractions in Dabong are The Fish Cave, Lata Kertas, and Lata Kenerong..

Ecotourism is a strategy for preserving a region's natural resources and biodiversity while taking poverty alleviation and rural development into consideration. It based its operations on the natural and cultural resources of the area and engages local populations in tourism-related activities. This study explores the effects of ecotourism programmes on people who live in and around tourist-friendly areas.

Ecotourism initiatives can only be considered "successful" from a development point of view if local communities have a degree of control over them and if they share the advantages associated with ecotourism activities. With a focus on exploring the advantages, effects, and difficulties of ecotourism development in the area, the study looks at the socioeconomic impact of ecotourism attractions in Dabong. The study's conclusions show that the ecotourism sector in the region generates advantages including better transportation networks, economic possibilities, increased family income, and job development. Furthermore, tourism also helps to stimulate economic growth (Nasir &

Wongchestha, 2022). Based on these findings, the study recommends that all tourism industry stakeholders take an active role in the region's ecotourism development at all stages and that tourism be included as a required subject or course in high schools, colleges, and universities to raise local awareness and boost the labor force. The study approach that will be used in Dabong, Kelantan comprises the creation of an algorithm to assess local activities as well as a collection of scientific and useful ecotourism locations.

The top destinations for ecotourism are chosen through expert review, which is also used to compile best practises and create a handicap system. Community-Based Ecotourism (CBET) is a kind of localised natural resource management that is based on the principles and methods of conservation. This study will look at how the growth of ecotourism affects the standard of living in the local community in Dabong, Kelantan.

SIGNIFICANCE OF THE STUDY

Ecotourism development initiatives can assist local communities, but they also benefit travellers who travel to protected natural areas from all over the world. This research will also look at how well-informed locals and visitors are about potential quality issues in Dabong, which is good for both the nation's natural environment and the tourism sector.

LITERATURE REVIEW

RELATIONSHIP BETWEEN SOCIAL CULTURAL IMPACTS TOWARDS QUALITY OF LIFE AMONG LOCAL COMMUNITIES

From a social perspective, the growth of ecotourism has a favourable effect, i.e., improves and advances infrastructure amenities, infrastructure, and facilitates improved connection amongst community members. The benefits of ecotourism development can raise community standards of living and spur the growth of small and medium-sized businesses (SME) (James Et al, 2021). However, by promoting pride in cultural traditions and preventing urban redevelopment by generating local jobs, effects on tourism can be favourable and seen.

RELATIONSHIP BETWEEN COMMUNITY IMPACTS TOWARDS QUALITY OF LIFE AMONG LOCAL COMMUNITIES

In addition to preserving biodiversity and natural resources, protected areas often benefit local communities or populations by generating revenue from tourists. The majority of nature tourism destinations are frequently found in remote or wilderness areas; yet, in order to protect the natural value and draw more visitors, basic but required facilities must be provided. The study's conclusions indicate that the perception of the tourism industry's effect from economic, social, cultural, and environmental viewpoints might affect the quality of life in the neighbourhood. In terms of the social aspect, the tourism sector's perspective can improve the neighbourhood's ability to communicate with visitors in other languages. Finally, from an environmental perspective, it has compelled the local population to preserve the reputation of the hamlet or tourist attraction. Greater efforts are now being made to encourage environmental conservation in order to maintain the environment's quality. Overall, the positive impact of tourism expansion can raise the standard of living in the neighbourhood.

RELATIONSHIP BETWEEN ECONOMIC IMPACTS TOWARDS QUALITY OF LIFE AMONG LOCAL COMMUNITIES

Larger economic benefits from tourism growth contribute to the betterment of nearby towns. Malaysia's tourism industry, like that of many other countries, is typically measured in terms of dollars and cents, notably the quantity of arriving and spending foreign visitors. In Malaysia, the number of visitors increased from 23.65 million in 2009 to 25.72 million in 2013, bringing in RM 65.44 billion in 2013 as opposed to RM53.4 billion in 2009. According to Brown (1998), the combined effects of infrastructural upgrades and a rise in tourists show that travel has a mixed record of effects on the economy, culture, and environment. The Department of Statistics of Malaysia reports that the expansion in tourism has helped to increase tourist arrivals, income, and employment. According to the MTSA's 2005–2012 data, overall employment in the tourism industry rose by 4.7% in 2012 compared to 7.8% in 2011.

Tourism has many economic benefits, such as higher foreign exchange revenues, job possibilities, better social circumstances, and more market stability than conventional commodities exports. Local communities gain economically, physically, and socially from tourism activities, with the most immediate benefit being the creation of employment and the potential for individuals to enhance their income and level of life. The consequences of tourism vary by location, and include economic, environmental, socio-cultural, service-related, taxation, congestion, and community reactions.

The majority of individuals benefit financially from tourism resources, which raises their standard of living. Additionally, tourism benefits local communities by bringing in money, opening up new business and investment opportunities, and improving living circumstances. According to Courtney (1999), some of the positive changes brought about by tourism, such job opportunities, more money, and employment, may be appreciated by the locals.

IMPACTS OF ECOTOURISM DEVELOPMENT TOWARDS QUALITY OF LIFE AMONG LOCAL COMMUNITIES.

Ecotourism has a great impact on the local community in Dabong, as it is the best way to ensure tourism in Malaysia remains stable and increase the country's income. Local residents can also carry out economic activities by working and earning their own income through business.

RESEARCH HYPOTHESES

The literature review below shows independent variables such as the social, cultural, community and economic impact of the quality of ecotourism development services among the local community in Dabong, Kelantan.

H1: There is relationship between social cultural toward quality of life among local communities in Dabong, Kelantan.

H2: There is relationship between environment impacts toward quality of life among local communities in Dabong, Kelantan.

H3: There is relationship between economic impacts toward quality of life among. local communities in Dabong, Kelantan.

RESEARCH FRAMEWORK

The link between the independent and dependent variables utilised in the study is shown by the conceptual framework. In this study, three independent variables (IVs), including visitor satisfaction, place attachment, and destination attractiveness, were employed. The destination loyalty DV is the dependent variable.

Figure 2.1: Conceptual Framework

METHODOLOGY

RESEARCH DESIGN

The process of developing an appropriate framework for a study is known as research design. Research methodologies may be divided into three categories: mixed methods, qualitative design, and quantitative design. Combining quantitative and qualitative research into a single study or collection of studies is known as mixed methods research. The quantitative research approach will be used in this study since it produces precise and measurable data that can be used to a huge population.

DATA COLLECTION

Qualitative data is gathered in Dabong by community leaders or door-to-door surveys using spoken or written words, such as interviews, observations, records, and artefacts.

Secondary data is used to provide justification for judgements and quantitative research is used to investigate phenomena or events that affect people.

Primary data research is gathering information from real sources, while secondary data research is collecting published material for the current study challenge. Primary data will be collected from 152 respondents in Dabong, Kelantan, while secondary data will help make decisions clearer.

SAMPLING

To get useful data for market research, researchers employ a variety of sampling techniques. In certain circumstances, like the early stages of a study or financial restrictions, non-probability sampling is more beneficial than other types of sampling. In our investigation, convenience sampling was used as the non-probability strategy.

DATA ANALYSIS

Analysis of the connection between independent and dependent variables is done through descriptive analysis. Pearson A statistical method called correlation employs the correlation coefficient's magnitude to assess the strength of a relationship between independent and dependent variables.

FINDINGS

TABLE 1 : DEMOGRAPHIC ANALYSIS

	Demographic characteristics	Frequency	Percentage (%)
Gender			
Male		82	54.3
Female		69	45.7
Age			
15 - 25 years		92	60.9
26 - 35 years		29	19.2
36 - 45 years		13	8.6
46 - 55 years		15	9.9
55 years above		2	1.3
Marital Status			
Married		39	25.8
Single		112	74.2
Occupation			
Government		15	9.9
NGO		15	9.9
Retired		5	3.3

Self-employed	19	12.6
Student	93	61.6
Unemployed	4	2.6

According to table 1 gender results, there are 82 responders who are men, or 54.3 percent of the total. While there are 45.7 responses who are female, or 45.7 percent of the total. Next, the results for respondents' ages, 60.9 percent, or 92 respondents, are between the ages of 15 and 25. There were 1.3 percent fewer responders in the 55 and older age group than there were overall. While the ages of 26 to 35, 36 to 45, and 46 to 55 had 29, 13, and 15 respondents, respectively, with percentages of 19.2%, 8.6%, and 9.9%. Based on the reply of respondents, single has the largest number of respondents which is 112 respondent and the percentage is 74.2%. The least respondents is married. The number married is 39 respondent and 25.8 %. According to the table, there were 93 respondents, the majority of them were students, making up 61.6% of the total. The second largest category in the statistics, with 19 respondents, or 12.6%, was self-employed. Government and NGO came in third with 15 respondents and a 9.9% response rate. Retired ranks fourth in the statistics with 5 respondents and 3.3%. The lowest percentage of respondents (4, or 2.6%), were unemployed.

TABLE 2 : DESCRIPTIVE ANALYSIS

Variables	N	Mean	Standard Deviation
Quality of life	151	17.62	2.432
Social cultural impact	151	16.92	2.849
Environmental impact	151	17.34	2.891
Economic impact	151	16.98	3.035

The mean and standard deviation of the dependent variables and independent factors were displayed in Table 1 by the number of respondents. The dependent variable's median value, or quality of life, is 17.62. The highest mean for independent variables is Environmental Impact (17.34), followed by Economic Impact (16.98), and Social Cultural Impact (16.92).

TABLE 3 : RELIABILITY ANALYSIS

Variable	Number of Item	Cronbach's Alpha coefficient	Strength of Association
Quality of Life	4	0.862	Very Good
Social Culture	5	0.890	Very Good
Environment	5	0.886	Very Good
Economic	5	0.872	Very Good
Overall Variables	19	0.961	Excellent

The aggregate Cronbach's Alpha Coefficient for the independent and dependent variables in this study was displayed in Table 3. Next, five questions were used to assess the quality of life in Dabong, Kelantan, and the Cronbach's Alpha result for the question in this part was 0.862, indicating extremely excellent. Five questions were used to assess the social and cultural influences on residents' quality of life in Dabong, Kelantan. Table 2 revealed that the question in this area had a very strong Cronbach's Alpha score of 0.890. As a result, the coefficients found for the social culture influences variable were accurate. Additionally, there were five questions to assess how the environment affected residents' quality of life in Dabong, Kelantan. This section's Cronbach's Alpha coefficient value is 0.886, which is deemed to be very excellent. Five questions were used to measure the economic effects on quality of life among local populations in Dabong, Kelantan.

TABLE 4 : PEARSON CORRELATION ANALYSIS

Table 4 below show the result of the Pearson Correlation Analysis

Correlations					
		DV	IV1	IV2	IV3
DV	Pearson Correlation	1	.788**	.781**	.774**
	Sig. (2-tailed)		.000	.000	.000

	N	151	151	151	151
IV1	Pearson Correlation	.788**	1	.814**	.855**
	Sig. (2-tailed)	.000		.000	.000

	Sum of Squares and Cross-products	818.921	1218.19	1005.78	1108.85
	Covariance	5.459	8.121	6.705	7.392
	N	151	151	151	151
IV2	Pearson Correlation	.781**	.814**	1	.803**
	Sig. (2-tailed)	.000	.000		.000
	Sum of Squares and Cross-products	824.285	1005.78	1254.09	1057.68
	Covariance	5.495	6.705	8.361	7.051
	N	151	151	151	151
IV3	Pearson Correlation	.774**	.855**	.803**	1
	Sig. (2-tailed)	.000	.000	.000	
	Sum of Squares and Cross-products	857.258	1108.85	1057.68	1381.97
	Covariance	5.715	7.392	7.051	9.213
	N	151	151	151	151
**. Correlation is significant at the 0.01 level (2-tailed).					

The somewhat favourable association between social culture and quality of life was indicated by the correlation value of 0.788. The somewhat favourable link between environmental damages and quality of life was shown by the correlation value of 0.781. Table 3 displayed the 151 instances, the significant value, and the Pearson correlation coefficient. The somewhat favourable association between economic effects and quality of life was indicated by the correlation value of 0.774.

DISCUSSION AND RECOMMENDATION

This study suggests further research on immigration, focusing on local tourists to Malaysia. The findings are consistent, but may vary if including foreign tourists. The study should ask other tourists to respond to the questionnaire, focusing on four characteristics affecting consumer behaviors among local Malaysian visitors.

Next, this study may overlook other factors affecting Malaysian residents' tourist behaviour, such as economic factors. Future research should consider larger sample sizes and employ interviews or open-ended questions to improve precision and dependability. Additionally, researchers should consider using a larger sample size and incorporating economic considerations to better understand the millions of domestic and international visitors to Malaysia.

The current study has several limitations, such as the time constraint, busy conditions, and respondents' reluctance to cooperate in answering online questionnaires. The researchers have tried to get respond quickly in a short time.

This study only looked at local tourists to Malaysia, but the findings may vary if it includes foreign tourists. To improve the precision and dependability of the study, researchers should ask other tourists to respond to the questionnaire. Additionally, larger sample sizes should be used to increase the precision and dependability of the study.

CONCLUSION

The researcher used a Google Form to collect data, and both visitors and residents of Dabong submitted 150 replies. Google Forms was also used by the researcher to get replies from people all throughout Malaysia. This is because respondents find it easier to complete all of the surveys when utilising the Google form, which also saves the researcher time and money. The results from the preceding chapter and all of the survey data were then examined using a software tool named. The researchers utilise this programme because it makes it easy to comprehend all the information. Therefore, it is anticipated that all of the information supplied throughout this research will be helpful to the subsequent researcher.

ABSTRACT

Tourism has become an activity that is familiar to generate and improve the private economy and also to benefit the national economy, it allows local communities to create opportunities for tourists to learn about their culture and promote their own history and stories (López-Guzmán et al. Local communities must provide services to tourists based on the initiative and management of their natural and cultural resources. In Kelantan, Pulau Suri is one of the unique places for the development of economic tourism. Therefore, their objective when traveling is not only to discover new locations but also local culture, ethics, and historical sites where they can have an authentic and meaningful experience based on their own perception. In order to answer research collection, test hypotheses, and evaluate results, data collecting is a procedure that involves gathering and methodically quantifying information on variables of interest. The data collection process had been done from 19 May 2023 till 21 May 2023, the researcher spread the questionnaire to the local community for answers the question. Data collecting is used in many different types of study, including the natural and social sciences, humanities, business, and others. Quantitative methods were used in this study which is 160 respondents have been chosen to answer the questionnaire.

Keywords: Tourism, Socioeconomic, Quality of life, Community

INTRODUCTION

Since it enables local communities to develop possibilities for visitors to learn about their culture and promote their own history and stories, tourism has come to be known for generating and enhancing the private economy as well as benefiting the national economy (López-Guzmán et al., 2011). Local communities must take the initiative and manage their natural and cultural resources in order to give services to tourists. Tourists will benefit from better access between locations if this is done. Based on these elements, it is commonly

acknowledged that local communities play a crucial role in the development of the tourism industry and in future tourism growth (Butler and Pearce, 2003; Mason, 2003; Telfer and Sharpley, 2007).

Tourism will make locals feel unappreciated if they are not properly empowered and involved in the development of local tourism. As a result, it will be less probable that they will earn tourism money (Lea, 1988). Possibly, the potential of local people and local knowledge raises the likelihood that community involvement can play a central role in tourism development. The engagement of the local community is essential in the tourism business because it may ensure that tourists have a memorable experience and can visit a variety of attractive locations, thereby generating revenue for the community. Due to their familiarity with the area, locals provide decision-makers with vital supporting data. Therefore, tourism development must utilise the population's potential to entice locals to join the tourism business. By doing so, chances to access markets and establish enterprises in the community can be created, so creating employment possibilities and reducing rural poverty.

PROBLEM STATEMENT

The stated issues that Pulau Suri has been explained in this section. The floating markets in Pantai Suri, which are close to the water, could be impacted by increasing sea levels, tsunamis, flash floods, and monsoon floods. This is because the study that we have collected on roads for the transport of goods is missing. Roads are very important to deliver goods or bringing tourists who are unable to walk to make it easier for tourists to move here and there like the elderly. Therefore, the party in charge must take this matter seriously so that more tourists come to this Pulau Suri. Pulau Suri has difficulty with the availability of clean water. Another issue with this is that when visitors use the restroom, the water is slow and murky. As a result, it is imperative that this issue is properly resolved because tourists and vendors alike depend heavily on the use of water.

RESEARCH HYPOTHESIS

The research's hypothesis is based on the study's elements, including economic, environmental, cultural, and community factors that influence the choice of domestic tourism destinations. The hypothesis had been developed and was going to be evaluated based on the investigation.

H1: There is no relationship between economic impact and Quality of life in local community of Pulau Suri in Kelantan.

H2: There is no relationship between social impact and Quality of life in local community of Pulau Suri in Kelantan.

H3: There is no relationship between environmental impact and Quality of life in local community of Pulau Suri in Kelantan.

Research Framework

The research framework used for this study is displayed in figure 1 below.

Figure 1 : Research Framework

METHODOLOGY

Research methodology refers to the methods or tactics used to locate, pick, analyse, and evaluate data regarding a topic. A research paper's methodology section enables the reader to unbiasedly assess the study's overall validity and trustworthiness. Research methodology discusses and explains the methods you used for data collection and analysis in your study. Any thesis, dissertation, or research paper should have a methodology chapter that outlines what you did and how you did it, allowing readers to assess the reliability and validity of your research and dissertation topic.

RESEARCH DESIGN

In order to get all the information required to conduct this research, we used the survey approach with online questions via Google Form to collect the data. Additionally, because it is standardized, this method of investigation is typically less expensive and simpler to administer than alternative ones. Researchers used this method to obtain data and information because it is an effective way to do so and because this study included a high number of respondents (Paduka, 2017). A research instrument is a device that has been scientifically and methodically created and is used to gather, measure, and analyze information on the research interests and

alignment (s). When conducting a study, researchers typically have to choose between a quantitative, qualitative, or mixed-method approach. The various types of instruments that can be used include surveys, tests, questionnaires, achievement/aptitude tests, interviews, scales (measuring and weighing tapes), archival documents and government sources, oral histories, focus group discussions and experiments, observation forms, tally sheets, and others. There are benefits and drawbacks to every instrument. The questionnaire is the most common method for obtaining research data from study participants (Abuya, 2016).

DATA COLLECTION

Data collection is a process that involves acquiring and meticulously quantifying data on variables of interest in order to answer research questions, test hypotheses, and assess results. For the purpose of gathering information for this study, a total of 160 respondents were surveyed, and respondents were chosen via convenience sampling. Many diverse fields of study, such as the natural and social sciences, humanities, business, and others, use data collection. The need for exact and reliable data collecting stays the same, even while methods vary depending on the constraints (Kapur, 2018). Any attempt to collect data should be made to collect high-quality data that can be utilised to produce thorough data analysis and develop compelling cases for the issues being addressed.

SAMPLING

The process of selecting a subset of the intended audience for a research study is called sampling. Smaller groups are used to collect data because it is often impractical for the entire population of interest to participate in research projects. Sampling from the population is frequently more realistic than attempting to contact every person in the community and makes it possible to collect data more quickly and affordably. So, in order to cover a big number of surveys swiftly and affordably, the researcher employed convenience sampling, which is perhaps the most popular sampling technique, to carry out this study. The sample is chosen because the researcher has access to it, which necessitates choosing any available sample of respondents that is appropriate for the researcher.

FINDINGS

Result of Frequency Analysis

Male respondents made up 81 of the total respondents, while female respondents made up 79. Male respondents made up 51% of the 160 total respondents, while female respondents made up the remaining 49%. There were 160 respondents overall, with ages ranging from 20 and under (21 respondents), 21–30 (37 respondents), 31–40 (62 respondents), 41–50 (21 respondents), and 51–60 (19 respondents). The respondents who ranged in age from 31 to 40 made up the largest group of respondents (38%). As for the interviewees, the bulk (91.9%) of them reported being single, while only 8.1% were married. Regarding occupation, the majority of respondents—29.4% (47 respondents)—came from the private sector, followed by housewives—26.3% (42 respondents). The second highest occupation was from the government, with a percentage of 20.6% (33 respondents), followed by fishermen with a percentage of 11.3% (18 respondents), construction workers with a percentage of 6.9% (11 respondents), shopkeepers with a percentage of 3.1% (5 respondents), and others with a percentage of 2.5% (4 respondents).

Characteristic	Frequency	Percentage (%)
Gender		
Male	81	51
Female	79	49
Age		
20 and below	21	13
21 – 30	37	23
31 – 40	62	38
41 – 50	21	13
51 – 60	19	12
Race		
Malay	103	64.4
Chinese	50	31.3
Indian	7	4.4
Marital Status		
Single	70	91.9
Married	90	8.1

Occupation		
Government	33	20.6
Private Sector	47	29.4
Housewife	42	26.3
Construction Worker	11	6.9
Retailers	5	3.1
Fisherman	18	11.3
Others	4	2.5

Result of Descriptive Analysis

In Table 2, the variable's mean score and standard deviation are displayed. When the mean score is between 1.00 and 1.99, the factors are regarded low; when it ranges between 2.00 and 4.00, they are deemed high. Results of a descriptive analysis are shown in Table 2:

VARIABLES	ITEMS	MEAN	STANDART DEVIATION
Economic Impact	1. Tourism activities had increase the economic income in Pulau Suri	4.15	0.616
	2. Tourism development in Pulau Suri helps in supporting local products.	4.26	0.482
	3. Tourism development in Pulau Suri had create many job opportunities towards local community	4.37	0.486
	4. The tourism development in Pulau Suri had encourage the entrepreneurial activities in local community	4.47	0.525
	5. The development of tourism has promoted economic benefits in Pulau Suri.	4.59	0.530
Social Impact	1. The development of tourism in Pulau Suri made it easier for the people there to get along with outsiders	4.56	0.698

	2. The development on Pulau Suri also helped increase the mastery of foreign languages among the local community	4.54	0.768
	3. The presence of tourists on Pulau Suri can improve the communication skills of local residents with foreign tourists	4.54	0.633
	4. The development of tourism in Pulau Suri can reduce the unemployment rate among the population	4.52	0.644
	5. The development of tourism in Pulau Suri can help local people to maintain and practice their cultural	4.61	0.572
Environmental Impact	1. Tourism development at Pulau Suri impacted homestay accommodations	4.59	0.553
	2. Tourism development provides a good function to help the development of the surrounding population.	4.44	0.522
	3. Tourism development at Pulau Suri improves local infrastructure and communication facilities	4.49	0.593
	4. Tourism development at Pulau Suri improves the environment	4.88	3.234
	5. Tourism development activities had create people's awareness to take care of the environment	4.57	0.509
Quality of Life	1. The development of tourism in Pulau Suri has improved the quality of life of the local community	4.57	0.545
	2. The local community has been greatly exposed to today's advanced technology	4.58	0.508
	3. The local community has gained a lot of experience in tourism activities	4.60	0.491

	4. The development of tourism in Pulau Suri has improved the standard of living among local community in Pulau Suri	4.69	0.465
	5. The community can promote sales revenue to tourists to boost their economy if development is upgraded on Pulau Suri	4.57	0.497

Pearson Correlation Analysis

One of the crucial analyses that determined the linear relationship between the two variables was the Pearson's correlation study. This analysis's goal was to find any relationships between the independent variables (economic, social, and environmental impact) and the dependent variable (life quality). Researchers must assess whether the association's strength is acceptable if the relationship is substantial.

Table 3 shows a significant relationship between independent variable and dependent variable. Based on the result, there is no significant between the independent and dependent variables. Therefore, the following hypothesis is not accepted:

Correlations

		DV	EC	SOC	ENV
DV	Pearson Correlation	1	.051	.104	.190*
	Sig. (2-tailed)		.523	.193	.016
	N	160	160	160	160
EC	Pearson Correlation	.051	1	-.021	.096
	Sig. (2-tailed)	.523		.787	.229
	N	160	160	160	160
SOC	Pearson Correlation	.104	-.021	1	.081
	Sig. (2-tailed)	.193	.787		.309
	N	160	160	160	160
ENV	Pearson Correlation	.190*	.096	.081	1
	Sig. (2-tailed)	.016	.229	.309	
	N	160	160	160	160

*. Correlation is significant at the 0.05 level (2-tailed).

DATA ANALYSIS

Frequency analysis, descriptive analysis, reliability testing, and Pearson correlation analysis were the four methods of data analysis used in this study. To demonstrate the link between the dependent variable and the independent factors, the data was examined using SPSS version 26. The statistics generated by SPSS include valid percentage and cumulative percentage. Tables, charts, and graphs will be used to illustrate how the data will be presented.

DISCUSSION AND RECOMMENDATION

The limitation of the study is the methodology that affects or influences the interpretation of the findings of this study. The researchers had a rewarding experience completing this full study. However, there are some constraints that cannot be ignored in order for the research process to run well.

The researcher's difficulty in swiftly locating respondents is a significant barrier to generalizing these findings. Some villages choose not to respond to their questionnaires. As a result, the researcher repeatedly asked the villagers to complete and respond to new questionnaires.

In addition, the findings contain errors in the information that the respondents submitted. Some of the respondents did not fully commit to performing this study, even if they did not complete the entire questionnaire supplied by the researchers. As a result, it was challenging for researchers to compile their findings.

Finally, this study has several limitations. In this study, third-year Wellness students at Universiti Malaysia Kelantan with three independent variables of economic impact, social impact, and environmental impact, and one dependent variable which is quality of life is the main subject in the study conducted by the researcher.

RECOMMENDATION

Tourism is crucial for women's economic empowerment and contributes to infrastructural development, which in turn benefits other sectors of the economy. There is also enormous potential to green and sustainable the sector, so contributing to environmental conservation. Pulau Suri, which possesses a diverse range of tourism resources, should be promoted as a new tourist destination. However, concerted cooperative efforts are essential to revitalise the sector and overcome the post-COVID-19 consequences caused by an almost two-year lockdown.

Our marketing methods, as well as how and where we advertise, are critical to capturing the attention of potential tourists. By focusing our marketing campaigns on the fascinating aspects of our location, we will quickly capture the interest of international travellers. We will notice that each marketing campaign highlights well-known tours, events, and sites from the

country in question. They've managed to collect everything that excites tourists and market it through their ads.

Finding the ideal outlets to promote your marketing strategy is also critical to ensuring that you reach the right audience. For example, if you want to reach a largely younger clientele, online marketing is the way to go. However, collaborating with local travel agencies or promoting through print media channels may be a better fit if you're selling to an older audience.

CONCLUSION

In conclusion, the research on the impact of tourism development in Pulau Suri Kelantan on the quality of life in the local community reveals a complex interplay of positive and negative effects. While tourism has brought economic benefits and improved access to amenities and services, it has also led to environmental strain, social changes, and challenges to cultural identity. To ensure a sustainable and inclusive tourism model, it is essential for policymakers and stakeholders to prioritize environmental protection, community involvement, and equitable distribution of benefits. By striking a balance between economic growth and the preservation of cultural and natural heritage, Pulau Suri Kelantan can aspire to a tourism industry that enhances the overall well-being and quality of life for its residents.

ABSTRACT

This study is about tourist perception who visit Kuala Terengganu as an Islamic tourism destination. Perception is one of the important factors considered by tourist in visiting a destination beside motivation attractiveness, spiritual experience, culture attribute, religion and accessibility. Therefore, this research is to examine the relationship between brand image and tourist perceptions of Kuala Terengganu as an Islamic Tourism destination. Second, to examine the relationship between spiritual experience and tourist perceptions of Kuala Terengganu as an Islamic tourism destination. Lastly, to examine the relationship between cultural attributes and tourist perceptions of Kuala Terengganu as an Islamic tourism destination. The quantitative method used in this research is questionnaires. About 327 respondents which is domestic and international tourists who went and experience in Kuala Terengganu chosen in this study.

Keywords: Tourist Perception, Islamic Tourism

INTRODUCTION

This study examines the perception of tourists visiting Kuala Terengganu as an Islamic tourism destination. It examines the relationship between brand image, spiritual experience, culture attribute, religion, and accessibility. The research uses questionnaires to gather 327 domestic and international tourists. Kuala Terengganu is a developing city with diverse cultures, rich heritage, and friendly locals. The Terengganu State Museum, located in Kampung Losong, is one of Malaysia's largest museums. The results show that spirituality, destination branding, and cultural characteristics strongly influence tourists' perception of Kuala Terengganu. The opinions of visitors are significant as they will influence future tourists. The study highlights the importance of understanding tourists' perceptions of destinations and implementing measures to boost tourism revenues and protect tourism-related characteristics.

Significance of the Study

Theoretically, this study has many consequences. This study uses a quantitative methodology to generalize conclusions and findings. The results of this study serve as a standard to guide Tourist Perceptions of Kuala Terengganu as an Islamic Tourism Destination. This study focuses on tourists' views. It addresses three main research questions: What are people's perspectives about Kuala Terengganu being an Islamic tourism destination? How far do people understand the history of Islam in Malaysia? What are the postulated characteristics of the Islamic tourism destination transpiring in Kuala Terengganu? Visitor satisfaction is one of the most important elements that guarantee future business growth. Today, many businesses use visitor happiness as a critical metric to measure the effectiveness of their operations. According to the tourism literature review, the destination's ability to satisfy visitors is an important consideration when choosing a location. If visitors are satisfied with their trip to the site, they may recommend it to others or return it themselves. (Site, Abbasi et al. 2019)

LITERATURE VALUE

IV₁: Brand Image

The brand image serves as the foundation of a framework that has a variety of consequences on customer reactions to tourism industry marketing. Given the significance of brand image for the tourist sector, during the past ten years, the sector has been working to build a conceptual framework for brand image, and, from the viewpoint of the travel sector, improve a sweet impression on customers. For the travel and tourist industry, the conceptual framework recognizes both the moderators and the antecedents of brand image. In actuality, the antecedents and moderators of brand image are latent factors whose function is to establish and uphold a brand image in the minds of customers. The conceptual underpinning of the tourism industry's brand image will be crucial in this regard given the existing state of tourism marketing. One of the key elements of customer-based brand equity that supports views of a travel brand and is communicated by the brand associations ingrained in a customer's memory is the conceptual framework of brand image (Keller, 2008). As a result, it is understood that the conceptual framework of brand image for the tourism industry plays a key role. As a result, it is recognised that the conceptual framework for the tourism industry's brand image plays a significant role as antecedents and moderators of brand image, allowing the industry to remain in customers' memory for a long time.

IV₂: Spiritual Experience

Three new, essential components of spirituality are highlighted by a synthesis of numerous viewpoints: Conscious attention to God, the Supreme Being, or the High Spirit comes first, followed by an awareness of oneself and others (Mitroff, 2003; Piedmont and Leach, 2002). Mitroff (2003) upheld the idea that spirituality is connected to God, a High Spirit, or a Supreme Being by referring to God as the controlling force behind the universe. According to Piedmont and Leach (2002), who concur that humans have always sought to connect with some great and sacred truth, which has been a constant force in humanity, spirituality is tied to God. This reality is described as a "non-delimited formless form of the unseen" by Sufi Rumi, according to a quotation from him "(Rustom, 2008, p.4)

IV₃: Cultural Attribute

Learning about, exploring, experiencing, and consuming both real and intangible cultural attractions and products in a trip destination are the main goals of cultural tourism. In addition to literature, music, the creative industries, living cultures with their unique ways of life, value systems, beliefs, and traditions, arts and architecture, historical and cultural heritage, culinary heritage, arts and architecture, these attractions/products are linked to a variety of distinctive material, intellectual, spiritual, and emotional characteristics of a society.

DV: Kuala Terengganu as an Islamic Tourism Destination

The phrase Islamic tourism arose from a debate at an Organization of Islamic Cooperation summit in 2000, which recommended the practice of travel inside Islamic nations to produce cash and help countries grow (Lina Munirah & Hairul Nizam, 2012; Zamani-Farahani & Henderson, 2010). However, the 9/11 tragedy in 2001 spurred the rise of secular thought connected with Islam with terrorism, leading to the establishment of Islamic tourism to overcome Islam's image crisis (Norlida Hanim et al., 2010). Since then, debates have centered on the definition of Islamic tourism. As this tourist idea should be regarded in various aspects, the clear definition of Islamic tourism is still vague, as is the outcome itself. Thus, additional discussion in this work contributes to a more specific understanding of the idea of Islamic tourism, including participants, activities, sites, goods, dimensions, value, and Islamic tourist management.

