The practical significance of this study lies in its potential to benefit event organizers and enhance the overall success of events. By examining the impact of entertainment, educational, esthetic, and escapist experiences on visitor satisfaction, the study provides valuable insights that can be applied in real-world scenarios. Event organizers can use this knowledge to evaluate their events and make improvements that cater to the preferences and expectations of attendees, ultimately creating more enjoyable experiences. The findings also underscore the importance of creating engaging and meaningful experiences for event participants, which can lead to higher levels of satisfaction and even attract more visitors in the future. In essence, this study offers practical guidance that can empower

event organizers to design and implement truly memorable and impactful events that leave a lasting impression on attendees.

LITERATURE REVIEW

Escapism Experience

Psychological dependence on solely imagined activity or amusement as an escape from reality or habit (Anon, 2019). Escapism in the form of self-suppression is motivated by the desire to avoid painful ideas, self-perceptions, and feelings, while self-expansion is motivated by the desire to obtain good experiences and discover new sides of oneself (Anon, 2022). Often, escape tendencies are a sign of procrastination, although they are not identical.

Entertainment Experience

A number of studies have shown that entertainment is an important determinant of visitors' satisfaction attraction across various contexts, including the influence of physical environment on emotion (Ali & Amin, 2014). Entertainment is activities that are distracting, enjoyable, or fun and appropriate for the time and attention of the audience (Vogel, 2014). Based on Pine and Gilmore's theory, entertainment experience happens when people are passively observing other people's activities or performances through the senses as it portrayed pleasure and enjoyment such as concerts and theatre performances (Radder & Han, 2015). Nostalgia is described as a fondness for goods that were more common when the individual was younger, or a wish to dwell in a bygone era of history (Cervellon et al., 2012).

Esthetic Experience

According to Cupchik and Winston (1996), aesthetic experience is a psychological process in which the attention is focused on the object while all other objects, events, and everyday concerns are suppressed. Aesthetic things are objects that are appreciated for their beauty. These include art, architecture, design, crafts and other elements of human creative expression. Aesthetics are cultural and personal such that what is appealing to one person may not be to another (John Spacey, 2022).

Education Experiences

Experiences are "events that engage the individual in a personal way," according to Pine and Gilmore (1999). An experience "arises in a relation or in a dialectical link between subject and object, both of which will have an influence on what is experienced," according to a Danish report (ODA, 2006:30). Education is often identified as a motivator to use the products and services of visitors who purchase, including tourist attractions. Forhan (2020) mentions that to achieve the event's goals, careful advance planning and strong leadership are still needed for success. Here shows the experience in education is very important in creating a good experience in bundle events and visitor satisfaction.

Research Hypothesis

From the conceptual study in Figure 1 below, the independent variable education, entertainment, aesthetics, and escapism was determined and one dependent variable, namely satisfaction as a mediator for this study, based on the variable cited above, these hypotheses are defining:

H1: Escapism experience positively affects visitor's satisfaction attraction in bundle event.

H2: Aesthetic experience positively affects visitor's satisfaction attraction in bundle event.

H3; Entertainment experience positively affects visitor's satisfaction attraction in bundle event.

H4: Expectations positively affect confirmation attraction in bundle event.

Research Framework

A study framework was established based on the literature evaluation to explore the link between visitor's satisfaction and the investigation of bundle event experience. Figure 2.1 depicts the suggested conceptual framework, which includes the independent variables of escapism, esthetics, entertainment, and education. The dependent variable is visitor's satisfaction.

Figure 2.1: Proposed Conceptual Framework adopted from Boo & Busser (2018)

METHODOLOGY

The study employs a quantitative research design to investigate the impact of variables such as escapism, esthetics, entertainment, and education on visitor satisfaction. The population consists of visitors who have visited Mek Awe bundle event, with a target population 600 visitors weekly. The sample size was determined using a table based on Roscoe's (1975) guidelines. Data collection is conducted through an online survey created using Google Forms, with a total of 234 participants. Purposive sampling is employed, selecting respondents based on the researcher's judgment and expertise. The research instrument consists of items adapted from previous studies in the field of tourism consumer behavior adopted from Boo & Busser (2018). Data analysis involves using the Statistical Package for the Social Sciences (SPSS) version 29.0, utilizing descriptive statistics, reliability analysis, Pearson's correlation, and regression to analyze the collected data.

FINDINGS

Descriptive Analysis

According to Will Kenton (2019), the descriptive statistic is a short descriptive coefficient that summarizes a given data set, which can represent a population or a sample population. As a result of descriptive analysis, the segment research explains the mean score obtained. Overall mean score and standard deviation of variables and sub-variables were designed based on 7 points likert scale (1 =

strongly disagree, 2 = disagree, 3 = moderately disagree, 4 = neutral, 5 = moderately agree, 6 = agree, 7 = strongly agree). The overall mean (M) and standard deviation (SD) for each variable and measurement are shown in the table below.

According to the research, it showed that independent variables verified a moderate mean score (M=5.2938, SD=0.96642). Altogether the dimension variables also scored a moderate mean score where escapism M=5.2938, (SD=0.96642), aesthetics M=5.5395, (SD=0.95552), entertainment M=5.7201, (SD=0.97730). Besides, the dependent variable verified middle mean score (M=5.8034, SD=0.98068) where the sub variable named a education.

Reliability Test

The test's reliability denotes how non-biased (error-free) it is and thus guarantees accuracy in calculation over time and across different sections of the instrument (Kumar, 2013). The reliability analysis was conducted in this analysis to determine Cronbach's Alpha values for all variables. The values are as follows: escapism (0.728), aesthetic (0.850), entertainment (0.840), education (0.862) and visitor satisfaction (0.825). All the reliability was above the 0.86 average, usually considered very good (Matkar, 2012).

Demographic Profile

The online platform had assigned a total of 234 sets of questionnaires. Table 1 shows the summarized demographic results of the respondent's profile. About (26.9%) of the respondent were male, and another (73.1%) were female. According to the data, Malay respondents had the greatest value of 197 respondents, or (84.2%) percent, while Chinese had the second highest value of 11 respondents (4.7%). While Indian had the third highest number with a total 6 respondents (2.6%), While Siamese had the fourth highest number with a total 5 respondent (2.1%) and also Dusun 4 respondent (1.7%). The lowest with only 3 respondent (1.3%) which is Bumiputera Sabah and Sarawak. While Bajau had the second lowest value of 2 respondents (0.9%). While Negro had the third lowest which is 1 respondent (0.4%).

Based on the above data, it can be concluded that Muslim respondents have recorded the highest number, with a respondent value of 209 people, or equivalent to 89.3%. while Hindu and Buddha has 6 and 7 respondents recorded the lowest number, with only respondents (2.6%) and Buddha respondent (3.0%). In addition, this data has also shown that Christian respondents recorded the second-highest value with 12 respondents (5.1%).

According to the data acquired using a Google Form survey for the Marital Status area, singles have the biggest number with 182 respondents, corresponding to (77.8%) , while married have 52, (22.2%) respondent respectively.

Based on table 1, it shows the average age for the group 21 years old to 30 years old recorded the highest number of respondents with a record of 146 people (62.4%). 31 years old to 40 years old was ranked second with 41 respondents or (17.5%) followed by the age group below 20 with 38 people (16.2%). While 41 years old to 50 years old was in fourth place with 6 respondents or with a percentage value of (2.6%). and the lowest was 51 and above with only 3 respondents (1.3%).

The findings of table 1 show that the majority of respondents in this study have a degree, with a total of 101 people, or 43.2%. In addition, SPM recorded the second-highest value with 45 respondents (19.2%), followed by diploma in third place with 35 respondents, leading to a value of 15.8%, while SPM recorded the fourth-highest value with a reading of 24 respondents 10.3%, While Master recorded the fifth-highest value with 6 respondent and 2.6%. PHD the lowest position with only 4 respondents, or equivalent to 1.7%. The second - lowest position with only 2 respondents (0.9%).

Based on table 1, it shows the average monthly income for the group Below RM 1000 recorded the highest number of respondents with a record of 126 people (53.8%). RM1001- RM2000 was ranked second with 49 respondents or (20.9%), followed by the income group of RM2001-RM3000 with 35 people (15%), while RM3001-RM4000 was in fourth place with 20 respondents or with a percentage value of (8.5%), and the lowest was RM4001 and above with only 4 respondents (1.7%).

Table 1: Respondent Demographics profile

Respondent profile	Classification	Frequency	Percentage (%)
N=234			

Gender	Male	63	26.9%
	Female	171	73.1%
Age	Less than 20 years old	38	16.2%
	21-30 years old	146	62.4%
	31-40 years old	41	17.5%
	41-50 years old	6	2.6%
	51 years old and above	3	1.3%
Race	Malay	197	84.2%
	Chinese	11	4.7%
	Indian	6	2.6%
	Buddha	1	0.4%
	British	1	0.4%
	Siamese	5	2.1%
	Bumiputera Sabah	3	1.3%
	Bumiputera Sarawak	3	1.3%
	Dusun	4	1.7%
	Bajau	2	0.9%
	Negro	1	0.4%
Marital Status	Single	182	77.8%
	Married	52	22.2%
Respondent's Religion	Islam	209	89.3%
	Christian	12	5.1%

	Hindu	6	2.6%
	Buddhist	7	3.0%
Education	SPM	45	19.2%
	Diploma	37	15.8%
	Bachelor of Degree	101	43.2%
	Postgraduates	15	6.4%
	Master of Degree	6	2.6%
	PHD	4	1.7%
	STPM	24	10.3%
	Malaysian Skills Certificate 3	2	0.9%
Income (RM)	Less than RM1000	126	53.8%
	RM1001-RM2000	49	20.9%
	RM2001-RM3000	35	15%
	RM3001-RM4000	20	8.5%
	RM4001 and above	4	1.7%

Hypothesis Testing

There are four (4) possibilities were provided. The first hypothesis establishes an escapism experiences between visitor's satisfaction attraction in bundle event. The second hypothesis establishes aesthetic experiences link between visitor's satisfaction attraction in bundle event. The third hypothesis establishes entertainment experiences link between visitor's satisfaction attraction in bundle event. Finally, the fourth hypothesis investigates the link between education experience and visitor's satisfaction attraction in bundle event.

Table 2: Hypothesis Testing

Hypothesis	Result	Findings of Data Analysis
H1: Escapism experience positively affects visitor's satisfaction attraction in bundle event.	r = 0.512, p = 0.00 Positive	H1: Accepted
H2: Aesthetic experience positively affects visitor's satisfaction attraction in bundle event.	r = 0.616, p = 0.00 Positive	H2: Accepted
H3: Entertainment experience positively affects visitor's satisfaction attraction in bundle event.	r = 0.610, p = 0.00 Positive	H3: Accepted
H4: Education experience positively affects visitor's satisfaction attraction in bundle event.	r = 0.612, p = 0.00 Positive	H4: Accepted

The above table serves to summarise the findings of this study. Hypotheses that have been tested for this study will be further elaborated as follow:

The first hypothesis (H1) claimed that escapism experience has a positive correlation with visitor's satisfaction attraction in bundle event. The escapism recorded value of Spearman Correlation Coefficient, which is $r = 0.512$, $p = 0.00$, according to the findings provided in Table 2. As a result, the finding supports hypothesis 1 (H1), which states that escapism experiences positively affect related to visitor's satisfaction attraction.

Hypothesis 2 (H2) also argued that aesthetics has a positive association towards visitor's satisfaction attraction in bundle event. The aesthetics recorded a Spearman Correlation Coefficient of $r = 0.616$, $p = 0.00$, according to the findings provided in Table 2. As a result, the data supports hypothesis 2 (H2), which states that aesthetic experience positively affects visitor's satisfaction attraction in bundle event.

As for entertainment, according to Hypothesis 3 (H3), has a positive association with visitor's satisfaction attraction in bundle event. The data revealed that entertainment is documented in the Spearman Correlation Coefficient, $r = 0.610$, $p = 0.00$, as shown in table 2. As a result, the data supports hypothesis 3 (H3), which states that entertainment is positively related to visitor's satisfaction attraction in bundle event.

Education, according to Hypothesis 4 (H4), has a positive link with satisfaction attraction. The findings revealed that education is recorded in Spearman Correlation Coefficient, $r = 0.612$, $p = 0.00$, as shown in table 2. As a result, the finding supports hypothesis 4 (H4), which states that education is positively related to visitor's satisfaction attraction in bundle event.

DISCUSSION AND RECOMMENDATION

This study was conducted to investigate the bundle event experience and visitor satisfaction. Result revealed that there is a positive relationship between escapism, aesthetics, entertainment and education towards Mek Awe Bundle Event. The study also revealed that aesthetic variable has more significant relationship with visitor satisfaction. The result indicated that all visitor satisfied visiting Mek Awe Bundle Event. They felt bundle event's venue provide pleasure to their senses, allow them to felt excited to be in the bundle event and learned a lot from the event particularly on how to 'selam bundle'.

This study focus on Mek Awe Bundle Event only. Future researchers can expand the study area from one state to another state around Malaysia or cover different region of Kelantan who have die-hard bundle fans to get a higher number of respondents based on the bundle event. By studying multiple states or regions, researchers can conduct comparative analyses. They can compare different variables, factors, or phenomena across various areas to identify similarities, or trends. This comparative approach can provide valuable insights towards the current study.

A whole amount of 353 questionnaires was distributed online. From 353 questionnaires collected from the targeted respondents, only 234 refunded questionnaires that were useable. The response rate can be considered quite low, hence future researcher should increase number of participants to increases the generalizability of the findings.

Finally, the current researc used only for variables such as escapism, aesthetics, entertainment and education. Future researchers need to include other possibles variables affecting the satisfaction of visitors coming to Mak Awe Pasar bundle such as product variety quality, pricing and value for money. Including these additional variables in future research can provide a more comprehensive

understanding of visitor satisfaction at Mak Awe Pasar Bundle and help identify areas for improvement or enhancement.

CONCLUSION

The link between four independent factors escapism, aesthetics, entertainment, and education, and the dependent variable, visitor's satisfaction attraction in bundle event, was investigated using a framework Pine and Gilmore Experience Economic Theory Realms (1980). The results show the extent to which the independent variable impacts the dependent variable.

The overall objectives of this research have been answered, and a responsible synthesis of knowledge has been provided. Almost all respondents stated that their visit to Bundle event provided them with an unforgettable visitor experience based on escapism, aesthetics, entertainment, and education. They were excited to have had the opportunity to visit Bundle event at Dataran Mara Kota Bharu Kelantan and hope can come again in event bundle. They also agreed that going to Bundle event, can learn about how to 'Selam Bundle' properly. 'Selam Bundle' can be an attraction for tourists to come bundle event and experience 'Selam Bundle' at the bundle event.

The findings of this study are believed to provide a great help to the bundle club creates attractive activities and teach how to 'Selam Bundle' for entertaining visitors at bundle event. and enticing them to visit bundle event in the future research.

ABSTRACT

The study aims to examine university students on factors which include online review, value capture and security that influence Kelantan as experience tourism. A questionnaire was used as the data source. The results of the study revealed that the factors are of significant relevance to university students. Both academics and practitioners can benefit from the findings. Additionally, the report ends with suggestions for institutions on how to approach the problems mentioned.

Keywords: Experience tourism, online review, value capture, security

INTRODUCTION

One of the sectors with the highest growth rates is tourism, which helps many countries create a lot of jobs and foreign cash. In fact, it's among the most amazing economies and societies. The Malaysian economy has benefited most from the tourism sector. Similarly, it also stimulate the global economic growth (Nasir and Wongchestha, 2022). Malaysia is one of the world's top tourist destinations, and its expansion in other linked industries, directly and indirectly, leads to job creation there (Abd Al Khuja, 2014). The primary segment of the tourism industry is discussed in this paper. For a greater understanding of the tourism industry sector, it offers a comprehensive overview.

There are three objectives of this research:

1. To determine the relationship between online reviews and Kelantan experience tourism.
2. To identify the relationship between value capture and Kelantan experience tourism.
3. To examine the relationship between security and Kelantan experience tourism.

SIGNIFICANCE OF THE STUDY

The tourism industry should promote products based on tourism experiences to attract high-quality tourists, leading to long-term and lucrative income for the country. Director General of Tourism Malaysia, Datuk Musa Yusof, highlighted the high demand for this type of tourism, particularly in Malaysia, known for its rich flora, fauna, and well-preserved rainforests. Experiential tourism focuses on exploring the atmosphere, history, local community, culture, food, and environment of a specific place. Word-of-mouth testimonials are a cost-effective and widespread method to promote this form of tourism. Additionally, Malaysia's diverse races and cultures serve as the main attraction, offering unique cultural experiences such as festivals and traditional cuisine for tourists to enjoy.

LITERATURE REVIEW

Research Hypothesis

1. Kelantan Attraction (DV)

Kelantan, one of Malaysia's captivating and historic tourist destinations, attracts visitors with its inexpensive and valuable antique items. Despite its small size, Kelantan's agriculture industry contributes significantly to the nation's economy. The cultural aspect of travel is a major draw for tourists, and efforts have been made to enhance traditional folk entertainment for a better appreciation of Kelantan's stunning scenery. Kelantan is well-known for attracting many tourists, and increasing domestic and foreign visitors can drive economic growth in the state. Visitors' exposure to Kelantan's remarkable attractions sparks their desire to experience the destination, and they often share their experiences with others. The tourism journey in Kelantan defines the overall experience, providing knowledge and opportunities to explore interesting locations. Various options, facilities, and technologies cater to diverse experiences, offering both physical and mental variety.

2. Experience Tourism (DV)

Tourism experience refers to the moment when tourism consumption and production intersect, involving the acquisition of skills and behaviors through travel. It is influenced by the multi-sensory, fantastical, and emotional nature of tourism products, impacting tourist behavior. Travelers can shape their own experiences by engaging in events, activities, and interactions outside their homes. These experiences create personal narratives, memories, and emotions associated with the visited place. Tourism experiences involve traveling, learning, and participating in activities

away from home, contributing to the co-creation of ideas and productive outcomes. Such experiences cater to individual desires, ranging from enjoyment to the search for meaning.

3. Online Review (IV 1)

Online customer reviews are critiques written by customers after using or purchasing a product or service. These reviews contribute to big data in the services sector and can be found on various online platforms. They provide valuable information and feedback on whether a product or service lives up to its claims. Social media platforms enable users to create, share, and exchange ideas and information through virtual communities and networks. The Office of Communications and Marketing manages major social media accounts and offers tools and consultations to establish and maintain a social media presence. Online comments and reviews on social media platforms provide insights into the experiences of customers who have used specific products or services. Positive online reviews with high emotional intensity are more likely to influence travel intentions compared to negative reviews. These reviews play a role in shaping tourists' desires and identifying interesting attractions and activities.

4. Value Capture (IV 2)

Value capture refers to the process of retaining a portion of the value provided in every transaction. In the context of tourism, tourists seek experiences that they believe will offer them more value than what they are paying for. Establishing sustainable trust between customers, company providers, and society is crucial for effective value capture. It is essential for tourism companies to assess their ability to extract value from customers, as it leads to increased company value and customer satisfaction. By adding value through experiential tourism, economies in the tourism industry can expand globally and reduce reliance on traditional sectors such as clothing, agriculture, and commodity exports.

5. Security (IV 3)

Security incidents significantly impact tourists' risk perception and travel decisions. Managing safety and security in the tourism sector is crucial to maintaining the popularity of a tourist destination. It involves addressing the concerns of visitors in navigating unfamiliar environments, understanding local customs, interpreting social cues, and ensuring confident purchasing experiences. Peace and hospitality are essential for successful travel and tourism, while war and insecurity are detrimental. When evaluating destination behavior during a crisis, it is important to consider the proactive or reactive measures taken by the destination and its involvement with interested parties aiming to minimize the impact. Providers in the tourism industry must

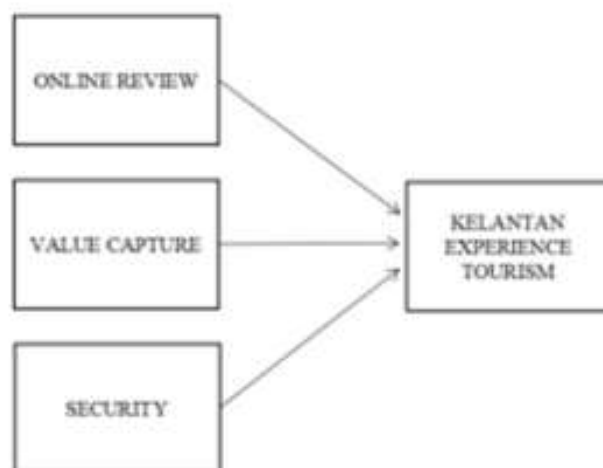

understand how risk influences consumer behavior and how travel information affects destination selection and travel behavior. The government, along with the Ministry of Tourism and Culture and tourism industry stakeholders in Malaysia, should take the initiative to manage tourism risks through strategic cooperation between local authorities, tourism companies, and local communities. This proactive approach aims to mitigate the risk of future unwanted events.

Research Hypothesis

In this study, there were three hypotheses:

H1: There is a significant relationship between online review and Kelantan experience tourism. H2: There is a significant relationship between value capture and Kelantan experience tourism. H3: There is a significant relationship between security and Kelantan experience tourism.

Research Framework

METHODOLOGY

Research Design

Research design refers to the framework and techniques used by a researcher to conduct a study. It specifies the process followed to test hypotheses or achieve study objectives. The choice of research design is crucial as it determines how information is gathered and reported. Research design can be categorized into exploratory, descriptive, and causal research. Data collection methods can be classified as primary (including qualitative and quantitative) and secondary. In this study focusing on UMK students' experiences, a quantitative method will be used to obtain accurate data.

Data Collection

Data collection is the methodical process of acquiring observations or measurements. Whether you are conducting research for corporate, governmental, or academic reasons, data collection helps you to gain first-hand information and distinctive insights into your study problem. A pilot study will be done to confirm that it will be applied to test the viability of recruiting, randomization, retention, assessment protocols, novel approaches, and application of the novel intervention. The researcher distributes the questionnaires online using a Google Form through WhatsApp group and email. Once the number of students' answers is sufficient, the Google Form will be closed. All data will be recorded and stored for the use of this study.

Sampling

Sampling is the process of selecting a subset of a larger population to be studied. Its goal is to gather information from a smaller group to make conclusions about the larger population. The key is to choose a representative sample that includes all relevant factors present in the population. There are two main types of sampling methods: probability sampling and non-probability sampling. In this research, non-probability sampling, specifically purposive sampling, will be used. Out of 11,413 UMK students, a random selection of 375 respondents will be surveyed using questionnaires distributed through WhatsApp groups or email. The focus will be on exploring the students' experiences related to Kelantan's tourism.

Data Analysis

Data analysis is a systematic approach that involves applying mathematical and logical methods to interpret, summarize, and analyze data. Its purpose is to extract meaningful insights from the data and make informed decisions based on the analysis. Various analytical techniques are used to draw inferences and distinguish significant patterns from statistical fluctuations in the data. The goal is to derive valuable information from the data and use it to inform decision-making processes.

FINDINGS

Result of Frequency Analysis

Table 1: Demographic Analysis

CHARACTERISTIC		FREQUENCY	%
Gender	Male	154	40.6
	Female	225	59.4
Age	18 - 20 years old	49	12.9
	21 - 23 years old	190	50.1
	24 - 26 years old	106	28.0
	27 years old and above	34	9.0
Religion	Muslim	239	63.1
	Buddhist	49	12.9
	Christian	51	13.5
	Hindu	40	10.6
Year of study	1	42	11.1
	2	65	17.2
	3	143	37.7
	4	100	26.4
	Postgraduate	29	7.7

Source of funds	Parents	52	13.7
	PTPTN	211	55.7
	Loan	93	24.5
	Self-employed	23	6.1

The respondent profile is summarized in Table 1. The total number of respondents for males and females was 154 and 225. The percentage of male respondents was 40.6% while females were 59.4%. The highest percentage of age was 21 - 23 years old which is 50.1% (190 respondents). The second highest is for 24 - 26 years old with 28% (106 respondents), followed by those by 18 - 20 years old with 12.9% (49 respondents) and the lowest percentage of age is 27 years old and above with 9% (34 respondents).

Next, the analysis showed that the total number of respondents for the Muslim religion is the highest, which is 239 respondents (63.1%). The lowest is Hindu religion with 40 respondents (10.6%). The Buddhist religion is 49 respondents (12.9%) and Christian religion, has 51 respondents (13.5%).

Besides that, the analysis of years of study of year 3 was the highest percentage which is 37.7% with 143 respondents. The second highest percentage of years of study was year 4, which is 26.4% with 100 respondents. followed by year 2 with 17.2% (65 respondents), then year 1 with 11.1% (42 respondents). The lowest percentage of respondents for a year of study is post graduate which is 7.7% with 29 respondents.

Furthermore, the analysis of the source of study for the highest number of respondents was PTPTN which has 211 respondents with 55.7%. The next is a loan which is 93 respondents with 24.5%. Followed by the source of study for parents which is 52 respondents with 13.7%. The last is the lowest number of respondents of source of study for self-employed which is 23 respondents

with 6.1%.

Result of Descriptive Analysis

This study has analyzed the mean and standard deviation for sections B, C, D and E of the questionnaires.

Table 2: Descriptive Analysis

VARIABLE	ITEMS	MEAN SCORE	STANDARD DEVIATION
Online review	I agree that advertising through social media influenced the choice of the holiday destination in Kelantan.	4.28	0.653
	I agree that advertising on mobile apps (Facebook, Instagram & TikTok) influenced my desire to go on vacation in Kelantan.	4.31	0.665
	I agree that the website has the potential to influence my intention to go on vacation to Kelantan.	4.33	0.679
	I agree that quality blogs influence my intention to visit Kelantan.	4.37	0.664

	I agree that positive online feedback such as on YouTube can influence to visit Kelantan.	4.38	0.677
Value Capture	I agree that physical facilities such as banks and business premises can attract my interest in visiting Kelantan.	4.30	0.637

Kelantan Experience Tourism	I think the cost of travel affects the choice of tourist destinations in Kelantan.	4.17	0.637
	I think the attraction of tourism in Kelantan influences the choice of travel destination.	4.26	0.637
	I think the availability of information about accommodations affects the choice of tourist destinations in Kelantan.	4.26	0.685
	I think Kelantan is famous for having a wide variety of interesting foods.	4.37	0.691
	I think the price factors of affordable product sales affect the choice of tourist destination in Kelantan.	4.27	0.653

The mean and standard deviation analyses were on the independent variable, the online review factor. The highest mean score was 4.38 where the respondents agree that positive online feedback such as on YouTube can influence them to visit Kelantan. The lowest score for online review was 4.28 where the respondents agree that advertising through social media influenced the choice of holiday destination in Kelantan.

The mean and standard deviation analyses of respondents for the second independent variable which is value capture. The highest mean score for value capture was 4.41 where the respondents agree that shared homestay experiences can attract visitors to Kelantan. The lowest score of value capture was 4.30 where the respondents agree that physical facilities such as banks and business premises can attract my interest in visiting Kelantan.

The mean and standard deviation analyses of respondents for the third independent variable which is security. The highest mean score for security was 4.47 where the respondents feel comfortable staying at an accommodation that has high-security features. The lowest score for security was 4.21 where the respondents think Kelantan has maximum safety features when doing activities.

The mean and standard deviation analyses of respondents for dependent variable which is Kelantan experience tourism. The highest mean score for Kelantan experience tourism was 4.37 where the respondents Kelantan is famous for having a wide variety of interesting foods. The lowest score for Kelantan experience tourism was 4.17 where the respondents think the cost of travel affects the choice of tourist destinations in Kelantan.

Result of Reliability Analysis

A reliability analysis was used based on the internal consistency items that represent the factor influencing Kelantan experience tourism as well as the overall scale. The reliability analysis used Cronbach's Alpha Coefficient.

Table 3: Reliability Analysis

VARIABLES	NUMBER OF QUESTIONS	CRONBACH'S ALPHA COEFFICIENT	STRENGTH OF ASSOCIATIONS
Online review	5	0.727	Good
Value capture	5	0.723	Good
Security	5	0.692	Good
Kelantan experience tourism	5	0.614	Good

Cronbach's Alpha Coefficient values for independent variables and dependent variables in this study were more than 0.6. The conclusion presented was considered reliable and may be accepted in this study. The online review of the factors that influence Kelantan experience tourism among UMK students was measured using five questions, and Cronbach's Alpha Coefficient results for this section was 0.727 and which is considered good. As a result, the coefficients produced for the online review variable questions were reliable.

Besides that, the value capture of the factors that influence Kelantan experience tourism among UMK students was measured using five questions. Cronbach's Alpha Coefficient result for the value capture section was 0.723. This is considered good. As a result, the coefficients produced for this section's questions were reliable.

Furthermore, there were another five questions for the security section of the factor influencing Kelantan experience tourism among UMK students. Cronbach's Alpha Coefficient result for the security section was 0.692 and this is considered good. As a result, the coefficients calculated for the security variables were reliable.

Finally, another five questions were used to measure the Kelantan experience of tourism among UMK students and Cronbach's Alpha Coefficient result for this section was 0.614. This is

considered good. As a result, the coefficients may be concluded that this study was reliable.

Pearson Correlation

Table 4: Pearson Correlation Analysis

HYPOTHESIS	P-VALUE	RESULT (SUPPORTED/NOT SUPPORTED)
H1: There is a significant relationship between online review and Kelantan experience tourism among UMK students.	0.520	H1 is supported
H2: There is a significant relationship between value capture and Kelantan experience tourism among UMK students.	0.582	H2 is supported
H3: There is a significant relationship between security and Kelantan experience tourism among UMK students.	0.520	H3 is supported

Table 4 shows the result of the Pearson Correlation Analysis of factor influence Kelantan experience tourism among UMK students. The p-value of online review of Kelantan tourism experience is <0.001 which is less than the very significant level at 0.001. The relationship between online review and Kelantan experience tourism is moderate with a correlation value of 0.520.

Then, the relationship between value capture and Kelantan experience tourism with p-value is <0.001 which is less than the significant level at 0.001. A correlation value of 0.582 shows that there was a moderate correlation between value capture and Kelantan experience tourism.

Finally, for the security factor, the p-value is <0.001 which is less than the very significant level at 0.001. The correlation value of 0.520 revealed a moderate relationship between security and

Kelantan experience tourism.

DISCUSSION AND RECOMMENDATION

An important and substantial step for finishing the research has been encountered throughout the entire project. However, permitting research to proceed as intended comes with some built-in limitations. There are serious issues with the current study that must be acknowledged. The first drawback of this study was the lengthy period needed to complete all of the data collection. The researchers went above and beyond to get in touch with the respondent right away.

The survey participants' unwillingness to participate in responding to the online questionnaire. Since it is difficult to locate travellers to perform in-person surveys for this study, all information must be entered online. Online polls that were shared through Facebook pages, Instagram, and WhatsApp groups had little responses. Researchers often had to submit the survey and make requests to the respondents in order to get their participation.

This study reveals the factors that influence Kelantan experience tourism, such as online review, value capture and security. It also recommends using qualitative methods to collect information more specifically and accurately. A structured face-to-face interview is better for getting a clear and precise response from the respondents, while a one-sided data source using a questionnaire may not be accurate. The researcher must first identify the intended target responder, who should be familiar with the study's title. Finding a good target responder is important if the respondents still do not understand the complexity of the study's topic.

This research should larger the sample size to increase the realizability of the study. Data collection questionnaires should be placed in every travel agency that provides Kelantan tourism experience, and early stages should include joining active groups with a connection to the study's subject. Additionally, more variables should be taken into consideration, such as online review, value capture, and security. These three variables have a minor amount of connection with the dependent variables.

CONCLUSION

This study concludes that all three factors which are online review, value capture and security are significant in Kelantan experience tourism. The exchange of tourist experiences should be used as a strategy to boost tourism in Kelantan and bring in more visitors. To learn more about tourism in Kelantan, students who are studying there should visit attractive locations. The findings of this study may clarify what motivates students to experience tourism. A representative population sample should be considered in future studies. The results will be inconsistent if the sample is unbalanced. The sample size needs to be raised after that to obtain exact, accurate, and consistent results. To learn more aspects that affect visitors' decisions to travel to Kelantan, researchers might also consider combining more variables.

Faculty of Hospitality, Tourism and Wellness, Universiti Malaysia Kelantan

aryani.a@umk.edu.my

ABSTRACT

Women have become more involved in the tourist business in Malaysia, and they have made major contributions to many different areas of the economy throughout the years. In Malaysia, a number of projects and programs had a particular emphasis on empowering women in the tourism sector. For instance, the Malaysian Association of Hotels (MAH) launched the Women in Hospitality and Tourism (WiHT) programme with the aim of encouraging leadership opportunities and professional development for women working in the hotel business. The primary goal of this study was to identify the factors that influenced women's participation in tourism. The Malaysian government's efforts to encourage its citizens to start businesses were evident. Targeted replies were from participants all around Malaysia, and 384 respondents successfully completed the online survey. The data was examined using SPSS version 29.0, which stands for Statistical Package for Social Science. SPSS Statistical was responsible for managing the complete statistical analysis process, encompassing planning, data collection, analysis, and reporting, to enhance performance and facilitate effective decision-making. In this study, the researchers utilized the Pearson correlation coefficient to investigate the association between skills and training, leadership, well-being, and digitalization toward women's participation in tourism. The results showed a significant effect of the relationship toward women's participation in tourism. Through this study, we could understand the skills and training, leadership, well-being, and digitalization that affected women's participation in tourism.

Keywords: women participation in tourism, Women involvement in the tourist business

INTRODUCTION

The history of the study and the issues with research topic are covered in this chapter. In response to the problems mentioned in the research problem, research objectives are created. The significance of the study is discussed in the chapter's final section.

This study is done practically so that it can contribute to the improvement of women's participation and tourism in Malaysia. Women are regarded as cultural caretakers across the world. They are the chefs, weavers, farmers, and housewives, the keepers of traditions and

stories. According to academics, women who participate in tourism can increase their expertise. For example, they can learn a variety of languages based on the tourists that visit their locations. They can learn more about themselves because of this. According to research, a good quality education can have an influence on entrepreneurial growth by increasing an individual's self-efficacy and self-confidence (GEM, 2012)

Looking at the sector, women's engagement in tourism will boost the local economy. A strong association between gender and perceived business performance was discovered in the current study, suggesting that gender has a favourable influence on company success. A greater gender balance in entrepreneurship may indicate a better work-life balance for a society (GEM, 2013). Economic growth might benefit from persuading brilliant girls to consider establishing a firm and taking on the hurdles that may be tough for others. To that purpose, brave and entrepreneurial ladies might serve an essential role as role models or mentors.

When seen as a whole, this underlines the critical relationship between macroeconomic and social welfare policies for women to enjoy any real empowering effects from tourism engagement. There is frequently a schism between women who work in tourism, who are sometimes labelled "money ladies" because they earn money or "stand out," and other members of the community. This emphasises the significance of taking 'intersectionality' into account when creating gender equality measures in tourism. This includes considering women's many identities and privileges in terms of geography, race, nationality, socioeconomic background, disability, and other identity markers, as well as the intersections of these identities.

There are four objectives of this research:

- a. To examine the relationship between skills and training towards women participation in tourism.
- b. To examine the relationship between leadership towards women participation in tourism.
- c. To examine the relationship between well-being towards women participation in tourism.
- d. To examine the relationship between digitalization and participation towards women participation in tourism.

SIGNIFICANCE OF THE STUDY

This study focuses on the importance of women's participation in tourism in Malaysia. Women are seen as cultural caretakers and can increase their expertise by learning different languages. A good quality education can have an influence on entrepreneurial growth by increasing self-efficacy and self-confidence. Women's engagement in tourism can also boost the local economy, and there is a strong association between gender and perceived business performance. To ensure gender equality in tourism, it is important to consider women's identities and privileges in terms of geography, race, nationality, socioeconomic background, disability, and other identity markers.

LITERATURE REVIEW

This chapter reviews research in which female tourism participation is a dependent variable while skill and training, leadership, well-being, and digitization are independent variables. It also contributes to the formation of hypotheses and the research framework. A literature review is an academic piece of writing that displays knowledge and command of academic literature on a certain topic.

A skills training naturally is one that organisations offer to teach or strengthen workplace abilities. The tourism business employs about 200 million people, with women accounting for 70% of those jobs. Two of the biggest causes of this isolation are gender preconceptions and established gender standards. The MSME sector in the Philippines and India is critical for employment creation and entrepreneurship. Female leaders serve as role models for their subordinates.

WLT encourages and promotes women's participation in tourism's highest levels of corporate governance. Women should be allocated crucial positions for company leadership, as only 37% of managers, 28% of board members, and less than 1% of top executives are female. Well-being is both personal and subjective, and safety shields against both unintended and useful injury. The use of digital technologies to modify a business model and generate new revenue and value can be referred to as digitalization. Women micro entrepreneurs employ mobile technology to aid them with client payments and banking, and digital technologies increase access to markets, customers manufacturing technologies, marketing, and business information, knowledge, and resources.

The United Nations World Tourism Organisation (UNWTO) has chosen as its subject matter "Tourism Opening Doors for Women" for Tourism Day 2007. By setting up stalls, selling souvenirs and food, and connecting with hawkers, women in the industry of tourism contribute to the informal economy. Women contribute to family income, yet their influence in society stays limited. Women make up 46% of the workforce in the industry, which is higher than the global average of 34-40%. The proportion of women working in this sector varies greatly per country, ranging from 2% to more than 80%. Despite the lack of clear regional trends, it appears that women comprise roughly half of the workforce in countries with more developed industries such as tourism.

Brand image, skills and training, leadership, well-being, and digitalization all have a positive impact on women's participation in tourism. Skills and training have a positive impact, leadership has a positive impact, well-being has a positive impact, and digitalization has a positive impact. All of these factors have a positive impact on women's participation in tourism.

This chapter discusses the literature review, which includes two main variables: independent variable (IV) and dependent variable (DV). Independent variable (IV) is an attribute or function that can be counted, monitored, or manipulated, while dependent variable (DV) is an item that can be counted, monitored, or manipulated.

RESEARCH HYPOTHESIS

The study's hypothesis is to determine whether there are any correlations or relationships between dependent variables and independent factors:

- H1: Skills and training have a significant relationship with the participation of women in tourism.
- H2: Leadership has a significant relationship with participation of women in tourism.
- H3: Well-being has a significant relationship with participation of women in tourism.
- H4: Digitalization has a significant relationship with the participation of women in tourism.

RESEARCH FRAMEWORK

The Figure 1 below shows the research framework used for this study.

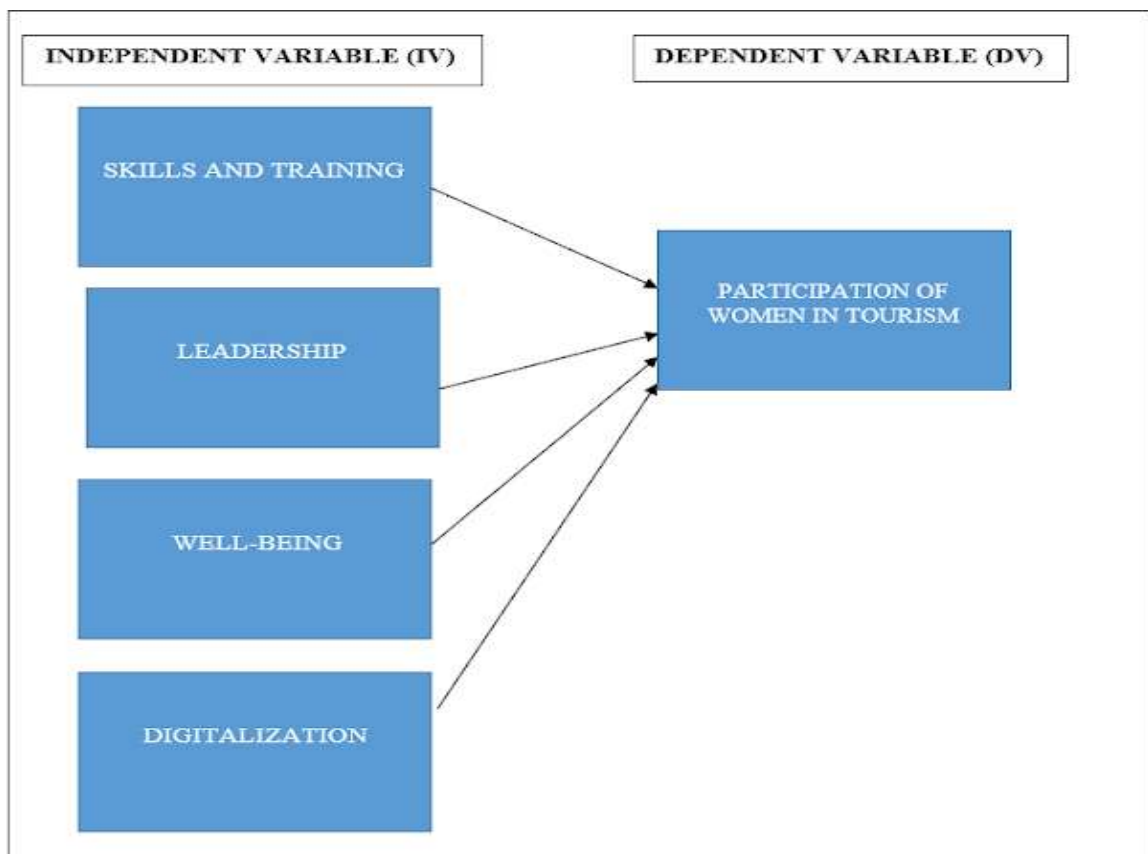

Figure 1: Research Framework

METHODOLOGY

Research Design

The research design is the overall approach you adopt for combining the various study components in a logical and persuasive manner that ensures you will effectively address the research topic. It serves as a road plan for data collection, measurement, and analysis.

The descriptive research approach is utilized in this study to describe anything that might be a phenomena or a present circumstance. This study will use a quantitative strategy to obtain data for the research by delivering a questionnaire to Malaysia residents. Quantitative research requires facts, logic, and an objective point of view. In contrast to divergent reasoning, quantitative research focuses on thorough, convergent reasoning. (Bhandari et al., 2020).

Population

A population is a collection of people about whom you wish to draw conclusions. A gender questionnaire will be utilized to collect data for this investigation. Malaysia's population reaches one million people. Moreover, Malaysia is ranked among the top tourism destination in SouthEast Asia (Muhamad Nasir et al., 2022). To help our people, our researchers made the case for funding our study.

Sample Size

To determine the sample size, Krejcie and Morgan (1970) sample was used in this study. Krejcie & Morgan (1970):

Table 3.1
Table for Determining Sample Size of a Known Population

N	S	N	S	N	S	N	S	N	S
10	10	100	80	280	162	800	260	2800	338
15	14	110	86	290	165	850	265	3000	341
20	19	120	92	300	169	900	269	3500	346
25	24	130	97	320	175	950	274	4000	351
30	28	140	103	340	181	1000	278	4500	354

Note: N is Population Size; S is Sample Size *Source: Krejcie & Morgan, 1970*

The exact amount of sample size for the population is 384.

Data Collection

A process for acquiring and evaluating data for research and validation purposes is known as data collection. Data is gathered to look into an issue, find its solution, and identify potential future trends. Techniques for gathering data aid in decision-making. In this study, data collection methods used primary data that we will distribute using questionnaires to respondents to get the primary data. The survey will be delivered online, or it may go by another name, which is an online survey. A form may be a collection of queries or that aims to gather info from a respondent. A probe form frequently consists of both closed- and open-ended inquiries. The purpose of this analysis was identified within the covering letter within the form distributed to the respondents. Therefore, the respondents can perceive the motive and purpose of this study, so it permits respondents to produce additional correct info. After they finish, all the questionnaires will be collected, and then the researcher will count the number of questionnaires that will be distributed to them. Using the data collection procedure, a questionnaire, the researcher can save time, and this method is also relatively inexpensive.

Sampling

For the research, a small group of people were chosen from a large population using the sampling method. A portion of the population was chosen by the researchers for additional examination during the sampling phase. Probability sampling and non-probability sampling are the two different categories of sampling procedures. In this research, non-probability sampling procedures were used because convenience sampling is simple to perform and cost-effective.

Research Instrument

The quantitative method will be used in this study. The quantitative data collection method generates statistics (rather than meaning) through large-scale survey research using questionnaires.

Table 1: Measurement items

Measurements	Number of items in the questionnaires	Scales used	Author
Section A: Demographic information	6	Adapt	
(Dependent Variables) Section B: Women Participation in Tourism	5	Adopt	Serafimova et al., (2018)
(Independent Variables) Section C: Skills and Training	5	Adopt	Andrades et al., (2019)
(Independent Variables) Section D: Leadership	5	Adopt Alharthi,	Samad & (2022)
(Independent Variables) Section E: Well-being	5	Adopt et	Moreno-González al., (2020)
(Independent Variables) Section E: Digitalization	5		Khurramov et al., (2020)
Total	31		

Data Analysis

This study utilized frequency, descriptive, and reliability analyses to demonstrate the links between dependent and independent variables. Using the Statistical Package for the Social Sciences (SPSS), the collected data were statistically processed through regression analysis.

FINDINGS

Demographic Profile of Respondent

Race

Table 4.3: Number of Respondents by Race

Gender	Percentage (%)	Cumul ative	Perce ntage (%)
	F r e q u e n c y		
Chinese	59	15.4	15
Indian			4
Malay	53		
Others		13.8	
Total	266		29
		69.3	2
	6		
		1.6	
	384		98
		100	4
			100

This table show the total respondents by race. 384 respondents—Malay (266), Chinese (59), Indian (53), and others (6)—completed the questionnaire. Figure 4.1 showed that most

percentage of responders was 21-30 years old (38.1%), followed by 31-40 years old (37.8%), 41-50 years old (15.1%), 50 and above years old (8.8%), and below 20 years old (0.3%).

Education Level

Table 4.5: Number of Respondents by Education Level

Fields	Frequency	Percentage (%)	Cumulative Percentage (%)
Degree	308	80.4	80.4
Master's	8	2.1	82.5
Others	4	1.0	83.6
SPM	19	5.0	88.5
STPM/Diploma/Matriculation	44	11.0	100
Total	384	100.0	

This table showed total respondents by education level. Degree (308 respondents), Master's (8 respondents), SPM (4 respondents), STPM, Diploma, and Matriculation (19 respondents) completed the questionnaire. Figure 4.3 indicated the biggest percentage of responders was Degree (80.4%), followed by Master's (2.1%), SPM (5.0%), STPM, Diploma and Matriculation (11.0%), and others (1.0%).

Marital Status

Table 4.6: Number of Respondents by Marital Status

Status	Frequency	Percentage (%)	Cumulative Percentage (%)

Married	192	50.0	50.0
Others	4	1.0	51.0
Single	188	49.0	100.0
Total	384	100.	
		0	

This table showed total marital status respondents. Marriage had 192 respondents, singles 188, and others 4. 49.0% of 384 respondents were single, 50.0% were married, and 1% were other participants.

Field

Table 4.7: Number of Respondents by Field

Field	Frequency	Percentage (%)	Cumulative Percentage (%)
Hotel and Resort Management	91	23.7	23.7
Marketing and Sales	60	15.6	39.3
Travel Agent	59	15.4	54.7
Tour Guides	24	6.3	61.0
Event Planning	58	15.1	76.1
Others	92	23.9	100.0
Total	384	100.0	

Percentage of Respondents by Field revealed field totals. Hotel & Resort Management led with 23.7% (91 respondents), followed by others with 23.9% (92 respondents). 15.6% (60 responses) for Marketing and Sales. Next were Travel Agents (15.4%, 59 respondents), Event Planning (15.1%, 58 respondents), and Tour Guides (6.3%, 24 respondents).

State

Table 4.8: Number of Respondents by State

State	Percentage (%)	Cumulative Percentage
Frequenc	y	(%)

Johor	21	5.5	5.5
Kedah	74	19.3	24.7
Kelantan	31	8.1	32.8
Melaka	21	5.5	38.3
Negeri Sembilan	8	2.1	40.4
Pahang	19	4.9	45.3
Perak	25	6.5	51.8
Perlis	25	6.5	58.3
Pulau Pinang	89	23.2	81.5
Sabah	11	2.9	84.4
Sarawak	2	0.5	84.9
Selangor	28	7.3	92.2
Terengganu	8	2.1	94.3
Wilayah Persekutuan Kuala Lumpur	22	5.7	100
Total	384	100	

From the table above, Pulau Pinang had 23.2% of responders (89), followed by Kedah with 19.3% (74). Kelantan had 8.1% (31 respondents) and Selangor 7.3% (28 respondents). 6.5% (25 people) were from Perak and Perlis. 5.7% (22 responses) from Wilayah Persekutuan Kuala Lumpur Melaka and Johor followed with 5.5% (21 respondents). Pahang (4.9%; 19 respondents), Sabah (2.9%; 11 respondents), Terengganu and Negeri Sembilan (2.1%; 8 respondents), and Sarawak (0.5%; 2 respondents) followed.

Reliability Test

Alpha Coefficient Range	Strength of Association
< 0.6	Poor
0.6 to < 0.7	Moderate
0.7 to < 0.8	Good
0.8 to < 0.9	Very Good
0.9	Excellent

This Table Illustrates the overall consistency (pilot test) for the dependent and independent variable.

Table 4.2: Result of Reliability Coefficient Alpha for the Independent Variables and Dependent Variable

Variable	Number of items	Cronbach's Alpha coefficient	Strength of Association
Skills and Training	5	0.856	Very Good
Leadership	5	0.932	Excellent
Well-Being	5	0.942	Excellent
Digitalization	5	0.929	Excellent
Women Participation Tourism	5	0.936	Excellent
Overall variables	25	0.979	Excellent

This study's independent and dependent variables' Cronbach's Alpha Coefficients was shown in Table 4.2. From the table, all variables were over 0.7 and overall variables were 0.979.

Malaysian women's tourism participation was measured using five skills and training questions. Table 4.2 shows a very good Cronbach's Alpha of 0.856 for this section's question. Thus, the skills and training variable coefficients were accurate.

Five questions measured leadership's impact on Malaysian women's tourism. This section's Cronbach's alpha coefficient, 0.932, is excellent. Leadership variable coefficients were reliable.

Finally, five questions were utilized to measure the well-being variable that influenced Malaysian women's tourism. This section's Cronbach's Alpha was excellent at 0.942. Thus, wellbeing variable question coefficients were reliable.

Five questionnaires measured the digitalisation variable that affected Malaysian women's tourism industry engagement. The query's Cronbach's alpha score was 0.929, which is excellent. Thus, the coefficients for digitalization variable inquiries were reliable.

The Cronbach's Alpha for this section's question was 0.936, indicating outstanding. Thus, these questions' coefficients on Malaysian women's tourism involvement were credible. Since the variables' Cronbach's Alpha charge exceeded 0.7, surveys are credible, and the study can continue. Overall, reliability showed that respondents understood the questions, approving the questionnaires for this study.

RESULT OF INFERENTIAL ANALYSIS

Pearson's correlation analysis was an essential linear connection analysis. This investigation examined independent variable-dependent variable correlations.

Table 4.15: Strength Interval of Correlation Coefficient

Size of Correlation	Interpretation
0.90 to 1.0 (-0.90 to 1.0)	Very high positive (negative) correlation
0.70 to 0.90 (-0.70 to -0.90)	High positive (negative) correlation
0.50 to 0.70 (-0.50 to -0.70)	Moderate positive (negative) correlation
-0.30 to 0.50 (-0.30 to -0.50)	Low positive (negative) correlation
0.00 to 0.30 (-0.00 to -0.30)	Negligible correlation

Hypothesis 1: Skills and Training

H1: There is a relationship between skills and training towards women participation in tourism.

DISCUSSION BASED ON RESEARCH OBJECTIVES

This literature review promotes female tourism. This study found a correlation between skills and training, leadership, well-being, and digitalization among women in tourism.

Hypothesis	Pearson's correlation results	
H1: There are relationship between skills and training among women participation in tourism	$r = 0.767, p < 0.01$	Strong
H2 : There are relationship between leadership among women participation in tourism	$r = 0.793, p < 0.01$	Strong
H3 : There are relationship between well-being among women participation in tourism	$r = 0.808, p < 0.01$	Strong
H4 : There are relationship between digitalization among women participation in tourism	$r = 0.794, p < 0.01$	Strong

The table confirmed that all hypotheses on skills and training, leadership, well-being, and digitalization among women in tourism were accepted through Pearson's correlation analysis at a 0.01 significance level. The results demonstrated a strong and positive correlation between the independent variables and women participation.

RECOMMENDATIONS

Tourism can empower women. Tourism-related jobs and income can help women financially. Economic empowerment can improve their lives and their families, reducing poverty and promoting socio economic growth. Thus, empowering women requires this proposition. Education empowers Encourages women to study tourism. Encourage women to pursue tourism and hospitality management degrees or certificates to gain knowledge and

skills. Entrepreneurship and Business Training helps women start tourism-related enterprises. Help them with startup ideas, funding, marketing, and legal and regulatory issues. This can help women become tourism entrepreneurs and leaders.

CONCLUSION

In conclusion, this study was done to investigate the variables that encourage women to travel. The influencing elements (independent variables) of leadership, well-being, digitization, and skills and training have an influence on women's engagement, which is a dependent variable. A Google Form containing 384 respondents was used by researchers, as described in Chapter 3, to distribute surveys to respondents who work in the tourism sector. To contact respondents across Malaysia, the researchers use a Google Form. This is due to the fact that utilising this Google Form makes it simpler for participants to complete all surveys, which in turn helps the researchers save time and money.

Numerous analyses, including frequency analysis, descriptive analysis, reliability analysis, and correlation analysis, were used to determine the findings of the questionnaire survey results. Next, the Statistic Package for the Social Science (SPSS) software programme was used to examine the results from the previous chapter as well as all of the data from the questionnaire. This software was chosen by the researchers because it makes it simple to access all the findings. Finally, a summary and conclusion of the final findings from the data analysis. All of the given hypotheses (H1, H2, H3, and H4) are accepted for this study. As well as analysing the results of the questionnaire survey, limits and suggestions were made for this research in the hopes that they may be useful for future investigations. It is thus also hoped that all the knowledge shared during this research may aid the following researche

INTENTION TO USE METAVERSE IN TEACHING AMONG UNIVERSITI MALAYSIA KELANTAN LECTURER

NUR FARAHANIM BINTI AZIZ, NUR FIZATULNISA BINTI BACHIK, NUR HANI MAISARAH BINTI MUHAMAD NIZAM, NUR HANIM FARISYA BINTI MOHD ZAIN & PN FADHILAHANIM ARYANI BINTI ABDULLAH
Faculty of Hospitality, Tourism and Wellness, Universiti Malaysia Kelantan aryani.a@umk.edu.my

ABSTRACT

The study aims to investigate the way lecturers at University Malaysia Kelantan are influenced by the metaverse in their teaching in terms of performance expectancy, effort expectancy, and facilitating conditions. Questionnaires were used as the quantitative tool in the study. The results of this study have significance for learning and help to comprehend lecturers at the University Malaysia Kelantan's intentions of using the metaverse in their teaching.

Keywords: Intention to use metaverse, Performance expectancy, Effort expectancy and facilitating condition,

INTRODUCTION

The purpose of this study is to investigate the intention to use Metaverse in teaching among University Malaysia Kelantan lecturer. The metaverse has been defined as a new internet iteration that makes use of virtual reality headsets, block chain technology, and avatars as part of a new fusion of the real and virtual worlds (Lee et al., 2021). Working with students to ensure that they understand and can put ideas, concepts, and processes into practise is referred to as teaching. It entails design, content selection, delivery, assessment, and reflection. The act of integrating pupils in the active construction of knowledge is known as teaching. To teach is to involve the learner in the process. The study aims to investigate the relationship between performance expectancy, effort expectancy and facilitating conditions and metaverse in teaching.

SIGNIFICANCE OF THE STUDY

The metaverse provides virtual environments that can immerse students in realistic simulations and interactive experiences. By studying the metaverse, educators can design activities that engage students in experiential learning, allowing them to explore and interact with virtual objects, and gain practical skills in a safe and controlled environment. Global collaboration and intercultural understanding. The metaverse enables students from different geographical locations to collaborate, communicate, and learn together in virtual classrooms. By studying the metaverse, lecturer can facilitate global collaborations, fostering cultural exchange and creating opportunities for students to work with peers from diverse backgrounds. This promotes intercultural understanding and global citizenship.

LITERATURE REVIEW

i) Intention to use metaverse (DV)

The metaverse aims to build a digital universe that combines elements from the real and virtual worlds, such as simulated or mirrored environments, avatars, non-player characters, etc. Numerous modeling and simulation tools, including SketchUp, Unity, and Blender, are already available to create digital objects (Tlili et al., 2022). Therefore, "intention to use metaverse in teaching" refers to an individual's deliberate plan or inclination to employ the metaverse, which represents a virtual reality space or collective virtual shared space, for the purpose of facilitating teaching and learning activities. It suggests a conscious decision to leverage the metaverse's potential as a tool or platform for educational instruction and engagement.

ii) Performance Expectancy

The concept of performance expectation has drawn significant attention from a number of authors and researchers working in a variety of human undertakings (Venkatesh, Morris, Davis, and Davis, 2003; Derntl, 2011; Khayati & Zouaoui, 2013, etc.). As noted by Rogers (2003), several of these studies made an effort to identify and apply the concept to explain information technology adoption and use. Performance expectation (PE) is the degree to which a person anticipates that implementing a system would enable him or her to enhance performance at work. (Venkatesh et al., 2003).

iii) Effort Expectancy

The UTAUT model also includes a construct called effort expectation that gauges how simple an information technology is to use. According to Venkatesh et al. (2003), effort expectancy refers to how simple it is to utilize an information system. It implies that postgraduate students should not anticipate their use of smartphones to involve significant physical or mental work. The foundation of effort expectation is the notion that there are connections among the effort expended at work, the results obtained as a result of that effort, and the rewards obtained as a result of that effort. (Ghalandari, 2012).

iv) Facilitating Condition

According to Venkatesh et al. (2003), the degree to which a person believes that the organisational and technological infrastructure is in place to facilitate usage of the system is known as the "facilitating condition." In the context of this study, it refers to the objective elements, such as infrastructure and resources that UMK lecturers want to employ in their instruction. According to Venkatesh et al. (2013), enabling conditions and behavioural intentions to use and accept technology have a favourable association. Age and experience did, however, mitigate the link, making it greater for older individuals with more experience. When both performance and effort expectation constructs are present, according to TPB and DTPB, enabling circumstances are insignificant and direct antecedents of usage (a characteristic also evident in MPUC).

Research Hypothesis

H1: There is relationship between Performance expectancy and metaverse in teaching among UMK lecturer.

H2: There is relationship between Effort expectancy and metaverse in teaching among UMK lecturer.

H3: There is relationship between Facilitating condition and metaverse in teaching among UMK lecturer.

Research Framework

Toward finishing the analysis, a conceptual framework might be used as a device for accumulating information on this research. Thus, this framework is likewise beneficial in describing the connection among impartial variables and based variables in the research.

Figure 2.4 Conceptual Framework

METHODOLOGY

Research Design

Quantitative research places more focus on exact, convergent thinking than divergent reasoning (P. Bhandari, 2020). The quantitative study's design emphasises how events are judged and described in a detached way. This approach uses data, control, and statistics in the study design to maximise impartiality. As a result, this study employed a quantitative approach to gather its research data.

The study's primary data were collected using the quantitative research approach. Kumar claims that descriptive research may reveal everything, including trends, current events, and characteristics of a person, a group, or an organisation, among other things (2013). William (2011) defined quantitative analysis as the process of preparing data such that it can be quantified and statistically evaluated to establish or reject specific knowledge claims. This study examines the performance expectations, effort expectations, and facilitating condition of lecturer at UMK who use the Metaverse for teaching. Quantitative method is the best approach included surveys, observations for numeric information in this research.

Data Collection

. The survey form has been applied to a wide range of fields, including politics, marketing research, and psychology. For the study, 123 questionnaires were collected. There are 123 questionnaires in total were given to lecturer in teaching at UMK. Based on their desire to take part in the survey, a random selection process was used to choose all respondents. When they're done, all the questionnaires will be collected, and the researcher will then count up how many questionnaires were given out overall. The researcher can conserve their time by employing the questionnaire-based data gathering approach.

Sampling

A approach for selecting a small sample from a large population for research purposes is the sampling method. The researchers choose a subset of the population for further examination during the sampling phase. Probability and non-probability sampling techniques are the two main categories. Using probability theory, researchers select samples from a broader population. This method is known as probability sampling. This kind of sampling creates samples in accordance with the current procedure and takes into account every member of the population. In a non-probability sample, participants are chosen at random by the researcher. With this form of sampling, there is no predetermined or specified selection procedure. Convenience sampling is simple and affordable to do. In this investigation, we have chosen to use non-probability. Non-probability sampling was chosen because it is more efficient and less expensive than probability sampling because the researcher is already familiar with the sample.

Data Analysis

Data analysis is done when a large quantity of data is gathered, and it turns the data into insightful knowledge that helps identify patterns. So, using the widely used statistical programme SPSS (Statistical Package for Social Science), the data analysis for the data instrument of this research study questionnaire was carried out. A number of analyses, including the descriptive analysis, reliability test, inferential analysis, and Pearson correlation, will be used to further support the results once each survey item has been individually investigated.

FINDINGS

This chapter presents the results of a survey conducted with 123 lecturers from University Malaysia Kelantan. The survey data was analyzed using various methods, including frequency analysis, descriptive analysis, reliability analysis, reliability tests, and Pearson correlation coefficient analysis. The findings are discussed in relation to the research objectives. The survey included filter questions, and the demographic profile of the respondents, including gender, age, academic grade, and highest education, was collected and summarized.

The number of respondents based on Gender

		Gender			
		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Female	88	71.5	71.5	71.5
	Male	35	28.5	28.5	100.0
	Total	123	100.0	100.0	

The statistic table that based on gender of the respondents. The total of all the respondents is 123 respondents. In this research, the female respondents have the highest percentage compared to the male. Female respondents have higher percentage with 71.5% (N=88) respondents. While male have 28.5% (N=35) respondents.

The number of respondents based on Age

		Age			
		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	30 years	39	31.7	31.7	31.7
	31 - 40	69	56.1	56.1	87.8
	Above 41	15	12.2	12.2	100.0
	Total	123	100.0	100.0	

Based on the result from, the table show the statistic table that based on age of the respondents. Out of 123 respondents the highest number of group age of 31-40 years old with 56.1% (N=69) respondents followed by second highest group age of 30 years old with 31.7% (N=39) respondents. As for the group age of above 41 the percentage is 12.2% (N=15) respondents.

The number of respondents based on Academic Grade

		Academic Grade			
		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Lecturer	92	74.8	74.8	74.8
	Professo	15	12.2	12.2	87.0
	Senior L	16	13.0	13.0	100.0
	Total	123	100.0	100.0	

Table illustrate the frequency and status based on the academic grade of respondents. Out of 123 respondents 92 of them were lecturer with 74.8% (N=92) respondents while the other senior lecturer with 23.0 % (N=16) respondents and professor with 12.2% (N=15).

The number of respondents based on Highest Education

		Highest Education			
		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Degree	14	11.4	11.4	11.4
	Doctor o	49	39.8	39.8	51.2
	Master	60	48.8	48.8	100.0
	Total	123	100.0	100.0	

Table illustrate the respondents based on their highest education. With 48.8% (N=60) respondents have a master. With 39.8% (N=49) of the respondents have doctor which is the second highest level of education. The followed by 11.4% (N=14) respondents have degree.

DISCUSSION AND RECOMMENDATION

LIMITATIONS

Throughout the study, a practical and reliable method for drawing conclusions has been encountered. However, permitting research to proceed as intended comes with some built-in limitations. There are serious issues with the current study that must be addressed. The respondents also expressed reluctance to participate in the online poll. The COVID-19 that has affected our country and other countries across the world has had a significant influence on the tourist industry. In order to collect all the information, it is difficult for researchers to collect data in person. Google Forms was used to distribute online surveys that collected data.

In order to encourage respondents to participate in this survey, researchers continuously implored them to do so.

Recommendation for UMK Lecturer's

In Malaysia's Kelantan province, the majority of college lecturers want to incorporate the metaverse into their instruction. The metaverse has the potential to alter how lessons are taught in the classroom, electronically bring together teachers and students in one location, improve career preparation, and open up new options for lifelong learning. With the rise of the metaverse, information technology and artificial intelligence have stimulated educational innovation, altered traditional pedagogical ideas and techniques, and created the foundation for smart education.

Future Study

For better research goals, this study employs quantitative approaches. However, since they take a different approach and can produce different information than quantitative approaches, researchers may choose to employ qualitative methods in the future to gather data. Utilising several methodologies is done to see whether the outcomes from earlier study differ. For instance, researchers may not get particular data when using quantitative approaches, but they are more likely to get precise data while utilising qualitative methods.

CONCLUSION

The goal of this study, was to find out whether Universiti Malaysia Kelantan lecturers intended to use the metaverse for education. The study found that factors including performance expectations, effort expectations, and enabling circumstances all had a significant influence on people's motivation to use the metaverse. 123 research participants responded to questionnaires distributed through Google Forms. Data collection was made simple, cost-effective, and time-effective by using Google Forms. To assist with the descriptive, reliability, and inferential analyses of the gathered data, the SPSS software programme was employed. The results of the analysis supported all of the study's assumptions (H1, H2, H3, and H4). The study also identified its limitations and made recommendations for further investigation.

ABSTRACT

In order to sustain business performance among homestay operators in Kelantan, this research study will review the literature on the roles that knowledge capacity, innovation capacity, asset capacity, and digitization capacity play. There will always be a knowledge capacity issue in some aspect of human life. Its capacity for knowledge includes its ability to gather information, create knowledge, disseminate knowledge, and apply knowledge. A person's experience with knowledge capacity can be either positive or negative depending on their personality and social network.

Keywords: Homestay operators, business performance, capacity

INTRODUCTION

Kelantan is well known for its alluring natural beauty and diverse cultural heritage. Many visitors from abroad come to Kelantan, and most of those who come here choose to stay at a homestay. The way the environment like the market reacts to the actions of the entrepreneurs determines how well a business performs. To put it another way, a company will succeed if there is a market for the goods or services it provides. Business performance therefore depends on entrepreneurial performance as well as internal factors such as staff reactions to different decisions and external factors changes in consumer relations environment action. Performance as an entrepreneur is different from performance as a business in this approach. An entrepreneur may be operating at a high level, yet unanticipated or uncontrollable factors may lead their business to perform poorly (Delmar, F. 1996).

For instance, a business owner might want to grow but find that doing so would be difficult due to fierce competition or legislative restrictions. It is more reasonable to define entrepreneurial performance as the specific tasks that can or should be controlled because, to put it another way, an entrepreneur can never control all of the aspects driving firm performance. Here, business performance is defined as the capacity for expansion or survival. This is believed to be a clear sign of entrepreneurship. Although survival alone is insufficient as a sign of entrepreneurship, it is a sign of market resilience (Delmar, F. 1996). The importance of business performance is to help you in public relations so people can know who you are, what business you do, and why you do it.

The Malaysian homestays are defined as a place “where tourists stay with the host’s family and experience the everyday way of life of the family in both a direct and indirect manner” (Ministry of Tourism and Culture [MOTAC]) as cited in Ibrahim & Razzaq, 2009. A type of tourism product called homestay offers tourist accommodation services in tourist locations far from the city (Abd Hadi Khan et al., 2022). Villagers have taken the initiative to provide accommodation facilities by hosting tourists in their homes because these tourist spots are located on the outskirts/rural areas and lack

accommodation facilities such as hotels, resorts and chalets. (Shukor et al., 2014). In addition, homestay owners need to be registered with the Ministry of Tourism, Arts, and Culture (MOTAC) to promote their homestays to tourists. However, homestay operators need to have some knowledge of the ins and outs of business. This is to maintain the performance of the homestay business. In Kelantan there are 8 registered homestays based on the January 2023 Statistical Report issued by the Ministry of Tourism, Arts and Culture (MOTAC). The homestays are Homestay Kg Pantai Suri in Tumpat, Homestay Renok Baru in Gua Musang, Homestay Bukit Jering in Jeli, Homestay Kg Batu Papan in Gua Musang, Homestay Kg Kubang Telaga in Bachok, Homestay Seterpa in Kota Bharu, Homestay Kg Jelawang in Dabong and Kemunchup Homestay in Machang.

The capability or capacity of a system, area, or community to adjust to the consequences or impacts of climate change is known as adaptive capacity. An effective way to deal with climatic changes and uncertainties, especially unpredictability and extremes, is to improve one's adaptive capacity. Enhancing adaptive ability decreases vulnerabilities and encourages sustainable growth in this way. (Goklany, 1995).

There are three objectives of this research:

1. To examine the relationship between knowledge capacity and business performance among homestay operators in Kelantan.
2. To examine the relationship between innovation capacity and business performance among homestay operators in Kelantan.
3. To examine the relationship between asset capacity and business performance among homestay operators in Kelantan.

Significance of the Study

The results of this study will also give subsequent researchers an advantage as they work to learn more about how homestay operators' businesses are performing. It also attempts to teach the homestay operators the value of relationships with adaptive capability and commercial performance. According to research and data on this industry's performance among homestay operators, It can and will continue to help the expansion of the tourist sector in our nation.

As a result of this study's findings, homestay operators will also benefit from improved business performance and a greater understanding of the value of homestay tourism. Additionally, it would enable the homestay providers to raise the calibre of their commercial operations.

LITERATURE REVIEW

Business performance among operator homestay in Kelantan.

The evaluation of a business's success in accomplishing its aims and objectives is referred to as business performance. It includes a variety of factors, including as overall growth, market share, customer happiness, operational effectiveness, and financial performance. Here are a few important variables that can affect a company's financial performance. It was significant to bear in mind that business performance could differ between sectors and businesses. Continuously enhancing corporate performance and attaining long-term success depend on consistently tracking key performance indicators (KPIs), carrying out performance assessments, and arriving at data-driven decisions. For the example, factor that can influence business performance among operator homestay in Kelantan is market competitiveness and customer satisfaction.

Knowledge capacity

Knowledge capacity refers to the most significant quantity of knowledge that a person or system can effectively learn, store, process, and use. It stands for the maximum amount of knowledge that a person or organization may acquire and apply. A business operator in the homestay sector can excel in guest pleasure, business operations, and long-term success by building and growing knowledge capacity in these areas. For improving knowledge capacity in this area of study, chances for professional growth, industrial research, and continuous learning are important. Knowledge capacity can be affected by a number of variables, such as cognitive talents, learning capacities, capacity for memory, processing of information skills, and the resources accessible for learning and maintaining knowledge. It is an expanding concept that can grow and extend as the outcome of education, experience, exposure to new ideas, and learning new things. For the example knowledge capacity in business operator homestay were marketing sales and industry knowledge.

Innovation capacity

Innovation capacity was the capacity and willingness to create and implement innovative ideas, procedures, and solutions to improve the homestay business and improve the guest experience are referred to as innovation capacity in the context of a business operator in the homestay industry. In order to encourage and support innovation activities, it is important to cultivate an innovative culture and ensure that the essential tools, techniques, and procedures are in place. A business owner in the homestay sector can differentiate their offerings, improve operational effectiveness, draw in more visitors, and maintain an advantage in an increasingly competitive marketplace by growing their capacity for innovation. It is an ongoing procedure that calls for a drive to learn and a willingness to embracing change and continuous progress.

Asset capacity

When a business operator in the homestay sector discusses assets, asset capacity refers to the tools and financial assets that are at their disposal in order to support operations and offer excellent services to visitors. The effectiveness and competitiveness of the homestay industry are greatly influenced by these resources. Enhancing operations, creating outstanding guest experiences, and establishing long-term success in the homestay business depend on effectively managing and employing these assets.

To increase asset capacity and maintain market competitiveness, it calls for routine maintenance, upgrades, strategic expenses, and the emphasis on continual improvement.

Research Hypothesis

The literature review highlights the independent variable such as knowledge capacity, innovation capacity and asset capacity. According to the literature reviewed, the following is a summary of the study's hypothesis:

H1

There is a relationship between knowledge capacity and business performance among homestay operators in Kelantan.

H2

There is a relationship between innovation capacity and business performance among homestay operators in Kelantan.

H3

There is a relationship between asset capacity and business performance among homestay operators in Kelantan.

Research Framework

The research framework is illustrated as shown in Figure 1 to investigate the relationship between knowledge, innovation and asset. The independent variables are knowledge capacity, innovation capacity and asset capacity. The dependent variable is business performance among homestay operators in Kelantan.

Figure 1: Research framework of adaptive capacity among business performance operators homestay in Kelantan.

METHODOLOGY

Research Design

The overall approach you select to integrate the many elements of the study in a cogent and logical manner is referred to as the research design. It will then successfully handle the research challenge. It will also be able to create a plan of action for gathering, measuring, and analysing data. The design of this study is focused on factors influencing the commercial performance of Kelantan's homestay operators. Additionally, data will be gathered from Kelantan's homestay operators using the questionnaire approach. The association between adaptive capacity and business success among homestay operators in Kelantan is closely related to descriptive research on knowledge capacity, innovation capacity, and asset capacity. A descriptive research design makes it simpler to respond to research questions and accomplish research goals. The researchers decided on a quantitative methodology for this investigation. Data collection and analysis must be done quantitatively. Quantitative approaches can be used to prove or disprove any notion.

Data Collection

This study uses a survey to gather information from respondents about their goals or to obtain firsthand data from homestay operators in Kelantan on the relationship between flexibility and company performance. Primary data can be found in studies, assessments, surveys, and arguments. A set of questions on an evaluation form are intended to collect information from respondents for statistical or research purposes. A survey also used Google Forms and sent to owner homestay in Kelantan via email or Whatsapp group. So this question has be sent using Google Forms via email or Whatsapp groups. A survey made using Google Forms and sent to owner-run homestays all around Kelantan. These questions were created and sent using Google Forms. The respondents' demographic data is provided in Section A. Five Likert scale questions were included in Section B, and Section C. Business performance and adaptive capacity were the main topics of Section C of the study. We asked

the participants about the adaptive capacity and business performance when they were running the homestay in Kelantan. The results of this method might be used to show the connection between Kelantan homestay operators' financial performance and adaptability.

Sampling

Sampling is a method for choosing an adequate number of constituents from a population (Kumar, 2013). A particular subgroup of the population chosen by the researcher serves as the sample subject for the sampling procedure. A selection made using probability and other criteria. There are two different sampling techniques: sampling and random sampling. In this investigation, non-probability sampling was used. Purposive sampling is a sort of non-probability sampling in which researchers choose members of the community to participate in a survey based on their own opinions. It is also referred to as judgmental, selective, or subjective sampling. The sample collected is from operator homestay in Kelantan. The researcher randomly chooses a sample of homestay providers. Any sample of respondents that is easily accessible and convenient for the researcher must be chosen since the sample is available to the researcher. Researchers used sample the study's target population using non-probability and purposeful sampling techniques.

Data Analysis

Data analysis is the act of collecting, modelling, and analysing data to produce insights that can be applied to decision-making. Depending on the industry and the objective of the research, there are numerous methods and strategies for doing analysis. These approaches all have two types of research as their fundamental pillars: quantitative and qualitative research. The researchers used quantitative methods on this study.

FINDINGS

Demographic profile of respondents

According to the results, there were 97 respondents, with 60.8% men and 39.2% women. The majority of respondents are between the ages of 50 and 55 (46.4%), 40 and 45 (38.1%), 60 and older (13.4%), and between the ages of 30 and 35 (2.1%). Regarding race, 100% of the respondents are Malay. This is due to the researcher's observation that other races are more interested in operating resort and hotel businesses than homestay enterprises. The result of demographic profile of respondents has been showed in Table 1.

GENDER	PERCENT
Male	60.8 %

Female	39.2 %
AGE	PERCENT
30 – 35 years old	2.1 %
40 – 45 years old	38.1 %
50 – 55 years old	46.4 %
60 years old and above	13.4 %
RACE	PERCENT
Malay	100 %

Table 1 : Demographic profile of respondents

The relationship between adaptive capacity and business performance among homestay operators in Kelantan

The results of the reliability analysis show that Cronbach's alpha is valid for both the independent and dependent variables. Asset capacity has a Cronbach's alpha score of .873, which is the highest in this investigation. Business performance among homestay operators in Kelantan comes in at .842 and is followed by Knowledge capacity at .804. Innovation capacity had the lowest Cronbach's alpha in this sample, at .732. The results of this analysis's SPSS data demonstrate the significance of both independent and dependent variables. The questionnaire has been acknowledged as valid and approved. Table 2 contains the conclusion of the hypothesis test.

Hypothesis	Pearson's Correlation Results	
H1 : There is a relationship between knowledge capacity and business performance among homestay operators in Kelantan.	(r=1.000 p<0.01)	Strong

H2 : There is a relationship between innovative capacity and business performance among homestay operators in Kelantan.	(r=0.480 p<0.01)	Moderate
H3 : There is a relationship between asset capacity and business performance among homestay operators in Kelantan.	(r=0.470 p<0.01)	Moderate

Note: Significant at $p < 0.01$.

Table 2 : Hypothesis testing

Table 2 shows the result of hypothesis testing based on significant value and strength of relationship between variables. The result proves that, all the independent variables are having significant relationship with the dependant variable at ($p < 0.01$). Hence, all the hypotheses were accepted.

DISCUSSION

This study aims to investigate the connection between business performance and adaptability among Kelantan homestay operators. With a result of $r = 1.000$, $n = 97$, and $p < 0.01$ the findings demonstrate a significant relationship between knowledge capacity and business performance among Kelantan homestay operators. This result were supported by Schober, Boer, & Schwarte (2018) that knowledge capacity are mostly influenced by the push factors to fulfill their desire to gain unique business performance among homestay operators in Kelantan.

With $r = 0.480$, $n = 97$, and $p < 0.01$ for the relationship between inventive capacity and business performance among homestay operators in Kelantan, the results were also moderate. This outcome is consistent with Schober, Boer, and Schwarte's (2018) finding that one factor that can enhance business performance among Kelantan homestay operators is their innovative capacity.

At $r = 0.470$, $n = 97$, and $p < 0.01$ the relationship between asset capacity and business performance among homestay operators in Kelantan is moderate. The conclusion is consistent with Schober, Boer, and Schwarte's (2018) finding that asset capacity can affect homestay operators' business performance in Kelantan.

CONCLUSION

In summary, this study looked at how business performance among Kelantan homestay operators related to their ability to adapt. The research's conclusions showed that homestay operators with a higher level of adaptability do better in their businesses than those with a lower level of adaptability. The research showed that there are various components that make up adaptive ability, such as gaining knowledge, resource mobilisation, relationship development, and innovation.

ABSTRACT

This study will look at the motivational variables that contribute to the volunteer tourism program of students in Malaysia. Malaysia does have the ability to attract tourists due to its magnificent natural environment. As a result, the institution and students arrange a variety of activities each year to promote the university as a tourist destination in Malaysia's northern area. Many of these campus activities were made possible by the Department of Student Affairs and thousands of student volunteers. Their contribution is evident and is seen as equally significant as that of full-time employees. Knowing their volunteers' motivational elements and degree of satisfaction allows organizers to plan, execute, and assess their contributions. Many studies have been conducted on the motivating factors, but relatively few have been conducted on volunteers.

Keywords: Volunteer Tourism, student volunteers, motivational elements, motivating factors

INTRODUCTION

The purpose of this research is to identify the aspects that motivate students' willingness to take part in volunteer tourism in Malaysia. The researcher explains and clarifies words in this research before summarising the research backdrop, issue statement, research aims, and importance of the study. The theory of this report consists of chapters explaining concepts of motivation, volunteering, and volunteerism.

Significance of the Study

The importance of a study reflects its impact on the field and its benefits. This study focuses on motivating university students to participate in volunteer tourism in Malaysia. It examines demographics, motivation theories, and the relationship between motivation and student interest in volunteer travel. Factors like self-actualization, social needs, and physiological needs contribute to increased interest in volunteer travel.

LITERATURE REVIEW

Self-Actualisation

While Maslow is most generally associated with personal development, the term was coined by Kurt Goldstein. Goldstein defined person-actualization as a comprehensive differentiation, or a way to develop a human being that acts as a primary motivator of activity in humans, in which the person acknowledges that they and their environment are two aspects of a larger entity. (Whitehead, 2017).

In simple terms, self-actualization is the full realisation of one's creative, intellectual, and interpersonal capabilities as a result of one's own intrinsic drive. Because self-actualization concentrates on maximising one's skills in order to reach one's greatest prospective, it is an extremely personalised endeavour that will certainly range significantly from individual to human. This emphasis on individual impulses is important to Maslow's work, and it represents what he feels separates it from current motivational psychology. Self-actualization has additionally been defined as the psychological approach to making the most use of one's talents and resources. This procedure may differ from person to person (Couture et al., 2007).

Social Needs

Social needs can be described as human basic requirements, known as social needs, demonstrate that they are social beings. Among the most important social wants are those for love, connection, friendship, and a sense of belonging. These demands compel individuals to engage with one another, fostering society and solidarity. These essential requirements must be met in order to have a healthy mind and a pleasant existence. Otherwise, unhappiness and despair take hold and make life miserable.

Abraham Maslow, an American Psychologist, developed the behavioral Hierarchy of Needs, and the desire for feeling loved and included lies on the third stage of the hierarchy. Maslow extends it to friendship, family, and physical relationships. The topics addressed by Social Needs include in communal contexts, social needs encompass at least one of the four bases, which are to communicate, connect, contribute, and create. For example, social needs can be satisfied by addressing one or more of the four C's listed above. Friendship encompasses communicating and connecting, but passionate love encompasses communicating, connecting, and procreating".

Physiology Needs

Physiological requirements occupy the bottom of Maslow's hierarchy of wants (Maslow 1943, 1970). The physiological needs, or drives, contain all the internal signals that are put in place to urge the organism's immediate protection. Food insecurity, sexuality, and dehydration are examples of physiological necessities. Maslow pointed out that the list of requirements may be broadened to contain even more particular demands, such as a desire for a certain vitamin or mineral, protein content, or cholesterol (Maslow 1943, 1970).

The physiological needs all have a single trait in prevalent: they all assist to preserve the body's normal, normal operation. (Maslow 1943, 1970). The significance of physiological needs having access to food is one of Maslow's hierarchy of requirements. Examples of physiological demands include nourishment. Physiological demands must be satisfied before anyone can think about anything else.

Willingness to Volunteer

'Motivation to learn,' from a psycho-educational standpoint, has been defined as a student's 'energy and desire to learn, work efficiently, and accomplish to their potential,' as well as the behaviors connected with this energy and drive (Martin, 2004). Kusurkar et al. (2012) acknowledge that the undergraduate curriculum has been mostly influenced by cognitive techniques rather than motivational theories, leading them to the conclusion that desire to study has been undervalued thus far.

According to (Doleel, 2016) in research (Zárubová & vecová, 2021), volunteerism is a broad theme that crosses national, state, and religious boundaries. It continues to be a part of civilization, and its significance is growing all around the world. Volunteers help in catastrophes, wars, and other comparable events. Volunteer duties, together with donation organisations and NGOs that engage with volunteers, are associated with connection with cultural social values and the provision of products and services that are environmentally friendly on a local and global scale, based on (ebestová & Haltofová, 2014).

Research Hypothesis

H1: There is a relationship between self-actualization and factors that motivate student's willingness to be involved in volunteer tourism programs in Malaysia.

H2: There is a relationship between social needs and factors that motivate student's willingness to be involved in volunteer tourism programs in Malaysia.

H3: There is a relationship between physiological needs and factors that motivate student's willingness to be involved in volunteer tourism programs in Malaysia.

Research Framework

The researchers have proposed a framework to study the self-actualisation, social needs and physiology needs of willingness to participate in volunteer tourism programmes in Malaysia, based on the previous literature review.

Hence, as seen below, the structure:

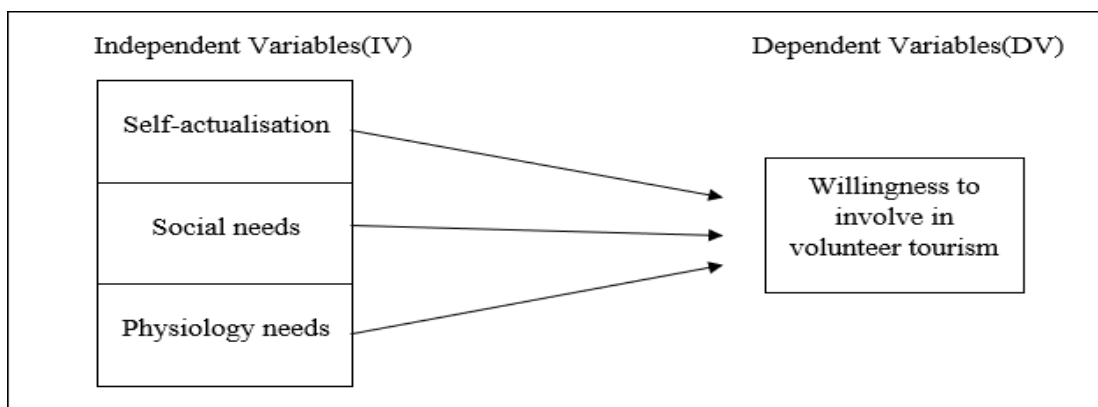

Figure 1: Conceptual Framework

METHODOLOGY

Research Design

The study structure acts as an outline for a researcher's approaches and tactics. Because of the design, researchers may focus on research approaches that are suited for the topic at hand in order to set up their investigations for success. Investigative studies, descriptive studies, and causal research are the three types of research designs. In design study, gathering information, measuring it, and analysing it may be divided into three areas. As stated by Jahoda, Deutch, and Cook, a research design is the development of settings for the collection and analysis of data in a way that tries to combine the importance of the study's objective with efficiency and approach. Quantitative research design is more flexible and inductive when compared to qualitative research design. This gives us the ability to adjust our strategy in response to what

we learn from the research phase.

Data Collection

Data collection applies to an efficient method of collecting and analysing details from many sources in order to acquire full and reliable knowledge. This data collection includes sources that are both primary and secondary. Subscribers, members, non-users, or other entities involved in the research. Secondary data is also any information from published sources that was expressly obtained for this study challenge. Data collection methods include questionnaires, Google forms, survey forms, and personal interviews. The survey used for this study was used to collect primary data. For the purpose of gathering data, an application will be given to selected students using Whatsapp and Telegram.

Sampling

The sampling method used in this paper was the simple sampling. Sample refers to the element of the population. The subject was known as the sample participant and the total number of subjects in the sample is known as the sample size. The researchers chose a relatively small number of students from a cohort of University of Malaysia students using Krejcie and Morgan's table to determine sample size, and there are approximately 150 students from University of Malaysia Kelantan.

Data Analysis

This part explains the statistical analysis results used in this investigation. Data analysis, according to Edewin Perez (2019), is the technique of completely examining every part of information acquired or given using logical and theoretical principles. The Statistical Package for the Social Sciences (SPSS) investigators examined the data contained on the online survey that was provided to the responders. Academics can use the Statistical Packaging for the Social Sciences (SPSS) tool to swiftly calculate data and do quantitative evaluations. Because of these qualities, this particular piece of software is a particularly renowned statistics system.

FINDINGS

Frequency Analysis

Table 1.1 shows the frequency and percentage of respondents by gender. The number of female respondents is 111 with 73.5%, while the number of male respondents is 40 with 26.5%. The percentage of females is higher than the male, and this shows that females are more willing to participate in volunteer tourism.

Table 1.1 Demographic Profile

	Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Female	111	73.5	73.5
	Male	40	26.5	100.0
	Total	151	100.0	

Table 1.2 Age of Respondent

	Frequency	Percent	Valid Percent	Cumulative Percent
Valid	18 years and below	2	1.3	1.3
	19 - 21 years	10	6.6	7.9
	22 - 24 years	127	84.1	92.1
	25 years and above	12	7.9	100.0
	Total	151	100.0	

Based on Table 1.2, the number of respondents aged 18-24 years old is 139 with 92%, while the number of respondents above 25 years old is only 12 with 7.9%. This shows that youths aged 18-24 years old are the main respondents with willingness to participate in volunteer tourism, even once.

Table 1.3 Number of Respondent by Race

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Chinese	5	3.3	3.3	3.3
	Indian	6	4.0	4.0	7.3
	Malay	137	90.7	90.7	98.0
	Other	3	2.0	2.0	100.0
	Total	151	100.0	100.0	

Based on Table 1.3, the number of respondents race a total of 151 people who answered the survey, including Chinese is 5 with 3.3%, Indians is 6 with 4.0%, Malay is 137 with 90.7, while the number of respondents for others 3 with 2.0%. This shows that Malay are the main respondents with willingness to participate in volunteer tourism.

Table 1.4 Education Level

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Bachelor's Certificates	1	.7	.7	.7
	(Master) Degree	129	85.4	85.4	86.1
	Diploma	12	7.9	7.9	94.0
	Master	2	1.3	1.3	95.4
	SPM	5	3.3	3.3	98.7
	STPM	2	1.3	1.3	100.0
	Total	151	100.0	100.0	

Based on Table 1.4, the number of respondents of education level Bachelor's Certificates Master is 1 with .7%, Degree is 129 with 85.4%, Diploma is 12 with 7.9%, Master is 2 with 1.3%, SPM is 5 with 3.3%, while the number respondents for STPM is 2 with 1.3%. The percentage of Degrees is higher than others, and this shows that education level Degrees are more willing to participate in volunteer tourism.

Descriptive Analysis Push Factor

Table 1.5: Descriptive Statistics

	N	Minimum	Maximum	Mean	Std. Deviation
IV1	151	1.75	5.00	3.9437	.79013
IV2	151	2.75	5.00	4.2368	.62503
IV3	151	2.50	5.00	4.2732	.61735
DV	151	.67	2.00	.7792	.30765
Valid N (list wise)	151				

The number of respondents, mean, and standard deviation of independent variables were displayed in Table 1.5. Self-actualization came in third at 4.2368, with the means of the independent variables ranging from 3.9437 to 4.2732. The highest mean for the independent factors was physiological needs. 0.7792 was the value of the dependent variable's mean.

Table 1.6: Descriptive statistics of social needs

	N	Minimum	Maximum	Mean	Std. Deviation
My friend who influences my behavior think that I should join volunteer tourism.	151	1	5	3.91	.945
My friends think that I should join volunteer tourism.	151	1	5	3.89	.977
My friends will motivate me to join volunteer tourism.	151	1	5	4.05	.815
Most people surrounding me used to join volunteer tourism.	151	1	5	3.92	1.036
Valid N (list wise)	151				

The mean and standard deviation analysis for the independent variable, social requirements, is displayed in Table 1.6. The survey participants who believed that their friends would support them in going on volunteer trips received the highest mean score 4.05 among all respondents. The reaction was only slightly in favor of their friends' advice that they take part

in volunteer travel, as seen by the lowest mean score of 3.89 (My Friends Think That I Should Join Volunteer Tourism). It was advised that the results for the data set from 151 respondents, where the standard deviation was frequently less than 1, were relatively close to the mean.

Table 1.7: Descriptive statistics of self-actualisation

	N	Minimum	Maximum	Mean	Std. Deviation
By joining more program in volunteer tourism, make me gain more experience.	151	1	5	4.47	.738
Malaysia provide many volunteer tourism program for me to join.	151	1	5	3.99	.883
Students can control their behavior and are motivated to grow and reach their fullest potential because the tourism industry is helping in fulfilling their basic needs.	151	2	5	4.18	.767
By joining more volunteer programs make me get more brainstorming idea and more active.	151	1	5	4.30	.739
Valid N (list wise)	151				

Table 1.7 displays the mean and standard deviation analysis of respondents for the self-actualization independent variable. The respondents thought that taking part in more volunteer travel programs would help them get more experience, as evidenced by the highest mean score of 4.47. The respondent partially agreed that Malaysia offers many volunteer tourism programmes for them to engage as the mean value dropped to 3.99. Standard deviation values for the bulk of the 151 respondents' data were below 1, suggesting that the data were near the mean, whereas standard deviation values over 1 indicated that the data were more scattered.

Table 1.8: Descriptive statistics of physiology needs

	N	Minimum	Maximum	Mean	Std. Deviation
Volunteer tourism program providing assistance such as food, drink, medicine, shelter, and clothing to the needy to reduce unemployment.	151	1	5	4.30	.808
Do you consider yourself suitable to be a volunteer who helps in terms of necessities to people in a country whose economy is failing.	151	1	5	4.13	.819
I joined a volunteer program to help people in need such as food, water and shelter. My religion instructs to help people who are in trouble to continue living.	151	3	5	4.31	.732
The organizers of volunteer tourism program must provide assistance such as food, drink, medicine, and shelter.	151	1	5	4.35	.785
Valid N (list wise)	151				

Table 1.8 showed the mean and standard deviation analysis of respondents on the independent variable which was physiology needs. The respondents' agreement that volunteer tourism programme organisers must provide aid in the form of food, drink, medicine, and shelter resulted in the highest mean value of 4.35. The respondent marginally agreed that they were qualified to serve as a volunteer who provides essentials to citizens of a nation with a failing economy in the lowest mean at 4.13. The majority of the 151 respondents in the data set have standard deviations less than 1, which indicates that their responses were more evenly distributed than the mean.

Descriptive Analysis Pull Factor

Table 1.9: Descriptive statistics of willingness to involve in volunteer tourism

	N	Minimum	Maximum	Mean	Standard Deviation
Is there a need for anyone to understand the nature of volunteer tourism?	151	2	5	4.79	.656
Does adopting a volunteer tourism mindset increase one's environmental responsibility?	151	2	5	4.73	.757
Do you think volunteering while travelling is enjoyable?	151	2	5	4.84	.578
Valid N (list wise)	151				

Table 1.9 showed the mean and standard deviation analysis of respondents on the dependent variable which was willingness to be involved in volunteer tourism in Malaysia. The respondents who thought that volunteering while travelling was enjoyable had a mean score of 4.84. The respondents' agreement that adopting a volunteer tourist perspective promotes one's environmental responsibilities had the lowest mean, 4.73, of all the responses. The majority of the 151 respondents' data set's standard deviation values fell below 1, indicating values that were close to the mean, while standard deviation values over 1 showed values that were more dispersed.

Pearson Correlation Coefficient Analysis

One of the crucial tests for determining the linear relationship between the two variables was Pearson's correlation analysis. In this analysis, the dependent variable (willingness to participate in volunteer tourism) and the independent variables (self-actualization, social needs, and physiological needs) were compared to see if there were any relationships. If the relationship is significant, researchers must determine whether the association's strength is appropriate.

Table 1.10: Strength Interval of Correlation Coefficient

Size of Correlation	Interpretation
0.90 to 1.0 (-0.90 to 1.0)	Very high positive (negative) correlation
0.70 to 0.90 (-0.70 to 0.90)	High positive (negative) correlation
0.50 to 0.70 (-0.50 to 0.70)	Moderate positive (negative) correlation
-0.30 to 0.50 (-0.30 to 0.50)	Low positive (negative) correlation
0.00 to 0.30 (-0.00 to -0.30)	Negligible correlation

Source: Abgunbiade and Ogunyika, (2013)

H₁ : Sosial Needs

Table 1.11: Correlations coefficient for social needs and willingness to involve in volunteer tourism in Malaysia.

		IV1	DV
IV1	Pearson Correlation	1	.136
	Sig. (2-tailed)		.097
	N	151	151
DV	Pearson Correlation	.136	1
	Sig. (2-tailed)	.097	
	N	151	151

Table 1.11 showed the Pearson correlation coefficient, the significant value, and the 151 cases. The p-value was 0.097, below the significant level of 1.0. Self-actualization and willingness to engage in volunteer tourism were related, according to the 0.136 correlation

coefficient.

H₂ : Self-Actualization

Table 1.12: Correlations coefficient for self-actualisation and willingness to involve in volunteer tourism in Malaysia.

		IV2	DV
IV2	Pearson Correlation	1	.050
	Sig. (2-tailed)		.543
	N	151	151
DV	Pearson Correlation	.050	1
	Sig. (2-tailed)	.543	
	N	151	151

Table 1.12 showed the Pearson correlation coefficient, the significance level, and the 151 respondents. The p-value was 0.543, which was below the 1.0 level of significance. The 0.050 correlation coefficient indicated a weak relationship between self-actualization and willingness to participate in volunteer travel.

H₃ : Physiological Needs

Table 1.13: Correlations coefficient for physiology needs and willingness to involve in volunteer tourism in Malaysia.

		IV3	DV
IV3	Pearson Correlation	1	.148
	Sig. (2-tailed)		.069
	N	151	151
DV	Pearson Correlation	.148	1
	Sig. (2-tailed)	.069	
	N	151	151

Table 1.13 above illustrated Pearson correlation coefficients, significant value and the number of respondents which is 151. The p-value was 0.069, below the threshold for significance of 1.0. The correlation coefficient of 0.148 indicated a weak relationship between physiological requirements and willingness to participate in volunteer travel.

DISCUSSION AND RECOMMENDATION

The discussions were aimed to solve the questions and address the hypothesis as mentioned in the first chapter of this study. In general, this study has extensively researched the factors that motivate student's willingness to volunteer. Based on findings of the study, there are some recommendations other variables may impact tourism student's willingness to participate in a volunteer program.

Moreover, additional studies on this topic should use qualitative methods instead of quantitative data gathering approaches from respondents. This is because different people have different perspectives of the same object. The methods used in the questionnaire may not correctly reflect the thoughts of the minor respondents. It is advised that future research use interviews to obtain respondent comments regarding tourism students' aspirations to participate in tourism volunteerism. Because of the different techniques used to collect information, the correctness of the outcomes may be improved.

Furthermore, it is advised that subsequent studies extend the amount of study participants outside the University Malaysia Kelantan to include Malaysian states. Given that the target population for hospitality students might be found in a variety of states, expanding the sample size will help to create more precise conclusions.

In addition, the scholar has suggested that Non-Governmental Organisations (NGOs) such as Malaysia Red Crescent, The Buddhist Association, and The Lion Club be permitted to organise activities in universities in order to inspire students to get involved in charitable and green endeavours. Apart from that, the researcher suggests that colleges and universities offer unique or specialised courses on hospitality volunteering in order to enhance exposure and urge hospitality students to get involved in volunteer projects. Also, hosting events at junior high schools would educate youngsters about the ethics of volunteering.

CONCLUSION

In consequence, variables influencing volunteer tourism participation within Malaysia Kelantan City Campus graduates are being researched. The study revealed that mat attitude, social influence, and perceived behavioural control all had a significant impact on university students' understanding of volunteer tourism. According to the statistics, the players influencing volunteer tourism participation are driven by people's eagerness to learn new skills, which could encourage them to favour volunteer tourism over leisure tourism. Another element influencing volunteer tourism is the significant effort made by individuals close to the individual, such as friends or family, to engage in volunteer tourism. Finally, the conclusions of this research might provide a plethora of information for the volunteer tourism sector to raise attention amongst university students about the profits of volunteering.

ABSTRACT

It has come to everyone's attention that volunteering is an excellent way for students to get educational and culture experiences while also assisting to community in with they are staying. Because volunteers play such a significant role in the tourist business, participating in volunteer work within the industry is an essential part of the education process for the tourism sector. Due to the fact that volunteering is an educational activity, the objective of this research is to investigate the influence of adolescents' interpersonal skills traits on the activities they participate in as volunteers in the state of Kelantan in Malaysia. Teamwork, non-verbal communication, and building relationship have all been utilized as variables in this study to examine the usefulness of these interpersonal skills traits in inspiring teens to participate in volunteer work. The survey via Google Form was administered to a target audience of 260 adolescents from the surrounding of Kelantan.

Keywords: *Volunteerism, Team Working, Negotiation, Non-Verbal Communication, Building Relationship*

INTRODUCTION

Over the years, there seems to be some pedagogical argument and public dispute about the acknowledgment of different forms of tourism, such as ecotourism, sustainable tourism, and responsible tourism (Smith & Font 2014). Volunteer tourism is one of the quickest developing kinds of alternative tourism, and it has been recognized as a beneficial combination of assistance to the host community while simultaneously providing cultural and educational advantages for students (Molz,2016) (sin 2009; McGehee 2014). Furthermore, many agencies such as Global Vision International (GVI) and Love Volunteer at Global Level, in context at Malaysia the agencies that involved is SOLS 24/7, WWF Malaysia, and UNICEF Malaysia have dispatched volunteer tourists from around the country and provide the opportunity for students to learn and develop and experience people in the industry of tourism to attract foreign travelers.

Interpersonal skills are abilities that must be used in everyday life to engage and communicate with others, whether alone or in groups. Interpersonal skills have been referred to as social skills, social competence, human skills, human talents, and social intelligence, according to previous studies. “Skills essential for individuals to communicate effectively with each other or a community of individuals,” according to Rungapadiachy, (1999).

Next, interpersonal skills, on the other hand, refers to a collection of abilities that includes interactive conversations, connections, and a collaborative way of managing connections in terms and inside organizations, along with networking with individuals from various communities and different expertise (Malaysia Qualification Framework, 2017). Nonverbal communication, listening skills, conveying information, negotiating, collaborating, decision making, team working, networking, relationship building, assertiveness, respect, tolerance, socializing with skills and etiquette, self-awareness, and ethical responsibility are 216 characteristics (Malaysia Qualification Framework, 2017) that can be used in interpersonal skills.

Volunteering in the tourism industry is also an important element of the tourism education process. According to Kim & Cuskelly (2017), because volunteerism are so vital in the tourism industry, there has been a lot of studies on volunteerism in the tourism market from throughout the world, for example 21 Century Volunteering Practices, Report: Volunteerism and Youth Employment in Cambodia and Volunteering Typologies (UN Volunteers website <https://www.unv.org/publication/research-volunteerism?page=0> last accessed 04/01/2022). Volunteering is a concept that originated in Western countries, and the vast bulk of current study on the subject is conducted by Western academics in developed economies, according to Baillie Smith, Laurie, & Griffiths, (2018). Given the scarcity of research on the subject and China’s growing importance in the global tourism industry, volunteerism in tourism should be looked into further. Tourism volunteering, according to Uriely, Reichel, & Ron, (2003), should extend beyond volunteer travelers to include hosts who work in the local tourism industry.

Motivation in volunteering as a multidimensional phenomenon consists of two categories of motivations: self-interest and altruistic motivation, according to (Mustonen, 2007; Stebbins, 1992, 2004; wearing,2001). has significance self-interest is a wide phrase that encompasses a variety of components of motivations that focus around the participants' self - 34 interest, whereas altruistic motivation entails other advantages. This altruistic motivation can be described in a variety of ways and different forms. It's the same as "making a change" (Brown,2005; lo & Lee, 2011). All of these are reflective of earlier researchers' altruistic motivations.

Motivation in volunteerism as a multidimensional phenomenon consists of two categories of motivations: self-interest and altruistic motivation, according to (Mustonen, 2007; Stebbins, 1992,2004; Wearing, 2001). Has significance self-interest is a wide phrase that encompasses a variety of components of motivation that focus around the participants' self-interest, whereas altruistic motivation entails other advantages. This altruistic motivation can be described in a variety of ways and different forms. It's the same as " making a change"

(Brown,2005;Lo & Lee, 2011). All of these are reflective of earlier researchers' altruistic motivations.

PROBLEM STATEMENT

Volunteering has traditionally been seen as a "human manifestation of helping" (Clary EG, Snyder M and Ridge RD, 1998), a pro-social activity in which time is given voluntarily for the purpose of helping others without monetary compensation (Wilson, 2000).). Penner, 2004). The fact that both the person helping others and the person being helped can benefit in this way can also be described as a win-win concept. But this benefit is not only in terms of helping others with their financial needs, but also in terms of helping with personal emotional problems, daily needs, and physical assistance. In addition, the most important aspect of involvement in volunteer activities should be the fact that the nature of personal interpersonal skills will be greatly enhanced.

The fact that the interpersonal skills of youth can be improved is an educational alternative. However, it is not easy for young people to understand how volunteers feel and the mood they understand during volunteering activities. Therefore, the youth group should be more involved in social volunteering activities. In addition, Bianca & Ronelle (2018) stated that volunteering is a platform where youth can learn to serve (that is, be exposed to community issues and identify solutions to solve them) and serve to learn (that is, acquire interpersonal traits and skills ./soft skills attributes, along with other aspects).

Youth volunteering in this way can emphasize the possibility for active learning and service, as well as the possibility to gain practical experience and develop interpersonal skills while learning about the people and issues the volunteer supports.

Interpersonal skills can be defined as "the skills needed to communicate effectively with other people or groups of people" (Rungapadiachy, 1999). In other words, this clearly shows that interpersonal skills lead to the ability to express oneself fluently with others. Interpersonal skills are often needed by people entering society, especially the youth group. It is even more important for the youth group to increase the necessary interpersonal skills including their attributes for their future. According to the findings of Albina (2017), many youth improve their interpersonal skills to develop skills related to their future careers and from their volunteering experiences. This researcher believes that volunteering is like a professional activity and can be integrated into the learning process of youth, which can make the whole experience more positive and enjoyable for youth.

Furthermore, the Australian Qualifications Framework (AQF) has set some of these attributes for different qualification levels since 2011. These include teamwork skills, which will be included in the AQF at all levels of education (AQF, 2016; Fraser & Thomas, 2013). Teamwork is about working together with different people to complete a job or activity. In volunteering activities, it is inevitable that you may meet people with opposing views while helping. A study conducted by Goh and Lee in 2018 showed that students are also afraid of working with teams in their future jobs because of the pressure that will be caused by people working together. However, volunteer activities combine with the pressures and tensions that exist between different age groups and between people from different sectors to ease their rusty understanding. This disagreement and disharmony can be explained by the fact that there is usually less involvement in large teams. It is easier to complete any challenging task when teamwork is perfect.

Negotiation is an efficient communication technique in human interaction. Some people believe that negotiation skills are learned at an early age, but this is not the reality; Good negotiation requires training and practice for the majority of individuals (Shell, 2000; Thompson, 1991). Volunteering improves negotiation skills because volunteers engage with a variety of individuals, including stubborn people, people who do not listen to advice, people with rebellious beliefs, and others. As a result, when the youth is gifted with someone who is deliberately tough, his negotiation skills will be

stimulated to help them effectively. In other words, the volunteer can use his negotiation skills to persuade others who make unreasonable demands to comply with the plan. Furthermore, experience of volunteer negotiation skills may have a confidence-boosting effect. As a result, negotiation skills can influence the success of an event and maintain relationships between negotiators on both sides

Next, just because a volunteer doesn't offer a cash reward doesn't mean that the volunteer doesn't satisfy the volunteer. Volunteers seek to learn new knowledge, meet new friends, use their abilities, and gain a sense of self-worth by participating in volunteer activities. The most obvious benefit of volunteering is that it improves personal non-verbal communication abilities as well as personal communication skills. Non-verbal communication skills aim to enable students to understand non-verbal communication when they cannot always 'read' the non-verbal behavior of others (Patterson & Berg, 2014). Non-verbal communication usually requires practice and direct conversation. While much coursework allows students to explore nonverbal communication, service learning provides a very rich channel for students to recognize, evaluate, and investigate non-verbal communication in interpersonal situations (Patterson & Berg, 2014).

Volunteering for learning not only aims to prepare youth for social engagement and interaction across a large population, but either leads to higher achievement in today's diverse modern workplace (Levesque-Bristol, Knapp, & Fischer, 2010; Littlefield, 2006).). Non-verbal communication skills are important because people in need may use these skills to ask for help from volunteers. They will usually act subconsciously, such as with body movements, facial expressions, and speaking in a tone that helps to convey the meaning of the language. This is because non-verbal communication skills are subtle cues that are often overlooked by volunteers and result in the best time to help others being missed.

In addition, the most likely nature of personal interpersonal skills that can be explored in volunteering is the building of relationships between people. Building relationships is based on getting to know each other and building relationships in a friendly way. On the other hand, relationships are not defined and developed to support their activities through trust between individuals. Although the volunteer presence is not permanent, they believe in building relationships in the community because of their volunteer activities. Therefore, volunteer activities build relationships with the community more than building activities, because building relationships with the community is more valuable

and educational for the volunteer. Much of volunteering abroad is about building relationships, which is a two-way process and suggests that volunteers take advantage of opportunities to learn differences from other cultures (Comhl amh, 2011). This is one of the key interpersonal skills that volunteers feel should be included in volunteering activities when it comes to building relationships.

Finally, altruism is defined as a long-term and organized effort for the benefit of others, for example, formal volunteering. Although the individual responsible for altruism may profit indirectly from it, he feels a sense of accomplishment in doing good for others. However, not every voluntary act is an act of altruism, and not every act of altruism is a voluntary act; however, the two notions are so closely related that one cannot be asserted without the other (Haski-Leventhal, 2009). Therefore, altruism is a win-win concept in volunteering before it inspires most individuals, especially the youth, to want to be involved in the activity. Because of their experience in education, they will want to do something beneficial, and volunteering will be their first choice. Youth volunteers will see the meaningful event as their contribution to society, and in return, they may gain a sense of satisfaction from their service, including interpersonal skills.

SIGNIFICANCE OF THE STUDY

There are many studies related to volunteerism that have been discussed by other researchers, but the relevant content depends on benefits, disadvantages, effects, consequences or others. While interpersonal skill attributes have not been done for now or the lack of research focuses on this context. Based on this study, youth and community know the usefulness of volunteering not only to help others but also to improve and develop their interpersonal skills. Interpersonal skills are valued nowadays because people are considered important whether in a position as a student, employee, or unemployed. The reason is that interpersonal skills can be communication skills, attitudes, and kindness as a social being. Furthermore, the attributes of interpersonal skills are not something acquired through study, but they require people to be involved and understand the lives of others. The attributes of interpersonal skills learned in volunteering help improve one's ability and attitude to do something. This study is about understanding whether Malaysians can improve and develop interpersonal skills while volunteering. In addition, conducting this study will be an important resource for future researchers, including students from other institutions as well as relevant government departments. For future researchers, this may only be an analysis for youth in volunteering. Instead, investigators need to learn more about the nature of interpersonal skills that can be developed in volunteering and understand the perceptions of other professions. Future

investigators can use this study to compare with future research, allowing future researchers to see whether volunteering has made a difference to Malaysians or individuals in the community and whether their interpersonal skills issues have improved (Developing interpersonal skills: a micro-skills approach, 2002).

LITERATURE REVIEW

Research Hypothesis

A hypothesis is a specific, verifiable description of what the researcher(s) expects to happen in the study (plural: hypotheses). It is announced at the start of the research. In most cases, this entails speculating on a possible correlation between two variables: the independent variable (what the researcher modifies) and the dependent variable (what the research measures). The null hypothesis and the alternative hypothesis are two variants of the hypothesis that are frequently used in research (called the experimental hypothesis when the method of investigation is an experiment). A theory must be able to be tested against reality and either confirmed or disproved. Before conducting the test, the researcher makes the initial assumption that there is no difference between the populations from which they are drawn. The null hypothesis is understood to be this. The alternative hypothesis is another name for the research hypothesis. (McLeod, 2021)

H1 – There is a relationship between negotiation and volunteer among youth

Joining a team is a simple way to improve your teamwork skills. In school and education, there are numerous opportunities to do so. In-class projects can be completed in groups or pairs. You can become a member of a sports team. You can organize a school-wide charity event and solicit donations and support from your friends and family. The development of a hypothesis between teamwork and motivation among youth benefits the youth by giving them confidence in contributing ideas to voluntary project initiatives. Furthermore, the youth can contribute to the project by providing energy and a positive attitude.

H2 – Existence of teamwork and motivation to volunteer among youth

Negotiation is a process or interaction aimed at reaching a mutually beneficial agreement while maximizing individual benefits. The results have an impact on all or some of the parties involved. By definition, negotiation is critical reach consensus decisions that provide satisfaction and justice to all parties involved. In negotiations, it is also necessary to control emotions and feelings, as well as understand each other's roles. Hypothetical development to negotiate and motivate youth to volunteer is likely to form high and positive interpersonal skills towards themselves. Negotiation and motivation to volunteer becomes an indicator of a volunteer's personality when they are fully committed.

H3 – There is a relationship between negotiation and motivation to volunteer among youth

Building relationships is about our ability to recognize and initiate working relationships that benefit ourselves and others. Positive relationships are essential to getting things done well and achieving success. By definition, a good relationship is very important in benefiting each other's lives. Develop positive relationships with everyone, not just family, friends or co-workers. As a result, developing hypotheses in building relationships and motivation to volunteer is important for his group to achieve high interpersonal skills. Building relationships and interpersonal skills can help them deal with others more comfortably and cordially. They may be able to form a harmonious relationship as well.

H4 – There is a relationship between relationship building and motivation to volunteer among youth

Research Framework

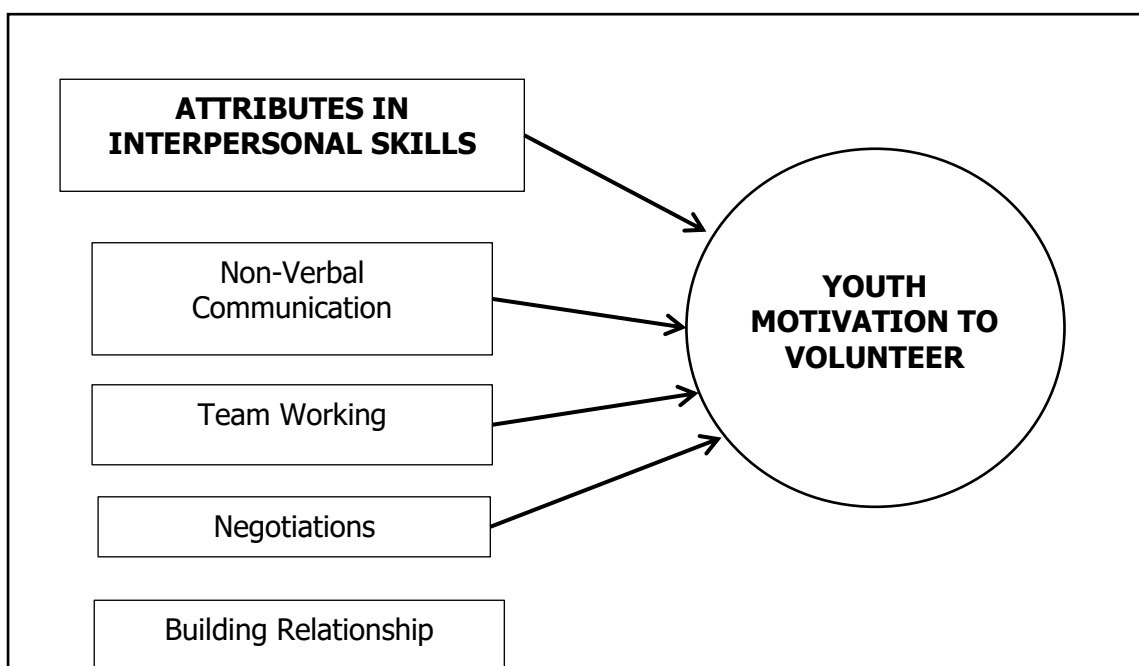

Figure 1: Conceptual of Framework the Youth

Source: Malaysian Qualification Framework,2017

By referring to the literature review, a research framework has been proposed to investigate the relationship between the effect of interpersonal skills attributes and motivation on Volunteering among youth in Kelantan . The proposed conceptual framework is illustrated in Figure 2.4. Proposed independent variables include interpersonal skills attributes of nonverbal communication, teamwork,

negotiation, and relationship building. The dependent variable is the youth's motivation in volunteering.

The researcher found a correlation between the motivation of young people to participate in volunteering activities and the attributes of interpersonal skills. The researcher concludes that any skills that can benefit students during volunteering ATTRIBUTES IN INTERPERSONAL SKILLS Non-Verbal Communication Team Working Youth Motivation To Volunteer Negotiations Building relationship activities can be used as motivation to make undergraduate students participate in volunteering activities. Furthermore, the nature of these interpersonal skills acts as a stimulus to both university students and volunteers for them to have a better version of themselves and be able to live a smoother working life in the future. Although there are many types of interpersonal skills attributes, this study will focus on non-verbal communication, teamwork, negotiation skills, and relationship building (Aqf.edu.au, 2013). However, these interpersonal skills can indirectly influence the motivation of youth in participating in volunteering activities.

METHODOLOGY

Research Design

This study design is a broad framework that might accommodate all of the aspects of a research study. Earlier studies have characterized the design of this study as a collection of conditions for data collecting and analysis in a way that tries to combine data and information, according to Jahoda, Deutch, and Cook (1965). This study was designed in a variety of ways, including qualitative, quantitative, and mixed research. In this study, the researchers have decided to employ quantitative research design to collect and analyze data in this study. The selection of study design approach, quantitative research, characterized be characterized as an analysis for a problem that is investigated and through collecting of quantifiable data and data analysis utilizing mathematical methodologies. According to Leedy & Ormrod (2001), and Williams (2011), quantitative research began with the formulation of a problem, the generation of hypotheses, the literature review, and the analysis of quantitative data that use inquiry strategies and data collection instruments designed to produce statistical data. research. The use of survey questionnaires that is an inter-field study to help researchers collect data from the group or population to be examined and queried is one of the research designs used by researchers to acquire data.

Data Collection

Data collection is explained as the process of collecting and measuring information about variables in a predetermined and systematic way that allows respondents to answer predetermined research questions, test hypotheses, and predict future trends (Kabir, 2016). Some of the data collection is universal for all research sectors, including commercial, physical, social and humanitarian. The goal of all data collection is to produce high-quality evidence, which can then be translated into comprehensive data analysis and used to provide reasonable answers to stated questions. Regardless of how the field of research or preference defines data (quantitative, qualitative), reliable data collection is essential to the integrity of the study

This research will be conducted using an online questionnaire constructed by providing a Google Form as a distribution method. The researcher will share the Google form to various social media platforms such as Whatsapp, Facebook and Telegram to be able to collect feedback from respondents. Respondents for this research were collected from among all the youth in Kelantan. Therefore, the researcher will show and explain to the respondents how to answer this questionnaire. The questions in this questionnaire raise some concerns regarding the notion of the relationship between motivation to volunteer and interpersonal skills among youth in Kelantan. However, a 6-point Likert scale will be used to evaluate the data collected.

Sampling

In this study, the researcher chose the sampling method in this study to facilitate data collection. The sampling method used in this study is critical. This is due to the fact that it is a procedure to select a sufficient number of policies from the population (Kumar, 2013). During the sampling phase, the researcher selects individuals from the general public to be used as subjects of the sample population. Furthermore, there are two types of sampling methods: probability sample and non-probability sample.

Quantitative research is synonymous with probability sampling methods. This method is used randomly when the sample contains characteristics from the study population. Therefore, before performing the probability sampling procedure, the researcher should determine the size of the population and obtain a list of subjects in the population. Non-probability sampling, also known as non random sampling, is a type of non-random sampling commonly used in qualitative research.

Although non-probability sampling methods are samples collected in a process such that each element of the population has no known chance of being selected. The degree of bias in selecting the sample is unknown.

In this study, the researcher used probability sampling to conduct this research. This is due to the fact that probability sampling is a technique where the researcher uses the method of probability theory to select a sample from a larger population. A random sample is one drawn from a method used when the entire population is available and the researcher has a list of the target population. The sample frame is a list obtained from the subjects in this population. Based on the findings of this study, the sample was taken from the effect of interpersonal skill characteristics on the motivation of youth volunteers in Kelantan

Data Analysis

Data analysis is the process of using a statistical or logical approach to describe, summarize, and evaluate data. Some data analysis tools, according to Shamo and Resnik (2009), allow researchers to derive inductive conclusions from data by distinguishing between "phenomena of interest" and "statistical fluctuations" in the data. Data analysis is the process of obtaining, modeling and analyzing data to obtain insights that can be used to make decisions. Analytical

approaches in any study are mostly focused on two areas, namely quantitative and qualitative methods.

In addition, primary data and secondary data are types of data analysis. Primary data is defined as the researcher collecting data through surveys, interviews, or experiments for specific research purposes. Secondary data means collected only by collecting it from previously released information. In this study, the primary data obtained by the researcher was collected from a questionnaire. Meanwhile, secondary data is collected from journals, newspapers, and websites.

In addition, the researcher examined statistical data analysis using SPSS, known as Statistical Analysis for Social Sciences, version in this research. It is a window based program that allows you to create tables and pie charts for data entry and analysis (Magrizos, Kostopoulos and Powers, 2020).

In this study, the researcher collected data for data analysis and conducted descriptive statistical analysis, reliability test analysis, and Pearson correlation analysis.

DISCUSSION AND RECOMMENDATION

Most of the participants in this programme are college students between the ages of 21 and 23. Furthermore, volunteering has a lot of positive effects on both mental and physical health. Stress, rage, and anxiety are treated with the assistance of volunteers. Helping and working together with others is a social relationship quality among Kelantan's young. Through this volunteer programme, young people can also acquire practical experience and develop crucial skills like leadership, problem-solving, and time management. Students between the ages of 21 and 23 make up the majority of participants in this programme. Furthermore, volunteering has numerous advantages for both mental and physical health. Stress, rage, and anxiety are among conditions that volunteers aid in treating. Helping and working together with others is a component of social relationships among young people in Kelantan. By participating in this volunteer programme, young people can also develop crucial skills like leadership, problem-solving, and time management. There are various benefits of volunteering for both mental and physical health. Young people who take part in the volunteer programme can benefit from the assistance of volunteers in overcoming the negative consequences of stress, rage, and anxiety. Helping others is also regarded as one of the ways people create, preserve, and deepen social bonds between young people and others. We can develop a sense of community, meet new people, and feel a sense of belonging through volunteering and assisting others, for instance.

This research findings may be useful for a variety of vocations, particularly for university students who are interested in learning more about the causes and impact of volunteerism. In order to further enhance the investigations outcomes, there are also some suggestions for future studies. Four interpersonal skills which is non verbal communication, teamwork, negotiation and relationship development describe in this research are not the only ones that apply to volunteering. This is because everyone has a different personalities, their interactions with one another will totally be different. Therefore, getting along may require more than these four attributes such as the ability to listen, make decisions, show respect for others, be tolerant, be self aware, be ethically responsible or many other attributes.

Future research may also take into account a number of additional elements that are crucial for examining its efficacy. In addition, several ideologies may be examined in future research to uncover additional factors that affect university students willingness to volunteer. In conclusion, employing questionnaires as the only quantitative way to gather study results may only yield disappointing outcomes. Therefore, additional research techniques, such as qualitative ones, may be added in the future to produce more reliable results.

CONCLUSION

This study aims to ascertain the proportion of youth in Kelantan enthusiastic about volunteer programmes as well as the effects of volunteering on youth. Youth who participated in this volunteer programme can gain new experiences and learn more about volunteering while also developing their social skills and public speaking abilities. In conclusion, the public are greatly impacted by volunteering programme since it can increase their knowledge and provide them to be more confidence to interact with the public. The goal of this volunteerism project is to educate people especially the youth about the value of volunteering and its advantage for them personally.

ABSTRACT

This study aims to achieve the goal and investigate the possibility of significant success in community-based tourism in Min House Camp, Kubang Kerian, Kelantan. There are four factors stated in the study showing the success that strengthens community-based tourism in Min House Camp, namely leadership, tourism management, community participation and tourism networks. This study also uses quantitative methodology. The collected data were obtained through a questionnaire distributed to 296 respondents. The study was conducted via survey research, together with participant and non-participant observations during Min House Camp tourism-related events.

Keywords: Leadership, Tourism Management, Community Participation, Tourism Network, Community-Based Tourism, Min House Camp

INTRODUCTION

The proposes to understanding success factors that strengthen Min House Camp as a community-based tourism product in Kelantan during post-covid be discussed in the introduction to this chapter. This chapter 1 will begin to present the background of this topic by the context of study. Additionally, the subheadings for this chapter will include the problem statement, research question, and research objective. It will be continued to know the significance of the study and definition of terms. Lastly, it will end with the summary as a conclusion for the entire introduction chapter.

SIGNIFICANCE OF THE STUDY

This benefit research is very important to improve the quality of tourism services and it can give good feedback to the Min House Camp. Through this benefit, the relevant agencies can find out more clearly about community-based tourism. The study findings would be of immense value to the following:

1. Volunteer

Volunteer is someone who gives their time willingly and uncompensated to charitable causes, especially aiding others. This volunteer work can help them in doing tasks faster. This will bring many benefits to volunteers because they can help without spending a lot of capital. Volunteers at Min House Camp will be exposed to a variety of skills and more knowledge and enable them to communicate well and thoroughly. Volunteers will work harder because there are various benefits received.

2. Tourism

Tourists who come to Min House Camp will also feel satisfied and comfortable with all the services that have been provided there. The facilities provided allow tourists to be interested in the way the service is provided. When we travel, we can contribute to improving the local economy. One of the sectors that has been adversely impacted by the COVID-19 outbreak is the tourist sector. Tourists can also get to know the different cultures and traditions found at the Min House Camp. The strategic position allows tourists to make Min House Camp a stopover location for foreign and local tourists. Community-based tourism can be used as a tourism area in Min House Camp, Kubang Kerian because there are various services provided.

3. General public

General public are people who are around the Min House Camp area. They can visit there to see the panoramic beauty of the village and see the beauty of the area. Min House Camp is a community-based tourism area that has a variety of unique flora and fauna. With various activities provided, the general public can do activities such as kayaking, fishing and so on to fill their free time while there. This is because, Min House Camp is also a resort that has been recognized by various travel agencies in Malaysia. Therefore, the quality of service at Min House Camp will continue to improve as many communities and people show a deep interest in tourism.

LITERATURE REVIEW

Leadership

Leadership involves leading a team or organization and inspiring followers towards a common goal, according to Livingston and C.I. Bernard. Min House Camp (MHC) is a Community-Based Tourism (CBT) in Kelantan run by local business people. It provides valuable learning opportunities, builds confidence, and develops leadership skills among participants. MHC offers various attractions in Kampung Pulau, including chalets, halls, a bee farm, a mini petting zoo, and water sports activities. Leaders guide and ensure safety during activities like kayaking. CBT keeps revenue within the community, and this study focuses on successful community-based tourism at MHC, emphasizing the leadership approach and the growth of SMEs (Blackman, 2008).