Research Hypothesis

The analysis of the available literature revealed that independent factors such as brand perceptions, spiritual encounters, and cultural characteristics affected how visitors saw Kuala Terengganu as an Islamic tourist destination. As a result, the research methodology examines the relationships between the variables. Researchers assert that the antecedents and moderators of brand image components within the context of the proposed conceptual framework of brand image, spiritual experiences, and cultural attributes for the tourism industry would have a potential for developing a strong tourism brand in the contemporary environment of tourism marketing because they can offer helpful managerial implications that will aid the tourism brand managers. Thanks to many of the ideas presented in this suggested conceptual framework, the reader will have a deeper understanding of how the tourism sector may establish and sustain a brand's reputation, spiritual experiences, and cultural characteristics. According to researchers, the tourism sector will be able to forge a strong brand identity and turn consumer connections into a competitive marketplace with the support of social media. With the aid of the conceptual framework they have developed, researchers think the tourism sector will be able to create a strong brand identity and turn consumer connections into a competitive marketplace.

Research Framework

FIGURE 2.1: CONCEPTUAL FRAMEWORK INDEPENDENT VARIABLE AND DEPENDENT VARIABLE
SOURCE

METHODOLOGY

It is defined as using research information while applying something to a planned outcome. The research process, data collection techniques, sampling plan, and presented work form a large part of the analytical approach. From the above statement, it can be concluded that what conveys the definition of research is a methodical and objective effort with the aim of gathering or collecting correct and useful facts. The process of reviewing and researching studies systematically and fairly is known as methodology.

Research Design

This study uses several research models to propose a conceptual model that can fully explain the perception of quality destinations in tourism satisfaction. In addition, the important thing to consider is that between gender and the frequency of visits will have an impact on the relationship and these factors.

Data Collection

The research study will collect data using primary data, which is information gathered directly from sources by researchers via an online survey GOOGLE FORM. In this study, primary data was collected using

questionnaires, which were distributed to respondents. The questionnaire will be distributed via an online survey, also known as an online questionnaire. The purpose of this analysis was stated in the link included with the form that was distributed to the respondents. As a result, respondents can understand the motivation and purpose of this study, allowing them to generate more accurate data. The questionnaire was distributed to 131 respondents regarding tourist perception of Kuala Terengganu as an Islamic tourism destination.

Sampling

This random sampling method refers to the collection of information to participate in research studies from members of the population (Sekaran, 2009). Therefore by using random sampling the number of people is large which will include all individuals. A random sampling method was used for sampling in this study. This study simulates the relationship between brand image, spiritual experiences, and cultural attributes and looks at the extent to which tourist perception Kuala Terengganu as an Islamic tourism destination. Since cluster sampling has been a common approach in market research, this type of sampling can save a lot of time, money, and effort. It is used when researchers cannot obtain information about the entire population but can gain information about specific clusters.

Data Analysis

This study simulated the factor affecting tourist perception while traveling in Kuala Terengganu or tourists that have an experience in Kuala Terengganu. The findings revealed that brand image, spiritual experiences, and cultural attributes factor influenced tourist perception of Kuala Terengganu as an Islamic tourism destination.

FINDINGS

Demographic Analysis

This item measuring the chosen research constructs were adopted from prior related research in the field of tourist that had been in Kuala Terengganu.

Table 1: Measurement Items

Measurements	Number of Items in the Questionnaire	Scales Used
Section A: Demographic Information	7	Adapt
Section B: Perception of Kuala Terengganu as an Islamic Tourism Destination (DV)	5	Adopt
Section C: Relationship between Brand Image and Perception of Kuala Terengganu as an Islamic Tourism Destination (IV ₁)	4	Adopt
Section D: Relationship between Spiritual Experience and Perception of Kuala Terengganu as an Islamic Tourism Destination (IV ₂)	4	Adopt
Section E: Relationship between Cultural Attribute and Kuala Terengganu as an Islamic Tourism Destination (IV ₃)	3	Adopt

Table 2: Demographic Profile of Scale

Characteristic	Frequency	Percentage (%)
Gender	Female	42
	Male	58
Age	18-23 years old	73.3
	21-25 years old	0.8
	24-29 years old	19.1
	30-35 years old	3.8
	36-40 years old	2.3
	41 years old and above	0.8
Race	Chinese	3.8
	Indian	2.3
	Malay	93.1
	Siamese	0.8
Level of Education	Diploma	13.7
	Degree	74.8
	Master	0.8
	SPM	9.2
	No Education	1.5
Occupation	Government Staff	2.3
	Private Sector Staff	10.7
	Self-employed	5.3
	Student	78.6
	Unemployed	3.1
Income	No Income	77.1
	RM1001-RM1500	4.6
	RM1501-RM2000	4.6
	RM2001-RM2500	2.3
	RM2501-RM3000	1.5
	RM3001 and above	3.8
Status	Single	92.4
	Married	7.6

Table 2 presents an overview of the responder profile. A total of 55 female respondents, compared to 76 male respondents, completed the survey. The age group from 18 to 23 years old had the highest percentage of respondents (73.3%), followed by the age group from 24 to 29 years old (19.1%), the age group from 30 to 35 years old (2.3%), and last but not least, the age groups from 21 to 25 years old and 41 years and over (0.8%).

There were 120 respondents who answered the questionnaires, including 122 Malay respondents, 3 Indian respondents, 5 Chinese respondents, and 1 Siamese respondent. Malay respondents made up the majority with 93.1%, followed by Chinese respondents with 5%, Indian respondents with 3%, and Siamese respondents with 0.8%.

The degree of education is next. Degrees account for the responder population's greatest level of education (74.8%). With 13.7%, Diploma comes in second. SPM comes in second with 9.2%, and No Education is third with 1.5%. Master comes in last but not least with 0.8%.

The occupation is next. Students made up the response group with the highest percentage (78.6%). The private sector workforce has the second-highest share with 10.7%. Self-employed people come in third with 5.3%, followed by the jobless with 3.1%. Government employees had the lowest number among the respondents (2.3%).

Then comes the respondents' income. With a percentage of 77.1%, those with no income have the highest percentage of income. The next greatest percentage, 4.6%, is found in the range of RM1001 to RM1500 and RM1501 to RM2000. The following percentage is 2.3% for RM2001 to RM2500. The lowest percentage of income, or 1.5%, is between RM2501 and RM3000.

The status of the respondents is not the least important. The percentage of respondents who are single is the largest (92.4%), followed by the percentage who are married (7.6%).

Descriptive Analysis

This study has analyzed the mean and standard deviation for section B, C, D, and E of the questionnaire

Table 3: Descriptive Statistic

Variable	Average of N	Average of Mean	Average of Standard Deviation
Perceptive of Kuala Terengganu as an Islamic Tourism Destination	130	1.7	0.864
Brand Image	128	1.61	0.801
Spiritual Experience	124	1.60	0.794
Cultural Attribute	128	1.7	0.810

Table 3 shows the mean and standard deviation analysis for the independent and dependent variables. The perception of Kuala Terengganu as an Islamic tourist destination is the dependent variable in this study, whereas brand image, spiritual experience, and cultural attributes are the independent variables. The component where respondents agreed more with each other, with a higher mean value of 1.7, was respondents' perception of Kuala Terengganu as an Islamic tourist destination and cultural attributes. The respondents in this survey agreed that Spiritual Experience had the lowest Mean Value for that measure, which is only 1.6. The data set that has more dispensing values has a Standard Deviation of more than 1 out of 120 respondents.

Reliability Test

A reliability test is used to assess a systems overall stability and performance over a particular period under various testing situations. The pilot test was conducted with 120 people via internet survey.

Table 4: Result of Reliability Test

Variable	Number of Items	Cronbach's Alpha Coefficient	Strength of Association
Perception of Kuala Terengganu as an Islamic Tourism Destination	5	0.713	Good
Brand Image	5	0.773	Good
Spiritual Experience	4	0.441	Poor
Cultural Attribute	4	0.633	Moderate

Table 4 displays the independent and dependent variables' Cronbach's Alpha Coefficient values. The table above shows that the majority of the variables were more than 0.6. As a result, the drawn conclusion can be trusted and used in this investigation. Five questions were used to gauge how persons who had visited Kuala Terengganu perceived it as an Islamic tourist destination; the Cronbach's Alpha result for this section question was 0.713, which is good. As a result, the coefficients calculated for these questions in assessing how persons who had visited Kuala Terengganu perceived it as an Islamic tourist destination were also trustworthy. Since variables exceeded the Cronbach's Alpha charge, it can be inferred that surveys are very reliable and that the study can move on.

Five questions were used to measure the Brand Image variable, which affected how people who had visited Kuala Terengganu perceived it as an Islamic tourist destination. The Cronbach's Alpha result for these questions was 0.773, which was favorable. The computed coefficients for the Brand Image variable questions were therefore accurate.

As a result of the four questions used to assess how Spiritual Experience affected people's perceptions of Kuala Terengganu as an Islamic tourist destination, the result was a poor 0.441, which is regarded as inadequate. The coefficient calculated for the Spiritual Experience variable was unreliable as a result.

Finally, four questions were used to evaluate the Cultural Attributes variable, which affected how people who had visited Kuala Terengganu perceived it as an Islamic tourist destination. The result was 0.633, which is regarded as moderate. The coefficient estimated for the Cultural Attributes variable was accurate as a consequence.

Pearson Correlation Analysis

One of the most important analyses that examined the linear relationship between the two variables was the Pearson Correlation Analysis. The goal of this study was to ascertain whether Kuala Terengganu's perception as an Islamic tourism destination and the independent variables of brand image, spiritual experience, and cultural characteristics were correlated in any way. If the relationship is significant, the researchers must determine what degree of connection strength is acceptable.

Hypothesis 1

H₁: There is relationship between Brand Image and Kuala Terengganu as an Islamic Tourism Destination among people that had been in Kuala Terengganu.

Table 5: Correlation Coefficient for Brand Image and Kuala Terengganu as an Islamic Tourism Destination among the people that had been in Kuala Terengganu

		IV ₁	DV
IV ₁	Pearson Correlation	1	0.926**
	Sig. (2-tailed)		0.000
	N	131	131
DV	Pearson Correlation	0.926**	1
	Sig. (2-tailed)	0.000	
	N	131	131

**Correlation is significant at the 0.01 level (2-tailed)

Hypothesis 2

H₂: There is significant relationship between Spiritual Experience and Kuala Terengganu as an Islamic Tourism Destination among people that had been in Kuala Terengganu

Table 6: Correlation Coefficient for Spiritual Experience and Kuala Terengganu as an Islamic Tourism Destination among the people that had been in Kuala Terengganu

		IV ₂	DV
IV ₂	Pearson Correlation	1	0.376**
	Sig (2-tailed)		0.000
	N	131	131
DV	Pearson Correlation	0.376**	1
	Sig. (2-tailed)	0.000	
	N	131	131

**Correlation is significant at the 0.01 level (2-tailed)

Hypothesis 3

H₃: There is significant relationship between Cultural Attributes and Kuala Terengganu as an Islamic Tourism Destination among people that had been in Kuala Terengganu

Table 7: Correlation Coefficient for Cultural Attribute and Kuala Terengganu as an Islamic Tourism Destination among the people that had been in Kuala Terengganu

		IV ₃	DV
IV ₃	Pearson Correlation	1	0.135
	Sig. (2-tailed)		0.126

	N	130	130
DV	Pearson Correlation	0.130	1
	Sig. (2-tailed)	0.126	
	N	130	131

To ascertain the linear relationship between the two variables that were designated as the study's purpose, researchers employed correlation analysis. The correlation analysis's findings, which are presented in Table 8, demonstrate a substantial correlation between brand image, spiritual experience, and cultural attributes. Additionally, among those who have visited Kuala Terengganu, there is a significant correlation between Brand Image, Spiritual Experience, and Cultural Attributes.

Discussion & Recommendation

The study examined the connections between Kuala Terengganu's brand image, spiritual experience, cultural characteristics, and perception of it as an Islamic tourist destination. This study's goal is to ascertain the relationship between brand image, spiritual experience, cultural characteristics, and visitors' perceptions of Kuala Terengganu as an Islamic tourist destination.

This study only takes into account the three factors—brand image, spiritual experience, and cultural attributes—that affect how people who have visited Kuala Terengganu see it as an Islamic tourist destination. However, it's possible that this study is ignoring other significant factors that have an impact on how visitors to Kuala Terengganu perceive it as an Islamic tourist destination. As a result, future researchers might suggest adding more variables.

The target population of this study may be determined using the 120 samples that were used. Higher sample sizes might be used to analyze millions of Malaysians if the amount is sufficiently dependable. Consequently, future researchers should increase their sample size in order to enhance the validity and reliability of their studies.

Future studies should be conducted to stay current on factors that could affect how Kuala Terengganu is perceived as an Islamic tourist destination with a distinctive brand, spiritual experience, and cultural characteristics. It is possible to evaluate the elements that affect people's perceptions of Kuala Terengganu as an Islamic tourist destination, which could help company owners employ more effective marketing strategies. In the future, academics might develop a special framework for assessing how people who have visited Kuala Terengganu with the tourism business perceive the region as an Islamic tourist destination. Regional surveys must be done to determine how positively people perceive Kuala Terengganu as an Islamic tourist destination because people's perceptions are diverse.

Instead of asking respondents to fill out a scaled online survey questionnaire, an interview method is used to create open-ended questions for them. Interviews may yield a high response rate for researchers, allowing them to immediately explore any uncertainties or partial answers. Thus, these strategies will do away with misinterpretation and greatly enhance research outcomes.

CONCLUSION

In conclusion, the purpose of this study was to investigate how visitors to Kuala Terengganu saw it as an Islamic tourism destination. Brand image, spiritual experience, and cultural characteristics are the

influencing factors (independent variables), and Islamic tourist destinations among domestic and international visitors to Kuala Terengganu are the dependent variables. As mentioned in Chapter 3, the researcher employed a Google Form with 131 respondents who travelled to and visited Kuala Terengganu to receive the questionnaire's responses. Additionally, the researcher only uses quantitative techniques to gather data and information. Additionally, the researcher reached respondents across Malaysia by using Google Forms as a platform. This is so that respondents can more easily complete all of the surveys by utilizing this Google form. Additionally, it can enable researchers to cut expenses and time.

The outcomes of the questionnaire survey were examined using a variety of techniques, including frequency analysis, descriptive analysis, reliability analysis, and correlation analysis. The results from the preceding chapter as well as all of the data from the questionnaire were then examined using the Statistical Package for the Social Science (SPSS) software application. The researchers choose this program because it makes it easy to access all the findings. Finally, depending on the data analysis, a summary and recommendation. For this investigation, all of the stated hypotheses (H1, H2, H3, and H4) are accepted. Additionally, there are certain restrictions and suggestions that could be used to future research in this study.

Corresponding email: mohanad.ssa@umk.edu.my

ABSTRACT

This study's objective is to evaluate the engagement of native populations in tourist and conservation development initiatives. More specifically, the research will concentrate on the indigenous population of Sabah, which is located in Malaysia. We develop a framework for understanding the elements that influence the participation choices of this community using the motive, opportunity, and ability model. This model is used to understand the factors that drive the participation choices of this community. Based on the findings, it appears that indigenous people's engagement can be positively influenced by their levels of knowledge and awareness (ability), as well as their perceptions of the environmental and economic implications of tourism (motivation). In addition, the findings of this research do not lend credence to the idea that opportunity or the perceived social consequences of tourism have an effect on involvement.

Keywords: Ability, Motivation,

INTRODUCTION

The traditional culture and way of life of indigenous populations are frequently a draw for domestic and foreign tourists, and they can have a big impact on how competitive a place is (Fletcher, Pforr & Brueckner, 2016). However, the voice and knowledge from indigenous people should be involved in their planning, legislation, and development to guarantee that such places are sustainable (Butler & Hinch, 2007; Fletcher, 2016). As a result, needs, objectives, and preferences of indigenous communities should be taken into consideration by all tiers of government and business. (Carr, Ruhanen & Whitford, 2016).

Social obligations, cultural standards, and morals. Differences between environmentalists and indigenous people may make it difficult for them to understand one another (Carr, 2016; Chicchon, 2009). Although the relationship between indigenous people and the outside world is meant to be one of sincere respect, in most cases this relationship begins with misunderstanding because of unequal land distribution that favours one party or because indigenous people admit that these connections or exchanges do not benefit them (Carr, 2016; Chicchon, 2009; Fletcher, 2016). Therefore, it is vital to understand and take into account the objectives of indigenous peoples when establishing strategies for the protection of biodiversity or of land, in addition to setting conservation goals as soon as feasible.

There are research objectives of our study:

1. To identify the perceived economic impact on tourism development in Sabah.
2. To identify the perceived social impact on tourism development in Sabah.
3. To identify the perceived environmental impact on tourism development in Sabah.

SIGNIFICANCE OF THE STUDY

The academic community and event participants in general will benefit from a number of significant theoretical and managerial contributions from this study. This research will probably add to the growing body of knowledge concerning Sabah's tourism industry. At the same time, the future research may extend the body of literature in tourism and hospitality research.

This study primary objective is to determine the challenges that have been encountered during the growth of the tourism industry in Sabah from a more practical point of view. Furthermore, the organizer can utilize this measurement as an option in contrast to analyzing satisfaction performance in terms of their expert knowledge throughout the implementation and to better understand the desires and needs of Sabah's tourism development.

LITERATURE REVIEW

Tourism Development

To answer the question of whether or not the impact of tourism development on economic growth is dependent on the amount of economic development already present in a country, we will return to the contentious topic of the relationship between the two. Within the limitations of a Note, it is only possible for us to discuss previous material in a constrained manner, as stated by the most recent review carried out by (Castro-Nuno et al., 2013). tourism's impact on the world's ecosystems. Beyond Sustainability raises issues about the paradigm of sustainable tourism development, which, for the past 20 years, has been the preeminent theoretical and applied approach for the growth of the travel industry. Beyond Sustainability argues that this paradigm needs to be reexamined. It goes beyond the somewhat managerialist "blueprint" and destination-focused approach that characterize even the most recent agenda for "sustainability" in tourist infrastructure development. The author draws parallels between the current political-economic, socio-cultural, and environmental contexts and the limitations of sustainable tourism development. To do so, they examine the historical development of the concept, its contemporary representations in contemporary scholarly literature, as well as changes in policy and the processes that underlie such changes.

Perceived Economic Impact

The tourism industry contributes positively to the economy in a number of ways, including an increase in personal income and tax revenue, an improvement in the general quality of life, and the creation of additional employment opportunities. Examples of sociocultural influences include interactions between people of different cultural origins, attitudes and behaviors, and linkages to material items. Sociocultural influences can also be seen in the world around us. Tourism has the potential to aid indigenous people in a number of ways, including reducing poverty, diversifying economic activity, and increasing demand for and sales of indigenous goods and services. These positive effects need to be weighed against the potential negative economic repercussions, which may include higher expenses of living, higher real estate prices and property taxes, rises in the cost of products and services globally, and a preference for jobs in the tourism industry that pay lower wages.

Perceived Social Impact

Numerous things, including the development of new areas for recreation and entertainment, the clarification of a community's sense of cultural identity, the encouragement of locals to take pride in their culture, and the promotion of the revival and preservation of traditional arts, culture, and crafts are all things that tourism can assist with (Jaafar, 2017; McGehee, 2002). The social and cultural life of a culture can be impacted by tourism in both positive and negative ways, with the former effects being more likely to be felt by rural communities and indigenous peoples than the latter. This is particularly valid when there are lots of tourists present (Bennett, 2012).

Perceived Environmental Impact

However, irresponsible tourism can also have negative consequences on the neighborhood and the environment. Travel that isn't self-centered and doesn't pay enough attention to how travel affects society and the environment is referred to as responsible tourism, for example, may have an effect on quality of the water, whereas trekking and climbing could have a negative effect on plants and vegetation. For the sake of communities, potential tourists, and the next generation, the tourism business must therefore maintain its sustainability while preserving current resources and tourist attractions. Visitors coming at any tourist site have varying behaviors or attitudes regarding that region due to the diversity of motivations that motivate travel (Spenceley, 2008).

RESEARCH HYPOTHESIS

In this study, there were three hypotheses tested are:

1. The perceived economic impact of establishing protected areas and tourism development have a positive effect on the participation of indigenous people in conservation programs and tourism development.

2. The perceived social impact of establishing protected areas and tourism development have a positive effect on the participation of indigenous people in conservation programs and tourism development.

3. The perceived environment impact of establishing protected areas and tourism development have a positive effect on the participation of indigenous people in conservation programs and tourism development.

RESEARCH FRAMEWORK

This framework demonstrates by the summary of the related research, a conceptual framework that identifies the participation in conservation and tourism. The study determined the perspective of perceived economic impact, social impact and environmental impact.

Figure 1: Research Framework

METHODOLOGY

Research Design

The quantitative methods used in this study to gain the data from respondents through questionnaire via Google Form from hashtag at TikTok apps. The questionnaire was designed in two language which are English and Malay to make sure respondents understand the question. The questionnaire was divided by 3 section, which section A, B and C. There have a 5point Likert with closed-ended questionnaire ranging from (1) "Strongly Disagree" to (5) "Strongly Agree" used in measuring all the variable.

Data Collection

Firstly, the researcher spreading 150 set questionnaires to the respondents via TikTok apps with the hashtag #KamiOrangSabah. The questionnaire fulfilled by the Sabahan people especially to the Kinabatangan people. Researcher takes time almost 3 weeks to complete 150 respondents.

Sampling

The-non probability sampling used in this study and known as convenience sampling. Convenience sampling involves selecting participants who are often ready and available. It appears to be a favorite student technique because it is inexpensive and straightforward than the other sampling technique.

Data Analysis

All data collected via the self-administrated questionnaire were analyzed using the statistical package for social sciences (SPSS) latest version and the necessary measures were implemented. SPSS is one of the appropriate programmed for conducting data analysis.

FINDINGS

Result of Frequency Analysis

Table 1 shows the result of frequency analysis of respondents.

Table 1: Frequency Analysis

	Demographic characteristics	Frequency	Percentage (%)
Gander			
Male		42	28.0
Female		108	72.0
Age group			
20 – 29 years old		136	90.7
30 – 39 years old		12	8.0
40 – 49 years old		2	1.3
Race			
Chinese		9	6.0
Indian		5	3.3
Malay		133	88.7
Others		3	2.0
Religion			
Buddha		3	2.0
Hindu		5	3.3
Islam		135	90.0
Kristian		7	4.7

Education level		
Certificate or Diploma	10	6.7
Degree	130	86.7
Master	6	4.0
No Formal Education	4	2.7

Table 1 shows the result of frequency analysis of respondents. The research focus on the indigenous people in Kinabatangan, Sabah. The result shows that the female respondent is the highest which is 108 respondents (72%) while male respondent is 42 respondents (28%). Next, majority of respondent in age group was from 20 – 29 years old respondents which is 136 respondents (90.7%) while 30 -39 years old is 12 respondents (8%) and 40 – 49 years old respondent is only 2 respondents (1.3%). Next, most of the respondent's race are Malay which is 133 respondents (88.7%) while Chinese respondent is 9 respondents (6%), other than that, Indian respondent is 5 respondents (3.3%), lastly, for others race is 3 respondents which is (2%). In addition, the religion of this result shows that from the Islam religion is the greater which is 135 respondent (90%), the second highest is Kristian religion which is 7 respondents (4.7%), next is Hindu religion have 5 respondents (3.3%) and lastly, Buddha religion which is 3 respondents (2.0%). Last but not least, the highest respondent from education level was from Degree respondent which is 130 respondents (86.7%), the second highest is from Certificate or Diploma Level which is 10 respondents (6.7%), next is Master level which is 6 respondents (4%) and lastly, for No Formal Education Level there are 4 respondents which is (2.7%).

Result of Descriptive Analysis

Table 2 shows the result of descriptive analysis of variable

Table 2 : descriptive analysis

Variable	Items	Mean Score	Standard Deviation
Tourism development in Sabah	Do you think the tourist development has a positive effect on the indigenous people in Sabah?	4.66	0.572
	Do you think that the tourist development can change the economy in terms of many job opportunities so as to reduce the poverty of the indigenous people?	4.83	0.417
	Does the tourist development in Sabah not affect the environment?	4.60	0.691

	Do you think the tourist development provides progress in a good way of life and opens up a broad and mature mindset for the indigenous people in Sabah?	4.70	0.495
	Do you think the tourist development must be emphasized more for the life of the indigenous people in Sabah?	4.66	0.615
Perceived economic impact	Do you think that the success of many economies throughout the world depends on tourism?	4.11	1.024
	For indigenous people, do you think that tourism can alleviate poverty, diversify economic activities, and increase the demand for and sale of indigenous goods and services	4.14	1.017
	Do you think that in the wake of tourism development can give the bad impact to the environment?	3.91	0.969
	It is very important to indigenous communities to increased wildlife population, improving the rainforest, and protecting rivers and natural asset to the way of their life. Do you think that the development of tourism can also result in the establishment of protected wildlife and heritage areas?	3.95	0.965
	Do you think that economic is important to the indigenous people?	4.06	0.935
Perceived social impact	Do you think the social impact of tourism development in Sabah can improve infrastructure such as roads, schools, hospitals and parks.	4.16	0.977
	With the social impact on the development of tourism in Sabah, do you think tourism can encourages a variety of cultural activities?	4.17	0.999
	Do you think tourism development increases the availability of recreation opportunities in local community?	4.09	0.979
	Do you think tourism causes congestion and is unpleasant to the local community?	3.93	1.030
	Do you think tourism increases crime in the local community?	3.86	1.056
Perceived environmental impact	Do you think the effects of the developed development will have a negative impact on the environment?	3.99	0.909
	Do you think uncontrolled development will be the cause of air pollution?	4.07	0.924
	Do you think the progress carried out in Sabah will destroy the sustainability of the environment in Sabah, especially in the indigenous villages?	3.90	1.035
	Do you think the development carried out will damage the natural treasures in Sabah?	3.90	1.022

Do you think the development that is being carried out will fail the current agenda which is the agenda of sustainable development?	3.95	0.958
---	------	-------

Table 2 was represented the descriptive analysis of variable. Based on dependent variable of this study, tourism development in Sabah descriptive analysis, the highest mean score is 4.83 it is “Do you think that the tourist development can change the economy in terms of many job opportunities so as to reduce the poverty of the indigenous people?” with standard deviation is (0.417) in our 52 research. Other than that, for the questions “Does the tourist development in Sabah not affect the environment?” has 4.60 the lowest mean score with (0.691) at standard deviation. Next, for the first independent variable, perceived economic impact, questions number 2 " For indigenous people, do you think that tourism can alleviate poverty, diversify economic activities, and increase the demand for and sale of indigenous goods and services” were showed the highest mean score, it is 4.14 with standard deviation is (0.017) in our research. In addition, for lowest of the mean score, which is “Do you think that in the wake of tourism development can give the bad impact to the environment?” which is 3.91 with standard deviation (0.969). Besides, for the second independent variable which is perceived social impact, the results of the highest mean score stated that question number 2, “With the social impact on the development of tourism in Sabah, do you think tourism can encourages a variety of cultural activities?” With mean 4.17 SD= 0.999 while the results of the lowest mean score was stated that question number 5, “Do you think tourism increases crime in the local community?” With (M= 3.86, SD= 1.056). Lastly, for the third independent variable which is perceived environmental impact, the question number 2 with the greatest average score was " Do you think uncontrolled development will be the cause of air pollution?" (Mean 4.07 SD= 0.924), while the question with the lowest average score was " Do you think the development carried out will damage the natural treasures in Sabah?" (Mean 3.90 SD= 1.022).

Result of Reliability Analysis

Table 3 shows the result of reliability analysis based on dependent variable and independent variable.

Table 3: Reliability Analysis

Variable	Number of items	Cronbach's Alpha
Perceived economic impact	5	0.774
Perceived social impact	5	0.779
Perceived environmental impact	5	0.820

In this particular study, the variables were measured by means of a reliability test. According to table 3, all of the variables had an alpha coefficient value that was larger than 0.7, which indicates a strength of connection that is moderate. A Cronbach's Alpha value of 0.774 was assigned to the perceived economic impact, which was followed by the perceived social impact, which was assigned a value of 0.779, and the perceived environmental impact, which was assigned a value of 0.820. According to the findings, all of the independent variables as well as the dependent variables are virtually continuous and dependable, with connections ranging from good to very good (Taber, 2017).

Result of Pearson Correlation Analysis

Table 4 shows the result of Pearson correlation analysis based on the hypothesis.

Table 4: Pearson Correlation Analysis

Hypothesis	P-Value	Result (Support/ Not Support)
H1 – There is a significant relationship between perceived economic impact and tourism development in Sabah	0.001	H1 is supported
H2 – There is a significant relationship between perceived social impact and tourism development in Sabah	0.001	H2 is supported
H3 – There is a significant relationship between perceived environmental impact and tourism development in Sabah	0.001	H3 is supported

DISCUSSION

The discussion is aimed both local and international tourists will be increasingly aware of indigenous tourism. Native American tribes who retain their ancient ways of life are typically a top attraction for both domestic and international travellers, and they have a significant influence on how competitive a location is. Despite having various traditions and cultures, they are all vulnerable to the same harsh realities, including being driven out of their native nations, being physically attacked, and being treated like second-class citizens. Participating locals in conservation planning and management not only increases engagement but also strengthens the bonds between different groups and the regional biodiversity protection goal. As a result, all levels of government as well as the corporate sector should be knowledgeable about the requirements, objectives, and preferences of indigenous populations.

CONCLUSION

This study was carried out to investigate the elements that determine the influence of perceived economic, social, and environmental impact on the development of tourism among indigenous people in Sabah, Malaysia. Sabah is located in Malaysia. The findings and conclusions of this study are presented in this section. The important determinants (independent variables) in tourist development among indigenous people in Sabah, Malaysia, are the perceived economic impact, perceived social impact, and perceived environmental impact (dependent variable). In Chapter 3, it was mentioned that in order to carry out these surveys, the researchers employed Google Form with a total of 150 participants as responders. Indigenous people from the state of Sabah are represented among those who filled out and returned these questionnaires as responders. In addition to employing the qualitative technique, the researcher makes use of the quantitative method when it comes to the collection of data and information. In addition, the researcher uses social media sites like as Facebook and TikTok to communicate with potential respondents in the state of Sabah. Because employing them makes it easier for responders to finish filling out all of the questions, which in turn enables the researcher to save both time and money, this is the reason behind this.

In this investigation, the results of a questionnaire survey were submitted to a variety of analyses, including descriptive analysis, reliability analysis, correlation analysis, and frequency analysis. These analyses were carried out in order to draw conclusions about the findings of the investigation. After that, using a piece of software known as the Statistical Package for the Social Science (SPSS), all of the results that were obtained in the previous chapter as well as the data from the questionnaire were examined. The researchers have decided to use this particular piece of software since it significantly simplifies the process of locating each and every result. In conclusion, there is further information to summarize, and it is possible to draw inferences about the final result based on the examination of the data. In light of the findings of this investigation, all 67 of the hypotheses numbered 1 through 3 (H1, H2, and H3) can be accepted as true. In addition, we came up with several suggestions as well as some limitations for this research, both of which, in our opinion, will prove to be beneficial to future researchers in the years to come. As a consequence of this, it is wished that the later researcher would consider each and every piece of information provided throughout this investigation to be of use..

ABSTRACT

Halal tourism, also known as halal-friendly tourism, is crucial for Muslim students and non-Muslim visitors as it caters to Muslim families adhering to Islamic law. This study examines service quality, tourist contentment, destination image, and loyalty to increase visitor pleasure and repeat business. The quality and cost of a vacation are significantly impacted by using halal food items and non-halal services. University Malaysia Kelantan tourism students should restrict non-halal services and examine halal food product services, as satisfaction is determined by quality and cost. Researchers must achieve their objectives and ensure reproducibility to achieve their research objectives. The methodology provides a comprehensive account of the research process, guiding readers through the process and evaluating the study's validity and reliability. A summary of the findings summarizes the major findings and observations, highlighting average means and levels of agreement for assertions related to Halal Tourism.

Keywords: BANNING NON-HALAL SERVICES, GENERAL HALAL SERVICES, HALAL FOOD PRODUCT SERVICES, SATISFACTION.