Tourism Management

Tourism is considered crucial for nation's development and economic progress with predicted global arrivals surpassing 1.6 billion by 2020, according to the UNWTO. Tourism management is viewed as a promising employment industry due to the numerous career

prospects it offers in the public and commercial sectors. CBT empowers rural communities to manage tourism resources and engage in tourism services, contributing to community development. Tourism management handles and oversees activities related to the tourism business, providing education, expertise, and experience for managerial positions in the travel and hospitality sectors. MHC, a CBT enterprise in Kelantan, offers various tourism attractions, benefiting the locals through job opportunities, income generation, and entrepreneurial involvement. Coexistence and meeting changing expectations among local communities, government, non-governmental organizations, institutions, private businesses, and visitors are vital for success of CBT (Zhang et al., 2006).

Community Participation

Community participation refers to the active involvement of community members in decision-making, problem-solving, and collective action to address local concerns and improve the community's well-being. Community participation is seen as a proactive process where visitors actively contribute their insights, skills, and knowledge to design and implement effective solutions, rather than just receiving information or benefits (Sarkission, Walsh et al., 1997:17). The visitors can visit MHC for holidays and vacations, engaging in visitors in visitor-oriented activities while enjoying the natural surroundings and sounds of birds chirping. Community participation can take various forms, including individual participation, group initiatives, attending neighbourhood meetings, volunteering, planning events, joining neighbourhood association, and collaboration with community leaders and stakeholders.

Tourism Network

The UNWTO estimates that international tourist arrivals increased from 435 million in 1990 to 940 million in 2010, with a projected increase to 1.8 billion by 2030. In 2017,

international tourism contributed approximately 30% of global exported goods or services, 10% of global GDP, and 10% of global employment (UNWTO, 2018). Tourism network enhance the overall tourist experience by providing information, itineraries, festivals, events, websites, and recommendations, benefiting visitors to MHC. Networking involves interconnected groups of people who can share valuable information at MHC, including the local community showcasing their culture to educate tourists and foreigners. Employees can provide information to visitors about the community and attractions in MHC, strengthening the organization's relationship with visitors and fostering community engagement.

Success that Strengthen Community-Based Tourism in Min House Camp

Understanding the current of the destination, community, and relevant variables is crucial for successful CBT (Nuzhar, 2016). Thus, MHC was chosen as a case study due to its exemplary practice of CBT. The central idea of CBT is the participation of the local community, as widely agreed by Mitchell & Ashley (2010), Lucchetti & Font (2013), and Telfer & Sharpley (2016). According to Taylor (1995), CBT relies heavily on interactions and relationships between local, tourists and other aspects of tourism. MHC in Kelantan benefits the local community by providing job opportunities and increased income through visitor engagement. CBT contributes to social and economic growth, community empowerment, ownership, and enhance the visitor experience. This study focusses on understanding the factors that make MHC a successful CBT development, rather than addressing any issues the organization may be facing it.

Research Hypothesis

Using data from previous studies, it can be seen that all four of these elements are related to community-based tourism. Studies in the past have shown that the camp site offers so many distinctive experiences that are not available at other hotels in the city or town area but can be had at the Min House Camp, guests are very interested in visiting. There, one can gain new experiences and learn new things. Due to the numerous indoor and outdoor activities

that feature natural attractions like kayaking, fireflies, Kelulut bees, capturing Lokan, growing organic herb plants, cooking classes, and others, it's probable that many tourists want to visit and stay at the Min House Camp.

In this study, there were four hypotheses concerning the association between two variables:

There is a relationship between the leadership towards the success that strengthen community-based tourism at Min house camp

In order to implement sustainable growth inside a firm, leaders are essential. Thus, it is claimed that the primary driver of new improvements is leadership. Men (2012) noted that the presence of a trustworthy leader increased staff engagement in organizational improvements or adjustments and boosted employee confidence. The head of the Min House Camp is Muhamad Zanini (Cikgu Zanini) and Wan Noriah (Kak Yah), a respected individual in the group who possesses a broad perspective, effective communication skills, and innovation. Members are encouraged to engage in negotiations to secure funding and other forms of assistance to further their objectives. Therefore, this study will be concluding the hypothesis between the leadership towards the success that strengthen community-based tourism at Min House Camp.

H1: There is a good relationship between the leadership towards the success that strengthen community-based tourism at Min House Camp.

There is a relationship between the tourism management towards the success that strengthen community-based tourism at Min House Camp

Under the direction of the Min House Camp Tourism Board, Min House Camp was run in a touristic manner. Members of Min House Camp's tourist team look after visitors. The

goal is to work together maintaining the original way of life of the riverfront neighbourhood, including its culture, environment, and natural surroundings. The handling of tourism is seen generally favourable in Min House Camp. Everyone thinks they have the power to handle situations in order to bring about either their personal lives or the community are changing. Therefore, this study will be concluding the hypothesis between the tourism management towards the success that strengthen community-based tourism at Min House Camp.

H2: There is a good relationship between the tourism management towards the success that strengthen community-based tourism at Min House Camp.

There is a relationship between the community participation towards the success that strengthen community-based tourism at Min House Camp

Long-standing community members are the most knowledgeable of one another and of the community itself, the core involvement must come from inside the community. Through involvement in tourism-related activities, the local population must be provided consideration and possibilities. Additionally, Min House Camp prevented local objections by enabling residents to understand how tourism gives benefits to the neighbourhood. Therefore, this study will be concluding the hypothesis between the community participation towards the success that strengthen community-based tourism at Min House Camp.

H3: There is a good relationship between the community participation towards the success that strengthen community-based tourism at Min House Camp

There is a relationship between the tourism network towards the success that strengthen community-based tourism at Min House Camp.

In order to maximize and grow capacity, networking is crucial. Data sharing occurs as a result of individuals within the network having an impact on information and resource turnover. Based on the intricacy of the data, this is an efficient form of communication. The network is constantly connected thanks to networking and any choices are sent to all group members. Numerous networks that transport tourists to renowned locations, including the Min House Camp community and villagers, are advantageous to Min House Camp. This is a crucial component of community-based tourism, which helps to prevent rivalry and conflict. Therefore, this study will be concluding the hypothesis between the tourism network towards the success that strengthen community-based tourism at Min House Camp.

H4: There is a good relationship between the tourism network towards the success that strengthen community-based tourism at Min House Camp.

Research Framework

As a result of previous literature review, the researcher has proposed a framework to study the success that strengthen community-based tourism Min house camp. Hence, as seen below, the diagram:

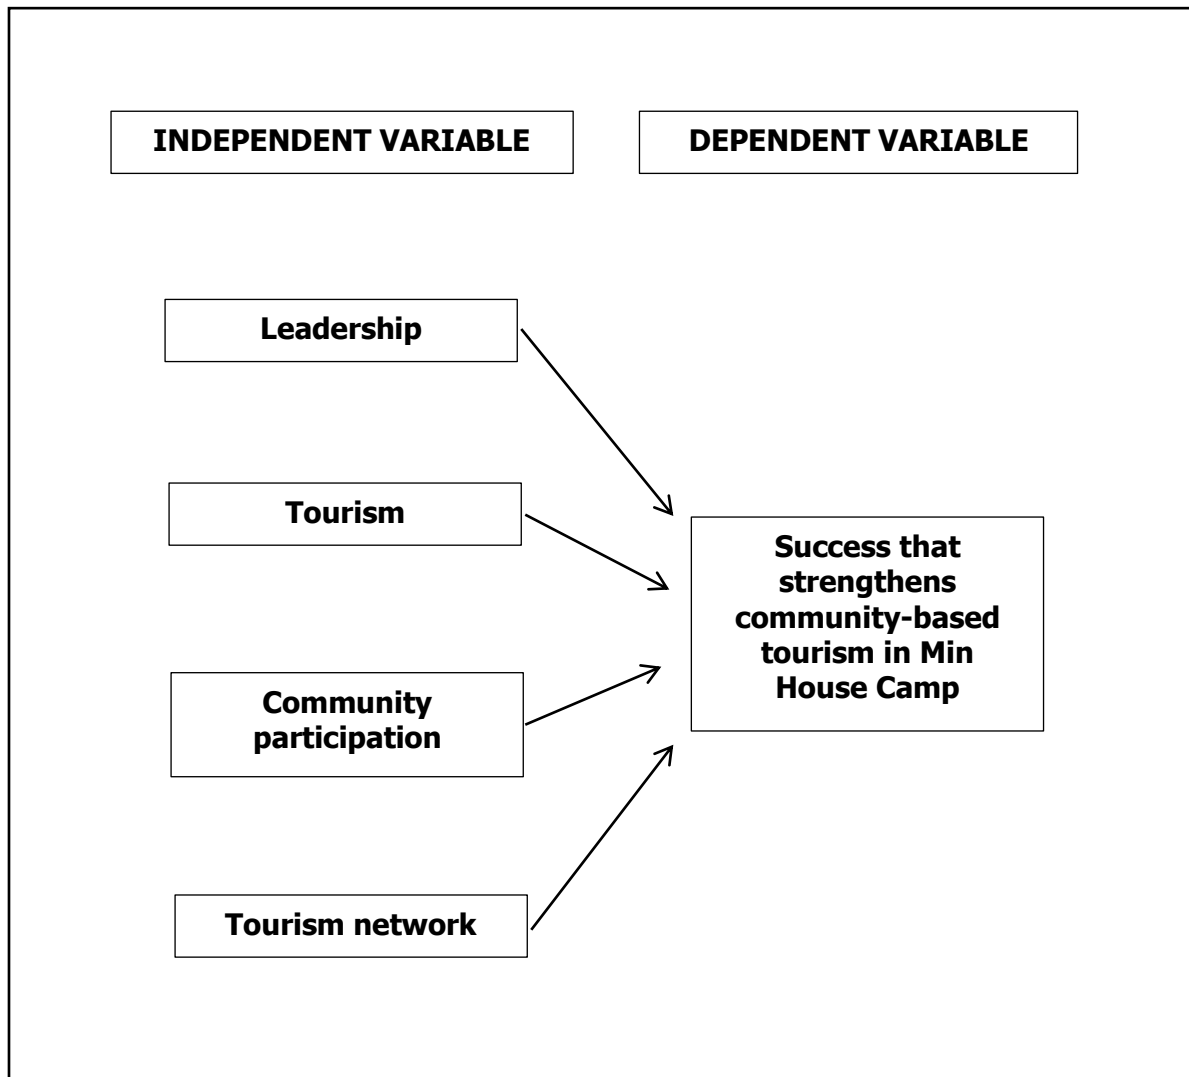

Figure 2.1: Conceptual framework.

METHODOLOGY

Research Design

Research design specifies the process of gathering and processing data efficiently while aligning with research objectives (Kothari, 2004). It provides guidelines for researchers to achieve their study objectives and test hypotheses (McDaniel and Gates, 1999). The selection of a study design, whether exploratory, descriptive, or causal, is crucial as it determines how information will be collected and reported. The collection of research design has 3 namely exploratory research, descriptive research and causal research.

Furthermore, in order to carry out this research, all sources for the first information should be consulted using secondary data existing data sources. If there is no information or it is still available but not enough to answer the objective research questions, researcher needs to choose an approach for data collection using primary data.

In this study, the research design was quantitative. This quantitative method is the only data collection method involving numbers. This is because the data collection uses the primary data. The method used in this study is causal research. When one variable is thought to be able to influence the other variable, it gives the researcher more information when determining the casual relationship between the variables in the study.

Data Collection

Data collection involves gathering, quantifying, and evaluating accurate insights using established techniques (McLaughlin, 2018). It is a crucial step in research projects and allows researchers to assess their hypotheses. Primary data, collected through interviews, questionnaires, experiments, and other means, is used in this study to generate evidence supporting the chosen topic and objective.

Nowadays, everyone owns a smartphone and communicates with friends, family, and others via it without ever physically meeting. This study contacts the respondent via a Google Form so they can fill out the questionnaire and submit all of their responses. Using social media platforms like *Instagram*, *Telegram*, and *WhatsApp* can make it simpler to contact the respondents. For instance, to contact respondents from Johor and Kelantan, simply share the link to the Google form. Researchers utilize Google Forms because they can save money and time by using them to answer surveys and quickly and effectively gather data.

Part A, Part B, and Part C are the three sections that make up the Google form. There are six questions in Part A that pertain to the demographic segmentation of the respondents. The questions in this section are based on information about the demographics of the population, such as age, gender, work status, and marital status. The subjects in the dependent variable (section B) pertain to community-based tourism. The last part is independent variables (section C) generate inquiries regarding variables that influence visitors, product and services that may increase visitors, and issues and challenges in managing the community.

Sampling

According to Shona McCombers (2019), sampling methods is a sample a representative sample of those who will actually take part in the study. The study must carefully consider how to choose a representative sample of the complete group in order to draw accurate conclusions from the results. Due to this, it can get a sample that contradicts the population for consideration. There are two types of sampling methods that can be used in this study, that is probability sampling and non-probability sampling. Therefore, this study will analyze the data guided by the framework through sampling.

This study utilizes convenient sampling, a non-probability sampling technique often used when probability sampling is not feasible. Convenient sampling aims to produce a sample

that reflects the proportions of the overall population of interest (Moser & Stuart, 1953). However, online non-probability sampling methods can introduce biases due to under coverage and non-response. Non-probability sampling involves some form of random selection, but it also allows for bias based on the characteristics of participants who choose to participate in the survey.

In this research, convenient sampling was used as a technique to gather data from easily accessible individuals in the community. This involved selecting available respondents to gather information. For instance, in the case of promoting Min House Camp as a tourist spot, the research aimed to understand the community's perspective on using Min House Camp as a tourist destination after the Covid-19 pandemic. The survey conducted within the local community provided insights from individuals who shared similar financial backgrounds, ethnic heritage, values, and inclinations related to community-based tourism at Min House Camp.

The purpose of this sampling method that is convenient sampling is to create a conclusion to understanding success factor strengthen Min House Camp as a community-based tourism in Kelantan after Covid-19. The research also collected data from the owner and tourist at Min House Camp. Data obtained from respondents will be collected by using google form to get responses from those involved and shared on *WhatsApp* applications and so on. Through the interview, all the information obtained will be faster.

Data Analysis

As a guide for individuals who are interested in the fundamentals of data analysis, the study claims that data analysis is something that combines mathematics and necessitates a more in-depth study in order to know something (Brandt, 2014). Additionally, it has been

suggested that the study of data analysis is beneficial for those working in the fields of science and engineering because they require a basic knowledge of the statistical techniques used to analyze experimental data and solve problems (Brandt, 2014). We employed a variety of methodologies for this data analysis in order to collect all the data required to provide a more robust justification for the project's title.

Descriptive Statistic

Descriptive statistics provide an understandable summary and description of the data (Zikmund et al., 2013; Creswell & Creswell, 2017). consequently, both the independent and dependent variables in this study were converted into a descriptive statistic. Measuring central tendency (mean, median, and mode), measuring dispersion (range, variance, and standard deviation), and determining the distribution's shape are some examples of descriptive statistics that are frequently used. Tables, graphs and plots are frequently used to show descriptive statistics, which can help in displaying the data and making it simpler to understand. To describe the fundamental characteristics of the data in a study, descriptive statistics are used. Using descriptive statistics, quantitative descriptions are provided in a clear manner. Descriptive statistics allow us to logically simplify enormous amounts of data. Every descriptive statistic condenses a large amount of data into a shorter description.

Reliability Analysis (Cronbach Alpha)

Measure internal consistency is now a characteristics of reliability analysis. The level to which any indication of a thought appears to be consistent at some basic levels is referred to as internal consistency (Zikmund et al., 2013; & Creswell, 2017). Reliability tells how consistently a method measures something. The results will be the same when the same method is applied to the same sample under the same circumstances. If not, the measurement

technique might not be accurate, or bias might have snuck into the study. The straightforward measure of Cronbach's alpha can be used to assess reliability.

Table 1: Rule of Thumb Cronbach' Alpha

Cronbach Alpha	Classification
$\alpha \geq 0.9$	Excellent
$0.9 > \alpha \geq 0.8$	Good
$0.8 > \alpha \geq 0.7$	Acceptable
$0.7 > \alpha \geq 0.6$	Questionable
$0.6 > \alpha \geq 0.5$	Poor
$0.5 > \alpha$	Unacceptable

Pearson Correlation Analysis

The statistical tests that assess the correlation or link between two constant variables are determined by Pearson correlation. It merely offers a measure of how monotonically a relationship between two variables can be stated, or how well a monotonic function can capture that relationship. The Pearson's correlation coefficient measures the direction and the intensity of the association between two ranking factors, abbreviated as:

Table 3.4 Rule of Thumb for interpreting Pearson's correlation.

Cronbach Alpha	Classification
$\alpha \geq 0.9$	Excellent

$0.9 > \alpha \geq 0.8$	Good
$0.8 > \alpha \geq 0.7$	Acceptable
$0.7 > \alpha \geq 0.6$	Questionable
$0.6 > \alpha \geq 0.5$	Poor
$0.5 > \alpha$	Unacceptable

Statistical Package for the Social Sciences (SPSS) is the official name of the programmed that we use to analyze the data. A popular software package for finding information and data is called SPSS (Frey, 2017). Utilizing SPSS has the benefit of being a particularly suited tool for processing social science research data. They include those in the medical, educational, and marketing industries. Additionally, this software is excellent for learning statistical data. Because this programmed accurately analyzes the data, it may be used to produce accurate data about society. It can also create independent variables that will be closely related to dependent factors.

FINDINGS

The key findings of the study based on the recapitulation of the results from the data analysis results and on the study's objectives, research questions, and hypotheses. The first findings of the study to determine the leadership traits that strengthen Min House Camp as a community-based tourism product. Based on the mean descriptive statistic, Min House Camp has successfully achieved success in strengthening its position as a tourist focus area around the local community. The results show that the strength of success in the community is very well received and has influenced the community to make a decision as a tourism center in Min House Camp after Covid-19. Based on the

research, Min House Camp is very suitable to be made as a community-based tourism place because there are various facilities and facilities that have been provided there and can attract more communities around Min House Camp. This is because, its position has become a very significant focus causing Min House Camp to be used as a tourist spot. The surrounding community also managed to strengthen its position after the outbreak of COVID19.

Based on the findings of the data analysis, tourist management has a considerable link with the local community to boost the effectiveness of community tourism at Min House Camp. H2 reflects the findings on the correlation between the independent and dependent variables. Most of the respondents agree more with tourism management because it can form a community to achieve success in better tourism management and enable the community to successfully shape the success of Min House Camp as a tourist destination. For example, they can recommend Min House Camp on social media platforms such as *Facebook, Instagram, Tiktok* and more to enable local communities and tourists to choose Min House Camp as a tourist destination. In terms of employment prospects and revenue potential, having a community-based tourism business in Min House Camp has benefited the locals. It has also provided opportunities for the entrepreneur to become involved with the organization. As a result, after the pandemic of Covid-19, the tourism management around Min House Camp have been successful in forming a community that successfully attracts tourists to come there.

The third objective of the study is to see how community participation between significant relationships towards the success strengthens community-based tourism at Min House Camp after the Covid -19. According to the mean in descriptive statistics, Community participation in Min House Camp has received a very good response from tourists because they successfully promote the tourism center. This is because, the responsibility that they have to do is managing and handling the communications with the visitors in both directions with the visitors in Min House Camp. As a result, the findings of this study show that the participation of this community is getting a very encouraging

response because Min House Camp is a very popular tourist spot for both foreign and domestic tourists.

Previous study from the World Tourism Organization (UNWTO, 2012) can support the objective fourth for this research by the relationship between the tourism network towards the success that strengthens community-based tourism at Min House Camp. This objective four is moderately accepted and supported in this study. As a result, H4 was approved in this research. To help tourists and foreigners learn more about our culture, the Min House Camp community can demonstrate or convey aspects of our way of life community-based tourism, which places a focus on serving local needs and is non-competitive and environmentally benign (Fennell (1999)).

DISCUSSION AND RECOMMENDATION

Based on the results, leadership influences Min House Camp to enhance community-based tourism. Leadership and community-based tourism are positively correlated, and the correlation coefficient is 0.852. An earlier study that looked at whether there were any connections or relationships between the dependent and independent variables supports this conclusion. The research purpose is supported and H1 is proven because both variables' significant levels are 0.000, which are extremely significant.

In order for tourists to experience community-based tourism in Min House Camp and learn about the local culture, it is intended that this paper will share ideas with interested parties. The proprietor of Min House Camp can design a beautiful aesthetic space to draw visitors and help them make cherished family, friend, and relative memories here. In addition, they can encourage visitors to engage in community-based tourism activities like walking through the village, participating in handicrafts or painting, visiting a local market, and making and eating local cuisine. It can help tourists have a nice time, take in the breath-taking views of nature, and spend quality time with their loved ones This is one of the best ideas to foster camaraderie between the employees and the visitors and to

help them build wonderful memories while they are here. Therefore, it is strongly advised that researchers employ a big simple size for subsequent research. This is so that the study's larger samples can be more representative of the general population.

CONCLUSION

In conclusion, the research aimed to examine the success that strengthen the community-based in Min House Camp. The results demonstrate of four main factors that strengthen Min House Camp as a community-based tourism, which are: (i) leadership; (ii) tourism management; (iii) community participation; (iv) tourism network. The local population in the region has realised how quickly the place has developed into a tourism hub. This study is a synopsis of multiple chapters outlining the Min House Camp community-based strengthening components.

ABSTRACT

Tourists' revisit intention towards community-based tourism destinations in the context of a developing country. Atmosphere, cultural environment, and destination brand attachment towards community-based tourism destinations in a developing country are investigated to determine what contributes to tourists' revisit intention. The study suggests to practitioners that it is crucial to understand the impact of atmosphere, cultural environment, and destination brand of community-based tourism destinations, as well as revisit intention, especially, in developing effective marketing strategies for better market segmentation and targeting. The main data for the study will be collected by using a structured questionnaire, and the analysis will be done by using SPSS software. This study surveyed tourists from community-based tourism destinations in Kelantan, Malaysia. Thus, the outcome of this study will help to expand the current knowledge on similar areas of community-based tourism destinations, and the contributory effect of atmosphere, and cultural environment on re-visit intention towards community-based tourism destinations in a developing country context.

Keywords: Atmosphere Cultural environment; Destination brand; Revisit Intention; Community-based tourism destination.

INTRODUCTION

Sustainable tourism development expands on this idea by focusing on environmental, social, and economic issues and taking action to lessen any negative effects that the industry may have on these areas. Tourism is probably one of the largest and fastest-growing sectors in the world today (Daniloska & Hadzi Naumova, Mihajlovska, 2015). This industry has made remarkable strides toward establishing itself as a major driver of overall economic growth. According to the World Tourism Organization, tourism accounts for 9% of global GDP (2014). Additionally, according to estimates from the global tourism sector, over 5 billion domestic visitors and over 1050 million foreign tourists traveled to various tourist spots in various nations in 2013.

Malaysia's tourist sector is one of the fastest expanding (Shariff & Abidin, 2013). By generating foreign currency, assuring job possibilities, raising tax revenues, and extending economic prospects to local populations, it significantly boosts the nation's Gross Domestic Product (GDP). Malaysia's government has taken practical measures to promote this industry (Siti-Nabiha, Abdul Wahid, Amran, Haat, & Abustan, 2008). In order to promote the growth of Malaysia's tourist industry, the government established the Tourism Policy in 1992. However, due to Malaysia's diverse civilization, the importance of the growth of the tourist sector to local economies varies across the nation. Since

community-based tourism destinations are a growing sector of 2 tourism in developing countries, particularly Malaysia, focusing on them in Malaysia's remote regions may present a chance to implement the government's tourism strategy successfully (Chin & Lo, 2017).

The newest type of tourist product is community-based tourism (CBT), in which local communities oversee and coordinate the majority of tourism-related activities. Since community-based tourism forbids the involvement of outside parties, local residents are completely responsible for carrying out all aspects of tourist management. The primary goal of community-based tourism is to organize the production and delivery of tourism services to visitors. Through community-based tourism, tourists are also given the opportunity to learn about the way of life, culture, and customs of the community (Kaur et al., 2016). Although Tok Bali, Kelantan has demonstrated the acceptable growth of community-based tourism, the study is still needed to determine how tourists perceive the region and if they plan to return. Tok Bali, Kelantan has demonstrated that community-based tourism can grow in an acceptable way, but more research is needed to understand how visitors view the area and whether they intend to return (Abdul & Lebai, 2010). In previous research, the outcomes of visitor experience and satisfaction were frequently cited as the causes of visitors' revisit intention or behavioral intention (Cole & Chancellor, 2009).

Discussion of pertinent literature and research methodologies serves to create the remainder of the essay. This study thus poses the question of whether factors influencing various tourist perspectives towards community-based tourism destinations 3 have any impact on revisit intention as well as the mediating role of attachment factors between tourist perspective and revisit intention. The study is described first, and then the analysis and results are discussed. Finally, it is agreed that the study will support the results and implications of the study in the paper's final section.

The research objectives are:

1. To investigate the relationship between tourist perspectives on Tok Bali, Kelantan.
2. To investigate the relationship between tourists, revisit the intention to visit Tok Bali, Kelantan.
3. To investigate the relationship between the attractions at Tok Bali, Kelantan that can attract tourists to revisit the place.

SIGNIFICANCE OF THE STUDY

Significance to Practice

This investigation could assist local stakeholders in the development of tourism strategies by highlighting the many factors involved in creating community-based tourism (CBT). As a result, the research was thought to help with long-term planning. The community-based tourism (CBT) procedure has aided in establishing and bolstering sluggish tourism sectors while supplying rural inhabitants with employment and expanded economic options (Butts & Sukhdeo-Singh, 2010; Srisuwan, Chantachan, & Thidpad, 2011). In order to help tourist planners, understand how the local community will react to industry changes, the study's findings may be used to guide the implementation of plans.

Significance of Social Image

This research should assist Tok Bali, Kelantan, in experiencing positive social change, as community-based tourism (CBT) strategy based on community feedback should strengthen the state's tourism sector and increase foreign currency inflows. The 8 development of more new businesses, more government spending, and more private sector, spending all benefit from increased foreign exchange. These economic stimulus measures ought to increase the number of jobs available. Although there is

no agreed-upon definition of community-based tourism (CBT), Salazar (2012) stated that it aims to give community members more control.

Given the growing importance of the tourism sector in terms of GDP contribution, it is necessary to investigate the factors that influence a destination's tourist appeal (Omerzel, 2011). People are drawn to and spend time at a tourist location because of its appeal (Omerzel, 2011). According to L. S. Stone and Stone (2011), CBT boosted and revitalized the tourist sectors of various nations. Therefore, the introduction of CBT to Tok Bali may aid the struggling tourism sector. Reviving Tok Bali, Kelantan, and the tourist sector ought to boost travel demand and boost the country's economy as a result.

DEFINITION OF TERMS

Tourist's Perspective

(Verma, D., 2015) The researcher finding the tourist/visitor seeks various emotional and physical experiences and satisfactions from tourism. And the nature of these encounters will largely determine the locations picked and the activities experienced, appreciated or participated in. Revisit Intention According to (Um, S., Chon, K., & Ro, Y., 2006), relative to the start decision. making process, the intention to revisit has been seen as a continuance of satisfaction. The chance of repeat business may be influenced by several independent factors, including perceived performance quality throughout the on-site and post-purchase phases, the destination's distinctiveness, and the research finding (Um, S., Chon, K., & Ro, Y., 2006).

ATMOSPHERE

The reason "atmosphere" is a good starting point for measurement, according to research (Bauer et al., 2005; Pfaff, 2002), is that it can help people become aware of a space's design elements through sight, smell, touch, and taste. It can also be used as a management tool to influence visitor behaviour and attitudes (Heide & Grnhaug, 2006).

This study sees the interconnected components of creative people, creative processes, creative goods, and creative environments/presses as forming the "creative atmosphere" (CA) of "creative tourist destinations," which is defined as a distinct ambiance with visual and emotional appeal (G. Richards, 2011; G. Richards & Wilson, 2006). As a result, CA is philosophically open-ended.

Examples of how the creative environment in a creative district is created to pique and stimulate traveler interest include the cooperative efforts of travel writers, bloggers, and painters, the creation of artistic works, and the growth of interaction at the levels of "creative environment," "creative people," "creative product," and "people-tourist" (Uhrich & Benkenstein, 2010). However, what does CA actually mean and how is it determined? There are still gaps in the literature and opportunities for future research on these topics.

One of the numerous stunning beaches that line Kelantan's shore is Pantai Tok Bali. Due to the dense casuarinas that surround it, Tok Bali Beach is more serene and peaceful than other, more well-known beaches. Visitors will only find peace at this beach because it is one of the more secluded ones in Kelantan. Visitors can enjoy the warmth of the tropical sun and the cooling effect of the pleasant sea wind without the hassle of large crowds. Due to the beach's seclusion, there is plenty of room for picnics and group games, or tourists can go swimming in the comparatively shallow waters.

When needed, the densely growing casuarinas along the beach provide significant shade from the hot sun. A red-orange glow will greet visitors at dusk as it lowers to meet the open horizon, creating a romantic atmosphere. The beach is most popular for its isolation from crowded areas, which makes it a wonderful and tranquil escape, rather than the calm waves and sand beach.

CULTURAL ENVIRONMENT

The three-part framework of economy, society, and environment, which has recently been enhanced and supplemented by the cultural dimension, has been used to examine the complicated and contentious relationship between tourism and development from a number of angles. (K. Soini and I. Birkeland, 2014).

The three pillars of "sustainability," the bases on which tourism values, processes, and choices may be negotiated and implemented, gain further analysis and operationalization the cultural aspect of sustainability issues, resource uses, practises, demands, and interests, etc., including tourism prospects and repercussions, is included.

The most fundamental and all-encompassing social dimension in every location is culture, which encompasses all facets of human existence and cognition as well as their resultant products, activities, meanings, symbols, representations, etc. In Tok Bali, Kelantan they still maintain Malay culture to attract visitors from abroad to know more about Malay tradition.

Tourism's cultural environment has a mutually beneficial relationship that can increase the attractiveness and competitiveness of destinations, regions, and countries. Culture is gradually becoming an important factor in attracting tourists, creating distinction in a crowded global marketplace. Creating a difficult relationship between tourism and culture can help destinations become more appealing as places to live, visit, and spend.

DESTINATION BRANDS

Destination branding is the foundation of marketing strategies and the most important marketing tool in the tourism sector for shaping the images of places in the minds of potential tourists and other stakeholders by emphasizing the exclusivity of these locations (Tasci, A.D.A., and Kozak, M. 2006). It's important to remember that place branding, also known as destination branding, is intricate and plays a significant part in local and corporate marketing initiatives aimed at attracting tourists to the area (Rudolf, W.; Wraas, A. 2021).

Branding benefits businesses as well as buyers. One of its responsibilities is to help customers recognize products and judge the caliber and consistency of the product. Brands allow one manufacturer to be held accountable for the product's performance. Another function of a brand is to facilitate decision-making and lessen the risk that consumers perceive. According to Aaker (1991), the purpose of a brand is to inform customers about the product's origin and to shield the producer from competitors who might provide similar goods.

According to these viewpoints, a brand serves as a tool for consumers' decision-making. In Tok Bali, they do their branding by promoting their place on social media, on websites, and other digital facilities.

HYPOTHESIS

The research hypothesis is made based on research factors influencing service, environment, and facilities and the confirmed factors that directly revisit the intention of community-based tourism in Tok Bali, Kelantan.

H1: There is a significant relationship between atmosphere and revisit intention among tourists in Tok Bali, Kelantan.

H2: There is a significant relationship between the cultural environment and the intention to revisit Tok Bali, Kelantan.

H3: There is a significant relationship between destinations and brand attractions at Tok Bali, Kelantan, that can attract tourists to revisit the place.

Research Framework

The important part is the conceptual framework, which is intended to demonstrate the relationship between the independent and dependent variables, as shown in Figure 2.1:

Figure 2.1: Conceptual Framework

METHODOLOGY

Research Design

The researcher's research design shapes the methodologies and approaches that will be used. The focus of research can be on developing successful studies using methodologies that are appropriate for the subject. The three main categories of study designs are data gathering, measurement, and analysis.

Population

A population is a group of people with whom we want to come to terms. In research, a population is typically not related to humans. It can refer to a group of objects, events, organizations, countries, species, and organisms that are being researched. The population of this study includes all residents of Tok Bali, Kelantan, who have an impact on tourism.

Sample Size

Fleetwood (2021) defines a sample as a smaller data set that is collected or selected by a researcher from a larger population using a particular selection method. The size of the sample is useful in gaining insight into a group of people chosen from the general population, and it is thought to be representative of the true population for that particular research. The sample for this study will be selected from the target population.

Sampling Method

The selection of a sufficient number of elements from a population is known as sampling. Researchers will be able to generalize traits or characteristics to aspects of the population after conducting sample studies and understanding the traits or characteristics. Survey questionnaire is relatively easy because it can reach respondents more closely and the data obtained is more accurate. To select respondents among random peoples, a simple random sample was used to target 340 peoples, factors affecting revisit intention. The researcher can select the sample size and pick the communities conveniently.

Data Collection Procedure

Structured equation modeling, a Google form, and use software SPSS (Statistical Package for the Social Sciences), generally known as IBM SPSS Statistics, is a software package used for statistical data analysis. Refers to its first application in the social sciences, it has since been used in other data markets. Research in the fields of healthcare, marketing, and education frequently uses SPSS. Analyses a wide range of data types. Survey results, client databases from businesses, Google Analytics, the findings of scientific study, and server log files are examples of common sources. Almost all formats of structured data, as well as many different types of data, are supported by SPSS for analysis and customization. Spreadsheets, simple text files, and relational databases like SQL, SATA, and SAS are all supported by the software.

In order to get the essential information for this analysis, questionnaires were given to representatives, who completed them and provided the necessary information. Residents of the state of Kelantan who agreed to participate in the study by answering questions online were given the questionnaire. The respondent will be given a questionnaire with 20 questions in order to learn more about the factors influencing tourists' perspectives in community-based tourism toward reliability and revisit intention at Tok Bali, Kelantan. The questionnaire is divided into three sections: Part A, Part B, and Part C. Section A, includes demographic elements that collect background information from respondents, such as name, gender, and age. Section B includes questions about three aspects of tourists' perspectives. Section C includes questions about tourists' plans to return to Tok Bali, Kelantan. The question also asked the respondent to rate the extent of their agreement with each element.

Research Instrument

An observation-based interview and a questionnaire are part of a set of measuring tools known as research instruments that are used to gather useful information from target respondents on a certain topic. Therefore, it is essential the inquiry that the right study instrument be chosen for data gathering. Research tools can be classified as either qualitative or quantitative.

Qualitative research has a tone of evidence. According to Creswell, Hanson, Clark- Plano, and Morales (2007) and Hamilton and Finley (2019), qualitative researchers have access to a variety of data collection tools from which to choose based on their research objectives and proficiency with them. In order to specifically collect pertinent data for a study objective, it conducts a face-to-face conversation between a researcher and participants. A focus group discussion guide, according to Guest (Namey, Taylor, Eely, and McKenna 2017), provides questions to guide researchers when they gather people from similar backgrounds or experiences together to explore a specific issue of interest.

Data Analysis

According to Eteng, O. 2022, data analysis is an important aspect of research because a poor analysis results in an incorrect report, which leads to inaccurate and poor decision-making. As a result, selecting an appropriate data analysis strategy is critical to obtaining reliable and meaningful insights from your data. Finding patterns, connections, and links in data can be difficult. Nonetheless, with the proper data analysis process and tools, it can run through its data and generate information about it.

Descriptive Statistics

Descriptive statistics, according to Bhandari, 2023, are the qualities of a data collection that are organised and summarised using descriptive statistics. A data set is a collection of observations or responses from a subset of a population or the entire population. The first step in quantitative research statistical analysis is to describe the characteristics of the responses, such as the average of one variable (such as age) or the connection between two variables (such as age and creativity). One of the most common types of data analysis is descriptive analysis, which is well-known for producing intelligible insights from uninterpreted data. In contrast to other data analysis methodologies, descriptive analysis does not attempt to forecast the future. Instead, it simply employs changed historical data to make sense of it in order to draw conclusions.

Reliability Analysis

In statistics, a metric's consistency is referred to as dependability. Researchers like tests with high dependability because it suggests that the results may be trusted because the test regularly provides measurements throughout time (Zach, 2022). The reliability analysis approach, in addition to giving data on the correlations between the scale's constituent items, generates a number of commonly used scale reliability measures. Intraclass correlation coefficients can be used to assess inter-rater dependability.

Pearson Correlation Analysis

The Pearson Correlation Analysis was employed in this study. According to FlexMR (2021), correlation analysis is a statistical approach used to assess whether or not there is a link between two variables or datasets and the strength of that association. This means that in market research, correlation analysis is used to assess quantitative data obtained from research methodologies like as surveys and polls to see whether there are any noticeable links, patterns, or trends between the two.

The correlation coefficient, often known as Pearson's correlation coefficient, is a statistic that describes how strongly two variables are associated, according to Stewart, 2023. Pearson's correlation coefficient r has a range of -1 to +1. A value of 0 indicates that there is no connection between the two variables, but values of 1 or +1 indicate that there is a perfect linear relationship (Stewart, 2023). (Negative numbers simply indicate the direction of the relationship, with one variable growing while the other lowers.) Correlation coefficients that depart from 0 but are neither 1 nor +1 indicate a linear link, but not a totally linear one. The correlation coefficient was discovered in 1896 by British mathematician Karl Pearson, who expanded on previous studies by French physicist Auguste Bravais and British eugenicist Francis Galton (Stewart, 2023).

DATA ANALYSIS

DEMOGRAPHIC CHARACTERISTICS OF RESPONDENTS

An internet platform used to deliver 340 questionnaires in total. We intended for this survey to receive 280 responses, however we received 60 more than we expected. In that case, we used

340 respondents to create the SPSS. Below was a table with the total of questionnaires:

The total number of surveys distributed	340
Questionnaires returned and usable to be analysis	340
Response rate	100%
Questionnaires were utilised in the analysis	340

<i>Characteristics</i>		<i>Frequency</i>	<i>%</i>
	Gender	76	22.0
	Male	246	78.0
Race	Female	327	96.2
	Malay	5	1.5
	Chinese	2	0.7
	Indian	6	1.8
	Others	301	88.5
	Age	20-30	31
	years old	5	1.5
	31-40 years old	3	0.9
	41-50 years old	264	78
	51 years old above	76	22
Marital Status	Single	60	17.4
	Married	35	10.3
Educational	Secondary School	34	10.0
	Form 6	202	59.1
	Diploma	8	2.4
	Bachelor of Degree	1	0.3
	Master Degree	224	66.2
	PhD	78	22.6
Occupation	Students	37	10.9
	Employed	1	0.3

Unemployed

Retired

FINDINGS

Demographic Profile of Respondent

RESULT OF DESCRIPTIVE ANALYSIS

Descriptive statistics are used to organise and summarise the features of data collected. A data set is a collection of observations or responses from a subset or the entire population (Bhandari, 2023). We utilised mean and standard deviation for the independent and dependent variables. The mean, or M, is the most often used method for computing the average. Simply add up all of the response values and divide the total by the total number of responses to get the mean. The total number of observations or answers is indicated by N. The standard deviation (s or SD) represents the average degree of variability in your dataset. It displays the average deviation from the mean of each score. The higher the standard deviation, the more unpredictable the data collection (Bhandari, 2023). The respondent's replies were rated using the Likert scale, with "Strongly Disagree" and "Disagree" being the options. "Neutral", "Agree", and "Strongly Agree"

Result of Descriptive Analysis Dependent Variable and Independent Variable

<i>VARIABLES</i>	<i>N</i>	<i>MEAN (M)</i>	<i>STANDARD DEVIATION (SD)</i>
<i>Re-visit Intention</i>	340	3.9725	.84407
<i>Atmosphere</i>	340	3.7953	.78510
<i>Culture Environment</i>	340	3.9447	.75571
<i>Destination Brand</i>	340	4.0512	.76399

A descriptive analysis of dependent and independent factors is shown in Table 4.8. The means and standard deviations of dependent and independent variables are shown in descriptive statistics. The highest mean in the table is 4.0512 (SD=.76399) for Destination Brand. The lowest mean in the table is 3.7953 (SD=.78510) for Atmosphere.

RESULT OF RELIABILITY TEST

Reliability analysis can be used to evaluate the qualities of measuring scales and the items that comprise the scales. A number of frequently used scale reliability measures are computed by the reliability analysis technique, together with details on the correlations between particular scale items. Inter-rater reliability estimates can be computed using intraclass correlation coefficients (IBM Documentation, n.d.). According to the SPSS - Statistics How To, (2023), Cronbach's Alpha range by Interpretation if the alpha level is high, the test items may be significantly related. The 0.9 may be greater when there are more items, and the 0.5 may be lower when there are fewer items. If alpha is high, it may signal that more inquiries are required (Cronbach's Alpha: Definition, Interpretation, SPSS - Statistics How To, 2023b).

Pilot Test

The researcher used a Google form to perform a pre-test to 33 respondents to ensure there were no grammatical problems, to see whether the respondents could understand the question, and to determine whether the claim was adequately presented. Source: SPSS

<i>Variables</i>	<i>Cronbach's Alpha</i>	<i>Number of Items</i>
<i>Revisit Intention</i>	0.670	5
<i>Atmosphere</i>	0.852	5

<i>Cultural Environment</i>	0.941	5
<i>Destination Brand</i>	0.956	5

Reliability Test

<i>Variable</i>	Cronbach's Alpha	No of item	N
<i>Revisit Intention</i>	0.666	3	340
<i>Atmosphere</i>	0.904	5	340
<i>Cultural Environment</i>	0.920	5	340
<i>Destination Brand</i>	0.932	5	340
<i>All Variable</i>	0.957	18	340

Reliability Analysis Result

The accuracy and repeatability reliability test has been completed. The survey was completed and replies were given by 340 random individuals. The survey's reliability analysis is provided in Table 4.15. The reliability of all constructs ranges between 0.666 and 0.932. Based on the findings of all the constructions, the coefficient is questionable and excellent. The results of this study show that destination brand has an exceptional construct value of 0.932, followed by cultural environment, which has an excellent construct value of 0.920, atmosphere at 0.904 (excellent), and finally re-visit intention at 0.666 (questionable).

RESULT OF PEARSON'S CORRELATION COEFFICIENT ANALYSIS

Pearson's Coefficient of Correlation The relationship between the independent variables of atmosphere, cultural environment, and destination brand and the dependent variable of revisit intention was investigated using a coefficient analysis. The coefficient correlations and the intensity of the association are shown in the following table:

Correlation Coefficient 'r' Strength Relationship

$0.9 < r < 1$ or $-0.9 < r < -1$	Perfect
$0.7 < r < 0.9$ or $-0.7 < r < -0.9$	Strong
$0.5 < r < 0.7$ or $-0.5 < r < -0.7$	Moderate
$0.3 < r < 0.5$ or $-0.3 < r < -0.5$	Weak
$0.01 < r < 0.30$ or $-0.01 < r < -0.3$	Very Weak
0	Zero

Hypothesis 1

H1: There is a significance relationship between the atmosphere towards revisit intention at Tok Bali, Kelantan.

CORRELATIONS			
		Atmosphere	Revisit Intention
Atmosphere	Pearson Correlation	1	.624**
	Sig. (2-tailed)		< .001
	N	340	340
Revisit Intention	Pearson Correlation	.624**	1
	Sig. (2-tailed)	< .001	
	N	340	340

**Correlation is significant at the 0.01 level (2-tailed)

A medium association between the atmosphere and revisit intention at Tok Bali, Kelantan, with a correlation value of .624**. This demonstrates that the atmosphere has a good relationship with the revisit intention at Tok Bali, Kelantan. The significant value of the atmosphere is 0.000, which is less than the highly significant value of 0.001. As a result, there is a relationship between the atmosphere towards revisit intention at Tok Bali, Kelantan. H1 is therefore supported.

Hypothesis 2

H2: There is a significance relationship between the cultural environment towards revisit intention at Tok Bali, Kelantan.

CORRELATIONS			
		Cultural Environment	Revisit Intention
Cultural Environment	Pearson Correlation	1	.590**
	Sig. (2-tailed)		< .001
	N	340	340
Revisit Intention	Pearson Correlation	.590**	1
	Sig. (2-tailed)	< .001	
	N	340	340

**Correlation is significant at the 0.01 level (2-tailed)

Demonstrates that there is a .590** association between cultural environment and revisit intention in Tok Bali, Kelantan. This shows a relationship between the cultural environment and revisit intention at Tok Bali, Kelantan. The significant value for the cultural environment is 0.000, which is less than the significant level of 0.01. As a result, there is a substantial association between the cultural environment towards revisit intention at Tok Bali, Kelantan. H2 is therefore supported.

Hypothesis 3

H3: There is a significance relationship between the destination brands towards revisit intention at Tok Bali, Kelantan.

CORRELATIONS			
--------------	--	--	--

		Destination Brand	Revisit Intention
Destination Brand	Pearson Correlation	1	.652**
	Sig. (2-tailed)		< .001
	N	340	340
Revisit Intention	Pearson Correlation	.652**	1
	Sig. (2-tailed)	< .001	
	N	340	340

**Correlation is significant at the 0.01 level (2-tailed)

The correlation value of .652** reveals a medium relationship between the destination brands towards revisit intention at Tok Bali, Kelantan. This shows that the relationship between the destination brands towards revisit intention at Tok Bali, Kelantan. The significant value of the destination brand is 0.000, which is below the highly significant value of 0.001. H3 is therefore supported.

DISCUSSION BASED ON RESEARCH OBJECTIVES

The findings of this study examined the relationship between the atmosphere, cultural environment, destination brand, and revisit intention at Tok Bali, Kelantan.

Hypothesis	Pearson's Correlation Results
H1: There is a significance relationship between the atmosphere towards revisit intention at Tok Bali, Kelantan.	r = .624**, p < 0.01 Medium
H2: There is a significance relationship between the cultural environment towards revisit intention at Tok Bali, Kelantan.	r = .590**, p < 0.01 Medium
H3: There is a significance relationship between the destination brands towards revisit intention at Tok Bali, Kelantan.	r = .652**, p < 0.01 Medium

According to table, Pearson's correlation analysis was used to evaluate the hypothesis on atmosphere, cultural environment, destination brand, and revisit intention in Tok Bali, Kelantan. All hypotheses were accepted at the 0.01 significance level. Furthermore, the end result demonstrated that the independent factors of atmosphere, cultural environment, and destination brand have a medium and positive link with the intention to visit again.

RECAPITULATION OF THE FINDINGS

The results presented in Chapter 4 are based on a questionnaire created by the researchers and administered to the respondents. The questionnaire has a total of 20 questions across all parts. Section A focuses on the respondents' demographic information, which includes their gender, race, age, marital status, and occupation. The atmosphere, cultural environment, and destination brand were the independent variables (IV) discussed in Section B. Section C concentrated on the dependent variable (DV), which is the revisit intention in Tok Bali, Kelantan from a tourist standpoint. The questionnaire focuses on the quantitative character of descriptive science and has several alternatives for respondents to fill out.

Relationship between atmosphere and revisit intention of community-based tourism in Tok Bali, Kelantan.

In order to respond to research question 1, the results of hypothesis H1 in the prior chapter were examined. In addition, H1 said that in Tok Bali, Kelantan, there is a connection between the mood and visitors' intentions to return. According to the results, there is a favourable atmosphere and a moderate relationship between community-based tourism intentions for repeat visits in Tok Bali, Kelantan, with a correlation value of.624. The atmosphere's p value is.000, which is below the extremely significant level of.0001. In Tok Bali, Kelantan, there is a connection between the mood and visitors' intentions to return. H1 accepted.

Relationship between cultural environment and revisit intention of community-based tourism in Tok Bali, Kelantan.

The findings of hypothesis H2 in the previous chapter was reviewed in order to answer research question 2. In addition, H2 said that there was a connection between the cultural setting and the ambition of community-based tourism in Tok Bali, Kelantan, to return. According to the findings, cultural environment is positively and significantly associated to community-based tourism return intention in Tok Bali, Kelantan, with a correlation value of.590. Place attachment has a p value of.000, which is below than the.001 level of statistical significance. Additionally, in Tok Bali, Kelantan, there is a connection between the cultural context and the intention to return. As a result, H2 accepted.

Relationship between destination brand and revisit intention of community-based tourism in Tok Bali, Kelantan.

To respond to research question 3, it was necessary to evaluate the outcome of hypothesis H3, which was presented in the preceding chapter. In addition, H3 reported that in Tok Bali, Kelantan, there is a connection between the destination brand and the inclination to return. According to the results, destination brand is positively and modestly associated with the desire of returning to Tok Bali, Kelantan's community-based tourism, with a correlation coefficient of.652. Place attachment has a p value of.000, which is below than the.001 level of statistical significance. Additionally, there is a

connection between the destination brand and the intention to return in Tok Bali, Kelantan. As a result, H3 accepted.

LIMITATIONS

A beneficial and crucial method to complete the research was experienced throughout the full investigation. Even yet, there are several constraints that cannot be avoided by proceeding with the research as planned. It is important to be aware of the restrictions on the current study. The first restriction of this study is the lengthy timeline required to complete the entire data gathering. The researcher attempted to gather responses as rapidly as possible. Furthermore, respondents' unwillingness to cooperate in answering the online questionnaire. It is difficult for researchers to discover visitors who visit Tok Bali, Kelantan on a regular basis in order to conduct an appropriate study. Online questionnaires spread via WhatsApp groups, Facebook pages, and Instagram gained little answers. To encourage respondents to complete out the survey, the researcher had to continuously ask and appeal to them.

RECOMMENDATIONS

This work still needs to be improved for future research. As a result, certain recommendations have been created to be utilised in future research in order to improve the output. The first recommendation is that this study be conducted utilising both qualitative and quantitative methodologies. This is because it can help researchers obtain more accurate and high-quality results in the future. Following that, if survey questions are given online, researchers must do it in a more official manner. Furthermore, the surveys must be accompanied by a letter of confirmation from the institution or superiors in order to perform the study. As the survey is included with the confirmation letter, this ensures that respondents trust and do not hesitate to answer the surveys provided.

When it comes to the function of perceived advantages in revisit intention, perceived benefits play a significant part in tourist decision making. Future research should look into the influence of perceived advantages including cultural immersion, social interaction, and environmental sustainability on the desire to return to Tok Bali community-based tourism. Furthermore, for future studies, researchers might study the impact of tourist motive on return intention, the function of trust in revisit intention, and the impact of information sources on revisit intention.

In conclusion, this study was conducted to investigate variables influencing the return intention of community-based tourism in Tok Bali, Kelantan: the tourist perspective. The important characteristics (independent variables) of the atmosphere, cultural environment, and destination brand have an influence on visitors' revisit intention (dependent variable) in Tok Bali, Kelantan. As described in Chapter 3, researchers used Google Forms with 342 respondents to deliver surveys to those who go

to and visit Tok Bali. The researcher also gathers all data and information using a quantitative technique. The researcher also used Google Forms to connect with folks from all throughout Kelantan.

The Statistical Package for the Social Science (SPSS) software was then used to analyse the data from the questionnaire and the conclusions gathered in the previous chapter. The software was used by the researchers since it made it simple to obtain all the results. The next step is to summarise the data and decide the final result. For this investigation, all three of the offered hypotheses H1, H2, and H3 are accepted. Furthermore, limits and suggestions were developed for this study, which we think would be useful in future research. As a result, it is hoped that all of the material presented during this research will be useful to the next researcher.

ABSTRACT

The purpose of this paper is to discuss how passengers' satisfaction with quality services supplied by airlines can be quantified using the AIRQUAL technique. A quantitative study was conducted to identify airline tangibles, Terminal tangible, and personnel service among the airline passengers the company improves to the service quality of the airlines. The researcher administered 384 responses using a convenience sample of Malaysia Airlines passengers. The outcomes of this study will assist Malaysia Airlines in redefining its marketing approach to one that is more focused on passengers and emphasizes airline service quality.

Keywords: Malaysia Airlines, customers satisfaction, terminal tangible, Airlines tangible, personnel.

INTRODUCTION

Tourism is the third-largest sector in the world, with domestic, inbound, and outbound tourism being the three categories. The air transportation sector is an important industry that supports tourism, with the global airline industry transporting 2.7 billion passengers yearly. Malaysia Airlines is the nation's national airline, providing insurance and compensation to passengers in the event of a fatality or other accident. Next, the importance of airlines in the tourism industry is to increase their profits. Tourists will use airplanes to go to destinations such as vacations abroad or domestically. Furthermore, during school holidays or festivals, airline demand will rise. Apart from that, tourists will purchase flight tickets when airlines offer them at low prices. After that, airlines will provide insurance and compensation to passengers in the case of a fatality or other accident, including pilot carelessness, take-off damage, crashes, or other occurrences. Malayan Airways Limited, which was founded in 1947, made its first commercial flight in 1947. In 1963, the year the Federation of Malaysia was created, it was renamed Malaysian Airways. The airline was renamed Malaysia Singapore Airlines (MSA) in 1966 and Malaysian Airline System (MAS) in 1972.

Several objectives of this study were established as follows:

1. To examine the relationship between airline's tangible towards customer satisfaction using Malaysia Airlines.
2. To examine the relationship between terminal tangible towards customer satisfaction using Malaysia Airlines.
3. To examine the relationship between personnel services towards customer satisfaction using Malaysia Airlines.

SIGNIFICANCE OF THE STUDY

The findings of this study are predicted to be significant in tourists' satisfaction with Malaysia Airlines flight services. In addition, this study is expected to help various parties who want to conduct studies in the future related to satisfaction with Malaysia Airlines flight services. The Malaysia Airlines aviation industry sector will be able to grow if we can find a way to deal with the issues faced by customers who use Malaysia Airlines. Practically, it can be useful to various individuals, including customers, pilots, co-pilots, and cabin crew. The following is an example of a hypothetical research scope, with the research question being "How satisfied are customers with Malaysia Airlines services?" We were also informed that the questionnaire was the tool used to evaluate any changes in this investigation. Any other approach is beyond the scope of the research and may constitute a limitation of the study. This is a clear statement of how the outcome measures will be explored.

LITERATURE REVIEW

Service Quality

Refer to the Indeed Editorial Team (2022) article. Service quality is a measure of how successfully a company satisfies its customers' requirements and expectations. Customers purchase services to satisfy specific needs. Whether people are aware of it or not, customers have criteria and expectations for how a business's service delivery fits their needs. A company that delivers outstanding service quality meets or exceeds its customers' expectations.

Airline tangible

The term "airline tangible" refers to the physical indications of an airline's degree of customer service. (2006) (Ekiz and colleagues). It is widely acknowledged as one of the most essential aspects of service quality in the aviation industry. Gudmundsson (1998) and Farooq (2016) According to Ali et al. (2015), airline tangible refers to the total state of an aircraft, which includes the quality of its components the equipment both inside and out, the grade of the meals, the comfort of the seating, and cleanliness.

Terminal tangible

According to Arifin and Yahaya (2013), one of the most visible indicators of an airline's service excellence is its final tangibles. Terminal tangible has a direct impact on the overall image of the airline. The terminal's tangible nature signifies the terminal's service quality. (2006) (Ekiz et al.). Effective sign boards, a pleasant security and control system, a nice cooling system in the airport, clean toilets, and assistance desks for passenger advice are among the amenities provided. Wu and Cheng, 2013; Ali et al., 2015).

Personnel services

Personnel services are an important part of the total customer experience provided by an airline. Nadiri et al., 2008. It refers to the level of customer service offered by airline personnel, particularly flight attendant attitudes and practises in customer care. Boetsch et al., 2011; Ekiz et al., 2006). Additionally, human services include error-free ticketing, flight staff response, personal hygiene, and a pleasant attitude. Namukasa, 2013.

Customer Satisfaction

The good experience that travelers get after visiting the locations is termed customer satisfaction. Khan and colleagues (2013). When the experience of a guest exceeds their expectations, they are satisfied. (Deng and Pierskalla, 2011). Satisfied customers are the most important factor in purchase intent and loyalty (Kotler, 2000). One of the most regularly obtained elements of marketing outcomes is customer satisfaction statistics. The collecting, investigation, and distribution of this information inside companies reveal something particular about the importance of keeping track of consumers and guaranteeing that they have a favorable participation in the goods of the company and endeavors. Kotler (2000)

Research Hypothesis

The study's hypothesis is to see if there are any correlations or links between dependent variables and independent variables:

<p>H1: There is a significant relationship between airlines' tangible toward customer satisfaction using Malaysia Airlines.</p>
--

H2: There is a significant relationship between terminal tangible towards customer satisfaction using Malaysia Airlines.

H3: There is a significant relationship between personnel services towards customer satisfaction using Malaysia Airlines.

Research Framework

Figure 1 below shows the research framework used for this study.

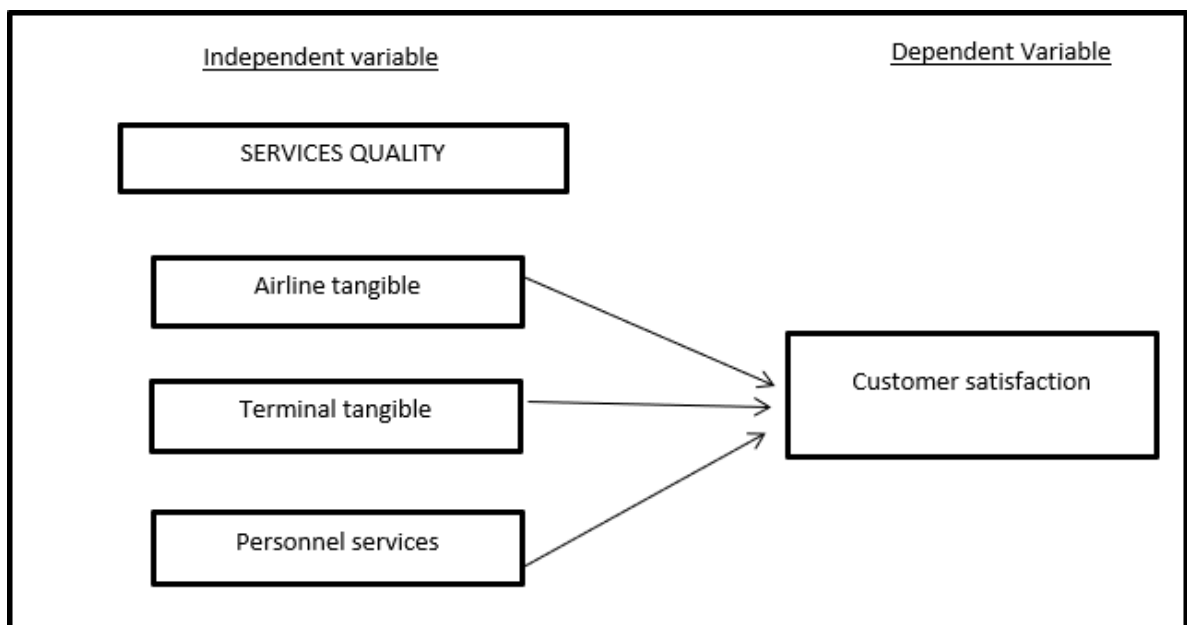

Figure 1: Conceptual framework

METHODOLOGY

Research Design

The research design refers to the overall approach taken in a study to address predetermined research questions through data gathering, interpretation, analysis, and presentation. It aims to produce results while minimizing variance. Quantitative research involves the measurable investigation of numerical data using methods like surveys and questionnaires. This study

employs a causal research design to identify the cause-and-effect relationship between variables and how they impact existing criteria and assumptions. A cross-sectional study design is used, which gathers information at a single point in time and focuses on identifying correlations between variables. Cross-sectional designs often utilize surveys due to their efficiency and cost-effectiveness. The unit of analysis in this study is the passenger customers of Malaysia Airlines. Surveys are the preferred method for data collection, and Google Forms is used to administer self-administered questionnaires online. This approach allows for an easy assessment of customer satisfaction with Malaysia Airlines' services.

To collect information from this large population, surveys are used. The population's participation is crucial in achieving the research objectives, particularly in examining the satisfaction levels among students and workers in Kota Bharu, Kelantan. The number of participants involved in the study is referred to as the sample size. To ensure a representative sample, proper sampling methods and satisfactory responses are required. In this study, the researcher follows the model proposed by Krejcie and Morgan (1970). Based on this model, the sample size is determined by the population of Malaysia, which is approximately 32.78 million. Thus, a sample size of 384 respondents will be selected and surveyed to represent the population.

Data Collection

Data collection is a crucial process for obtaining comprehensive and reliable information from numerous sources. It enables individuals or organisations to address pertinent topics, analyse results, and forecast future trends. In this study, questionnaires were employed to collect data. method through a survey. Questionnaires involve respondents answering a series of standardized questions. This approach is often cost-effective and easier to manage compared to other methods. Additionally, due to the large number of participants involved in this study, the researchers opted for questionnaires as an efficient means of gathering data and information.

Sampling

Sampling designs in research there are two forms of sampling: non-probability sampling and probability sampling. Sampling without regard for probability involves selecting individuals from the population without a known probability of being chosen, while probability sampling ensures that elements in the population are selected based on known probabilities. To pick respondents for this study, a non-probability sampling strategy, namely simple sampling procedures, was used from the population of Malaysia Airlines. This sampling strategy was considered suitable for the investigation. To ensure ethical practices and maintain neutrality, a comprehensive ethical strategy was employed during the data collection process. Convenience sampling was used to select participants who were willing and able to take part in the survey. This method allows for the selection of respondents based on their availability and willingness to participate.

Data Analysis

Researchers will use the program Statistical Programmers for Social Science (SPSS) version 28 to examine the primary data. SPSS is a program-based data processing and analysis window that allows you to create tables and pie charts. Computers aided researchers in lowering the effort required to determine the information and making quantitative analyses easily and quickly. The researcher evaluates quantitative data using descriptive statistics, reliability statistics, Pearson's correlation, and regression.

FINDINGS

Demographic Profile Respondents:

Demographic	Categories	Frequency (N)	Percentage (%)
Age	18 - 22 years	84	21.9
	23 - 27 years	249	64.8
	28 - 32 years	28	7.3
	33 years and above	23	6.0
Gender	Male	99	25.8
	Female	285	74.2
Race	Malay	351	91.4
	Indian	11	2.9
	Chinese		
	Others	10	2.6
		12	3.1

Marital Status	Single	336	87.5
	Married	48	12.5
Education Level	Secondary School	18	4.7
	Diploma	39	10.2
	Bachelor of Degree	312	81.3
	Master's Degree Doctor of Philosophy	14	3.5
		1	.3
Occupation	Government	44	11.5
	NGO	21	5.5
	Self-employed	19	4.9
	Unemployed	9	2.3
	Student Retired	286	74.5
		5	1.3

Table 1: Demographic Profile

Table 1 presents the age distribution of the respondents, with a total of 384 participants. The respondents are divided into four age groups: 18–22 years old, 23–27 years old, 28–32 years old, and 33 years old and above. The largest group consists of respondents aged 23–27 years, accounting for 64.8% (249 respondents). The second-largest group is aged 18–22 years, comprising 21.9% (84 respondents), followed by the 28–32 years group with 7.3% (28

respondents). The smallest group is 33 years and older, representing only 6.0% (23 respondents).

Meanwhile, for gender distribution, female respondents account for 74.2% (285 respondents), while male respondents make up 25.8% (99 respondents). Thus, there is a higher proportion female respondent outnumbers to male respondents.

The racial distribution among the respondents shows that the majority, 91.4% (351 respondents), belong to the Malay race. Other races account for 3.1% (12 respondents), with Indian respondents comprising 2.9% (11 respondents) and Chinese respondents comprising 2.6% (10 respondents).

Regarding marital status, the majority of respondents are single, making up 87.5% (336 respondents), while married respondents constitute 12.5% (48 respondents).

As for the level of educational background, the majority of respondents, 81.3% (312 respondents), have a bachelor's degree. The second-highest educational level is diploma, with 10.2% (39 respondents), followed by secondary school at 4.7% (18 respondents). A small percentage of respondents have a master's degree, accounting for 3.5% (14 respondents), while only one respondent, representing 0.3%, holds a Ph.D.

In terms of occupation, the largest group of respondents consists of students, accounting for 74.5% (286 respondents). Government employees represent 11.5% (44 respondents), while respondents working in non-governmental organizations (NGOs) constitute 5.5% (21 respondents). Self-employed individuals make up 4.9% (19 respondents), while the unemployed represent 2.3% (9 respondents). The smallest group consists of retired individuals, accounting for 1.3% (5 respondents).

RESULT OF DESCRIPTIVE ANALYSIS

Variable	Items	N	Means	Standard Deviation
Airlines Tangible	Aircraft are safe and clean	384	4.22	.780
	The quality of catering served on the plane is good	384	4.08	.796
	Plane toilets are clean	384	4.11	.779

	Plane seats are clean	384	4.22	.795
	Plane seats are comfortable	384	4.08	.873
	Quality of air conditioning in the planes are good	384	4.20	.798
	Up to date newspaper, magazines and video films are available during the flight	384	4.04	.883
Terminal Tangible	Ground staff are very helpful	384	3.72	.886
	Malaysia Airlines employees are consistently courteous	384	3.75	.883
	Check-in procedures are efficient	384	3.77	.862
	The airport has effective and advance system	384	3.86	.902
	Airport facilities are very clean	384	3.84	.849
	Baggage handling is quick	384	3.84	.849
	Terminal announcements at Kuala Lumpur	384	3.84	.849

	International Airport are very clear			
	Provide security procedures (for persons & Luggage)	384	3.84	.849
Personnel	Employees' general attitude is good	384	4.06	.729
	Airline personnel give exact answers to your questions	384	4.07	.730
	Personnel show personal care equally to everyone	384	4.08	.757
	Employees have the knowledge to answer your question.	384	4.21	.687
	The airlines personnel show empathy	384	4.13	.732
	Airlines personnel are aware of their duties	384	4.21	.702
	Reservations and ticketing transactions are error-free	384	4.09	.737
Customer Satisfaction	I feel that my experience with Malaysia Airlines has been enjoyable	384	4.12	.784
	Feeling satisfied with	384	4.15	.769

	the services provided by Malaysia Airlines			
	My choice of Malaysia Airlines as a service provider was a wise one	384	4.14	.773
	I now have a more positive attitude towards the company Malaysia Airlines	384	4.18	.768
	Overall, I feel satisfy with Malaysia Airlines	384	4.17	.801

Table 2: Result of Descriptive Analysis

Table 2 displays the mean and standard deviation of the dependent and independent variables in this study. Question 1 and 4 yielded the highest mean value for the dependent variable, 4.22 (SD= 0.780 and 0.795), indicating that respondents agreed that aeroplanes and airline seats are safe and clean. The lowest mean score was 3.72 (SD= 0.886) for Question 1, indicating that respondents believed Malaysia Airlines' ground workers were really helpful. People received the highest mean score, 4.21 (SD= 0.687 and 0.702), suggesting that respondents thought Malaysia Airlines workers knew how to answer passenger questions and were aware of their responsibilities. The lowest mean score for Question 1 was 4.12 (SD= 0.784), indicating that respondents enjoyed their experience with Malaysia Airlines. Question 4 had the highest significant mean value of 3.86 (SD= 0.902) for the independent variable of terminal tangible, indicating that respondents thought the airport had a modern and efficient system.

RESULT OF THE RELIABILITY TEST

According to Creswell and Creswell (2017) and (2013), reliability analysis is increasingly being utilised to assess measurement internal consistency. Internal consistency refers to the degree to which any indication of a concept appears to function consistently at a few fundamental levels. Researchers accept Cronbach's alpha values of 0.70 and above. Cronbach's alpha is a test reliability metric. Researchers have the ability to recognise.

Construct	Cronbach's Alpha	No of Item	N
Airlines Tangible	0.936	7	31
Terminal Tangible	0.985	8	31
Personnel	0.946	7	31
Customer Satisfaction	0.980	5	31
All Variable		27	31

Table 3: Pilot Test Result

The dependability of four components is shown in the table below. Cronbach's Alpha was used to analyse the consistency of the 27 questions used to test five distinct domains. The coefficients of all buildings range from good to remarkable, according to data. Furthermore, the result is larger than 0.7, suggesting that the questionnaire may be sent and the survey can proceed.

According to statistics, customer satisfaction has the highest coefficient, with a reliability testing result of 0.980 (excellent), and terminal tangible has an extraordinary grade of 0.985. Meanwhile, the tangible and personnel coefficients of the airline have been 0.936 and 0.946, respectively (excellent).

PEARSON CORRELATION

Hypothesis 1

H1: There is a significant relationship between airlines' tangible toward customer satisfaction using Malaysia Airlines.

CORRELATIONS			
		Service Quality	Tourist Satisfaction
Service Quality	Pearson Correlation	1	.710
	Sig. (2-tailed)		.000
	N	384	384
Tourist Satisfaction	Pearson Correlation	.710	1
	Sig. (2-tailed)	.000	
	N	384	384

**Correlation is significant at the 0.01 level (2-tailed)

Table 4: Correlation Analysis for Hypothesis 1

Table 4 shows a 0.710 significant correlation between major airlines and customer satisfaction, which influences consumer delight when flying with Malaysia Airlines. This indicates a link between airline tangibles and Malaysia Airlines customer satisfaction. The significance of the airline is 0.000, which is less than the significance of 0.001. As a result, there is a strong link between airline tangibles and consumer happiness, which has an influence on customer pleasure when travelling with Malaysia Airlines. As a consequence, H1 is suitable.

Hypothesis 2

H2: There is a significant relationship between terminal tangible towards customer satisfaction using Malaysia Airlines.

CORRELATIONS			
		Motivation	Tourist Satisfaction
Motivation	Pearson Correlation	1	.764
	Sig. (2-tailed)		.000
	N	384	384
Tourist Satisfaction	Pearson Correlation	.764	1
	Sig. (2-tailed)	.000	

	N	384	384

**Correlation is significant at the 0.01 level (2-tailed)

Table 5: Correlation Analysis for Hypothesis 2

Table 5 shows that there is a 0.764 correlation between terminal tangibles and customer happiness, which influences consumer pleasure when flying with Malaysia Airlines. This implies that the link between terminal tangibles and customer satisfaction is rather robust and well-established among Malaysia Airlines customers. The terminal tangible has a significant value of 0.000, which is less than the 0.01 required. As a result, there is a strong link between terminal tangibles and consumer pleasure while flying with Malaysia Airlines. As a consequence, H2 may be used again.

Hypothesis 3

H3: There is a significant relationship between personnel services towards customer satisfaction using Malaysia Airlines.

CORRELATIONS			
		Involvement	Tourist Satisfaction
Involvement	Pearson Correlation	1	.749
	Sig. (2-tailed)		.000
	N	384	384
Tourist Satisfaction	Pearson Correlation	.749	1
	Sig. (2-tailed)	.000	
	N	384	384

**Correlation is significant at the 0.01 level (2-tailed)

Table 6: Correlation Analysis for Hypothesis 3

Table 6 shows a correlation value of 0.749, demonstrating a positive association between Malaysia Airlines workforce and customer satisfaction. This demonstrates that the link between people and customer happiness is very strong and firmly associated among Malaysia Airlines customers who choose Malaysia Airlines as their preferred airline to travel to their destination. Personnel has a significant value of 0.000, which is less than the 0.01 significance criterion. As a consequence, when travelling with Malaysia Airlines, there is a high correlation between crew and customer happiness. As a result, H3 is suitable.

DISCUSSION AND RECOMMENDATION

As identified in the opening chapter of this research, discussions are aimed at answering concerns and addressing issues. In general, this study thoroughly investigated the influence of the service quality air qual model on Malaysia Airlines customer satisfaction. Based on the study's findings, there are some recommendations for improving consumer satisfaction as well as the researchers in future studies.

This research has significance for the continuation of future research. Future researchers should examine and select a specific research subject to make it simpler for respondents to grasp that issue by adding additional demographic information about the respondents. Age, gender, education level, occupation, marital status, and many more factors can all be used to create distinct conclusions or findings from diverse perspectives. The researchers can obtain more detailed and precise data by doing this investigation.

Furthermore, future researchers could enhance data gathering for This research, particularly in terms of respondent allocation. Instead of handing out questions in person, future researchers can use Google Forms to distribute questionnaires. Some respondents, for example, refused to respond and ignored the researchers' questionnaire. As a consequence, while providing questionnaires to possible respondents, researchers may rapidly contact the respondent via Whatsapp status, groups, or personally and explain the research goal in-depth and precisely.

CONCLUSION

Finally, the goal of this study was to identify the factors that influence tourist satisfaction while utilising Malaysia Airlines as their favourite domestic carrier. Three independent factors were chosen to explore the link between the dependent variable, customer satisfaction, and Malaysia Airlines as a preferred domestic carrier: service quality, airlines tangible, terminal tangible, and staff. 384 participants aged 18 and above were chosen at random to complete the questionnaire. The assumptions are confirmed in our study by examining data from 384 respondents using the SPSS programme. Every theory was confirmed to be right.

ABSTRACT

The objective of this research proposal is to examine tourist satisfaction with ferry services in Langkawi. Additionally, this study aims to examine relationships between quality service, high fares, and ferry safety assessment on tourist satisfaction toward ferry services in Langkawi. 384 questionnaires were distributed to the community. This study used a quantitative approach. The sample size was collected using convenient sampling. Data was collected through an online survey. This study shows that the three factors of service quality, high fares, and ferry safety assessment are the main factor that influences tourist satisfaction.

Keywords: Tourist Satisfaction, Quality Service, High Fares, Ferry Safety Assessment

INTRODUCTION

Tourism is travel for pleasure or business; it is also the theory and practice of touring, the business of attracting, accommodating, and entertaining tourists, and the business of operating tours. The tourism sector in Malaysia also contributed to the most important element that guarantees future business growth: tourist satisfaction. Today, many businesses use traveler happiness as a key metric to measure the effectiveness of their operations. By establishing the right process that ensures the services provided meet tourist expectations, tourist satisfaction is achieved. According to the tourism literature, a study shows that tourist satisfaction with a service or place is an important factor. This is because if tourists are happy with their trip to a location, they may recommend it to others.

SIGNIFICANCE OF THE STUDY

The study aims to assess tourist satisfaction with ferry services in Langkawi. The findings are expected to be significant for improving satisfaction levels among tourists. The study can also serve as a reference for future research on ferry services in Langkawi. The expansion of the tourist sector in Langkawi relies on addressing the issues faced by visitors. The study's practical implications are valuable to a wide range of individuals, including visitors, tour guides, and business people. The research question "To what extent are tourists satisfied with the ferry service in Langkawi?" will be explored using a questionnaire as the primary tool for evaluation. This study focuses solely on the questionnaire as the means of gathering data, and any other approaches are beyond the scope of the research and may be considered study limitations. In summary, the study anticipates significant findings regarding tourist satisfaction with ferry services in Langkawi. It can guide future studies and be useful for visitors, tour guides, and business people. The research will employ a questionnaire as the primary tool for data collection, specifically exploring the research question mentioned.

LITERATURE REVIEW

Tourist Satisfaction

Tourist satisfaction plays an important role in ensuring the long-term viability of tourist attractions. Tourist satisfaction is recognized as an important indicator of long-term tourism sustainability. (Gidey & Sharma, 2017). It has the potential to aid in the development of sustainable tourism. (Daud & Rahman, 2011; Razovic, 2013). Tourist satisfaction can determine a tourism company's long-term success. (Gursoy et al., 2007; Razovic, 2013). Tourist satisfaction is an important factor in determining long-term tourism development in a given heritage site. It reflects the quality of tourism management in terms of services and visitor motivation. Tourist satisfaction, according to Beard and Ragheb, is the level of affirmative emotion and awareness formed after participating in certain leisure activities. It was defined by Lounsbury and Polik as the tourist evaluation following the overall tourism experience. Satisfaction is defined as the customer's overall evaluation of the service received in comparison to the service expected. This definition captures the cognitive aspect of satisfaction; however, it is important to note that satisfaction also has an emotional component. In the research of (Miguel Jesus Medina-Viruel, 2019)

Quality Service

The tourist's assessment of the standard of service delivery performance associated with the travel experience is defined as service quality. (Chen & Tsai, 2007). Recent service quality definitions have expanded to include a visitor's emotional response. Service quality might thus be determined by the visitor's overall assessment of a location based on their experiences and internal sentiments. (Cong, 2016). A general definition of service quality is a visitor's evaluation of the amenities and services offered at a location based on their personal feelings and experience. SERVQUAL, a service quality model developed by Parasuraman et al. (1988), recognized the tangible aspects of services. SERVQUAL is divided into five categories: tangibles, empathy, dependability, responsiveness, and assurance. Service quality can be defined as a company's ability to meet or exceed customer expectations. It is the difference between the customer's expected and perceived level of service. Good service quality will increase a company's profitability by increasing its customer base.

High Fares

Choosing a daily price is equivalent to choosing a travel expense. The market value of a holiday is determined by its price. Therefore, price coordination through destination management and coordination provided by tourism operators that supply vacations include management decisions that balance supply and demand to control prices or inventory availability to maximize revenue growth and profits (Ugurlu, Cosgun, and Ekinci, 2012). Maximizing profit from ticket sales may increase funding but can meet customers' social needs for a trip. As reported by a local newspaper article (Bernama, 2018). From an economic perspective, ferries promote economic development by increasing land values, motivating sector tourism, and attracting excess spending (Mittleman, 2018). The main feature of the price optimization issue for vehicles (ferries).

Ship Safety

The rehabilitation of the tourism sector has been somewhat slowed down by a string of events involving stranded passenger ferries in the waters off Kuala Kedah and Kuala Perlis. Imagine that on the 23rd and 28th of October last year, two occurrences occurred within five days as a result of the ferry becoming trapped on a sandbar and the buoy cable becoming

entangled in the mouth of Kuala Kedah (Kosmo, 2022). Many tourists are also forced to reconsider visiting Langkawi Island due to the ferry journeys, which have been cut in half compared to the norm of 10 excursions in 2019. In addition, safety on the ferry is also the talk of tourists. This is because they do not care about the safety of passengers. For example, not requiring tourists to wear life jackets. Also, luggage storage is very disorganized. If there is an accident, it will prevent the movement of passengers to get to the emergency door.

Research Hypothesis

The study's hypothesis is to determine whether the dependent variable and independent variable have any relationship or correlation.

H1: There is a significant relationship between service quality and tourist satisfaction using the ferry in Langkawi

H2: There is a significant relationship between high fares and tourist satisfaction using the ferry in Langkawi.

H3: There is a significant relationship between ferry safety and tourist satisfaction using a ferry in Langkawi.

Research Framework

As a result, research on visitor satisfaction demonstrates a significant correlation between high prices and quality service, as well as an evaluation of ship safety. Consequently, the model can be altered as follows:

METHODOLOGY

Research Design

The purpose of this study is to investigate how users' perceptions related to quality services, high fares, and ship safety ratings in ferry services. The researcher used a cross-sectional research design, which involved collecting data from multiple individuals at one time. A quantitative approach was employed, and a survey using a questionnaire was used as the research method. The sample consisted of tourists aged 18 to 45 who had traveled and used ferry services in Langkawi. The questionnaire included predefined options for demographic information. To measure tourist satisfaction, a Likert scale was used, ranging from 1 (strongly disagree) to 5 (strongly agree). Data collected through the questionnaire will be analyzed using the Statistical Package for the Social Sciences (SPSS), a statistical analysis tool. After the analysis, the study's conclusions will be shared with the respondents, providing them with information about the research findings.

Data Collection

Data collecting is a technique for compiling information from numerous sources to provide thorough and trustworthy data. Data gathering enables people or organizations to assess outcomes, provide meaningful answers to queries, and predict potential future possibilities and trends. Data for this inquiry were gathered by a survey that employed a questionnaire. A questionnaire is a tool for gathering data that involves asking respondents several questions. Additionally, because it is standardized, this kind of research is typically less expensive and simpler to manage than other approaches. Furthermore, because there is a large number of participants in this study, the researcher used this strategy because it is an effective method to collect data and information. The study used primary data to obtain data for this investigation. Primary data is information that researchers obtain directly from primary sources through experiments, surveys, and interviews. The largest type of data for research is primary data, which is usually collected from the same place where the statistics were first discovered. In addition, in this study, a descriptive quantitative research design was used. The target population, visitors who use the Langkawi ferry service, was collected using a sampling method.

Sampling

Non-probability convenience sampling will be used in this investigation as the sampling method. Convenience sampling methodology enables researchers to choose any accessible respondent of their choice, as opposed to choosing from the entire population. Convenience sampling is employed in this study to cut costs and save time during the data collection phase. Visitors who had been to Langkawi and traveled there by ferry were the ones that responded to the questionnaire. It is possible to complete a questionnaire and generate statistics based on the responses as the number of tourists visiting Langkawi rises.

Data Analysis

Frequency analysis, descriptive analysis, and reliability analysis are the three types of data analyses that were used in this study. The collected data were analyzed with the Statistical Package for the Social Sciences (SPSS) to demonstrate the relationships between the dependent and independent variables as a set of statistical processes approximated by regression analysis.

FINDINGS

Demographic	Categories	Frequency (N)	Percentage (%)
Gender	Male	75	19.5
	Female	309	80.5
Age	Below 20	49	12.8
	21 – 29	292	76.0
	30 – 39	0	0.0
	40 – 49	41	10.7
	50 – 59	2	0.5
Race	Malay	349	90.9
	Chinese	18	4.7
	Indian	5	1.3
	Others	12	3.1
Marital	Single	300	78.2
	Married	80	20.8
	Others	4	1.0

Table 1: Respondent Profile

Table 1 shows 384 profiles of the respondents and most of them are female which is 80.5% of the total of the gender total while male only 19.5%. The majority of the respondents are at the age of 21 – 29 years old which is 76% more than others. Meanwhile, for race, the highest number of respondents are Malay with 90.9% while Indian has the lowest frequency with 1.3%. For marital status, most of the respondents are single 78.2%, followed by married status with 20.8% and only 1% others. Thus, the data accurately reflect the real demographic compilation on the tourist satisfaction towards ferry service in Langkawi.

Variable	Items	N	Mean	Standard Deviation
Tourist Satisfaction	Tourists will recommend the Langkawi ferry service to other tourists who want to go there.	384	3.99	0.654
	Tourists are overall satisfied with the ferry service provided in Langkawi.	384	3.97	0.625
	Tourists will use the ferry service again after this.	384	4.01	0.658
	Tourists are satisfied with the service provided by the staff.	384	3.96	0.657
	Tourists feel comfortable while on the ferry.	384	3.97	0.654
Service Quality	The staff on the ferry provide obvious physical facilities and equipment to tourists while they are on board.	384	3.98	0.602
	In terms of service reliability, ferry workers deliver the promised service accurately and reliably.	384	4.00	0.594
	Ferry service staff consistently offer a good response, such as being ready to help tourists immediately.	384	4.04	0.586
	Ferry service staff in Langkawi can provide a good guarantee of tourist confidence and trust in them when using their services.	384	4.07	0.564
	Ferry staff are receptive and aware of the needs and concerns of their passengers.	384	4.05	0.594
	Using the ferry service to Langkawi is safe.	384	4.07	0.616
	The ferry used has complete safety features.	384	4.10	0.580

Ship Safety Assessment	The crew gives a safety briefing.	384	4.05	0.666
	The crew staff sufficient for enforcement purposes.	384	4.08	0.611

	The ferry specifications are suitable for use as public transportation.	384	4.08	0.573
High Fares	The price of ferry transportation in Langkawi is too high.	384	3.85	0.797
	The government and authorities need to take steps to control the cost of ferries in Langkawi.	384	4.07	0.632
	The convenience and comfort when riding the ferry in Langkawi are worth the high fare.	384	3.86	0.739
	The high fare can guarantee the safety of the passengers.	384	3.64	0.828
	Most of the ferries used in Langkawi have a high cost, causing customers to pay a high fare.	384	3.82	0.707

Table 2: Descriptive Analysis of Tourist Satisfaction Towards Ferry Services in Langkawi

Table 2 demonstrates the mean and standard deviation of the study's dependent and independent variables. The highest mean value in the dependent variable which is tourist satisfaction was obtained by Question 3 with 4.01 (SD=0.658) where the respondent agreed to use the ferry service again after this. The Independent variable for service quality had the highest mean value that belongs to Question 4 with 4.07 (SD=0.564) which means that the respondent agreed that service staff in Ferry Langkawi can provide a good guarantee of tourist confidence and trust in them when using their services. From the service quality in the questionnaire, Question 1 has the lowest mean value with 3.98 (SD=0.602) which means, the respondent agreed that the staff on the ferry provide obvious physical facilities and equipment to tourists while they are on board. After that, Question 2 from the ship safety assessment questionnaire has the highest mean value with 4.10 (SD=0.580), followed by Question 4 and Question 1 while Question 3 has the lowest mean value with 4.05(SD=0.666). It means the respondent agreed that the crew gives a safety briefing. For the last independent variable, Question 2 has the highest mean value with 4.07 (SD=0.632) meaning that respondents agreed with the statement that the government and authorities need to take steps to control the cost of ferries in Langkawi. While Question 4

followed by Question 5 is the lowest mean in the high fares question. This means that respondents agreed with the statement which is that high fares can guarantee the safety of the passengers and most of the ferries used in Langkawi have a high cost, causing customers to pay a high fare.

Variable	Number of Items	Reliability Cronbach's Alpha
Tourist Satisfaction	5	0.925
Quality Service	5	0.923
Ship Safety Assessment	5	0.922
High Fares	5	0.800

Table 3: Reliability Analysis between Service Quality, Ship Safety Assessment, and High Fares toward Ferry Service in Langkawi.

The findings of the reliability analysis for each variable are presented in Table 3. All variables have Cronbach's Alpha coefficient values of 0.800 and above. Tourist satisfaction has the highest Cronbach's Alpha coefficient of 0.925. The service quality Cronbach's Alpha coefficient value is 0.923. While the ship's safety assessment shows the value of Cronbach's Alpha coefficient is 0.922. The last independent variable, which is high fares, showed a Cronbach's Alpha result of 0.800. Therefore, all the questionnaire is acceptable and can be used in the study.

		Tourist Satisfaction Towards Ferry Service in Langkawi
Service Quality	Pearson Correlation	0.561
	Sig. (2-tailed)	<.001
	N	384
Ship Safety Assessment	Pearson Correlation	0.500
	Sig. (2-tailed)	<.001
	N	384
High Fares	Pearson Correlation	0.550
	Sig. (2-tailed)	<.001
	N	384

Table 4: Pearson's Correlation Analysis between Service Quality, Ship Safety assessment, and High Fares toward Ferry Service in Langkawi.

Relationship between Service Quality, Ship Safety Assessment, and High Fares toward Ferry Service in Langkawi.

H1: There is a significant relationship between service quality and tourist satisfaction with ferry service in Langkawi.

The results in Table 4 show that the correlation between service quality and tourist satisfaction with ferry services in Langkawi is 0.561 which is considered a moderate positive correlation. In addition, service quality has shown a significant positive relationship with tourists' satisfaction with ferry services in Langkawi considering that the p-value is less than 0.05. In conclusion, hypothesis H1 is supported.

H2: There is a significant relationship between ship safety assessment and tourist satisfaction with ferry service in Langkawi.

The assessment of ship safety and tourist satisfaction with ferry services in Langkawi with 0.500 also shows a moderate positive correlation. Furthermore, the evaluation of ship safety has shown a significant positive relationship with tourists' satisfaction with ferry services in Langkawi considering that the p-value is less than 0.05. In conclusion, hypothesis H2 is supported.

H3: There is a significant relationship between high fares and tourist satisfaction with the ferry service in Langkawi.

High fares and tourist satisfaction with ferry services in Langkawi show 0.550, which shows a moderate positive correlation. Furthermore, high fares show a positive significant relationship with tourist satisfaction with ferry services in Langkawi considering that the p-value is less than 0.05. In conclusion, hypothesis H3 is supported

DISCUSSION AND RECOMMENDATION

The discussion tries to provide answers to the issues and theories raised in the study's first chapter. The aspects that affect tourists' satisfaction with ferry services as their chosen mode of transportation for trips to Langkawi have generally been thoroughly investigated in this study. To increase learning in the future, there are some recommendations for tourism businesses and upcoming scholars based on the study's findings.

This study is important for the continuation of research in the future. It is recommended that future researchers investigate and provide more information related to ferry services. For example, a study on information about the benefits of ferry services to residents and visiting tourists and identifying tourists' satisfaction with ferry services Next, choose a specific research topic to make it easier for the respondents to understand the topic by including more demographic information about the respondents. For example, age, race, gender, education level, occupation, marital status, and other factors, for instance, can provide various conclusions or findings from different perspectives. By doing so, the researcher can obtain more detailed and accurate data.

Future researchers could also refine how the data were gathered for this study, particularly concerning how the questionnaires were distributed. Instead of distributing questionnaires face-to-face, future researchers can conduct a Google Form questionnaire distribution. For example, some respondents do not want to answer and ignore the questionnaire presented by the researcher. As a result, when distributing questionnaires to potential respondents, researchers can get respondents quickly through contact via Twitter, Facebook, WhatsApp, and Instagram, whether for group or personal purposes and in detail and precisely.

CONCLUSION

In conclusion, this research has been done to identify the elements that determine tourist satisfaction with the ferry service in Langkawi. Three independent variables which are service quality, high fares, and tourist satisfaction have been chosen to determine the relationship between the dependent variable, which is the number of tourists who prefer the ferry as a mode of transportation in Langkawi. A total of 384 respondents from the age 21-29 years old were selected randomly to answer the questionnaire. Based on our survey it was found that the hypotheses are supported by using the SPSS software to analyse the data using 384 respondents. It was found that all the hypotheses are supported. Moreover, all the independent variables have a strong relationship with the dependent variables.

ABSTRACT

This study aims to establish a connection between consumer satisfaction and exceptional service at the Zamburger Hotel in Pengkalan Chep, Kelantan. Customer satisfaction is defined as a metric that evaluates the extent to which consumers are satisfied with a company's products, services, and capabilities. Customer satisfaction information, such as surveys and evaluations, can help a business determine how to enhance or modify its products and services. Providing quality customer service entails providing consumers with prompt, polite, and expedient assistance while also establishing strong relationships with them. Customers lodging at Hotel Zamburger are the scope and limits of this investigation. This study's sample comprises of Kelantan's general population and foreign visitors. They will comment on the calibre of service at the Zamburger Hotel. Using questionnaires as the research instrument, the researchers employ quantitative and descriptive methods in this study.

Keywords: Customer satisfaction, Service Quality

INTRODUCTION

Many different forms of study have been conducted on the issue of inadequate customer satisfaction in service quality levels at Hotel Zamburger. This study was chosen because many problems emerge from employees and some from employers. Hiring the wrong people for critical jobs is one of the reasons for poor and insufficient service. Work, a lack of training, staff fatigue, a misinterpretation of client expectations, and a lack of employee involvement are all factors. Furthermore, research has revealed that another issue with Zamburger Hotel is limited

facilities and less clean accommodation. This issue develops due to a lack of cleaning employees at the hotel as well as clients who do not care about cleanliness while staying at this Zamburger Hotel.

This study focuses on client satisfaction with high-quality services. It is a vital step in developing customer loyalty, pleasing consumers, and producing great word-of-mouth. The research on this subject has chosen references to gain further material, such as literature, newspapers, journals, and so on. Furthermore, the nomenclature employed is specific. The focus of the study was confined to the relationship between customer contentment and service quality. The sample size is the number of people or observations that comprise the sample. The sample size for the study is determined by the cost of data collection and the statistical power (Singh & Masuku, 2014). Customers of the Zamburger Hotel comprise the study's sample. The researchers will employ 384 respondents in their sample for this study. The researcher will choose the size of the sample utilized in this study to collect replies. As a result, all races and faiths who opted to reply to the questionnaire are included in our sample size.

Therefore, the primary objective of this research is to examine the relationship between customer satisfaction toward quality service at the Zamburger Hotel. There are three research objectives:

1. To examine the relationship between service quality (reliability, assurance, tangible, empathy, responsiveness) of Zamburger Hotel towards customer satisfaction.
2. To examine the relationship between the high prices of the Zamburger Hotel towards customer satisfaction.
3. To examine the relationship between responsiveness and customer satisfaction in Zamburger Hotel.

SIGNIFICANCE OF THE STUDY

The outcomes of this study are expected to have a major impact on quality service. Furthermore, this research will assist consumers in determining the impact of customer satisfaction on the quality of service, which is bad and inadequate, as well as inadequate amenities and less hygienic housing.

LITERATURE REVIEW

Service Quality

Quality is a theory that is evasive and ambiguous, and it is also important to differentiate between commodities and services as they have distinct characteristics, according to (Ali et al., 2021) in the research of (Abdullah & Afshar, 2019). The former is more tangible than the latter, which is an immaterial live performance (Abdullah & Rahman, 2015). Many definitions and ideas of service quality are presented in academic literature and a substantial body of research, and many of these works also compare consumer expectations with performance. According to Parasuraman, Valarie, Zeithaml, and Berry's research (Ali et al., 2021), service quality is "the perception coming from the contrast of customer expectations with actual service performance" (paraphrased from Parasuraman, Valarie, Zeithaml, and Berry, 1985, p. 42). According to Churchill and Surprenant (1982) and Parasuraman et al. (1985), who together popularised the theory of customer satisfaction through the measurement of a firm's actual service delivery following customer expectations as defined by the achievement of perceived quality, service was defined in the 1980s as meeting the wants and needs of the customer above and beyond their expectations. According to Fida et al. (2020), this method employs five quality factors to define the excellence of a service. This dimension consists of five components: tangibility, dependability, responsiveness, assurance, and empathy; however, various authors have altered the meanings of these components. It evaluates consumers' perceptions of service quality based on the gap between their expectations and their actual experiences. Because service quality is a multifaceted concept, each SERVQUAL dimension provides unique characteristics for evaluating customer perceptions and expectations of service quality in the hospitality industry. (Al Ababneh, 2017).

Customer Satisfaction

According to (Suchánek & Králová, 2019), it is also crucial to evaluate customer satisfaction in the context of competitiveness because, as Hennig-Thurau & Klee (1997) claimed, customer satisfaction has a significant impact on the competitiveness of the product and, by extension, on the firm. In the business world, "customer satisfaction with a company and its products is generally considered the key to a company's performance and long-term competitiveness." Focusing on satisfying customers is crucial to a company's long-term success, as shown by the definition of "customer satisfaction" provided by Zeithaml et al. (1996). To put it another way, in order to achieve customer happiness, a firm must provide results that go above what customers anticipate. Several researchers (Fida et al., 2020) Customers are more likely to remain loyal if their needs are consistently met, which in turn decreases the likelihood of customer churn, as stated by Lau and Cheung (2013). Customer satisfaction and the subsequent connection between the business and the client stem in large part from the quality of the service provided (Amin & Isa, 2008).

Customer Expectations

According to the study of Hallowell (1996), as referenced by Uzunboylu (2016), knowing the expectations or wants of consumers enables companies to determine how to best serve the customer and offers a basis for making changes to increase their satisfaction. The term 'expectation' varies depending on how it is used in the literature on service quality or customer satisfaction (Parasuraman et al., 1988). In the literature on service excellence, "expectations" refer to the wishes or desires of consumers. In other words, people's opinions about what the service should be as opposed to what it is. In the satisfaction literature, on the other hand, it is employed as a customer's forecast of what is likely to happen during a service exchange (Kunst & Lemmink, 1996). According to Parasuraman et al. (1988), the term "expectations" can have various meanings depending on where you look in the service quality or consumer satisfaction literature. Kunst and Lemmink (1996) define expectations as the customer's intentions or desires in the service quality literature. In other words, individuals are more concerned with what the service should be than with what it actually is. In the satisfaction literature, however, it refers to a customer's anticipation of what might occur during a service exchange, as cited by Uzunboynu (2016).

Research Hypothesis

The study's hypothesis is to determine whether there are correlations or relationships between dependent variables and independent variables.

H1: There is a positive relationship between service quality and customer satisfaction at Zamburger Hotel.

H2: There is a positive relationship between high prices and customer satisfaction at Zamburger Hotel.

H3: There is a positive relationship between responsiveness and customer satisfaction at Zamburger Hotel.

Research Framework

The research framework utilised for this investigation is illustrated in Figure 1.

Figure 1: Research Framework

METHODOLOGY

Research Design

This research method applied the quantitative approach and used a survey that was conducted through questionnaires. This research consists of the general public and foreign tourists in Kelantan. The Likert scale has been applied to know the level of satisfaction of customers towards quality service at Zamburger Hotel which is service quality, high prices, responsiveness, and customer loyalty.

Data Collection

This study uses primary data as its method of data collection. Through experiments, surveys, and interviews, it was obtained directly from primary sources. The general public and foreign visitors are the focus of this quantitative, descriptive study. In addition, data are gathered using a probability-stratified sampling method. This study uses a Google Form to create questionnaires and distributes them via social media platforms such as Twitter, Facebook, WhatsApp, and Instagram to collect data. The surveys consisted of four sections: Section A for demographic information, Section B for

suggestions on customer service quality, Section C for customer satisfaction with costly products, and Section D for consumer expectations regarding responsiveness and loyalty.

Sampling

Sampling is picking a group from which the researchers will gather the data for their study. The probability and non-probability sampling methods are the two available sampling techniques. A probability sampling technique has been applied in this study. Using probability sampling, which incorporates random selection, will able the researcher to draw robust statistical conclusions about the entire group.

Data Analysis

Regarding data analysis, the information gathered for this analysis will be analysed using Statistical Package for the Social Sciences, Version 27 (SPSS). This IBM SPSS version 27 is a comprehensive set of statistical instruments for processing statistical data and generating a variety of outputs in response to the research question.

FINDINGS

Demographic Profile

Table 4.1: Number of Respondents by Demographic Profile

Gender	Frequency	Percent (%)
Female	89	42.2
Male	122	57.8
Age	Frequency	Percent (%)
20 years and below	24	11.4
21 - 30 years old	121	57.3

31 - 40 years old	50	23.7
41 - 50 years old	11	5.2
51 - 60 years old and above	5	2.4
Marital Status	Frequency	Percent (%)

Single	156	73.9
Married	48	22.7
Others	7	3.3
Race	Frequency	Percent (%)
Malay	148	70.1
Indian	35	16.6
Chinese	24	11.4
Others	4	1.9
Monthly Income	Frequency	Percent (%)

RM 1000 and below	135	64.0
RM 1000 - RM 20000	45	21.3
RM3000 and above	31	14.7

Table 4.1: Summary of Demographic Profile

The demographic characteristics of the respondents are depicted in table 4.1. 211 individuals have responded in total. The number and percentage of respondents are shown based on gender in Table 4.1 and figure out of 211 respondents, 122 respondents were male and the remaining 89 respondents were female. As can be seen here, the respondents were predominantly male compared to female. The percentage of male respondents was 57.8%, which was higher than the female respondent's 42.2%.

The number and percentage of respondents are shown based on age in Table 4.2.2 and figure out, 21-30 years old is the highest of respondents with 121 (11.4%). The second range of age is 31-40 years old that is 50 (23.7%). The third range of age is 20 years and below with 24 (11.4%). Next for the fourth range of age is 41-50 years old with 11 (5.2%) meanwhile 51-60 years old and above respondents 5 (2.4%).

The number and percentage of respondents are shown based on monthly Income in Table 4.2.5 and figure out, and for monthly income RM 1000 and below is the highest of respondents with 135 (64%). The second range of monthly Income for RM1000 - RM20000 is 45 (21.3%) meanwhile for RM3000 and above respondents is 31 (14.7%).

Descriptive Analysis

Descriptive analysis is the practise of providing a concise summary of a data set that may stand in for the complete population or for a specific subset of that population.

4.3.1 Service Quality

Variables	N	Mean	Standard Deviation
-----------	---	------	--------------------

You are satisfied with the service quality that Zamburger Hotel provided.	211	4.09	.719
You are satisfied with the appearance of the Zamburger Hotel	211	4.11	.701

You are satisfied with the cooperation that was given by the staff at Zamburger Hotel	211	4.15	.728
When they promise to do something by a certain time, they do it	211	4.09	.683
When a customer has a problem, they should show sincere interest in solving the problem	211	4.08	.658

Table 4.2: Descriptive statistics of service quality

4.3.2 High Prices

Variables	N	Mean	Standard Deviation
Do you think the price of an overnight stay is reasonable and affordable with the service, facilities, and accommodation provided by Zamburger Hotel?	211	4.10	.703
You are satisfied with the price and promotion on sales service by Zamburger Hotel.	211	4.06	.760
The frequency with which customers come to Zamburger Hotel has a positive effect on customer loyalty	211	4.10	.714
Price and value have a positive impact on customer loyalty	211	4.08	.746
Service quality has a positive impact on customer loyalty	211	4.04	.713

Table 4.3: Descriptive statistics of high prices

4.3.3 Responsiveness

Variables	N	Mean	Standard Deviation
You are very satisfied with our hotel and will recommend Zamburger Hotel to your friends or colleagues	211	4.13	.691
You will likely stay at Zamburger Hotel again.	211	4.18	.687
Overall, at what level were you satisfied with Zamburger Hotel?	211	4.07	.747

Table 4.4: Descriptive statistics of responsiveness

RELIABILITY TESTS

Table 4.3 shows the pilot survey test result.

Construct	Cronbach's Alpha	No of Item	N
Service Quality	.895	5	30
High Prices	.822	5	30
Responsiveness	.913	3	30

PEARSON'S CORRELATION

Hypothesis	Result	Findings of Data Analysis
H1: There is a positive relationship between service quality and customer satisfaction at Zamburger Hotel	r = 0.874, p = >.001 Moderate positive	H1: Accepted
H2: There is a positive relationship between high prices and customer satisfaction at Zamburger Hotel	r = 0.837, p = >.001 Moderate positive	H2: Accepted
H3: There is a positive relationship between responsiveness and customer satisfaction at Zamburger Hotel	r = 0.821, p = >.001 Moderate positive	H3: Accepted

Table 4 serves to summarise the findings of this study.

Based on Table 4, the result revealed that all three variables have a strong relationship with customer satisfaction at Zamburger Hotel with a correlation value from $0.874 > 0.837 > 0.821$. The highest correlation relationship was service quality and the lowest one was responsiveness. Nevertheless, all hypotheses are accepted.

DISCUSSION AND RECOMMENDATION

The purpose of the discussions was to address the questions and hypotheses raised in the first chapter of this study. In general, this study has investigated in depth Customer satisfaction with respect to quality service at the Zamburger Hotel. On the basis of the study's findings, there are a number of recommendations for future tourism operators and researchers.

The first recommendation is that the manager of Zamburger Hotel should promote regular customers. For example, regular customers can get a discount or special price. Promotions are vital since they are a wonderful method to immediately increase occupancy and income when you are facing a low time or want to capitalize on a high period. A good campaign will enhance client trust by providing them with awareness, value, and excitement.

Furthermore, the hotel manager should provide more facilities for customers such as fitness facilities. The majority of modern hotels have some kind of fitness center. This might be as basic as a room with a few key workout devices. Fitness facilities at a more notable upmarket hotel may comprise many rooms, including a full gym manned by trained trainers. While not everyone keeps up their exercise routine while on vacation, many guests like exercising and want to prevent being deconditioned while traveling. Good facility management is critical here since selecting appropriate equipment and ensuring safety are critical.

The final suggestion is that hotel personnel should continue to provide superior service to guests. Consistent labour and effort are required from the staff in order to provide exceptional customer service. Customers must be engaged, courteous, accessible, and, above all, attentive to the customers. Moreover, empathy is essential not only for resolving but also for comprehending problems. The staff must first comprehend the needs and perceptions of the visitors in order to devise an outstanding solution. Effective customer service can quickly adapt to any circumstance and has an in-depth understanding of its customers' needs.

CONCLUSION

Ultimately, the purpose of this study is to examine customer satisfaction with respect to the quality of service at the Zamburger Hotel. There are three independent variables: service quality, price, and responsiveness. Each of these variables affects the dependent variable, which is the level of customer satisfaction at the Zamburger Hotel.

Understanding The Effectiveness of Marketing Communication Towards Tourist Decision-Making to Visit Min House Camp

Nurhazirah Binti Jabir, Nurhidayah Binti Mohamad Nasir, Nurnadhirah Binti Muhamad, Nurul Afiqah Binti Shamsuddin & Nurul Aziah Binti Ahmad*

Faculty of Hospitality, Tourism and Wellness, Universiti Malaysia Kelantan
Corresponding email: nurulaziah@umk.edu.my

ABSTRACT

The purpose of this study is to find out the effects of communication marketing on a tourist attraction. The practice of communication marketing is very common today among businesspeople. Understanding how marketing communication works and how successful marketing communication may improve interactions between consumers and brands is essential. Understanding the marketing promotion mix, as well as integrating marketing communication in the settings of brand building and consumer contact, are critical components of modern marketing communication. A quantitative study was conducted to identify The Impact of Communication Marketing Promoting Tourist Destinations in Min House Camp, Kota Bharu, Kelantan. Data were collected from 103 respondents using convenience sampling and analyzed using the BMI SPSS 27 version. The study's conclusions demonstrate that the majority of visitors are familiar with the destination because of its social media communication marketing plan.

Keywords: Sales Promotion, Advertising, Interactive Marketing, Tourist Decision Making, Min House Camp

INTRODUCTION

Marketing communication plays a crucial role in achieving company objectives, particularly in driving sales growth, which has a significant influence on the overall profitability and sustainability of the organization (Martin, Javalgi, & Ciravegna, 2020; Porcu, del Barrio-Garca, Kitchen, & Tourky, 2019). Effective communication, coupled with a well-designed management plan, is essential in promoting tourism sites and engaging prospective tourists (Wu, 2018; Kozak & Buhalis, 2019; Yousaf & Xiucheng, 2018). To educate, convincingly convince, and remind prospective tourists, both domestic and foreign, about the advantages and benefits of a tourist destination, whether directly or indirectly (Lee & Syah, 2018; Mustafa, 2019), a decent, helpful, and deep interaction pattern is required. In theory, communication marketing methods can help businesses target and grow new market segments while also correcting negative public relations caused by bad events (Dore and Crouch, 2015). Contrary to popular belief, requires a long battle and represents a difficulty in merging a variety of diverse perceptions that attempt to gather interests in resolving conflicts of interest between

each stakeholder (Dorn, 2015). As a result, for destinations to profit from a larger portion of global tourism, as witnessed today, the development and promotion of local products must be accelerated. This product, also known as a tourist product, is critical for destination marketing since it shapes people's impressions of a region, as well as their decisions and behavior towards it. The tourism product, according to Bhaita (2016), is not the tourist destination, but rather the experience of the area and what happens there. The tourism industry contributes 56.5 billion in national income while also becoming Malaysia's second biggest industry, therefore this study is considered significant to promote Malaysian tourism destinations more efficiently and effectively using elements in marketing communication. Therefore, the main focus of this study is to find out the effectiveness of marketing communication towards tourist decision-making in choosing Min House Camp as their preference. There were three objectives of this research:

RO1: To determine the relationship between sales promotion towards decision-making in choosing Min House Camp as their preferred destination.

RO2: To examine the relationship between advertising towards decision-making in choosing Min House Camp as their preferred destination.

RO3: To examine the relationship between interactive marketing and decision-making in choosing Min House Camp as their preferred destination.

SIGNIFICANCE OF THE STUDY

Researchers have investigated the connections between various factors, such as sales promotion, advertising, and interactive marketing, within marketing communication. These variables have been found to influence the decision-making process of tourists. The findings of this study are expected to provide a valuable solution for marketing communication consumption. Not only will this benefit future researchers, but it will also be advantageous for students at Universiti Malaysia Kelantan, City Campus, and other individuals interested in this field of study.

LITERATURE REVIEW

Sales Promotion

The extremely competitive economy encourages sellers to constantly employ various marketing tactics and strategies to acquire new customers and boost an enterprise's profitability. One of the most effective approaches to attracting new customers and retaining existing ones is through the implementation of sales promotions. These marketing initiatives aim to temporarily enhance the value of products, encouraging consumer purchases and improving the effectiveness of intermediaries. A questionnaire was used in the study, which involved 60 men and women between the ages of 18 and 64. The study confirms that sales promotion is an effective tool that has a positive effect on consumer purchasing behavior. According to the study's findings, all methods and means of consumer sales promotion are effective because 21% of respondents are more likely to purchase 59% of respondents would gain from a product's promotion. The Internet, which is utilized by 82.5% of consumers, and promotional brochures provided by sellers, which are used by 77.2% of customers, are the two most popular communication channels used by consumers to learn about various promotional activities. (Evgheni Genchev, Gergana Torova, 2017).

Advertising

Advertising is seen to function as one of the special branches which is through an object and places the importance of learning social communication in advertising. In these few decades, the study of advertising is not very widespread and only limited to the field of marketing. In the limited area of advertising-related writing, the focus is more on consumer misrepresentation that may be justified but rather unfounded. In this literature review, this aspect proves that the most irrelevant and interesting thing that we can ask the question of advertising is whether it moves the product. Aspects in this chapter summarize that advertising must be achieved as a body of social institutions and intermediaries in which social correction (William Leiss, Stephen Kline, Sut Jhally, Jacqueline Botterill, Kyle Asquith, 2018).

Interactive Marketing

Interactive online media is a form of structure that consumers and advertisers are increasingly interested in. In addition, interactive marketing can improve online video ads that can skip more widely and it is something normal in social media networks such as YouTube. The specific elements and consequences of this interactive marketing tool require further evaluation and advice. By focusing on methods that have an interesting effect, this journal examines the consequences of high stimulation and low stimulation on an advertisement, namely advertisement attitude, brand, and interference with advertisements, with the ability to moderate the coherence of aspects and products. Consumer products determine that ad interruptions can skip high and low stimulation. This invention, along with its practical implications for the novel, provides a subsequent guide for research as well (Daniel Blanche, Carlos Flavián, Alfredo Pérez-Rueda, 2017).

Research Hypothesis

Based on the discussion above, the hypothesis of the study is proposed below:

- H₁**: There is a positive relationship between sales promotion and tourist decision-making.
- H₂**: There is a positive relationship between advertising and tourist decision-making.
- H₃**: There is a positive relationship between interactive marketing and tourist decision-making.

Research Framework

Figure 1 below shows the research framework used for this study:

Figure 1: Framework

METHODOLOGY

Research Design

The research discusses the importance of study design in research methodology. A well-planned study design ensures that the chosen research methodologies align with the research objectives and facilitate effective data collection and analysis. The three types of research designs mentioned are exploratory, descriptive, and causal. The research in question follows a quantitative approach and utilizes a survey conducted through questionnaires. Specifically, it employs a descriptive research methodology, which focuses on describing the characteristics of the population or phenomenon being studied. The quantitative research design is deemed essential for organizational growth, and the questionnaire is designed to gather information related to the research objectives. The demographic section of the questionnaire offers multiple options for respondents to choose from. The quantitative data acquired by the survey is used in this assessment technique. The survey includes age, gender, ethnicity, and other factors. 103 students who visited Min House Camp from Universiti Malaysia Kelantan, City Campus will be among the approximately 103 respondents whose responses will be chosen for this study.

Data Collection

In this study, researchers utilized primary data as a form of data-gathering approach. Primary data refers to raw data that is collected specifically for the study. It is considered a secure data collection method as researchers have control over the source and compilation of the information. To collect data for this study, researchers employed the questionnaire approach. Questionnaires were chosen because they offer a faster response rate

from a larger number of respondents compared to other methods. This approach ensures more accurate and reliable results for the entire research project. The questionnaire was administered online, providing convenience to respondents and enabling them to answer without any strain. This method also facilitates the provision of honest and accurate information.

Additionally, secondary data analysis, which involves utilizing existing data, was employed as a quick and cost-effective means to gather information from various sources. Secondary data, often referred to as data analysis, can be a valuable tool in research projects. In this study, secondary data was obtained from academic journals, handbooks, and databases like Google Scholar. These sources of secondary data contributed to the research design and complemented the primary data collected through questionnaires.

Sampling

Researchers will use convenience sampling in this study. Convenience sampling is a non-probability sampling method where units are selected for inclusion in the sample because they are the easiest for the researcher to access. Since each respondent has an equal chance of being chosen, researchers will utilize convenience sampling to choose several respondents. Students from the Universiti Malaysia Kelantan, City Campus, were chosen as respondents. The total number of respondents is 103 students who were chosen to answer the questions to help researchers collect data regarding the research topic being researched. The reason why researchers chose students in Universiti Malaysia Kelantan, City Campus as respondents is that they usually visit or are familiar with Min House Camp.

Data Analysis

This section provides an overview of the key information utilized in the research and aims to discuss the research hypotheses and objectives. It includes tables, charts, and graphs that present the data analysis, statistical findings, and conclusions of the research study. The main analyses employed in this study are reliability testing, Pearson correlation, and descriptive statistics.

The data collected from the questionnaire was structured, edited, categorized, and coded by the researcher using computer tools such as the Statistical Package for the Social Sciences (SPSS). This software facilitates quick data calculations and enables faster and less demanding quantitative investigations. Various statistical techniques, including descriptive analysis, reliability analysis, and Pearson's correlation coefficient, were employed in this study. These analyses helped evaluate the relationship between variables and explore the respondents' demographic information.

Reliability statistics were utilized to assess the significance of the relationship between variables in the study, while Pearson's correlation coefficient was employed to analyze the independent variable and examine the data (Bewick et al., 2003). By utilizing data sources, researchers were able to assess the logical conclusions derived from the use of this computer program.

FINDINGS

Results of Frequency Analysis

Table 1 shows the result of the frequency analysis of respondents. Most of the respondents were female 68 respondents (66%) while the male is 35 respondents (34%).

The majority of the respondents are females which consists of 66% more than male 34%. After that, the respondents age, most of them are at the age of 21-29 years old which is 74.1% of the total sample and followed by the ages 30-39 years old (11.5%), 40-49 years old (10.7%) and 60 years and above (2.9%). The lowest frequency of respondents' age is below 20 years old with 1.9%.

In terms of race, the highest number of respondents is Malay with 77.9%. Chinese and Indian share the same percentage which is both 9.6%. The race of others race gives the lowest frequency which is 2.9%.

The religion that got the majority of the respondents is Muslim with 79.8%. Christian and Buddha share the same percentage which is 9.6%. The religion of the respondent that shows the lowest frequency is other religions which are 1%.

As for the level of education, 68.9% of Bachelor of Degrees are the majority of the total respondents out of 103. Level of education for a Master is (12.6%), Siil Pelajaran Malaysia (10.7%). 0.5% is the lowest frequency of the respondents that are for others' level of education.

For occupation, most of the respondents are students with 72.8% and followed by the private sector (10.7%), government employees (8.7%). However, the lowest frequency of the respondents for other occupations is 7.8%.

The country of origin that shows the highest is local people which is 75.5% and the lowest is the tourist which is 24.5%. Thus, the data accurately reflect the real demographic compilation of the effectiveness of marketing communication towards tourist decision-making to visit min house camp.

Table 1: Frequency Analysis

DEMOGRAPHIC

Demographic	Category	Frequency (N)	Percentage (%)
Gender	Female	68	66
	Male	35	34
Age	Below 20 years	2	1.9
	21-29 years	77	74.1
	30-39 years	12	11.5
	40-49 years	10	9.6
	60 years and above	3	2.9
Race	Malay	81	77.9
	Chinese	10	9.6
	Indian	10	9.6
	Others	3	2.9
Religion	Muslim	83	79.8
	Christian	10	9.6
	Buddha	10	9.6
	Others	1	1
Education Level	Sijil Pelajaran Malaysia	11	10.7
	Bachelor of Degree	71	68.9
	Master	13	12.6
	Others	8	7.8
Occupation	Student	75	72.8
	Government Employee	9	8.7
	Private Sector	11	10.7
	Others	8	7.8
Country of Origin	Local People	77	75.5
	Tourist	25	24.5

Result of Descriptive Analysis

Table 2 shows the result of the descriptive analysis of the variable.

Table 2: Descriptive Analysis

Variable	Items	Mean Score	Standard Deviation
Sales Promotion	Sales promotion further strengthens the decision of tourists to Min House Camp	4.38	0.756
	Sales promotion gives satisfaction to the decision of tourists to Min House Camp	4.37	0.741
	Sales promotions make it easier for tourists to go to Min House Camp.	4.35	0.750
	Sales promotion attracts more tourists to Min House Camp	4.45	0.696
	Sales promotions bring excitement to tourists to Min House Camp	4.40	0.662
	Sales promotion further increases tourist visits from abroad to Min House Camp.	4.42	0.761
Advertising	Do you believe that advertising influences how people make decisions?	4.45	0.737
	Did the advertisement change your opinion and prejudices about Min House Camp?	4.44	0.696
	Do you think there are benefits from the advertisement about Min House Camp?	4.38	0.742
	Is the advertisement for Min House Camp believable?	4.33	0.733
	Advertisements on social media for Min House Camp are annoying/irritating?	3.47	1.533
	The product information provided about Min House Camp in the advertisement is relevant?	4.31	0.728

	The design of the advertisement attracts me while I am searching for information about Min House Camp on the Internet.	4.39	0.717
Interactive Marketing	Have you been interested in interactive marketing materials released by Min House Camp for example on social media ads?	4.31	0.741
	In your opinion, Min House Camp's interactive marketing materials are more persuasive than other forms of marketing.	4.30	0.739
	Is interactive marketing important to you when planning about wanting to travel to Min House Camp?	4.36	0.698
	Do you believe that interactive marketing materials have the appeal to shape your perception of choosing a destination for Min House Camp?	4.34	0.735
	Would you recommend the Min House Camp destination to others based on your experience with interactive marketing materials?	4.37	0.714
Tourist decision-making	The beauty of the flora and fauna found at Min House Camp can attract me to visit it.	4.46	0.683
	Min House Camp has offer lower and more reasonable daily prices to tourists.	4.27	0.795
	Min House Camp is an attraction for tourism that can involve the community	4.37	0.671
	Will you visit again to Min House Camp?	4.40	0.676
	Will you recommend Min House Camp to your friend or relatives to visit Min House Camp?	4.43	0.762

Result of Reliability Test

The reliability analysis results for the dependent variable and independent variable are presented in Table 3. The Cronbach's Alpha value, which measures the internal consistency of the scale, falls within the acceptable range of 0.60 to 0.90.

Table 3: Result of Reliability Test

Variable	Number of question	Reliability Cronbach's Alpha	Comment
Sales Promotion	6	0.944	Excellent
Advertising	7	0.874	Very good
Interactive Marketing	5	0.912	Excellent
Decision Making	5	0.933	Excellent

Results of Pearson Correlation Analysis

Table 4 shows the result of Pearson Correlation Analysis to see the relationship of each predictor with tourist decision-making consumption. According to the results, there are three factors (sales promotion, advertising, and interactive marketing knowledge about tourist decision-making effectiveness) that have a positive significant relationship with tourist decision-making consumption since the p-value is less than 0.05. The Pearson correlation value of sales promotion ($r = 0.794$), advertising (0.814), and interactive marketing (0.852) indicate a positive high relationship with tourist decision-making consumption.

Table 4: Pearson Correlation Analysis

Predictors	Pearson Correlation	P-Value
Sales Promotion	.794**	.000
Advertising	.814**	.000
Interactive Marketing	.852**	.000

Results Of Hypothesis Testing

H1: There is a significant relationship between sales promotion and marketing promotion toward tourist decision-making in choosing Min House Camp as their preferred destination.

The correlation between sales promotion and marketing promotion toward tourist decision-making in choosing Min House Camp as their preferred destination is 0.794 which is considered as a strong positive correlation. Moreover, effectiveness has shown a positive significant relationship toward tourist decision-making in choosing Min House Camp as their preferred destination since the p-value is less than 0.05. H1 is supported.

H2: There is a significant relationship between advertising and marketing promotion toward tourist decision-making in choosing Min House Camp as their preferred destination.

Advertising and marketing promotion toward tourist decision-making in choosing Min House Camp as their preferred destination showed 0.814 indicating a moderately strong positive correlation. In addition, quality of service has shown a positive significant relationship toward tourist decision-making in choosing Min House Camp as their preferred destination since the p-value is less than 0.05. H2 is supported.

H3: There is a significant relationship between interactive marketing and marketing promotion toward tourist decision-making in choosing Min House Camp as their preferred destination.

Interactive marketing and marketing promotion toward tourist decision-making in choosing Min House Camp as their preferred destination with 0.852 indicated a moderate positive correlation. Furthermore, interactive marketing has shown a positive significant relationship toward tourist decision-making in choosing Min House Camp as their preferred destination since the p-value is less than 0.05. H3 is supported.

DISCUSSION AND RECOMMENDATION

The researcher highlights the importance of following proper procedures in research while acknowledging the presence of unavoidable constraints. One limitation mentioned is the difficulty some respondents face in understanding the questionnaire, emphasizing the need for clear explanations from the researcher. Another limitation is the reluctance of certain individuals to participate in the questionnaire due to concerns about sharing opinions, lack of interest, and perceived time consumption. The COVID-19 pandemic further complicates data collection, as online administration of the questionnaire takes more time to gather sufficient responses. Many respondents tend to ignore or skip questionnaires shared through social media platforms. The summary emphasizes the importance of dedication and collaboration among the research team and the respondents to successfully conduct the survey and manage the workload effectively.

The researcher suggests that tourism operators should play a vital role in attracting tourists to revive the tourism industry, emphasizing the importance of excellent facilities and infrastructure at the destination. The study focuses on the effectiveness of marketing communication in influencing tourists' decisions to choose the Min House Camp as their preferred destination. Recommendations are provided for future research, and the study can serve as a reference for exploring digitalization methods in attracting tourists to the camp.

The use of both quantitative and qualitative research methods enhances the study's accuracy by considering different perspectives. Quantitative research involves the collection and analysis of numerical data to identify trends, formulate hypotheses, examine causality, and make generalizations. It emphasizes precise measurements and statistical analyses using surveys, polls, and computational techniques. This approach allows for a better understanding of specific events and enables broader generalizations across different groups of individuals.

CONCLUSION

The research aims to explore the effectiveness of marketing communication in influencing tourist decision-making regarding visits to the Min House Camp. The independent variables under investigation include sales promotion, advertising, and interactive marketing. These variables collectively impact the dependent variable, which is tourist decision-making. The study's findings reveal a significant relationship between the three independent variables and the dependent variable. The analysis of the results was conducted using the Statistical Package for Social Science (SPSS). However, the research encountered limitations arising from factors such as limited understanding, lack of interest among respondents, and time constraints. To enhance future research, it is recommended to incorporate additional demographic characteristics of the respondents and considers utilizing multiple languages.

ABSTRACT

The tourism sector in Malaysia faced a serious threat from the covid-19 outbreak in the early months of 2020. The covid-19 epidemic has had an impact on millions of people's lives worldwide. The development of tourism will be most impacted by the onset and spread of COVID-19. As nations throughout the world continue to impose travel restrictions and close their borders, the market for tourism services like resorts is dropping (The Star 2020). For instance, it can be argued that practically all resort reservations have been cancelled in Kelantan. This paper examines the technology, facilities and social factors of tourism development in tourist arrival. There are three objectives of this research. Which is to investigate the relationship between technology and the tourism development in tourist Arrival, to identify the relationship between facilities and the tourism development in tourist arrival. The third objective is to determine the relationship between social factors and the tourism development in tourist arrival. This study used a quantitative technique, and it included primary data from the self-administered questionnaire as well as secondary sources to do the literature review.

Keywords: Resort, Tourism, Kelantan, Covid-19

INTRODUCTION

The COVID-19 Pandemic has impacted both the worldwide supply and demand for goods and services. Domestic travel makes up around 75% of the sector in countries where tourism is projected to fall sharply (Razak, 2020). The complex and challenging demand would decrease as a result of foreign buyers postponing or cancelling purchases, domestic and foreign visitors postponing visits, and stock market decreases (Salman et al., 2021).

The effects of the Covid-19 outbreak have been felt most strongly in the tourism sector. Due to the explanation that resorts cannot thrive during or after these pandemics, this outbreak has also caused individuals to postpone travel and resort reservations (Baker and Judge, 2020). After the Movement Control Order (MCO) was withdrawn, several resort enterprises that were

unfortunate and struggling to exist will have to close. In Malaysia, the first Covid-19 wave caused resort services to be discontinued for several months.

SIGNIFICANCE OF THE STUDY

This study looked into changes in tourism development in Kelantan before and after the conflict. The report can serve as a resource for other studies looking to examine the growth of local tourism in Kelantan. This report aids in understanding the minor factors influencing Kelantan's tourist development.

LITERATURE REVIEW

Technology

Technology is basically anything that enables us as humans to make all of those things, including all tools, machinery, tools, apparatus, weaponry, shelter, clothes, transport, and communication gadgets. The future of modern society and the national economy are both at risk due to the globalization of climate change (Urry 2015). Therefore, it is not surprising that studies have linked people to the direct drivers of this extraordinary transformation as a result of our activities (Cloern et al. 2016, 513-29; Cavicchioli et al. 2019, 569-586).

The technology that we will adapt to this study is green technology. Sustainability is crucial since it may cut down on environmental degradation, wasteful outputs, and unneeded losses (Hornig 2017). In the hospitality and tourism sectors, green technology innovation has made a significant contribution to lowering resource consumption and environmental pollution during industry development (Yousaf 2021).

Facilities

According to Atkins and Brooks, (2004) facilities are an integrated strategy to manage, maintain, enhance, and change an organization's buildings and infrastructures in order to produce an environment that strongly supports the organization's key objectives. According to Sulastiyono (2007:3), a resort is a place to stay that offers amenities like lodging, food and drink, and other services like a sports court and laundry. Another definition of a resort given by Steadmon (2003:8) in Fadmawati is an establishment whose main business is to offer lodging to the general public and which offers one or more of the following services.

Yoeti (1995:111) asserts that a resort needs to meet four requirements in order to be considered. These include physical facilities, the calibre of the goods and services, the attitudes of the employees, and competitive pricing. Property, equipment, and services make up the three main parts of facilities management, according to Abd Rahman (2002). Each of these components is handled and made available to users by the appropriate management.

Social Factor

When underprivileged groups participate in tourism activities, social and financial measures are used to encourage this type of tourism, which is known as "social tourism" (Haulot, 1982). The local culture is crucial in conveying to tourists that cultural practices are part of daily life there. Additionally, as a society, individuals must accept the culture that newcomers bring and merely regard their traditions as temporary visitors (Raden Ismail, R. M. F. H., Jusoh, N. A. S. & Rohiat, M. A.) (2021). Socially factors are things that affect someone's lifestyle. These could include wealth, religion, buying habits, education level, family size and structure and population density (globalizationpartners.com/2016/06/09/).

The accessibility of travel information, the comfort of the gear, and the upbeat attitudes of the family, friends, and locals will all contribute to the environment. Encourage those with mobility issues to go on more trips (Lei, 2010). Instead of that, knowing accessible information improved their journey enjoyment. Even if the destination is inaccessible but they truly want to go, there are still ways for them to arrange it and have a good trip (Lei, 2010).