INTRODUCTION

Halal tourism, also known as halal-friendly tourism, caters to Muslim families following Islamic law. It includes hotels without alcohol, separate spa and swimming areas, halal meals, prayer rooms, and common areas. This type of tourism is particularly important for Muslim students who want to unwind after studying. The study aims to understand how Muslim students navigate their travels and explore the effects of halal tourism on non-Muslim visitors. Halal tourism is Muslim-friendly, offering holiday equipment without prohibited substances and religious activities.

This approach helps Muslim tourists travel easily and reduces travel costs. The Muslim tourism industry is third in terms of global travel spending, with Muslim travel increasing the global GDP by over US\$156 billion in 2016 and projected to do so again in 2020. Consequently, tourism industry is considered as one of the pillars that stimulate the world economic growth (Nasir &

Wongchestha, 2022). The study aims to understand the importance of halal travel in the contemporary world.

There are three objectives of this research -

1. To study the opportunity of banning non-halal services towards satisfaction of tourism students at University Malaysia Kelantan.
2. To examine general halal services towards satisfaction of tourism students at University Malaysia Kelantan.
3. To investigate the need of Halal food product services towards satisfaction for tourism students at University Malaysia Kelantan.

SIGNIFICANCE OF THE STUDY

Based on the study, it can contribute to individual, which can easily find out the most impact on halal tourism towards tourism students at University Malaysia Kelantan. This allows them to have a better experience by having the halal food during the period. Moreover, the experience of conducting halal tourism can allow them to have the feeling of satisfying towards the halal food. Indirectly, it can help the individual to prepare themselves for conducting the satisfaction of it.

Besides that, this research can be used as a valuable reference for further investigation. By conducting further investigation, this may be the second tool in using other types of methodologies to be conducting the impact on halal tourism towards UMK's students. Therefore, the investigator needs to learn and understand more about the halal tourism and its impact on it. For future investigator to know whether student's perception on halal tourism and what does the effects of it to the UMK students.

LITERATURE REVIEW

NON-HALAL SERVICES

Halal goods and services are not only advertised to Muslims in Malaysia. They are also advertised to non-Muslims, considering that this is an opportunity to promote better cultural exchange and advertising within the nation between Muslims and non-Muslims.

GENERAL HALAL SERVICES

In Malaysia, "Muslim-friendly hotels" are common place that offer halal food, alcohol-free drinks, prayer mats and surau with the call to prayer to Muslim tourists who follow Islamic beliefs. Due to security and privacy concerns, the researcher's study of hotels in Malaysia revealed that isolated lodging is also accessible in "women only floor" and "family only floor" in Muslim-dominated neighborhoods of such as Chow Kit, Jalan Masjid India, and Jalan Tunku Abdul Rahman in Kuala Lumpur.

HALAL FOOD PRODUCT SERVICES

Non-Muslim tourists said they prefer to stay in accommodations that welcome both vegetarian and non-vegetarian visitors and they have no issues consuming halal food because they think all halal food is hygienic. Besides, they do not mind halal food and can go without pork or alcohol if they need to comply with halal travel packages when traveling using halal travel packages.

SATISFACTION

Some travelers who engage in halal tourism also believe that halal goods and services are more safe and more hygienic since they have the blessing of Islamic religious authorities also halal tourism participants claim that the hotels where they stay are reasonably priced because the proprietors conduct their operations in accordance with Islamic principles rather than merely looking to make a quick buck. Many non-Muslim tourists claim they have no problem staying in a hotel run by Muslims if they don't make any comments about their attire when using the hotel's pool or nearby beach. Additionally, they added that they always adhere to the belief that halal products should only be consumed since they do not have any negative health consequences and require special licensing from the relevant health authorities. Next, they stated that since Muslim-friendly hotels are less concerned with making a profit, they are a better option if they need a place to stay. Their main priority is always travelling affordably but comfortably.

RESEARCH HYPOTHESIS

From the conceptual framework, an independent variable was being connection with halal tourism satisfaction. Based on the variable above, these hypotheses are defining as;

H1: There is relationship between banning non-halal services towards satisfaction

University Malaysia Kelantan student of halal tourism.

H2: There is relationship between general halal services towards satisfaction University

Malaysia Kelantan student of halal tourism.

H3: There is relationship between halal food product services towards satisfaction
University Malaysia Kelantan student of halal tourism.

RESEARCH FRAMEWORK

A study framework was established based on the literature evaluation to explore the link between satisfaction and the impact of tourists' perceptions on halal tourism destination. Figure 2.1 depicts the suggested conceptual framework, which includes the independent variables of banning non-halal services, general halal services, and halal food product services. The dependent variable is satisfaction.

Independent Variables

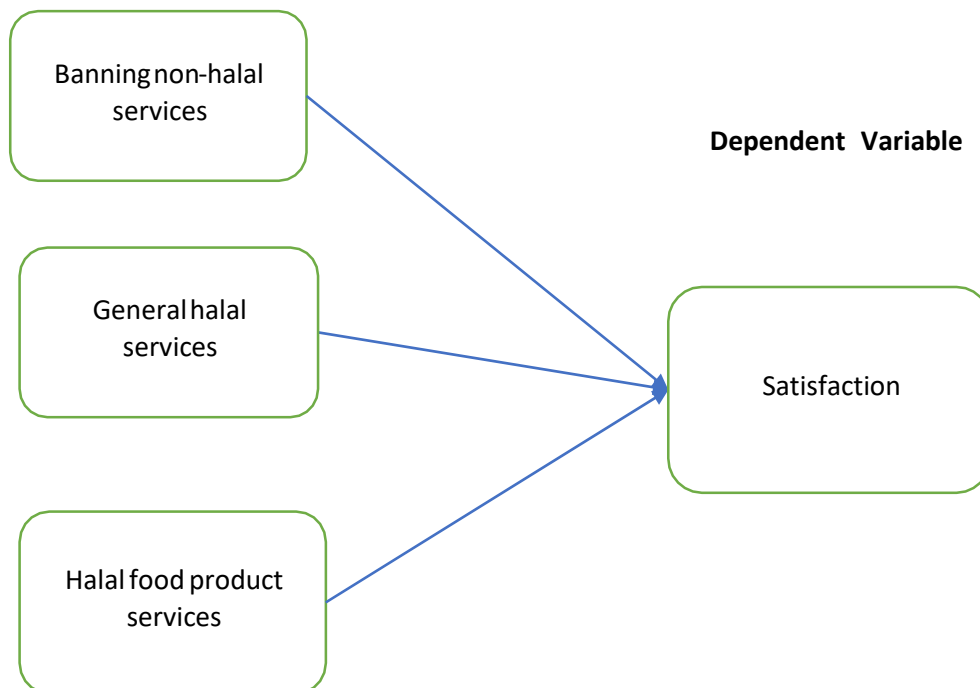

Figure 2.1: Conceptual Framework

METHODOLOGY RESEARCH DESIGN

Research design is the framework for a researcher's techniques and methods, guiding them in developing appropriate research methods and creating successful studies. It determines the data needed for gathering, analyze, and assessing data, as well as testing hypotheses and evaluating programs. The research design identifies the problem, its scope, and context, addresses how people learn, needs, and why they need it, and includes a theoretical framework. A study design is an approach for employing empirical data to address an issue. Research designs can be categorized as descriptive, experimental, or mixed methods.

Quantitative methods use rigorous, objective, and systematic numerical data to define variables and investigate their relationships. This research uses questionnaires and Google Forms for quantitative data collection, which are standardized tools used for precise measurement and establishing cause and effect relationships between variables. Google Forms is a good choice for administering questionnaires due to its professional appearance and various formats, making it an effective tool for collecting data for research purposes.

A sample is a more limited set of participants chosen from the overall population of the study to make inferences about the target population. Additionally, if a sample is accurately representative, conclusions drawn from it can be applied to the full population. The study was conducted on several types of people who fit the study's design. This study used a sample of respondents from every possible area and had a total of 10 respondents.

This equation provided the sample's formula with a 95% confidence interval and a 5% level of significance.

The Formula for sample size: $n = \frac{N}{1+N(e)^2} \dots \dots \dots (ii)$

- Where:
- n = Sample size to be studied
 - N = Population size
 - e = margin of error

The following formula provided, the sample size for this study :

$$n = \frac{57}{1 + 57(0.05)^2}$$

$$n = \frac{57}{1 + 0.1425}$$

$$n = \frac{57}{1.1425}$$

$$n = 49.89$$

The sample in this study is 50

From the formula above, the sample required for this study is fixed at 50 students which will focus on University Malaysia Kelantan students.

DATA COLLECTION

This research uses the question method to obtain data from the survey questions given. This question method is very easy to use by simply answering a few questions given and submitting according to the procedure and relatively free from several types of error.

SAMPLING

The quantitative study sampling method in this research is to obtain representative data of a small group from a large group. Quantitative research based on analysis in which statistical, mathematical and computational methods are used to analysis measurable or quantifiable data sets. Sampling strategy is a non-probability facility that is quick, easy, and affordable to use.

DATA ANALYSIS

The researchers will analyze the primary data using (SPSS), SPSS is a statistical package for the social science. The generation of tables and pie charts is made possible by the program-based data analysis and processing window known as SPSS. Computers made it easier for academics to collect data and facilitate quantitative analysis. Utilizing Pearson's correlation, regression, reliability statistics, and descriptive statistics, the researcher assesses quantitative data.

	N	151	151	151	151
M_DV4	Pearson Correlation	.609**	.661**	.746**	1
	Sig. (2-tailed)	.000	.000	.000	
	N	151	151	151	151

Hypothesis 1: Relationship between banning non-halal services towards satisfaction of halal tourism.

Table 4.7.1 displays the Pearson correlation coefficient, significant value, and number of answers (151) based on the Pearson correlation coefficient. As a consequence of the analysis, hypothesis 1 is accepted. Pearson correlation 0.661 indicates a substantial link between positive level. This demonstrates that independent variable 1 influences 66.1% of the dependent variable (satisfaction towards halal tourism). H1, which was developed to assess the association between banning non-halal services and satisfaction, is acceptable.

Hypothesis 2: Relationship between general halal services towards satisfaction of halal tourism.

Table 4.7.1 displays the Pearson correlation coefficient, significant value, and number of answers (151) based on the Pearson correlation coefficient. As a consequence of the analysis, hypothesis 1 is accepted. Pearson correlation 0.746 indicates a substantial link between positive level. This demonstrates that independent variable 1 influences 74.6% of the dependent variable (satisfaction towards halal tourism). H2, which was developed to assess the association between banning non-halal services and satisfaction, is acceptable.

Hypothesis 3: Relationship between halal food product services towards satisfaction of halal tourism.

Table 4.7.1 displays the Pearson correlation coefficient, significant value, and number of answers (151) based on the Pearson correlation coefficient. As a consequence of the analysis, hypothesis 1 is accepted. Pearson correlation 0.609 indicates a substantial link between positive level. This demonstrates that independent variable 1 influences 60.9% of the dependent variable (satisfaction towards halal tourism). H3, which was developed to assess the association between banning non-halal services and satisfaction, is acceptable.

Result: There was a link between hypotheses 1, 2, and 3 and halal tourism satisfaction. Hypothesis 1, 2 and 3 are the independent and dependent variables in this hypothesis, respectively.

DISCUSSION AND RECOMMENDATION

Figure 4.8 shows the data values for the significant independent variables to the dependent variable. The dependent variable, satisfaction, showed a significant relationship with three independent variables: Banning non-halal services, General halal services, and Halal food product services. Among these independent variables, banning non-halal services have the highest Pearson correlation value of 1.00. The Pearson correlation value for General Halal services is 0.718, which is the second highest. Meanwhile, the Pearson correlation value for Halal Food Product is 0.505. As a consequence, banning non-halal services, General halal services, and Halal food product services are three separate elements that have a connection with satisfaction. However, the correlation between the dependent and independent variables is only moderate since the strength of the correlation between them is modest.

CONCLUSION

In conclusion, this study was conducted to learn more about the elements that affect tourist satisfaction. In addition, this study can be used as a reference by other academics who conduct research on halal tourism. The results obtained in Chapter 4 using the Statistical Package for the Social Sciences (SPSS) were further explored, and inferences were made as a result of the findings. So, it can be concluded that banning non-halal services, general halal services and halal food product services have a moderate effect on tourist satisfaction.

ABSTRACT

The text highlights the importance of advanced technologies in the travel and tourism sector, emphasizing their role in improving customer experience and operational efficiency. It mentions that technology can help companies reduce costs, increase revenue, and enhance financial outcomes. The use of technology in the industry can also provide convenience, safety, and fewer touch points for travellers, especially in the context of the COVID-19 pandemic. The concept of "revenge travel" is introduced, referring to the pent-up desire for travel after a period of restrictions. The text also mentions the significance of ensuring traveller security in travel plans. The effectiveness of technology use in Kelantan, Malaysia, is discussed, highlighting its impact on tourist satisfaction and the rapid growth of the country's economy. The research methodology is briefly outlined, including the use of a quantitative study, probability or random sampling technique, and online questionnaire surveys for data collection.

Keywords: *Technology, Tourist Satisfaction, Kelantan, ICT*

INTRODUCTION

The text highlights the increasing reliance of tourists on technology in various aspects of travel and the potential impact it has on tourist satisfaction in Kelantan, Malaysia. While previous studies have demonstrated the positive effects of technology on communication and convenience in the tourism industry, research specifically focused on the relationship between technology use and tourist satisfaction in Kelantan is limited. To address this gap, the study aims to examine the effectiveness of technology use in enhancing tourist satisfaction in the region. The study will investigate the type, frequency, and purpose of technology use as independent variables, while tourist satisfaction will serve as the dependent variable, measured through surveys or interviews. The findings of the study will provide valuable insights for tourism stakeholders in Kelantan on how to effectively leverage technology to improve the overall tourist experience.

Significance of the Study

This study on the effectiveness of technology use among tourist satisfaction in Kelantan, Malaysia has several significant implications. Firstly, it provides valuable insights for tourism stakeholders, helping them understand how technology can enhance the tourist experience and attract more visitors to the region. Secondly, it contributes to the sustainable expansion of the tourism sector by exploring how technology can promote sustainable tourism practices. Thirdly, the study aims to understand technology use among different types of tourists, enabling tailored services for specific segments. Lastly, it adds to the existing literature on technology use and tourist satisfaction, expanding knowledge in this field and setting the foundation for further research.

Overall, this study is important for improving the tourism experience in Kelantan and supporting the sustainable development of the tourism industry.

LITERATURE REVIEW

The literature review for chapter 2 of the research study on "The effectiveness of technology use among tourist satisfaction in Kelantan" examines the different types of technology commonly used in the tourism industry, such as online booking systems, mobile applications, and social media. Studies have shown that technology positively affects visitor satisfaction. For instance, research by Li and Petrick (2018) indicates that online booking systems enhance the booking process and increase satisfaction. Similarly, Wang and Wang (2019) found that mobile applications provide convenience and control, resulting in higher satisfaction levels.

Moreover, the indirect impact of technology on satisfaction through trust and perceived risk is explored. Wang and Wang (2019) discovered that technology usage increases trust in tourist destinations, leading to greater satisfaction. Similarly, Kim and Lee (2018) noted that technology reduces perceived risk during travel decision-making, ultimately enhancing satisfaction. However, challenges associated with technology use in the tourism industry are also discussed. Mohd et al. (2020) revealed limitations in the use of technology in Kelantan, Malaysia, emphasizing the need for improved availability and accessibility. Additionally, Wang and Wang (2019) highlighted the potential issue of information overload caused by technology, which may decrease satisfaction.

Overall, the literature review emphasizes the positive impact of technology on tourist satisfaction but acknowledges the importance of considering context and challenges specific to the tourism industry. It calls for further research on the use of technology in Kelantan and its effects on tourist satisfaction.

Type Of Technology Use

The Internet of Things (IOT) is a sort of technology that can be utilised to increase tourist pleasure. This is due to the Internet of Things, which involves the interconnection of common household gadgets based on the Internet and enables them to send and receive data. This is one of the most interesting emerging concepts in travel technology.

To improve tourist satisfaction, Kelantan can make use of information and communication technology (ICT). Thanks to ICT, travellers may readily look up and compare travel-related products on demand. The internet is often regarded as the most common and effective form of communication. People from all around the world can communicate through written, voice, and video messaging thanks to it. Users of the internet can trade information and communicate practically instantly. This makes it an effective tool for organisations, causes, institutions, and people. The internet has changed the ways in which services are provided to customers.

Virtual reality has gained popularity across several businesses, but its impact on the tourism industry is particularly remarkable. Kelantan should take use of this technology in the future. The ability to research distant locales from the comfort of one's home is made possible by technology, which may influence a traveller's decision to book a reservation or not. Virtual tours are available for everything from hotels and eateries to famous landmarks, national parks, and even individual locations.

In the tourism sector, mobile technology is a key enabler of M-Commerce. For PDA-based systems and mobile information systems, tourism has been a prominent industry. In fact, one obvious application area for mobile phones and other portable gadgets is tourism. M-commerce is thus a limited form of business. Consumers profit from mobile communications because M-commerce allows for both the extension of the advantages of the Web and the creation of special services made possible by the integration of the Internet and mobile technology. Mobile gadgets like smartphones, notepads, and cell phones offer non-location-based information access as well as potential new communication channels.

Frequency Of Technology Use

Large-scale analyses of technology use frequently emphasize on reported frequency, typically the period spent using digital technology, under the presumption that it is possible to determine the frequency of digital technology use. The frequency of use recorded, such as "No time," "1-30 minutes a day," or "greater than 6 hours a day," is typically used to assess time (OECD, 2017). Such scales, however, frequently fall short when attempting to quantify brief but intense periods of technology use, and they also neglect to account for the effectiveness of that time.

Tourists have a wealth of knowledge. To choose the best holiday for them, they search for various tools that are useful for everyone. Businesses in the tourism industry need to put in place an effective customer system on the app, and the app can respond to all material, give personalised services, and provide ease by staying up to date with technological advancements. Using social media is one of the most effective and convenient travel technology. Making engaging material is one strategy for utilising social networks. Social network user recommendations can serve as "Digital Referrals" and influence many of their followers to visit that business.

Outsourcing software development services may be necessary when developing new technology-driven tourism products. The system also helps with the primary objective of enhancing the customer's overall experience with the brand, from their booking to their stay to the administration of evaluations they might typically leave only once. This clearly shows how often tourists will use technology as their intermediary to get all the information they want in the travel survey they will do. The technology introduced in tourism makes it easier for many parties to communicate with foreign tourists coming to Kelantan.

Purpose Of Technology Use

Using technology is meant to improve productivity, efficiency, and quality of life for people. Technology is the umbrella term covering the devices, methods, and procedures utilised to produce, store, and share data and information. Almost every element of contemporary life has been altered using technology, from communication and transportation to healthcare and entertainment. For instance, the ability to analyse massive volumes of data rapidly and precisely thanks to computers and software has improved work in industries like banking, commerce, and scientific research (Timothy Bresnahan, 2010). The ability to instantaneously contact with individuals anywhere in the globe thanks to the internet and mobile technology has completely changed how we interact with one another and conduct business.

Tourism stakeholders in Kelantan may use technology to sell their goods and services, enhance tourist interaction, and reduce administrative procedures (Ishwar Khatri, 2019) more effectively. Creating digital marketing plans is one of the main ways technologies is being used in Kelantan tourism. Tourist organisations and companies in Kelantan are using social media sites like Facebook, Instagram, and Twitter to market their services and reach a bigger audience. Moreover, they are utilising search engine optimisation (SEO) strategies to raise their online presence and increase website traffic.

Tourist Satisfaction

Tourist satisfaction is an important aspect of the tourism industry as it plays a crucial role in the success of destinations and businesses. Satisfaction refers to the positive evaluation of one's experience in a particular setting or activity, and in the case of tourism, it relates to the perceived quality of various aspects such as accommodation, food and beverage, attractions, transportation, and overall destination experience (Chen & Tsai, 2011). Moreover, Nasir et al. (2023) claimed that satisfaction is occurred when tourists perceptions exceed their initial expectations which cause them to feel satisfy using tourism products and services in a certain destination.

In the context of Kelantan, a state in Malaysia known for its rich cultural heritage and natural attractions, understanding tourist satisfaction is crucial for the growth and sustainability of the tourism industry. With the increasing use of technology in the tourism sector, it is important to examine how technology use affects tourist satisfaction. Technology use refers to the use of various digital tools

and platforms, such as websites, social media, mobile apps, and information kiosks, to enhance the tourist experience and facilitate communication and information sharing (Buhalis & Law, 2008).

Therefore, the present study aims to investigate the effectiveness of technology use among tourist satisfaction in Kelantan. Specifically, the study will explore the extent to which technology use, such as mobile apps and social media, contributes to tourist satisfaction in the state. By doing so, the study aims to provide insights into the role of technology in enhancing tourist satisfaction, which can inform tourism stakeholders and policy makers in developing effective strategies to improve the quality of tourism services and facilities in Kelantan.

Research Hypothesis

A hypothesis is a statement or prediction about the relationship between variables that can be tested through research. In the context of this research study, "The effectiveness of technology use among tourist satisfaction in Kelantan," the hypotheses are statements about the relationship between the use of technology in the tourism industry and tourist satisfaction in Kelantan. These hypotheses can guide the research by providing a framework for the data collection and analysis and help to identify the specific research questions that need to be answered.

Hypothesis 1

The use of technology in the tourism industry will have a favorable effect on tourist satisfaction in Kelantan.

Hypothesis 2

The use of online booking systems will have a greater impact on tourist satisfaction than the use of mobile applications or social media in Kelantan.

Hypothesis 3

The use of technology in the tourism industry will have a positive impact on trust and a negative impact on perceived risk in Kelantan, which in turn will lead to increased tourist satisfaction

The researcher typically proposes hypotheses based on their knowledge of the subject, the body of existing literature, and their expectations. These hypotheses then need to be evaluated and confirmed using actual data and research findings.

Research Framework

METHODOLOGY

Research Design

The survey will gather information on technology use for trip planning and during the trip, as well as satisfaction with various aspects of the trip. Demographic questions will also be included to explore differences in the relationship between technology use and satisfaction among different tourist subgroups. Descriptive statistics will be used to summarize the data, and inferential statistics will be used to evaluate hypotheses. Pearson's correlation and multiple regression analysis will specifically be employed to investigate the relationship between technology use and satisfaction. To ensure the study's validity and reliability, the survey instrument will undergo pre-testing and pilot testing. Additionally, the collected data will be carefully cleaned and checked for missing or inconsistent values.

Data Collection

This study will employ a self-administered questionnaire method to collect data on the effectiveness of technology use among tourist satisfaction in Kelantan. The questionnaires will be distributed to tourists visiting Kelantan in places such as hotels, restaurants, and tourist attractions. The questionnaires will consist of closed-ended questions, which will allow for quantitative data

collection. The data will be analysed using descriptive and inferential statistics to summarize the data, identify trends, test hypotheses, and generate new hypotheses. To ensure the accuracy and reliability of the data, the questionnaires will be pre-tested for clarity, and revisions will be made as necessary. The data collection process will be conducted systematically and controlled, with data being gathered over a few weeks to ensure an adequate sample size.

Sampling

This study will utilize a convenience sampling method, which involves selecting participants based on their accessibility and willingness to participate. The target audience for this study will be visitors to Kelantan. The sample size for the study will be determined using a sample size calculator, considering factors such as the population size, desired degree of confidence, and margin of error. To determine the minimal sample size needed, the sample size calculator will be employed. Based on the population of visitors to Kelantan, a sample size of 238 individuals will be chosen. The selected participants will be provided with self-administered questionnaires to collect the necessary data.

In summary, this study will utilize convenience sampling to select participants who are accessible and willing to participate. The sample size will be determined using a sample size calculator, with a target of 238 individuals. Data collection will be conducted through the distribution of self-administered questionnaires to the selected sample

Data Analysis

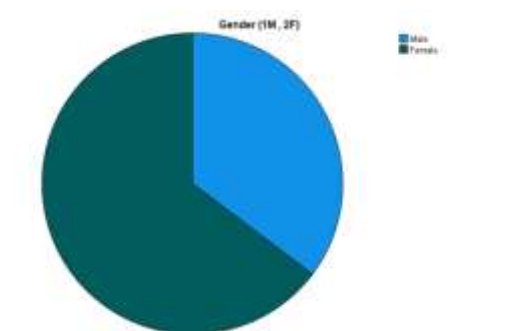

Data analysis is an essential aspect of any research study as it helps in interpreting the collected data and drawing meaningful conclusions from it. First, descriptive statistics such as frequency distributions, mean, median, and standard deviation will be used to summarize the data and provide a general overview of the population's characteristics and responses. This will help in understanding the demographic profile of the participants. Next, inferential statistics will be used to test the hypotheses and research questions formulated in the study.

Correlation and regression analyses will be used to examine the relationship between the independent variables and the dependent variable. These analyses will help in determining the extent to which technology use influences tourist satisfaction in Kelantan. Additionally, chi-square tests will be employed to determine the significance of the differences in responses between different subgroups of participants, such as gender, age, and education level. This will help in identifying any potential

bias or variations in the responses based on these demographic factors. Overall, the data analysis will provide insights into the effectiveness of technology use among tourists in Kelantan and its impact on their satisfaction levels.

FINDINGS

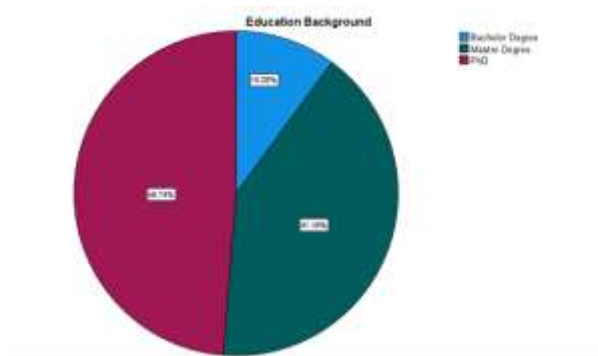

Demographic Analysis

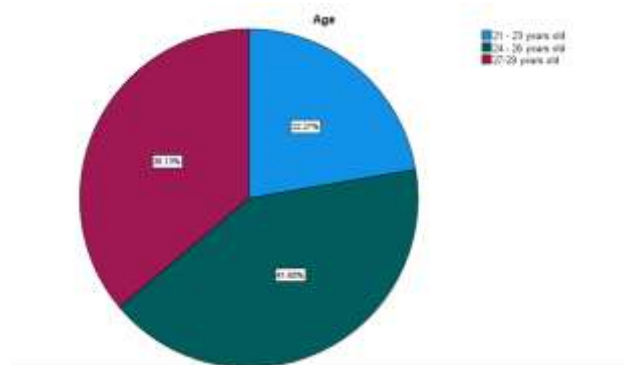

The table above displays the frequency and percentage of respondents by gender. 238 people responded to this quiz and provided responses. There were 158 of them, or 64.7% of the total, who were female. 54 responders were men, or 35.3% of the total, making up the total. According to these findings, there were more female respondents than male respondents.

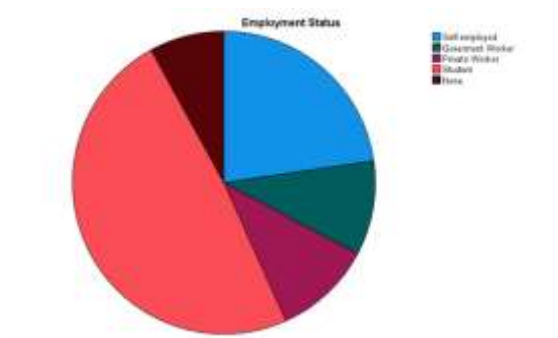

The age range of each responder who filled out our questionnaire is represented in this table. All respondents' marital status was separated into 3 categories. You can be single, married, or divorced. The largest group had 183 respondents (76.9%) who identified as single. Following that, 53 (22.3%) of the respondents to the questions about marriage and 2 (0.8%) of the responders to the questions about divorce completed them.

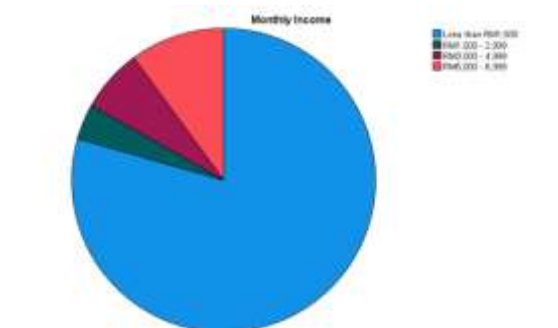

This table displays the respondents' educational backgrounds who responded to our survey. Of those surveyed, 24 (10.1%) had a bachelor's degree. The next group of respondents, 98 (41.2%) had a master's degree. This group responded to the survey with the second-highest average level of education. Finally, 116 PhD holders completed the questionnaire which is (48.7%).

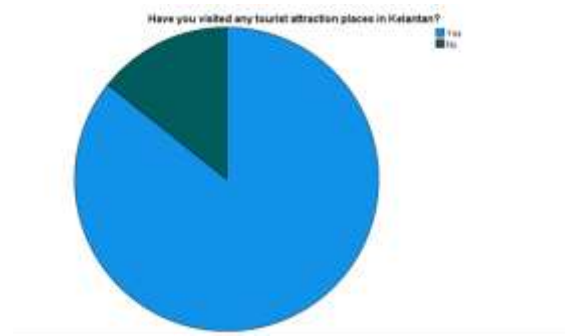

Age groups for each respondent. 53 (22.3%) of the people surveyed identified as being between the ages of 21 and 23. Following that, 99 (41.6%) of those surveyed were between the ages of 24 and (36.86%) people between the ages of 27 and 29 then answered this questionnaire. They made up (36.1%) of the entire.

The jobs held by each respondent who completed this survey. Of those surveyed, 54 (22.3%) were self-employed. This group answered the questionnaire in the second-highest number. After then, 24 (10.1%) of the interviewees identified as government employees. 25 respondents, or 10.5% of all respondents, identified themselves as private workers. The questionnaire was then completed by 116 (48.7%) students in total. This group had the highest likelihood of completing the survey. Lastly, 19 respondents (8.0%) were identified as unemployment / none.

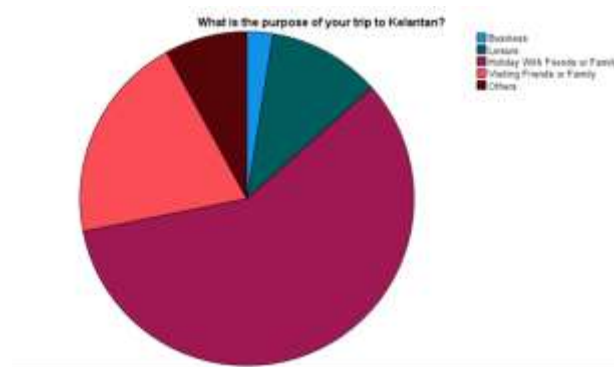

The monthly income ranges for each respondent. 189 people were interviewed in total, or (79.4%), had incomes under RM1,500. In terms of the total number of questionnaires, this is also the largest category. After that, 9 (3.8%) of the respondents said they made between RM1,500 and RM2,999 each month. Furthermore, 16 respondents (6.7%) stated that their monthly salary was between RM3,000 and RM4,999. Finally, 9 (3.8%) of the respondents reported monthly earnings of RM5,000–6,999. These numbers demonstrate that the respondents who filled out the survey were evenly dispersed across a range of income levels.

This table lists the respondents who completed our survey and have visited any Kelantan, Malaysia, tourist attractions. This question merely asks for a yes or no response to determine whether respondents have been to any Kelantan tourism attractions. While as you can see, 204 out of the total respondents indicated a yes response (85.7%), while 34 out of the total respondents indicated a no response (14.3%).

The table lists the respondents to the question, "When was your last visit to Kelantan, Malaysia?" A total of 190 people were interviewed at the time (79.8%). In terms of the total number of questionnaires, this is also the largest category. Following that, 8 (3.4%) of the respondents stated that they had last visited Kelantan, Malaysia, a year prior. In addition, 16 respondents (6.7%) said they have visited Kelantan, Malaysia, within the previous two years or more. The last time 24 respondents (10.1%) visited Kelantan, Malaysia, was three years ago or more. According to these figures, respondents last travelled to Malaysia's Kelantan.

The frequency and proportion of respondents who stated "to visit Kelantan" are displayed in the table above. 238 people responded to this quiz and provided responses. 6 of them, or 2.5% of the total, were businesses. Meanwhile, around 26 respondents (10.9%) were choosing leisure time as their purpose to visit Kelantan. There were 139 (58.4%) vacations spent with friends or family. Additionally, 48 of them (20.2%) were on a visit to friends or family, while the other 19 respondents (8.0%) were elsewhere. This statistic reveals to the respondent why you are visiting Kelantan.

Table of these statistics displays the respondents who normally stay when travelling to Kelantan. Of the people surveyed, 201 (84.5%) were present at the hotel. In terms of the total number of questionnaires, this is also the largest category. Then, 7 (2.9%) of the respondents said they had stayed at a homestay. Furthermore, 12 responders (5.0%) stated that they were also recorded for guesthouses. Finally, 18 respondents (7.6%) reported that respondents stayed somewhere else.

Descriptive Analysis

Descriptive Analysis Statistic of Types of Technology Use

Item Description	N	Mean	Std. Deviation
Do you agree with the effectiveness of the use of this technology being expanded in Kelantan?	238	4.5378	.65975
The service provided through this technology is very helpful to you.	238	4.3613	.75452
Do you agree that mobile technology can expand further in Kelantan?	238	4.4538	.69048
The use of this technology should be expanded in hotels and any places in Kelantan.	238	4.5084	.67967
The use of IOT technology in hotel rooms can affect tourist satisfaction in Kelantan.	238	4.2017	.95095

This table shows the Descriptive Analysis Statistics of Types of Technology Use. The item with the greatest meaning was with the effectiveness of the use of this technology being expanded in Kelantan.' It had a 4.5378 mean, which is on the agreeable scale. The question with the second highest average, again at the level of agreement, was 'The service provided through this technology is very helpful to you' with a mean of 4.4538. The remaining questions for this independent variable, according to the data in the table, are at the neutral level. The highest result is 4.4538 and the question is do you agree that mobile technology can expand further in Kelantan? Following that means that the use of this technology should be expanded in hotels and any places in Kelantan is 4.5084. Finally, the mean for the use of IOT technology in hotel rooms can affect tourist satisfaction in Kelantan was 4.2017.

Descriptive Analysis Statistic of Frequency of Technology Use

Item Description	N	Mean	Std. Deviation
The use of technology can increase productivity and gain a competitive advantage in the market.	238	4.4790	.70380
Adapting to adopt technology and digitalization rapidly, communication, marketing, and promotion can advance the attractive tourism sector in Kelantan.	238	4.3782	.69345
The frequency of use of digital technology can increase the sustainability of tourism products and improve the delivery of existing services.	238	4.4664	.67889
Technology is used as an easy platform to find information and attract tourists to travel.	238	4.5840	.63585
The increasingly frequent use of digital technology in tourism can benefit the tourism sector in Kelantan.	238	4.5000	.64794

This table shows the Descriptive Analysis Statistic of Frequency of Technology Use. The item with the greatest meaning was the use of technology can increase productivity and gain a competitive advantage in the market. It had a 4.4790 mean, which is on the agreeable scale. The question with the second highest average, again at the level of agreement, was adapting to adopt technology and digitalization rapidly, communication, marketing and promotion can advance the attractive tourism sector in Kelantan with a mean of 4.3782. The remaining questions for this independent variable,

according to the data in the table, are at the neutral level. The highest result is 4.5840 for the statement Technology used as an easy platform to find information and attract tourists to travel. Following that, the frequency of use of digital technology can increase the sustainability of tourism products and improve the delivery of existing services is 4.4664. Finally, the mean for the increasingly frequent use of digital technology in tourism can benefit the tourism sector in Kelantan was 4.5000.

Descriptive Analysis Statistic of Purpose of Technology Use

Items Description	N	Mean	Std Deviation
The main purpose of technology in the field of tourism is to make things easier for tourists in Kelantan?	238	4.5084	.67967
The purpose of technology is to improve tourism convenience and the overall travel experience for travellers.	238	4.4160	.67449
The purpose of technology is also to coordinate and improve the booking process for travellers in the tourism industry to make it easier and more efficient.	238	4.4412	.69561
Applications such as Waze, Instagram and Facebook are examples of how technology is used to promote sustainable tourism practices, such as through smart destination management.	238	4.4874	.69191
The purpose of technology is used to promote cultural preservation and heritage tourism, such as through digital archives, virtual museums, and language translation tools, to	238	4.4916	.70407

help travellers better understand and appreciate local culture and traditions such as in Kelantan.			
--	--	--	--

This table shows the Descriptive Analysis Statistics of purpose of Technology Use. The item with the greatest mean was the main purpose of technology in the field of tourism is to make things easier for tourists in Kelantan It had a 4.5084 mean, which is on the agreeable scale. The purpose of technology is to improve tourism convenience and the overall experience for travellers with a mean 4.4160. The purpose of technology is also to coordinate and improve the booking process for travellers in the tourism industry to make it easier and more efficient with a mean of 4.4412. Applications such as Waze, Instagram and Facebook are examples of how technology is used to promote sustainable tourism practices, such as through smart destination management with a mean of 4.4874. The remaining questions for this independent variable, according to the data in the table, are at the neutral level. The second highest result is 4.4916 for the purpose of technology being used to promote cultural preservation and heritage tourism, such as through digital archives, virtual museums, and language translation tools, to help travellers better understand and appreciate local culture and traditions such as in Kelantan.

Descriptive Analysis Statistic of Tourist Satisfaction

Items Description	N	Mean	Std Deviation
-------------------	---	------	---------------

The use of technology during my visit to Kelantan enhanced my overall tourist experience.	238	4.5252	.67301
The availability of technology in Kelantan helped me plan my itinerary more effectively.	238	4.4706	.69140
The use of technology in Kelantan made it easier for me to navigate the area and find attractions.	238	4.4412	.72530
The technology used in Kelantan helped me learn more about the culture and history of the area.	238	4.4370	.73649
Overall, my satisfaction with my trip to Kelantan was positively influenced by the availability and use of technology.	238	4.5168	.70988

This table shows the Descriptive Analysis Statistic of Tourist Satisfaction. The item with the greatest mean was the use of technology during my visit to Kelantan enhanced my overall tourist experience. It had a 4.5252 mean, which is on the agreeable scale. The question with the second highest average, again at the level of agreement, was the availability of technology in Kelantan helped me plan my itinerary more effectively with a mean of 4.4706. The remaining questions for this independent variable, according to the data in the table, are at the neutral level. Next, it means the statement The use of technology in Kelantan made it easier for me to navigate the area and find attractions. Following that is mean for the technology used in Kelantan helped me learn more about the culture and history of the area is 4.4664. Finally, the mean for the tourist satisfaction with my trip to Kelantan was positively influenced by the availability and use of technology was 4.5168.

Reliability Analysis

Variables	Number of questions	Cronbach's alpha coefficient
Types of Technology of Use	5	.786
Frequency of Technology Use	5	.857
Purpose of Technology Use	5	.879
Tourist satisfaction	5	.913

The table above is the findings of SPSS showing the importance of both independent and dependent variables in this analysis. All variables exceed or decrease. All variables were more than 0.700. The questionnaire has been safely approved and how many of our questions have been used to evaluate our title 'The Effectiveness of Technology Use Among Tourist Satisfaction in Kelantan'. The Cronbach Alpha results are 0.786 for first variables which are types of technology of use. This figure is questionable in terms of internal consistency ($0.8 > \alpha \geq 0.7$) and has proven to be acceptable.

The following independent variable, frequency of technology use, was tested for validity and reliability using 5 questions. Cronbach's Alpha for this variable is 0.857. Internal consistency for this number is good ($0.9 > 0.8$). The coefficients found for the variable for these questions are accurate. The third and last independent variable in the study is the reason for using technology. 5 elements make up this variable, which has a Cronbach's Alpha value of 0.879. Internal consistency for this number is also favourable ($0.9 > 0.8$). The coefficients found for the variable for these questions are accurate.

There are five items that cast doubt on the validity of the dependent variable, tourist satisfaction. Cronbach's Alpha for this variable is 0.913, which is outstanding in terms of internal consistency (0.9). This suggests that the respondents' views on tourist satisfaction were consistent. Because all the studies in this research are highly steady ($0.8 > 0.7$) to exceptional (0.9), they are all considered to be reliable. Finally, 0.954 is the overall reliability test score for all variables, which is regarded as being extremely good for reliability. Additionally, respondents may find it simpler to

comprehend the questions posed to some factors if they share the respondents' perspectives and grasp of the issues raised.

Pearson Correlation Analysis

		TT	FT	PT	TS
TT	Pearson Correlation	1	.764	.735	.775
	Sig. (2-tailed)		<.001	<.001	<.001
	N	238	238	238	238
FT	Pearson Correlation	.764	1	.829	.773
	Sig. (2-tailed)	<.001		<.001	<.001
	N	238	238	238	238
PT	Pearson Correlation	.735	.829	1	.796
	Sig. (2-tailed)	<.001	<.001		<.001

	N	238	238	238	238
TS	Pearson Correlation	.775	.773	.796	1
	Sig. (2-tailed)	<.001	<.001	<.001	
	N	238	238	238	238

** . Correlation is significant at the 0.01 level (2-tailed)

The association between the dependent variable, tourist satisfaction and the three independent variables, types of technology of use (TT), frequency of technology use (FT), and purpose of technology use (PT) are shown in Table 4.23. Types of technology of use, frequency of technology use and purpose of technology use have a positive correlation with tourist satisfaction. The connection between types of technology of use, frequency of technology use and purpose of technology use with tourist satisfaction is positive and has a strong correlation. As a result, this information demonstrates that all independent variables are linked to dependent variables.

DISCUSSION AND RECOMMENDATION

For discussion and recommendation, to increase the credibility of the study, it is recommended to recruit more respondents beyond the typical limit of 238 participants. This will enhance the diversity and dependability of the research findings. Additionally, efforts should be made to ensure that the questionnaire's questions are easily understood to facilitate quicker and easier responses. One suggestion is to engage more individuals interested in tourism technology online to provide accurate and reliable answers, thus improving the accuracy of the research findings.

Based on the study's findings, several recommendations can be made to enhance the effectiveness of technology use in improving tourist satisfaction in Kelantan. Firstly, the Kelantan

State Tourism Board should invest in the development and improvement of mobile applications that provide comprehensive information and assistance to tourists. This can include features such as real-time updates on local events and attractions, interactive maps, and directions to popular destinations.

Secondly, tourism businesses in Kelantan should be encouraged to adopt and integrate technology into their operations. This can involve the implementation of online booking and payment systems, digital marketing strategies, and the utilization of smart technologies like automated check-in and check-out systems in hotels. Thirdly, providing adequate training and support to tourism industry professionals on the effective use of technology is crucial. Training programs can focus on utilizing mobile applications and social media platforms to engage with tourists, as well as collecting and analysing data to enhance business operations and customer experiences.

Fourthly, collaboration between the Kelantan State Tourism Board and local technology companies can foster the development of innovative and tailored solutions to meet the unique needs of tourists in Kelantan. This can include the creation of augmented reality applications that offer immersive experiences of Kelantan's culture and heritage. Lastly, continuous monitoring and evaluation of the effectiveness of technology use in enhancing tourist satisfaction in Kelantan is recommended. Regular surveys and data analysis can help identify areas for improvement and inform future investments and developments in this field.

In conclusion, implementing the above recommendations can contribute to improving the effectiveness of technology use in enhancing tourist satisfaction in Kelantan. Through investing in technology, providing training and support to tourism professionals, and collaborating with local technology companies, Kelantan can enhance its tourism offerings, attract more visitors, and generate greater economic benefits for the state.

CONCLUSION

This study was conducted to learn more about the effectiveness of technology among tourist satisfaction. This study may be utilized as a reference by other academics who are doing research on technology use among tourist satisfaction. The results acquired in Chapter 4 using the Statistical Package for the Social Sciences (SPSS) were explored further, and inferences of the findings. As a result, it is intended that all the information gathered during using this study would assist associated parties in generating cash and profit.

ABSTRACT

This study was proposed to examine the Satisfaction level towards safety in Tok Bali, Kelantan. The independent variable of this study consists of the local tourist, knowledge, Infrastructure, and local culture. Next, this has four objectives to examine to identify local tourist's factors that be the reasons of satisfaction level towards safety in Tok Bali, to identify knowledge factors that influence satisfaction level towards safety in Tok Bali, to identify infrastructure factors that influence satisfaction towards safety in Tok Bali, and to examine local culture factors satisfaction safety in Tok Bali. This study is to attract more tourists who come to Tok Bali, for a holiday with family and friends and improve to safety in Tok Bali.

Keywords: local tourist, knowledge, infrastructure, and local culture.

INTRODUCTION

1.1 BACKGROUND OF THE STUDY

The study's historical context is Malaysia's Kelantan state. As the nation's capital and the royal family's residence, Kota Bharu serves as both. Its Arabic honorific is Darul Naim ("The Blissful Abode"). In the northeastern portion of the peninsula, in Kelantan, there are beautiful paddy fields, attractive fishing communities, and beaches bordered by coconut trees. Due to Kelantan's relative seclusion and predominantly agricultural lifestyle, its culture differs fro

Malay culture in the rest of the peninsula. Tok Bali is a location that tourists should not skip to visit seeing while in Kelantan. In recent years, it has served as an alternative departure point for tourists to the Perhentian Islands. The villagers' main source of income in Tok Bali is fishing. Meanwhile, here there is also the historical name of the destination. It comes from an experience that had happened in the past time. The truth is, Tok Bali actually comes from fishermen from Bali, Indonesia. Although some of opinions about Tok Bali is started from other moment but it is also started with the moment, the place was called and known as Tok Bali. So, here we were decided to make the research about visitors' awareness level and visitors' satisfaction level towards safety in Tok Bali.

1.2 RESEARCH QUESTION

1. What is the relationship local tourists with satisfaction level towards safety in Tok Bali?
2. What is the relationship knowledge with satisfaction level towards safety in Tok Bali?
3. What is the relationship infrastructure with satisfaction level towards safety in Tok Bali?
4. What is the relationship local culture with satisfaction level towards safety in Tok Bali?

1.3 SIGNIFICANCE OF THE STUDY

Our research's primary focus is on generation Y. Generation Y is group born between 1980 and 1995. Generation Y is also the millennial or millennial generation that uses technology a lot. (Kouperschmidt,2000 in Putra,2016). This is because generation Y is more committed in deciding and openness. Generation Y will also have a higher level of awareness and high concern for safety if they visit a place. For example, it will learn from mistakes with awareness in themselves. Therefore, the focus on generation Y is very beneficial because they know about tourism. This will give a high chance in attracting more tourists from outside to come Tok Bali, because they upload in social media like, Instagram, Tik Tok, Facebook and so on. This will be able to advance the tourism sector in our country.

1.4 DEFINITION OF TERMS

SAFETY

Providing the high quality in tourism depends on safety and security. The ability to offer guests a safe and secure environment is more important to a tourism destination's success or failure than any other economic activity. This document is the end product of serious research by the WTO. It looks at both local and national planning considerations. Case studies for a various tourism industries are also provided, along with concepts for brochures.

AWARENESS

Awareness is the state of being aware of something. It is more particularly the ability to personally know and sense, feel, or be aware of happenings. Another definition is that is a condition in which a person is aware of certain information when a knowledge is immediately available to bring to bear a wide variety of behavioural behaviours. The idea is frequently used as a synonym for consciousness and is also thought to be awareness itself.

LOCAL CULTURE

Local culture is local culture refers to a personality that describes the culture practiced in a country. So here the local culture is too important when it will be the example for the others tourists. Connecting with the locals is at the centre of any vacation (Reisinger & Turner, 2003). Carmichael (2005) identifies social interaction between tourists and locals as both an essential and memorable part of the tourism experience (Morgan & Xu, 2009).

KNOWLEDGE

Knowledge is refers to subjective part of a tourist own experience that involves in learning and education (Morgan & Xu, 2009). People can decide where to go and what to do when they get there based on how much they like to learn (Poria, Butler, & Airey, 2004). Hirschman and. Holbrook (1982) says that expending feelings can lead to interest, enjoyment, and feelings of happiness, and the stream of associations can lead to learning. (McKercher & du Cros, 2002) tell that travellers can learn a lot from their travel experiences. This comes learning in the form of new practical skills, knowledge, practical wisdom, and consciousness.

LITERATURE REVIEW

Local Tourist

Local tourists are individual who enjoy short journeys within their country, familiar with its history, traditions, and landmarks. They spend money on lodging, transportation, and food, contributing to the local economy. They seek authentic experiences, visit famous sites, explore the outdoors, and attend cultural events. They are environmentally conscious, opting for eco-friendly accommodations and activities, and often seek lesser-known destinations to support sustainable tourism practices.

Knowledge

Knowledge is a subjective aspect of the tourist knowledge experience, which is involving learning and education. People can choose destinations and activities based on their interests. Consumption feelings can lead to enjoyment and pleasure, while associations can foster learning. Travel experiences designate towards new practical skills, knowledge, wisdom, and consciousness. Knowledge encompasses factual awareness, practical abilities, and familiarity with items or circumstances, with philosophical disagreements on justification and necessity.

Infrastructure

Beach infrastructure comprises beaches access like parking, lifeguard stations, restrooms, changing facilities, promenades, recreational amenities, coastal protection measures, and environmental conservation efforts. It ensures safety, cleanliness, and accessibility while providing convenient pathways, lifeguard stations, and recreational facilities. Coastal protection measures protect the shoreline from erosion, while environmental conservation efforts maintain ecological balance and waste management.

Local Culture

Local culture related to a country's collection of behaviors, beliefs, and practices, which include anything from how people eat and dress to how they work and communicate. Meeting locals is at the heart of each trip (Reisinger & Turner, 2003). According to Carmichael (2005), the social connection between tourists and locals is an important and memorable component of the tourism experience (Morgan & Xu, 2009).

Satisfaction Level Toward Safety in Tok Bali

The concept of satisfaction is widely studied by existing literature (Nasir et al., 2021). Tok Bali's high safety satisfaction is due to various factors, including trained lifeguards, well-maintained facilities, clear signage, and safety precautions. Risks are reduced, and a safe environment is promoted through adequate lighting and designated swimming areas. Collaboration between regional government agencies and beach management groups enhances safety procedures, while regular drills and community participation further enhance preparedness. Tok Bali ensures a consistently safe and enjoyable experience for beachgoers through ongoing monitoring and improvements based on visitor feedback.

Factors Influencing Visitor's Awareness Level and Visitor's Satisfaction Level Towards Safety in Tok Bali.

Research appropriate that visitor awareness and satisfaction with safety at tourism destinations are significantly influenced by factors such as pollution and pollution. Safety is the most important factor in the development of tourism, and Tok Bali is no exception. The absence of pollution, such as river and river pollution, ensures visitors' safety and prevents diseases while they are there or after returning home. Tok Bali's cleanliness and absence of pollution make it a top destination for visitors, as it prevents diseases and ensures their safety. As a result, visitors trust the quality of their stay and are satisfied with their safety in Tok Bali.

Research Hypothesis

The proposed theory focuses on factors like local culture, knowledge, infrastructure, and customer behaviour affecting safety satisfaction in Tok Bali. From the study, the following hypothesis has been designated and tested.

H1 - There is a relationship between local culture with a level of satisfaction with safety in Tok Bali.

H2 - There is a relationship between knowledge considering safety satisfaction in Tok Bali.

H3 - There is a relationship between infrastructure with satisfaction intensity of safety in Tok Bali.

H4 - There is a relationship between customer behavior and with satisfaction Tok Bali`s degree of safety.

Research Framework

A study framework investigates the relationship between tourist safety satisfaction in Tok Bali and visitor awareness, considering factors like local culture, knowledge, infrastructure, and local culture as independent variables.

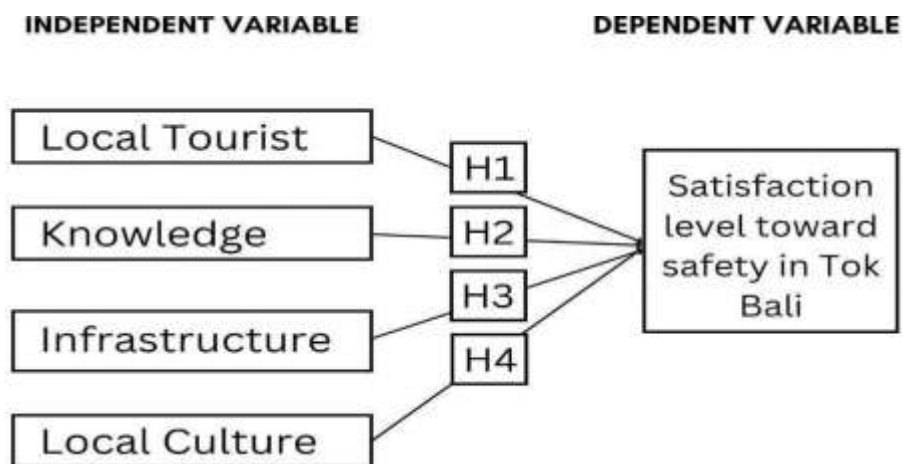

Figure 1: Proposed Conceptual Framework Adapted from Erore Sthapit & Dafnis

METHODOLOGY

RESEARCH DESIGN

Research design is describing about the meaning of a tips for answering the research question using empirical data. In creating a research design, it is related to the means that makes decisions about the all of the research objectives and approach. Besides, sampling of the methods or criteria for selecting subjects is also should be considered in describing the research design. It is because the sampling method is one of the ways that will help the readers.

POPULATION

Visitors to Tok Bali, Kelantan, which are 50 respondents were chosen as respondents for this study. The data will be collected in and around Tok Bali, Kelantan. This study focuses on visitors who like to visit Tok Bali, Kelantan, to determine their level of awareness and satisfaction with safety in Tok Bali. This population was chosen because the researcher lives nearby, making it easier for the study to locate respondents, and consumption patterns have long been a source of concern for Tok Bali residents concerned about visitor awareness and satisfaction levels with safety.

SAMPLE SIZE

A sample is a subset of a population from which data is collected. The sample size is always less than the total population size (Pritha Bandari (2020)). The sample size justification for such studies should explain how the collected data is expected to provide valuable information given the researcher's inferential goals (Lakens, D. (2022)). The sample size is a group of people chosen from the general population to be considered of the real population for the purpose of the study. Inappropriate, too large, or too small sample sizes continue to have an impact Equation I provide the sample's formula with a 95% confidence interval and a 5% level of significance.

DATA COLLECTION

According to (Craig Stedman et al.,2022), data collecting is the progress of acquiring data for being considered in business decision-making, strategic planning, research, and other purposes. Quantitative data had gathered complete and draw the characteristics, behaviours of populations (Parohoo,2006). This research uses the method data from the survey questions. This survey's questions are simple for respondents to respond. The collection data to support findings and analysis.

SAMPLING

Sampling involves choosing a representative sample of the population being studied Mcleods. (2019). Convenience sampling is non-probability sampling method used in this investigation. The convenience sampling is the most common form of no probabilistic sampling, misused according by (et Thomas W. Edgar al.,2017). Quantitative research that focus on quantifying the collection and analysis of data based on the study. This enables the researchers to archive the sample size they need in a relatively easy and inexpensive manner. Researchers have provided random questionnaires to study increasing visitor awareness level and visitor satisfaction level toward safety in Tok Bali.

RESEARCH INSTRUMENT

Research tools used to gather, quantify, and assess data relevant to the research issue. A proper research questionnaire contains both closed and open questions. Respondents can expound on their responses when the questions are lengthy and open-ended. Questionnaires used for data collecting can generate both qualitative and quantitative information. Questionnaire surveys could or might not contain surveys, however the surveys should always be used in connection with questionnaires.

DATA ANALYSIS

The progress of collecting, modelling, and evaluating information orderly to derive knowledge that can be applied to decision-making. There are numerous ways and procedures for manage analysis, depending on the field and the objectives. Diverse data analysis techniques are thus generally based on two main study subfields: quantitative methods and also qualitative approaches. To extract usable information from data and base judgements on that analysis is the purpose of data analysis. There are main and secondary primary data in research methodology. Primary data refers to data that researchers have gathered from original sources such surveys and interviews.

FINDINGS

DEMOGRAPHIC PROFILE

The online platform had assigned a total of 208 sets of questionnaires. The contextual profiles of the respondents existed in this segment. About 38 % of the respondent were male and another 62 % were female. The table showed most of the respondents in the race are Malay with 82.2% followed by Chinese with 10.6% and from Indian has 7.2%. The table also shows the respondents who responded to this survey are speciously aged between 18 -35 above years old with the frequency of 208 respondents. This is tracked by 22 - 25 years old with 128 respondents

(61.5%), follow by respondent age from 26 - 30 years' old which is with 15.9% and 22 respondents from 18 - 21 years old (10.6). Both of age between 31 - 35 years old with 18 respondents.

Additionally, table 4.5 indicated that most respondents have a degree (74%, n=154). This followed by 26 of the respondents (12.5%) from certificated, 12 of the respondents (5.8%) has a master. Also, 16 respondents (7.7%) from primary and secondary. Based on table also shows the respondent's status. The highest status of respondents is single status with 158 respondents (76%), then, follow by married tracks this with 49 respondents (23.6%), and the balance of 1 respondent (5) has a taken status. Lastly, the table indicated that most respondents is a student (68.8%, n=143). This followed by 28 of the respondents (13.5%) has an employee, 17 of the respondents (8.2%) are from business owner occupation, 16 of the respondents (17.7%) from a government officer, And the balance is from housewife which is 4 respondents with 1.9 percentages.

Reliability Test

The calculation's reliability indicates the instrument's stability and precision in calculating the definition, thus contributing to the measure's goodness

Variables	Bil of Item	Cronbach's Alpha coefficient	Strength of Association
Local Tourist	5	0.830	Excellent
Knowledge	3	0.836	Excellent
Infrastructure	3	0.864	Excellent
Local Culture	3	0.858	Excellent

Satisfaction Level Toward Safety	1 4	6.08 65	Very good
-------------------------------------	--------	------------	-----------

Table 3 Result of Reliability Test

Cronbach's Alpha Coefficient values for the independent and dependent variables in this study are shown in Table 3, the conclusion presented is reliable and may be accepted in this study. all variables were mostly over 0.8. The questionnaire was approved, and five questions were used to assess local tourist in Tok Bali, Kelantan. The Cronbach Alpha result is 0.830 and has been proven to be excellent. The coefficient obtained for knowledge questions was also accurate.

Afterwards, Knowledge that influenced visitors' awareness level and satisfaction level toward safety in Tok Bali have a three questions were used and Cronbach's Alpha result is 0.836,

which indicated good. Hence, the coefficient obtained for these questions in the knowledge variable was reliable.

Then, three questions were used to calculate the infrastructure that influenced the visitor's awareness level and satisfaction level toward safety in Tok Bali, and the Cronbach Alpha outcome is also 0.864, which was also indicated as excellent. The coefficient obtained in the infrastructure variable for this variable was accurate.

Finally, three questions were to calculate the Local Culture intention variable Towards Safety in Tok Bali, and the Local Culture outcome was .858, which was indicated as excellent. The Satisfaction Level Towards Safety in Tok Bali for these questions in the Local culture was thus accurate.

Descriptive Analysis

Descriptive statistic is being the short descriptive coefficient that summarizes a given data set, which can represent a population or a sample population

Variable	N	Mean	Standard deviation
Local Tourist	208	6.0483	1.13571
Knowledge	208	6.1875	1.17132
Infrastructure	208	6.0048	1.09676
Local Culture	208	6.0673	1.06108
Satisfaction Level Toward Safety	208	6.0865	.98893

Table 4 displays on the independent variable and dependent variable, the mean and standard deviation analysis. Local tourist, Knowledge, Infrastructure and local culture was independent variable while dependent variable was Satisfaction Level Toward Safety. The highest mean value was knowledge which is 6.1875, where respondents supported more on this variable. Meanwhile, the lowest mean value was infrastructure, which is only 6.0048 where in this study the respondents agreed lower for that variable

Pearson Correlation

Spearman's correlation coefficient method was used to assess the contact between the independent and dependent variables. A numerical analysis of the heading and the strength of the direct connection between independent variables and dependent variables may be necessary to determine the correlation coefficient. The title and quality of the direct relationship between independent variables and dependent variables were examined digitally by Spearman.

H1: There is a positive relationship between local tourist and satisfaction level toward safety in Tok Bali.

		Local Tourist	Satisfaction Level Toward Safety in Tok Bali
Local Tourist	Pearson Correlation	1	.830**
	Sig. (2-tailed)		<.001
	N	208	208
Satisfaction Level Toward Safety in Tok Bali	Pearson Correlation	.830**	1
	Sig. (2-tailed)	<.001	
	N	208	208

Table provided that the results of the correlation between satisfaction level toward safety in Tok Bali and Local tourist are 0.830. The consequence proved that there is a relationship between the variables. The positive value of the correlation coefficient 0.830 indicated that their relationship is very highly positive.

H2: There is a positive contact between knowledge and satisfaction level toward safety in Tok Bali

		Knowledge	Satisfaction Level Toward Safety In Tok Bali
Knowledge	Pearson Correlation	1	.836**
	Sig. (2-tailed)		<.001
	N	208	208
Satisfaction Level Toward Safety In Tok Bali	Pearson Correlation	.836**	1
	Sig. (2-tailed)	<.001	
	N	208	208

Table provided that the results of the correlation between satisfaction level toward safety and knowledge are 0.836. The consequence proved that there is a contact between the variables. The positive value of the correlation coefficient 0.836 indicated that their relationship is very highly positive

H3: There is a positive contact between infrastructure and satisfaction level toward safety in Tok Bali.

		Infrastructur e	Satisfaction Level Toward Safety In Tok Bali
Infrastructure	Pearson Correlation	1	.864**
	Sig. (2-tailed)		<.001
	N	208	208

Satisfaction Level Toward Safety In Tok Bali	Pearson Correlation	.864**	1
	Sig. (2-tailed)	<.001	
	N	208	208

Based on table established that the relationship between satisfaction level toward safety and infrastructure was stated as 0.864. This result exposes the existence of the relationship between the variables. The positive value of the correlation coefficient 0.864 indicated that their relationship is very highly positive.

Hypothesis 4: There is a positive relationship between local culture and satisfaction level toward safety in Tok Bali.

		Local Culture	Satisfaction Level Toward Safety in Tok Bali
Local Culture	Pearson Correlation	1	.858**
	Sig. (2-tailed)		<.001
	N	208	208
Satisfaction Level Toward Safety in Tok Bali	Pearson Correlation	.858**	1
	Sig. (2-tailed)	<.001	
	N	208	208

Table shows the relationship between Satisfaction level toward safety and local culture at 0.585, which indirectly augment the relatively strong relationship between variables. It shows that a significant, strong, and very high positive correlation between Satisfaction level toward safety and local culture

Summary result of Spearman Correlation Coefficient.

Hypothesis	Significant Value	Conclusion	Correlation Value	Conclusion
1	0.001	Accepted	0.830	Very high positive

2	0.001	Accepted	0.836	Very high positive
3	0.001	Accepted	0.864	Very high positive
4	0.001	Accepted	0.858	Very high positive

All the 4 variables have a strong relationship with satisfaction level toward safety in Tok bali.

Hence, all hypothesis is accepted. Table serves to summarize the findings of this study.

DISCUSSION AND RECCOMENDATION

The study was direct to examine the contact between local tourist, knowledge, infrastructure and local culture and Satisfaction level toward safety.

The researcher acknowledge that there were several limitations to their study. The first limitation is focus on small sample size. This study's relatively limited sample confines to respondents who agree and disagree about satisfaction level towards safety in Tok Bali.

For the second limitation, the researcher only focus on Tok Bali respondents through questionnaire. We believed in Tok Bali level towards safety can attract more tourists to come for holiday with family and friends because the safety will improve. Throughout the study in Tok Bali, we lacked respondents because we could not meet more of respondents there. Due to the lack of respondents we could not produce accurate collect data.