Tourist Arrival

Because tourist attractions can attract random visitors to a destination (McKercher, 2017), individual perceptions of an attraction's ability to meet visitor needs and travel motivations drive attraction selection (Leiper, 1990). However, travelers usually don't have enough background knowledge to make all the travel arrangements. Extensive information about tourist attractions, including their characteristics, alternative options, and other contextual factors, is required to support decision-making and shape expectations for future experiences.

According Lim, C., & McAleer, M. (2001) If the mean and variance of a series of tourist arrivals remain constant throughout time, the series is considered to be stationary. Governments and commercial businesses all over the world are eager to increase tourism as the number of visitors rises.

Research Framework

The researchers have proposed a framework to study the technology, facilities and social factors of tourism development in tourist arrival., based on the previous literature review. Hence, as seen below, the structure:

Figure 1: Proposed Research Model

METHODOLOGY Research Design

A quantitative approach has been applied into this research and it involves secondary sources in order to perform the literature and primary data from the self-administered questionnaire. Quantitative research, according to Van der Merwe (1996), is a research strategy used to analyse ideas, find facts, show correlations between variables, and forecast outcomes. In quantitative research, natural science approaches are employed to establish validity, generality, and consistency (Weinreich, 2009). The methods used in quantitative research involve a systematic questionnaire, an intervention to test predefined hypotheses regarding the relationships between particular variables, and an independent random selection of research respondents from the study population.

Data Collection

To collect data for this study, the researcher employed the questionnaire approach. Questionnaires are chosen because, compared to other methods, they can generate a quick response from a large number of respondents and provide more accurate and dependable results for the entire research project. Data will be collected based on questions related to tourism development, attraction and accommodation that will be selected. We do the data online, we will provide a Google Form and blast to tourists who visit Kelantan using online platforms such as group communities in Facebook WhatsApp, and Telegram. Then we will change to QR code for easy provided to tourist scan and answer question for easy they understanding what we want to know and ask.

Sampling

The simple sampling technique was employed in this study. Sample describes a portion of the population. The subject was referred to as the sample participant, and the sample size is the total number of people included in the sample. According to Krejcie (1970), for population in Kelantan starting from 20 until 44 years old is around 750, the required sample was 254 respondents.

Data Analysis

This study employs four types of data analysis: frequency analysis, descriptive analysis, reliability analysis, and Spearman correlation coefficient analysis. The collected data is then analysed using the Statistical Package for the Social Sciences (SPSS). To begin, the current study examined the response rate, the respondents' demographics and other information, nonresponse bias, and the data's validity and reliability. This includes statistical calculations such as the average and distribution of frequency and percentage of information provided by questionnaire respondents.

FINDINGS

Demographic Analysis

Table 1: Demographic analysis

The study of a population based on characteristics like age, race, and sex is known as demographic analysis. Socioeconomic information expressed statistically, such as employment, education, income, marriage rates, birth and death rates, and more, is referred to as demographic data. nonetheless, we only mention three, namely gender, race, and education. The first one is gender, shows that the respondents are male with 46.7% with 98 respondents and for female 53.3% which is 112 respondents. The second is race, the highest respondents is Malay, 79% with 166 respondents. This is followed by Indians 16.7% (35 respondents) and Chinese 4.3% the lowest with 9 respondents only. The last one is education, according to the chart the highest percentage 62.9% for degree which is 132 respondents. Also followed by Primary/Secondary School 17.1% with 36 respondents and Diploma get 14.8% (31 respondents). So lastly Master with 5.2% (11 respondents).

Descriptive Analysis

Content (DV)	Mean	Std. Deviation
Satisfied with all the services provided in resort.	4.16	.770
will come frequently to resort due to the availability of accommodation provided	4.13	.771
will recommend family and friends to come to resort	4.12	.779
The friendliness of resort staff made me like and come to the resort	4.00	.920
The culture in Kelantan made me come to Kelantan	4.06	.886
I like the interesting places in Kelantan	4.17	.788
I will come to Kelantan frequently.	3.92	.975

Content (IV1)	Mean	Std. Deviation
The application on the phone can make matters easier to book a resort	4.35	.782
The resort's internet facilities are acceptable	4.12	.797
Social Media help to ease access the information about resort	4.34	.715
contactless payment can make payment matters easier	4.35	.775
The filled data has been saved to make things easier if repeat the resort	4.14	.833
Green technology used by the resort can attract more tourists.	4.17	.845
Satisfied with the technology provided by the resort.	4.20	.709

Content (IV2)	Mean	Std. Deviation
The facilities offered at the resort can be an attraction for visitors	4.24	.753
The resort's facilities, such as computers, laptops, and projectors, are ideal for holding meetings, seminars, and important events.	4.14	.786
Pool areas, toilets, and even showers are clean and safe to use.	4.24	.752
Visitors could be attracted to resorts that have recreational facilities.	4.33	.760
The provision of adequate parking facilities and a wide area	4.26	.789
Rooms include facilities such as a television, a telephone, and an internet connection	4.30	.784
The facilities provided at the resort are satisfied	4.23	.735

Content (IV3)	Mean	Std. Deviation
always search the resort want to go and stay in social media	4.25	.763
The main reason I came to Kelantan is because of their traditional food culture.	4.09	.856
What has been portrayed in social media same with my expectations	4.00	.844
I mostly travel because I want to release my stress.	4.25	.794
I enjoy the experience of cultural activities held in resort.	4.10	.818
I travel because of outstanding natural resources available at the resort.	4.12	.838
The experience I get at the resort is value for money	4.10	.819

Table 2: Descriptive Analysis

Table 2 shown descriptive analysis that utilising both recent and old data to find patterns and connections is known as descriptive analytics. It describes trends and associations but doesn't delve deeper, earning it the moniker "the simplest form of data analysis." In this research, researchers provide seven question for dependent variable and seven question for each independent variable. So total overall is 28 question

Reliability Analysis

Variable	Number of items	Reliability Cronbach's Alpha	Comment
Tourist Arrival	7	0.929	Excellent
Technology	7	0.940	Excellent
Facilities	7	0.946	Excellent
Social	7	0.926	Excellent

Table 3: Reliability Analysis

The significance of both independent and dependent variables in this study was shown in Table 3 of the SPSS results. Table 4.3.2 shows that all variables were more than 0.900. The survey received approval. The seven questions were used to evaluate how the entry of tourists affected Kelantan's tourism industry before and after COVID-19. The Cronbach Alpha score of 0.929 has been demonstrated to be very high. The Cronbach's Alpha score for the technology questions was 0.940, and the coefficient obtained was also precise. The Cronbach Alpha result is also 0.946 after seven questions were used to compute the variable for facilities in tourist development. Last but not least, seven questions were utilised to determine the social impact of tourism development, and the Cronbach Alpha result was 0.926, which was considered excellent.

Pearson Correlation Analysis

Hypothesis	Pearson's Correlation Results	
H1: Technology - tourist development in tourist arrival	$r=0.780, p<0.05$	Hypothesis accepted
H2: Facilities - tourist development in tourist arrival	$r=0.788, p<0.05$	Hypothesis accepted
H3: Social factors - tourist development in tourist arrival	$r=0.835, p<0.05$	Hypothesis accepted

Table 4: Pearson Correlation Analysis

Based on Table 4, it can be seen that the hypothesis regarding the impact of technology, facilities, and social variables on tourism development on visitor arrival was evaluated using Pearson's correlation analysis. All offered hypotheses were accepted at the 0.05 level of significance. Furthermore, the conclusion demonstrated that independent variables, including technology, facilities, and social factors, had a very strong and high positive connection with tourism development, supporting the entire premise.

DISCUSSION AND RECOMMENDATION

The study's findings show that factor affecting tourist development in Kelantan before and after covid-19. The economy of the world benefits enormously from tourism. It is because, since 2013, a sizable portion of jobs has come from the tourism industry. However, the tourism business is in danger as a result of Covid-19, which has harmed the population. As a result, the informants were questioned to learn more about their difficulties and strategies for solving the issue. During the Covid-19 pandemic, those would become the most contaminated industries. Human travel restrictions are crucial for limiting the spread of Covid-19, but they will also have an impact on the world economy and tourism growth (Gaffney et al., 2020). This crisis is more likely to have an impact on nations whose economies rely more heavily on tourism (Fernandes, 2020).

It is hoped that the suggestions presented in this paper will help the relevant stakeholders enhance resort operations so that visitors are happy while also opening up opportunities for bringing in more visitors in the future. There have been several studies on resorts, but their disparate findings ultimately give rise to further questions for future research. However, the sample size in this study was modest. Therefore, it is strongly recommended that researchers use a large sample size for subsequent studies. This is so that the larger samples more closely reflect the population. The aspects could be explored in future studies which is choose a specific topic on research, establish a strategy, and build the same research in a different setting, locale, or culture.

CONCLUSION

The COVID-19 pandemic has affected the demand and supply of goods and services worldwide. The impact of the Covid-19 epidemic has been felt most strongly in the tourism industry. This study compared the changes in tourist development in Kelantan before and after the war, when holiday services were banned for several months during the first wave of Covid19 in Malaysia.. The report can be a resource for other studies on local tourism growth in Kelantan. This report helps to understand the minor factors affecting tourism development in Kelantan. In the hospitality and tourism sector, green technological innovations have helped to significantly reduce resource consumption and environmental pollution during the development of the industry (Yousaf 2021). A resort, according to Steadmon (2003:8) in Fadmawat, is a facility whose main business is providing lodging to the general public and which offers one or more of the following services.

A resort must have four elements or basic criteria. These are physical infrastructure and facilities, quality of products and services, attitude of staff and competitive price. Local culture plays a key role in letting tourists know that cultural practices are part of everyday life there. The availability of travel information, the comfort of equipment and the cheerful attitude of family, friends and local people contribute to the environment. Comprehensive information about tourist destinations, including their characteristics, alternative options and other contextual factors, is necessary to support decision-making and form expectations about future experiences.

ABSTRACT

This research aims to investigate the relationship between facilities, safety and security, and services in Genting Highland and their impact on tourism development. The main objective is to identify the factors influencing tourism in Genting Highland. The study will utilize quantitative methods, including convenience, safety, security, and hospitality as factors, and will gather data through a questionnaire. Statistical analysis will be conducted using SPSS version 26.0 to support decision-making and improve performance. The research intends to achieve its objective of understanding the development of tourism in Genting Highland.

Keywords: Genting Highland, tourism development, facility, service, safety and security.

INTRODUCTION

For this study researcher focuses on identifying the factors that may be influenced by tourism growth. The survey conducted provides insights into the tourism industry in the Genting Highlands area, including leisure and travel sectors such as lodging, retail, ecotourism, cruise tourism, spa and wellness, gastronomy, and domestic and international travel (PEMANDU,2013). Genting Highlands has a history of updates and new amenities, planning to reopen in 2020 and welcoming tourists from mid-2021. COVID-19 has affected all countries, but its impact on Genting Highlands is minor as it primarily affects Malaysians (Genting Berhad, 2020). The study aims to examine the relationship between tourism development and factors like amenities, safety, and security, with the goal of finding solutions to potential challenges. The study specifically evaluates the factors influencing the tourism development in Genting Highland.

SIGNIFICANCE OF THE STUDY

Researchers

This study will assist researchers in determining the factors influencing tourism development in Genting Highland in terms of facility, safety and security, and service. Therefore, this will be a tool that will guide and navigate them when they find reliable factors known as data needed for deeper learning of the topic.

Community

This study will help tourism players to overcome this problem to modify the industry. Then, suggestions on how to improve the performance of tourism development in Genting Highland.

Government

This study also helps the government restore development by promoting Genting Highland to increase revenue. The results enable Genting Berhad to improve the quality of places and services to attract and retain new or existing tourists. In conclusion, it can also help increase their profit margins.

LITERATURE REVIEW

i) Tourism Development

Tourism development involves the process of increasing, developing, and promoting tourism in a destination to generate economic benefits. Genting Highlands in Malaysia is a popular tourist site known for its cool climate and outdoor theme park. Resort World Genting (RWG) plans to reopen in 2022 and expects 30 million visitors, capitalizing on the reopening of border gates and the anticipated population recovery. Sustainable tourism considers economic, social, and environmental effects, meeting the demands of guests, the industry, and host communities (Wahl, Lee & Jamal, 2020). Genting Highlands, located 35 kilometers from Kuala Lumpur, offers a range of tourism options, including hotels, casinos, shopping centers, and the Skyworlds Theme Park. The area also features surrounding valley attractions, such as rural villages, culinary hotspots, and natural destinations. The strategic location and continuous growth of Genting Highlands contribute to its stable tourism industry. Tourism development involves planning strategies to maximize tourism's positive impact on human welfare and environmental quality (Pearce, 1989).

ii) Facility

Tourist facilities, such as accommodations, hotels, theme parks, and transportation services, play a crucial role in the development of tourism in Genting Highlands. These facilities support the growth of the tourism and recreation sector and enhance the overall visitor experience. Sustainable tourism practices, including long-term environmental planning and the utilization of regional public infrastructure, can guide the placement of facilities and increase visitor satisfaction

(Chi et al., 2005; Ramasamy, 1994). Transportation systems, including buses and cable cars, are available to transport visitors to Genting Highlands, while lodging options like hotels provide comfortable stays. The Outdoor and Indoor Theme Parks offer a wide range of thrilling attractions for visitors of all ages. Understanding the relationship between facilities and tourism development is essential for maximizing the potential of Genting Highlands as a tourist destination.

iii) Service

A service is an intangible action or benefit provided by one person to another, not resulting in ownership, according to Kotler and Armstrong (2019). Services encompass various industries such as accounting, banking, education, transportation, and hotels. In Genting Highlands, the hotel business plays a significant role in promoting development, offering excellent service and hospitality to guests. The region features a range of accommodations, from budget rooms to luxurious five-star hotels. Additionally, Genting Highlands offers a theme park, shopping centers, entertainment venues, and a casino. Quality is recognized as an important aspect of services, contributing to operational effectiveness and financial success. This study aims to explore the relationship between services and tourism development in Genting Highlands.

iv) Safety And Security

Safety and security are essential aspects of tourism, with safety focusing on protection against accidental incidents and security addressing deliberate acts (Albrechtsen, 2003). Concerns about safety and security significantly influence tourists' travel choices (Spencer and Tarlow, 2021; Wang et al., 2019). Genting Highlands has implemented strict health and safety measures to prioritize the well-being of employees and guests, particularly in response to the COVID-19 pandemic. The region emphasizes the significance of tourism safety and security for the quality of tourism. Visitors seek secure settings for relaxation, tranquility, and adventure. Resorts World Genting has installed thermal scanners and implemented protocols to monitor body temperature and track visitors. Safety is the top priority, and rigorous onboarding processes were enforced during the Movement Control Order to ensure the safety of guests. According to researchers Kovari and Zimányi (2010), safety and security are crucial components of the economy and tourism, and this study explores their interaction with tourism development. Adequate security measures are necessary at tourist destinations to guarantee visitor safety. The study aims to investigate the relationship between safety, security, and tourism development in Genting Highlands.

RESEARCH OBJECTIVE

There are 3 objectives that this study aims to achieve as follow:

1. To determine the relationship between facility and development in Genting Highland.
2. To determine the relationship between safety and security and tourism development in Genting Highland.
3. To determine the relationship between services and tourism development in Genting Highland.

RESEARCH QUESTIONS

The questions for this study are as follows:

1. What is the relationship between facilities and tourism development in Genting Highland?
2. How does tourist find out the safety & security level of tourism development in Genting Highland?
3. What is the level of services and tourism development of Genting Highland?

RESEARCH HYPOTHESIS

A hypothesis must be testable and realistic, taking into account the most recent findings and research methods. Furthermore, a hypothesis is a prediction or an explanation of how two variables are related. It implies that a dependent variable and an independent variable are connected predictably. As a result, the

Hypothesis 1 :

H_0 : There is no relationship between facility and tourism development in Genting Highland.

H_1 : There is a relationship between facility and tourism development in Genting Highland.

CORRELATIONS			
		Facility	Tourism Development
Facility	Pearson Correlation	1	.452**

	Sig. (2-tailed)		<.001
	N	300	300
Tourism Development	Pearson Correlation	.452**	1
	Sig. (2-tailed)	<.001	
	N	300	300
**Correlation is significant at the 0.01 level (2-tailed)			

Hypothesis 2 :

H_0 : There is no relationship between level of services and tourism development in Genting Highland.

H_3 : There is a relationship between level of services and tourism development in Genting Highland.

CORRELATIONS			
		Safety & Security	Tourism Development
Safet & Security	Pearson Correlation	1	.664**
	Sig. (2-tailed)		<.001
	N	300	300
Tourism Development	Pearson Correlation	.664**	1
	Sig. (2-tailed)	<.001	
	N	300	300
**Correlation is significant at the 0.01 level (2-tailed)			

Hypothesis 3 :

H_0 : There is no relationship between safety & security and tourism development in Genting Highland.

H_2 : There is a relationship between safety & security and tourism development in Genting Highland.

CORRELATIONS			
		Safety & Security	Tourism Development
Safet & Security	Pearson Correlation	1	.620**
	Sig. (2-tailed)		<.001
	N	300	300
Tourism Development	Pearson Correlation	.620**	1
	Sig. (2-tailed)	<.001	
	N	300	300

**Correlation is significant at the 0.01 level (2-tailed)

RESEARCH FRAMEWORK

The conceptual framework for this research is seen in Figure 1. The three factors that make up the independent variables are facility, safety and security, and service. Tourism development in Genting Highland is the dependent variable.

Figure 2 : Conceptual Framework of the relationship between facility, safety and security, and service with tourism development in Genting Highland

METHODOLOGY

Research Design

The study incorporates the factor influencing the tourism development in Genting Highland. A quantitative technique is used in this study, and data will be collected from individual using a self-administered questionnaires (Pritha Bhandari, 2022). The relationship between facilities, service and safety and security toward the tourism development in Genting Highland us the subject of a descriptive study. The descriptive study design assists in answering the research questions and achieving research objective.

This study used quantitative method via statistics through the use of large scale survey research to collect the data distributing a set of questionnaire through Google Form. The questionnaire are designed related to facilities, service and safety and service and the tourism development in Genting Highland using 5-point Linkert scale (1=strongly disagree and 5 strongly agree).

Population And Sample Size

Overall, the population of arrival tourists to Genting Highland is 2,369,121 million. However, the researches population of this study only involves the tourists from January to June 2022. To determine the sample size, Krejcie and Morgan (1970) sample was used in this study.

<i>N</i>	<i>S</i>	<i>N</i>	<i>S</i>	<i>N</i>	<i>S</i>

Figure 3 : Krejcie & Morgan (1970) :

Data Collection

In the first stage, the data collection method that had been used is online surveys using Google Forms. The reasons why the researchers used this platform is due free access and user-friendly. It also makes it easier to the researchers to collect all data from local tourist. The second stage is the study executed a pilot study whereby 30 respondents participated in the survey. Subsequently, the study conducted a field study whereby based on the required sample size, 384 tourists participated in this survey.

Sampling

Sampling is a method for collecting data in the academic world that allows researchers to learn more about a population by examining the results of a representative sample of people rather than concentrating on a small number of individuals (Turner, 2020). Probability sampling and non-probability sampling are the two major sampling methodologies used in this study. Probability sampling means that every item in the population has an equal chance of being included in the sample. One way to undertake random sampling would be if the researcher constructed a sampling frame first

and then used a random number generation computer program to pick a sample from the sampling frame (Zikmund, 2002). Non-probability sampling is often associated with case study research design and qualitative research.

Convenience sampling will be used in this research for the participants' convenience. Convenience sampling is a non-probability sampling strategy in which respondents are chosen for sampling just because they provide researchers with "convenient" sources of data.

RESEARCH INSTRUMENTS

This research instrument aims to assess user satisfaction in a specific public facility. It consists of five sections: demographic information, facilities evaluation, safety and security assessment, service quality evaluation, and development satisfaction. Each section utilizes a different type of scale or question format to gather data.

In this section, participants are asked to provide their demographic details such as gender, age, marital status, and education qualification. The open-ended scale allows respondents to provide detailed responses, providing researchers with a comprehensive understanding of the characteristics and backgrounds of the users.

The facilities evaluation section focuses on assessing users' perceptions of various aspects of the public facility. Participants are presented with five statements or questions related to facility conditions, such as cleanliness, maintenance, availability of amenities, ease of access, and overall ambiance. They are then asked to rate their level of agreement or satisfaction on a Likert scale, typically ranging from 1 (Strongly Disagree) to 5 (Strongly Agree). This scale allows for the quantification of satisfaction levels across different aspects of the facility.

The safety and security section aims to evaluate users' perceptions of safety measures in the public facility. It consists of five statements or questions related to security effectiveness, presence of surveillance systems, emergency response readiness, and overall sense of safety. Participants rate their level of agreement or satisfaction using a Likert scale, similar to the facilities evaluation section.

The service quality section focuses on assessing users' satisfaction with the services provided by the public facility. It includes five statements or questions related to staff friendliness, responsiveness, professionalism, accuracy of information provided, and overall service experience. Participants rate their level of agreement or satisfaction using a Likert scale.

The development satisfaction section measures users' satisfaction with the development initiatives within the public facility. It includes five statements or questions related to the availability and quality of additional features, ongoing improvements, and overall perception of progress. Participants rate their level of agreement or satisfaction on a Likert scale.

By employing a combination of open-ended questions for demographic information and Likert scale questions for evaluating facility conditions, safety and security, service quality, and development satisfaction, this research instrument provides a comprehensive approach to assessing user satisfaction in the public facility. The collected data can then be analyzed to identify areas of strength and areas for improvement, guiding decision-making and future development strategies.

Data Analysis

Researchers used Social Science Statistic Package (SPSS) in this study to examine the data collected from the respondent. SPSS is a program-based data processing and analysis window that allows the users to create distribution charts and plots as well as execute complex data processing and analysis with only a few simple keystrokes. This researchers used descriptive statistics, reliability tests, and Pearson's correlation coefficient for the analysis of the results.

FINDINGS

Based on the gender distribution of the 300 respondents, the higher percentage is represented by females at 59%, while males account for the lower percentage at 41%.

Based on the age distribution of the 300 respondents, the highest percentage falls within the 18-25 years old category at 58.7%. The lowest percentage is represented by the 36-39 years old category, accounting for 5% of the respondents.

Among the marital statuses mentioned, the highest percentage is represented by the "single" category, accounting for 70.3% of the respondents. On the other hand, the lowest percentage is attributed to the "married" category, with only 29.7% of the respondents reporting being married.

Among the mentioned, the highest by individuals with a 61.7% of the hand, the lowest individuals with a master's degree or PhD, accounting for 5.7% of the respondents.

educational qualifications percentage is represented bachelor's degree at respondents. On the other percentage is attributed to

DISCUSSION AND RECOMMENDATION

The discussions were aimed to solve the questions and address the hypothesis as mentioned in the first chapter of this study. In general, this study has extensively researched the factors influencing tourism development in Genting Highland. Based on the findings of the study, there are some recommendations for tourism operators as well as the future researchers in order to make an improvement in the future study.

The government should play an important role in ensuring that companies or institutions involved in the tourism industry can be given special allocations to redevelop businesses affected by Covid-19. As happened with the Genting Highland company they had to invest with a large investment to redevelop the areas affected by Covid-19. The government should take swift action in helping this company, this is because Genting Highland is a large tourism center and has always been attention from tourists and investors from home and abroad. Therefore, the sensitivity of the government in helping tourism companies like Genting Highland is very important because this is the main attraction for tourists to our country.

Next, the proposed improvement to redevelop Genting Highland after the Covid-19 pandemic is to relax some of the regulations in Genting Highland such as the Covid-19 Regulations which are too strict and many result in tourists and customers in Genting Highland not having fun when doing activities because they are bound by various new regulations. Therefore, the Genting Highland side should also make an arbitration regarding the rules that have been made to ensure that the visitors feel more enjoyable when they are in Genting Highland.

CONCLUSION

Genting highland is the biggest attraction in attracting foreign tourists to come and travel to the country. However, since the outbreak of the covid-19 outbreak, the rate of operation and movement of Genting Highlands has declined and resulted in huge losses. In addition, the uncertain global economic problem is also the cause of the decline of the highland business itself. Nevertheless, planning and research has been done in redeveloping the economy and operating system affected by this epidemic. Various steps and efforts are being taken to redevelop the development in Genting Highlands in order to attract domestic and foreign tourists to visit Genting Highlands

ABSTRACT

Tourism is one of the important industries in the country's economic development and almost every year shows an increase in the number of tourists. This growth is attributable to several government initiatives, including the Year of Visit Malaysia campaign, the encouragement of investment incentives, and the improvement of infrastructure that supports the growth of the nation's tourism industry. Tourism has also been identified as the main driver of the service industry, and it has also been recognized as a growing industry in several countries, such as Malaysia, Thailand, Spain, Greece, etc., because each of these countries has a large contribution to exchange remuneration foreigners and job opportunities. In addition, considering that countries in every corner of the world are experiencing a major crisis which is the COVID-19 pandemic, the arrival of tourists is decreasing due to the Movement Control Order (MCO) that has been issued by YAB Prime Minister of Malaysia, Malaysia. Therefore, efforts to increase the number of tourist arrivals are important to create sustainable tourism that continues and continues to progress so that the country can be competitive and maintain its place in the eyes of the world as a country that is the main choice of tourist destination. A total of 384 respondents participated to answer all questions in this survey. The independent variable which is Word-Of-Mouth received the highest mean score of 4.04 in data analysis and finding, indicating that this is the most important factor.

Keywords: Tourism, Tourist, Word-Of-Mouth

INTRODUCTION

The United Nations World Tourism Organisation (UNWTO) has classified Malaysia as the 15th most tourist-friendly nation in the world (World Tourism Barometer, 2020). The State of Kelantan is no stranger to receiving visits from domestic and foreign tourists at any time, regardless of the school year or the holiday season, just like other states in Malaysia. In accordance with the vision and objective established by the state of Kelantan's tourism and

culture department, it is the goal of the Official Portal of the Kelantan State Government (2022) to make the state of Kelantan a successful tourist destination by concentrating particularly on cultural tourism. The primary goal of this study is to investigate the attitudes that affect travellers' intentions when selecting environmentally friendly local and international travel destinations, including environmental attitudes, motivation, destination image, and perception of quality through word of mouth (WOM). This study focuses on tourists visiting Kelantan, Malaysia, and seeks to understand how visitors move, their modes of travel, the services they use while travelling, and how these factors affect the tourist attractions, activities, and programmes. Several objectives of this study were established as follows:

1. To investigate the relationship between experience and tourist visitation in selecting sustainable tourism destinations in Kelantan.
2. To identify the relationship between destination image and tourist visitation in selecting sustainable tourism destinations in Kelantan.
3. To determine the relationship between Word-of-Mouth (WOM) and tourist visitation to in selecting sustainable tourism destination in Kelantan

SIGNIFICANCE OF THE STUDY

The goal of this research is to make the new information easier to understand and include important knowledge about some recent studies or theses, as well as related websites, to meet the predicted interest of the people who will read it. This study gives advantages and opportunities to tourists to refer material for them to choose the tourist destination they want to go to, as well as all tourism institutes in Malaysia.

This study also continues the continuation of previous studies by examining the causes that influence tourists to come and travel, especially around the Kelantan area. Tourists have the right to make decisions about their travel destinations. In fact, this research can help them determine whether the location can meet the goals of the Malaysian tourism industry. Tourism institutes in Malaysia can analyze the percentage of tourists arriving at certain locations and create better packages and activities. Therefore, the results of this study will help the concerned parties in improving the tourism industry. In fact, this study aims to support the government's policy to improve the development of tourists in the eyes of the world.

LITERATURE REVIEW

Tourist Visitation

Tourism is a social, cultural, and economic activity involving people moving to foreign countries for pleasure, business, or professional reasons. Research by Gitelson and Crompton (1984) found five reasons why tourists return to a new location: risk reduction, familiar faces, emotion, exploration, and sharing. First-time and returning visitors have different motivations and efforts. First-time visitors seek new culture, experiences, while returning visitors seek leisure activities or quality time with friends and family. Tourism involves considering destinations beyond one's intention, and consciousness is crucial for emergence of desires or goals. Woodside and Sherrell's study argues that being aware of a location is the first step in a visit. Research reveals motivation, destination perception, and consumer feedback are crucial factors in travel decisions, as different destinations offer unique experiences. Tourism is a profitable industry for a country's economy, influenced by efforts from related parties and residents. Improvements in the destination attract visitors, and a sustainable tourism image can generate word of mouth and viral buzz.

Experience

The term "tourist" originated in Stendhal's "Mémoires d'un touriste" in 1838. Early definitions defined tourists as temporary travellers from their homes or residences, spending money earned there. The UNWTO defined tourists as visitors in 1968. The tourism industry involves tourism, tourists, visitation, and experience, which are closely related. This study aims to explore the impact of experience on tourist visitation and sustainable tourism in Kelantan. Experience is a moment related to practical, intellectual, and adequate physical experiences that cannot be considered separate factors. It must be maintained and explained through mental construction. Recent philosophical phenomenology emphasizes that we are both subjects and subjects to experience. Experience surpasses cognitive construction, and an extraordinary learning experience may be more important than subject requirements. Experience is crucial for learning in science education, as adult students learn through their experiences. Homeostasis is closely tied to their experiences at the Science Centre. Involving children in science learning experiences can improve their skills and provide data. Analysing experience categories is crucial for addressing questions related to social theory, efforts, and the environment, providing

a holistic account of the relationship between individuals and the environment. A positive and unique customer experience can improve product and service quality, creating engagement between destinations and travellers. Traditional differentiation methods need to be engaged with the growing demand for experiential products that meet specific needs. A specific and relevant experience in the tourism industry can lead travellers to experience something different.

Destination Image

Destination image encompasses tourists' perceptions, thoughts, and beliefs about a location, emphasizing its distinctiveness and allure. Tourists base their decisions on the perceived quality of the place, influencing their travel plans and pleasure. Kelantan's attractive beaches, such as Irama Beach, Senok Beach, Mr. Amat Beach, Kemayang Beach, and Cahaya Bulan Beach, are crucial in the tourism industry. Academics define destination image as a tourist's expectations, perceptions, and feelings towards a location, assessing their psychological and feelings. It encompasses objective knowledge, impressions, prejudice, ideas, and feelings, and can be difficult to define accurately. Recent tourism marketing guidelines emphasize that a tourist destination's image is influenced by consumer rationality and emotionality, with perceptual and cognitive factors being the main components. Attractions and attractions, as well as tourists' motivations, significantly impact the emotional component of the destination image.

Word-of-Mouth

Word of Mouth Marketing (WOM) significantly influences consumer behaviour, with managers developing efficient marketing solutions. Travel businesses use website commenting systems to encourage consumers to share information on social media, helping tourism organizations attract travellers and offer memorable experiences. WOM can influence customer perceptions of quality, purchase intentions, expectations, and satisfaction, raising their worth and risk perceptions. As a result, tourism organizations can proceed with WOM development. The fall of word-of-mouth (WOM) is a social communication phenomenon that reduces information transmission from various sources, impacting consumer behaviour. Social media usage has led to an exponential rise in online information exchange and WOM. WOM is a crucial source of information for travellers when making decisions about destinations, as they rely on recommendations from friends and relatives. This shift in attitudes may shift customers' perception of WOM as non-commercial. The article highlights the importance of

World of Warcraft (WOM) in tourists' travel decisions, examining its role in moderating the relationship between perceived image and behavioural intention. WOM plays a crucial role in both promotion and suppression mechanisms, acting as a moderating variable. The research highlights trends for long-term growth in marketing initiatives in tourist destinations and adds to the WOM theory. Kelantan, a region with undiscovered natural beauty and a rich culture, is often mentioned as a destination with reduced prices and tax-free goods.

Research Hypothesis

The hypothesis in the study is to find out whether there are any correlations or relationship between dependent variables and independent variables:

H1: There is a significant relationship between destination image and tourist visitation.

among tourists.

H2: There is a significant relationship between word-of-mouth and tourist visitation among

tourists.

H3: There is a significant relationship between experience and tourist visitation among

tourists.

Research Framework

Table: Relationship between independent variables and dependent variables of tourist visitation in Kelantan.

METHODOLOGY

Research Design

This project publishes a set of questions on Google Forms to collect data using quantitative methods through statistics and large-scale survey research. Respondents were collected using a questionnaire. Using a 5-point Likert scale (1=strongly disagree and 5=strongly agree), the questionnaire was created about the experience, destination image, and word-of-mouth as a factor in the arrival of tourists travelling to Kelantan.

A hypothesis test study is the type of research design employed in this investigation. We picked hypothesis testing because it allows us to investigate the causal link between the independent and dependent variables using sample data. The connection between both dependent and independent factors is examined in this study. The experience destination image, and word-of-mouth are independent variables, while the dependent variable Is factors impacting traveller visit among travellers a Kelantan case study. This study is cross-sectional because data was only gathered once over several months. Since the target respondents for this study are tourists, the unit of analysis is one individual.

Data Collection

In this study, data was collected using primary data. The tool we use in our research is a questionnaire in a Google form that we will ask respondents to answer. The questionnaire was used to collect information on factors that influence tourist visit among tourists a case study in Kelantan, Malaysia. The questionnaire has been distributed online and we will collect data from tourists who visit the state of Kelantan to make this data collection process successful. This is because tourists travelling in Kelantan are our sample size in this study.

In the first stage, this study carried out a pilot study in which 30 respondents participated in a survey. Next, the study conducted a field study were based on the required sample size, 384 tourists participated in this survey.

Sampling

The researchers decided on non-probability sampling for this investigation. Convenience sampling is the sample technique that has been selected. Convenience sampling was selected for this study because it is simple, reasonably priced, and appropriate for this study. The researchers calculated the sample size using Krejcie and Morgan's (1970) equation to acquire a valid and trustworthy sample for this investigation. According to a table by Krejcie and Morgan (1970), the significant sample size that is suited for this research is 384 since tourist arrivals are more than that ($N > 100\,000$).

Data Analysis

This study used three different forms of data analysis: reliability tests, descriptive analysis, and Pearson's correlation. The Statistical Package for the Social Sciences (SPSS) was used to analyze the data acquired in order to demonstrate the links between the dependent variable and the independent variables as a collection of statistical processes roughly approximated by regression analysis.

FINDINGS

Table 1: Findings For the factors affecting tourist visits among tourists in Kelantan, Malaysia.

Demographic	Category	Frequency(N)	Percentage(%)
Gender	Female	260	59,5
	Male	124	28.4
Age	18-22 years old	83	19.0
	23-27 years old	243	55.6
	28-32 years old	38	8.7
	33-40 years old	11	2.5
	41 years old	9	2.1
Marital Status	Single	341	78.0
	Married	43	9.8

Table 1 shows 384 respondent profiles, and most respondents are female (59.5% compared to 28.4% male). Following that, for respondents, who make up 55.6% of the sample and are primarily between the ages of 23 and 27, The respondent age with the lowest frequency is 41 years old (2.1%). Regarding race, Malay respondents make up the majority (65.9%). The least frequent category, with a frequency of 5.9%, is other people's race. In contrast, just 9.8% of respondents are married, making being single the most common marital status among respondents (78.0%). As a result, the data provides an accurate reflection of the demographic parameters that actually affect tourists' preferences for Kelantan vacation spots.

Analysis for Factor Influencing Descriptive analysis of the factors affecting tourist visits among tourists in Kelantan, Malaysia.

Table 2: Descriptive analysis of the factors affecting tourist visits among tourists in Kelantan, Malaysia

Variables (Experience)	N	Mean	Standard Deviation
I choose to relax and rest while travelling.	384	3.82	1.055
I choose the destination as a stress-relieving and physical,mental fatigue relieving goal.	384	3.91	1.062
I choose that destination because it can help me from spending over a limited budget	384	3.92	.987
I choose the destination as it is influenced by beautiful and cultural values.	384	3.78	1.058
I travel because the destination has beneficial from my mental health.	384	4.01	.927
I travel because I want to visit new place.	384	4.05	.926
I travel to get new knowledge about history,culture and unique that place	384	4.04	.904
I travel because i want to spend time with my family and my friends to keep in touch with them	384	3.93	1.039
I travel because I want to increase my communication skills and social skills.	384	3.91	.943
I travel because I want to make new friends and followers.	384	3.69	1.016

Variables (Destination Image)	N	Mean	Standard Deviation
The destination has good quality infrastructure.	384	3.93	.933
The place is a beautiful and natural destination.	384	3.84	1.086
Destination is safe.	384	4.13	.920
Destination have a good board for tourist information.	384	4.05	.926
Tourist enjoyable travel destinations.	384	4.22	.884
I believe Kelantan has a strong cultural heritage.	384	4.10	.871
I believe that kelantan has high-quality accommodations for visitors.	384	4.05	.894
Kelantan is a popular destination for adventure tourism.	384	4.00	0.948
Kelantan is known for its food and drink offerings.	384	4.03	.944
Kelantan is a good destination for family-friendly vacations.	384	4.03	.932

Variables (Word-of-Mouth)	N	Mean	Standard Deviation
I often consult other tourists' online travel reviews to help choose an attractive destination.	384	4.07	.941
I frequently gather information from tourists' online travel reviews before I travel to a certain destination	384	3.82	1.065
If I don't read tourists' online travel reviews when I travel to a destination, I worry about my decisions.	384	3.77	1.051
When I travel to a destination, tourists' online travel reviews make me confident in traveling to the destination	384	3.93	1.079
I often consult other tourists' online travel reviews to make sure I choose the right destination	384	3.98	.971
When I would travel to Kelantan, I would feel secure in following the suggestions made by the travelers or friends.	384	3.81	1.060
When I would travel to Kelantan, I would rely on the recommendations made by the travelers or friends.	384	3.84	1.054
The word of mouth from friends and family influenced me to go to Kelantan.	384	3.99	.980
Social media has influenced me to go to Kelantan.	384	3.98	1.090

Variables (Tourist Visitation)	N	Mean	Standard Deviation
I will recommend coming to Kelantan.	384	4.05	.850
I will come again to Kelantan.	384	3.98	.979
I am satisfied with the facilities provided in Kelantan	384	4.01	.942
Kelantan is on my budget travel list..	384	3.99	.923
Kelantanese people are friendly.	384	4.06	.933
I know Kelantan have a lot of mosques.	384	4.18	.907
I will invite others to visit Kelantan	384	3.69	1.134

Variables (Factor Influencing Tourist Visit Kelantan, Malaysia)	N	Mean	Standard Deviation
Experience	384	0.54	.737
Destination Image	384	0.55	.631
Word-of-Mouth	384	0.47	.671
Tourist Visitation	384	3.99	.673

Table 2 shows the mean and standard deviation of dependent variable and independent variable in this study. The highest mean value in dependent variable was obtained by Question 6 with 4.18 (SD = .907) where the respondents agreed that they have preference to love Kelantan because have a lot of mosques. Meanwhile, Question 7 has the lowest mean value with 3.69 (SD = 1.134) which means the respondents have preference to visit Kelantan after invite others to visit Kelantan. Independent variable for experience had the highest mean value that belongs to Question 5 with 4.05 (SD = .926) which means that the respondents agreed to visit the new place. After that, the lowest mean value was obtained by Question 10 with (SD = 1.016) where the respondents agreed that they want to visit because they want to get new friends and followers. Question 5 had the highest mean value for the independent variable destination image factor, with 4.22 (SD = 0.884, indicating that respondents believe that tourists enjoy travel destinations. Question 2 has the lowest mean value of 3.84 (SD = 1.086) meaning that the respondents agreed that the place beautiful and natural destination will maketourist revisit to Kelantan. The highest mean value for independent variable word-of-mouth isQuestion 1 with 4.07 (SD = .941, meaning that respondents agree with the statement that theyoften get consult other tourists' online travel review to help their to choose an attractive destination. Question 3 has the lowest mean score of 3.77 (SD = 1.051, showing that If they don't read tourists' online travel reviews when they travel to a destination, they can make mistakes about their decisions. The highest independent variable for the factor influencing tourist visit Kelantan is destination image with mean 0.55 (SD=0.631) , secondly is experiencewith mean 0.54 (SD=0.737) and lastly is word-of-mouth with mean 0.47 (SD=671).Not but least is mean for dependent variable for tourist visitation is 3.99 (SD=0.673)

Relationship between Experience, Destination Image and Word-Of-Mouth towards Factors Influencing Tourist Visits among Tourists in Kelantan, Malaysia.

Table 3: Pearson's Correlation between experience, destination image and word-of-mouth towards factors influencing tourist visits among tourists in Kelantan, Malaysia.

		Factors Influencing tourists visits among Tourists in Kelantan, Malaysia
Experience	Pearson correlation	0.541
	Sig. (2-tailed)	.000
	N	384
Destination Image	Pearson correlation	0.551
	Sig. (2-tailed)	.000
	N	384
Word-of-Mouth	Pearson correlation	0.474
	Sig. (2-tailed)	.000
	N	384

The result in Table 3 indicates that experience and factors influencing tourists visits among tourists in Kelantan .541 indicated moderately positive correlation. Next is detination image and factors influencing tourist visits among tourists showed .511 indicating moderately positive correlation. Followed by word-of-mouth and factors influencing tourist visits among tourists with 0.474 indicated the weakly positive correlation. Therefore, all the two variables positively correlated with factors influencing tourist visits among tourists and the relationship is significant ($p < 0.05$) meanwhile one variable weakly positive correlated with factors influencing tourist visits among tourists and the relationship is significant ($p < 0.05$)

H1: There is a significant relationship between experience and tourist visitation among tourists.

These domestic prior tourists might think about making a second trip to enjoy attractions or activities that they missed on their first trip or to relive their previous trip. If the guests like the place, they might come three or even more times.

H2: There is a significant relationship between destination image and tourist visitation among tourists.

(Lawson and Baud Bovy, 1977) 'the expression of all objective knowledge, impressions, prejudice, ideas, and emotional feelings an individual or group may have about a given place' is how one may define a destination image

H3: There is a significant relationship between destination image and tourist visitation among tourists.

WOM because this factor has the potential to mediate and moderate and is an essential moderating variable in the tourism industry and a key promotional tool.

DISCUSSION AND RECOMMENDATION

This discussion aims to address the research question and hypothesis put forth in the preceding chapter, which serves as the initial chapter in this report. The primary focus of this study has been to thoroughly investigate the various factors that can potentially impact tourist visitation to Kelantan. Drawing upon the study's findings, several recommendations have been formulated for future researchers or for ourselves as researchers to enhance future studies.

In this study, the researcher obtained a sample size of 384 from tourists who have visited Kelantan. The determination of this sample size was based on the Krejcie and Morgan table (1970), considering the total number of tourists who visited Kelantan in 2021, which was 1,921,000 individuals. The purpose of using sample size is ensures that research resources are use efficiently and ethically and it will be evaluated based on the quality of the resulting estimate. However, if this study is conducted in the future, the researcher may choose a smaller population size based on the suitability of the study to reduce the number of sample sizes to be examined.

Furthermore, the researcher should make appropriate adjustments or scheduling to obtain the predetermined sample size of 384 individuals based on the study population. This is because the time constraint faced by the researcher in recruiting respondents for this study has resulted in insufficient time to complete the report. Additionally, some of the visitors did not have time to respond to the questionnaire provided on the online platform, namely Google Form. Therefore, it is recommended that future studies, whether conducted by us or other researchers, allocate time effectively to avoid time constraints or insufficient time for other tasks.

The research that we are doing uses quantitative methods, which aim to produce the best research. However, if this study is conducted in the future, the researcher will likely use qualitative methods for the information search process. This is because this qualitative method is quite different from the method used by researchers now, which is quantitative. The purpose of using qualitative methods in future studies is that it is possible to obtain different information and results. With that, the researchers can also determine and learn the differences likely to be found in the study using the qualitative method. For example, using this quantitative method, the researcher will likely not get data from specific information. However, using qualitative methods makes it more likely to get accurate data as a result of the research that has been conducted.

CONCLUSION

In conclusion, the purpose of this study was to identify the factors that can impact tourist visitation to Kelantan. Three independent variables, namely Destination Image, Experience, and Word-Of-Mouth, were selected to investigate their relationship with the dependent variable, which is the number of tourist visitation to Kelantan. A total of 384 respondents aged 18 years and above, who were tourists visiting Kelantan, were randomly selected to investigate the factors influencing their decision to visit the Kelantan.

ABSTRACT

Kota Bharu, Kelantan offers a unique blend of culture, traditions, history, and natural beauty which serves as a major attraction for tourists; hence, the purpose of this research is to examine the relationship of tourism development in Kota Bharu, Kelantan with 3 aspects which is food image, destination image and islamic value. This research used a quantitative method and random sampling technique to collect data and involved the distribution of a total of 384 respondents among local tourists in Kelantan and people who visit Kelantan through an online survey which is a questionnaire. Data from the questionnaire were analysed using Statistical Package for Social Science (SPSS) to generate the quantitative result. Based on the finding, food image, destination image and islamic value are proven to be positively correlated to the factor influencing the tourism development in Kota Bharu, Kelantan. This research offers knowledge that might help the tourism development in Kelantan grow exponentially.

Keywords: food image, islamic value, destination image, tourism development

INTRODUCTION

The largest and the most important industry in the world nowadays is tourism. the industry has been acknowledged as one of the most significant service sectors in the world (Schumcher, 2007). many government goals might include tourism on the social, environment , and economic level. according to the World Tourism Organization (UNWTO, 2008), tourism also refer to leisure pursuits, theory and application, product commercial activities and tourist sites.

SIGNIFICANCE OF THE STUDY

In this section will be explained the significance of the study for the development of tourism in Kota Bharu, kelantan. The important in this study is the influencing Kelantan's tourism development. This study will assist the travel and tourism industry from practical point because there will be many tourists from abroad and locals who visit Kelantan, especially for the economy of the state of Kelantan. This research work will find out the challenges of sustainable development tourism in

Kelantan. This research will also find out the suggestions and guidelines that will help the policy and strategy determine what is negative and positive in Kelantan.

Food image

According to (Huang, 2009) to get better understand the benefit of food image in destination marketing, it was necessary to identify the basic dimensions and component of food images.

Destination image

In the study, the destination image was split into the cognitive image of the emotional image, was defined as the overall impression of the tourist destination. The image of the destination may be thought of as a pull factor that influenced travels decisions to visit or keep away the location (Gartner, 1994).

Islamic value

It stands for moral principles that are often regarded as having high standards. It also represents environment protection and respect for the local customs and beliefs. It stands for a fresh perspective on the world and society. In a time when consumerism is rampant and everything is accessible for use and abuse in the most selfish ways, it restores morals to the forefront of society.

LITERATURE REVIEW

I. Tourism Development

Tourism development is described as the creation and implementation of strategies, infrastructure upgrades or other efforts judged appropriate by the council with the intention of boosting a destination's appeal and attracting more tourists. Individual's well-being and host countries' incomes can both grow with tourism expansion (Ahn et al., 2002). The use for tourism development is frequently criticized. One of these criticisms is that "to anything which is not mass tourism" is commonly used to refer to alternative or sustainable kinds of travel (Harrison, 2015). In reality, alternative tourism is frequently criticized for being too small-scale, encouraging feigned participation rather than genuine engagement, and escalating local inequality (Goodwin, 2009). The development in Kelantan is getting more and more rapid with the development of various industries, including food, tourism, and Islamic value, which will further boost the development of the state of Kelantan. The development in Kota Bharu

has shown its development in terms of food image, with more and more restaurants, cafes, and opening kiosks, which will further increase the number of tourists coming to Kota Bharu (Pratt, 2018).

II. Food Image

Food is essential when traveling, but the food of a destination can also be an attraction (Stone & Migacz, 2016). Food is the network between tourism and destinations, as delicious food is a useful aspect of destinations (Horng & Tsai, 2012) and plays an important role in promoting and regular destinations (Horng & Tsai, 2010). Tourism in Malaysia is developing, with more and more tourists visiting the country. Food image are the most important factors shaping a visitor's understanding and influencing choice of tourist destinations (Long, 2004). Food image is a main factor in the tourism development of Kota Bharu, Kelantan. According to (Huang, 2009) to more appropriate understand the use of food image in tourism development in Kota Bharu, the basic dimensions and components of food image should be identified. According to (Syahida & Zainal, 2014), Kelantan is known as the Cradle of Malay Culture and is famous for its unique cultural heritage, natural surroundings and the exclusive hospitality of the locals, including unique food, which has influenced the tourism development of Kota Bharu.

III. Destination Image

The knowledge of an individual's or group's ideal, print, prejudice, imagination, and emotional thinking about a certain location is included in their destination image (Y. Li, Xu, Song, & He, 2020). In reality, the destination image is supposedly important and useful in the decision-making process of travelers (Bruwer, Pratt, Saliba, & Hirche, 2017). It is thought that the more pleasant an image is, the more likely it is that the location will be taken into account and ultimately chosen (Baloglu & McCleary, 1999). This presumption prompts study and calls for a concentrated effort to increase a destination's allure, cultivating and maintaining a positive reputation as a means of distinction from competing locations and therefore providing a possible competitive advantage (James, Durand & Dreves, 1976). To put it another way, Hanan & Aminudin (2012) claimed that the belief, thoughts, and writing of tourists and callers together can influence tourists' perceptions of a destination. The top tourist attractions in

Kelantan are Pantai Cahaya Bulan, Pantai Irama, Pasar Siti Khadijah, the Gelanggang Seni Cultural Center, Muzium Islam, and many more.

IV. Islamic Value

Islamic tourism refers to any activity, event, relaxation, or experience brought out within an environment where they teachings are in harmonious relationship with the purpose of having experienced one's own experience in Islamic life by implementing architectural and religious activities, design attractions, and Islamic history (Islamic Tourism Center, 2009). In Malaysia, tourism based on Islamic history and beliefs has existed since long periods of time, when Islam originally started to expand, and it has the opportunity to attract more tourists, whether they are Muslims or not (Hanim, 2016). Islamic values might be one of the factors in developments in Kota Bharu, Kelantan since it is known as “Kota Serambi Mekah” (Daud, 2002). According by Hashim et al. (2007), muslim prayer times are only available on the Kelantan State homepage. and none of the other home pages provide information on halal regional food or Muslim instruction or customs for people who aren't Muslims. Fatima, Naeem, & Rasool (2016) in their study on the perception of individuals or local tourists with regard to religious tourism measured the safety and security dimension.

Research Hypothesis

The research's hypothesis is formed based on the study's variables, such as food image, destination image, and Islamic value, that affect tourism development in Kota Bharu, Kelantan. The following hypothesis was developed and was to be evaluated based on the study:

H1: There is a positive relationship between food image and tourism development in Kota Bharu, Kelantan.

H2: There is a positive relationship between destination image and tourism development in Kota Bharu, Kelantan.

H3: There is a positive relationship between islamic value and tourism development in Kota Bharu, Kelantan.

Research Framework

The dependent variables and independent variables of this study are shown in Figure 1. The elements that influence the development of tourism in Kota Bharu, Kelantan, are known as independent variables which are food image, destination image, and islamic value. However, the dependent variable is tourism development. This figure shows the relationship between food image, destination image, and islamic value, and tourism development.

Figure 1: Conceptual framework

METHODOLOGY

Research Design

This study employed a quantitative research design using cross sectional survey. The design of quantitative analysis using figures and numbers to illustrate and adapt relationships among variables and their outcomes (Kumar, 2013). An online questionnaire that was distributed to the respondents was the tool used to obtain the data for the purpose of this study. This study used random sampling in order to gather and analyse participant data.

Data Collection

The researcher was authorised to reach respondents using Google Forms in order to distribute the questionnaire effectively. The questionnaire is divided into three sections: Parts A, B, and C. Respondents must complete the first section of the survey by providing their demographic data. The independent variables - food images, destination images, and Islamic values in Kelantan are then discussed in the next section. The final section will inquire and assess the respondent's opinion of the dependent variable, which is the development of tourism in Kota Bharu, Kelantan. Particularly those who were in or had travelled to Kelantan were among the criteria used to choose the sample.

Sampling

The major objective of the random sample is to identify the factors (Food images, Destination images and Islamic values) that travel reasons are most closely related to in Kota Bharu, Kelantan. Those who have visited Kelantan serve as the analysis's subject matter. A total of 384 respondents could be employed in this study due to the usage of an online questionnaire that was distributed to a large number of people.

Data Analysis

Descriptive analysis, reliability, and correlation were the three methods of data analysis used in this study. Statistical Package for the Social Sciences (SPSS) was used to analyse the collected data. Finding out how frequently respondents select the same response is a procedure called descriptive analysis. Data from the analysis, including demographic information on the respondents, frequency distribution, etc., are all provided. The purpose of the reliability test is to make sure that the distributed questionnaire is capable of measuring the variables outlined in this study, namely food images, destination images, Islamic values, and the growth of tourism in Kota Bharu, Kelantan. It is measured

to ascertain the relevance and dependability of each item for each variable in the questionnaire. Meanwhile, correlation analysis is a statistical tool used in research to determine the relationship between two variables or data sets, as well as to investigate the strength of the relationship.

FINDINGS

Demographic Profile of Respondents

Table 2: Demographic Profile of Sample

Characteristics			%
Age	18-23 years old	170	44.3
	24-29 years old	138	35.9
	30-36 years old	52	13.5
	37-42	12	3.1
	43 years old	12	3.1
Gender	Male	118	30.7
	Female	266	69.3
Race	Malay	280	72.9
	Chinese	50	13.0
	Indian	37	9.6
	Others	17	4.4
Education Background	Secondary / Primary school	38	9.9
	Certificate / Diploma	98	25.5
	Bachelor Degree	243	63.3
	Master Degree / PHD	5	1.3
Employment Status	Self-employed	50	13.0
	Government Worker	33	8.6
	Private Sector Worker	54	14.1
	Student	244	63.5
	Retired	3	0.8

Table 2 presents an overview of the responder profile. The age group from 18 to 23 years old had the highest percentage of responders (44.3%), followed by the age group from 24 to 29 years old (35.9%),

the age group from 30 to 36 years old (13.5%), and the age group from 37 to 42 years and 43 years old (3.1%). Male respondents made up 118 of the total respondents, while female respondents made up 266. 384 people replied to the survey, including 280 Malay, 50 Chinese, 37 Indian, and 17 others. Malay respondents made up the majority of the sample (72.9%), followed by Chinese respondents (13.0%), Indian respondents (9.6%), and other respondents (4.4%).

The majority of respondents, at 63.3% (243 respondents), were students. 25.5% (98 respondents) of the respondents were certificate/diploma, 9.9% (38 respondents) was secondary/primary school and lastly. 1.3%(5 respondents) was master degree/PHD.

In addition, there were 244 respondents who was student. 13.0% (50 respondents) who was work as self-employed. 14.1% (54 respondents) as private sector worker. 8.6% (33 respondents) as government worker. Lastly, 0.8% (3 respondents) are retired.

Reliability Test

A reliability system is employed to evaluate a system's overall performance and stability over a specific time period and in various testing scenarios.

Table 3: Results of Reliability Test

Variable	Number of items	Cronbach's Alpha coefficient	Strength of Association
Food Image	7	0.896	Very Good
Destination Image	7	0.843	Very Good
Islamic Value	7	0.908	Excellent
Tourism Development	7	0.909	Excellent

Table 3. showed the overall value of Cronbach's Alpha Coefficient for the independent and dependent variables in this study. From the table, we can conclude all the variables were above the value 0.6. therefore, the result shown was reliable and it can be accepted in this study.

There were seven question were used in measuring the food image variable that influenced tourism development in Kelantan. Table 4. showed that Cronbach's Alpha result for this section's requirement in food image variable was reliable.

Next, there had seven questions in measuring the destination image variable that influenced tourism development in Kelantan. The result Cronbach's Alpha coefficient that showed in this section is 0.843 which indicated very good. Thus, the coefficient obtained for the questions in the destination image variable were reliable.

Furthermore, in measuring the Islamic value variable that influenced tourism development in Kelantan, seven question were used. The Cronbach's Alpha result for this section's question was 0.908 which resulted in excellent. Therefore, the coefficient obtained for the questions in the Islamic value variable were reliable.

Lastly, in measuring the tourism development in Kelantan, seven question were used. The Cronbach's Alpha result for this section's question was 0.909 which resulted in excellent. Therefore, the coefficient obtained for the questions in the measuring the tourism development in Kelantan were also reliable.

Descriptive Analysis

Descriptive analysis was conducted based on the data collected from the 384 respondents on section B, and C of questionnaire.

Table : 4 Descriptive Statistics

Variable	N	Mean	Standard Deviation
Food Image	384	4.2879	.60635
Destination Image	384	4.1183	.60682
Islamic Value	384	4.2835	.59167
Tourism Development	384	4.1637	.62844

Table 4 shows the mean and standard deviation analysis for the independent and dependent variables. The dependent variable was Tourism Development in Kota Bharu, Kelantan. Food Image, Destination Image, and Islamic Value were independent variables. Food Image had the highest mean score, 4.2879, indicating that respondents were more in agreement with this characteristic. The variable with the lowest mean value in this study's respondents' agreement was Destination Image, which has a value of just 4.1183. The data set that has more dispensing values has a standard deviation of more than 0 out of 384 respondents.

Pearson Correlation

Pearson's correlation analysis was one of the most significant analyses that looked at the linear relationship between the two variables. This study's objective was to determine whether there were any correlations between the dependent variable which is Tourism Development in Kota Bharu, Kelantan and the independent variables which are Food Image, Destination Image, and Islamic Value. The researchers must decide what level of association strength is appropriate if the relationship is significant.

Hypothesis 1

H₁: There was a significant relationship between food image with tourism development in Kota Bharu, Kelantan.

Table 5: Correlation coefficient for Food Image and Tourism Development in Kota Bharu, Kelantan.

		Tourism Development	Food Image
Tourism Development	Pearson Correlation	1	.704**
	Sig. (2-tailed)		.000
	N	384	384
Food Image	Pearson Correlation	.704**	1
	Sig. (2-tailed)	.000	
	N	384	384

Table 5 showed the 384 examples, the significant value, and the Pearson correlation coefficient. The p-value was less than 0.01 and below the threshold of significance of 0.01. A strong positive association between a food image and tourism development may be seen in the correlation coefficient of 0.704.

Hypothesis 2

H₂: There was a significant relationship between destination image with tourism development in Kota Bharu, Kelantan.

Table 6: Correlation coefficient for Destination Image and Tourism Development in Kota Bharu, Kelantan.

		Tourism Development	Destination Image
Tourism Development	Pearson Correlation	1	.750**
	Sig. (2-tailed)		.000
	N	384	384
Destination Image	Pearson Correlation	.750**	1
	Sig. (2-tailed)	.000	
	N	384	384

Table 6 shows that there is a correlation between destination image and tourism development in Kota Bharu, with a correlation value of 0.750. This suggests that the relationship between destination image and tourism development is strong and significantly connected among tourists visiting Kota Bharu, Kelantan. Tourism development has a significant value of 0.000, which is less than a significant level

of 0.01. Hence, there is a significant relationship between tourism development and destination image. Hence, H2 is supported.

Hypothesis 3

H₃: There was a significant relationship between Islamic value with tourism development in Kota Bharu, Kelantan.

Table 7: Correlation coefficient for Islamic Value and Tourism Development in Kota Bharu, Kelantan.

		Tourism Development	Islamic Value
Tourism Development	Pearson Correlation	1	.736**
	Sig. (2-tailed)		.000
	N	384	384
Islamic Value	Pearson Correlation	.736**	1
	Sig. (2-tailed)	.000	
	N	384	384

Table 7 showed the 384 examples, the significant value, and the Pearson correlation coefficient. The p-value was less than the significant level of 0.01 at 0.01, or 0.01. Islamic Value and Tourism Development were strongly positively correlated, according to the correlation coefficient of 0.736.

Table 8: Summary of Correlation Analysis

Hypothesis	Significant Value	Conclusion	Correlation Value	Conclusion
1	0.000	Accepted	0.704	High Positive Correlation
2	0.000	Accepted	0.750	High Positive Correlation
3	0.000	Accepted	0.736	High Positive Correlation

To ascertain the linear relationship between the two variables listed as the study's goals, researchers performed correlation analysis. The findings of the correlation analysis are presented in Table 8, which showed a very strong correlation between the Food Image, Destination Image, Islamic Value and Tourism Development in Kota Bharu, Kelantan.

DISCUSSION AND RECOMMENDATION

The purpose of the study was to ascertain the connection between Food Image, Destination Image, Islamic Value and Tourism development in Kota Bharu, Kelantan . The goal of this study is to understand the connection between Food Image, Destination Image, Islamic Value and Tourism development in Kota Bharu, Kelantan. Based on the findings of the study, there are some recommendations for tourism marketers as well as future researchers to improve the future study.

Kelantan has much to offer in terms of arts, culture and heritage tourism, ecotourism as well as cross border tourism. By providing a variety of 'Experiential Tourism' options, Kelantan may be able to entice a greater number of visitors, particularly those from other countries. The cultural traditions, legacy, and unique values that are practiced by the inhabitants of Kelantan are coupled with the natural riches of the region. To maintain the tourism at Kota Bharu Kelantan, the management of Kelantan's tourism industry must be aware of these features and behaviours.

Next, for future research. This research does make use of quantitative approaches for the goal of conducting better research. However, in the future, researchers may employ qualitative approaches to find information since qualitative methods take a different approach and can provide different information than quantitative methods. This is because qualitative methods use different methodologies. When compared to the methods that have come before, the results of the current study should be compared to those of the older studies to see whether there are any significant differences.

For instance, when researchers use a quantitative method, they might not acquire particular data, whereas when researchers use a qualitative method, they are more likely to receive correct data.

CONCLUSION

This study examines the tourism development in Kota Bharu, Kelantan, especially Malaysians who have traveled to Kelantan. Based on the findings of the study, the independent variables of Food images, Destination images and Islamic values were found to influence the dependent variable which is the development of tourism in Kota Bharu, Kelantan with a positive correlation between the variables. Objectives and research questions have also been achieved and answered. Limitations such as technical, methodological and other related problems have been identified and some recommendations have been prepared to improve future research, such as by considering other variables and sampling methods. Overall, the researcher has successfully proven the efficiency of the study regarding the factors tourism development in Kota Bharu, Kelantan.

ABSTRACT

The purpose of this research is to investigate the impact of smart tourism applications on perceived destination image in Kelantan. The purpose of this research was to investigate the relationship between smart information systems, smart sightseeing, smart ecommerce, and smart forecasting and perceived destination image. A questionnaire was used as the quantitative method. A total of 384 Gen Z tourists were chosen as respondents. The study's findings indicate a significant relationship between smart information systems, smart sightseeing, e-commerce, and smart forecasting, as well as the influence of smart tourism applications. Smart information systems and e-commerce systems are positively affected in information search, while smart sightseeing and smart forecasting are positively affected in e-recommendations.

Keywords: Smart Tourism Application, Gen Z, and Destination Image.

INTRODUCTION

Tourism was defined as leisure, relaxation, entertainment, recreation, and hospitality (Morley,1990). According to Wild (2014), tourism is defined as a business enterprise that operates holidays and visits to famous and interesting destinations.

According to (Li, Hu, Huang, & Duan, 2017), Both the terms "smart tourism" and "smart destination" refer to a comprehensive tour information service provided to visitors while they are visiting a particular location using cutting-edge information and communication technologies (ICT). Many vacation spots have recently made an effort to accept this "smart" notion since it provides intelligent travel destinations with an advantage over competition over other tourist destinations based on the originality and distinctiveness of their product and service offerings.

According to the concept of intelligent tourism, this research was defined smart tourism application as a use of using technology in travel connected activities to improve visitors' tourism experiences in a certain places. Tourism or travel technology can improve travellers' experiences while also promoting tourism activities and interactions among tourism. Smart tourism has three major advantages which are economic, environmental, and socio-cultural. The economic advantages of smart tourism result from an injection of revenue into a destination's infrastructure. Smart tourist destinations typically include self-sufficiency systems, while the socio-cultural aspect refers to the indirect hedonic value created by smart or intelligent tourism initiatives.

There are four objectives in this research:

1. To study a smart information system application can improve how tourist perceive a destination image.
2. To identify the efficient e-commerce system apps can improve how tourists' perceived A destination image.
3. To study the useful smart sightseeing applications can improve how tourists' perceived A destination image
4. To study the efficient smart forecasting application can improve how tourists' perceived a destination image.

SIGNIFICANCE OF THE STUDY

i. To the Academic Field

It refers to the contribution and impact of research on a research field. The benefits of this study for future researchers, they can generate and develop more ideas and knowledge based on the issue. As information technology advances, the travel experience of future researchers improves, and their awareness or perception of their place image improves, which encourages their purpose to suggest that place or destination.

ii. Practical

This research was carried out in order to learn more about Kelantan as a tourist destination in Malaysia. This discovery will provide a better understanding of Kelantan's history, famous places in Kelantan, and the culture of the Kelantan community. This research will also provide information to tourism agencies and the Kelantan government about the influence of smart tourism applications on the perception of Kelantan's destination image, as well as the extent to which they are influenced by smart tourism applications in Kelantan.

LITERATURE REVIEW

Smart information system

The words of "Smart Information Systems" refers to the interaction of cutting-edge technological tools and frameworks that combine Artificial Intelligence with Big Data to analyses, characterize, and predict information and the word of 'Smart Information Systems' also referring to the distribution of free Wireless Networking, barcode scanners and smartphone applications based on. In this case, the use of smart devices in the tourism sector is expanding, which maximizes the value of the industry's resources and generates significant social and economic benefits. Wearable and portable devices, such as smartphones, smart glasses, and smart watches, are examples of smart devices. Furthermore, the entire tourism industry makes use of smart devices, such as self-service kiosks for hotel check-in, flight check-in kiosks at airports, self-service ticket machines, and tour guide systems at tourist attractions. Tourists can receive services that are both convenient and effective by using these smart devices.

Smart sightseeing

Using e-tour maps, e-guides, and recommendation services to promote a positive image of the destination is an example of smart sightseeing. So, considering tourists, intelligent sightseeing is important since it may help tourists in making their journey easier whether looking for a tourist attraction or shopping mall. One of the facilities that helps travellers is the availability of e-tourism maps, e-guides, and e-directions.

E-commerce system

An e-commerce system is a piece of software that makes it possible to conduct business by buying and selling things online. In conclusion, customers need the ability to search for a particular product on an e-commerce platform, manage their shopping cart, and make payments. In the international travel and tourism sector, e-commerce systems are creating new business opportunities when the world opens with internet technology or online systems for the tourism industry. It helps in taking advantage of the potential market that e-commerce has created, travel-related organizations and internet businesses are collaborating.

Smart forecasting

Intelligent forecasting platform (IFP) is a cutting-edge big data AI-based analytics platform designed to process unbounded time series data volumes with cutting-edge algorithmic capacity. It enables organizations to make data-driven strategic and operational decisions by automating prediction model lifecycle processes, while also streamlining planning and reducing uncertainty. Forecasting is critical because tourist flow and queueing time affect many tourists. Accurate time forecasting and arrangement encourages travellers to participation and visiting attractions in travel activities.

Perceived destination image

Destination image consists of cognitive (belief and understanding about the location), efficiency (emotions toward a place), and cognitive constructs (visitors act according to cognitive and emotional elements). However, some places are unable to use smart destination positioning for smart tourism due to limitations in information digital, staff, time and money. It is difficult to replicate the concept of location as a wise choice in the latter scenario. As a result, both directly and indirectly, destination values may attract the process of co-creation with customers.

Relationship between independent variable and dependent variable.

Relationship smart information systems and perceived destination image.

The efficiency of Qr codes and Wi-Fi for smart information systems increases the perceived favourability of an intelligent place or destination. For tourists who are traveling and looking for information, having access to the internet is essential. In many public spaces including buses, lobbies of hotels, and neighbourhood stalls, visitors can use their smartphones to connect to free Wi-Fi. To make it simple for tourists to visit their website and get information, many tourism businesses offer a Qr code.

Relationship smart sightseeing and perceived destination image.

Tourists must be given accurate smart sightseeing information. Tourists may prepare for their trip experience by having complete and accurate information about e maps, and recommended e tours. It is advised to provide clear information that is simple to comprehend and use. Offering tourists choices might provide them time flexibility, such as e-travel guides that compare the time and expense of traveling to various locations. Destination information may improve resource efficiency, lessen traffic congestion and wait times for tourists, and encourage interaction between tourists and local communities. The degree of intelligence of the online information and the data sources used by travel agencies and destination management institutions s offer can have an impact on how much time tourists spend searching for information. According to li et al. In 2009, when it relates to smart sightseeing, visitors with low information search frequency have a more advantageous impact on the perceived destination image than visitors with high information search frequency

Relationship e-commerce systems and perceived destination image.

E-commerce systems could significantly improve people's perception of destination image. In giving visitors a smooth online experience, high-quality, secure e-commerce platforms can boost their confidence when making reservations and purchases online. Direct and open communication between tourism providers and customers can increase trust in online business transactions throughout the e-commerce experience. Furthermore, tourist data on online shopping can be useful for future data analysis, marketing, and strategic planning.

Relationship smart forecasting and perceived destination image.

In forecasting applications, anomaly detection methods are divided into two categories: model-based approaches and feature-based approaches. Forecasting applications and information are very useful to tourists. With smart forecasting, tourists can prepare for their trip experience by having complete and accurate information on tourist flow and queuing times. Offering options to tourists can help them save time and money when travelling from one location to another. Big data projects can aid in the provision of real-time visitor flow statistics and queueing time projections, as well as population and traffic management, crisis management, and policy formulation. Destination information can improve resource efficiency, reduce tourist traffic and wait times, and facilitate dialogue between locals and tourists.

RESEARCH HYPOTHESIS

The research hypothesis was developed based on elements such as smart information systems, e-commerce systems, smart sightseeing and smart forecasting that affected the perceived destination. The following hypotheses (h1–4) are put out to fill the knowledge gap in the area of tourism activities and the design of the visitor experience:

1. H1. Effective use of smart information systems can influence how visitors view a place.
2. H2. An efficient smart sightseeing app can improve how travelers see a destination.
3. H3. A successful application for an e-commerce system can improve the perception of the destination among tourists.
4. H4. A successful smart forecasting application can improve how visitors perceive a destination.

RESEARCH FRAMEWORK

METHODOLOGY

Research design

A research design is essentially a plan for research that outlines the steps researchers should take to accomplish their goals or test their hypotheses proposed for their research. The value of research design lies in ensuring that the evidence generated from the data responds firmly and convincingly in response to the questioning. It can generally be separated into analysis of qualitative and quantitative frameworks.

Data collection

The process of gathering data from diverse sources in order to identify answers to the research problems is known as the data collecting data. Additionally, the data collected will be used to test the hypothesis and assess the results. Primary data and secondary data are the two types of data that are commonly gathered to finish a research study. The researcher used Google Forms to distribute a questionnaire to gather data for this research study. This method will be used because questionnaires are typically less expensive because they are standardised, and they are also relatively error-free. It is also an efficient method of gathering data from a large number of respondents.

Sampling

A sample represents a portion of the total population that perfectly represents it. The total number of samples chosen for the study is the sample size. The sample size is helpful in understanding a group

of participants chosen from the overall population who are thought to be a good representation of the study's target population. The target population will be used to select the sample for this study and help researchers to study it very well. Based on widespread agreement and new Gen Z analysis in the Pew Research Centre, the sample size is 384 Gen Z people born between 1997 and 2012.

Data analysis

Research data analysis is a strategy study utilized to compress and adapt information into a story. It helps to make obvious that the data analysis method helps to break down a great quantity of information into smaller bits. Additionally, the objective of data analysis is to have a greater understanding of the information before making conclusions. The information gathered from respondents in this study was evaluated using the social sciences statistical package (SSSP). Statistical analysis software for batch and non-batch logic is known as spss statistics. To collect data, researchers also use frequency, descriptive statistics, reliability tests, pilot tests, and correlation tests.

FINDINGS

Smart Information System (SIS)

Variable	Items	Mean	Std. Deviation	Ranks
SIS1	Through a wireless radio connection, Free Wi-Fi enables users to connect portable devices like personal digital assistants and mobile phones to the Internet. Currently, it is widely used in hotels, airports, and cafés.	4.54	.669	2
SIS2	Mobile devices can use quick response codes to acquire details about nearby attractions.	4.47	.681	1

The table above displays the highest mean score for the question about "Free Wi-Fi allows users to connect portable devices such as personal digital assistants and mobile phones to the Internet via a wireless radio connection." It is currently popular in hotels, airports, and cafés," with the second highest mean score of 4.54 and SD score of .669. The final question is about "Mobile devices can use quick response codes to obtain information about nearby attractions."

smart sightseeing

Variables	Items	Means	Std. Deviation	Ranks
-----------	-------	-------	----------------	-------

SS1	Users can create unique itineraries based on their own points of interest and collaborate to develop tour plans using the collaborative tour-planner technology.	4.48	.630	2
SS2	The logical step after guidebooks and audio cassettes is intelligent-guide technology. Tourists' experiences may be enhanced, and they may get new or different information.	4.46	.665	1
SS3	E-tourism-recommendation technologies could provide tourists with important information and help them locate and choose the websites that best match their interests.	4.52	.617	3
SS4	With the use of global positioning systems, electronic maps and compasses may provide tourists, hikers, and boaters with detailed geographic positions and directions.	4.52	.634	4

The question "The logical step after guidebooks and audio cassettes is intelligent-guide technology," as shown in table 4.10, had the highest mean score. Visitors' experiences could be enhanced, and they may learn something new or different. The mean score is 4.46, with a standard deviation of .665. The second question, with a mean of 4.48 and a standard deviation of 0.630, is about "Users can create unique itineraries based on their own points of interest and collaborate to develop tour plans using collaborative tour-planner technology." Third, "e-tourism recommendation technologies could provide tourists with critical information and assist them in locating and selecting websites that best match their interests." This question's mean and standard deviation were 4.52 and .617, respectively. The last question is, "With the use of global positioning systems, electronic maps and compasses may provide tourists, hikers, and boaters with precise geographic positions and directions," and the mean and standard deviation scores are 4.52 and .634, respectively. This leads to the conclusion that tourist pleasure can influence any decision.

e-commerce system

Variables	Items	Mean	Std. Deviation	Ranks
E-CS1	The market for buying travel-related items through mobile websites and applications is expanding. Mobile devices	4.53	.629	3

	are used by an increasing number of tourists to plan, pay for, and enhance their travels.			
E-CS2	In the travel industry, online coupons are being used increasingly often. People can get substantial savings with online coupons.	4.53	.629	2
E-CS3	Technologies like Wi-Fi, global positioning systems, geographic information systems, and global navigation satellite systems are deployed to meet the expectations of travelers making online bookings.	4.52	.630	1

According to the table above, the question "Technologies like Wi-Fi, global positioning systems, geographic information systems, and global navigation satellite systems are deployed to meet the expectations of tourists making online bookings" had the highest mean score, 4.52, and the SD score, .630. The following question is, "In the travel industry, online coupons are being used more frequently." People can save a lot of money by using online coupons." With a mean score of 4.53 and a standard deviation of .629. "The market for purchasing travel-related items through mobile websites and applications is expanding," says the final question. An increasing number of tourists use mobile devices to plan, pay for, and enhance their travels," received a mean score of 4.53 and an SD score of .629, the same as the second question. It can be seen here that many respondents travel using the E-commerce System method.

smart forecasting

Variables	Items	Mean	Std. Deviation	Ranks
SF1	Using the routes followed and the movements of tourists, managers of tourist locations may forecast tourist flow and give early warnings.	4.51	.646	1
SF2	Tourist attractions can forecast and provide tourists a queueing time using smartphone applications.	4.49	.658	2

According to the table above, the question "Using the routes taken and the movements of tourists, managers of tourist destinations can forecast tourist flow and provide early warnings" had a

mean score of 4.51 and an SD of.646. The second question received a mean score of 4.49 and a standard deviation of.658 for "Tourist attractions can forecast and provide tourists with a queuing time using smartphone applications." This demonstrates that travellers' satisfaction with this application may increase their satisfaction with their trip to a location.

DISCUSSION AND RECOMMENDATION

As for the discussion part, there are three different limitations in this study which are first, the study's limitations relate to the data collection and data analysis. The data obtained from the respondents take the researcher a lot of time to collect and analyse. The second limitation is there are several problems in the study when there is a lack of participation. When the majority of respondents do not cooperate with the researcher, data collecting has become difficult and takes time. The third limitation is that there are a few articles that can access previous research, making it difficult to find any good and relevant literature reviews. Due to payments or time limits, certain articles which ask for access might not be accessible.

Furthermore, as for the recommendation part, this study has various recommendations. This study only looks at the influence of smart tourism application on the image of the destination that is perceived in Kelantan. As a result, there are many tourists who should be the focus of future research. This study provides a number of recommendations for future research. While this study only focuses on the influence of smart tourism applications on the perceived image of the destination in Kelantan, there are many other factors that could be explored in future research. For instance, researchers could expand the sample size to improve the accuracy and reliability of the study. Additionally, it is recommended that open-ended questions be developed to eliminate misunderstandings and improve research findings, rather than relying solely on respondents' answers to scale online surveys. Given the widespread use of social media platforms like Instagram, Facebook, Twitter, and tiktok, future researchers could use these platforms to expand their findings and improve our understanding of the quality factors that impact tourist satisfaction in Kelantan.

CONCLUSION

The goal of this study was to look into the impact of smart tourism applications on Kelantan's perceived destination image. In this study, the smart tourism application influenced the perceived destination image. In addition, four independent variables were present: smart information, smart sightseeing, smart ecommerce, and smart forecasting. The Pearson Correlation Coefficient was used to analyse these independent and dependent variables. This shows that the independent variable influences the dependent variable. Finally, the study's findings revealed a connection between smart

information, smart sightseeing, smart ecommerce, and smart forecasting and perceived destination image.

ABSTRACT

Malaysia's mixed race has created a variety of local food according to race and culture with reasonable prices, and make these places a suitable place for tourists especially in Kelantan. Kelantan is famous for its culture, heritage and nature. Gen Y is the first generation that does not require an authority figure to gain access to information, resulting in a distinct and advanced workforce. The research aim to analyse the relationship between food quality and purchase intention of Gen Y tourists' towards local food in Kelantan. A set of questions was employed to collect information in order to obtain all of the essential inputs to carry out this study and analysed with SPSS data analysis software. The four independent variables were found to be statistically significant and to have a positive linear relationship. Food quality, service quality, price, and restaurant environment all had a substantial impact on Gen Y tourists' purchase intentions.

Keywords: Gen Y Tourists', Local Food, Purchase Intention

INTRODUCTION

Food and tourism have an inseparable relationship and the food is a significant source of tourism. (Henderson, 2004; Quan and Wang, 2004). It is important to supply energy to the body and when all travellers should eat when travelling, food may be the major draw and number one motivator for some people, which fulfils a variety of physiology and different desires (Tikkanen, 2007). Furthermore, food provides pleasure and entertainment for social purposes. This topic has attracted the attention of researchers who also consider one of the links between food manufacturing and marketing plans. Every traveller definitely needs a more relaxed and calmer attitude, but they have to decide what and where to eat outside of their home area. So, feeding and tasting national and authentic food is a great choice for a vacation.

Sometimes the experience of tourists hearing expressions in the community about products from various sources such as social media or websites also influence their purchase of the food. With that, the effect of local food knowledge needs to be studied so that its influence on customer purchase preferences can be seen. Buying the same product every day sometimes also makes users bored. According to Choe and Kim (2018), local food effortlessly draws the interests of tourists if it is prepared with widely recognised ingredients and methods and accompanied by explanations that are appropriate to their level of knowledge. Therefore, feedback and unique experiences need to be known to develop the intention to purchase local food.

Local food is recognized as an important factor in the selection of tourist destinations as well as a key component in tourist satisfaction and experience (Warshawsky and Vos, 2019). In this case, it should be known that the food industry in Malaysia has been faced with an increasing number of competitions. Although it is well-known among the local community itself, the variables that influence the intention to buy local food are still underexplored, especially in developing countries. A considerable amount of research refers to the conditions that contribute to the intention to buy local food, but consistent and interesting results have yet to be presented.

According to the Ministry of Tourism Malaysia (2013), Malaysia is home to various ethnic groups such as Malays, Chinese, Indians who each have their own unique and distinctive foods that

are marketed to tourists making Malaysia a unique destination. In Malaysia, food is an activity that contributes a lot in the tourism industry, especially local food. The number of tourists has increased significantly in spots where local and traditional meals have been pointed out through different food-related methods (Lai, Khoo-Lattimore and Wang, 2018). This is because the result of Malaysia's mixed race has created a variety of local food according to race and culture with reasonable prices, quality food and make these places a suitable place for tourists especially in Kelantan.

In fact, Kelantan is famous for its culture, heritage and nature. Although there is an increase in the number of tourist arrivals every year. However, there is very little data on the consumption of local Kelantan cuisine by tourists. So, this paper aims to examine the gap related to the intention to purchase local food in Kelantan. In other words, it will help explain some of the factors that influence the choice of that food.

The objectives of the specific study are formulated as below:

1. To analyses the relationship between food quality and purchase intention of Gen Y tourists' towards local food in Kelantan.
2. To examine the relationship between service quality and purchase intention of Gen Y tourists' towards local food in Kelantan.
3. To determine the relationship between price and purchase intention of Gen Y tourists' towards local food in Kelantan.
4. To investigate the relationship between restaurant environment and purchase intention of Gen Y tourists' towards local food in Kelantan.

Significance of the Study

Tourists

The research on the purchase intention towards local food in Kelantan is still limited. There is still minimal research and data on the cultural representation of Kelantan that is inclusive of both destination and food image.

Academic Researcher

Academicians may use this study to explain the reliable factors for a better understanding of this subject.

Practical Researcher

Researcher can be such a guidance for the awareness of the seller that might not realize that this topic kind of affects the performance of their sales. They might need this research to gain more knowledge on how to promote the local food of Kelantan to those who might want to try for the first time.

LITERATURE REVIEW

Definition of Service Quality

The term "actual result of the service" refers to the quantitative evaluation of the quality of the meals and beverages provided, including its quantity, presentation, freshness, flavour, and diversity. In this instance, it is only possible to assess the elements of the services after the product has been used. The measuring of tangible factors must also take into account the environment's physical cleanliness, safety and placement. Furthermore, the operation's working hours, environment, and physical location are all important. The lighting, temperature, music, and colours utilized in a restaurant can all have an impact on the overall atmosphere. As a consequence, it is important to consider the company's reputation in light of the fact that other visitors may form similar opinions about it and use it to decide whether to remain or go.

Food Quality

According to Sulek and Hensley (2014), one of the most crucial elements of a dining experience is the cuisine's quality. The buyer's culinary quality objectives have a significant impact on the restaurants they select. Similarly, Susskind and Chan (2000) discovered that the quality of the meals is the primary driver of patronage in fast food outlets. Fast food restaurants believe that meal quality is an important aspect in determining client retention. Sulek and Hensley (2014) discovered that meal quality is the most important factor determining purchase intent when environmental aspects and service quality are compared to other restaurant-related parameters. Furthermore, the positive association between food quality and customer happiness will impact customers' purchasing intentions. Rajput (2002) further emphasized that important factors influencing meal quality in the food service industry include portion size, menu design and food presentation. Given that Muslims make up the majority of Malaysia's population, it is essential to think carefully about halal food consumption and hygiene.

Price

Price is the most important component of purchase intention in the fast-food industry because most Malaysian customers pay great attention to a brand's pricing, which further stimulates them to purchase a meal. The cost of a comparable good is determined by a product's brand, raising the bar for brand manufacturing. Price has a strong influence on purchase intentions because production changes have a significant impact on customers. Furthermore, buyers are pleased with it and can afford it, which encourages them to purchase the brand's products again in the future (Gustafsson et al., 2005). As a result, the service provider should focus on brand costs that influence clients' purchasing intentions.

Restaurant Environment

Customers are increasingly prepared to shell out more money for convenience services that enhance their eating experience. These elements motivate restaurateurs to concentrate their efforts on providing a more pleasant atmosphere for patrons. Numerous studies have shown the importance of enhancing the environment and introducing new concepts to guarantee a company's success.

It was also shown that customers regard a fast-food restaurant's environment more highly more than the instant foods itself. As a result of continuously regarded as higher than the food provided, the present study hypothesises that developing the environment of fast-food enterprises is their most crucial attribute. Prior to offering fast food, a restaurant's ambiance establishes what patrons anticipate from their eating experience. The quality of the food and services offered, especially in connection to the setting of a restaurant, strengthens the current study's intangible components even more.

Social signals, environmental cues and design cues are the three categories into which environmental cues are divided. More specifically, social signals are nearby individuals who are Ambient cues are the actual aspects of a room, while design cues are the aspects of a space that capture consumers' attention such as aroma and cleanliness. As two components of environmental signals, cleanliness and ambiance were the focus of the present investigation. This could be explained by the more frequent prioritization of environmental aspects by experienced consumers.

Factors Affecting Gen Y Tourists' Purchase Intention Towards Local Food in Kelantan

Customers' assessments of production based on comparisons with goods from other companies in the same industry as well as their estimates of production services are both seen as indicators of customer satisfaction. In order to further investigating how consumers, feel about goods and services, purchase intention is in charge of determining if a product fits the demands and expectations of customers. According to this notion, customers would be pleased if the standards of the goods and services fulfilled their needs. Customers, on the other hand, won't be as happy if the manufacturing quality doesn't meet their standards. More crucially, since it keeps consumers and raises CLV (customer lifetime value), purchase intent is crucial for long-term company achievement.

It may be challenging to measure customer expectations and because businesses often learn about it is vital to maintain them once the product has been shifted in identifying purchase intention. Purchase intent is vital to businesses because it is a critical tool for maintaining a competitive advantage, despite the complexity and price involved. A high degree of purchase intent may also help you build fruitful connections with your customers.

Research Hypothesis

Four hypothesis have been evaluated in this study, namely;

H1: Food quality has a positive influence toward purchase intention.

H2: Service quality has a positive influence toward purchase intention.

H3: Price has a positive influence on purchase intention.

H4: Restaurant environment has a positive influence on purchase intention.

Research Framework

The study methodology outlined below was developed to investigate the link between independent factors (service quality, food quality, pricing, and restaurant environment) and dependent variables (buy intention). Furthermore, this approach may assess which aspects appear to be the most influential on visitors' gen Y attitudes about local food.

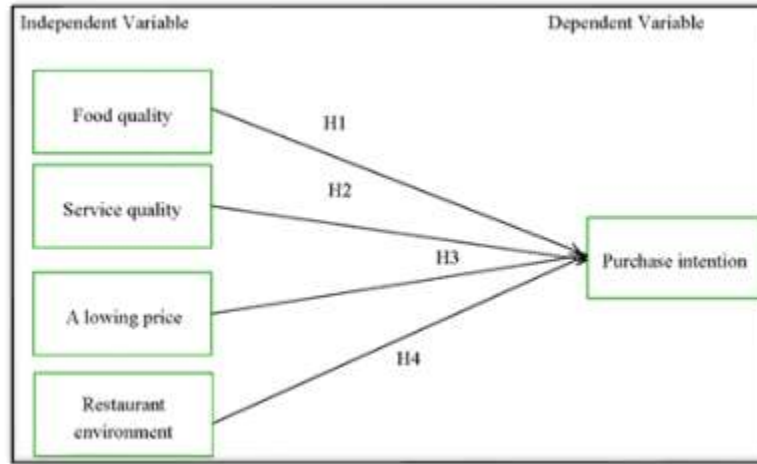

Figure 1: Factors Affecting Tourists' Gen Y Towards Local Food

Source: Adapted from: 'Factors Affecting Purchase Intention in Generation Y: An Empirical Evidence from Fast Food Industry in Malaysia'

(Shaohua Yang and Qaisar Iqbal, 2018)

METHODOLOGY

Research Design

This study employs a quantitative approach. Data for this study was gathered through exploratory research. The purpose of an exploratory research design is to conduct research on issues for which there is little or no prior research to consult (Shields & Rangarajan, 2013). The questionnaire was used as a data collection method in this study to capture responses about the purchase intentions of tourists of generation Y towards local food in Kelantan.

Data Collection

The main data obtained is from the questionnaire. The questionnaire conducted consists of 255 respondents among young tourists who have travelled to Kelantan, where some of them are experienced about local food in the population areas visited. The researchers took about two weeks to gather data from the responses of those involved. The questionnaire answering session will be conducted through an online survey so that respondents can answer the questionnaire without taking a long time. In addition, the researcher also included some pictures of local foods to help respondents better understand the questions asked.

Meanwhile, the secondary sources were obtained from some of the articles. The purpose used to gather additional information in order to the decision-making process. The analysis also refers to related sources online which is newspaper online. This study was conducted by 25 questionnaires to

the respondents among the tourist's generation Y between 25-40 years old throughout an online survey to Kelantan.

Sampling

The researchers utilized convenience sampling, a probability sampling technique, in this study. In order to gather research data for this study, quantitative sampling is used. In Kelantan, samples were gathered from a sizable generation Y of tourists who were interested in the local cuisine. Based on the Domestic Tourism Survey (2021), the data was collected of 97,900 tourists of generation Y who arrived in Kelantan. The information obtained serves to assist the researcher. So, the researcher's target is tourists among generation Y who have traveled to Kelantan to make this study a success. Furthermore, the local food of the Kelantanese community is also considered a tourism product in Malaysia. However, the amount of demand for purchasing local food among generation Y tourists has yet to be identified. There are even a few people who don't like or don't care about the existence of this local food. Therefore, the researcher lacks knowledge about the purchase of local food among generation Y tourists.

Data Analysis

There were four data types of data analysis in this study, the researcher used the Statistical Package for the Social Sciences (SPSS). SPSS is a collection of software programmes packaged together in an individual package. The primary application of this programme is the study of empirical evidence in the social sciences. This data may be used for market research, surveys, and data processing. The researcher may rapidly comprehend the market demand for a product using the statistical information gathered, and the researcher can alter the plan accordingly.

Frequency analysis was used to forecast and quantify the predictability of particular values of some variable phenomena. Researchers systematically measure their observations by using frequency distributions or graphs. Before performing statistical analysis, researchers always organize data into organized categories. They actually do this through frequency distributions or charts to make it easy to read. A frequency distribution is a graphical or tabular graphic that shows the number of observations within a particular range of values. (Sundar Rao PS, Richard J., 2006). Measures of central tendency and location (mean, median, mode), measurements of dispersion, and measures of variance are four fundamental features of frequency distribution (range, variance, standard deviation), The degree of symmetry/asymmetry (skewness) as well as the flatness or peakiness (kurtosis). We might highlight this frequency distribution with the measures of central tendency and measures of dispersion.

In order to characterise and summarise data, descriptive statistics were utilised. This branch of statistics was enhanced by the availability of a vast quantity of data and extremely efficient computing tools. (Sarmiento, Rui & Costa, Vera, 2017). This analysis method will facilitate investigators to explain and formulate an observation supported based on what they need. In addition, this applied math technique is chosen by the researcher. As a result, it can help the researcher in establishing the principle related to the quantification. Applied math measure is the initial part of quantitative research, because it converts observations into numerical figures.

Reliability refers to the stability and internal consistency of a test or measurement tool in measuring a concept or aspect. It is related to the instrument's level of dependability, which is how dependable and consistent the instrument is.

If a researcher does the same test, the results will be the same. Or give the same answer at different times, the answer will be the same. Researchers must show instrument dependability because without it, research results obtained with the instrument are not repeatable, and replicability is

essential to the scientific method. The association of an item, scale, or instrument with a hypothetical one that genuinely measures what it is meant to is referred to as reliability.

Pearson's correlation is one of the correlation measures used to determine the energy and path of the linear dating among variables. Two variables are stated to be correlated while an alternate in a single variable is followed with the aid of using an alternate with inside the different variable, both with inside the equal path or with inside the contrary path. It has to be remembered that a small correlation coefficient cost (now no longer significant) does now no longer imply that the 2 variables aren't associated with every difference. It is feasible that variables have robust dating, however the cost of the correlation coefficient is near zero, as an example within the case of a non-linear dating.

FINDINGS

Table 1: Descriptive Analysis Result

Variables	N	Mean	Standard Deviation
Food Quality	255	4.3098	0.80916
Service Quality	255	4.2225	0.74217
Price	255	4.2980	0.73669
Restaurant Environment	255	4.1647	0.72791
Purchase Intention	255	4.2327	0.78083

The number of respondents, mean ranking, and standard deviation of independent and dependent variables are shown in Table 1. For the independent variables, the highest mean is recorded for food quality at 4.3098 followed by price at 4.2980 also service quality at 4.2225 and restaurant environment at 4.1647. The mean for dependent variable is 4.2327.

Table 2: Reliability analysis result

Reliability Test	N	Cronbach's coefficient	Alpha	Strength of Association
Total	255	.952		Excellent

There were four independent variables and one dependent variable for this survey. This survey consists 15 questions for independent variables and 3 questions for dependent variables. The value of Cronbach's Alpha showed of all the independent variable and dependent variable of the reliability which was 0.952. It was shown that coefficient value of the variables ranges as excellent in term of reliability level.

Table 3: Pearson Correlation.

Variables		R- Value		Level
Food Quality	Pearson Correlation	0.675	1	Moderate
Service Quality	Pearson Correlation	0.685	1	Moderate
Price	Pearson Correlation	0.700	1	Moderate
Restaurant Environment	Pearson Correlation	0.691	1	Moderate

The intent of this study was to see if there were any relationships between the independent factors (food quality, service quality, price, and restaurant environment) and the dependent variable (purchase intention). As shown in Table 3, the Pearson correlation coefficient, significant value, and number of cases employed in this study were all 255. The R- value of food quality is 0.675 while service quality is 0.685. Also, price's R-value is 0.700 and restaurant environment is 0.691. The level of all variables is moderate.

DISCUSSION AND RECOMMENDATION

This study's findings indicate that there is a significant association between food quality and purchase intention Gen Y tourists' toward local food in Kelantan. From the findings, correlation coefficient as much as 0.675 it shows that food quality is positive and moderate related to purchase intention Gen Y tourists' toward local food in Kelantan. The p value of food quality is 0.000 which is less than the highly significant level 0.0001. According to Sulek and Hensley (2014), discovered that meal quality is the most important factor determining purchase intention when environmental aspects and service quality are compared to other restaurant-related parameters.

Secondly, there is a positive association between service quality and purchase intention Gen Y tourists' toward local food in Kelantan. From the findings, correlation coefficient as much as 0.685 it shows that service quality is positive and moderate related to purchase intention Gen Y tourists' toward local food in Kelantan. The p value of service quality is 0.000 which is less than the highly significant level 0.0001. This finding was validated by (Zeithaml, 1998), service quality is commonly described as the overall superiority of the quality service on the impressions of tourists because the communication between service providers and clients directly affects the quality of the service.

This study also wants to determine the relationship between price and purchase intentions of Gen Y tourists' towards local food in Kelantan and it shown that there is a positive relationship between price and purchase intention Gen Y tourists' toward local food in Kelantan. From the findings, correlation coefficient as much as 0.700 it shows that price is positive and moderate related to purchase intention Gen Y tourist' toward local food in Kelantan. The p value of price is 0.000 which is less than the highly significant level 0.0001. According to Kotler and Armstrong (2009), claim that a tourist's impression of the price of any good or service can affect their decision to buy it because the value that tourists believe they will receive from a good or service is significantly influenced by the cost.

This finding also indicates there is a positive relationship between restaurant environment and purchase intention Gen Y tourists' toward local food in Kelantan. The correlation coefficient as much as 0.691 it shows that price is positive and moderate related to purchase intention Gen Y tourists' toward local food in Kelantan. The p value of price is 0.000 which is less than the highly significant level 0.0001. This finding was validate by (Ryu and Jang 2008), the setting of a high-end restaurant, restaurant environments are a substantial antecedent of tourists' pleasure, arousal, and desire to make a purchase because the environment of high-end restaurants frequently produces an opulent and refined ambience.

As in every research, this study also has its own limitations. The first limitation of the study is the small sample size used for surveying respondents' visitation to food images. Due to constraints in time and resources, only 255 questionnaires were distributed, which is considered insufficient for a comprehensive study.

Future researchers are recommended to expanding the sample size to include the entire Generation Y population in Kelantan in order to provide a more representative dataset. The terms of the questionnaire also can be improved by doing the screening question to make sure the data collected are more accurate and can be used.

CONCLUSION

According to the research's findings, food quality, service quality, price, and restaurant environment all had a substantial impact on Gen Y tourists' purchase intentions. A favourable opinion of food and service quality enhanced the likelihood of purchasing food that was produced locally. Furthermore, the price and perceived value for money were important factors in defining their purchase intention. Furthermore, an attractive and appealing restaurant setting influenced their willingness to purchase local food.

These findings provide useful insights for Kelantan's local food businesses as well as marketers in understanding the aspects that influence Gen Y tourists' purchasing intentions. Improving food quality, raising service standards, maintaining competitive pricing, and providing a pleasant dining atmosphere are all practical consequences for attracting and retaining Gen Y customers.

ABSTRACT

Food tourism can encourage individuals to consume the food since food can easily be found whenever the person visits the places. This study aims to determine the factors that influence tourists' intention to consume local food in Kelantan. This research used quantitative surveys with convenient sampling. The data was collected through an online survey. This study employed a quantitative method with convenient sampling, and data was gathered from 321 tourists travelling to Kelantan via online survey using social media platforms such as WhatsApp. Results indicated that physical surroundings, excitement, prestige and escape from routine have a positive influence with intention to consume local food. These findings can help destination marketers and local restaurants strengthen the attractiveness of their locations and restaurants as well as the food celebration and events may encourage tourists to discover and participate in the regional food.

Keywords: Local Food, Food Tourism, Physical Surrounding, Excitement, Prestige, Escape from Routine

INTRODUCTION

The tourism industry includes people or individuals who spend more than a year traveling and residing in locations other than their usual surroundings for leisure, recreation, business, and other purposes. According to the world data on tourism, in terms of overall visitors, Malaysia welcomed four million tourists in 2020, placing it in 40th place globally. The number recorded in 2020 proves that the number of tourists to Malaysia has shown an increment from the previous year. This is due to several elements in tourism that have influenced the tourists to visit the country such as the attractions, leisure, accommodations, accessibility, amenities, and consuming food and beverage. From Malaysia's standpoint, the nation reported RM9.3 billion in net expenditures for the country's foreign tourists' food consumption in 2011 (Statista, 2016).

Every tourist destination must have a good attraction element to show that the place has its uniqueness and special features for tourists or visitors to come and experience the good attractions there. The element of food also belongs to the unique aspect of a destination. According to a survey, during a holiday, dining out accounted for more than one-third of all tourist expenditure, making food and drinks one of the crucial considerations for tourists who are on vacation or even on a business trip (Telfer & Wall, 2000).

The attractiveness of unique cuisine in a location greatly attracts tourists or visitors to come to that location, which is known as food tourism. In 2021, domestic tourists spent 2.8 billion Ringgit Malaysia (RM) on food and beverages, demonstrating the critical significance of food's roles in the tourism industry. From this total expenditure, it can be concluded that the diversity of food has great potential to influence tourism which will attract the attention of tourists or visitors to taste the difference of foods from each destination. Food tourism can encourage individuals to consume the food since food can easily be found whenever the person visits the places, especially when traveling to an area that they have never visited before to taste the local cuisine.

This study's aim is to see how the factors influence the tourist's intention to consume the local food in Kelantan. The deliciousness of the food, the quality of the ingredients used, the food's texture and colour that is interesting, and the portion and the way of food are given lead visitors or tourists to desire to try the food in the location. For example, Kelantan has the most popular local food, one of which is *nasi kerabu* where the rice is blue and various side dishes are served together that make people want to try it.

There are four objectives of this research :

1. To determine the relationship between physical surroundings and the intention of tourists to consume the local food in Kelantan.
2. To determine the relationship between excitement and the intention of tourists to consume the local food in Kelantan.
3. To determine the relationship between prestige and the intention of tourists to consume the local food in Kelantan.
4. To determine the relationship between prestige and the intention of tourists to consume the local food in Kelantan.

SIGNIFICANCE OF THE STUDY

Practical Perspective

It can assist food dealers worldwide, particularly in Kelantan, where they may use all the knowledge and information gained to put what they have learned into practice. By using this study as a roadmap to strengthen all of their weaknesses, the food industry can become even better at what they do.

Academic Perspective

Academic research is essential to academic life. It is what teaches pupils how to develop their analytical and critical thinking abilities. They can develop a firm understanding of the area of study they chose via this process as well. Students have the potential to significantly advance their fields of study, depending on the caliber of the research they do. Because it enables students to learn more about the goals and conclusions of the research that are connected to knowledge. The researchers' arguments presented in the academic article give the reader access to the scholar's thoughts. Research enables understanding particular difficulties from various perspectives that were never identified or discussed in great detail.

LITERATURE REVIEW

Physical Surroundings

The physical environment is recognized to have a good impact. It demonstrates that a recovery effect has been linked to the improvement in psychological well-being following exposure to the natural environment as contrasted to the cities. For instance, a study on environmental preferences discovered that seeing visuals of nature settings (as opposed to those of cities) was related to mood improvement and even lower levels of stress and depression. It is crucial for urban planners to comprehend the variations in attentional demands, as well as how they affect impact in both natural and built environments, and to pay attention to their unique characteristics when designing and building the environment (Kinnafock & Thøgersen-Ntoumani, 2014). However, local cuisine can also have an impact on the physical environment because of the resources it uses, the methods of preparation, and the tastes it uses.

Eating habits may be influenced by the local neighborhood environment (Hawkesworth et al. 2017). Due to the distinctive taste of regional cuisine, this may also have an impact on how attentively tourists explore local cuisine in Kelantan. Additionally, the location of local food stores affects how many tourists are attracted to Kelantan. The surroundings, such as a restaurant or shop, will also have an impact on a visitor's attraction to these places, therefore tourist attractions depend on their intention to visit the places more than just the local cuisine. Tourists must have a pleasurable interaction, especially in terms of the restaurant's or store's cleanliness and interior design. It shows the care for physical surroundings and desire is important for a visitor to enjoy themselves while dining and a great restaurant is built on a foundation of quality food, attentive service, and a design that can be more ambiance- and comfort-oriented (Jason, 2019).

Excitement

Excitement is one of the four characteristics cited by Kim et al. (2009) as motivating tourists to eat local cuisine when visiting a location. It can refer to a sensation of excitement or an exciting event. When visiting new locations, trying numerous novels and interesting meals, and engaging in many other activities, tourists will make for a great excitement. Trying new foods may be a stimulating experience and anticipating an exciting experience can make it even better (Rust & Oliver, 2000).

As a result, it is important to get the experience of tourists who are greatly influenced by the local cuisine. It serves as a distinctive and priceless source of difference that improves the experience of visitors. The purpose of the study is to investigate the significance of the local culinary experience and how it affects visitors' memorable knowledge, satisfaction, and behavioural intention (Piramanayagam & Seal, 2020). Impact, when tourists eat out, the excitement of trying something new will be felt more, even if we are unsure of how much we will enjoy it or not, as is the experience for newcomers.

Prestige

Prestige is described as the respect and admiration bestowed onto someone or something as a result of their standing for greatness, achievement, or societal influence. According to Williams and Soutar (2009), the social value of a trip experience may be related to the individual recognition or prestige it brings. Visitors' social worth can be raised by bringing and introducing friends and family to tourism destinations. Chang et al. (2010) claims that dining with friends while travelling could increase social status since other people may view travellers who "have been there" and "have eaten foreign food" as having a high level of cultural capital (Chang et al., 2010; Kim et al., 2009).

When traveling, tourists surely will research food-related items and place a high priority on the uniqueness, locality, originality, and distinctiveness of local foods. All of these factors have an impact on how satisfied they are with their travel experiences (Björk & Kauppinen-Räsänen, 2016). Tourists will be satisfied and willing to share when local food standards are fulfilled. This is important because they may convince other travelers to plan to eat the local cuisine at the same time. Tourists will also know which restaurants are the best and will suggest them to friends and family or publicly on social media. As a result, the people of Kelantan will become well-known through savoring the satisfying and memorable local cuisine.

Escape From Routine

Numerous studies by Davidson (2002), Fields (2003), and Passariello (1983) found that escape from everyday life is a reason for pursuing food, which is the opposite of daily activities. Escape from routine is one of nine sub-factors that have been proposed by Kim and Scarles (2009) that influence tourists' motivation toward local food consumption. Since travelling is considered a chance to get away from routine, MacCannell (1976) and Smith (1994) stated that travellers prefer eating in local places with a unique character instead of international cuisine chain restaurants.

In the prior research, it is mentioned that travelers frequently consume local cuisine to explore new things or escape from their daily routines. Tourists need something new to make them feel confident and comfortable, even though they appear to be pleased with their current life circumstances (Kim et al., 2009). Suntikul et al. (2019) argue that the promise of unique local cuisine encourages these tourists to disrupt their daily consumption habits because tourists view authentic local cuisine experiences as a method to break free from daily routines. Hence, escape from routines is the independent variable in this research.

Intention to Consume the Local Food

Tourists' intentions are usually unclear and change throughout their encounters. As it relates to gastronomic tourism, this raises the possibility that the surroundings might have a significant influence on visitor behaviour and intents. Apart from that, Abdullah et al., (2018) argue that the choice to travel toward a specific location, along with the following evaluations and prospective behavioural intentions, are all part of the tourist's intention. In general, food preferences are studied as elements of human behaviour. Tourists can experience local culture and immerse themselves in its norms by partaking in the local cuisine, particularly cuisine associated with place identification, which can serve as a symbol of a destination's culture (Zhang et al, 2018).

Food choices or intentions in tourism have evolved into an important component in the expansion of tourism industries. Rozin (1996) indicated that cultural identity has a significant impact towards the intent to consume local foods and the choices of foods. Even local cuisine serves as a platform for educating tourists about the culture. The choices made by tourists will change to meet

their physical requirements and consumption patterns. There are numerous elements, such as situational and individual circumstances that have an impact on this voting behaviour.

Research Hypothesis

The researchers hypothesis is to see whether there are any relationships between the study's dependent and independent variables.

H1: There is a relationship between physical surroundings and the intention to consume local foods.

H2: There is a relationship between excitement and the intention to consume local foods.

H3: There is a relationship between prestige and the intention to consume local foods.

H4: There is a relationship between escape from routine and the intention to consume local foods.

Research Framework

The Figure 1 below shows the research frameworks use for this study

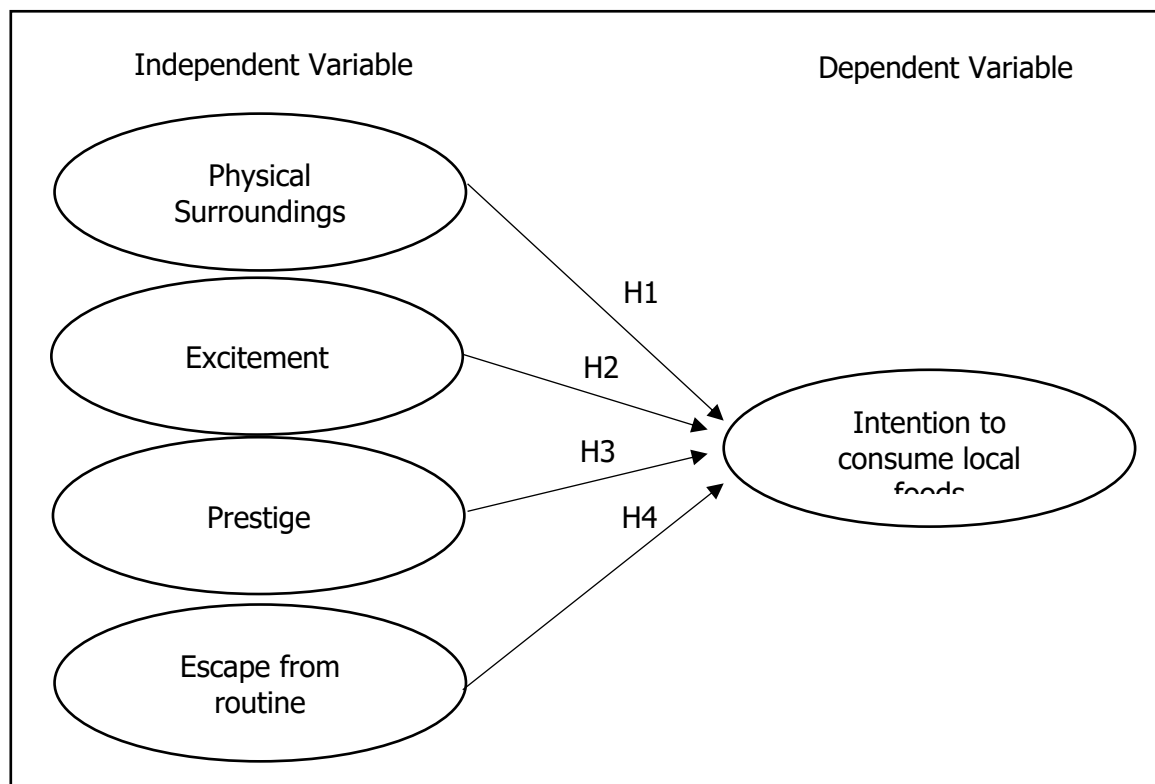

Figure 1 : Conceptual framework for intention to consume local foods.

Source: Kim et al. (2009)

METHODOLOGY

Research Design

In this study, a quantitative research design will be used. The process of gathering and analyzing numerical data is known as quantitative research design. Our targeted respondents 384, however the data group access from the respondents we acquired only resulted in 321 respondents and to analyze the primary data, researchers will use SPSS version 20.2 (Statistical Programmers for Social Science).

Additionally, this chapter explores the link between the variables that influence tourists to consume local food in Kelantan.

Moreover, the researchers use a questionnaire as a tool for the research instrument in this study. The researchers present the survey questions in a Google Form so that participants can respond online or through social media. To make it simpler for the respondents to understand every question in this survey two languages will be provided: Malay and English. This research question is divided into three sections which are sections A, B, and C.

Section A focuses on the demographic data of the respondents, whereas Section B relates to the independent variables, each variable contains two questions that respondents must answer. Section C, on the other hand, deals with the dependent variable and includes four questions that the responder must respond to. Typically, the Likert scale provides five possible answers to a statement that allows respondents to indicate their strength of agreement or disagreement regarding the question given. Closed-ended inquiries are types of questions that demand a straightforward response from the respondent. The question can be answered with a single word or a straightforward "yes" or "no."

Data Collection

The primary data approach will be employed in this study to collect information. The questionnaire will be distributed using online forms created with Google Forms that can be accessed anywhere and anytime by potential respondents. Respondents have a high level of flexibility in how they complete the questions since they may use their smartphone, computer, tablet, and other devices to respond by the researchers distributing or sharing the link Google Form through social media platforms.

Sampling

This study will utilize non-probability sampling and adapt convenient sampling from other types of nonprobability sampling. Convenience sampling is appropriate for this research since the methods are easy and affordable, and the participants are easily available. Additionally, Dörnyei (2007) supported that this type of nonprobability sampling is a sampling where participants from the target group fulfill certain practical requirements for them to be included in the study objectives.

Data Analysis

Four types of data analysis were used in this research : descriptive statistics, reliability test, correlation analysis and frequency analysis. The researchers will use SPSS version 20.2 (Statistical Programmers for Social Science). Organize data and pie charts with SPSS, a program-based data processing and analysis system.

FINDINGS

Result of Demographic Analysis

Table 1: Frequency Analysis

Demographic	Categories	Frequency (N)	Percentage (%)
Gender	Male	36	11.2
	Female	285	88.8

Age	18-24	276	86
	25-34	33	10.3
	35-44	7	2.2
	45-54	3	0.9
	55 above	2	0.6
Race	Malay	281	87.5
	Chinese	10	3.1
	Indian	8	2.5
	Others	22	6.9
Marital Status	Single	302	94.1
	Married	19	5.9
Education Level	Primary School	0	0
	Secondary School	16	5
	Diploma	19	5.9
	Undergraduate or Bachelor Degree	281	87.5
	Postgraduate Degree or above	5	1.6
Occupation	Student	282	87.9
	Employed	32	10
	Self Employed	4	1.2
	Housewife	2	0.6
	Unemployed	5	0.3
Have you ever been to or visited Kelantan before (in past 5 years)	Yes	257	80.1
	No	64	19.9

Table 1 shows that females are more likely than males to be influenced to consume the local food in Kelantan. The entire number of male respondents is 36, while the total number of female respondents is 285 persons. Their combined percentage is 88.8% compared to 11.2% for the male respondents.

Out of 321 responses, the majority of the respondents were 86.0% between the ages of 18 - 24 years old, with 276 individuals completing the survey, followed by 10.3% the ages between 25 - 34 years old resulting in 33 individuals, 2.2% respondents aged between 35 - 44 years old which is 7 people meanwhile 0.9% of 3 individuals are age between 45 - 54 years old and a total of 0.6% of 2 persons aged 55 and above. According to data analysis, 18 - 24 years shows that people in that age range are more influenced to consume the local food in Kelantan.

Next, with the 87.5% and 281 respondents, Malay is the race group with the most participants in the survey, followed by 3.1% Chinese with 10 respondents. With 2.5% consisting of 22 respondents, Others group races are the third highest answering the survey, followed by 2.5% of Indians with 8 respondents. According to this data's analysis, the more race influenced to consume the local food in Kelantan is Malay people.

Out of 321 responses, 93.8% of respondents were single, with a total of 301 respondents, compared with only 5.9% of the respondents who were married, with a total of 19 respondents. This shows that mostly more females engage in answering the survey about the influence of consuming local food in Kelantan than males.

The majority of the respondents answering the survey are 87.5% from undergraduate or bachelor's degrees, with a total of 281 respondents. Followed by a total of 19 respondents, the study indicates that 5.9% are diploma students. Meanwhile, 5.0% of the secondary school participated in

this survey with only 16 respondents, and the lowest percentage of education level is the postgraduate degree or above with only 5 respondents (1.6%).

With 282 respondents, the majority of the respondents are undergraduate or bachelor's degree holders, with 87.9%. The second highest is employed with 32 respondents (10.0), followed by self-employed with 1.2% representing four respondents. The two lowest percent of occupations are housewives, with only two respondents (0.6%), and only one respondent is unemployed (0.3).

Lastly, revealing that 257 respondents opted to reply yes to the question's statement, while 64 respondents chose to respond no to the question's statement. The researchers discovered that the percentage for those who respond yes with the question's statement is 80.1% and 19.9% the respondents who respond no with the question's statement. According to this data's analysis, there are more respondents who have visited Kelantan after five years.

Result of Descriptive Analysis

Table 2: Descriptive Analysis

Variable	Item	Mean	SD
Physical Surroundings	Cleanliness of the restaurants or places of destinations is important for your travel dining experience.	4.50	0.840
	Design of the restaurants is important for your travel or trip dining experience.	3.97	0.929
Excitement	Before going on a trip you search for the information about food first, the image of food makes you feel excited.	4.24	0.829
	When you eat out, it is exciting for you to try the most unusual items, even if you are not sure what you like.	4.02	0.899
Prestige	It is important for you to share photos and information of your dining experience with others through social media.	3.74	0.910
	You will go to the place of restaurants recommended by your surrounding social groups and the public.	4.10	0.791
Escape From Routine	Feel comfortable when you try food on a trip which is different from what you eat in your normal life.	4.03	0.858
	Your choices and behavior for dining experience during travel or trip is different from your daily life	3.95	0.877
Intention to consume local food	I would like to eat Kelantan local food.	4.31	0.700
	I am willing to eat Kelantan local food.	4.24	0.745
	I plan to consume local food in Kelantan.	4.19	0.779
	I expect to consume local food in Kelantan.	4.27	0.707
	I intend to eat Kelantanese local foods in the near future.	4.21	0.774
	I am willing to recommend people, family and/or friends to visit Kelantan for its food.	4.25	0.800

Table 2 shows the mean and standard deviation of independent variables and dependent variables. The data indicates that the highest mean value for the dependent variable is Question 1, with 4.31 and 0.700 standard deviation, in which respondents agreed that "they would like to eat Kelantan local food." Meanwhile, the lowest is Question 3, "I plan to consume local food in Kelantan," with a 4.19 mean value (SD=0.779).

Physical surroundings show that 'Cleanliness of restaurants or places of destination important for your travel dining experience' has the highest mean value of 4.50 (SD=0.840), followed by 'Design of the restaurant is important for your travel or trip dining experience' got a mean score of 3.97 (SD=0.929), slightly lower than the first question.

The highest mean score of excitement is 4.24 (SD=0.829), which means respondents agree, 'Before travel, you search for food, which image makes you feel excited, on social media or another medium.' Followed by the question, 'When you eat out, it's interesting that you try the most unusual items, even if you're not sure what you like' with a mean score of 4.02 and a standard deviation of 0.899.

Next, the respondents agreed with the question of prestige, which is "You will go to the restaurants recommended by your surrounding social groups, and the public" scored the highest mean value, which was 4.10 and 0.791 standard deviation. Followed by the question "Is it important for you to share photos and information about your dining experience with others through social media" yielded a slightly lower mean score of 3.74 and a standard deviation of 0.910, respectively.

The highest mean value for escape from routine is 4.03, and 0.85 indicates that respondents "feel comfortable when trying food on a trip that is different from what they eat in normal life." Meanwhile, the "Your choices and behavior for dining experiences during travel or trip is different from your daily life" only recorded a 3.95 mean score and 0.877 standard deviation.

Result of Reliability Analysis

Table 3: Reliability Analysis

Variable	N of items	Cronbach's Alpha
Physical surroundings	6	4.23
Excitement	2	4.13
Prestige	2	3.92
Escape from routine	2	3.99
Intention to consume local food	2	4.25

The results of the reliability analysis display the number of items, and Cronbach's alpha statistic. With six items in the statistic for intention to eat local food, Cronbach's alpha is 0.934. The additional factors are the physical environment, excitement, prestige, and escape from routine; each of the variables comprises two items. Cronbach's alpha reliability analysis for the physical surroundings is 0.662, excitement is 0.720, prestige is 0.616, and escape from routine is 0.752. Hence, the reliability analysis results' overall shown that all the variables are acceptable.

Result of Pearson Correlation Analysis

Table 4: Pearson Correlation Analysis

Hypothesis	Pearson's Correlation	Result
H1: There is a positive relationship between physical surroundings and the intention to consume local food in Kelantan.	0.383	Supported
H2: There is a positive relationship between excitement and intention to consume local food in Kelantan.	0.556	Supported
H3: There is a positive relationship between prestige and intention to consume local food in Kelantan.	0.418	Supported
H4: There is a positive relationship between escape from routine and intention to consume local food in Kelantan.	0.538	Supported

Hypothesis 1 (H1) proposed that physical surrounding show the value of Pearson's correlation at $r = 0.383$, meanwhile excitement in Hypothesis 2 (H2) indicate $r = 0.556$, prestige in Hypothesis 3 (H3) shows $r = 0.418$ and Pearson's correlation $r = 0.538$ in Hypothesis 4 (H4). With the significant level respectively at 0.000, which is less than the 0.05 level of significance. Thus, all proposed hypothesis were accepted. The Pearson's correlation results in the hypothesis above are supported and revealed that the independent variables namely physical surroundings, excitement, prestige, and escape from routine have a moderate positive and low positive relationship with the intention to consume local food in Kelantan. With all the significant less than $p < 0.05$, it is determinants of the likelihoods to consume local food while travelling.

DISCUSSION AND RECOMMENDATION

In summary, this research explored in depth the factors that influence the intention of tourists to consume the local food in Kelantan. The purpose of this study is to answer the questions and the hypothesis. Based on the data analysis, the current study makes some recommendations for tourists, academic researchers or the community to enhance the intention of tourists to come to Kelantan.

The recommendation or suggestion for future research about this study might include classic outdoor dining areas in Kelantan, which increases the Classic Wooden Houses and Rural Scenery. Local eateries may want to think about adding outside eating areas that are a reflection of the local architecture and landscape to improve the dining experience. For customers to enjoy their meals in a lovely location, this can feature outside seating spaces, gazebos with thatched roofs, or elevated dining platforms. Physical surroundings scenic views in Kelantan are renowned for its attractive landscapes, which include lush vegetation, rivers and traditional wooden cottages.

After that, organise food celebrations and events that highlight Kelantan's illustrious local food history. In addition to a vast range of regional local food, these events may also include interactive games, live culinary demos and cultural performances. Tourists will be encouraged to discover and partake in the regional local food if a joyful and joyous environment is created. These events can draw foodies and tourists interested in the local food in Kelantan by showcasing the distinctive tastes and ingredients of the area.

Next, cooperation with the Tourism and hotel sector. Promote local cuisine experiences as part of upscale travel packages by working with tourism boards, travel companies, and the hotel sector. To draw affluent travellers looking for excellent culinary experiences, highlight the exclusivity and

prestige of these events. Collaboration with the tourist and hospitality sector creates avenues for networking and forming collaborations with key industry players. These contacts may open up more chances for cooperation, such as taking part in renowned food events, culinary contests or global culinary exchanges.

Lastly, cooking classes and workshops where people may learn the fundamental methods and dishes of traditional Kelantanese cookery. As people engage in a novel and creative activity, these hands-on encounters provide a respite from routine. Participants may become lost in the world of food, pick up new skills and experience the pleasure of cooking and eating regional cuisine. Cultural Relationship Participants in cooking lessons and seminars that emphasize Kelantanese cuisine have a greater understanding of the local way of life.

CONCLUSION

In this study, the researchers aimed to investigate the factors that influence tourists' intentions to consume local food in Kelantan. They focused on four independent variables: physical surroundings, prestige, excitement, and escape from routine. The physical surroundings refer to the sensory aspects that can be perceived, such as touch, smell, sight, hearing, and taste. Trying unfamiliar food was considered an invigorating experience, and the expectation of excitement was believed to enhance the overall experience. Prestige, on the other hand, relates to the respect and admiration given to something or someone based on reputation, quality, success, or social influence. Lastly, tourists seeking an escape from their everyday routines valued local food experiences as a means of breaking away from their usual eating habits.

The findings of the study indicated that tourists did not place significant emphasis on the given factors. Instead, the data showed that tourists were more concerned with experiencing and understanding the authenticity of the local food in Kelantan. Most of them intended to taste the genuine flavors and differentiate them from widely recognized local food products. These well-known factors, therefore, influenced tourists' intentions to consume local food in Kelantan to a moderate extent. The study suggested that the environment had a substantial impact on visitors' intentions and behaviors regarding culinary tourism, as the intentions of tourists tended to shift during their experience.

According to the survey results, travelers expressed a strong desire to visit Kelantan due to their appreciation for the authenticity and excellence of the regional cuisine. Furthermore, the affordability of local eateries without compromising quality made them even more attractive to tourists. Witnessing the originality and authenticity of native cuisine in Kelantan contributed to tourists being more accepting of their own experiences.

Overall, the study concluded that the given factors, including the physical surroundings, prestige, excitement, and escape from routine, significantly influenced tourists' intentions to consume local food in Kelantan. By experiencing traditional local food, tourists could savour the authenticity of the cuisine, which played a role in preserving the food culture and heritage of Kelantan. Consequently, there is a high demand for tourists seeking local food experiences, and this research demonstrated that these factors indeed influence their intentions positively.

ABSTRACT

This study is to investigate the push and pull factors that influence tourists' interest in outdoor adventure tourism. Travellers have been choosing outdoor adventure tourism to have exciting adventures and get away from their daily routines. This is because someone goes to travel to feel fun and joy. So, they go to travel where they will find a peaceful place to comfort themselves. In this study of achieving this research aim are to identify the relationship between push and pull factors towards participation in outdoor adventure tourism in Malaysia. The quantitative research will use sampling methods. The distribution of online surveys and questionnaires to gather information from existing and potential customers. The Google Form could be easier to use because it only sends the link via WhatsApp. The survey offers useful data about the motives and preferences of adventure travellers, empowering industry participants to create specific promotions and improve the overall tourism experience.

Keywords: Outdoor adventure tourism, push factors, pull factors, tourist interest, adventures

INTRODUCTION

The tourism industry includes both labor and products provided by the travel industry, as well as non-evaluated highlights that rouse the travel industry, such as common destinations (such as seashores, mountains, and woods), significant sites, and social elements. The greeting given to visitors by industry workers and the local population is also very important. The travel industry incorporates friendliness (for example, convenience, eateries), transportation (for example, aircrafts, car rental), travel support and data (for example, visit administrators, travel planners, and vacationer data centers), and attractions and entertainment (for example, heritage locales and theme, public, and wildlife) (Normann, 2013).

The term "push and pull" factors was initially mentioned in connection with travel industry inspirations through Dann (1977). It is possible that certain inner factors 'push' a person to look for travel industry knowledge, whereas the choice of which knowledge or item to seek out is influenced by external factors that 'pull' a person to seek out that experience. The desire to get away, rest, and take a break, prestige, tour, sports and recreation, and social interaction are the most typical push

factors. Pull factors emerge due to an attractiveness of the place, including its beaches, recreational spaces, and tourism attractions (Jurowski, 1994).

Another concept in the travel industry is adventure. The travel industry has embraced experience, but there is no specific definition of experience in the travel industry. However, there are many other speciality sectors in the travel industry that share the same characteristics as having worked in the travel industry, such as ecological tourism, adventure trips, or skilled travel. The majority of researchers Syuhada Farhana Adnan and Shida Irwana Omar, 2021, agree that having worked in the travel industry is a speciality part of the travel industry. Adventure travel is a troubling and confusing concept. According to the Adventure Travel Trade Association (ATTA), 1990, "experience in the travel industry is a vacationer action that incorporates active work, social trade, or exercises in nature. "Adventure tourism comes in two different forms. Which is a hard adventure and a soft adventure (Vijita S. Aggarwal, 2017).

Hard adventure refers to exercises with a diversity of danger that require extreme responsibility and high-level abilities. The travel industry includes exercises such as climbing mountains/rocks/ice, journeying, caving, and so on. Soft adventure relates to actions with an extreme risk but low degrees of danger, requiring little responsibility and beginner abilities; experienced guides lead the majority of these activities. Soft travel incorporates activities such as exploring, setting up camp, climbing, kayaking, and so on (Sato et al., 2018).

The objectives addressed in this study of achieving this research aim are:

1. To identify the relationship between push factors towards participation in outdoor adventure tourism in Malaysia.
2. To identify the relationship between pull factors towards participation in outdoor adventure tourism in Malaysia.

SIGNIFICANCE OF THE STUDY

To The Academic Field

Future scholars can generate and develop new knowledge and ideas based on the issues because of this study. Given that the researcher must consider all the potential outcomes of the circumstance when conducting the research, it can also help develop a more analytical thinking style. This study can be used as a guide by future academics to conduct additional research on Push and Pull in outdoor adventure tourism.