Beside that, promoting domestic tourism and supporting the safe return of international tourism in Tok Bali, Kelantan. Special bundles and promotions are available. We may work with lodging providers, attractions, and local businesses to create appealing packages and promotions aimed exclusively toward domestic travellers

In addition, clear information is provided to travellers and businesses, reducing uncertainty. It is critical to maintain social media platforms up to date in order to keep travellers and companies informed and involved. Tok Bali may publish timely updates, news, and critical information via social media channels, ensuring travellers are informed of any changes or developments. It also enables proactive communication by swiftly responding to travellers' questions, concerns, and feedback, building a feeling of responsiveness and dependability

CONCLUSION

The summary of relevant knowledge reveals that the overall purpose of this research has been met. Almost half of those who responded to the survey gave a positive response regarding the level of security in this area. They also want to visit in the future following the unforgettable experience they get especially from the local culture, knowledge, refreshment and meaning. They enjoy and enjoy being in the area because they are surrounded by beautiful sea views and can breathe fresh air.

ABSTRACT

In the current global economic situation aftermath of crisis, tourist loyalty, as a critical component in assessing travel experiences, remains a focus of destination marketing organizations to succeed in an increasingly competitive tourism industry. This research aimed to determine the effect of destination attributes on tourist loyalty in Malaysia. This research used a quantitative approach. The collected data were obtained through a questionnaire distributed to 304 respondents. The research results showed that the destination attributes significantly influenced tourist loyalty. Results showed that the effect of destination attributes will be reduced during a crisis, allowing tourist destinations to attract tourists.

Keywords: Crisis, Tourist Loyalty, Destination Attributes, Quantitative, Malaysia.

INTRODUCTION

The COVID-19 pandemic seriously impacted countries on the tourism landscape. However, destination loyalty becomes more fragile in times of crisis due to the travellers' aroused fears, massive competition, and the emergence of safer places as new touristic destination brands (Gössling et al., 2020). Yet unfavourable information about destinations in general and crisis.

Tourism is an important driving force for regional economic development because it contributes to the generation of jobs and the enrichment of many related industries (San Martin & Rodriguez del Bosque, 2018). According to Gitelson & Crompton (2020), the tourism sector is important in society to contribute to the local economy. The tourist sector can help communities get financial resources. Therefore, the community should strive to attract more repeat visitors as the global market becomes increasingly competitive. In an increasingly competitive international tourism market with new emerging destinations, mature destinations can gain a competitive advantage through repeat visits. Impacted destinations specifically influence the actual experience (Nam et al. 2020).

According to Matiza (2021) and Yeh (2021), one key pillar in post-crisis tourism recovery is a strategy to ensure that tourists' loyalty to visit the tourism destination. Given the contemporary global tourism environment, tourism marketing has become critical to re-igniting tourism demand. Bastiaansen et al. (2020) conclude that destination marketing in tourism aims to enhance the affective component of the destination image, which in turn affects the destination decision of tourists. The destination attributes are to describe the place that the tourist destination has a travel attribute while traveling and the image of the destination that will be going (Mazlina Mahdzar, 2018). As a result, the destination attributes will impact the tourist destination in that they have their own choice and will be satisfied with the sales behavior (Gani, 2018).

Destination attributes have been recognized as an important element of destination identity (Saraniemi and Komppula 2017) and they have been the subject of research in many studies to date (Djeri et al., 2018; Ragavan et al. 2014). The utmost goal of tourist destinations is to achieve tourist satisfaction (Zhan et al. 2018) and, in order to assess overall satisfaction, the importance of and satisfaction with each component of a destination should be evaluated (Gursoy, Chen and Chi 2014). However, destination loyalty becomes especially more fragile in times of crisis due to the travelers' aroused fears, massive competition, and the emergence of safer places as new touristic destination brands (Gössling et al., 2020; Stylidis et al., 2020).

According to Nam et al., 2020, there are several factors that generate loyalty to tourism destinations after the crisis. The study examined various aspects was basic comfort facilities, tourist attraction, economic factors, safety, and security. When getting information from tourists, tourists are more inclined to visit destinations that have infrastructure facilities and interesting activities even if safety and security are less encouraging. To that end, this study is focusing on the factors of destination attributes that influence tourist loyalty during and aftermath of the crises. Therefore, the crisis will be affected to the tourism industry in Malaysia.

SIGNIFICANCE OF THE STUDY.

Awareness of destination attributes.

The demand-side perspective on the phenomenon of tourism destination development has been the subject of many studies. The tourist area needs to be researched first before starting the study to make sure the area is good or not. Community awareness in the destination was either a lot or not. The

researcher needs to ensure that the design chosen for the study was suitable according to the desired purpose.

Increase domestic tourism.

Domestic tourism destinations need to be added to attract tourists to travel within the state. The improvement of abandoned tourist areas by beautifying the area so that it was livelier and became an attraction for national tourists to come and travel to this area of the state. Each state needs to plan to think about how to improve tourism destinations in their respective states.

Covid-19 impact.

This was a study of the crisis covid 19. The study was made to see the changes that happened after and before covid 19 whether it changed for the better or worse. The right destination will not be the cause of the economy or declining attributes if everyone is good at maintaining and cleaning the area. Accurate control needs to be done to prevent the spread of covid-19 from continuing to increase.

LITERATURE REVIEW.

The Basic Comfort of Facilities.

Destination facilities are very important for the tourism sector. It not only has interesting places to visit, but it also has needs and facilities that can meet all the needs and wishes of tourists (Dzia-Uddin & Zakaria, 2018). Among the examples of basic facilities that must be provided by the destination are accommodation, transportation, and interesting activities to ensure that tourists (visitors) enjoy their days in that place. Destinations equipped with facilities or infrastructure can satisfy tourists and attract tourists to visit the destination repeatedly.

Variety of Tourist Attractions.

Tourist attraction was influenced by behaviour patterns and population, as well as the flexibility of activities and budget (Oram, 2022). Food, with its unique traditions and tastes, also attracts tourists, as they have their own expectations and tastes. Culinary activities are more popular than activities in tourist destinations. Attractions in the travel and tourism industry aim to capture customers' attention and encourage them to explore various attractions during their holidays. There are four types: purpose-built, natural, events, and heritage attractions. Attractions are crucial in attracting tourists from around the world, making them an essential part of the industry.

Economic Factors.

The tourism sector is crucial for generating income and boosting the national economy (Yusof, 2017). Factors like topography, economic factors, and job opportunities are crucial for businesses. Focusing on these factors can improve the economy and create job opportunities, reducing unemployment rates in Malaysia. This not only provided better living conditions but also enhances skills and experience for employees. Economic factors influence the economy, including interest rates, tax rates, laws, policies, wages, and government activity. These factors were not directly related to the business but affected the future value of the investment.

Safety and Security.

Battour et al. (2011) found that tourists' safety and cleanliness were crucial factors in decision-making. Strong security and crime-free destinations attract visitors, while clean, pollution-free destinations attract those who feel safe and comfortable. Tourists were more attracted to destinations with comfortable air and clean, safe environments. A tourism destination's success relies on providing a safe and secure environment for visitors. Safety involves natural disasters like hurricanes and earthquakes, while security involves anthropogenic factors like political instability and terrorist attacks. Factors like location, interdependencies, safety, awareness, image, brand, and cost or value contribute to a destination's competitiveness.

The Tourist Loyalty.

The intention of the traveller to return to the same location is characterized by good word of mouth and a sense of pleasure for the pleasant experience they had. While being the best predictor of post-visit behaviour, destination loyalty was an important component of marketing strategy (Chen & Chen, 2010). A key component of loyalty is the desire to return to the destination, and various authors have investigated this topic in-depth to determine the factors that enable reaching high values in the chance of recurrence (Backman & Crompton, 1991; Cronin, Brady, & Hult, 2004).

Research Hypothesis.

A hypothesis needs to be plausible, testable, and consider the most recent discoveries and methodologies. A forecast or an explanation of the relationship between two variables is also referred to as a hypothesis. It suggests that an independent variable and a dependent variable are related causally.

As a result, the research suggests:

H1: There was a positive relationship between basic comfort of facilities and tourist loyalty.

H2: There was a positive relationship between tourist attraction and tourist loyalty.

H3: There was a positive relationship between economic factors and tourist loyalty.

H4: There was a positive relationship between safety and security tourist loyalty.

Research Framework.

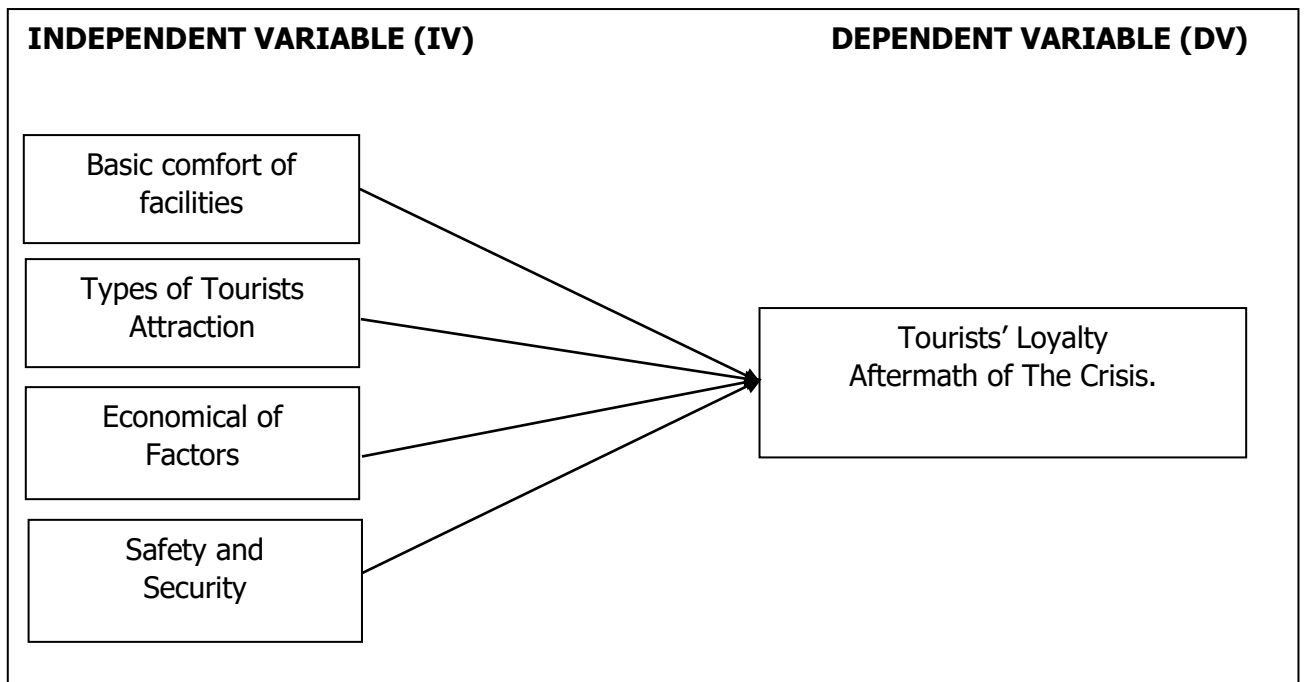

Figure 1: The Conceptual Framework for The Relationship between Destination Attributes and Tourist Loyalty.

METHODOLOGY.

Research Design

In this study, quantitative research and experimental design were used as research design. Quantitative research includes the use of mathematical, statistical, and computational tools to obtain results. Therefore, it can be defined as a structured causal relationship between problems and factors. Large-scale research surveys help in generating statistics in quantitative research using methods through questionnaires or structured interviews (SIS International Market Research, 2018).

Data Collection

There were two types of data collecting used: primary and secondary. According to Robson (2007), a researcher should gather more information than is necessary and employ the least

complicated method possible to gather data and identify the answers to their study questions. The researcher has also chosen a questionnaire as a data collection tool to accomplish the goals of this study. To gather respondents, the researcher will be conducting a questionnaire through social media, such as Facebook tourism sites in Malaysia. This is because the data that received through this technique is easier to analyse and more accurate.

Sampling Method

The convenience sampling technique, which uses non-probability sampling, is employed in this study. A set number of observations are selected from a larger population during the sampling process, which is a statistical research technique. This study needs a descriptive survey, this sampling strategy is helpful. In this study, the convenience sampling approach was applied to the distribution of the questionnaire to the intended respondents (Social Science Research Methods, 2018).

Data Analysis

According to Shamo and Resnik (2003), there are a few analytical techniques that offer a means of deducing inferences from the data and identifying the sounds contained in the data. The Statistical Package for Social Science (SPSS) was a computer programme that the researchers used to analyse closed questions. The statistical descriptive, reliability test, and Spearman correlation analysis were used to examine the data.

RESULT ANALYSIS AND FINDINGS

DEMOGRAPHIC CHARACTERISTICS OF RESPONDENTS.

The platform, which is based on the internet, has given out a total of 304 sets of questionnaires. About 39.8 % of the respondents were male, and another 60.2 % were female.

The respondents of this survey are falsely aged between 18-25 years old, a percentage of 70.4% with frequency 214 respondents. The second-highest percentage is 25-30 years old, a percentage 20.7% with frequency 63 respondents and 30 years old and above a percentage 8.9% with frequency 27 respondents answered the questionnaire.

The Malay race had the greatest response rate (64.8%) out of the 197 respondents who responded to this survey. The response rate from respondents of different nationalities was 31.3%, or 95 people. The Chinese then indicate that 10.3 percent, or 3.3%, of the population, responded. the remaining 7% of respondents, or 2 respondents, who identified as Indian.

A degree is a high level of education in the context of education, hence 102 respondents, or 46.4%, pointed out they had a degree. Asasi, with 33.6 responders, has the second-highest response rate at 33.6%. Third, 51 responses, or 16.8%, were Others. The 3.3% of respondents with master's degrees, or a total of 10 respondents, had the lowest level of education.

Sabah had the most responses (27% or 82) in terms of location. The states of Perak and Kelantan, with 15.8% or 48 responses, are the second highest. The state of Johor comes in second with 7.2% or 22 responders. Third, Selangor represents 6.3% of responders, or 19. Next, the same number of responses from the states—3.9%, or 12 respondents—came from Negeri Sembilan and Pahang. 3.3%, or 10 respondents, are from the Federal Territory, while 3%, or 9 respondents, are from Penang State. The state of Melaka came in second with 2.6% or 8 responses. The state of Perlis, with only 1% or 3 replies, has the fewest responders overall.

Table 1: Demographic profile of respondents

Respondent profile	Classification	Frequency N=304	Percentage (%)
Gender	Male	121	39.8%
	Female	183	60.2 %
Age	18-25 years	214	70.4%
	25-30 years	63	20.7%
	30 years old and above	27	8.9%
Race	Malay	197	64.8%
	Chinese	10	3.3%
	Indian	2	7%
	Other	95	31.3%
Education	Asasi	102	33.6%
	Degree	141	46.4%
	Master	10	3.3%
	Other	51	16.8%

1. Descriptive Analysis

Descriptive statistical analysis was used to back up the acquired data. According to Eiselen, Uys, and Porgieter (2005), descriptive statistics explain the components' total value and break it down into descriptive messages. Some of the simple questions utilised by researchers include frequency distribution, rate distribution, and mean computation. In our study, the outcomes are presented as tabular data.

Table 2: The result of descriptive analysis of variable

Variables	N	Mean	Standard Deviation
Tourist Loyalty	304	3.27	0.849
Basic Comfort of Facilities	304	3.71	0.889
Tourist Attraction	304	3.84	0.909
Economical of Factor	304	3.79	0.915
Safety and Security	304	3.42	1.125

Table show the independent variable and dependent variable, the mean and standard deviation analysis. **Basic Comfort of Facilities, Tourist Attraction, Economical of Factor and Safety and Security** was independent variable while dependent variable was **Tourist Loyalty**. The highest mean value was **Tourist Attraction**, which is 3.84, where respondents agreed more on this variable. Meanwhile, the lowest mean value was **Safety and Security**, which is only 3.42 where in this study the respondents agreed lower for that variable.

2. Reliability Test

As a result, the data was reviewed to determine the degree of accuracy using Cronbach's Alpha analysis as a reference. For all variables, Cronbach's Alpha must be better than 0.7. Table below shows the result of the reliability analysis.

Table 3: Result of Cronbach's Alpha

Variable	Number of items	Cronbach's Alpha coefficient	Strength of Association
Basic Comfort of Facilities	6	0.918	Excellent
Tourist Attraction	6	0.918	Excellent
Economical of Factor	6	0.917	Excellent
Safety and Security	6	0.922	Excellent

The table shows items for each variable have consistently and same characteristic. The first and second variable, Basic Comfort of Facilities and Tourist Attraction have same Cronbach's alpha coefficient 0.918 with strength excellent characteristic. In overall, our value Cronbach's alpha for each variable has the excellent of characteristic. These variables are significant and shows excellent strength of items for each variables.

3. The result of relationship between destination attributes and tourist loyalty

To examine the relationship between the independent and dependent variables, the Spearman correlation coefficient approach is used. In this study, there were four variables of destination attributes that influences of tourist loyalty in the aftermath of the crisis. Those hypotheses were accepted, which are

H1: There is a positive relationship between basic comfort of facilities and tourist loyalty. aftermath of the crisis.

Table : The relationship between

Correlations				
			Basic Comfort of Facilities	Tourist Loyalty
Spearman's rho	Basic Comfort of Facilities	Correlation Coefficient	1.000	0.746 ^{**}
		Sig.(2-tailed)		0.000
	Tourist Loyalty	Correlation Coefficient	0.746 ^{**}	1.000
		Sig.(2-tailed)	0.000	
**Correlation is significant at the 0.01 level (2-tailed)				

Table 4.18 shows the outcome of Spearman Correlation, which was run to determine the relationship between basic comfort of facilities and tourist loyalty in the aftermath of the crisis. Significant value and the number of cases which was 304. The p-value was 0.000, which was less than the significant level of 0.01. The correlation coefficient of basic comfort of facilities is 0.746 suggested high positive correlation between tourist loyalty aftermath of the crisis. This result is

supported that the basic comfort of facilities has a positive effect on tourists' loyalty to the destination (Dziatul Nadiah Dzia-Uddin & Nur Syazleen Zakaria, 2018). With complete basic facilities, tourists will feel comfortable and comfortable visiting the destination again.

H2: There is a positive relationship between tourist attraction and tourist loyalty in the aftermath of the crisis.

Table : The relationship between

Correlations				
			Tourist Attraction	Tourist Loyalty
Spearman's rho	Tourist Attraction	Correlation Coefficient	1.000	0.734 ^{**}
		Sig.(2-tailed)		0.000
	Tourist Loyalty	Correlation Coefficient	0.734 ^{**}	1.000
		Sig.(2-tailed)	0.000	
**Correlation is significant at the 0.01 level (2-tailed)				

Table 4.19 shows the outcome of Spearman Correlation, which was run to determine the relationship between basic comfort of tourist attraction and tourist loyalty in the aftermath of the crisis. Significant value and the number of cases which was 304. The p-value was 0.000, which was less than the significant level of 0.01. The correlation coefficient of basic comfort of facilities is 0.734 suggested high positive correlation between tourist loyalty aftermath of the crisis. According to previous research shows that loyal customers are willing to pay 20 to 25 percent more for their product (Almeyda-Ibáñez, and George 2017). Besides, the visitors are willing to pay more for the service in the destination (Godovikh and Tasci 2020).

H3: There is a positive relationship between economic factors and tourist loyalty in the aftermath of the crisis.

Table : The relationship between

Correlations				
---------------------	--	--	--	--

			Economical of Factor	Tourist Loyalty
Spearman's rho	Economical of Factor	Correlation Coefficient	1.000	0.712 ^{**}
		Sig.(2-tailed)		0.000
	Tourit Loyalty	Correlation Coefficient	0.712 ^{**}	1.000
		Sig.(2-tailed)	0.000	
**Correlation is significant at the 0.01 level (2-tailed)				

Table 4.20 shows the outcome of Spearman Correlation, which was run to determine the relationship between basic comfort of economic factors and tourist loyalty in the aftermath of the crisis. Significant value and the number of cases which was 304. The p-value was 0.000, which was less than the significant level of 0.01. The correlation coefficient of economic factors is 0.712 suggested a high positive correlation between tourist loyalty aftermath of the crisis. With advertising on social media, tourists will be able to find out everything that is available and special in the destination, and they occur and contribute to event tourism and destination marketing Sarah Tanford (2017).

H4: There is negligible relationship between safety and security and tourist loyalty aftermath of the crisis.

Table : The relationship between

Correlations				
			Safety and Security.	Tourist Loyalty
Spearman's rho	Safety and Security.	Correlation Coefficient	1.000	0.181 ^{**}
		Sig.(2-tailed)		0.002
	Tourit Loyalty	Correlation Coefficient	0.181 ^{**}	1.000

		Sig.(2-tailed)	0.002	
**Correlation is significant at the 0.01 level (2-tailed)				

Table 4.21 shows the outcome of Spearman Correlation, which was run to determine the relationship between basic comfort of safety and security and tourist loyalty in the aftermath of the crisis. Significant value and the number of cases which was 304. The p-value was 0.002, which was less than the significant level of 0.01. The correlation coefficient of safety and security is 0.181 suggested negligible correlation between tourist loyalty aftermath of the crisis. Aftermath of the crisis, the security of a place is one of the most significant deterrents to traveling (Hadiwijoyoin Prabowo et al., 2016).

DISCUSSION AND RECOMMENDATION

Based on the results of correlation analysis that was presented in this report, it shows a significant relationship that exists between both variables. As we know, the tourist loyalty is highly positively correlated with a basic comfort of facilities, and they moderate the relationship with 0.746 or 72%. Since the significant levels of both variables show 0.000 that highly significant. H1 has been proven and they were accepted, and the research objective has been supported. This result is supported from the previous study that found whether there is any correlation or the relationship between the dependent variables and independent variables.

It will discuss the limitation that was related to sample size. The study's extremely limited sample restricts how far the findings may be applied. Future related research will need to expand the sample size and completely evaluate this research model to overcome this constraint and produce more precise study results. Another limitation is that the researcher only uses social media platforms such as WhatsApp to interact with respondents in Malaysia. Due to slow response times throughout the online survey, the researcher was unable to gauge the respondents' understanding of the research. In order to address the third constraint, the researcher was probably forced to restrict the scope of the study analysis and the size of the research sample.

Based on the study, the recommendation that it will tell about safety and security is very low in influencing the rate of tourists' loyalty to the destination after the crisis. This is because places that are interesting and have a variety of activities become the focus of tourists to visit the destination. However, the basic comfort of facilities, tourist attraction, and economy factory available in the destination has become one of the factors that encourage the presence of tourists, because without

road facilities or transport and accommodation tourists will not know about the existence of the place. Every place or tourist destination must provide complete infrastructure facilities and activities that are attractive to tourists to maintain the loyalty of tourists to the destination.

In addition, the researcher needs to provide souvenirs for the respondents to attract their interest in answering the questionnaire. This is because, while the researcher was collecting data, the researcher experienced difficulties in finding respondents. By giving souvenirs or gifts to respondents, the researcher will easily get respondents to answer this google form. Next, use various types of social media to spread the google form. This is because the researcher only focused on one social media platform to distribute the google form ie WhatsApp. The researcher's ability to use social media has made it difficult for the researcher to get many respondents. Therefore, researchers should use platforms such as Instagram, Facebook, TikTok and many other social media to find respondent.

CONCLUSION

The aim of the research is to ascertain how basic facility comfort, tourist attractions, economic factors, and safety and security between tourist loyalty. The results of the study showed how, in the aftermath of the crisis, destination attributes have an impact on tourist loyalty. The results of demographic effects of destination attributes on tourist loyalty aftermath of the crisis such as gender, age, race, education, location, travel, and frequency. The result shows that all the effects have a positive relationship with tourist loyalty.

ABSTRACT

With the growth of the experience economy in recent years, travellers have continued to propose new demands. In terms of lodging, they are less content with standard tourist accommodations and instead place a higher value on authentic experiences and sentiments. Therefore, the only way a homestay can provide tourists with a novel experience and boost its competitiveness and tourist appeal is if it is heightened innovation and exploitation of cultural connotations. Innovation is an essential aspect of the tourism sector. However, a lack of awareness among homestay operators of the importance of innovation implementation leads to some homestay programs' incompetence. This study aims to explore the capability of innovation homestay programs. In total, eight homestay programs at East Coast Malaysia were selected based on several criteria. Face-to-face interviews were conducted with the homestay's coordinators, and the collected data were analysed using the thematic analysis technique. The practical implication is that industry players can utilise the empirical data as a benchmark to upgrade the other program homestay in Malaysia to be more competitive.

Keywords: Keywords: Homestay programs, innovation, tourism, qualitative, East Coast of Malaysia.

INTRODUCTION

Background of the Study

The need to innovate is a shift for a business to continue to thrive in a highly competitive global market (Divisekeran & Nguyen 2018). So is the tourism sector which has shown great development stimulate and also become an economic sector the most competitive (Backman Klaesson & Öner 2017). This includes rural tourism seen as having great potential to provide a destination that has its own uniqueness and originality of products covering the beauty of nature, the diversity of customs, and local culture (Mapjabil & Ismail 2015). The homestay program is one of the rural tourism that is so popular in Malaysia. It has been created in 1995 with the aim of offering an

interesting experience to tourists (Ramele & Yamazaki 2020) including accommodation, provision of food and drinks, package activities, and community product enterprises (Suffarruddin et al. 2020).

The Malaysian government has allocated a budget towards developing the tourism industry, specifically through the homestay program, to increase income levels and reduce poverty rates. The homestay program has the potential to promote rural tourism, which aligns with the Eleventh Malaysia Plan's efforts to transform the countryside and improve the well-being of the community. Unlike regular accommodations, the homestay programmes focus on providing tourists with an authentic experience by staying with host families and partaking in local activities. It will allow tourists to learn about the lifestyle and culture of the local community (MOTAC, 2017). This program helps boost the income of villagers and supports the development of tourism in rural areas.

Problem Statement

The COVID-19 pandemic severely impacted the tourism and hospitality industries, causing a 56% drop in international tourist arrivals and a loss of USD 320 billion in tourism exports in the first five months of 2020. The subsequent economic fallout led to a loss of USD 4.5 – 4.7 trillion and 62 million jobs in the travel and tourism sector. New standard operating procedures were implemented to limit the spread of the virus, with homestay operators urged to innovate through technology and social media to promote their businesses sustainably.

Even so, there are several programs and homestays that still offer services that affect the interest of tourists (Hussin & Kunjuraman 2014). This is because there are some less experienced entrepreneurs and knowledgeable in managing businesses as well as less exposure to innovation tourism (Sakdiyakorn & Sivarak 2016). The situation has affected the number of tourist arrivals thus reducing the total income of entrepreneurs and further causing them to be unable to survive again (Kasim et al. 2016). Data from MOTAC (2020) also shows almost 60 percent of the homestay program experienced a rate of decline often for the number of tourist arrivals from 2011 to 2019.

Based on previous studies, the focus on product innovation in the tourism industry is limited (Alsos et al. 2014; Martinez-Roman et al. 2015; Sakdiyakorn & Sivarak 2016) because the researcher focuses more on innovation in the sector manufacturing (Al-Ansari et al. 2013; Besides, previous studies in the tourism industry have focused on the impact of innovation in homestay programs, which can increase the income of homestay entrepreneurs. (Keling and Entebang, 2017; Boachie-Mensah &

Acquah 2015; Kafetzopoulos & Psomas 2015). **Therefore**, this study aims to identify what innovations are undertaken by homestay entrepreneurs to maintain stability in their homestay program after the outbreak of covid-19.

Scope of Study

The research focuses on identifying innovations in homestay programs to support the growth of the tourism industry. Due to the Covid-19 pandemic, many homestays face financial challenges. This research is focused on the important element in the tourism business. This study also emphasizes the importance of innovation for entrepreneurs in the tourism sector to survive and thrive.

SIGNIFICANCE OF THE STUDY

This research will provide a new perspective on the tourism industry about the potential of homestay programs In Malaysia. Most of the studies have discussed the community's involvement in homestay programs. However, research on the role of innovation in homestay programs is still limited. (Keling and Entebang, 2015). Therefore, the innovation aspect of tourism products needs to be studied in more detail in order to develop the tourism industry. Most homestays in Malaysia have their own uniqueness such as the beauty of nature and culture. The result of this study will contribute to enhancing domestic tourism development in rural areas. The development of the homestay program in Malaysia can increase the tourism industry and give tourist awareness about the importance of preserving culture. Therefore, innovation in the homestay program is important to attract more tourists.

LITERATURE REVIEW

Homestay programs

The concept of community-based tourism (Community-Based Tourism, CBT) was first introduced in the mid-1990s (Asker, Boronyak, Carrard & Paddon, 2010) through community involvement in providing tourism products for economic, social, and political empowerment (Hussin & Kunjuraman, 2014). According to Jamaludin, Othman, and Awang (2012), CBT is the community's responsibility and ability to make decisions.

In the context of Malaysia, a homestay can be defined as a form of lodging component of tourism that offers a village or kampong lifestyle experience for tourists or visitors (Kayat, 2011). It

refers to private accommodation that offers a fully furnished house that enables tourists to stay with a host family for a certain period (Oxford Dictionary, 2013). This homestay lifestyle involves cultural exchange, especially with foreigners as tourists from many countries around the world. Homestay is not solely a platform to generate money, but it is also a platform for villagers in rural areas to develop their entrepreneurial skills (Pusiran & Xiao, 2013). As one type of lodging that the tourists share with the homeowner with the intention to learn culture and lifestyles from the homeowner who is willing to transmit and share culture.

In late 2019, the COVID-19 pandemic impacted all nations, societies, and industries globally. The tourism and hospitality sector were among the worst hit when business activities came to a sudden halt, international borders closed, travel restricted and partial/full lockdowns were ordered (OECD, 2020). Thus, the travel and tourism sectors have suffered significant losses. Therefore, in order to revitalize the tourism sector and business activities after the covid-19 pandemic, reforms need to be made to attract the community to revitalize the economy in the tourism and business sectors including in the homestay program.

Concept of Innovation

The concept of innovation explains that innovation focuses on aspects of renewal and improvement. Innovation capability is an internal capability (Martínez-Román et al., 2015) that refers to the potential and ability to produce innovative products or services (Laforet, 2011). This involves the use of knowledge and ideas to produce something new in order to benefit the organization and stakeholders (Lawson & Samson, 2001).

Continuous improvement (Olsson, Wadell, Odenrick & Bergendahl, 2010) is also important by adding value to existing efforts (Hogan, Soutar, McColl-Kennedy & Sweeney, 2011).

Innovation is an important approach in the growth strategy to enter new markets in addition to improving existing markets and subsequently being competitive (Boachie-Mensah & Acquah, 2015). This approach is also in line with the economic objective which is to create innovation and difference to achieve business growth (Sundbo, 2019) as well as survive in the market (Jiménez-Jiménez & Sanz-Valle, 2011). Innovation also includes existing ideas that are reapplied or deployed in different settings for different customer groups. (Enz & Harrison, 2008).

Product Innovation

Product and service innovation is defined as something offered based on new ideas (Myers & Marquis, 1969) aimed at providing various options to customers. Innovation is also an initiative that parallels the development of current technology and global competition (Gunday et al., 2011). Kafetzopoulos and Psomas (2015) argued that product innovation is a continuous effort and has a function involving increasing different levels of efficiency inside and outside the organization.

. In the tourism industry, product, and service innovation focuses on renewal and improvements made to products and activities offered to tourists in a destination (Cosma et al. al., 2014; Nieves et al., 2014). The innovation carried out is important to increase tourist visits by offering more attractive packages (Keling & Entebang, 2017).

Marketing Innovation

Marketing innovation is the adoption of a new marketing strategy that involves significant changes in product design or packaging, product placement, product promotion, or pricing. Marketing innovations aim to better address customer needs, open up new markets, or reposition a company's product on the market, with the goal of increasing sales. (Oslo manual, Third Edition, Paris, 2005) The implementation of a marketing method not previously used by the firm distinguishes a marketing innovation from other changes in a firm's marketing instruments.

It must be part of a new marketing concept or strategy that is significantly different from the firm's current marketing methods. The new marketing method can be created by the innovating company or adopted by other companies or organizations. Both new and existing products can benefit from new marketing strategies.