Practical

There are countless ways to evaluate how well tourists participate. Using push and pull factors is one such strategy. Internal and external motivational dimensions are both investigated using the

push and pull factor technique. This contains factors that motivate people to look for adventure activities and gives the chance to evaluate factors that motivate people to look for adventure experiences in a particular location. Due to the number of locations that currently provide roughly comparable adventure activities, this is becoming more and more significant. Additionally, it can be a crucial component of the marketing of adventure tourism destinations. Therefore, the purpose of this study is to reconsider the push and pull factors that drive adventure tourism.

More research is required to fully understand some of these dynamics, and this study makes some significant additions to that understanding. Few researchers have looked at the effects of this shift, even though previous studies have demonstrated the industry's transformation. The importance of these developments for the planning, development and management of adventure tourism must be further studied. This study starts to talk about some of the ways that the sector seems to be changing, but it has numerous limitations. It is crucial to carry on with this study in different geographic settings and potentially with different research methodologies.

LITERATURE REVIEW

Push Factor

Push factors are tourists' behavioral contracts that affect their decision to visit a location or attraction. An individual's internal reasons that propel them to seek out a certain travel experience are referred to as push factors. When someone travels, experiences new things, or satisfies wants and desires, it is a result of internal stimulation. Push factors have been seen to be useful in explaining the desire for travel, as they are recognized as the starting point of understanding tourists' behavior (Crompton, 1979). It is a psychological reason from within that drives a person's desire to travel. The majority of push factors are internal motivators, such as the need for solitude, leisure, status, physical fitness, adventure, and interpersonal contact.

Pull Factor

Pull factors are the elements that attract someone to travel. Pull factors are outside causes that have an impact on a person's effort to satisfy a desire or requirement. One will select a location based on their requirements and preferences. Pull factors are things that take people from other places to a new region. Once people have made the decision to travel, their motive is what drives them to a specific location. Pull factors emerge due to the attractiveness of a destination, including beaches, recreation facilities and cultural attractions (Uysal and Jurowski, 1994). Traditionally, pull factors are considered more decisive in explaining destination choice (Bello and Etzel, 1985).

Outdoor Adventure Tourism

Our emotional and mental health can be improved by being in nature. A Stanford University study (Jordan, 2016) found that spending time outdoors can reduce stress levels, reduce anxiety, and possibly even reduce the risk of depression. Hard adventure activities and soft adventure activities are two different categories of adventure tourism activities. A tourist vacation that combines at least two of the following three components, such as physical exercise, exposure to the outdoors, and cultural education, is referred to as adventure tourism. It is common for visitors to be exposed to risk and require some abilities.

The Relationship Between Independent Variable and Dependent Variable Participate in Outdoor Adventure Tourism

Let consider research into the relationship between the relaxation by events and activities that affect outdoor adventure tourism. In this case, the dependent variable is relaxation by events and activities, while the independent variable is the effect of outdoor adventure tourism. The benefits of relaxation by events and activities allow us to improve our physical and mental health. Engaging in challenging activities forces us to focus our energy on what we are doing at the time. For example, people can do yoga, meditation or music and art therapy. Ultimately, this helps relieve overall stress levels.

People traveled in ancient times to explore sea routes, new destinations, even new countries. Culture is a key factor in expressing the proper kind of connection, but there also must be enough communication for it to work. Commercial adventure travel, on the other hand, is a recent development in which tourists employ expert tour operators to offer a variety of technical assistance, equipment, and cultural and environmental interpretation. For instance, many want to escape their daily routine by participating in outdoor activities like cycling, hiking, and kayaking. They engage in this behaviour to decompress or get rid of stress.

Going outside helps people feel less stressed. As they travel through some of the most breathtaking landscapes on earth, all of life's burdens will vanish. Recent years have seen a quicker global growth in adventure tourism because of new tourist destinations. This makes it possible for new areas to advertise themselves as truly unique and attract travelers looking for unique and outstanding experiences. Everyone has a smile on their face when they go back after an adventure because they are happy as a result. Backpacking, camping, and sailing are a few examples. They may take in the surroundings while engaging in these hobbies, unwinding from the stress of the outside world.

Research Hypothesis

From the conceptual participating, independent variable was determined as push and pull factors of tourists participating and a dependent variable is outdoor adventure tourism. Based on the variable above, these hypotheses are defined as follows:

H1: There is a relationship between push factors towards participating in outdoor adventure tourism in Malaysia.

H2: There is a relationship between pull factors towards participating in outdoor adventure tourism in Malaysia.

Research Framework

The following is the conceptual framework for this study. The two factors which push and pull factors that will comprise the proposed independent variable (IV) are as follows. Outdoor adventure tourism in Malaysia is the dependent variable (DV).

Figure 2.6: Conceptual Framework

METHODOLOGY

Research Design

This study uses a quantitative research design. Quantitative research is dealing with data, logic, and an objective point of view. It highlights numerical and static facts as well as intricate, convergent reasoning, in contrast to varied thinking, which is the unrestrained growth of multiple distinct opinions about a particular area in an unstructured manner. Quantitative research is the examination, analysis, and interpretation of the observations with the purpose of understanding the meanings and patterns of relationships. It is about asking people for their opinions through questionnaires in an efficient way so that the researcher can produce hard facts and statistics to guide. Descriptive, correlational, causal comparative/quasi-experimental, and experimental are the four subtypes of quantitative research. tries to prove cause-and-effect connections between variables. Data will be quantified using quantitative research, and outcomes from a sample will be applied to the entire 17 population. It can also be used to assess the presence of various points of view and suggestions in specific samples.

Finally, online surveys and questionnaires will be distributed to existing and potential customers as part of quantitative research to collect information. The outcomes can be represented numerically.

Data Collection

This survey used questionnaires to obtain data through a survey. A survey is a digital questionnaire that collects quantitative data. This method is to be employed because questionnaires are usually cheaper to conduct, relatively easy to administer because they are standardized and relatively free from several types of error and it is an efficient way of collecting information from a large number of respondents.

Sampling

Non-probability convenience characterizes the sampling strategy. It shows that the research population does not have the probability to be represented in the sample of Sekaran and Bougie (2013). As a result, this study will use the convenience sampling technique. The term "convenience sampling" refers to a method used by researchers to collect data from a readily accessible set of respondents for market research. Because it is so fast, simple, and affordable, it is the most frequently used sampling procedure. If members choose to be part of the sample, they are often easy to contact.

Data Analysis

Data analysis refers to the process of inspecting, cleansing, transforming, and modeling data to uncover meaningful insights, draw conclusions, and support decision-making. It involves the application of various statistical and computational techniques to analyze data sets and extract valuable information from them. To examine the primary data, researchers will use the programme

Statistical Programmers for Social Science (SPSS) version 26.0. SPSS is a data processing and analysis programme that lets you create tables and pie charts. Computers assisted researchers in reducing the amount of effort required to determine information and perform quantitative analysis quickly and easily. To evaluate quantitative data, the researcher employs descriptive statistics, reliability statistics, Pearson's correlation, and hypothesis testing.

FINDINGS

Response Rate

According to statistics, the "number of respondents who complete a questionnaire compared to the number assigned, usually expressed as a percentage," is known as the response rate. According to the 2009 edition of the OECD Glossary of Statistical Terms, "Response rate Definition," the response rate can also be applied to specific questions. Generally, the response rate refers to the quantity of replies a researcher receives after delivering questionnaires to participants. The response rates will also be calculated by separating the sample's total number of qualified participants by the quantity of valid responses.

A study's response rate is important since it establishes the validity of it. A low response rate might impact the reliability test and reduce the statistical power of the data obtained. As a consequence, it will have an impact on the study by providing the study's conclusions unreliable, which also shows that the findings of the research cannot be applied to the larger population. Therefore, a high response rate is partly influenced by how accessible and reachable the target audience is. The response rate will be low and vice versa if the reachability and availability are poor.

In this study, WhatsApp was used for spreading the surveys online. The surveys were answered by respondents with 217 questionnaires that distributed in total, which represents 100% of the questionnaires issued. Additionally, the researchers were able to compile all 217 completed surveys, total 217 dispersed questionnaires and a 100% response rate. There were neither any shared surveys that were not returned nor any received replies that were invalid. The identical number of surveys that were distributed were successfully collected, and there was a 100% response rate.

Demographics Characteristics of Respondent

There were 217 sets of valid questionnaires distributed and all the questionnaires were successfully collected back. In the frequency distribution analysis, there were 4 items of valid questionnaires that had been asked to the respondents including gender, age, income level, and platform to reach Jelawang, Kuala Krai, Kelantan. All the frequency distribution analysis was to category out the demographic profile of respondents.

Table 4.3: Demographics Characteristics of Respondent

		Frequency	Percentage	Cumulative Percentage (%)
GENDER	Male	85	39.0	39.0
	Female	132	61.0	100.0
	TOTAL	218	100.0	100.0
AGE	Under 18 years	2	0.9	0.9
	18 – 23 years	187	86.2	87.1
	24 -29 years	16	7.37	94.47
	30 – 35 years	5	2.31	96.78
	36 – 40 years	4	1.84	98.62
	41 years above	3	1.38	100.0
TOTAL	218	100.0	100.0	
INCOME LEVEL	No income	183	84.3	84.3
	Below RM1000	11	5.01	89.31
	RM1001 – RM2000	9	4.15	93.46
	RM2001 – RM3000	7	3.21	96.67
	RM3001 – RM4000	4	1.84	98.51
	Above RM4000	3	1.49	100.0
TOTAL	218	100.0	100.0	
PLATFORM TO REACH JELAWANG	Social media	83	38.2	38.2
	Friends	88	40.6	78.8
	Google search	38	17.5	96.3
	Others	8	3.7	100.0
	TOTAL	218	100.0	100.0

Male respondents accounted for 85 of the totals and that was 39% while female respondents accounted for 132 of the totals and that was 61%. Among respondents out of 217 respondents, the highest of respondents was female which is 132 that consists of 61%. While the lowest number of respondents was male which is 85 that consists of 39%.

The survey had 217 responses, with 2 respondents under the age of 18 (0.9%), 187 respondents between the ages of 18-23 (86.2%), 16 respondents between the ages 24-29 (7.37%), 5 respondents between the ages 30-35 (2.31%), 4 respondents between the ages 36-40 (1.84%), and 3 respondents above the age of 41 (1.38%). The highest of respondents were 18-23 years old that consists of 86.2% while the lowest number of respondents fall to 41 years above that consists of 1.38%.

They were 183 respondents (84%) who had no income. 11 respondents (5.01%) who had below RM1000 income and 9 respondents who had answered the questionnaire (4.15%) that income levels ranging from RM1001 to RM2000. There are 7 respondents (3.21%) who have an income between RM2001 to RM3000 already respond. There are 4 respondents who have answered the questionnaire, (1.84%) have an income level between RM3001 to RM4000 and 3 respondents (1.49%) an above-average income RM4000. The highest of respondents had no income that consists of 84.3% while the lowest was 3 that consists of 1.49%.

Social media respondents accounted for 83 of the totals and that was 38.2%. Friends' respondents for 88 of the totals and that consisted of 40.6%. Google search respondents accounted for 38 of the totals and that was 17.5%. Other respondents accounted for 8 of the totals and that was 3.7%.

The frequency and percentage of the responders based on the platform to reach Jelawang, Kelantan is the highest of respondents was friends which is 88 that consists of 40.6%. While the lowest number of respondents was others which is 8 that consists of 3.7%.

Descriptive Analysis

Table 4.4: Independent Variable and Dependent Variable

VARIABLE	N	MEAN	STANDARD DEVIATION
Push factor	217	4.3738	.57735
Pull factor	217	4.4055	.53913
Dependent variable	217	4.4597	.62670

The table displays the descriptive analysis for the independent variable (push and pull factors) and dependent variable. The pull factor has the highest mean score of any independent variable and that is 4.4055. The dependent variable, with a score of 4.4597, comes in second.

As we can see that district Jelawang, Kelantan is also one of the tourist destinations where visitors can explore its cultural resources such as the Geopark at Gunung Stong shows the highest mean score. The question indicates that the reasons will increase the demand of the place.

Reliability Test

A technique for examining a scale's internal consistency is the reliability test. To determine the level of consistency, we utilized Cronbach's alpha coefficient as the indication. Dependability analysis was used to examine the questionnaires' reliability. The survey's reliability and internal logic were confirmed using Cronbach's Alpha analysis. The reliability test measures how well test outcomes stand up over time from measurement of something. It covers how consistently the same set of test takers performs when the identical test is administered on several days (Rosaroso, 2015).

Table 4.5.2: Result of Reliability Coefficient Alpha for the Independent Variables and Dependent Variable

Variable	Reliability Cronbach's Alpha	Number of items	Results
Push Factor	0.931	8	Excellent
Pull Factor	0.902	8	Excellent
Outdoor Adventure Tourism	0.904	4	Excellent

Table 4.5.2 of the IBM SPSS Statistics version 26 findings revealed the importance of both independent and dependent variables in this analysis. The overall Cronbach's Alpha Coefficient for

the independent and dependent variables in this study was displayed in the table. All the variables, it may be considered, were more than 0.9. Consequently, the presented result is trustworthy and may be accepted in this analysis.

The push factor was assessed using eight questions. According to Table 4.5.2, Cronbach's Alpha for this section's question was 0.931, which was outstanding. As a result, the coefficients for the push factor were reliable. Following that, eight questions were asked to assess the pull factor. In this area, the Cronbach's Alpha value is 0.902, which is considered as excellent. Therefore, the coefficients generated for the pull factor were reliable.

In addition, four questions were used to evaluate the reliability variable, which influenced outdoor adventure tourism. Cronbach's Alpha was 0.904, which was regarded as excellent for this division's question. As a result, the coefficients calculated for the reliability factor were reliable. Since the Cronbach's Alpha value for such variables surpassed 0.9, the questionnaires are exceedingly reliable, as well as the research can move forward. Overall, the reliability found that the participants had a good understanding of the questions, implying that questionnaires were adequate for this investigation.

DISCUSSION AND RECOMMENDATION

Discussion

Most respondents agree the activities on adventure tourism were very extreme and attractive. The research explains more about the result of the factor study that showed that the respondent in this study perceived that pull factors had a major impact on outdoor adventure tourism. Based on other studies, the attention of arts, culture, history, and heritage was too common for a destination to attract more tourist arrival because typically tourists are more experienced with new things while learning about the destination through arts and history to increase their knowledge (Gunlu et. al, 2009).

Other than that, the arrival of tourists increases the economy, and it gives benefit to the region or country as it provides an opportunity for job creation and as money comes into the event destination areas which in turn encourage establishment of new enterprise and market a more positive image in an area (Zaei, M., 2013). But this result shows that pull factors affect economic impact but pull factors are considered as small issues of economic impact in this research. Besides, when cultural events are held, there are many stalls that promote job opportunities, especially for fresh graduates. For example, the fresh graduates around Bukit Jelawang area can take this opportunity to find their job opportunity for their future.

Through this, pull factors may affect outdoor adventure tourism. Beautiful natural resources, which also refer to the strategically relatedness of a place in the motivation of tourists, are usually a strong "pull" component in the idea of tourism resources. Researches that found a significant relationship between pull factors and outdoor adventure tourism.

Recommendation

Theoretically, this study has contributed to the literature by highlighting the push and pull factors of tourists participating in outdoor adventure tourism. Based on the survey conducted, to explore their motivation to engage in outdoor adventure tourism activities in Jelawang. There are several suggestions for improvement to increase overall visitor motivation.

The promotion of Jelawang's distinctive features, such as its picturesque landscapes, biodiversity, and cultural heritage, to draw tourists interested in adventure travel, is one of the push factors that encourage visitors to engage in outdoor adventure tourism in Jelawang, Kelantan. Additionally, design multiple adventure tourism packages that accommodate various interests and skill levels, including pursuits like hiking, rock climbing, river rafting, and wildlife observation. Additionally, increase accessibility. To make it simpler for travelers to reach Jelawang, improve connection and transportation infrastructure. For instance, improving roads. Enhance the standard and condition of the current roads going to Jelawang, making sure they are well-maintained, clearly marked, and appropriate for various vehicle types. Informational signs: To direct people to Jelawang, install clear signs at important transportation hubs and along main thoroughfares. Give precise and current information on available options, timetables, and costs for transit. Tourists will have easier access to Jelawang by improving transportation infrastructure and connectivity, which can draw more visitors and support the expansion of outdoor adventure tourism in the region.

Developing high-quality adventure facilities is one of the suggestions for the pull factors that entice visitors to partake in outdoor adventure tourism in Jelawang, Kelantan. To draw adventure seekers, make investments in the construction of well-maintained adventure amenities, such as hiking trails, climbing walls, and camping grounds. Next, offer qualified instructors and guides. Make sure that there are experienced and competent tour guides available who can give visitors engaging in outdoor adventure activities a safe and enjoyable experience. Last but not least, work with regional groups. Work with local groups to provide genuine cultural encounters for visitors, such as homestays, meals prepared according to tradition, and cultural performances.

CONCLUSION

In conclusion, the participation of tourists in outdoor adventure tourism is influenced by a combination of push and pull factors. Push factors represent the internal motivations and desires of individuals, including the desire for personal challenge, relaxation, knowledge gain, escaping daily

routine, sight-seeing variety. On the other hand, pull factors are external attractions that draw tourists to engage in outdoor adventure tourism, such events & activities, variety seeking, history & culture, and adventure.

Research on this topic has revealed that adventure tourists are driven by the desire for personal growth, the opportunity to escape and relax, the allure of scenic beauty and nature, the fascination with cultural immersion, the potential for social connections, the emphasis on environmental sustainability, and the pursuit of personal development and well-being.

Understanding this push and pull factors is essential for tourism stakeholders, as it enables them to tailor their offerings to meet the diverse motivations and preferences of adventure tourists. By highlighting the excitement, challenges, natural beauty, cultural richness, and sustainability of outdoor adventure tourism, destination marketers and operators can effectively attract and cater to the needs of this niche market. Ultimately, the fusion of personal motivations and external attractions creates fulfilling and memorable experiences for participants in outdoor adventure tourism.

ABSTRACT

This study was conducted to determine the factors that influence tourists' Selecting Melaka as Holiday Destination. The primary purpose of this study to examine key elements that affect tourists' holiday decisions regarding where to travel in the Melaka, one of the states located in Malaysia. The tools that used to conduct this research is quantitative research in descriptive design to measure the data collected during the study. The sample size of the respondent was 384 and the total collected who had answered the questionnaire through Google Form was also 384 respondents. The questionnaire shared through all social media platforms. It is quite simple for distributing and gathering data from responders in this manner. Thus, This work may be useful to other researchers in future endeavors to investigate the factors that influence tourists' Selecting Melaka as Holiday Destination.

Keywords: Melaka, Destination factor, Food, Infrastructure Facilities.

INTRODUCTION

The first chapter contains the background of the study followed by the problem statements, research objectives, research questions, significance of the study, definitions of terms, and ends with the summary. The background of the study includes the theories, concepts, words and ideas of a topic or issue. A problem statement is a concise and straightforward statement that defines the symptoms of a specific problem that the researchers intend to investigate. The research objectives are declarations of goal or intentional activities can be described as acts taken in response to the supplied questions. Significant broad questions may be complemented by preliminary inquiries on study subjects. Furthermore, the significance of the study might be described represents the amount that the researchers assisted in modifying a thought, enhancing understanding or establishing a new theory in a given sector of research. The definition of terms includes both independent and dependent variable.

When travelers pick where to go, the choice of their vacation destination might be considered to be crucial. The journey will be exhausting without a specific destination because there is no direction. When flaws in a sector can be found, changes can be done to prevent issues that might damage the reputation of that organization. The enhancements made will bring more tourists to a certain location. Because Melaka may have decent accommodations or has numerous destinations nearby that make it easy to move from one place to another in Melaka, the destination factor helped to increase the number of visitors. Food tourism is a developing trend that places a special emphasis on tasting regional identities that are authentic and traditional, giving local service providers and producers a platform. Infrastructure contributes to economic growth through boosting efficiency and providing amenities that enhance people's quality of life. The improvement of infrastructure amenities will increase the influence of vacationers visiting Melaka.

The objective of this research are:

1. To examine the relationship between destination factors towards Melaka as Destination Selection.
2. To examine the relationship between food factors toward Melaka as Destination Selection.
3. To examine the relationship between infrastructure facilities factors towards Melaka as Destination Selection.

Significant of the Study

Researcher

This research will assist travelers who require more knowledge about Melaka, particularly those who are visiting the city for the first time or who want to travel there. Every traveler needs to know why they are going somewhere, what they hope to get out of the trip, and what factors led them to choose to visit Melaka.

Study

This study aims to identify the elements that influence tourists' decisions to travel to Melaka. The researcher thinks that this study would encourage visitors to choose Melaka as their vacation spot and enhance their desire to do so. The results of the survey will be used to assess the options available to visitors to Melaka, determine whether Melaka is the best choice for their destination selection, and ensure that requirements for infrastructure, food, and lodging are met. The typical behavioral objectives relating to the tourism business at vacation spots near Melaka.

LITERATURE REVIEW

Destination Selection

Destination selection is one of the most important aspects of having a great travel experience. The destination selection was affecting the destination factor (refer to Melaka), food, and infrastructure facilities. There is a relationship between destination selection and destination factor, food, and infrastructure facilities. Destination selection, usually the choice of destination that meets the standard of tourists is the best place and worth their money, experience, and energy. The choice of destination should be that tourists will prefer a cheap destination area that may be close to their hometown but a historical site visit, suitable for all ages and the safety risk area. Destination selection is actually one of the important factors that influence tourists' choosing their holiday destination selection to help Melaka grow more, for the Destination factor (Melaka) the food in Melaka, and Melaka infrastructure facilities.

Destination Factor

The researcher can establish a link between destination factor and factor affect destination selection in Melaka. Melaka's own destination factor refers to how Melaka can persuade people to visit Melaka as a vacation location. Many travellers value their vacation experience, particularly the quality of their accommodations. The key goal for tourists who come on vacation to Melaka or anywhere else as a holiday destination is the quality of accommodation, and how Melaka (Destination's factor) influences tourists' decision to make Melaka their destination of choice. Melaka is essential in providing the best accommodation for tourists, including as hotels, resorts, and homestays, as well as lodging locations that are close to other surrounding destinations, making it easier for tourists to transfer from one destination to another. The ease with which tourists can get to

a particular destination influences their decision to visit Melaka. Traffic congestion also has an impact on tourist vacations.. Melaka is a densely populated location with a tiny land area compared to other Malaysian states such as Johor, Selangor, and Perak.

Food

In Malaysia, food has a significant impact on where people decide to go. The country is well-known for its extensive and diverse culinary scene, which attracts traveller from around the globe. Moreover, the tourists would receive valuable experience from their food consumption in a destination (Nasir et al., 2021). The unique combination of Malay, Chinese, Indian, and indigenous cuisines result in a fascinating tapestry of flavour and dining experiences. Melaka's status as a gastronomic heaven influences many travellers' choose Melaka as their destination selections. They want to experience the true flavour of the land, eat local cuisine, and try local specialties. From inexpensive fast-food restaurants to luxury dining facilities, Melaka provides a wide range of culinary options to suit all tastes and price ranges. Due to positive reviews and mouth-watering food images submitted by other traveller, Melaka may be an alluring destination for foodies. Melaka hosts a variety of food-related festivals and events every year that bring tourists from all over the world. For instance, the annual Melaka Food Festival showcases a range of regional specialties, providing guests with a unique opportunity to experience the city's culinary culture in a pleasant and lively atmosphere.

Infrastructure Facilities

Infrastructure facilities in tourism are physical aspects that are created and built to accommodate visitors. Plenty of researchers have proposed a theoretical link between growth in tourism and infrastructures. Infrastructure facilities are widely recognised as an essential component of tourism, playing a vital role in attracting tourists. Thus, tourism infrastructure facilities are the foundation of tourism development. Investment in infrastructure is crucial for increasing visitor numbers and adding to guest enjoyment and enthusiasm. By ensuring the required services to guests, infrastructure, as an essential part of regional tourism, is especially crucial for prospective tourism expansion and the greater advancement of tourist destinations. Many researchers have confirmed the clear link between tourist growth and infrastructure in philosophical terms and practise. Infrastructure facilities include ancillary and supplementary facilities, equipment, systems, procedures, and resources required for the operation of any tourist attraction, such as ensuring that the restrooms are clean and that the infrastructure is well-maintained and up to date.

Research Hypothesis

The hypothesis of the research is made based on the factors of the study such as destination factor, food and infrastructure facilities that affect the factor selecting holiday destinations in Melaka. Based on the study, the hypothesis had been created and to be tested.

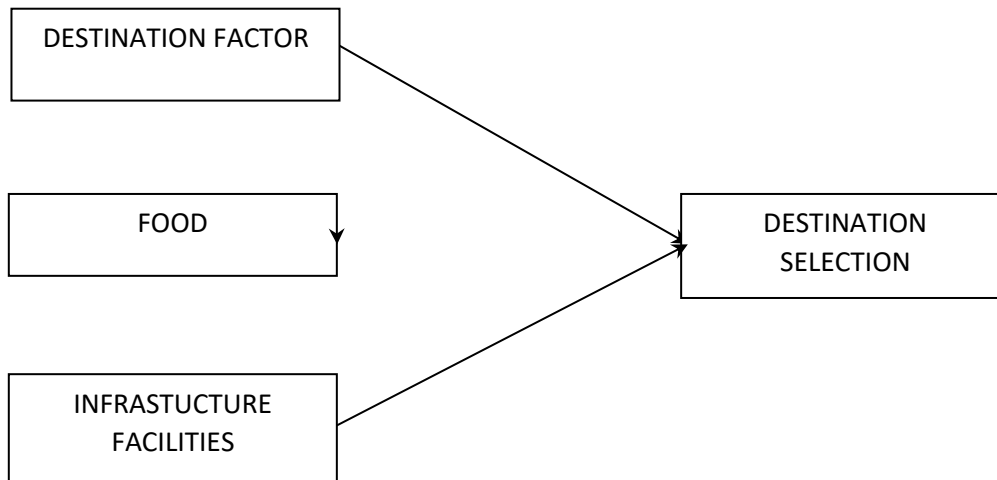

H1: There is a relationship between destination factor and destination selection in Melaka.

H2: There is a relationship between food and destination selection in Melaka.

H3: There is a relationship between infrastructure facilities and destination selection in Melaka.

Research Framework

Researchers have proposed a framework to study the factor influencing tourists selecting Melaka as holiday destination, based on the previous literature review. Hence, as seen below the structure.

METHODOLOGY

Research Design

In this research, the tools that will be used is quantitative research in descriptive design to measure the data collected during the study. Quantitative research design is the process of gathering data to find an informational design to determine who, where, and what they want to know in a study (Bhandari, 2020). The researcher will use this method to determine the destination factor, food, and facilities infrastructure are the factors influencing tourist's selecting Melaka as holiday destination.

Data Collection

The data collection method was focused on the primary and secondary. Primary data obtained from the questionnaire forms which were distributed to 384 respondents. It describes the demographic profile of visitors, discusses elements impacting local tourists' travel destination choices, and includes topics linked to tourists' destination preferences. After being created online with Google Form, the surveys will be sent via the WhatsApp network. Meanwhile, secondary data was acquired from books, journals, and the internet.

Sampling

The sampling method used was a non-probability sampling method. The respondents were domestic tourists traveling to Melaka state. The Sampling method consisted of the aspect of research population, sample, and location in obtaining the information and data that researchers analysed to obtain the results.

Non-probability type sampling procedures are commonly used by researchers in quantitative research. Non-probability sampling involves the selection of a sample from a population selected on the basis of their expertise in the subject investigated.

3.3.1 Research Population

The population of this study consisted of domestic tourists who ever travel in Melaka with a total of 9,098,000 in 2021 (CEIC DATA analysis from Department of Statistic Malaysia Official Portal, 2021).

3.3.2 Research sample

A total of 384 sets of questionnaires were distributed to the domestic tourist who ever travelled to Melaka. This was chosen based on the table by Krejcie and Morgan (1970). The questionnaire forms were for analysis purposes. Data obtained were analysed using the descriptive analysis method.

Table 1 : Sampling frame

Item	Total
Research Population	9,098,000
Population Sample	384

Data Analysis

Descriptive analysis methods were used in this study. The use of descriptive analysis was to determine the factor influencing tourists choosing Melaka as holiday destination. . It is a quantitative method and the data obtained were analysed using the Statistical Package for Social Science (SPSS Version 25.0) software. Different forms of reliability can be estimated using various statistical techniques. Some of them are internal consistency, interpreter reliability, and retesting.

The t-test is the most widely used method to evaluate the differences in the mean between groups. This test is the parametric test because they estimate parameters of some underlying normal distribution. The advantages of parametric tests are that they are more powerful and flexible methods that allow researchers to study the effect of many variables and their interaction. The research will use Independent T-Test when there are many instances that the researcher is interested to know whether two groups are different from each other on a particular interval-scaled of interest.

There are five (5) assumptions need to comply before performing this independent t-test, which are:

1. The examination of various data formats regarding test or dependent variables. The dependent variable needs to be represented by perpetual or quantitative data.
2. The sample is chosen at arbitrary from the target population. The sample chosen concerning the population must be chosen at random using any probability sampling methodology.
3. The measurements ought to be separate. This signifies that just one subgroup should include the sampling component. It shouldn't be compared to anything else or measured more than once.
4. The presumption of normality must be met. According to this presumption, the data distribution for each group must be normally distributed. Graphs like the 34 histogram, a normal Q-Q plot, or statistical tests like Shapiro-Wilk or Kolmogorov-Smirnov can be used to verify this claim. However, with a large sample size of more than 30, the deviance from this premise shouldn't have any significant negative effects.

5. The homogeneity assumption needs to be met. The homogeneity assumption must be met since both groups ought to bear an identical constant variance. Levene's test may be employed in order to verify this premise.

FINDINGS

This study aims to investigate the relationship between destination choice and destination elements, including infrastructure, food, and services. The researcher has investigated the three criteria in further detail and has been able to determine the study's findings based on the analysis done in chapter 4. Questions from this research are divided into four sections: A, B, C, and D. The total number of respondents who answered the survey via Google Form makes up the sample size of the total 384 respondents. Researchers gathered the data and used SPSS (Statistical Package for the Social Sciences) to analyse it, including reliability testing, frequency analysis, descriptive analysis, and Pearson's correlation coefficient analysis to come to their final conclusions about the factors that influence travellers' decisions to visit Melaka. All of the variables that are the dependent variable (DV) and the independent variable (IV) collected a higher Cronbach's alpha scale value, which was 0.7 and above, according to the results of the reliability test of the pilot study. The food variable, which has the highest Cronbach's Alpha score of all these variables at 0.922, displays great results.

DISCUSSION AND RECOMMENDATION

The research study was conducted to investigate the elements that influence travelers' decision to visit Melaka as a place to go on their holiday destination. The researcher investigated the connection throughout independent and dependent factors. The study was conducted has so much related with the development of the tourism industry throughout the Malaysia that researcher can identified. The scope of this study is in Melaka which the area in Malaysia, as mention Malaysia is the country is rich with the culture and diversity of food also Malaysia is one of the countries that are developing economically, politically and socially.

Suggestions in the present research that scholars may apply in future endeavors, such as cultural aspects in Melaka such as Dondang Sayang, Zapin, and Rebana Keras, or economic characteristics in Melaka such as their trade system, preferential tax system, and maritime regulations.

In this study researcher has recommend is the scope of respondents' contribution in the future to attract more tourists from Sabah and Sarawak because the frequency of those who answered the questionnaire from both states are less than half. Sabah and Sarawak is state in Malaysia which is separated from the Malaysian peninsula, which requires tourists from both states to spend more in terms of airplane transport because to go to Melaka you have to go through the South China sea route. With the research done will be a reference for potential tourists especially from Sabah and Sarawak to choose Melaka as a holiday destination

CONCLUSION

Based on the replies from 384 respondents using the Google form, the researcher was able to effectively finish this study on the "Factors Influence Tourists' Selecting Melaka as Holiday Destination." In order to accomplish the research goal, the researcher had to identify the most pertinent variables, such as infrastructure, food, and destination aspects, that might affect why traveller choose Melaka as their vacation location. The study's purpose states that there are a number of issues that need to be addressed since a person or traveller still needs to make a series of decisions and take a number of actions before deciding on a destination.

ABSTRACT

The goal of this article is to determine tourist satisfaction with heritage food on Pulau Pinang. The primary study question to be investigated is the influence of tourist satisfaction on local heritage food. Based on the findings of the study, the researcher learned about tourist satisfaction with local heritage foods in Pulau Pinang. This study employs quantitative research with 390 questionnaire delivered to participants. Data was acquired via reaching out to participants via online survey through Google form and SPSS software was used to analyse the data received from the respondents. The implications and recommendations are also presented for future researchers who may perform similar studied in the near future.

Keywords: Heritage Food, Students, Tourist Satisfaction, Food Image, Destination Image, Service Quality

INTRODUCTION

The first chapter discusses the background of the study of this research, the research question, and the research objective. After that, it is also addressed the scope and limitations of the study as well as its significance of the study. The topic of the research is tourist satisfaction towards the local heritage food in Pulau Pinang. Basically, local cuisines play a vital role in creating tourist destinations places, boosting tourism, and becoming one of the tourism product attractions. The purpose of this paper is to identify tourist satisfaction the intention on local food heritage at Pulau Pinang (Penang).

Significance of the Study

This study may be used to better assess visitor acceptability of cultural foods in Pulau Pinang. The cuisine scene on Pulau Pinang is virtually legendary with many people travelling long distances merely to sample the island's exquisite treats. Local heritage food knowledge has piqued the interest of all generations of tourist visiting Pulau Pinang. Some organizations must study this subject and be able to take preventative action so that Malaysians and visitor do not forget about the native heritage food on Pulau Pinang.

This study will help an industry that holds research to criteria other than academic publications, namely financial returns. The diverse preferences of all generations regarding local heritage food in Pulau Pinang were also included. Local heritage food in Pulau Pinang face issues that threaten cultural and identity of their food. Exposing students to this research will provided them with a distinct viewpoint than simply presenting journal themes or working in academic publications.

LITERATURE REVIEW

Tourist Satisfaction

The concept of tourists satisfaction has been studied extensively in the context of tourism and hospitality sector (Nasir et al, 2022). Tourist satisfaction refers to the visitor's satisfaction with a product or service that meets their wants, intentions, and desires. It is influenced by pre- and post-travel expectations and experiences. Satisfaction is achieved when experiences exceed expectations, while disappointments is expected if unhappy. Two factors influence satisfaction, the expectations the visitor had before the trip and the tourist's defense of the services received after the trip. Swan and Combs (2012) assert that contentment is a post-purchase attitude.

Westbrook (2012) proposed that cognitive and emotive characteristics contribute to customer satisfaction during the pre-purchase, purchase, and post-purchase stages of acquiring products and services. Customer satisfaction is a judgment made after a service encounter and it is diverse and requires fresh perspectives across industries.

Food Image

Pulau Pinang is renowned for its diverse cuisine and street food, including the best hawker food in Malaysia. Tourists can enjoy a variety of dishes, including *Char Koay Teow*, *Nasi Kandar*, *Pasembor* and *Laksa*. Pulau Pinang is recognized as the world's best food destination, surpassing other destinations like Bangkok and Paris. The selection of local food is influenced by nine motivational factors, including enjoyable experience, escape from routine, health awareness, knowledge, learning, authentic experience, togetherness, sensory stimulation and physical environment.

Local food selection among tourists is influenced by exploration of local culture, authentic travel experience, opportunities to learn and obtain information, status and prestige, influence from referred groups, and subjective perceptions. Food can provide a unique experience and pleasure to travel, making it one of the most memorable parts of a trip. Pulau Pinang street food is among the best in the world, offering affordable dishes from Chinese, Malay, Indian and Nyonya styles. The food of a destination can represent its image and special features.

Destination Image

Pulau Pinang a popular destination in Asia, is known as a "food paradise" due to its diverse food offerings, including traditional heritage and western cuisine. The city is also known for its famous street food, which combines Malay, Chinese, Indian, Arabic, Siamese and European cuisine. Pulau Pinang's attractions include social interaction, natural environment, culture, lodging, transportation, infrastructure, food, friendly people, physical facilities, recreational activities, bars and nightlife.

Tourism Malaysia categorizes Pulau Pinang into various tourism categories, including cultural, adventure, beach, medical, agricultural and food tourism. Local heritage cuisine is considered an intangible destination, offering authentic cultural experiences for both domestic and international tourists. The image of food and food destinations in tourism is rapidly growing with the availability of cultural diversity increasing tourists' interest in visiting place. Local cuisine can add value to traditional tourism experiences, particularly for tourists seeking new experiences. As the image of food of food in the tourism industry develops, it contributes to the rapid development of destinations and regions for the tourism industry.

Service Quality

Service is an activity or action performed by one party to another, resulting in mutual gain. It can be associated with tangible or intangible products. Service quality is a focused assessment that reflects a customer's perception of the service, including ability, assurance, empathy, responsiveness and tangibles. A key component for tourists is service quality, as they are concerned about the quality of shop service. A good, quick and well-treated shop attracts more customers, and clean food is essential for attracting them. Employers must also train staff to interact with visitors and provide high-quality service, ensuring customer satisfaction and future business growth.

Research Hypothesis

The hypothesis in the study is to find out whether there are any correlations or relationship between dependent variables and independent variables:

- H1:** There is a significant relationship between food image and tourist satisfaction on local heritage food in Pulau Pinang.
- H2:** There is a significant relationship between destination image and tourist satisfaction on local heritage food in Pulau Pinang.
- H3:** There is a significant relationship between service quality and tourist satisfaction on local heritage food in Pulau Pinang.

Research Framework

The literature review has prompted the development of a research framework that aims to investigate the satisfaction of tourist toward local heritage food in Malaysia's southern region of Pulau Pinang. A conceptual framework for the study has been created. The variables that are proposed for the research include the food image, the destination image, and the service quality of the local food.

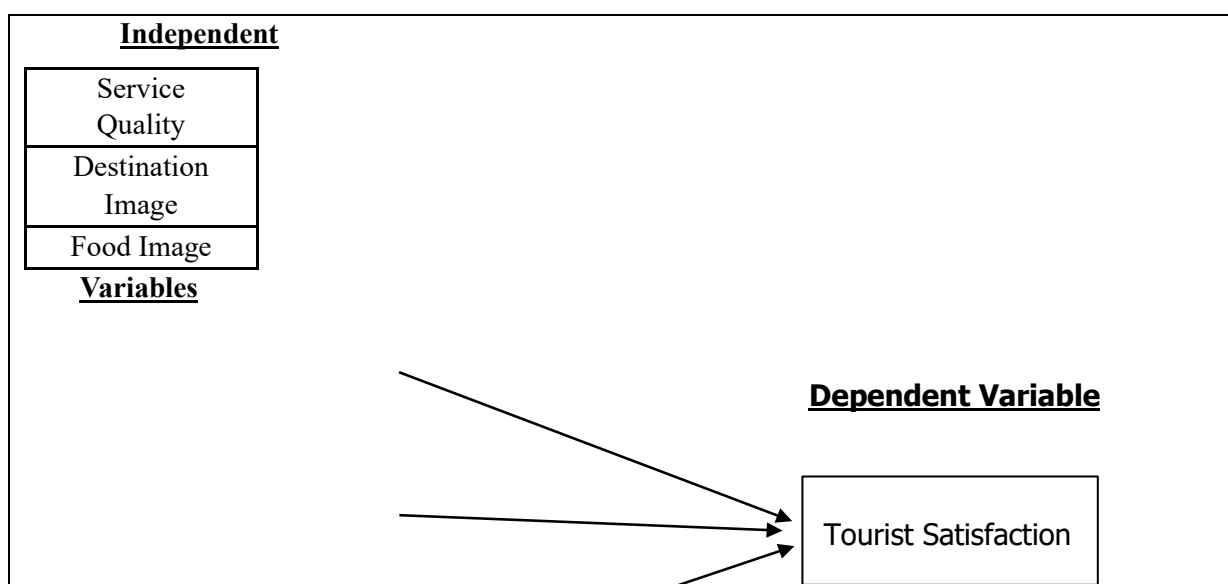

Figure 2.1: Conceptual Framework (Abdullah & Rahman, 2022)

METHODOLOGY

Research Design

The study's design incorporates the factors that impact consumer satisfaction with e-hailing businesses among Malaysian tourists. A quantitative technique will use in this study, and data will collect from individuals using a self-directed questionnaire. The relationship between food image, destination image and service quality towards local heritage food in Pulau Pinang. among Malaysian tourists is the subject of a descriptive study. The descriptive study design assists in answering the research questions and achieving the research objectives.

Data Collection

Online surveys using Google Forms were the main data collection tool in the study's initial phase. The justifications for the researcher's usage of this set of technological resources is because it is free and friendly user. It also makes it easier to the researcher to collect all the data from local tourists. Fieldwork was the second stage of data collecting. This study, questionnaire also had been used as the instrument for primary data collection.

There have 6 parts of the section that respondents need to answer. The questionnaire was provided to individuals in Malaysian local tourist attractions for the purpose to collect data.

Sampling

Sampling method chosen is stratified random sampling. Stratified random sampling is considered efficient, quick, and successful for gathering data in a sample. It involves dividing the population into smaller subpopulations or strata. Random samples are then selected from each stratum. The strata can be based on various classifications such as age, socioeconomic status, civic affiliation, religion, and educational achievement.

The questionnaire will be distributed through the web and directly to the targeted sample. Any incomplete or unreliable responses will be substituted with responses from other respondents. This helps ensure a comprehensive and reliable dataset for analysis.

Research Instrument

To conduct this investigation, researchers created a questionnaire consisting of four parts to evaluate the validity of the generated hypotheses. The questions were meticulously crafted to align with the research study's topic. The table below provides a summary of the factors considered and supported to assess the food image, destination image, and service quality in relation to heritage food in Pulau Pinang.

Table 1: Measurement items

Measurements	Number of items in the questionnaires	Scales used	Author
Section A: Demographic information	5	Adapt	Tomic, Deronja, Kalit & Mesic (2018)

	5	Adapt	
Section B: Tourist satisfaction towards heritage food in Pulau pinang			Abdullah, Rahman (2022)
Section C 1 : Food image towards heritage food in Pulau pinang	5	Adopt	Abdullah, Rahman (2022)
Section C 2 : Destination image towards heritage food in Pulau Pinang	5	Adopt	Abdullah, Rahman (2022)
Section C 3 : Service quality towards heritage food in Pulau Pinang	5	Adopt	Abdullah, Rahman (2022)
Total	25		

Data Analysis

In this section, the research data and statistical analysis findings are presented to achieve the study's objectives. The data analysis includes descriptive statistics, reliability tests, and Pearson correlation. The questionnaire data was organized, edited, and categorized using computer software like SPSS for accurate interpretation. The variables were analyzed, and descriptive analysis was used to describe respondents' biographical information. Reliability tests were conducted to assess the relationship between the variables in the study. The independent and dependent variables were analyzed, and the Pearson Correlation Coefficient was used, following the approach outlined by Bewick et al. (2003).

FINDINGS

The study found that heritage food significantly influences food image, destination image, service quality, and tourist satisfaction in Penang. The findings of the study show that food image, destination image, service quality, and tourist satisfaction in Penang, are based on a survey of 384 respondents. The highest mean value for food image was found in question 1, with respondents stating that heritage food was well-known and reasonably priced on offer. The highest mean values for destination image were found in questions 1 and 4, with respondents indicating a trend of people buying heritage food. The lowest mean value was found in question 2, where respondents considered Penang as a good destination for food tourists. Service quality was highest in question 5, with respondents being satisfied with the service provided and praising the attractive atmosphere, lighting, and music decoration. The highest mean value for tourists' satisfaction with local

heritage food was found in question 5, with respondents expressing a desire to bring others to try the food and share their experiences.

DISCUSSION AND RECOMMENDATION

On the side of overcoming the limitations stated in Chapter 5.5, some solutions can be proposed for potential researchers planning to perform a similar study. Firstly, the suggestion can be given for future researchers are to increase the research area which collect more data with various of tourism in another state in Malaysia such as Terengganu, Kedah and Pahang.

In the end, the researcher could prepare a multilingual version of the questionnaire to diversify it. Malay, English, and Mandarin are among the languages spoken in Malaysia, a multilingual nation. Respondents who are not strong in English may be confused by this study, which was conducted in only English. Therefore, it is recommended that future researchers get ready .To make it easier for the respondents and to ensure that the results are more accurate data, the questionnaire should be available in multiple languages.

In addition, the suggestion can be provided the future researchers is they can conducting interview sessions and focus groups because this might obtaining valuable and more reliable findings. Besides, many studies explored the tourist satisfaction toward local heritage based on affected media social. Therefore, the future researcher might be able to explore the tourist satisfaction based on product.

CONCLUSION

In this chapter, the research project had fulfilled its objectives to investigate the tourist satisfaction on local food heritage. Study summary, discussion of major findings, and research implications have been discussed. In addition, some of the limitations of this study were set to remind future researchers. Conclusion of overall research was provided. Lastly, the suggestions for further research were provided.

ABSTRACT

The objective of this research is to look into the relationship between service quality and customer satisfaction in Malacca hotels by using SERQUAL analysis. It also aims to explore the influence and outcome of providing quality service on customers satisfaction, as well as to determine which SERVQUAL dimensions of tangibility, assurance and reliability have been identified as independent variables while customer satisfaction has been in dependent variable. Each dimension was tested in order to determine and quantify the relationship with customer satisfaction. Customers who had stayed in Malacca hotels completed the questionnaires. A total of several respondents participated in the survey. The findings of the research show that the service quality provided by the hotels can affect customer's satisfaction.

Keywords: service quality, tangibility, assurance, reliability, customer's satisfaction

INTRODUCTION

The global market trend has turns dramatically from agricultural to service sectors (Asian Development Outlook, 2007). All service industries especially the hotel industry, are making effort to improve the quality of their offerings in order to satisfy customers. Hoteliers are currently emphasising quality in order to reach their guests' basic needs and assumptions. Parasuraman et al. (1985) concluded service quality as the contrasts between performance and assumption in major parameters. Another way to describe service quality is as an ascertain of how well an organisation meets the essentials and expectations of its customers.

The hotel sector contributes significantly to Malaysia's economic growth. Due to a hotel's primary service offering, it is important for hoteliers to place an emphasis on customer happiness with service quality and the avoidance of low customer satisfaction in order to preserve the hotel's reputation. Aiming to provide a quality of service that meets or exceeds customer expectations. Therefore, the purpose of this study is to ascertain how several critical aspects of hotel management interact and what impact that has on both service quality and guest satisfaction. The findings demonstrated that accommodations had a favourable impact on the level of service provided by hotels in Malacca.

There are research objectives of our study:

1. To examine the relationship between tangibility and customer satisfaction.
2. To examine the relationship between assurance and customer satisfaction.
3. To examine the relationship between reliability and customer satisfaction

Significance Of The Study

The finding of the study will benefit the future researcher, the community as a guide to do their research in the same field. The outcome of this study is to determine the relationship between Tangibility, Assurance and Reliability toward customer's satisfaction. There are many factors that will influence a person's level of satisfaction with a service, for example, service quality in a holiday destination such as a hotel. As we know, the place to stay when we are on vacation is one of the most important aspects to create a sense of satisfaction throughout the vacation.

Customers' levels of satisfaction will vary because each person will have a unique experience based on the location they visit. Various factors will also influence the level of customer satisfaction, so every service provided must be compatible and appropriate with the customer in order to leave a positive impression on them after their stay at the hotel is over. As a result, in this study, researcher will look at all the factors that customers may accept if they visit the hotel, and we will be able to provide feedback to the hotel industry if the level of service provided has deficiencies so that they can improve in the future. If the situation improves, the number of customers who visit Malacca's hotels will increase, as will the hotel industry's profit growth.

LITERATURE REVIEW

Customer Satisfaction

In the context of hospitality and tourism, the concept of satisfaction has been studied extensively (Nasir et al, 2022). Customer satisfaction is always regarded as a major issue in a highly competitive market that should be carefully considered by every company, particularly those in the service industries, because it is critical to improve service quality and maintain client loyalty. (Awwad, 2012; Alhkami & Alarussi, 2016). According to Wang'ombe and Ngige (2016), customer satisfaction is viewed as an indicator in the hotel industry that determines whether visitors are likely to go over and revisits to a specific hotel, regardless of whether they have a satisfied or dissatisfied service. According to Eshetic et al. (2016), hoteliers can measure their service quality to decide whether customers are satisfied or dissatisfied with the overall level of services.

Tangibility

The appearance of physical factors such as the facilities provided by a service firm is defined as the tangibility of service quality. It also refers to how a service provider presents themselves to potential customers. (Alhkami & Alarussi, 2016. Modern-looking room features and the availability of popular television channels are just a few examples of the well-maintained facilities that hoteliers must offer in order to attract potential visitors. According to Eshetic, Seyoum, and Ali (2016), tangibility exists a discrepancy between customer perceptions and expectations that is detrimental to overall customer satisfaction as well as experiences.

Assurance

According to Francis (2012), assurance appoints to the ability of service providers to inspire potential customers with a sense of trust and confidence when serving service. Customer happiness can be significantly impacted by assurance; thus, hoteliers must continuously focus on this aspect to comprehend the demands and wants of their guests (Tuan & Linh, 2014). Every service provider in the hotel sector should be knowledgeable in a variety of areas to boost total customer satisfaction, including the capacity to make guests feel safe while staying at the hotel, a wide range of essential knowledge about hotels, and a pleasant service attitude (Ahmad et al., 2018).

Reliability

The ability of a service provider to provide the best services within the time promised is referred to as service quality reliability (Bhawarna, Bashir & Mohsin, 2013). The hotel policies must then be strengthened so that service contributors can consistently deliver on their promises to potential guests while they are staying at the accommodation provided (Wang'ombe & Ngige, 2016). Customers are more likely to give a high perceived service quality if service providers can provide accurate information that meets their needs, which profits the overall impression of the hotel services (Gunarathne, 2014).

Research Hypothesis

In this study, there were three hypotheses tested are:

H1: There is a relationship between tangibility and customer satisfaction.

H2: There is a relationship between assurance and customer satisfaction.

H3: There is a relationship between reliability and customer satisfaction.

RESEARCH FRAMEWORK

The research model used for this study is to investigate the factors that affect customer satisfaction on the quality of hotel service. Tangibility, assurance, and reliability are the independent variables and the dependent variable is customers satisfaction on the quality of hotel service.

METHODOLOGY

Research Design

The quantitative methods used in this study to gain the data from respondents with questionnaire via Google Form. The questionnaire was created in two languages which are English and Malay to make sure respondents understand the question. This study wants to find the relationship between the factors affect customer satisfaction on the quality of hotel service. The questionnaire is having 2 section, Section A is Demography which is having 5 items while for Section B is about the variables which got 20 items. There have a 5point Likert with closed-ended questionnaire scales ranging from (1) "Strongly Disagree" to (5) "Strongly Agree" used in measuring all the variables.

Data Collection

Firstly, the researcher conducted the pilot test with 35 respondents to test the reliability. A set of questionnaires was spread to respondents in order to collect data through the social media platform. Customers who stayed at a three-star hotel in Malacca filled out questionnaires. A questionnaire may be distributed to hotel guests following the check-out process so that the researcher can obtain a response as soon as possible or random asking them to those who in rushing.

Sampling

The non- probability sampling used in this study and known as convenience sampling. Convenience sampling entails choosing participants who are frequently ready and available. It appears to be a popular student sampling technique because it is less expensive and easier to use than other sampling techniques (Ackoff, 1953).

Data Analysis

The latest version of the statistical package for social sciences (SPSS) was used to analyse all data collected via the self-administered questionnaire, and the necessary measures were implemented. SPSS is one of the perfect programmes for conducting data analysis (Raduzzi & Massey, 2019).

FINDINGS

Demographic Profile

Variables	Frequency	Percentage (%)
Gender		
Male	130	33.8
Female	255	66.2
Age		
16-40	142	36.9
41-50	29	7.5
51	12	3.1
< 25	202	52.5
Race		
Malay	266	69.1
Chinese	66	17.1
Indian	46	11.9
Others	7	1.8
Length of Stay		
1 night	118	30.6
2 nights	209	54.3
More than 2 nights	58	30.6
Frequency visit		
Once a year	201	52.2
Once every 6 months	184	44.8
Total	385	100.0

Based on the figure above, 66.2% of the respondents were females and 33.8% of them are males. Next, 142 respondents {36.9%} were aged between 26 until 40 years old. Followed by 29 respondents {7.5%} aged 41 until 50 years old. Also, 12 respondents {3.1%} aged at 51 years old. And 202 respondents {52.5%} were aged below 25 years old in total. The result also was dominated by Malays

with 266 respondents (69.1%) followed by Chinese with 66 respondents (17.1%). Also, Indians have 46 respondents (11.9%) and lastly the other race has 7 respondents (1.8%). For more than two nights there are 58 respondents (15.1%). But for one night there were 118 respondents (30.6%). And most of the respondents stayed two nights at the hotel with 209 respondents (54.3%). Lastly, there were 201 respondents (52.2%) who stay at the hotel once a year. Also, 184 respondents (47.8%) stayed at the hotel once every six months.

Reliability Test

Variables	N of Items	Cronbach's Alpha Value	N
Tangibility	5	.967	385
Assurance	5	.973	385
Reliability	5	.970	385
Customer's satisfaction	5	.980	385

The reliability results are displayed in the table presented above. The survey included three independent variables (tangibility, assurance, and reliability) and one dependent variable (customer's satisfaction toward service quality). The independent variable encompassed 15 questions, while the dependent variable involved 5 questions as designed by the researcher.

All the variables show an excellent level according to the Cronbach's Alpha Coefficient which is above 0.9. The Alpha values for all variables, as shown in the table above, indicate high reliability of the questionnaire instrument and internal consistency of the five-point Likert-type scales. The Alpha values obtained for variables demonstrate the high reliability of the questionnaire instrument and the internal consistency of the five-point Likert-type scales. It is strongly advised that in any perception study, the instrument's reliability and consistency should be assessed to ensure the reliability of the study's findings.

FINDINGS

The table below shows the results of Pearson's correlation coefficient analysis (r) for tangibility, assurance, and reliability (independent variables) as well as customer satisfaction (dependent variable). Based on the table, tangibility and customer satisfaction in the hotel industry shows a correlation of $r = 0.853$ ($p < 0.01$), while the correlation between assurance and customer satisfaction shows $r = 0.892$ ($p < 0.01$), and the correlation of reliability with customer satisfaction in the hotel industry was recorded at $r = 0.886$ ($p < 0.01$). Additionally, all the variables have a significance value of 0.000, which means that the hypotheses developed in the study are highly accepted. Based on the rule of thumb for correlation coefficient size outlined by Hair, Celsi, Money, Samouel & Page (2016), tangibility (0.853), assurance (0.892) and reliability (0.886) are all categorized within the moderate coefficient range.

Hypothesis	Result
------------	--------

H1: There is significant relation between tangibility and customer satisfaction.	Correlation Coefficient=0.889 P= 0.000	Accepted
H2: There is significant relation between assurance and customer satisfaction.	Correlation Coefficient=0.836 P= 0.000	Accepted
H3: There is significant relation between reliability and customer satisfaction.	Correlation Coefficient=0.853 P= 0.000	Accepted

DISCUSSION AND RECOMMENDATION

Customer satisfaction is defined as a metric that determines how satisfied customers are with the service provided by a company. Besides, Customer satisfaction surveys and ratings can help a company determine the best ways to improve or change its products and services (ASQ, 2023). Similar to other studies, the current study is also not without several limitations that make it harder for the researchers to complete the investigation. The first limitation is that this research just focuses on the hotels in area Malacca. However, researchers just are not focusing the respondent to respond to the questionnaire in area Malacca. But anyone that has experience stayed in a hotel in Malacca

Another limitation is by using quantitative method respondents tied to the available Likert scale. Actually, it is an easy task, but still difficult to reach during the data collection process. Some of the respondents would either ignore the survey link or misidentify the link as spam; some might have also thought that answering surveys is a waste of time.

Recommendation

There are few recommendations that should be taken into consideration for improving the research. First recommendation is to expand the study area from one state to another. In this study, the study area only covers the audience in Malacca state. Future study can be improved by expanding the area of study so that the study can reach a wider audience and cover a bigger sample size. Research should be conducted not only in Malacca but also other states that have high tourism.

Second recommendation is to use a qualitative method to observe more about satisfaction from the tourist that visits the hotel. Rather than using quantitative methods in surveys, qualitative methods should be used to obtain more thorough and detailed data. Moreover, an in-depth analysis can be made and the research result will be from the participant's perspective rather than the investigator's perspective and interpretation.

CONCLUSION

As the conclusion, this research study is happened to identity the factors that affect customer satisfaction on the quality of hotel service. This study helps to provide the hotels manager owner aiming to provide a quality of service that meets or exceeds customer expectations. This could be indicated that there is a directly proportional relationship between service quality and customer satisfaction. This hints that high quality services will lead to first-rate customer satisfaction. similarly, low quality services cause low satisfaction or dissatisfaction. Thus, it is hoped that all of the information provided throughout the research will help the upcoming researchers, students and public in good way.

ABSTRACT

Previously tourism researchers have identified the factors that influence the decision for selecting Langkawi Island as a tourist destination. The relationships between factors affecting destination selection have not been extensively studied, particularly in the context of Langkawi Island, although current research suggests a strong association between them. This research intends to examine a factor of destination selection among tourists on Langkawi Island. In addition, it was observed in the literature that there is still insufficient empirical data in explaining the factor of destination selection among tourists in Langkawi Island. The respondents to this study will be visitors who travelled to Langkawi Island. The statistical program IBM SPSS version 26 will be utilized in evaluating 384 samples of data. This study will extend the knowledge of factors of destination selection among tourists interested in this research the article in general in Langkawi Island, Malaysia.

Keywords: *destination selection, economic, infrastructure, and attraction.*

INTRODUCTION

The tourism sector offers various services and tourism products for tourists' needs on vacation, business, and other related tourism characterized travel trips (Nasir and Wongchestha, 2022). Tourism can be defined as visiting relatively unspoiled natural areas with the goal of acquiring knowledge, appreciating, and enjoying the environment and its wild flora and fauna, along with other remaining cultural and historical components. Amongst those are archaeological and historical monuments, sanctuaries, parks, hill resorts and clubs, and sea beaches, to list a few. This is a multi-sector industry that covers travel, accommodation, eating and drinking establishments, retail shops, entertainment establishments, activities, facilities, and other hospitality services provided to individuals or groups traveling away from home (Bhargava, 2009). Langkawi Island, Malaysia has evolved significantly since former Prime Minister Tun Mahathir Mohamed first visited in 1981. Several attempts have been made to develop the island, but have been unsuccessful. To benefit and expand the economy, changes and effective visitor-attracting techniques must be undertaken.

Destination selection is an important problem for service providers to handle, especially given the severe competition and clients' increased knowledge as a result of technology and the internet. This study on Langkawi Island's Destination Selection piqued our interest. Langkawi Island is a popular tourist destination in Malaysia that attracts millions of visitors every year. However, despite its popularity, there may be several factors that influence the decision-making process of tourists when selecting Langkawi Island as their destination of choice. Identifying these factors is crucial for the local tourism industry to develop effective marketing strategies and improve the overall tourism experience for visitors. Therefore, the problem statement is: What are the key variables that impact travellers' decisions to visit Langkawi Island, and how can these factors be used to strengthen the island's tourism industry?

The objective of this research are:

1. To examine the relationship between economy factors towards tourism industry in Langkawi as Destination Selection.
2. To examine the relationship between infrastructure factors towards tourism industry in Langkawi as Destination Selection.
3. To examine the relationship between attraction factors towards tourism industry in Langkawi as Destination Selection.

LITERATURE REVIEW

Destination Selecting

The factors of selecting Langkawi Island as a tourist destination. These include evaluating the location from the visitors' point of view, which includes their age and gender, family and socioeconomic status, the scope of the domicile location, and financial and physical well-being, as well as cultural, economic, and political developments, climate, and being accessible of attractions (such as cultural events, monuments, and festivals). After extensive study into this study, several characteristics have been found as explanatory variables for travellers' destination selections. These variables are roughly classified into two categories: environmental factors such as marketing data and destination features, and individual trait factors such as personal attributes and social-demographic profiles, among others. Cultural elements can significantly influence travellers' choice of destinations by influencing their social and demographic backgrounds, psychological characteristics, and choice of locations.

Economy

The first consideration is the expense of travel. This covers the cost of travel, lodging, food, and Langkawi activities. The cost of flight can be a crucial issue in deciding whether or not to visit Langkawi, since it can account for a large amount of total trip expenditures. The cost of lodging might also influence a tourist's decision to visit Langkawi. Tourists may be more inclined to visit if they can find inexpensive and pleasant lodgings, such as hotels, resorts, or vacation rentals, that meet their demands. The availability of a diverse variety of lodging alternatives may also play a role in the decision to travel. The cost of food can also influence the decision to visit Langkawi, as dining out can be a significant expense for tourists. The cost of activities and attractions can also be a factor in the decision to visit Langkawi.

Infrastructure

Tourists can decide on the Langkawi Islands as a destination because they believe the infrastructure will suit their demands and deliver a great and joyful travel experience. For example, if visitors believe the transit system is dependable, they are more likely to visit additional destinations and attractions during their stay. Additionally, if guests perceive the lodgings to be pleasant and clean, they are more inclined to return or suggest Langkawi Islands to friends. There are several factors that influence infrastructure in Langkawi Island as a vacation choice.

Transportation infrastructure plays an important role in the selection of Langkawi Islands as a tourist destination. This infrastructure includes all of the facilities and services that allow tourists to move around the islands conveniently, safely, and efficiently. The quality and availability of lodgings can influence a tourist's decision to visit, as well as their overall pleasure with their vacation. Langkawi Islands include a variety of lodgings to accommodate a variety of budgets, interests, and vacation types. There are luxury resorts, boutique hotels, cheap guesthouses, homestays, and serviced apartments to choose from.

Attraction

Attraction is one of the most important elements influencing tourism destination selecting and Langkawi Island offers several attractions that can entice tourists to choose it as their travel destination. Some of the elements contribute to Langkawi Island's popularity as a tourist destination. The first consideration is natural beauty. Langkawi Island is esteemed for its beautiful beaches, clear blue oceans, lush green jungles, and picturesque mountains. These natural features offer a calm and attractive setting that appeals to travellers looking for peace and leisure. The natural splendour of Langkawi Island creates a quiet and attractive setting that draws people looking to relax and reconnect with nature.

Research Hypotheses

The study's hypothesis is to analyse whether there is an important relationship between the factor that is dependent and the independent variables. Numerous industry pursuits have made Langkawi Island famous. In attraction, tourism has a commercial centre to attract tourists for shopping, as well as superior amenities and infrastructure. Natural attractions, such as national parks, marine parks, and waterfalls, are sites that have natural environment appeal.

H1. There is relationship between economy factors towards tourism industry in Langkawi.

H2. There is relationship between infrastructure factors towards tourism industry in Langkawi.

H3. There is relationship between attraction factors towards tourism industry in Langkawi.

Research Framework

The research's framework was described in the graphic, which comprised both independent and dependent variables. This study's independent variables include the economy, infrastructure, and attractiveness. Meanwhile, the destination selection is the dependent variable.

Independent Variables

Dependent Variable

Figure 1: Conceptual Framework of the relationship between economy, infrastructure, attraction and destination selection.