Process Innovation

Process innovation is a business strategy that comprises modifying, introducing, and optimizing manufacturing. A company's needs may be better served by new services, software, and equipment that are developed and introduced as part of the creative process. Besides, process innovation is the introduction of new or significantly improved production, supply chain, and administrative processes. (Piening & Oliver Salge, 2015). The new method *"offers much-needed flexibility for accessing the public markets and is likely to encourage additional initial public offerings"* (Diamond, 2017). Innovation provides an opportunity for organizations to launch techniques and technical solutions to help businesses by reducing manufacturing costs. Innovation in

organizations widely becomes the main driver of organizational competitiveness. Therefore, innovation allows an organization to improve its product or service.

Management Innovation

The term "innovation management" is also a source of much debate. Some argue that the very definition of innovation implies that it cannot be managed, whereas others are firm believers in developing systems and processes to foster more innovation. (Jesse Nieminen, 2018). Innovation management, according to Gartner, an IT research and consulting firm, is a business discipline that aims to drive a sustainable innovation process or culture within an organization. These innovation management initiatives frequently employ a disruptive method of change to transform business.

Research Framework

The research aims to determine the performance of innovation in homestay programs, focusing on generating additional income for operators and improving the experience through innovative solutions. The research aims to improve local homestay operators' experiences and practices, resulting in knowledge installation and increased earnings for operators. Innovation can help homestay entrepreneurs expand their businesses and attract tourists to Malaysia's tourism industry.

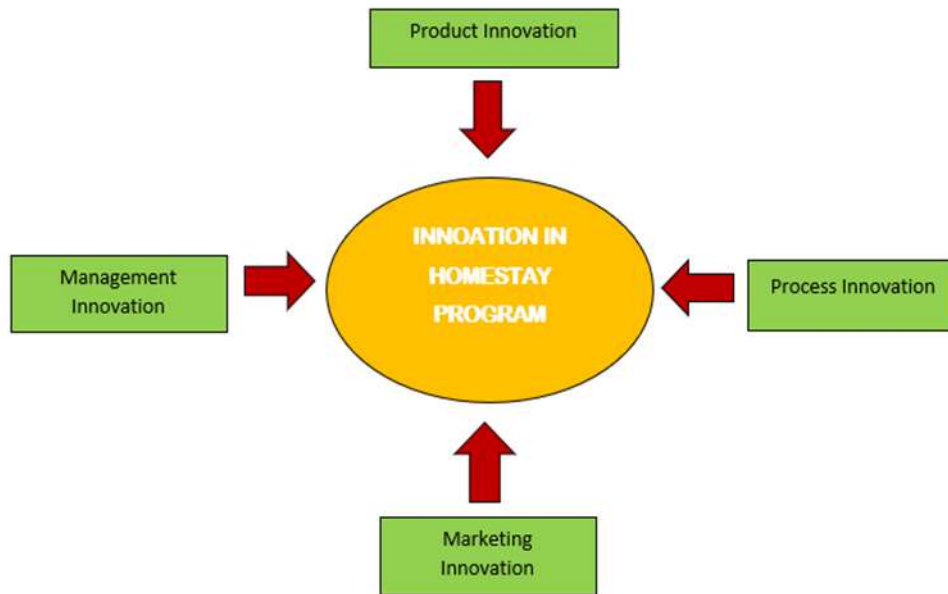

Figure 1: The Conceptual Framework

METHODOLOGY

Research Design

A qualitative approach was used through the method of semi-structured face-to-face interviews for case studies selected to get more information deep and detailed (Creswell 2014). Researchers will be in the respondent's situation in order to know the actual situation of the research issue covers the environment as well as sufficient evidence and is named as a case study (Yin 2011). There are three types of case studies: exploratory, descriptive, and explanatory.

The exploratory approach is preferred in this study, as it allows for a more detailed examination of innovation elements in homestay programs. This is in line with the recommendations of previous researchers, to answer the question of how and why innovation can happen (Sakdiyakorn & Sivarak 2016) especially in the homestay program (Hashim et al. 2015).

Data Collection

Data collections involve collecting, measuring, and analyzing insights for research using proven techniques. Primary data is original data collected for the first time, while secondary data is gathered by another source. Data collection is crucial for conducting research, starting with deciding the data needed and selecting a sample. Techniques for data collection include documentation, archival records, interviews, direct observations, participant observation, and physical artifacts. The interview method is the most appropriate research approach for this study.

Sampling

Qualitative data collection emphasizes quality over quantity, aiming to become saturated with information on a topic. It is guided by theoretical sampling, which helps determine when to stop sampling. Purposive sampling, a common method in qualitative analysis, is chosen for this study, as it provides rich information and is based on homestays registered with MOTAC in Kelantan. The study consists of three respondents, who have the best knowledge and experience regarding the research topic.

Data Analysis

Within the qualitative method, there are a variety of data analysis techniques. The available tools include content analysis, constant comparison, successive approximation, thematic analysis, domain analysis, ideal type, event structure analysis, matrices, grounded theory, and other analytical methods (Silverman, 2006). However, choosing an appropriate technique depends on many factors, including the nature of the data and the type of research question to be addressed. This study uses thematic analysis to analyze textual data, coding, and creation of themes.

FINDINGS

This paper analyzed the data obtained from the interview transcripts according to four categories of innovations. Category A involved product and service innovation; Category B which is marketing innovation; Category C was about management innovation and Category D involved process innovation as shown in Table 1.

Table 1: The result analysis of Innovation themes in Homestay Programmes.

Themes	Sub-Themes	Respondent	Discussion
Product	Small Medium Enterprise (SME)	R1: There are 10 types of foods product produce by the villagers themselves. Among them are Pekasam, salted eggs, honey baked, biscuits made form kelulut honey	This finding proves that SMEs have the potential to continue to thrive (Ahmad et al., 2017; Ismail, 2015) at the same time able to develop local community economy.
	Types of Activities	R4: Traditional game are enhanced by incorporating exploration activities. We provide 7 locations in each homestay. Tourists will play batu seremban, sepak takraw and congkak	This finding supports the study of Yusof et al., (2017) who found that the uniqueness of local food and culture can provide satisfaction for homestay program tourists.
Process	Registration	R6: “Tourists who come will go to the counter provided. So, all check-ins and check-outs happen here”.	This finding is in line with Aldebert et al. (2017) that the software used for registration can reduce costs and improve quality business.
	Food Production	R1: “What is popular now is eating in the	Sakdiyakorn & Sivarak (2016) proved that process

		village and in the river. In the village, we bring food there especially during the fruit season.”	innovation is very important to ensure products and services.
Marketing	Traditional Media	R5: “I also do promotions in my own store. Whoever comes here, I will give them a card and try to get them to visit the chalet so they can see the condition of the room for themselves.”	This result found innovation is entrepreneurs' effort in enhancing the advertising of their homestays and in line with previous findings involving homestays in Thailand (Yiamjanya, 2016)
	Print Media	R3: “Flyers are used to convey information to tourists and get an overview of our homestay.”	
Management	Infrastructure	R2: Before, we didn't have an office and it was quite difficult because all the work was done at the coordinator's house. now everything is managed in the office	This finding is an initiative to improve service quality (Cosma et al., 2014; Ronningen, 2016) in order to give comfort for tourists

Product and services innovation

This section describes product and service innovations in detail with respect to program-specific homestay changes and enhancements. According to the respondents' explanations, the goods and services offered can be divided into 3 categories such as small and medium enterprises (SMEs), types of activities, and accommodation. There are some homestays that create new packages by taking tourists to visit interesting places around the area. For example, R1 explained, *"We provide activities such as river cruises where tourists can go around, want to fish, visit the surroundings of Kuala Langat District up to Jugra. There is also an international paragliding place here"*. This effort is parallel to R3 and R5 which take tourists by bus to some interesting tourist destinations. Suffarruddin et al. (2022) and Hussin and Kunjuraman (2014) emphasize that such activities are usually able to offer natural enjoyment to tourists and are abundant in rural areas that are rich in natural resource

Process innovation

Based on respondents' descriptions, process innovation is often linked to products and services offered. Among them are reforms in terms of providing registration counters and improving methods of preparing food and transportation for tourists. Online booking was another much sought-after feature identified by the visitors which could have made their booking experience easier. Booking.com allows the homestay owner to interact directly with prospective guests and makes it easier to communicate with the guests prior-arrival and see guest reviews after staying in the homestay. For example, one of the respondents R3 and R4 said that *"We have simplified administrative affairs by providing a specific space for homestay managers..."*. This innovation is in line with Aldebert et al. (2011) and Yiamjanya (2016) that the software and system used can reduce costs and improve business quality. However, this innovation is only found in a small number of homestay programs according to their respective ideas and abilities.

Marketing Innovation

For promoting and differentiating the program, drawing in more visitors, and improving the overall guest experience, marketing innovation is used in the context of homestay programmes. Marketing innovation uses experience-based advertising and continuous improvement and guest feedback to create a marketing campaign. In this study, Most of the respondents who responded also said that the website needs to be better kept up to date to date and maintained. But some of the people who were listed on the website had already left. This finding is in line with previous findings involving homestays in Thailand (Yiamjanya, 2016).

Management innovation

The management innovations emphasize to reform and improvement of all matters relating to the administration of the homestay program. Refers to the description of the respondent, the innovation of which can be classified into three categories, namely administrative structure systematic, improvement of the information management system, and construction administrative infrastructure. The study discovered that competent people are a vital asset in a company to start a better management journey in terms of the systematic administrative structure. This result is consistent with other research that discovered this initiative is crucial for enhancing human resource management (Sakdiyakorn & Sivarak, 2016).

DISCUSSION AND RECOMMENDATION

The results of this study ought to have a substantial effect and help other homestay programs evolve in important ways. Through this initiative, the community may be exposed to innovation and development that can boost the local economy. The emphasis on innovation that has been made in the homestay program can then lead to the emergence of additional rural entrepreneurs. To accomplish this innovation, it is advised to each participant in the homestay program to be more sensitive to the surroundings that can influence invention. As a result, organizers, businesspeople, and communities are urged to emphasize the value of innovation, which calls for planning and a wide range of imaginative ideas.

CONCLUSION

This study investigated the identification of innovation elements in homestay programs. It identified several innovations that were made to the homestays involved, such as reforms and improvements, which have been well received by tourists and helped smooth the relationship between homestay operators and tourists. The findings of this study should have a large impact and contribute significantly to the efforts of other homestay programs to innovate. The findings of this study should also have a large impact and contribute significantly to the efforts of other homestay programs to innovate. Coordinators, businessmen, and communities are urged to put more emphasis on the importance of innovation, which requires preparation and a variety of creative ideas.

ABSTRACT

Globally, tourists have become more anxious to travel overseas due to increased uncertainties posed by disastrous global-scale incidents. The uncertainty crisis outbreak has significantly impacted on triggering important changes in tourism mobility and tourism. As a result, people have significantly changed their long-term traveling into near-term travel decisions. Therefore, this research aims to explore the new concept of staycation motivators by Malaysian vacationers on tourism mobility. The research employs an exploratory method with initially in-depth interviews by using a semi-structured set of questions. Data will be collected Globally; tourists have become more anxious to travel overseas due to increased uncertainties posed by disastrous global-scale incidents. The uncertainties crisis outbreak has significantly impacted on triggering important changes in tourism mobility and tourism. As a result, people have significantly changed their long-term traveling into near-term travel decisions. Therefore, this research aims to explore the new concept of staycation motivators by Malaysian vacationers on tourism mobility. The research employs an exploratory method with initially in-depth interviews by using a semi-structured set of questions. Data will be collected until it reaches saturation points. Thematic analysis will be conducted using Atlas.ti. There are seven vacationers involved as interviewees. There are four main elements in staycation concepts, which are 1) time period; 2) types of activities; 3) distance; and 4) place. The main limitation of this study is that the sample was small, but nevertheless, some interesting results were obtained.

Keywords: Crisis, Staycation, Experience, Qualitative

INTRODUCTION

Since the Covid19 outbreak in late 2019, global disruptions in global flows and mobility have led to economic loss to the tourism industry, affecting human freedom and well-being. Tourists face high risks due to health hazards and government limitations. The shutdown of numerous communities and the implementation of major restrictions on border crossings has virtually eliminated the tourism economy in communities throughout the world (Goodwin, 2020). Places, which only a few months ago were suffering from extreme problems of over-visitation (Milano et al., 2019) are presently eerily quiet (Kimmelman, 2020). This is because the tourism industry has been severely damaged due to travel being regarded as a high-risk activity. Worse still, due to the uncertainty and misleading information about epidemics in social media, tourist perceptions, and behavior changes in traveling have led to significant reductions in travel demand (Romagosa, 2020).

According to Romagosa (2020), the Covid-19 outbreak has already had a very significant impact on tourism, triggering important changes in mobility, social behavior, consumption patterns, and leisure. This is based on the proposition that the increase in social and environmental concerns

(Lew 2020) will encourage post-crisis tourists to choose destinations closer to where they live and move to travel within their area, which is called a staycation. Staycation is a new tourism trend, especially for city dwellers, because of changing lifestyles and work-life balance preferences. Staycation has become a complex cultural phenomenon and is essentially a holiday spent close to home but creating a traditional holiday environment. Being a tourist is the result of an informed decision, based essentially on the way individuals determine what they perceive as being unknown to them and how they decide to discover that context (Diaz-Soria, 2017).

Currently, some people are spending their holidays locally (Jeuring and Haartsen, 2017) and favor a staycation, where the number of staycation offers is increasing in popularity during COVID-19. Millennials are significant consumers of staycation packages, which involve staying home and participating in leisure activities within day-trip distance of their residence without overnight accommodation. This type of domestic tourism is increasingly popular due to their interest in new activities and travel. Millennials' staycation experiences during COVID-19 may differ from conventional travel experiences, as staycations involve staying at home or near home while creating the ambiance of a standard vacation (Besson, 2017).

Problem Statement

Domestic tourism has been understudied in literature, but its economic importance has been underestimated (Stylidis, Belhassen, & Shani, 2017). During Covid19, people are increasingly spending their holidays locally (Jeuring and Haartsen, 2017) and favouring staycations. This trend has become popular due to mobility constraints and border lockdowns. The staycation concept has gained attention due to the ongoing pandemic (Wong, Lin and Kou, 2021), but limited studies have considered it as a study object and potential empirical source of data.

During the Covid19 pandemic, the literature on staycation concepts has been limited (Knezevic Cvelbar & Ogorevc, 2020), raising questions about tourists' experiences, well-being, and psychological outcomes. A staycation can promote recuperation and recovery from daily exhaustion, replenishing resources, and potentially prevent severe health problems like depression, stress, trauma, and fear. However, there are limitations to staycation impact, as it has less pronounced effects on wellbeing than vacations spent outside one's usual living environment. Despite these limitations, the concept of staycation has the potential to offer recovery experiences and prevent severe health problems during this challenging time (de Bloom, Nawijn, Geurts, Kinnunen, & Korpela, 2017, p. 574).

Millennials are a significant consumer group for staycation packages (Barclays, 2019), seeking quality of life and meaningful experiences (Sethi et al., 2018). They are technologically savvy, trend-conscious, and open to trying new things. Staycations are locals who transform into domestic tourists due to their familiar surroundings but experience unique emotions, resulting in an extraordinary feeling of wonderment in their regular surroundings. Existing studies on staycations often overlook the younger consumer segment. James and colleagues (2017) study identifies four types of staycations: socialites, adventurous eaters, and culture enthusiasts. Therefore, this research aims to explore the concepts of staycation among Malaysian Millennials and drivers that push tourists to travel in the short-term period, staycation.

SIGNIFICANCE OF THE STUDY

The goal of this research is to investigate the need for a millennial staycation in the tourist business, with an emphasis on aspects such as the distance that can influence millennials' staycation,

as well as social experiences on millennials' staycation that can enhance their motivation when working. The study's focus is on millennials' opinions of staycations. For millennials, quality of life and enjoyable experiences are more important than for older generations (such as baby boomers), who prioritize their careers more. Millennials may find staycations appealing as a new norm because they are open to new experiences and trend conscious (Dabija et al., 2018; Ketter, 2020; Siegel and Wang, 2019). According to Bowen and McCain (2015) and Williams and Page (2011), millennials are also sensitive to current events and potential future developments. Millennials' behaviors are primarily influenced by actual events in their lives.

LITERATURE REVIEW

The Crisis Of Covid-19

The tourism industry has been significantly impacted by the Covid-19 pandemic due to reduced tourist flow, travel plans, unemployment, and business investment. Health outbreaks such as foot-and-mouth disease, the SARS epidemic, and the Avian Influenza pandemic have also caused a decline in demand in multiple tourism sectors (Borzyszkowski, 2013; Herbane, 2013; Calgaro, Lloyd, & Dominey-Howes, 2014). The COVID-19 pandemic has had a more devastating impact on international travel and tourism, with international arrivals plunging by 97% in April 2020 to levels not seen since the early 1990s, resulting in a more than tenfold loss of international tourism revenue (Romagosa, 2020).

Staycations have grown rapidly during the COVID-19 pandemic and have become part of the emerging customer behavior inspired by the epidemic. Several countries have started the staycation initiative to encourage visits to local destinations, such as Ireland, Iceland, Italy, Poland, Slovenia, Lithuania, South Korea, and Thailand. The tourist industry has been one of the most impacted by the Covid-19 pandemic, with an estimated RM3.37 billion between January and February 2020. Decision-making is a complex and dynamic process that is influenced by variables from both socio-psychological and non-psychological perspectives. Research is needed to understand and describe the dynamic nature of the decision itself, as it is expected to be influenced in different ways by different situations like COVID-19 and different generations.

The Concept Of Staycations

A staycation, sometimes known as a holiday or a mix of the words "stay" and "vacation," is a period when a person or family stays at home and engages in leisure activities that are easily accessible by day trip and do not necessitate overnight housing. (Sanchez-Rebull et al., 2022). By taking a holiday at home rather than abroad, the phrase has gradually evolved in British English to indicate domestic tourism. Staycation activities include using a home pool, visiting neighbourhood parks and museums, and attending fairs and theme parks. Some staycationers choose to follow a set of rules to replicate the experience of a traditional vacation. Setting a start and end date, making ahead arrangements, and avoiding routine are all examples of these rules (Wong, Lin & Kou, 2021).

The Covid-19 crisis has led to the development of proximity tourism, which is a form of domestic tourism with shorter length and proximity. A staycation is a vacation spent at or near one's home, creating a traditional holiday environment while enjoying everything that home and one's home ambiance have to offer (Rosu, 2020). According to Germann Molz (2009), staycations were represented through stillness and as 'undesirable' in the media, "a form of consumer mobility or as a failure of mobility" (p.282). In this manner, it was demonstrated how representations of mobility are constructed. Furthermore, staycation has been one of few concrete and feasible adaptations of tourism and hospitality activities factoring in the restrictions of mobility and access due to Covid-19, as against the immature recovery schemes such as the "tourism bubble," which has been nothing but disenchanting (The Strait Times, 2021).

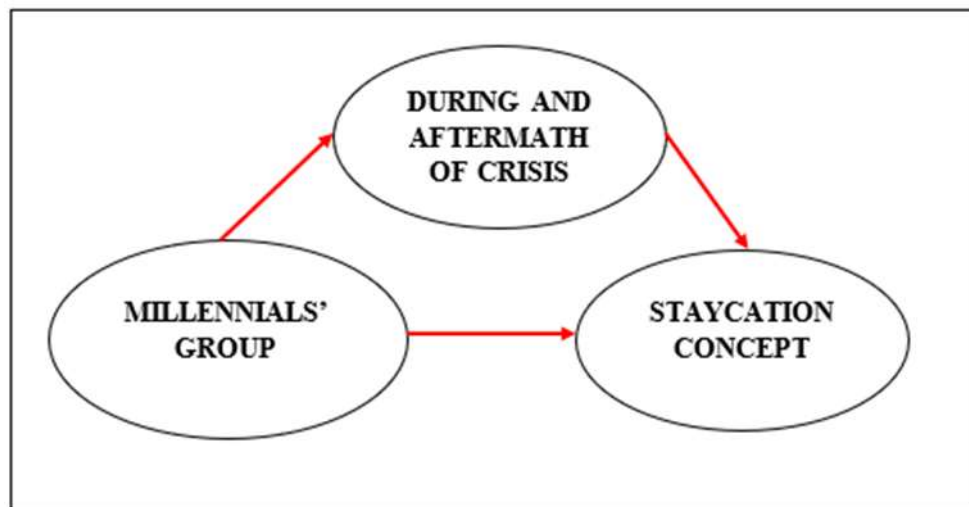

Millennials Group

Millennials, also known as Generation Y or Gen Y, are the generation in the West that comes after Generation X and before Generation Z (Saghiani, 2010). Researchers and the general public use the early 1980s as the starting birth years and the mid-1990s to early 2000s as the ending birth years when referring to the generation, which is typically defined as people born between 1981 and 1996. The millennial generation is a significant new market segment in the tourism industry. They are technologically savvy, open to trying new things, and have a lot of money to spend (Siegel and Wang, 2019). They prioritize the quality of life and meaningful life experiences and are one of the main consumers for staycation package items. Staycations are locals who transform into domestic tourists while on vacation because they are familiar with the surroundings but experience an extraordinary feeling of wonderment.

RESEARCH FRAMEWORK

A theoretical framework is a network of linkages between variables that are logical, explicable, and elaborated with respect to the issue. The association between staycations and millennials from the workplace is important to comprehend for this study. The study aims to identify the factors that cause millennials to take a staycation from the workplace, whether short or long distance affects travel for vacation, and whether the experience while on vacation can improve performance or motivation when working, as shown in Figure 2.1 below.

Figure 2.1: The conceptual framework of the staycation concept among millennials group during and aftermath of the crisis.

METHODOLOGY

Research Design

The research design involves choosing between quantitative and qualitative analysis methods. A qualitative approach summarizes phenomena based on numbers, while a quantitative approach is used to explore behavior, perspective, feelings, and experiences in real-life events. Researchers have chosen a case study as a qualitative research approach to investigate real-life events. A case study is an empirical inquiry that investigates a contemporary phenomenon within its natural context. There are three types of case studies: exploratory, descriptive, and explanatory.

The exploratory approach is preferred in this study, as it focuses on the potential of staycations among Millennials as a preferred travel choice during and after the COVID-19 pandemic. The case study's focus on examining the potential of staycations among Millennials as a preferred travel choice is relevant to this study.

Data Collection

Data collections are the process of collecting, measuring, and analyzing research insights using proven techniques. They can be divided into primary and secondary data, with primary data being the original data collected for research purposes, and secondary data being data gathered by another source. Data collection is a critical stage in conducting research, starting with deciding the type of data needed and selecting a sample from a specific population. For case study approaches, various techniques are used, including documentation, archival records, interviews, direct observations, participant observation, and physical artifacts. Data collection aims to achieve research objectives and answer questions, with the interview method being the most appropriate research approach for this study.

Research questions	Research approach	Respondents
1. What are the concepts of staycation used among Millennials?	Semi-structured interview	Millennial's people
2. What are the drivers that push Millennials to make staycation?		
3. Can staycation be one travel choice made during and in the aftermath of the Covid19?		

Table 3.1: Questionnaire exploring the potential of staycation as one preferred destination to travel during and aftermath of the covid-19.

Sampling

Purposive sampling, a common method in qualitative analysis, is chosen for this study, as it aims to select informants with the best knowledge and experience regarding the research topic. The sample size for this study is based on millennials in Malaysia, with a focus on age (born between 1981-1994) and professional type (lecturers). The sample size is among millennial groups in Kelantan.

DATA ANALYSIS

Within the qualitative method, there are a variety of data analysis techniques from which to choose (Creswell, 2011; Patton, 2015). The available tools include content analysis, constant comparison, successive approximation, thematic analysis, domain analysis, ideal type, event structure analysis, matrices, grounded theory, and other analytical methods (Silverman, 2006). However, choosing an appropriate technique depends on many factors, including the nature of the data and the type of research questions to be addressed.

Normally researcher frequently uses content analysis and thematic analysis. The content analysis uses a descriptive approach in both coding of the data and its interpretation of quantitative counts of the codes (Hsieh & Shannon, 2005). Conversely, the thematic analysis provides a purely qualitative, detailed, and nuanced account of the data (Braun & Clarke, 2006). However, both of these analyses are sets of techniques and systematic processes to analyze textual data, coding, and creation of theme (Forman, Creswell, Damschroder, Kowalski, & Krein, 2008; Vaismoradi, Jones, Turunen, & Snelgrove, 2016). For the purpose of the study **thematic analysis** was used to analyze the qualitative data analysis.

FINDINGS

Respondents were asked about their understanding of the concepts of staycations and the purposed of staycation. Most respondents expressed a positive reaction to staycation, as it is essential in everyday life and has both positive and negative effects.

The Concept Of The Staycation Among Millennial Groups In Malaysia

After seven interviews, four themes were identified: duration, type of activity (leisure activities and visiting family), place (hotel or resort), and distance (near to home). Most respondents understood the concept, with the duration being a short period, the type of activity being leisure activities, the place being a hotel or resort, and the distance being near to home.

Table 4.2 shows the summary of the result analysis.

Theme	Sub Theme	Example Of Responses
1. Duration	Short Period	R1: "A person who leaves home to go somewhere with a purpose in a short period of time." R3: "... a staycation can be defined is a short stay or less than three days."
2. Type Activity	Leisure Activity	R2: "Independence Day celebrations, went camping, and even participated in a concert"

	Visiting Family	R3: “Visiting parents and relatives, traveling to new places, and trying new foods.” R4: The purpose for a staycation is to visit family, and spend time with family”
3. Place	Hotel or resort	R3: “every time they visit their parents, usually opting for a 2-day 1-night or 3-day 2-night stay at a hotel.” R1:” Resorts and pools with beaches.”
4. Distance	Nearby from Home	R3: “The respondent's staycation location is to visit family but stay at a hotel or homestay for privacy because of their kids”

According to table 4.2, there were four main themes to explain the concepts of staycation among respondents. This study found a staycation can be referred to “*the activity of making a vacation out of staying at home*” (Sharma, 2009) and the new term was first used by Massey (2003). In general, the concept of a staycation refers to traveling to destinations closer to home within the context of tourism.

TYPES OF PLACES FOR STAYCATION

Diagram 4.1: Types of places for a staycation

The chart above depicts several types of destinations for staycation, which is an overview provided by multiple responders. The chart depicts the numerous locales that are suited for their staycation lodging. The described location is divided into two parts, the east coast, and the outside east. Based on their tastes and interests, responders can enjoy a wide range of venues in this situation.

According to the graphic, many respondents choose to spend their staycation somewhere other than the East Coast. This is owing to a number of external attractions located outside of the East Coast.

For example, R2 and R6 identified Kuala Lumpur as their ideal destination for a staycation, and R5 mentioned Penang as one of the intriguing places to visit. While R3 and R1 chose a location outside of Kelantan to see their families in their homeland and look for a beachfront hotel resort. This finding is supported by Rosu (2020) that found the length of a staycation is often short, as it mostly pertains to excursions within driving distance from home. Rosu (2020) interpreted that staycation as a temporary vacation spent at home or in one's hometown.

PURPOSE OF STAYCATION

Table 4.3 shows the purpose of a staycation.

Purpose Of Staycation	Percentage (%)
➤ Spend time with family.	45%
➤ Release stress	30%
➤ Lifestyle	25%

Most of the respondents explained their purpose of staycation. For instance, R1 explained based on her experience, *“Staycation is to release stress, spend time with family, and find resorts and pools with beaches”*. R2 said.

“She is a married couple (Long Distance Learning). They plan to go on vacation together during holidays to spend quality time with their family...”

In terms of releasing their stress, R4 stated that *“staycation can release stress from work and wants to spend time with the family, looking for a 'viral' food port is also a cause for a staycation and finally the children also influence for staycation”*. R5 stated that *“He makes a staycation to desire to unwind after a long day of work, relax, lose their desire to work, shop, and find tasty cuisine”*. This finding of the staycation purpose is supported by Pawłowska-Legwand and Matoga (2016) that found a staycation is a new tourism trend, especially for city dwellers, because of changing lifestyle and work-life balance preferences. People might tend to avoid spending much time planning and waiting all year for a vacation, which makes them feel fatigued and focus on it with great expectations.

IMPACT OF CRISIS ON A STAYCATION

Figure 4.2: Impact of crisis on staycation

The graphic above depicts the impact of the crisis on staycation, it is apparent that daily living has an impact on the crisis. This is due to the fact that staycation has had a big impact since the crisis. Staycations, spent at home or in one's local neighborhood, have become a popular option for people wishing to get away from their routine without traveling far. This circumstance is demonstrated by the responses given to two groups, namely "natural and yes.

LEVEL STRESS BEFORE AND AFTER STAYCATION

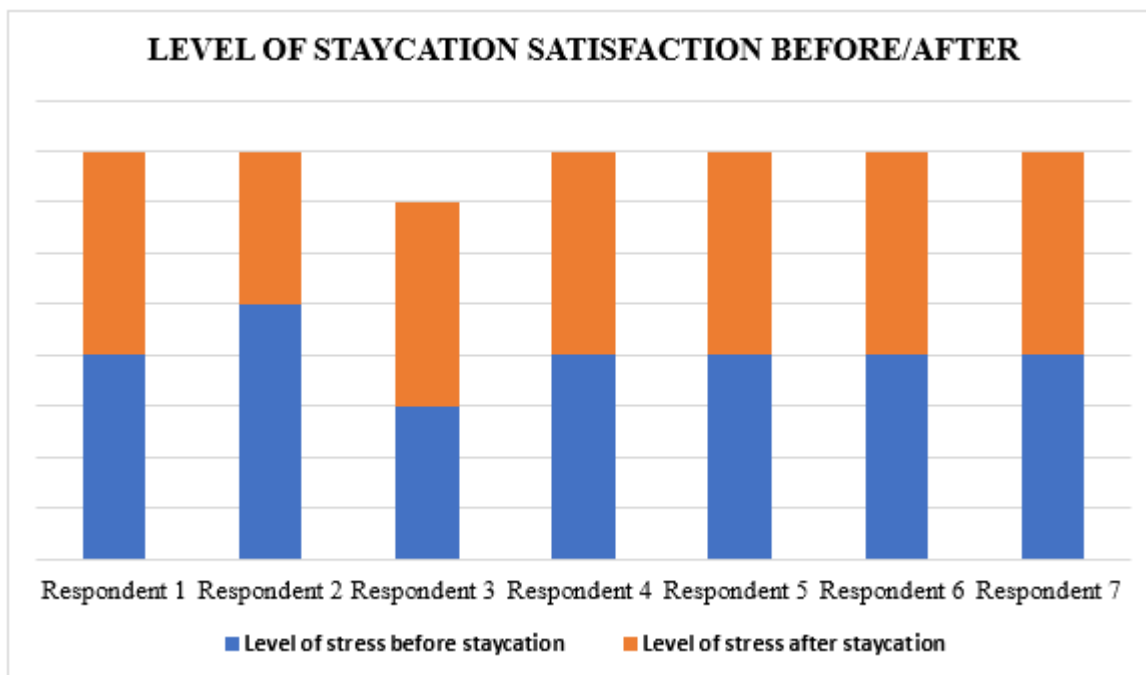

Figure 4.1: Level of staycation satisfaction before and after the crisis

DISCUSSION AND RECOMMENDATION

Discussion

Tourist well-being is influenced by the concept of staycation, which promotes recuperation and recovery from daily exhaustion. Staycations can help prevent severe health problems like depression, stress, trauma, and fear during the pandemic. Factors influencing Millennials' decision to staycation include stress relief, family time, and lifestyle changes. Staycation, a term used by Millennials, refers to leisure activities within driving distance of home, without overnight accommodation. This trend is popular among tech-savvy individuals who are more likely to try new things and travel. This finding result is supported by Pawłowska-Legwand and Matoga (2016), a staycation is a new tourism trend, especially for city dwellers, because of changing lifestyle and work-life balance preferences. Staycations are often shared with friends and family through social media platforms like Instagram, allowing them to experience the local area as a tourist without the time and expense associated with long-distance travel.

Staycation has become a popular trend during the Covid-19 pandemic, with studies showing short durations, leisure activities, and a focus on places. This trend has been particularly popular among city dwellers due to changing lifestyles and work-life balance preferences. The pandemic has imposed travel restrictions, forcing tourists to choose nearby destinations and avoid crowded places. Staycation has become a viable adaptation of tourism and hospitality activities, addressing mobility and access restrictions, and addressing immature recovery schemes like the "tourism bubble." "Millennials' staycation experiences during COVID-19 may differ from traditional travelers, as they explore local hotels and attractions in a restricted setting. This can lead to a shift in social circle behavior, as they assume the role of tourists exploring the neighbourhood. The pandemic has impacted millennials' decision to have a staycation, as the increased stress levels and lack of travel opportunities have led to a higher desire to release stress through staycations.

Recommendation

Staycations have become increasingly popular as an alternative to typical holidays, particularly in the aftermath of the COVID-19 pandemic. However, particularly in the academic environment, there is still a considerable gap in academic research on the consequences and outcomes of staycations. Qualitative research can help future researchers investigate the aspects and dimensions of staycation experiences. Through in-depth interviews, focus groups, and observation, researchers can collect extensive, nuanced data on the elements that contribute to tourist happiness during staycations. They can look into the several parts that constitute the staycation concept, such as relaxation, local discovery, cultural immersion, and tailored experiences. Using qualitative approaches, researchers can dive into the subjective impressions, motives, and actions of staycationers, providing significant insights into their preferences and expectations.

After qualitative research has identified the important features of staycation experiences, quantitative research can be done to evaluate these factors and analyze their impact on tourist satisfaction. Surveys and questionnaires can be used by researchers to obtain quantitative data on a broader scale, allowing them to quantify and examine the correlations between different factors. Researchers, for example, can investigate the effect of hotel quality, proximity to attractions, leisure activity availability, and affordability on tourist satisfaction during staycations. By combining qualitative and quantitative methodologies, researchers can acquire a more thorough and solid knowledge of staycations.

While quantitative research allows for statistical analysis and variable measurement and provides empirical support for the conclusions, qualitative research dives into the components and dimensions of staycation experiences. By presenting a more comprehensive understanding of staycations, this mixed-methods approach can assist destination managers, policymakers, and stakeholders in designing and promoting fun and fulfilling staycation experiences.

CONCLUSION

To conclude, considering a staycation is defined as "a vacation in which the vacationer stays at home, or near home while creating the ambiance of a standard vacation" in this section, millennials' staycation experiences at COVID-19 may differ from those of traditional travellers. A person on a staycation explores the local hotel's physical surroundings and visits nearby attractions rather than traveling to another region. Millennials' decisions to have a staycation are impacted by several circumstances or reasons, especially during the pandemic.

ABSTRACT

A short vacation usually refers to a short period spent away from home or work for leisure or recreation. It is a relatively short break or vacation, usually between a few days to a week, created to provide relaxation, tranquillity, and freedom. A short vacation can take many forms depending on individual preferences and circumstances. A short vacation offers an opportunity to disconnect from work-related stress. By taking leave, lecturers can stay away from work for a while to avoid work pressure. Based on the topic, we studied the effect of a short vacation on the stress level of lectures, especially lectures that teach in the field of tourism related. Therefore, this study aims to investigate the impact of short vacations on work stress among tourism lecturers. The research uses a semi-structured set of questions and an exploratory methodology, starting with in-depth interviews. When it reaches saturation points, data is collected. Thematic analysis is a technique for data analysis based on themes that appear in interviews, and it will be used for these types of interviews. Any number of formats, including transcripts from interviews, field notes, policy documents, images, and videos, could be used to represent the data that is being analyzed. Consequently, the main drawback of this study is the limited sample size, however impressive results were ultimately attained.

Keywords: Short Vacation, Lecturers, Stress, Destination, Workplace, Education.

INTRODUCTION

Globally the 21st-century workplace is a dynamic, complex, fast-paced highly challenging environment. Given the increasingly global character of the service industry and the competitiveness of the knowledge era, critical actors such as university professors are frequently under pressure. While moderate stress might improve performance, excessive stress can have harmful implications (Usoro, 2018). The functions of lecturers across the world are to produce ideas, improve human resource capability, and provide services.

Lecturers play a critical role in higher education since they represent their schools and determine the quality of instruction and learning. Furthermore, professors organize and convey to university students their specialized subject matter. This involves producing tutorials, marking assignments, and providing educational materials, instead of direct teaching. Also, they attend conferences as part of their study and publish books, articles, and other materials to convey their expertise. According to Tan (2019), the duty of a lecturer follows, which includes meeting with students individually to discuss progress, inspecting and assessing students' work, doing research, and interviewing students. Tan (2019) describes the role of a lecturer as "meeting students individually to discuss progress, checking and assessing students' work, pursuing research, out administration, such as attending faculty meetings and writing reports, planning to teach, and so on.

The word *workplace* refers to the physical location or environment in which individuals perform their jobs or work-related activities (Bhui, 2016). It is the context in which employees do their job tasks, engage with co-workers, and contribute to the organization's goals and objectives. Workplaces can differ significantly based on the sector, organization, and job type. They can include places like offices, factories, retail stores, hospitals, schools, and construction projects. In recent years, the definition of a workplace has broadened to encompass virtual or remote work settings in which workers may work from home or any other location by utilizing digital technology and online communication tools.

Work stress is defined as the physical, emotional, and mental strain that people suffer because of work-related pressures and responsibilities. It happens when a person's ability to cope with the demands of the work is exceeded, resulting in emotions of overwhelm, tiredness, and discontent (Hogan et al., 2022). While some degree of workplace stress is natural, prolonged, or severe workplace stress can have negative impacts on both physical and mental well-being. It can lead to burnout, exhaustion, lower productivity, and a range of health problems. Employers like lecturers also have a role to play in managing and reducing work stress by promoting a supportive work

environment, providing resources for stress management, fostering work-life balance, and addressing factors that contribute to stress. Employers like lecturers also have a role to play in managing and reducing work stress by promoting a supportive work environment, providing resources for stress management, fostering work-life balance, and addressing factors that contribute to stress.

A *short vacation* refers to a short period of time in which individuals take a break from their normal routines and responsibilities. Unlike longer vacations that may span several weeks or months, short vacations are usually shorter in duration, ranging from a few days to a week. They offer an opportunity to escape from the demands of work or study, rest and recharge. Individuals can choose to go on a short vacation alone, with a partner, family or friends. A short vacation can take many forms, depending on personal preferences and interests. Because of their shorter duration, short vacations are often more feasible and easier to plan than longer vacations. It can be scheduled during weekends, public holidays or times when individuals have several days off from work or school in a row. This makes short vacations a convenient option for individuals who may have limited downtime or find it difficult to be outside for extended periods (Abu Bakar, 2020). This job pressure might have an impact on their productivity. Teaching, publishing, and community service are all examples of occupations. This issue may be resolved in the future if people see the value of brief vacations in providing lecturers with new energy and happiness, allowing them to build a more educated and creative teaching force for the following phase of lectures.

Therefore, a short vacation provides a valuable opportunity to temporarily step away from the demands of everyday life and enjoy leisure, exploration, and self-care. This study aims to explore the relationship between short vacations and job stress.

Research Objectives:

1. To identify the factors that encourage lecturers to take vacations.
2. To study the role of short vacations among lecturers.
3. To explore the potential of a short vacation to reduce work stress among lecturers.
4. To identify whether a short vacation is effective in relieving stress among lecturers.

SIGNIFICANCE OF THE STUDY

Education is also characterised by a developing educational style. When developing workplace interventions, the conceptualization of work stress is absolutely essential. Work-related stress has been

defined as "a harmful reaction that humans have to undue stress and pressure at work." (Bhui K, 2016). Almost everyone tends to agree that job stress is caused by the communication between the worker and the working conditions. The next research goal is to raise awareness of short vacations in order to minimize workplace stress among lecturers. Short vacations may help and benefit employees in a variety of ways, including enhancing mindfulness and improving health.

Short vacations for lecturers in the field of tourism offer many benefits that positively impact personal and professional life. It is important for lecturers to prioritize self-care, engage in activities that inspire them, and seek opportunities for growth. By investing in short vacations in tourism, educators can improve their well-being, and teaching effectiveness and ultimately provide their students with a more enriched and diverse educational experience.

The findings of the study reveal some significant pressures faced by lecturers. These stressors include heavy workloads, long working hours, lack of job security, limited opportunities for career advancement, and difficulty balancing work and personal life. Overall, this study contributes to raising awareness of the work pressures faced by lecturer faculty members and policies aimed at improving their well-being and job satisfaction in higher education environments.

LITERATURE REVIEW

The Concept of Stress

This literature review aims to review the relevant literature and research related to work stress and a short vacation. First, discuss the concept of stress. Stress is a response to anything that requires our focus or action. Any amount of experience is common. However, our general well-being is significantly impacted by how we handle stress. 2019 (MyBib Contributors, 2019).

The Challenges of Higher Education during The Crisis

The second is higher education challenges during the crisis, the novel coronavirus illness 2019 (COVID-19) spread to other nations in early 2020 after the first cases were reported in Wuhan, China, in December 2019. As a result, universities around the world either canceled all on-campus events like conferences, workshops, sports, and other events or quickly converted many courses and

programme from a traditional classroom setting to an online one. In order to prevent the virus from spreading in academic settings, the Ministry of Education needs to be able to confirm that all professors are engaged in online teaching and learning.

The Concept of a Short Vacation

The third is about the concept of a short vacation. Short vacations are typically less than seven days. Short vacations are more common than long vacations. Long breaks are only available once or twice a year, whereas short vacations can be taken on weekends, extended weekends, and other public holidays combined with weekends day.

The Relationship between Short Vacation and Stress Release

The fourth is about the relationship between short vacations and stress release. Research shows that a good vacation can lead to the experience of fewer stressful days at least five weeks later. This is to say, vacations are a gift that never ends (Scott, 2020). Four-day long weekends or short vacations improved well-being, recovery, tension, and perceived stress for up to 45 days.

Research Conceptual

Figure 1.0: The concept of work stress and short vacation as a reaction.

METHODOLOGY

Research Design

The research design used for collecting data in this study is the interview method to collect all the data to meet the qualitative study requirements. This method is used for researchers to focus on a specific question, and ethically. So, this method's answer is more likely to be valid, thrust-worthy, and useful for the research result by only consuming less time and cost. The qualitative approach is a technique for understanding an individual's ideas, feelings, views, and the causes underlying these emotions. It is used to gather precise and exhaustive information on a certain subject. The data is

being gathered to examine the impact of a brief vacation on job stress reduction among tourism lecturers. As a result, we use the inductive technique in this research.

Data Collection

The data procedure in this qualitative approach study is an interview. This procedure aids in the data collection of more exact data for the research’s few phases that must be accomplished. This procedure aids in the collection of more accurate data throughout the inquiry. The next step in data collection is to gather measurements. The interviews are just for lecturers at UMK Campus Kota. Five lecturers from Faculty Hospitality, Tourism, and Wellness (FHPK) are targeted in this study. This simplifies obtain in gain more precise information about the advantages and significance of brief vacations for lecturers. Following the collection of all data, it will be measured to identify the best and most accurate data. Interviews are then utilized to determine whether most lecturers say the same thing in response to each question asked by the researcher. If the researcher gets enough same answers from the interview, then the interview will end.

Table 3.1: Research question for exploring the potential of staycation as one prefers a destination to travel to during and in aftermath of the covid-19.

Research questions	Research approach	Respondents
1. What are the key factors that encourage lecturers to take short vacations	Semi-structured interview	Lecturers
2. How can a short vacation help relieve lecturer stress?		

3. How can the staycation be one preferred travel choice during and in the aftermath of the Covid19?		
--	--	--

Sampling

This research are using the purposive sampling method to obtain the data from this interview. The purpose of this study and its case studies is to investigate the possibility of short vacations as a preferred location for lecturers to relieve job stress. With that, we'll select five tourism instructors from the Faculty of Hospitality, Tourism, and Wellness at the University Malaysia Kelantan campus Kota in Pengkalan Chepa, Kelantan. The respondents are lecturers in the Faculty of Hospitality, Tourism, and Wellness, and the sample will be drawn from 5 lecturers who teach tourism courses and occupy diverse positions in the university. These five lecturers will take this sample to demonstrate the data pointed in this research.

Data Analysis

There are many different data analysis techniques available within the qualitative method. The tools at hand include event structure analysis, thematic analysis, domain analysis, constant comparison, successive approximation, matrices, grounded theory, and other analytical techniques (Silverman, 2006). So, in this research, the researcher uses the thematic analysis technique under the qualitative data for Looking through a data set to uncover, analyse, and document reoccurring themes. It is a technique for describing data, but it also includes interpretation when identifying patterns as well as creating themes. One of theme analysis's distinctive features is its ability to be used within a wide range of theoretical and epistemological frameworks, as well as to be applied to a wide range of research topics, designs, and sample sizes.

FINDINGS

Based on the investigation carried out during the interview, the following findings are drawn. A group of instructors from the Faculty of Hospitality, Tourism, and Wellness who hold various positions in tourism-related fields makes up the responder. In this study, we discovered that lectures require a little break to relieve work stress.

The objective of the research is to determine whether lecturers would prefer brief vacations as a way to decompress from their jobs. Determining the characteristics that motivate lecturers to take a vacation is one of the study's specific goals. To investigate lecturers' approach to short vacations. Lecturers might spend time to contemplate and reflect during their short holidays. They might take a break from their regular activities to assess their career goals and make future plans.

Other than that, to look into the viability of a short break to reduce lecturers' stress from work. Lecturers can temporarily escape their employment obligations by taking a short vacation. They are able to emotionally and physically detach from the demands and stress of their work during this time away.

RESULT ANALYSIS

Table 4.2: Summary of result analysis

<i>THEMES</i>	<i>SUB-THEMES</i>	<i>EXAMPLE OF RESPONSES</i>
A LOT OF TASKS	INSUFFICIENT TIME	R2 - "Insufficient time or time limits make it difficult to finish every task because lecturers also conduct research, provide community activities, and more."

	MANY JOBS TO BE DONE	R1 - "Too many tasks need to be finished, which is the main issue. It can be challenging when administration requires more other work than teaching."
APPLICATION OF NEW SYSTEM	A NEW SYSTEM	R3 - "The issue is present in numerous systems, including e-learning, e-campus, and others. The best course of action is to become familiar with the systems, then ask friends for help and learn how to utilize the application."
	JOB CONSTRAINTS	R6 "There is pressure, as well as the workload of working as a lecturer."
PERSONAL MATTERS	UNBALANCE LIFE	R5- "The difficulty encountered is that it is hard to divide time between life and work; the stress grows as a result of our inability to divide time. When several problems cannot be resolved, there will be many conflicts with others, which may cause an impact on a person's mind-set."
		R6- "Work contributes to stress because of a heavy schedule and the need to handle personal concerns while working"

Impact of Short Vacation on Reduce Stress Towards Lecturers

Figure 4.3 shows the bar chart percentage result on the impact of short vacations on reducing stress among tourism lecturers.

The bar chart above the top illustrates how taking a short vacation helped tourism lecturers feel less stressed after returning from their trip. This is because short vacations have a significant influence on helping lecturers lower their working stress. This can be determined from the percentage, which reveals that 70% of respondents agree that short vacations can help them reduce stress, whereas 30% stated the contrary, short vacations cannot help them to reduce their stress because of certain reasons and this is including the different experiences during their vacation, which not meet their expectation and needs as well as a lack of time to spend more time on short vacations because of management-assigned tasks.

LEVEL OF STRESS AMONG LECTURERS BEFORE AND AFTER A SHORT VACATION

Figure 4.1: Level of stress before and after of short vacation.

DISCUSSION AND RECOMMENDATION

Discussion

Stress-related factors affecting lecturers' jobs, this part exemplifies the primary difficulty of the lecturers' work. Based on the data examined, this study's three primary themes—a lot of chores, trouble adjusting to new systems, and problems with personal matters—were identified. This research is aligned that Stress can be divided into chronic and acute. Given the differences between acute and chronic stressors, they may differ in their relations with individual strains and performance (Omair et al., 2019). The term "short vacation" describes a brief length of time spent away from home or a job for leisure or enjoyment. It is a short vacation or break, typically lasting a few days to a week, designed to promote rest, tranquility, and freedom.

As to solve the problem short vacation is known as one of the alternatives that can help these lecturers to reduce their stress, as short vacations known as one to four-day intervals are considered short vacations. The unreliable source was cited. Every employee finds it simple to take time off from work. Short trips are ideal for younger people or workaholics because they allow personnel to get away from high-stress jobs or from boredom so they can return to work after a few days of rest with renewed strength.

Vacations planned over the weekend or extended weekends are the exclusive focus of short vacations. Individuals can take a break from their normal routine during this time to quickly get over their fatigue by engaging in activities that can help to settle their minds, such as taking in the scenery or engaging in physical activity. Other than that, by taking a short vacation as an alternative for lecturers they can socialize, laugh, travel, engage in pleasant hobbies, engage in physical activity, and get enough sleep are just a few of the leisure activities that can reduce personal stress and come back stronger and fresher into the learning environment.

Recommendation

The subsequent suggestions are given regarding this component of the recommendation in considering the work conducted during this study as well as the findings that have already been provided. The present investigation may be viewed as a first step in the examination of how brief vacations reduce the stress of lecturers. However, the results of this study should be regarded cautiously due to the small number of participants and the absence of information regarding the subject's demographics.

Further studies ought to concentrate further on how much stress undergraduates experience and how family vacations might help them rest. On top of that, depending on physiological and human aspects, it might increase the comprehension of the optimum location to go while under stress. The investigation also discovered that many faculty members did not have adequate vacation time since they had several or diverse tasks to complete and were unable to conduct lengthy interviews. Thus, it is advised that higher-ups convey to the lecturers a specified holiday or period of time so they may complete the assignment, spend time with family, and continue onward.

CONCLUSION

Numerous short vacations, according to research, lead to greater and longer-lasting happiness. These results are consistent with the Broaden-and-Build Theory's premise that happy vacation experiences may increase a person's ability for stress management. One quick getaway can improve well-being and help individuals to decompress from stress.

To sum up, this study demonstrates that managing the investigation by identifying the work-stress elements among educators before and after when the short vacation and the varied types of stress in each lecturer. And both on an internal and external level, this can have a significant impact. For instance, a short vacation might relieve tension in lecturers, enabling them to instruct students more effectively because they are

still feeling the benefits of their most recent holiday. In the end, this study highlighted and clearly claimed that lecturers are able to benefit their self of peace by taking short vacations.

ABSTRACT

This study aims to explore the influence of memorable eco-tourism experiences on the behavioral intentions of tourists who have taken train trips to Dabong, Kelantan. Using a quantitative research approach, an online survey will be administered to 384 respondents who have visited this region in Malaysia. The results reveal that hedonism, novelty, meaningfulness, and knowledge are positively associated with tourists' behavioral intentions. This research stands out as the first investigation of memorable eco-tourism experiences towards ecotourism destination in Kelantan. The implications of this study are significant as it offers valuable insights to tour operators and tourism marketers on how to create and promote memorable eco-tourism experiences, ultimately enhancing tourist satisfaction.

Keywords: Ecotourism, Memorable Tourism Experiences, Behavioral Intention, Tourist Satisfaction

INTRODUCTION

After the pandemic, the 'Train to Dabong' trip has gained nationwide popularity as people seize the opportunity to explore Malaysia's hidden gems (Berita Harian, 2022). Dabong, a charming village in Kelantan, has become renowned for its natural wonders, including waterfalls and caves. However, beneath its scenic beauty lies a significant issue. Dabong struggles with marketing its services and products compared to other ecotourism destinations, making it difficult for tourists to find relevant travel packages online. This is evident from the limited selection of only six packages offered by local tour operators on the Expedia.com website (2022). Additionally, Dabong lacks diverse activities, experiences, and accommodations, which hampers tourist engagement in the area.

Table 1.1: Number of tourist arrivals at Malaysia's ecotourism destinations (2021)

Number of tourist arrivals at Malaysia's ecotourism destinations (2021)			
Dabong (Kelantan)	Cameron Highland (Pahang)	Hulu Langat (Selangor)	Kinabalu Park (Sabah)
50 000	790 024	344 027	269 819

Source: Statistic Tourist Arrival in Malaysia (2021)

These limitations are reflected in the number of tourists visiting Dabong (Table 1.1), which is lower compared to other popular ecotourism destinations like Cameron Highlands and Kinabatangan. To address this situation, immediate action is required. Destination Management Organizations (DMOs) or authorities in Dabong must prioritize promoting and expanding the range of engaging activities available to enhance the visitor experience. Such improvements have the potential to increase tourist

arrivals and encourage repeat visits to Dabong. This, in turn, would boost profits and position Dabong as a formidable competitor among ecotourism destinations. Moreover, ecotourism can stimulate economic development, enhance social welfare, and contribute to the preservation of natural environments and cultural heritage through awareness creation (Manu et al., 2012).

To effectively market and promote Dabong's destination qualities, destination managers must highlight the unique aspects of memorable tourism experiences (MTEs) alongside offering such experiences on-site. This involves effectively showcasing various local tourist programs, a diverse range of activities, notable tourism infrastructure, and the warm hospitality of local residents in commercials and promotional materials. Research on MTEs supports the notion that novel experiences are better remembered (Kim, Hallab, et al., 2012; Kim, Ritchie, et al., 2012), and experiencing something new, unique, or different enhances the memory of the travel experience (Kim, 2010; Kim, Hallab, et al., 2012; Kim, Ritchie, et al., 2012). Tung and Ritchie (2011) further emphasize the crucial role of destination managers in facilitating an environment that allows tourists to create their own MTEs.

Despite the significance of MTEs in destination positioning, studies on MTEs in ecotourism destinations remain limited. Currently, research has primarily focused on MTEs in areas such as cultural tourism (Siamak, Michael & S. Mostafa, 2019), urban tourism (Chao et al., 2019), museums (Islam et al., 2020), and heritage destinations (Mostafa et al., 2021). Therefore, this study aims to investigate the impact of MTEs on behavioral intentions in the context of ecotourism destinations in Dabong, Kelantan.

There are four objectives of this research and there are:

1. To examine the relationship between hedonism on behavioral intention.
2. To examine the relationship between novelty seeking on behavioral intention.
3. To examine the relationship between tourist meaningfulness experience on behavioral intention.
4. To examine the relationship between tourist knowledge on behavioral intention.

SIGNIFICANT OF STUDY

Practical perspective

The practical significance of this study lies in its potential to provide valuable insights and practical implications for tour operators and tourism marketers. By examining the influence of memorable ecotourism experiences on tourists' behavioral intentions in Dabong, Kelantan, this research offers practical guidance for creating and promoting impactful eco-tourism experiences. The findings highlight the importance of factors such as hedonism, novelty, meaningfulness, and knowledge in shaping tourists' intentions. Armed with this knowledge, tour operators and tourism marketers can strategically design and market eco-tourism experiences that resonate with visitors, thereby enhancing their satisfaction. Ultimately, the study's practical significance lies in its ability to inform and guide industry professionals in their efforts to create memorable and impactful eco-tourism experiences in Dabong, Kelantan, leading to increased visitor satisfaction and potentially boosting the local tourism industry.

Academic perspective

The academic significance of this study is twofold. Firstly, it contributes to the existing body of knowledge by being the first investigation to specifically explore the influence of memorable ecotourism experiences on behavioral intentions within the context of an ecotourism destination in

Kelantan. By focusing on Dabong, the study expands the understanding of how eco-tourism experiences can impact tourists' intentions and sheds light on the unique dynamics and factors at play in this particular destination. Secondly, this study extends to the broader field of tourism research by investigating the factors that drive tourists' behavioral intentions in the context of eco-tourism experiences, the study adds to the theoretical understanding of tourist behavior and decision-making processes. The findings provide valuable insights into the importance of hedonism, novelty, meaningfulness, and knowledge in shaping tourists' intentions, thereby enriching the existing body of knowledge on tourist motivations and preferences.

LITERATURE REVIEW

Hedonism

Hedonism was described by Kim et al. (2010) as "pleasurable sentiments that stimulate oneself in terms of travel experiences. According to Mannell and Kleiber (1997), hedonism is the pursuit of pleasure. It is an essential component of recreational activities. Hedonism can also be enjoyed while travelling (Xie, 2005). The level of hedonism consumers experience is likely to have an impact on how valuable they believe a product or service to be (Coudounaris & Sthapit, 2017). According to Tung and Ritchie (2011), positive emotions and sensations connected with travel experiences, such as pleasure and enjoyment, were essential to MTE. Kim (2014) also investigated how essential hedonism is to the characteristics of MTE destinations. People seek enjoyment (i.e. pleasure/hedonism) when "consuming" tourist things or experiences, in contrast to other products and activities (Holbrook & Hirschman, 1982).

Novelty

Novelty signifies the property of being new and uncommon, something not experienced before. Novelty seeking is a key driving force behind travel and has been linked to the likelihood that satisfied tourists will not return to the same location. (Kim & Kim, 2015). Since people wish to have an experience that contrasts with their previous experiences, tourists are more likely to choose novel and unusual activities than they would otherwise (Bigné et al, 2009). Numerous research have shown that there is a correlation between the appeal of travel places and travellers' desire for novelty. (Kassean and Gassita, 2013). Additionally, researchers have noted that novelty-seeking has a favourable effect on visitor pleasure (Assaker et al, 2011,.) When an encounter deviates from a visitor's expectations, novel tourism experiences are characterised (Ma et al, 2013).

Meaningfulness

A sense of high value, significance, or an expansion of one's perspective on life and society are all examples of what is meant by meaning (Uriley, 2005). According to earlier studies, the meaningfulness dimension includes thinking about one's significance when travelling or learning about oneself. This dimension is linked to traveler's propensity to look for enriching encounters that contribute to their personal development. Travel is a common experience that many people perceive to be beneficial for themselves discovery (Tung and Ritchie, 2011). Tourists who participate in tourism-related events and buy local goods may discover a chance to gain insight into various viewpoints on relevant issues. These pursuits may enhance one's psychological health and well-being, enabling vacationers to express individuality and discover new locations and cultures (Kim et al., 2012). Meaningfulness can encourage the personal development and transformation of the traveller; when returning home, daily life may be viewed from a new perspective, and the lessons learned may be applied to everyday life (Tarssanen, 2007).

Knowledge

Knowledge (the educational component of the travel experience) is connected to gaining new knowledge and abilities (Kim, 2016; Kim & Ritchie, 2014). This causes travel to important historical

and cultural locations to be significantly motivated by self-education, which enhances knowledge and abilities. Research has shown that visitor happiness benefits plans and returns (Yoon & Uysal, 2005; da Costa Mendes, Oom do Valle, Guerreiro and Silva 2010; Kim et al., 2015; Tapar et al., 2017). Kim, Woo, and Uysal's (2015) research also demonstrated that a high degree of leisure experience satisfaction enhances the chance of a repeat trip. According to studies on tourism motivation, one of the push factors that motivates individuals to travel is the desire to learn. For instance, a lot of individuals travel to learn more about the places they go (especially in terms of geography, history, language, and culture). Discovered that intellectual growth was one of the most important elements of MTEs in a study that tried to understand the "essence" of MIEs Tung and Ritchie (2011).

Behavioural Intention

Swan (1981) defines behavioural intention as an individual's anticipated future behaviour. According to (Baloglu, 2000), it has been linked to observed behaviour. Ajzen (1988, 1991) then introduced the Theory of Planned Behavior to predict behaviours that are not completely under volitional control. According to the Theory of Planned Behavior (Ajzen, 1991), factors such as attitudes toward a location, subjective norms, and perceived behavioural control may impact tourist destination choice and future behavioural intentions. The Theory of Planned Behavior's fundamental propositions is that people are more likely to engage in a specific type of behaviour if they believe it will result in a specific and valuable outcome, that their essential referents will value and approve of the behaviour, and that they have the necessary abilities, resources, and opportunities to engage in such behaviour (Ajzen, 1985; Conner et al., 1999).

Research Hypothesis

The following research hypothesis is based on a conceptual framework; independent variables, namely Hedonism, Novelty, Meaningfulness and Knowledge, were determined and dependent variables, i.e., behavioural intention.

H1: There is a significant relationship between hedonism and behavioural intention.

H2: There is a significant relationship between novelty seeking and behavioural intention.

H3: There is a significant relationship between tourist meaningfulness experience and behavioural intention.

H4: There is a significant relationship between tourist knowledge and behavioural intention.

Research Framework

A study framework has been presented to examine the link to discover the influence of memorable tourist experiences on behavioural intention in Ecotourism. The dependent variable is behavioural intention. The proposed independent variable consist of Hedonism, Novelty, Meaningfulness and Knowledge.

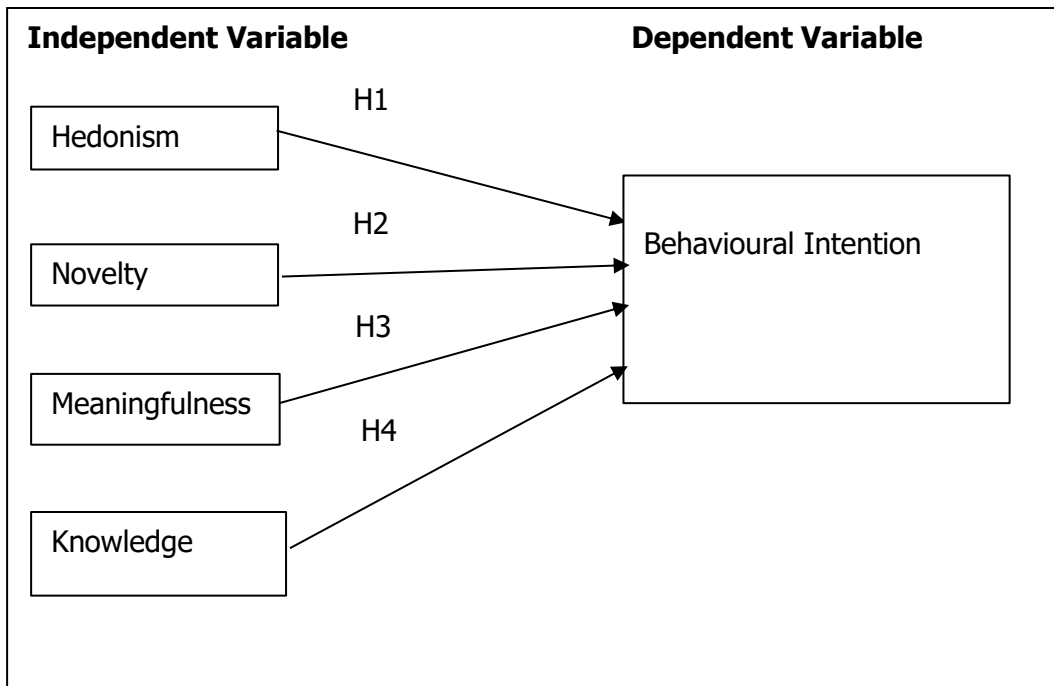

Figure 1: Proposed Conceptual Framework Adapted from Kim and Ritchie (2013)

METHODOLOGY

The research design is the plan that outlines how the researcher will answer a set of questions and obtain, analyze, and interpret data. In this study, a quantitative research design was employed, using self-administered questionnaires distributed through a Google Form. The data collection period spanned three months, taking advantage of public holidays and busy tourist seasons. Purposive sampling was used to select 384 individuals who partake trip train to Dabong, a popular eco-tourism destination in Kelantan. Data analysis involved using statistical methods, including descriptive statistics, reliability statistics, Pearson's correlation, and regression, using the SPSS software.

FINDINGS

Descriptive Analysis

This segment information showed the mean score attained as descriptive analysis. Overall mean score and standard deviation of variables and sub-variables were designed based on 5 points Likert scale (1= strongly disagree, 2= disagree, 3= somewhat disagree, 4= neutral, 5= somewhat agree, 6= agree, and 7= strongly agree). The overall mean (M) and standard deviation (SD) for each variable and measurement are exposed.

The independent variables verified moderate mean score (M= 6.31978, SD= 0.79550). Altogether the dimension variables also scored a moderate mean score where hedonism 6.3645(SD= 0.81758), novelty 6.3202 (SD= 0.83164), meaningfulness 6.2693 (SD= 0.91903) and knowledge 6.3251(SD= 0.86710). Besides, the dependent variable verified middle mean score (M=6.5406, SD=0.72347) where the sub variable named aesthetic gained 6.5406 (SD=0.72347).

Reliability Test

The reliability analysis was conducted in this analysis to determine Cronbach's Alpha values for all variables. The value follows Hedonism (0.877), Novelty (0.906), Meaningfulness (0.893), Knowledge

(0.894) and Behavioural Intention (0.887). All the reliability was above the 0.86 average, usually considered very good (Matkar, 2012).

Demographic Profile

There were a total of 203 sets of questionnaires assigned through the online platform. Table 4.2 displays common of the respondents are male with 50.2% (n=102) related to 49.8% (n=101) are female. In table 4.3, respondents who responded to this survey are speciously age between 21 – 30 years old with the frequency of 136 respondents (67.0%). Based on table 4.4, most of the respondents who answered this survey were single, with 127 respondent (62.6%). The table 4.5 showed most of the respondents in the race are Malay, with 140 respondents (69.0%). Table 4.6 showed most of the respondents in the religion are Islam with 149 respondents (73.4%). Additionally, table 4.7 show that most respondents have a degree with 112 respondents (55.2%). Table 4.8 shows that the majority of respondents who went to Dabong was 1st time which is 121 respondents (59.6%). Lastly, based on table 4.9 shows the average length of stay in Dabong. The highest average length of stay in Dabong is less than 3 days with 163 respondents (80.3%).

Table 1: Respondent Demographic profile

Respondent profile	Classification	Frequency N= 203	Percentage (%)
Gender	Male	102	50.2%
	Female	101	49.8%
Age	< 20	18	8.9%
	21-30	136	67.0%
	31-40	42	20.7%
	41 above	7	3.4%
Status	Single	127	62.6%
	Married	76	37.4%
Race	Malay	140	69.0%
	Chinese	36	17.7%
	Indian	23	11.3%
	Other	4	2.0%
Religion	Islam	149	73.4%
	Christian	26	12.8%
	Hindu	15	7.4%
	Buddha	13	6.4%
Education Background	Diploma	33	16.3%
	Degree	112	55.2%
	Master	17	8.4%

	PHD	3	1.5%
	Other	38	18.7%
Frequently visit	1 st time	121	59.6%
	2 nd time	72	35.5%
	More than 3 times	8	3.9%
	Other	2	1.0%
Length of stay	Less than 3 days	163	80.3%
	3-5 days	37	18.2%
	5-7 days	3	1.5%

Hypothesis Testing

There are four (4) possibilities were provided. The first hypothesis establishes a favourable association between hedonism and behavioural intention. The second hypothesis establishes a positive link between novelty and behavioural intention. The third hypothesis establishes a positive link between meaningfulness and behavioural intent. Finally, the fourth hypothesis investigates the link between knowledge and behavioural intention.

Hypothesis	Result	Findings of Data Analysis
H1: There is a positive relationship between hedonism and behavioural intention.	$r = 0.713, p = 0.000$ Strongly positive	H1: Accepted
H2: There is a positive relationship novelty and behavioural intention.	$r = 0.598, p = 0.000$ Strongly positive	H2: Accepted
H3: There is a positive relationship between meaningfulness and behavioural intention.	$r = 0.711, p = 0.000$ Strongly positive	H3: Accepted
H4: There is a positive relationship between tourist knowledge and behavioural intention.	$r = 0.670, p = 0.000$ Strongly positive	H4: Accepted

The above table serves to summarise the findings of this study. Hypotheses that have been tested for this study will be further elaborated as follow:

Hypothesis 1 (H1) proposed that hedonism has a very strong positive link with behavioural intention. The education recorded value of Spearman Correlation Coefficient, which is $r = 0.713$, $p = 0.000$, according to the findings provided in Table 4.16. As a result, the finding supports hypothesis 1 (H1), which states hedonism is positively associated with behavioural intention.

Hypothesis 2 (H2) proposed that novelty has a very strong positive link with behavioural intention. The education recorded value of Spearman Correlation Coefficient, which is $r = 0.598$, $p = 0.000$, according to the findings provided in Table 4.17. As a result, the finding supports hypothesis 2 (H2), which states novelty is positively associated with behavioural intention.

Hypothesis 3 (H3) proposed that meaningfulness has a very strong positive link with behavioural intention. The education recorded value of Spearman Correlation Coefficient, which is $r = 0.711$, $p = 0.000$, according to the findings provided in Table 4.18. As a result, the finding supports hypothesis 3 (H3), which states meaningfulness is positively associated with behavioural intention.

Hypothesis 4 (H4) proposed that tourist knowledge has a very strong positive link with behavioural intention. The education recorded value of Spearman Correlation Coefficient, which is $r = 0.670$, $p = 0.000$, according to the findings provided in Table 4.19. As a result, the finding supports hypothesis 4 (H4), which states that tourist knowledge is positively associated with behavioural intention.

DISCUSSION AND RECOMMENDATION

The findings of this study demonstrate a positive correlation between hedonism, novelty, meaningfulness, and knowledge with behavioral intention among tourists who have taken train trips to Dabong, Kelantan. These results indicate that tourists who have memorable eco-tourism experiences are more likely to exhibit favorable behavioral intentions, such as revisiting the destination or recommending it to others.

Based on these findings, several recommendations can be made. Firstly, researchers can utilize the eight memorable tourism experience (MTE) factors identified in existing literature to further explore and enhance the understanding of the impact of these factors on behavioral intention. Expanding the study region beyond a single state, such as incorporating multiple ecotourism destinations, would provide a broader perspective and contribute to the generalizability of the findings.

Additionally, there is a need for more methodological research by referencing researchers and organizers. This could involve refining and developing measurement tools or frameworks to better capture the nuances and complexities of memorable eco-tourism experiences and their relationship with behavioral intention. Such research would strengthen the validity and reliability of future studies in this field.

Lastly, it is worth noting that this study primarily employed a quantitative research approach, which provides valuable insights into the relationships between variables but may not capture the full depth and richness of tourists' experiences. Future research could consider incorporating qualitative methods, such as interviews or focus groups, to gain a more comprehensive understanding of the subjective aspects of memorable eco-tourism experiences and their impact on behavioral intention.

In conclusion, this study contributes to the understanding of the impact of memorable eco-tourism experiences on behavioral intention. The positive correlation between hedonism, novelty, meaningfulness, and knowledge highlights the importance of creating and promoting memorable experiences to enhance tourists' intentions. The recommendations for future research and the acknowledgement of limitations provide directions for further exploration and development in this field of study.

CONCLUSION

In conclusion, this study has shed light on the impact of memorable eco-tourism experiences on the behavioral intentions of tourists who have taken train trips to Dabong, Kelantan. The findings reveal a positive correlation between hedonism, novelty, meaningfulness, and knowledge with behavioral intention, indicating that tourists who have memorable experiences are more likely to exhibit favorable intentions such as revisiting the destination and recommending it to others. These findings have significant implications for researchers and practitioners in the field of eco-tourism. Researchers can utilize the identified eight memorable tourism experience (MTE) factors from existing literature to further investigate and enhance our understanding of their impact on behavioral intention. Additionally, broadening the study region beyond a single state and incorporating multiple ecotourism destinations would provide a more comprehensive perspective and enhance the generalizability of the findings. In addition, this study emphasizes the importance of creating and promoting memorable eco-tourism experiences to enhance tourists' behavioral intentions. By considering the identified factors and addressing the research recommendations, practitioners can better cater to tourists' preferences and maximize their satisfaction. Ultimately, this research contributes to the growing body of knowledge in the field of eco-tourism and offers valuable insights for researchers, policymakers, and industry professionals alike.

ABSTRACT

This research paper aims to investigate and analyze the impact of event experience on the satisfaction levels of e-sport participants. Specifically, the study focuses on three crucial factors: consumer-to-consumer interactions, effective communication, and online content engagement. Data was gathered from a sample of 259 e-sport participants in Kelantan, and the Statistical Package for the Social Sciences (SPSS) was utilized for data analysis. The results obtained from the data analysis strongly support the proposed research model, reinforcing the significance of consumer-to-consumer interactions, effective communication, and online content engagement in shaping e-sport participants' satisfaction levels. The findings provide meaningful insights into the factors that contribute to participant satisfaction, ultimately informing industry professionals, event organizers, and stakeholders in their efforts to enhance the overall e-sport experience.

Keywords: *E-sport, participants, satisfaction, event experience, consumer-to-consumer interactions, effective communication, and online content engagement*

INTRODUCTION

Asia stands as the largest and most significant region in the global e-sports industry, with more than 57% of the \$1.1 billion market share. In 2021, the Asia E-sports market generated \$634.3 million, marking a 16.6% increase compared to the previous year. The region boasts nearly 700 million e-sports fans, with a 13% growth in viewership observed in 2021. League of Legends, PUBG, and Valorant dominate the PC e-sports scene in Asia, while PUBG Mobile/BGMI, Free Fire, and League of Legends: Wild Rift take the lead in mobile e-sports (Niko Partner, 2022).

Malaysia, specifically, is predicted to generate \$5.31 million in e-sports revenue in 2023. The market is expected to grow further, reaching \$8.47 million in sales by 2027, with a compound annual growth rate (CAGR) of 12.37% during that period. (Hong, 2022). The largest segment, Media Rights, is projected to contribute \$1.38 million in 2023 (Statista, 2023). Malaysian e-sports competitors have achieved notable success, amassing a total prize money of \$17,004,876.42 USD from 1,054 competitions. Dota 2 stands out with \$12,757,611.39 in winnings, accounting for 75.02% of all Malaysian players' earnings. Yap "xNova" Jianwei, with \$2,028,185.72 USD in prize money from Dota 2 competitions, holds the title of the highest-paid Malaysian player.

While the e-sports events industry holds significant potential, it also faces obstacles. Apart from the challenges posed by the ongoing COVID-19 pandemic, there are other noteworthy barriers to growth. Declining e-sports investments and the difficulty of hosting large-scale live events hinder the industry's progress. Prolonged market uncertainty, reduced advertising and sponsorship spending, and challenges in securing additional funding from existing sponsors are among the factors impeding e-sports expansion (Foley & Lardner, 2020). These concerns are mirrored in the fluctuating number of active players in Malaysian e-sports, causing worry among players, spectators, and fans (Statista, 2022).

Figure 1.0: Total number of active players in E-sport in Malaysia from 2016-2021

Sources: Statista, 2022

In response to this landscape, event organizers in the e-sports industry should prioritize efforts to enhance the experience of visitors, audiences, and participants. Research on event experiences suggests that novel, special, or distinctive encounters leave a vivid impression on individuals, leading to stronger recollection (Kim, Hallab, et al., 2012; Kim, Ritchie, et al., 2012). Moreover, participant satisfaction plays a crucial role in fostering repeat participation, as it is closely tied to the perceived event experience (Krohn & Backman, 2011). However, the study of event experiences, particularly in the realm of e-sports events, remains limited. (Jupiter Research, 2021). Therefore, this study aims to investigate the impact of event experiences on the satisfaction levels of e-sport participants, filling a crucial gap in the existing research.

Research Objectives

1. To investigate the relationship between the impact of online consumer-to-consumer interaction and satisfaction among e-games participants.

2. To examine the relationship between the impact of effective communication and satisfaction among e-games participants.
3. To assess the relationship between the impact of online content engagement and satisfaction among e-games participants.

SIGNIFICANCE OF THE STUDY

Academic Perspectives

This study holds academic significance as it adds to the existing knowledge in the field of e-sports research. By investigating the influence of event experience on participant satisfaction, it provides insights into consumer-to-consumer interactions, effective communication, and online content engagement within the e-sports context. (Libai, 2010). This dissertation hopefully will provide a noble benefaction by extending a literature review on the satisfaction of event experience. Furthermore, this study will aid in directing future research advancement, particularly in areas associated with event management, including lecturers and students who are majoring in these subjects and fields. (Brodie, 2013). Additionally, this study will aid researchers in drawing solid conclusions from the outcomes of their theories, hypotheses, and research queries

Practical Perspective

The findings offer practical implications for industry professionals, event organizers, and stakeholders, enabling them to improve the e-sports experience. By understanding the factors that contribute to participant satisfaction, these individuals can make informed decisions and implement strategies to enhance the overall e-sport experience. This study bridges the gap between academia and industry, providing actionable insights that can drive improvements in e-sports event planning, execution, and participant engagement. The findings of this study offer practical implications for enhancing the overall e-sport experience. Understanding the factors that contribute to participant satisfaction enables industry professionals and event organizers to make informed decisions and implement strategies that improve various aspects of e-sports events. By emphasizing the importance of consumer-to-consumer interactions, effective communication, and online content engagement, stakeholders can develop initiatives that foster meaningful engagement and create memorable experiences for participants. (Harris, 2000).

LITERATURE REVIEW

ONLINE CONSUMER TO CONSUMER INTERACTION

Increased customer contact made possible by the emergence of social media has the ability to affect how consumers view businesses (Eigenraam et al., 2018; Brodie et al., 2013). Particularly recent sporting occurrences create a "tremendous buzz" online (McGillivray,

2014). While Johnson and Grier (2013) define it as the active or passive interaction between two or more consumers within a service setting, Algesheimer, Dholakia, and Herrmann (2005, p. 21) define consumer interaction from a community perspective as "the consumer's intrinsic motivation to interact and co-operate with community members." This is especially true in online settings because users have access to a variety of digital tools that make it easier for them to engage with one another (Morgan-Thomas & Veloutsou, 2013).

EFFECTIVE COMMUNICATION

Any organization's marketing strategy must prioritise communicating with customers effectively (Adjei et al., 2010; Grisseman & Stokburger-Sauer, 2012). For businesses, effective communication provides a number of advantages, including lowered risk perceptions and positive overall experience ratings from customers (Klaus, 2013). Additionally, Drennan et al. (2015) contend that effective communication improves brand experience and raises brand awareness because people tend to use new information to build experience and draw conclusions that are more certain and self-relevant (Delgado-Ballester et al., 2012). By suggesting that communication is a two-way conversation between a company and its customers, Vargo and Lusch (2004) revolutionised the way businesses approach communication in service settings. Regular contact and follow-ups between the parties involved in this two-way dialogue are essential.

ONLINE CONTENT ENGAGEMENT

This is the basis for setting engagement apart from other relationship concepts with a similar meaning, such involvement. Because it involves a proactive and interactive relationship with an engagement object (such as an event) and necessitates a person's perceived experiential value (Brodie et al., 2013; Mollen & Wilson, 2010), consumer engagement goes beyond involvement (i.e., a consumer's interest and personal relevance of an event) (Hollebeek et al., 2014; Brodie et al., 2011) experiences with a focal agent/object within a particular service connection. Customers are provided with website customizations and website-based interaction (such videos), which not only create value but also encourage more involvement (Liechty et al., 2001). Customization, interactivity, and website design are just a few of the ways that businesses may control how their customers interact with the internet (Srinivasan). According to Schivinski et al. (2016), these elements frequently encourage customers to engage in a two-way conversation with the company (Anderson, & Ponnnavolu, 2002).

Important components of consumer engagement include the capacity for customers to "redesign" their interactions with a company's website (Eigenraam et al., 2018). In other words, increasing the whole experience requires that customers interact with the online material that a company offers (Calder et al., 2009). Mega-events have not been used to test the literature on internet consumer participation. We contend that a greater understanding of the fundamentals of effective consumer participation in this setting is crucial given the universal attraction of big events in contemporary societies and their potential spectrum of repercussions. In particular, we contend that greater comprehension.

The relationship between consumer-to-consumer interaction, effective communication and online content engagement towards satisfaction among E-sport event participants.

The rise of social media has enabled an increased interaction between consumers (Brodie, Ilic, Juric, & Hollebeek, 2013; Eigenraam, Eelen, van Lin, & Verlegh, 2018), which has the potential to influence their perceptions of organisations (Carlson & O'Cass, 2012). Contemporary sport events in particular generate a 'tremendous buzz' online (McGillivray, 2014). Algesheimer, Dholakia, and Herrmann (2005) define consumer interaction from a community perspective as "the consumer's intrinsic motivation to interact and co-operate with community members", while Johnson and Grier (2013) refer to it as the active or passive interaction between two or more consumers within a service setting. This is particularly relevant within online environments, where consumers have access to several digital tools that facilitate their interaction with each other (Morgan-Thomas & Veloutsou, 2013). As a result, we define online consumer-to-consumer interaction as the dialogue between two or more consumers by virtue of online experiences.

Communicating effectively with consumers is a critical aspect of the marketing strategy of any organisation (Adjei et al., 2010; Grisseman & Stokburger-Sauer, 2012). Effective communication has several benefits for organisations, such as reduced perceptions of risk and consumers' positive evaluations of overall experience (Klaus, 2013). In addition, Drennan et al. (2015) have argued that effective communication increases brand awareness and enhances brand experience, because people tend to use acquired knowledge to build experience and make inferences that are more self-relevant and certain (see also, Delgado-Ballester, Navarro, & Sicilia, 2012). Vargo and Lusch (2004) transformed the way organisations approach communication in service settings, arguing that communication is a two-way dialogue between an organisation and consumers. This two-way dialogue needs to include regular contact and follow ups between the organisation and its consumers (Brodie et al., 2013;

Grissemann & Stokburger-Sauer, 2012). In line with this view, Liang, Ekinci, Occhiocupo, and Whyatt (2013) highlighted the importance for organisations to respond promptly to the opinions and information requests from their consumers.

This is the basis for distinguishing engagement from other similar relational terms such as involvement. That is, consumer engagement extends beyond involvement (i.e. consumer's interest and personal relevance of an event; Hollebeek, Glynn, & Brodie, 2014), given that it encompasses a proactive and interactive relationship with an engagement object (e.g. event) and requires an individual's perceived experiential value (Brodie et al., 2013; Mollen & Wilson, 2010). Experiences with a focal agent/object within a specific service relationship" (Brodie et al., 2011, p. 258). Web customisations and website-based engagement (e.g. videos) delivered to consumers not only generate value but also promote further engagement (Liechty, Ramaswamy, & Cohen, 2001). Organisations have a variety of ways to manage the web experience of their consumers, including customisation, interactivity and website design (e.g. Srinivasan, Anderson, & Ponnnavolu, 2002), and these features often lead consumers to a twoway interaction with the organisation (Schivinski, Christodoulides, & Dabrowski, 2016). Consumers' ability to customise their interaction with an organisation's website and 'redesign' their experience represents important aspects of consumer engagement (Eigenraam et al., 2018).

RESEARCH HYPOTHESIS

Based on the discussion above, the hypotheses of the study are proposed as below:

H1: There is a significant relationship between the impact of online consumer-to-consumer interaction and satisfaction among e-sport participants.

H2: There is a significant relationship between the impact of effective communication and satisfaction among e-sport participants.

H3: There is a significant relationship between the impact of online content engagement and satisfaction among e-sport participants.

CONCEPTUAL FRAMEWORK

Research Framework proposed for the current study are as below:

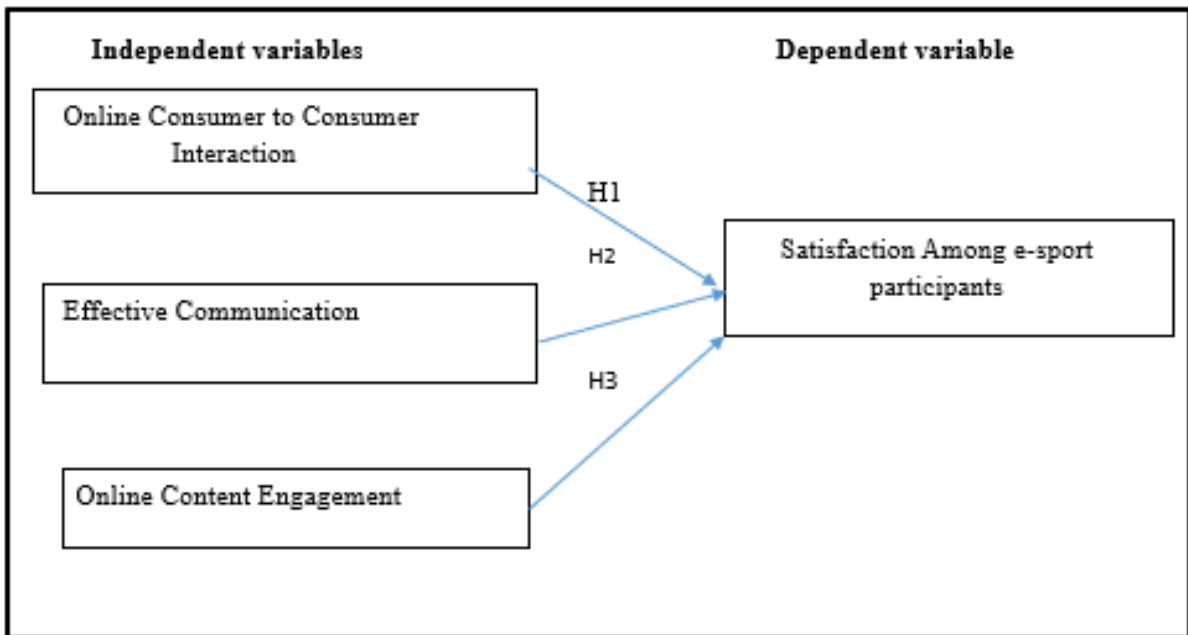

Figure 1: Proposed Conceptual Framework adopted from Husni Kharouf & Rui Biscaia (2020)

METHODOLOGY

This study adopts a quantitative research design to explore the influence of variables such as online consumer to consumer interaction, effective communication and online content engagement towards satisfaction among e-sport event participants. The target population consists of is the audience or viewers who have participated in any e-sports event is 19.8 million. To ensure an appropriate sample size, the researchers followed **Krejcie & Morgan (1970)** set of guidelines. Data collection is conducted through an online survey utilizing Google Forms, with 259 participants involved. The selection of participants relies on purposive sampling, enabling the researcher to exercise judgment and select individuals with e-sport experience. The research instrument incorporates items drawn from Husni Kharouf & Rui Biscaia (2020) using 5 likert-scale. In order to analyze the gathered data, the researchers employ the Statistical Package for the Social Sciences (SPSS) version 29.0, employing various statistical techniques including descriptive statistics, reliability analysis, Pearson's correlation, and regression.

FINDINGS

Demographic Profile

The online platform had originally distributed a total of 384 sets of questionnaire via Google Form, however, only 259 respondents responded; with a response rate of 67.44%. In this section, respondents have a contextual profile. About 62.2% were male and another 37.8% were female. The table indicated majority of the respondents were Malay, with a total of 158 (61%).

Respondents who responded to this survey are mostly aged between 21 to 30 years old, with the frequency of 212 respondents (81.9%). This is followed by those who aged between 31 to 40 years with the frequency of 24 respondents (9.3%). Next, respondents under the age of 20 years old make up a total of 8.1% of respondents with the frequency of 21 and finally, respondents whose aged above 41 years old with total frequency of 2 respondents (0.8%).

According to this table, 64.5% respondents (n=167) have a Bachelor Degree. 46 respondents (17.8%) received a Diploma, followed by 22 respondents (8.5%) with a Form 6 Diploma, 13 respondents (5%) owned a Master Degree; and finally, 4.2% respondents (n=11) graduated with a secondary school diploma. None of the respondents have a PhD yet.

Table 1: Demographic of respondents

Respondent profile	Classification	Frequency	Percentage (%)
		N=259	
Gender	Male	161	62.2%
	Female	98	37.8 %
Age	< 20	21	8.1 %
	21-30 years old	212	81.9%
	31-40 years old	24	9.3%
	41-50 years old	2	0.8%
Race	Malay	158	61%

	Chinese	70	27%
	Indian	26	10%
	Bumiputera	2	0.8%
Marital Status	Married	40	15.4%
	Single	219	84.6%
Respondent's Religion	Islam	160	61.8 %
	Christian	62	23.9%
	Buddha	28	10.8%
	Hindu	4	1.5%
	Sikhism	1	0.4%
	Catholics	1	0.4%
Education	Secondary	11	4.2%
	Form 6	22	8.5 %
	Diploma	46	17.8 %
	Bachelor of Degree	167	64.5 %
	Master of Degree	13	5 %
	PHD	0	0.0%

Reliability Test

Table 2: Result of Reliability Test

Variable	Number of items	Reliability Cronbach's Alpha	Comment
Online Consumer to Consumer Interaction	3	0.921	Excellent

Effective Communication	3	0.899	Excellent
Online Content Engagement	4	0.900	Excellent
Behavioural Intension	5	0.858	Excellent

The dependability of the computation reveals the instrument's stability and precision in calculating the definition, which contributes to the measure's goodness. Table 2 shows the Cronbach's Alpha Coefficient values for the independent and dependent variables in this study. All variables were ranged between 0.858 to 0.921. This demonstrates that all question presented is reliable and the questionnaire was approved to study the Impact of Event Experience Among E-sports Events Participants.

Descriptive Analysis

A descriptive analysis is a short descriptive coefficient that summarises a given data set, which can represent the entire population or a subset of the population.

Table 3: Results of Descriptive Analysis.

Variables	N	Mean	Standard Deviation
Online consumer to consumer interaction	259	4.9289	1.17129
Effective Communication	259	4.9457	1.06929
Online content engagement	259	4.9829	1.09160

Table 3 shows the independent variable and dependent variable, the mean score, and the standard deviation analysis. Online consumer-to-consumer interaction, effective communication, and online content engagement were the independent variables while the behavioural intention was the dependent variables. The highest mean value was 4.9829, which is Online Content Engagement. Meanwhile, the lowest mean value was Online Consumer-to-Consumer Interaction, which is only 4.9289.

Pearson's Correlation

Table 4: Summary result of Spearman Correlation Coefficient

Hypothesis	Result	Findings of Data Analysis
H1: There is a positive relationship between online consumer-to-consumer interaction and e-sports participants' satisfaction.	r = 0.613, p = >0.001 Highly positive	H1: Accepted
H2: There is a positive relationship between effective communication and satisfaction among e-sports participants.	r = 0.609, p = >0.001 Highly positive	H2: Accepted
H3: There is a positive relationship between online content engagement and satisfaction among e-sport participants.	r = 0.649, p = >0.001 Highly positive	H3: Accepted

Table 4 serves to summarise the findings of this study. Based on Table 4, the result revealed that all three variables have a strong relationship with the Satisfaction Among E-sports Event Participants with correlation value range from 0.609 to 0.649. The highest correlation relationship was Online Content Engagement and the lowest one was Effective Communication. Nevertheless, all hypothesis are accepted.

DISCUSSION AND RECOMMENDATION

The study was conducted to examine the Impact of Event Experience Towards Satisfaction Among E-Sport Events Participants. The researchers recognised that there were several limitations to their study. The first limitation is related to the time taken to collect respondents' responses. To overcome this issue, researchers can aid in filling the questionnaire responses on behalf of the respondents. This is due to the fact that most respondents were too busy with their commitments.

Next, the study conducted only focuses on Malaysia's respondents who had participated in esports events. The questionnaire was conducted through Google Form which was then distributed through WhatsApp, and Instagram. Therefore, we believe that this study is still far from being completed since the data collected were only in Malaysia. Besides, the distribution window for this survey is relatively narrow, as it runs from February through April. Hence, for this second limitation, we recommended future researchers to further expand the study to outside of Malaysia to cover wider regions of respondents such as the Philippines and 89Indonesia. This is because Southeast Asia is quickly emerging as a global hotspot for professional gaming, attracting big-name sponsors to an esports sector that is predicted to nearly treble by mid-decade.

Finally, researchers only use only three variables that could influence satisfaction among esports participants namely: content engagement, effective communication, and online consumer-to-consumer interaction. To overcome this issue, future investigations should explore other factors that may influence esport player happiness, such as complex interplay, game design, performance, competitiveness, community and social ties, and accessibility.

CONCLUSION

This study aimed to investigate the impact of event experience towards satisfaction among e-sports event participants, including factors such as online consumer-to-consumer interaction, effective communication, and online content engagement. The findings revealed a strong association between these objectives and the satisfaction among E-sports events participants. The respondents acknowledged the significant impact that Online Consumer-to-Consumer Interaction, Effective Communication, and Online Content Engagement and their overall satisfaction in E-sports Events as participants. This study has the potential as a guideline to future researchers or event organisers in ensuring that the event participants satisfaction is always be taken as a top priority, hence contributing to the overall success of event organising; especially in E-sports.

INVESTIGATION OF BUNDLE EVENT AND VISITOR SATISFACTION

A CASE OF BUNDLE EVENT

NUR AMNI ATHIRAH BINTI JASURA, NUR ANIS SHAHIRAH BINTI OTHMAN, NUR AQILAH BINTI TJUMAN, NUR ASSYUARA, NURZEHAN BINTI ABU BAKAR

Faculty of Hospitality, Tourism and Wellness, Universiti Malaysia Kelantan

ABSTRACT

This study aims to explore the comprehensive impact of visitors' event experiences through the lens of Pine and Gilmore's (1998) experience economy realm, encompassing entertainment, educational, esthetic, and escapist dimensions. In order to achieve this, 234 questionnaires were distributed to attendees of the Mek Awe bundle event in Kelantan. The collected data was then meticulously analyzed using the Statistical Packages for the Social Sciences (SPSS). The findings from the analysis revealed a significant positive correlation between visitor satisfaction and the elements of entertainment, educational, esthetic, and escapist experiences. This study holds great significance for event organizers as it provides valuable insights into evaluating the success of their events, devising novel experiential programs, and placing a greater emphasis on the personal experiences of event attendees.

Keywords: Pine and Gilmore's; Event experience; Bundle event, Satisfaction

INTRODUCTION

Established on October 27th, 2022, Mek Awe Market in Dataran Mara, Kota Bharu, Kelantan is managed by Puan Anis, the owner of Rumah Bundle Store. Inspired by her participation in various bundle events across Malaysia, Puan Anis created Mek Awe Market to attract bundle shirt enthusiasts. Through strategic use of social media platforms like TikTok and Instagram, the market quickly gained visibility and offers a diverse range of items, including bundle shirts from Indonesia, Cambodia, Thailand, Vietnam, and the Philippines. These shirts, neatly packed in sacks, provide affordable access to renowned

foreign brands, cultural styles, and fashionable garments, with some items even receiving appraisals and higher price tags (Adam Hayes, 2022)

While Pasar Mek Awe and other bundle events have their unique appeal, they also face challenges such as uninteresting themes, confusion among attendees, and inadequate facilities. Moreover, the inconsistent supply of quality merchandise due to reliance on donated or second-hand items introduces fluctuations in availability and quality (Nguyen et al. 2019) Additionally, bundle events encounter difficulties in promoting themselves and attracting a diverse audience, often being perceived as limited to specific demographics or lacking mainstream appeal.

To overcome these obstacles, event organizers must adopt a comprehensive promotional strategy for Pasar Mek Awe, actively encouraging attendees to share their experiences through customized social media filters. By curating user-generated content on social walls and digital displays, the overall event experience can be enhanced, leading to increased visitor engagement (Daniella Turcanu, 2021). It is crucial to focus on improving event management skills, attracting repeat exhibitors, and delivering a unique and memorable experience to visitors, thus enabling Pasar Mek Awe to overcome its challenges and flourish (Cvent,2021)

Despite these hurdles, the continued support from visitors demonstrates the special place Pasar Mek Awe holds in their hearts. The market offers an exclusive experience to attendees. However, research on event experiences in the context of bundle events remains limited, with most studies focusing on hotel events, general events, and mega bundles (Getz, 2007). Consequently, this study aims to delve into the event experience and visitor satisfaction specifically within the realm of Pasar Mek Awe, filling a crucial research gap in the field. There are four objectives of this research:

1. To examine relationship between escapism experience in bundle events towards visitorsatisfaction

2. To examine relationship between aesthetic experience in bundle events towards visitorsatisfaction
3. To examine the relationship between entertainment experience in bundle events towardsvisitor satisfaction.
4. To examine the relationship between education experience in bundle events towards visitor satisfaction.

SIGNIFICANT OF THE STUDY

Academic perspective

This study holds academic significance in several ways. Firstly, it helps us better understand the experience economy by applying Pine and Gillmore's framework to bundle events, giving us insights into how different aspects of the event experience impact visitor satisfaction. Secondly, it fills a gap in our knowledge by focusing specifically on the Mek Awe bundle event, allowing us to gain a deeper understanding of what makes visitors happy in this particular context. Thirdly, the study's use of questionnaires and statistical analysis provides a solid foundation for future research methods. Lastly, the findings have practical implications for event organizers, helping them evaluate their events and create more tailored and engaging experiences for attendees. Overall, this study enriches our knowledge, addresses specific questions, contributes to research methods, and offers practical guidance for event organizers.

Practical Perspective