METHODOLOGY

Research Design

In this study, quantitative research design had been used. Quantitative research reviews phenomena through accurate measurements in a systematic and controlled manner (Rutberg & Bouikidis, 2018). In this study, quantitative analysis can be applied because this study wants to obtain the data about the factors of selecting Langkawi Island as tourist destination selection.

Population And Sample Size

The statistic of 2.5 million visits to Langkawi in 2022. Langkawi has recently acquired over 200,000 visitors per month and is on track to meet its target of 2.5 million inbound travelers by the end of the year. The population of the research in this study was placed in North Malaysia, whereas the sample was on Langkawi Island, Kedah. The researcher conducts this study using the stratified sampling technique. The stratified random sample is used to begin examining disparities between groups depending on race, gender, or educational attainment. You want to make a conclusion on the population as a whole. There are tourists in this population.

According to (Tabachnick, Fidell, & Osterlind, 2001), A sample size of 50 cases is regarded extremely small, 300 instances is considered decent, and 1000 cases or more is considered exceptional. The process of determining sample size for a finite population can be simplified. In this study, Krenjcie and Morgan's table was used as a reference. The required sample size for a population ranging from 500,000 to 749,999 is 384, according to (Krejcie & Morgan, 1970).

Data Collection

This study's data will be collected by stratified sampling. Stratified sampling frequently involves segmenting a population into subpopulations with potentially drastically differing characteristics. It is easier to derive more accurate findings if each subgroup is fairly represented in the sample. Visitors to Langkawi Island will be given certain questions that the researchers have prepared. Researcher collects data when they read and observe things, then write down the information they discover.

Sampling

The researcher has used convenience sampling in this case. The sampling technique consists of two methods: probability sampling, which includes stratified, simple, and cluster sampling. Non-probability sampling includes quota, convenience, and judgemental sampling. The purpose of the research was achieved using both probability sampling and non-probability sampling, with convenience sampling being the most often employed method. The targeted respondents were chosen via stratified sampling, which represented them proportionately to the population.

Research Instrument

The questionnaire had been created for a pilot test with domestic tourists. There were three portions designed: sections A, B, and C. The researcher was asked questions on demographic information in section A. Section B discussed questions regarding three independent variables which is economy, infrastructure, and attraction. portion C, the final portion, asks questions about the dependent variable, which is destination selection.

The study's instruments, for example, were adapted and modified from previous studies. Five-point ranking scales were used for these topics, with 1 indicating strongly disagree, 2 indicating disagree, 3 indicating neutral, 4 indicating agree, and 5 indicating strongly agree.

Overall, 100 surveys will be sent to visitors on Langkawi Island as part of their destination selection, and the research recommends employing 100 respondents to establish the link between economic, infrastructure, attraction, and destination selection.

Data Analysis

The Cronbach Alpha values in this investigation were examined using IBM SPSS version 25 software. IBM SPSS is an ideal initiative for this study since it gives versatility in managing and solving basic and complicated issues. As a result, employing this software to do reliability analysis in this study is beneficial to researchers. Cronbach's alpha will be used to analyse the internal consistency of the data during the reliability test. (Sekaran, 2006). The coefficient alpha value ranges from 0 to 1, with less than 0.60 indicating poor internal consistency dependability (Hair, Wolfinbarger, Ortinau, & Bush, 2008).

Next, descriptive statistics will be used to describe and summarize the data into a meaningful way. It was used for data analysis because some of the issue addressed in the study involved perception. The reason for chosen descriptive techniques in this study because involved measurement, classification, comparison, data analysis, and interpretation with the advantage of describing the state of affairs as it exists.

Data will be described and summarised using descriptive statistics, Pearson's correlation will be used to evaluate the relationship between the independent and dependent variables. Pearson correlation coefficients vary between +1.00 and -1.00.

FINDINGS

Demographic Profile

Table 2 shows the demographic profiles of the respondents. There are a total 41 respondent which 27 female respondent and 14 male respondents. Most respondents are aged between 18 to 23 years old which 73.17%, 24 to 29 years old which 19.51%, 30 to 35 years old which 4.88%, 36 to 40 years old which 0%, and 41 years old and above which 2.44%. The status , student which 75.61% and work which 24.39%. The highest travel style of respondent is traveling with friends which is 48.78% and the lowest is traveling alone or solo.

Reliability and Validity

The Rule of Thumb on Cronbach Alpha

Alpha Coefficient Range	Strength of Association
< 0.6	Poor
0.6 to < 0.7	Moderate
0.7 to < 0.8	Good
0.8 to < 0.9	Very Good
0.9 >	Excellent

Table 2
(Source Hair et.al (2003);

Essential of Business Research Method)

The Alpha Reliability Coefficient for the Independent and Dependent Variables

Cronbach's Alpha analysis was used as the reliability test technique in this study. Its purpose is to assess the questionnaire's dependability. According to Hair et al (2003), an Alpha Coefficient range of less than 0.6 considers poor, 0.6 to 0.7 is considered moderate, 0.7 to 0.8 is considered good, 0.8 to 0.9 is considered very good, and 0.9 is considered excellent. The rule of thumb on Cronbach Alpha as table 2 below.

Variable	Number of Question	Cronbach's Alpha Coefficient	Strength of Association
Economy	5	0.907	Excellent
Infrastructure	5	0.907	Excellent
Attraction	5	0.855	Very Good
Destination Selection	5	0.890	Very Good
Overall Variable	20	0.890	Very Good

Table 3

(Source SPSS)

Table 3 show all the variable with number of questions, Cronbach's Alpha Coefficient value, and correlation strength. Overall variable has 20 questions with 0.890 Cronbach's Alpha Coefficient value which strength of association is very good. The highest value is 0.907 which is variables economy and infrastructure. Attraction and also destination selection shows very good strength of association because the values are 0.855 and 0.890. Conclusion, the questionnaire is acceptable and can be use in the study.

CONCLUSIONS

During an actual study, the main objective of this pilot test research is to determine the validity and reliability of the measuring instruments that are factors in selecting Langkawi Island as a tourist destination. A pre-test was carried out to assess the content and face validity of the survey from a perspective of an expert. Furthermore, the test of reliability found that all of the items are trustworthy, with Cronbach's Alpha greater than 0.7, suggesting that no items should be deleted because they are considered good. Moreover, the study methodology was shown to be practical.

Overall, the questionnaire has been validated by examining its "reliability and construct" validity measures. The real survey, which is scheduled to collect 384 travellers', would be able to explain why travellers' chose Langkawi Island as a tourist destination. The findings of this study have some implications for existing knowledge in related domains and will be valuable for policymakers, tourist groups, and practitioners working to boost Malaysia's tourist industry. Meanwhile, it may serve as a model for future study.

ABSTRACT

This research is being done to determine what influences heritage visitors' behaviour in terms of memorable travel experiences. The study's goals are to comprehend the connections between traveller involvement, destination image, and plans to return. A quantitative approach was applied in the investigation. Data was gathered using a survey design that employed a convenience sample strategy and distributed questionnaires. 150 questionnaire responses from chosen respondents will be collected for this study. In a nutshell, this study will show that great travel experiences will influence heritage tourists' behavioural intentions.

Keywords: memorable tourism experiences, revisit intentions, visitor engagement, authenticity and destination image

INTRODUCTION

This chapter is about experience, which is an incredibly important part of life for today's traveller and has been called a megatrend. The term "experience" has been used in many ways. Students have referred to these encounters as "daily encounters" and "frontier experiences" (Pine and Gilmore) (1998) emphasise the importance of expertise throughout a genre's society, describing it as the result of the spike in economic progress that develops through the stages of the goods, commodities, and services economy. To gain a competitive advantage, the focus has shifted from products or services to expertise as another component. Experience is the heart and soul of industrial enterprises. Moreover, encounters with industrial enterprises are presented as pleasant, memorable, and interactive. (Oh, et al, 2007), as well as transient phenomena. When tourists visit a region or destination, they experience authentic, rewarding, meaningful, multisensory, and transform.

SIGNIFICANCE OF THE STUDY

Theoretical Implications

This study helps to review the existing literature on the link between MTE and behavioural intentions in the context of historical tourism in Malaysia Focus on behaviour after the experience. As part of historical tourism in Malaysia, this study showed how MTE can act as an intermediary between the Influence of visitor participation, authenticity and image of the destination on the return visit Intentions By focusing on a less studied historical tourism scenario, so will it helps better understand MTE's context-based perspective. This investigation expanded the literature on heritage tourism experiences by analyse the MTE scale in a heritage-tourism environment. He also highlighted interesting topics for future research, especially with regard to the possible influences of MTE.A In addition, (So et al. and Kim et al.) have developed visitor participation or MTE Scale (2012).

Practical Implications

The findings of this study offer destination management useful suggestions for service improvements, identifying and sustaining MTE among visitors, and boosting the competitiveness of cultural tourism destinations. The richest experiences, according to (Pine and Gilmore 1998), establish a "sweet spot" in customers and influence their future decisions and behaviour. They are also frequently the most trustworthy source of information in terms of revisit intention and visitor communications. This is crucial since well-established tourist attractions have frequently overlooked the demands and experiences of visitors in favour of product-oriented marketing and management techniques (Zhang et al., 2018). As a result, they might fail to create and offer those experiences that can be mentioned only briefly when travellers discuss their experiences, which would have a negative impact on travellers' intentions to return and would also discourage them from posting positive reviews on travel websites, especially social media.

Methodological Implications

This study will serve as a methodological base for the future studies intended on memorable tourism. The analysis of the target market's tourist needs and the tourist operator's capacity to meet those needs through the use of methods of observation, comparison, intuition, and logic, as well as the application of marketing management tools, forms the basis of the methodology of project management in the tourism industry. Furthermore, the tourism destinations need more practice and experienced tourists without negatively affecting revisit-intentions. To build a strategy that aligns with your objectives, vision, and mission in finishing the chart tourist in Malaysia, it is therefore necessary to examine the techniques or research

utilised in our industry as well as the theories or guiding concepts behind them. The Methods are the particular tools and practises you employed to gather and analyse data for the travel and tourism sector which can be directly attributed to the current paper's original methodological contribution.

LITERATURE REVIEW

Heritage Tourism

Heritage tourism is the practice of using the tangible and intangible remnants of the past as a source for tourists, focusing on living and architectural components of culture. It is one of the largest, most prevalent, and fastest-growing components of the tourism industry today. Heritage tourism is a key component of international travel consumption, making up 40% of all travel worldwide and 85% of the general populace. It reduces poverty and boosts local economies, and enables tourists to forge and enhance personal identities. MTE is important for tourism destinations to gain competitive advantage, but little research has been done on the capacity drivers of MTE within the context of legacy tourism, leading to gaps in current understanding.

Dependent Variable

- **Revisit Intention**

Independent Variable

- **Visitor Engagement**
- **Authenticity**
- **Destination Image**

Research Hypothesis

The concerns that have an impact on this issue of memorable travel experiences are shown in the literature review as an independent variable, while the dependent variable is the intention to return. The hypothesis basically serves to summarise the research on how to find, assess, and establish the relationship between the three (3) independent variables and the dependent variables. Accordingly, the following hypotheses will be investigated for this research based on the study:

2.3.1 Relationship between visitor engagement and revisit intention.

Traveller engagement improves customer support and optimises the visitor experience, and is a predictor of goal to return. Higher tiers of engagement with an area have a beneficial effect on tourists' attitudes, intentions to return, and loyalty.

H1

There is a significant relationship between visitor engagement and revisit intention.

2.3.2 Relationship between authenticity and revisit intention.

Authenticity is an important concept in tourist stories, and has been identified as a predictor of journey enjoyment and satisfaction. Empirical research has found a link between authenticity and stories of tourists who have made purchases.

H2

There is a significant relationship between authenticity and revisit intention.

2.3.3 Relationship between destination image and revisit intention

The destination image is made up of a traveller's information, assumptions, opinions, and impressions of a place, and the goal to go back to a destination is expected via satisfaction.

H3

There is a significant relationship between destination image and revisit intention.

Research Framework

Figure 2.4.1 Conceptual Framework

The relationship between the independent and dependent variables in this study is depicted in the above figure. Issues that affect visitors' memorable travel experiences and behaviour intentions are carried out by the independent variables. Importantly, this study includes three (3) independent variables: tourist engagement, authenticity, and destination image. Each independent variable will have an impact on the dependent variable, which is the intention to return.

METHODOLOGY

Research Design

Research design is a technique and framework used to construct a research study. It can be divided into quantitative, qualitative and mixed methods. This study will use a quantitative research method, which can be developed by questionnaire survey through google form. It follows the causal research design. This method is the structural way to measure and collect any data that is obtained from various sources. In addition, quantitative can be determined by the relationship between causes of the issues and factors affected by the issues. According to Oxford Fajar (2013), this quantitative research method can be developed by questionnaire survey through google form. Because it uses a large-scale research survey, this study uses quantitative methods and questionnaires because it can spread the survey through an any online platform in social media including Instagram, face book , and so on.

Data Collection

Data collection is the process of gathering, measuring, and analysing accurate insights for research objectives. In most cases, no matter the topic of research, data gathering is the first and most vital stage. Data collection is split by two which is primary and secondary. Data primary is that the style of data that the research collected through interview, survey and questionnaires, experiment and other. While data secondary may be a research method that involves using already existing data.

Nowadays, everyone has a smartphone and uses it for communication with each other without meeting or face to face with their friends, family and others. This study uses the google form questionnaire to reach the respondent to answer all the questions that research provides. Using social media like Telegram and WhatsApp can make it easier to reach the respondents, for example just share the link of google form for respondents from Kelantan.

Moreover, it is divided into primary and secondary data, and this study uses the google form questionnaire to reach respondents. The three sections of the questionnaire are Part A, Part B, and Part C. Part A focuses on the demographic segmentation of the respondents, while Part B discusses the variables suggested used in the study. Where nether is Part C focuses on visitor engagement, authenticity, and destination image.

Sampling

This observer hired the non-opportunity sampling technique. It means that there's no chance that contributors of the studies population can be uncovered to the chosen pattern (Sekaran and Bougie, 2013). The pattern approach on this has a look at a convenience sampling technique. Convenience sampling is the exercise of accumulating facts from folks or agencies who're simply to be had to do so in Kelantan. The Convenience sampling is possibly the finest technique for fast accumulating a few simple records and is maximum regularly utilised all through the exploratory segment of a study. A survey made with Google Forms will be used to gather information from responders, and it will be distributed over social media channels. This technique can save money and time by not having to meet the person face to face.

Data Analysis

Data analysis is the procedure of collecting, modelling and analysing the data which involves critical analysis and interpretation of figures and numbers to find out the reasons behind the emergence of the

main findings. There are a number of approaches and techniques for evaluating data and information gathered from a variety of various sources in order to extract the most important content. The information and data will be evaluated using the newest version of the Statistical Package for Social Sciences (SPSS) in this investigation. SPSS version 26 is a fantastic tool for folks who aren't statisticians but work in a variety of professions. SPSS version 26 is primarily used for processing and analysing statistical data and providing various outputs in order to answer objective research questions. There are numerous methods and approaches for evaluating data and information gathered from various sources in order to extract the most useful information.

The data analysis of this study will follow the following empirical tests.

- Descriptive analysis
- Correlation tests
- regression tests

FINDINGS

The research instrument is an implementation used to measure and analyse data collection of a topic study. It contains five ways to conduct the survey, including questionnaires, observation, face to face interview, experiment and group discussion. The quantitative method of study will be used, consisting of three sections: demographic questions, dependent variables and independent variables. The data collection method will be applied in English and Malay, accessible for respondents' understanding.

Basically, there are three sections in questionnaires, section A for demographic questions. That consists of age, gender, employment status also their spouse employment status, areas and number of its children. Next, section B and section C will be discussing topics that relate to dependent variables and independent variables of study. Dependent variable (section B) topics apply on visitor engagement, authenticity and destination image. While independent variables (section C) develop questions about revisit intention. Generally, this data collection method will be applied in dwi-languages, which are English and Malay, accessible for respondents' understanding. The measurement of Likert code (from the scale 1 to 5) and questionnaires for this study are shown in the appendices section at the end of questions.

DISCUSSION AND RECOMMENDATION

The data for the significant independent factors in relation to the dependent variable. The dependent variable, revisit intention, was found to be related to three independent variables: visitor engagement, authenticity, and destination image. Visitor engagement and destination image have the same significant value of 0.000 among these independent variables. 0.664 is the significant value for authenticity. As a result, visitor engagement, authenticity, and destination image are three distinct components that are linked to revisit intention.

For the recommendation, researchers should consider conducting in-depth interviews with respondents in person to gather more detailed data and answer questions about the impact of Covid-19 on memorable tourism experiences. Researchers should obtain permission from the police station to conduct face-to-face interviews, and improve internet connection support for those conducting interviews through Google Meet. Universities should publish qualitative research reports and provide secondary data sources to gather information. The study should be extended to other parts of Kelantan to obtain better results. For limited time, researchers could create open-ended questions in Google Forms and send them via WhatsApp, Telegram, Instagram, and email. Additionally, researchers should include all programmer students in university from the first year to the fourth year of study, reducing misunderstandings and biases.

CONCLUSION

The purpose of this study was to identify the factors that influence the behavioural intentions of heritage tourists among students at the University Malaysia Kelantan. This study also created a conceptual framework and explored the elements that contributed to revisit intention in the tourist business. The conceptual framework is one of the major elements that have been discovered in relation to the research difficulties and past research studies. The researchers anticipate that the findings of this study will be useful to future studies.

Wenzhou-Kean University, China

ABSTRACT

Community-based tourism is an important industry in helping to increase the interaction between the existing community-based diversity because it creates and strengthens the identity of a country. The purpose of this study is to identify factors that influence tourists to engage in community-based tourism in Kelantan, Malaysia. Therefore, this study examines the factors of tourist involvement directly and indirectly through the level of satisfaction at the tourist destination. Data will be collected from the cooperation of tourists to help provide an overview of the development of the community-based tourism industry in Kelantan, Malaysia. To investigate the involvement of tourists, this study will use the Statistical Package for Social Sciences (SPSS) which consists of descriptive analysis and correlation. In addition, the literature review proves that uniqueness, campaign and promotion, and accessibility are the main factors for tourists to start and continue to be involved with the community-based tourism industry. Uniqueness are the most significant factor of the independent variable is uniqueness between tourist involvement with community-based tourism in Kelantan, Malaysia.

Keywords: Kelantan, Malaysia, Community-based Tourism, Re-visiting, Intention, Insight for Tourists.

INTRODUCTION

Tourism has become among the most crucial and quickly growing industries in the world. (2015) (Daniloska and Hadzi Naumova-Mihajlovska). This industry has made significant improvements towards becoming a critical engine of economic growth. Tourism accounts for 9% of worldwide GDP, according to the World Tourism Authority (2014). Furthermore, it is expected that over 1050 million foreign and more than 5 billion domestic tourists visited various tourist destinations in several countries in 2013. Based on the point of

view of society, it has been acknowledged that community engagement is an important component impacting people's support for the development of tourism, especially in rural areas.

Furthermore, in recent decades, tourism in South East Asia has grown considerably on both a national and international scale (Turner & Freiermuth, 2016). By 2025, the tourism sector in South East Asia is projected to directly support 15,510,000 jobs and more than USD 528 billion in GDP. Most people in rural areas, according to Mason and Cheyne [30], may have different perspectives on tourist development, resulting in different levels of community attachment and finally, influencing their support for tourism development. Tourism is considered as one of the most major sectors in South East Asia, coming next after manufacturing and agriculture, especially for Malaysia and Thailand. (2011) (Bhuiyan, Siwar, Ismail, Islam, and Ehsan).

The country's tourism industry, like those of other developing nations, is expanding (Shariff & Abidin, 2013). It substantially raises the country's GDP by producing foreign exchange, providing employment opportunities, increasing tax receipts, and increasing economic possibilities for the residents (Ibrahim, 2010; Jalis, Zahari, Izzat, & Othman, 2009). Malaysia's government has implemented strong action to develop this industry (Siti-Nabiha, Abdul Wahid, Amran, Haat, & Abustan, 2008). The Ministry of Tourism developed the Tourism Policy in 1992 to encourage the establishment of Malaysia's tourism industry. However, because of the diversity of Malaysia's culture, the value of tourism growth to local economies is different across the country.

Although community-based destinations for tourists are an increasing part of the tourism industry in countries that are developing such as Malaysia, concentrating on these locations in the country's isolated areas might offer an opportunity to effectively follow the federal government's tourism plan. 2017 (Chin & Lo). Community-based tourism (CBT) is among the most current type of tourist product, in which local communities organize and establish a great deal of the tourism-related events (Kaur, Jawaid, & Othman, 2016). While getting involved with community-based tourism, tourists may be able to learn more about a community's way of life, heritage, and customs (Kaur et al., 2016). Tourism is an acknowledged factor to the rise in expenditure on tourism in the majority of emerging countries (Promsivapallop & Kannaovakun, 2017).

There are three objectives in this research:

- 1) To investigate the relationship between the atmosphere and re-visit intention.

- 2) To examine the relationship between cultural environment and re-visit intention.
- 3) To identify the relationship between the destination brand and re-visit intention.

SIGNIFICANCE OF THE STUDY

1. Practically Significance

This study is the practice to help develop community-based tourism in Malaysia. The researcher expects this study to increase the number of local and foreign visitors who want to visit Malaysia. Considered the following changes to increase the number of tourists participating in Malaysia's community-based tourism. Uniqueness is an important consideration since it is a national emblem that aids in the promotion and attraction of tourists to Malaysia.

2. Theoretical Significance

This study adds to the understanding of Malaysian tourists' intention to return home. This research will add to the knowledge gained from the environment of developing countries. Several sites are important subjects for local community-based tourism destinations in Kelantan, Malaysia, with great potential for strategic market differentiation. These places are becoming increasingly popular among domestic and foreign tourists as national community based tourism destinations. The surrounding area is uninhabited and has the same and unique resources and environment for tourism related activities. This community-based tourism destination is owned and operated by the local community.

3. Methodology Significance

This study will serve as a methodological foundation for studies that fail but will be revisited in Kelantan, Malaysia. The population of the present study consisted of tourists who visited several community-based tourism sites in Kelantan, Malaysia, in accordance with the methodology's importance. Because of the popularity of its nature attractions and community based attractions relative to other states in Malaysia and Kelantan was selected to represent Malaysia.

LITERATURE REVIEW

The dependent variable and independent variable are discussed in the literature review. A variable that is being measured or tested in an experiment is known as a dependent variable.

In an experiment, a dependent variable is a variable that can change depending on the independent variable, which is a variable that a researcher can change throughout the research. Researchers can look at the dependent variable to see how the independent variable influences it. Unlike the independent variable, the researcher makes no changes to the dependent variable during an experiment.

The second stage is to alter a component of the study, and the final step is to assess the prospective outcomes. In this literature review, the researcher has discovered three points in the independent variable. If the value of an independent variable changes, the researcher is in control of the change and it is not the consequence of external influences. The researcher chooses the independent variable. Unlike the dependent variable, whose values are still being determined by the experiment, the researcher can identify what it is.

RESEARCH HYPOTHESIS

In this study, three hypotheses had been examined namely;

H1: In Kelantan, Malaysia, there is an important relationship between the atmosphere and re-visiting community-based tourism intention: Insights for Tourists.

H2: In Kelantan, Malaysia, there is an important relationship between the cultural environment and re-visiting community-based tourism intention: Insights for Tourists.

H3: In Kelantan, Malaysia, there is a considerable relationship between the destination brand and re-visiting community-based tourism intention: Insights for Tourists.

RESEARCH FRAMEWORK

For the purpose of examining the association between independent variables (atmosphere, cultural environment, and destination brand) and dependent variable (re-visit intention), the following research methodology was developed. Furthermore, this framework can establish which of the following characteristics appear to be the most influential factors of returning to community-based tourism in Kelantan, Malaysia: Tourist Information.

Research Design

The researcher will use this causal study approach for this assessment. Informal study can be defined as examining the connection between cause and effect between multiple variables. Many businesses regularly apply causal analysis. It allows the evaluation of the implications of process advancements and modifications to current exercises. The researcher will employ a technique that is quantitative. A quantitative research approach is a method of determining data from a questionnaire or survey that is used during the study.

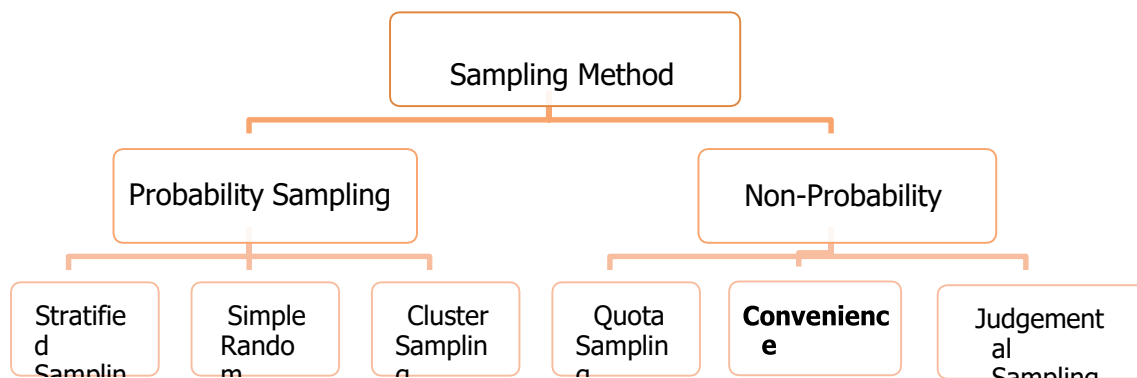

This is the most common method for study participants to provide more data. A quantitative research design, according to Bhandari (2020), is a method for gathering data to figure out who, where, and what the researcher wants to learn. For conducting the research and evaluate the data obtained, the tools of this study will include quantitative analysis with a design that is descriptive. These researchers are using such an approach to identify the elements that affect visitors' engagement with cultural tourism as well as the desire to return to community-based tourism.

Data Collection

Warner creates a data gathering strategy, such as the randomly response technique, that allows researchers to collect data while protecting respondents' privacy. Data collection is defined as a technique for obtaining and evaluating data for research and validation purposes. Data is gathered to investigate a problem, as well as to find its solution and potential future trends. The data collection procedure used in this study is questionnaire. The survey questionnaire is a type of data collection technique used to gather, analyse, and interpret the various viewpoints of a group of individuals from a specific population.

The survey questionnaire will be used in many different fields, including psychology, marketing, research, and politics. After they are finished, all of the questionnaire will be collected and then the researcher will count the number of questionnaires that have been distributed to them. By using this data collection procedure which is questionnaire the researcher can save their time and this method is also relatively inexpensive. There are two sorts of data that will be collected in this procedure which is primary data and secondary data. Primary data can be gathered using a variety of methods.

Sampling Method

In this part, the probability sampling and non-probability sampling methods were utilised to meet the study's purpose. The sampling technique is made up of two methods: probability sampling, which includes stratified, simple, and cluster sampling. Quota, convenience, and judgemental sampling are examples of non-probability sampling. In this study, however, the researcher chose convenience sampling. Convenience sampling is a method used by researchers to acquire market research data from a pool of conveniently available respondents. It is the most often used sample technique since it is fast, easy, and inexpensive. Convenience sampling procedures were utilized to meet the study's aim, and respondents were carefully picked to check that they were the intended respondents. When extra inputs are not required for the primary inquiry, researchers use convenience sampling. There are no requirements for being a part of this sample.

Data Analysis

The research would prepare the analysis for analysis once it had been processed, arranged, and cleansed. Depending on the objectives, several data analysis approaches are available to comprehend, evaluate, and draw conclusions. If you want to understand the

messages in the data, you can also utilize data visualization to explore the data in a graphical style.

Statistical data models such as correlation and regression analysis can be employed to determine the relationships between data variables. The study may be made more straightforward, and the results are easier to express with the aid of these models that are descriptive of the data. As a result, these operations are iterative. The process may call for extra Data Cleaning or new Data Collection.

1. Correlations

It will demonstrate the presence of a correlation between the two variables without explaining either the source or the effect. To accomplish the goal of this research study, the researcher will employ the most appropriate technique, namely Pearson correlation can be employed to identify the connection among independent variables, such as uniqueness, campaign and promotion, and accessibility, and the dependent variable, which is tourist engagement with Malaysian cultural tourism.

2. Regression

The advancement that follows correlation is regression. This technique is employed when attempting to forecast a variable based on the value of another variable. The dependent variable is the one we're trying to indicate or the outcome variable. The variable we use to predict the other variable's value is the independent variable or the predictor variable. For example, you might apply linear regression to determine whether test achievement can be anticipated based on revision time, whether cigarette intake can be predicted based on smoking length, and so on. Researcher must use multiple regressions if you have two or more independent variables rather than simply one.

FINDINGS Table 1: Descriptive Analysis Result

Descriptive Statistics					
	N	Minimum	Maximum	Mean	Std. Deviation
age	200	1	50	2.57	3.948
gender	200	1	2	1.84	.368
status	200	1	2	1.12	.326

education	200	1	5	2.79	.662
Atmosphere: IV1	200	3	5	4.61	.557
Cultural environment: IV2	200	3	5	4.66	.528
destination brand: IV3	200	3	5	4.67	.521
revisit intension: DV	200	3	5	4.63	.547

The mean as well as the standard deviation of the independent and dependent variables are shown in Table 1. The independent variable with the highest mean is destination brand (4.67). The cultural environment follows in second with a score of 4.66. The lowest mean is 4.61 for the atmosphere. The researcher only has one dependent variable in this study, which is re-visit intention, which is 4.63.

Table 2: Reliability Test

Reliability Test	N	Cronbach's Alpha	Cronbach's Alpha Based on Standardized Items	N of items
TOTAL	200	.958	.960	16

Table 2 shows Cronbach's Alpha for all independent and dependent variables of dependability was 0.958, whereas Cronbach's Alpha for standardized items was 0.960. The coefficient values of the variables were found to be excellent in terms of dependability level.

A common rule of thumb for characterizing internal consistency using Cronbach's Alpha is presented in the table below.

Table 3: Pearson Correlation

Correlations

		Atmosphere	Cultural Environment	Destination Brand	Revisit Intension
Atmosphere	Pearson Correlation	1			
	Sig. (2-tailed)				
	N	200			
Cultural Environment	Pearson Correlation	.757**	1		
	Sig. (2-tailed)	.000			
	N	200	200		
Destination Brand	Pearson Correlation	.742**	.839**	1	
	Sig. (2-tailed)	.000	.000		
	N	200	200	200	
Revisit Intension	Pearson Correlation	.690**	.780**	.834**	1
	Sig. (2-tailed)	.000	.000	.000	
	N	200	200	200	200
** . Correlation is significant at the 0.01 level (2-tailed).					

Table 3 shows the Pearson Correlation. The objective of this analysis is to determine whether there is a correlation between dependent variable and independent variable. Cronbach's Alpha was 0.958 for all independent and dependent factors of dependability, whereas Cronbach's Alpha for standardized items was 0.960. The coefficient values of the variables were found to be excellent in terms of dependability level. A common rule of thumb for characterizing internal consistency using Cronbach's Alpha is presented in the table below.

DISCUSSION & RECOMMENDATION

The findings in this study from this study has shown that there is a significant association ($r = 0.690$, $p=0.01$) between atmosphere (IV 1) and re-visit intention (DV). Pearson Correlation 0.690 suggested a relationship between atmosphere and want to return.

Simultaneously, the significant level of both variables, 0.000, was shown to be very significant, with a modest degree of significance. To conclude, atmosphere and re-visit intention affect the tourist's decision whether they want to visit Kelantan again.

Secondly, the findings also found the significant relationship between cultural environments and re-visit intention. There was a significant connection between the cultural environment (IV 2) and re-visit intention (DV) ($r = 0.780$, $p=0.01$). Pearson Correlation 0.780 suggested a relationship between cultural environment and re-visit intention. Simultaneously, the significant level of both variables, 0.000, was shown to be very significant, with a modest degree of significance. The researcher found that the re-visit intention and the cultural environment had a good relationship based on the data. To conclude, cultural environment also affects the tourist's decision to re-visit Kelantan again. This is because cultural environment is also an important factor. If the cultural environment in a state is good it will make tourists want to revisit the place.

Lastly, the findings also indicate a significant relationship between the destination brands and re-visit intention. The relationship between destination brand (IV 3) and re-visit intention (DV) is significant ($r = 0.834$, $p=0.01$). Pearson Correlation 0.834 demonstrated a favourable relationship between destination brand and inclination to return. At the same time, the significant level of both variables, 0.000, was shown to be very significant, with a moderate degree of significance. The researcher found that the re-visit intention and the cultural environment had a positive connection based on the information gathered. To conclude all of this destination brand is the main factor why tourists need to re-visit Kelantan when they have free time. But it does not mean that The only cause why tourists come Kelantan is because of the destination brand. The other factors such as atmosphere and cultural environment also play a crucial role in determine whether tourists want to visit Kelantan again or not.

This study, including many other research, has limitations. It is limited sample size to perform whole respondents of the re-visiting community-based tourism intention in Kelantan, Malaysia: insights for tourists. Due to the time and resource limits, the researchers have distributed 200 questionnaires which measured as a limited sample size to conduct for study.

The limitations also use questionnaires through quantitative. It was being facing during the finishing this task is understanding of questionnaire by the respondents. Moreover, the respondent didn't fully understand what the question need and they just filling the answer without knowing either the answer is correct or not. Lastly is the researchers only focus on

three variables from International Journal of Business and Society, Vol. 20 No 2, 2019, 585604. It was a quite hard for researchers to do this study because all of the questionnaire must related with the variables that has been provided in the journal.

Future researchers are recommended to expand the study area from one state to another state around Malaysia especially Kedah who have the best place such as Langkawi to get a higher number of respondents based on the re-visiting community-based tourism intention, insights for tourists. This will provide a higher number of respondents allowing the results to increase. Future researchers are also recommended to change the method from quantitative to qualitative as their questionnaires because the method of qualitative is much easier to get the data. The researcher just need to go an interview the owner or the event organizer as the respondents and can also improve their skill in communicate with other people and help them to become a brave and build more confidence for their self. Future researchers also can use other variables from another journal. This can help this study to get more info especially the journal that are related for this study wants to do. It also can help this study become a good journal because it can give much information to the others people.

CONCLUSION

This study aims to explore the factors influencing tourists' engagement in community based tourism in Kelantan, Malaysia. The research aims to identify factors that influence tourists to engage in this industry, both directly and indirectly, through the level of satisfaction at the tourist destination. The study will use the Statistical Package for Social Sciences (SPSS) to investigate the involvement of tourists.

The study's findings will help inform the development of the community-based tourism industry in Kelantan, Malaysia. The findings will be implemented in directing the growth of the industry as well as the development of the region's tourism sector. The study's findings will be used to inform the development of the tourism industry in Kelantan, Malaysia, and to inform the development of the tourism industry in the region.

In conclusion, this study provides valuable insights for tourists interested in community-based tourism in Kelantan, Malaysia. By examining the factors influencing tourists' engagement in this industry, the study aims to contribute to the growth and development of the tourism industry in the region.

ABSTRACT

One of the most significant modern challenges confronting many rural tourism groups and destinations is maintaining stability. ICT expertise has a wide variety of consequences for the achievement of sustainable rural tourism. The goal of this study is to develop a theoretical model for homestays in Malaysian rural society that incorporates information from ICT competency and sustainable tourism marketing literature. The purpose of this study was to investigate the relationship between ICT competency and sustainable tourist marketing in the setting of rural homestays in Malaysia. A self-administered questionnaire was used in conjunction with a disproportionate stratified random sample procedure to reflect participant attitudes. This survey included 180 owner homestays in Kelantan. To verify the study hypothesis, a multiple regression method was used. According to the study results, there is a strong relationship between the antecedent (ICT competency) and the consequent (sustainable tourism marketing). The report also suggests using sustainable tourism marketing as features and capabilities strategy to encourage and monitor the long-term effectiveness of rural tourism. The study aims to provide a commitment to Malaysian tourism, where sustainability is acknowledged as a working system aspect and long-term objective.

Keywords: Information and communication technology, The Ministry Of Tourism, Arts, Culture, Corporate social responsibility, General Practice

INTRODUCTION

Information technology is also referred to as information and communication technology (ICT). It highlights the importance of offers an effective network and the convergence of computers and telecoms. It also includes the specific item, networking, memory, and corporate software that users need to access, save, transfer, comprehend, and alter information. Researcher focus on owner's homestay in Kota Bharu, Machang, Bachok and Pasir Puteh, Communication technology (ICT) and sustainable tourism marketing could be further expanded to advance their homestays

SIGNIFICANCE OF THE STUDY

PARTIAL SIGNIFICANCES OF STUDY

The main prerequisite for promoting sustainable tourism is information and communication technology (ICT) competence. Expanding their information technology knowledge and increasing the share of Information technology users in rural tourist industry should be the objectives of policymakers. Information and communication technology (ICT) proficiency develops metrics for tracking tourists' sustainable travel practises, and the sustainable transformation of rural tourism goods. Information and communication technology (ICT) offers priceless chances to manage the visitor experience, support cutting-edge tourism products, and create novel marketing methods. Improvements in rural living styles and social and economic development are influenced by information and communication technology (ICT) expertise.

THEORETICAL SIGNIFICANCES OF STUDY

When used in contrast with information and communication technology (ICT) competency, this study helps to illustrate the triple bottom line hypothesis. To enhance the societal, economical, and environment sustainability aspects of a rural community-based homestay offering, the triple bottom line theory appears to be an appropriate basis. A unique contribution to the literature on sustainable tourism is made by the model, which demonstrates agreement here among theory is a qualitative and the findings of its components. The usefulness of this causal model is increased by the fact that it is not limited to a particular location or tourism environment.

LITERATURE REVIEW

ICT use was explored in reference to the UN Organisation 2030 Sustainable Development Agenda (UNO). The degree to which a business is aware of this and efficiently manages data inside the firm is known as its ICT competency. The three ICT competence pillars focus on resources that show the group's aptitude for understanding and utilising ICT technologies and procedures that are anticipated to handle market and customer data (Tippins & Sohi, 2003). A tourism company's ICT competence is made up of ICT Processes, Skill levels, and ICT Products. ICT items are conceptualised as computer equipment, application, and support staff (Tippins & Sohi, 2003). ICT management is defined as a company's utilisation of ICT to manage marketplace and client information (Tippins & Sohi, 2003).

VARIABLE EXPLANATION

1. INDEPENDENT VARIABLE

The first independent variable is Environmental sustainability tourism marketing practices. The need to maintain natural resources while maintaining conserving global ecosystems for future and current wellbeing and quality of life is known as environmental sustainability. Because many climate-related decisions do not have an immediate impact, among the most significant characteristics of environmental sustainability is all forward nature.

The second independent variable is CSR practices. Corporate social responsibility is refer to managing idea that urges businesses to take cultural and physical factors into account in their daily operations and consumer interactions. CSR, sometimes known as the "Triple-Bottom-Line Approach," describes an industry's attempts to uphold its commitments to financial, physical, and cultural goals while still achieving consumer and shareholder expectations.

The last independent variable is Economic sustainability tourism marketing practices. Economic sustainability related to measures which promote long-term economic expansion, while not drastically compromising the society's basic, environmental and health, and cultural components. This means that the government sector, in particular, will encourage jobs and industries that enhance the environment and people's well-being.

2. DEPENDENT VARIABLE

Dependent for this research is ICT competency. The architecture and elements that allow installation software are referred to as information and communications technology. Despite the lack of a single, universal definition of ICT, it is broadly acknowledged to refer to all equipment, switches and routers, software, and systems that collaborate together to allow organizations and individuals, for example, companies, charitable groups, authorities, and crime firms to communicate in the virtual environment.

Theoretical framework

Sustainability refers to a country's, a group of social structures, or a cultural firm's long-term vitality. Sustainability is known as a generational ethical where current generations' environmental and economic decisions do not limit the possibilities for future generations to experience comparable degrees of prosperity, usefulness, or well-being (James Meadowcroft, 2022). In order to ensure societal (justice and equality), economic, and environmental sustainability in the development of a sustainability travel industry and destinations, STM develops market tactics (Cristobal-Fransi et.al, 2020). The "Triple Bottom Line" (TBL) refers to these three sustainability pillars (Elkington, 2004).

Research Hypothesis

Understanding the relationship between ICT and sustainable tourist marketing is essential for the development and the tourist industry's success (Ali & Frew, 2014). ICT is a crucial tool for improving sustainable marketing strategies, and it has a favourable relationship with the likelihood that tourism organisations will adopt sustainability marketing innovations (Divisekera & Nguyen, 2018). Effective sustainability marketing can dramatically raise tourists' understanding of their effects on sustainability with the aid of ICT (UNWTO, 2017). ICT integration in the tourism industry is thought to benefit sustainability marketing. In fact, one of the main factors influencing the sustainable expansion of the tourist industry is the adoption and ICT adoption by tourism businesses (homestays) (Divisekera & Nguyen, 2018).

To position ICT as a key enabler of environmental sustainability, knowledge of environmental sustainability is required (Ojo & Fauzi, 2020). By increasing resource usage efficiency and transforming homestay marketing tactics into more environmentally friendly ones, ICT aids tourist businesses (homestays) in their pursuit of environmental sustainability (Wang, Chen, & Benitez-Amado, 2014). In order to attain professional socially sustainable outcomes, productive sector on ICT increase productivity of procedures, and systems and help to make more readily available CSR data for partners (Uyar et al., 2020). By generating financial gains for residences in popular tourist areas, innovative ICT use supports sustainable tourism marketing (Gretzel et al., 2020). The following hypotheses can be developed in light of the topic regarding ICT proficiency and the role it plays in marketing communications practises that were just mentioned.

H1

ICT Competency positively affects Environmental Sustainability Marketing practices of Homestays in Malaysia.

H2

ICT Competency positively affects the CSR practices of Homestays in Malaysia.

H3

ICT Competency positively affects Economic Sustainability Marketing practices of Homestays in Malaysia.

Research Framework

The researchers have established a framework to explore the relationship between ICT and sustainable tourist marketing based on the previous literature evaluation. Consequently, the conceptual framework is depicted in the diagram below.

Figure 1: Conceptual Framework

Environmental sustainability tourism marketing practices are the responsibility to protect global ecosystems and natural resources for both present and future health and quality of life. most important components of environmental stability its upwards component, because many climate-related actions do not have an immediate impact. Indeed, according to the US Environmental Protection Agency, it serves current requirements without endangering the potential of the outcomes to satiate future needs. As a self-regulatory business model, corporate social responsibility (CSR) practise helps a corporation be socially responsible to their own, its partners, and the broader public. Businesses that use sustainable business practises, also known as "governance," are conscious of how their actions affect all facets of society, including monetary, cultural, and lifestyle factors. This implies that the public sector, in particular, will support occupations and businesses that improve the environment and the welfare of people.

METHODOLOGY

Research Design

A research design describes the steps taken to gather, examine, analyse, and present data in research investigations. In other words, the study's design defines how the crucial information will be gathered, examined, and used to address the research question. Surveys were applied in this study because they allow for the collection of quantitative data and the application of a deductive hypothesis testing strategy to examine the association between variables. Casual research can be used to evaluate marketing campaigns, enhance internal procedures, and improve business planning. The best methods

for meeting your demands can be determined by understanding how one scenario impacts another. The survey questionnaire was conducted among Malaysian host families. The respondents' data were gathered using a disproportionate stratified sampling technique. In order to examine seven or fewer constructs, the current study proposes a sample size of 180 respondents (Hair et al., 2018). The overall number of visitors at homestays in Kelantan, Malaysia that have been registered, as of June 2018, according to the MOTAC report.

Data Collection

Data collection is obtaining, quantifying, and evaluating relevant information for study purposes using a dependable, and acknowledged methodology. Researchers can assess their hypotheses based on the evidence gathered. Primary or secondary data sources may be used in data collection. The type of data obtained by research through questionnaires. While secondary data was gained from textbooks and journals, this is a research strategy that incorporates the use of already collected data. The real questionnaire had 180 responses of owners and was administered in Kelantan. Researchers utilise Google Forms to save money and time by having respondents complete the questionnaire more quickly and effectively.

The Google form has three parts. For example, section A, B, and C. The first section involves questions regarding demographics of the respondent's segmentation and has six questions to answer. That consists of gender, nationality, homestay location, units, duration, and type of room. Meanwhile, section B discusses the variables suggested used in this study. It will discuss the independent variable, Environmental Sustainability Marketing practices, CSR practices and Economic Sustainability Marketing practices. Section C will focus on all of the dependent variables, such as the affected of ICT Competency.

Sampling

Through the use of sampling, the researcher may extrapolate data about the population from the findings of a sample of the population without needing to look at every single person. In the sampling method, the researcher selects some elements of the population as the focus of the study. Several different sampling techniques are available, and they can be split into two groups. For example, probability sampling and non-probability sampling. Probability sampling is the process of selecting individuals from a community that are reflective of the community. When it comes to quantitative research, there are four fundamental kinds of selecting processes. Simple random, sampling process,

sampling techniques, and cluster sampling are some of them. In this study, the researcher chose a convenient sampling technique. The researcher takes samples from homestay details. Researchers selected a sample of detailed of owner in homestays that located in Kelantan.

Data Analysis

Regression analysis is a class of data analysis for determining the relations between a dependent variable and one or even more independent variables. The researcher is employing the Statistical Package for the Social Science in this study (SPSS). A collection of network applications has been combined to become SPSS. The main use of this programme is the evaluation of social science-related empirical data.

Additionally, SPSS is a cutting-edge piece of software that researchers use to process crucial data in a straightforward manner. Working with data is a difficult and time-consuming task, but with the help of a few tricks, this programme can manage and operate data with ease. These techniques are applied between different data variables to analyse, manipulate, and produce a distinctive pattern. Additionally, the output can be represented graphically so that a user can quickly understand the result.

This study will use the following analysis:

12. Descriptive analysis
13. Corelation analysis
14. Regression analysis

FINDINGS

Demographic Analysis

4.2.1 Respondent Demographic Profile

4.2.1.1 The number of respondents based on Gender.

Gender	Frequency	Percent
Male	68	38
Female	112	62
Total	180	100

Table 1: statistic table based on gender

Figure 1: Pie chart of respondent based on gender

Figure 1 shows the percentage of the respondent that based on their gender. Total of all respondents is 180 respondents. Out of 180 respondents the highest number of genders is female with 62% (N=112) while the male has 38% (N=68). This result shows that the percentage of female and male respondents is balanced, which increase the study validity.

4.2.1.2 The number of respondents based on Nationality.

Nationality	Frequency	Percent
Local	153	85
Foreign	27	15
Total	180	100

Table 2: statistic table based on nationality

Figure 2: Pie chart of respondent based on nationality

Based on the result from Figure 2, the table show the statistic table that based on nationality of the respondents. In this research, the local respondents have the highest percentage compared to the foreign. Local respondents have higher percentage with 85% (N=153) respondents. While foreign have 15% (N=27) respondents.

4.2.1.3 The number of respondents based on Location.

Location	Frequency	Percent
Kota Bharu	100	56
Machang	22	12
Bachok	28	15
Pasir Puteh	30	17
Total	180	100

Table 3: statistic table based on location

Figure 3: Pie chart of respondent based on location

Figure 4 illustrate the respondents based on respondents' location. The highest of location with 56% (N=100) respondents is homestays at Kota Bharu. While 17% (N=30) of the respondents have homestays at Pasir Puteh which is the second highest on location. The followed by 15% (N=28) respondents have homestay at Bachok. And the last location is Machang certificate which is 12% (N=22) respondents.

4.2.1.4 The number of respondents based on Duration.

Duration	Frequency	Percent
One	68	38
Two	46	25
Three	34	19
More than three	32	18
total	180	100

Table 4: statistic table based on duration

Figure 4: Pie chart of respondent based on duration

Figure 4 shows the percentage of the respondent that based on duration. Out of 180 respondent the highest of duration is one that homestay unit's respondents have with 38% (N=68) respondents followed by second highest is two units with 25% (N=46) respondents. The followed by 19% (N=34) respondents have three homestay units. And the last duration is more than three units which is 18% (N=32) respondents.

4.2.1.5 The number of respondents based on Type of Rooms.

Type of rooms	Frequency	Percent
Single	50	28
Double	103	57
Dorm type	22	12
Others	5	3
total	180	100

Table 5: statistic table based on type of rooms

Figure 5: Pie chart of respondent based on type of rooms

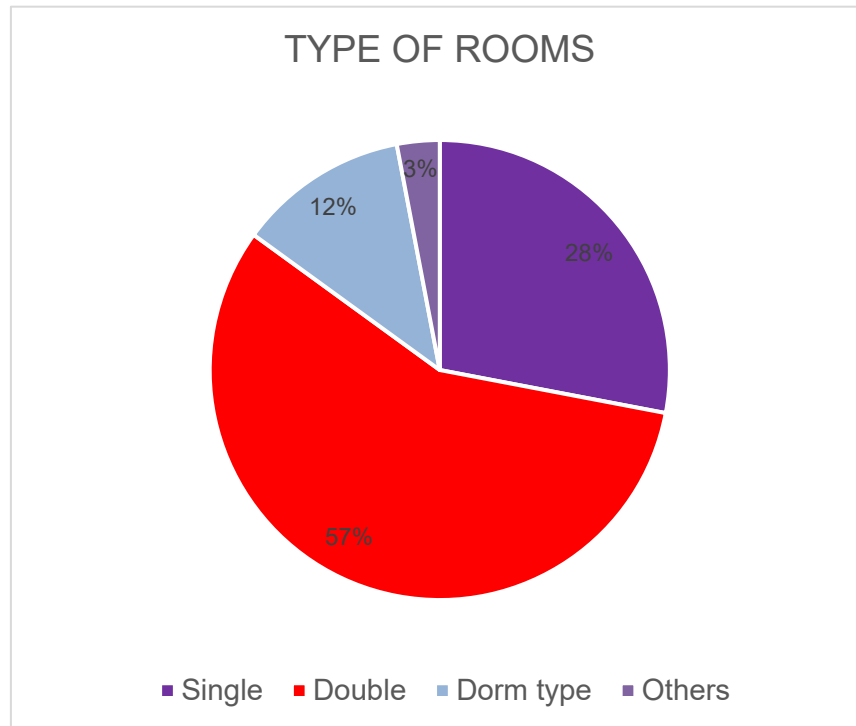

Figure 5 shows the frequency and percentage of the respondent that based on types of rooms their homestays. This questionnaire elicited responses from 180 people. Out of 180 respondent the highest number type of rooms is double room with 57% (N=103) respondents followed by second highest type of rooms is single room with 28% (N=50) respondents. While the third highest is dorm type with 12% (N=22) respondents and the last one is others with 3% (N=5) respondents.

DESCRIPTIVE ANALYSIS

For independent variable 1. The highest response is question 1 and question 2. The question is “We safeguard the environment as a whole” and “We inform our guests about our environmental practices during their stay” which is 43% respondents’ response for strongly agree. While for the question “When our guests come, we enlighten them about our environmental practices” with 42% respondents’ response for agree. This is accurate because protecting the environment is a vital objective that calls for group actions.

For independent variable 2. The highest response for this table is question “We provide staff training possibilities” which is 52% respondents was response for agree. While question “We take an active part in social and cultural events. Traditional games, traditional dances, traditional cuisines, and traditional art are all examples” with 49% respondents was response for agree and “Regardless of gender, ethnicity, nationality, or religion, we treat all of our employees fairly and without any forms of abuse or discrimination” with 49% respondents was response for strongly agree. Both of this question is the highest response by respondents. And the next question is “We advise our staff to participate in community service” and “We provide employees consistent career possibilities” with 47% respondents for agree.

For independent variable 3. The highest response for this independent variable is question 9 which is “In order to ensure that future generations have a better future, we have invested in our homestay to help under-privileged sections of the society” with 49% respondents’ response for agree. While the second highest is question “We are dedicated to enhancing the safety of the communities where we conduct business. For example, providing self-employees opportunities and reducing poverty by employment and business creation” dan “we contribute to the social and economic well-being of women and rural residents by creating career chances and generating revenue” with 48% respondents response for agree.

For dependent variable (DV). The highest response is question 15 and 16 which is “To store and process information for our homestay accommodations, we rely on ICT such as reservation software, and property management software” and “The management of our ICT is one of the primary responsibilities of an executive we've hired such as reservation software and property management software” with 49% respondents’ response for agree. The second highest is question “Information and communication technologies (ICT) knowledge is possessed by certain of our personnel. Example: Computers, smart phones, printer” with 48% respondents’ response for agree. And the last one question “We understand how to develop communication connections with our present clients using the most recent social media platforms. Example: Facebook and Instagram” with 46% respondents’ response for strongly agree while the question “When it comes to handling customer information, we regularly use decision-support systems. Example: social media and mobile apps, also with 46% respondents’ response but for agree.

RELIABILITY ANALYSIS

Reliability Test	N	Cronbach's Alpha	Cronbach's Alpha Based on Standardized Items	N of items
TOTAL	180	.947	.950 ?	16

Based on the reliability results shown above, the researcher has verified all of the independent and dependent variables. For all independent and dependent factors of dependability, Cronbach's Alpha indicated a value of 0.947, whereas Cronbach's Alpha based on Standardised items reveals a value of 0.950. The coefficient values of the variables range as excellent in terms of reliability level, as was demonstrated. A common guideline for characterising internal consistency using Cronbach's Alpha is presented in the table below.

PEARSON CORRELATION ANALYSIS

Table: Result of Pearson Correlation Analysis

		Correlation				
		EST	CSR	ESTM	ICT	
EST	Pearson Correlation	1				
	Sig. (2-tailed)

	N	180	180	180		

ICT	Pearson Correlation	.552**	.601**	.719**	1	
	Sig. (2-tailed)	0.000	0.000	0.000		
	N	180	180	180	180	
**. Correlation is significant at the 0.01 level (2-tailed).						

The table below displays the Pearson Correlation Analysis results for the three independent variables and the dependent variable. For independent variable 1, the association is significant at the 0.01 level (2-tailed). It's a positive relationship. The result of Pearson correlation is a Pearson correlation that is significant at the 0.01 level.

DISCUSSION AND RECOMMENDATION

First discussion is that there are positive value of Pearson Correlation 0.552 showed a relationship between economic sustainability tourism and information communication technology (ICT). Secondly, The positive value of Pearson Correlation 0.601 showed a relationship between CSR practice and information communication technology (ICT). Lastly, the positive value of Pearson Correlation 0.719 showed a relationship between environmental sustainable tourism marketing and information communication technology (ICT).

The first recommendation is that researcher increase number of ICT user. For example, researcher can use any platform to promote to people especially people that are not knowing much about hidden homestays. It will bring profit to rural homestays because people nowadays will only go to stay in popular places. The second recommendation is that researcher is that researcher should increase overall ICT knowledge. Researchers should learn more about the topic that they are studying to make difficulties easier to deal with. For example, use internet to look into detail about information and communication technology (ICT). The third recommendation is that researcher should explain more detail about the questionnaire to respondent. For example, explain each question to respondent to make them give the right answer. Some respondent cannot read every question due to the age factor. Lastly, researcher need to be more knowledge about the definition of topic that researcher choose to studied. For example, search more definition about the same topic because there are many meaning that researcher can get if they explore more about it.

CONCLUSION

In conclusion, this study is proposed to examine The Nexus of Information and Communication Technology (ICT) and Sustainable Tourism Marketing among homestay owners in Kota Bharu, Machang, Bachok and Pasir Puteh. In addition, this research can be used as a reference by homestay operators in the districts of Kota Bharu, Machang, Bachok and Pasir Puteh, who conduct research on ICT for homestays. The results obtained in Chapter 4 using (SPSS) were further explored, and inferences were made from the findings. Based on the results, almost all respondents answered that they have almost less than a year of experience in operating a homestay.

ABSTRACT

Demand in the global tourism sector significantly impacts the number of visitors visiting Malaysia. As a result, the government has given this industry considerable consideration since it has a good impact, particularly in terms of increasing local residents' income. Even if they are aware of the diversity of Malaysian ethnicity and culture, it has been found that personnel in the tourist sector in Malaysia lack information regarding the adoption of the smart tourism idea. For instance, cultural sensitivity and Halal food ignorance would be problematic for both international tourists and locals. In addition, the major reason Malaysia has not adopted smart tourism is the absence of advertising and information on historical sites in Malaysia and attractive places to visit. The purpose of this study is to influence the use of smart tourism apps among Malaysia tourism stakeholders. The purpose of this study is to the issue pertaining to elements impacting the memorable tourist experience and Smart Tourism (ST) behavioural goals that serve as the independent variable. Three independent variables—Trust, Culture, and Technology Readiness. Each of these independent factors has an impact on the dependent variable, Smart Tourism (ST). The study's core data will be collected via a structured questionnaire and examined using SPSS software. The poll will be sent to 100 people who plan to visit any Malaysian destination again. The data in this study was processed using descriptive, reliability tests, and correlation analyses.

Keywords: Smart Tourism Apps, Malaysia Tourism Stakeholder

INTRODUCTION

By utilizing Information and Communications Technology (ICT) tools, a destination can be deemed as promoting smart tourism when it facilitates easy access for tourists and visitors to various goods, services, locations, and experiences related to tourism and hospitality. This can include features such as mobile apps, online platforms, digital guides, and interactive services that enhance the overall travel experience.

Investing in smart tourism development allows a city or destination to enhance its resources, attract more tourists, and shine brighter in the global tourism landscape. By incorporating technology into various aspects of tourism, such as transportation, accommodation, attractions, and visitor services, destinations can streamline processes, improve efficiency, and offer personalized experiences to visitors.

The benefits of smart tourism extend beyond businesses and the tourism industry. Individuals in the community also enjoy improved infrastructure and services, such as efficient transportation systems, smart city initiatives, and enhanced connectivity. This can lead to a higher quality of life for residents and a positive overall image for the destination.

However, the global COVID-19 outbreak has severely impacted all industries, with the travel and tourism sector being particularly affected. Travel restrictions, health concerns, and reduced tourist demand have caused significant disruptions to the tourism industry. In response to these challenges, there is now a greater emphasis on revitalizing communities and diversifying tourism offerings by leveraging smart tourism concepts.

The focus has shifted towards smart tourism destinations that leverage technology to enhance safety, provide contactless experiences, and enable efficient management of tourist flows. This includes implementing health and safety protocols, adopting digital solutions for ticketing and reservations, utilizing data analytics for crowd management, and promoting virtual and augmented reality experiences.

In the context of the study in Malaysia, the aim is to examine the factors influencing the use of smart tourism apps by tourism stakeholders. The study focuses on three main factors: Trust, Culture, and Technology Readiness.

Trust refers to the perceptions of reliability, credibility, and confidence in using smart tourism apps. This includes factors such as the goodwill of the app provider, predictability of app performance, and perceived competence in delivering the desired outcomes.

Culture encompasses cultural dimensions that may influence the adoption and acceptance of smart tourism apps. These dimensions include power distance (the extent to which power is distributed unequally in society), uncertainty avoidance (the degree to which a society tolerates uncertainty and ambiguity), individualism/collectivism (the emphasis on individual or collective goals), and masculinity/femininity (the values placed on assertiveness and competitiveness versus nurturance and collaboration).

Technology readiness refers to individuals' attitudes and perceptions towards technology. This includes factors such as insecurity (concerns about data privacy and security), innovativeness (the willingness to try new technologies), discomfort (the level of comfort with using technology), and complexity (perceived difficulty in using and understanding technology).

The study aims to get a deeper understanding of Malaysia's smart tourism business and provide insights into how tourism stakeholders can efficiently embrace and utilise smart tourism apps by evaluating these variables. Finally, this research can help to establish policies and activities that encourage the growth and sustainability of Malaysia's smart tourism business.

SIGNIFICANCE OF THE STUDY

The primary contribution of the paper focuses on the relationships between trust, culture, and technology and how these moderately affects smart tourism through social media. This work not only advances our understanding but also has consequences for how we all learn and live. Customers for travel agencies, responsible governmental entities, and conscientious, ecologically friendly travel. Other things the study wants to underline include a culture of trust and technical readiness. In addition, there is a unique blend of traditional traits (smart tourism) with predictive elements (trust, culture, and technical preparation). The study looks at how social media affects the link between the two in a moderating way. Both of these are standard variables and predictor variables. Prior to now, the absence of study discovered the issue of how social media influences how trust, culture, and technology readiness interact with one another to get ready for smart tourism.

LITERATURE REVIEW

SMART TOURISM

When other observable factors affect a variable, it is said to be dependent in research. These variables should alter as a result of modifying the experiment's independent variable(s). In the context of this study, the dependent variable is smart tourism. Smart tourism is viewed as an innovative approach to fostering the development of the country's tourism industry while upholding Islamic principles, culture, and values. It should be noted that tourism, as defined in this study, does not solely encompass visits to mosques or pilgrimages, but rather it encompasses a journey that integrates Islamic ideals with nature, culture, or innovation. The tourism industry is financially lucrative, supported by a wide range of amenities and services provided by the local community, business owners, as well as federal and local governments. The

term "smart tourism" is commonly used to describe this approach, as it encompasses various tourism-related services, culinary experiences, beverages, attractions, and travel destinations, as long as they align with moral and ethical values.

TRUST

The adage "seeing is believing" emphasizes the importance of trust in the tourism sector. Customers often rely on tangible evidence to build trust and make informed decisions about their travel experiences. In the context of smart tourism, trust becomes a crucial factor in ensuring customer satisfaction and loyalty.

Community engagement is another key aspect that contributes to building trust in smart tourism. Engaging with local communities and involving them in tourism development initiatives can foster a sense of ownership and shared responsibility. It can involve working with local businesses, artisans, and cultural organizations to showcase their products and traditions. By supporting local economies and empowering communities, destinations create a positive image and build trust among customers who appreciate authentic and immersive experiences.

Providing accurate and up-to-date travel information is essential for establishing trust in the smart tourism industry. Smart tourism apps play a crucial role in delivering relevant and reliable information to customers. This can include details about attractions, accommodations, transportation options, safety guidelines, and cultural insights. By ensuring that the information provided through smart tourism apps is comprehensive, accurate, and easily accessible, destinations can enhance customer trust and satisfaction.

The goal of smart tourism apps is to provide customers with exceptional services and enriching experiences. These apps leverage technology to offer personalized recommendations, real-time updates, interactive maps, and convenient booking features. By utilizing smart tourism apps, customers can access a wide range of services and experiences tailored to their preferences and needs. This enhances their overall travel experience and fosters a sense of trust and satisfaction in the destination.

CULTURE

Tourism provides a unique context for studying cultural production due to its inherent nature of exposing individuals to different societies, cultures, and customs. Traveling offers countless opportunities for people to gain knowledge and firsthand experiences of diverse cultural practices, traditions, and heritage.

The World Tourism Organisation (WTO) broadened the definition of cultural tourism in 1985. According to this definition, cultural tourism encompasses the movement of people who have a desire for diversity and seek to increase their cultural understanding and experiences. It involves engaging with different cultures, acquiring new information, and having meaningful encounters with people from different backgrounds.

Cultural tourism goes beyond mere sightseeing and involves immersive experiences that allow travellers to interact with local communities, participate in cultural activities, visit historical sites, explore museums, attend cultural events, and engage in cultural exchanges. These experiences not only provide tourists with a deeper understanding of the cultural fabric of a destination but also contribute to personal growth, learning, and the acquisition of new perspectives.

By studying cultural production within the tourism context, researchers and practitioners can examine how cultural heritage is presented, interpreted, and commodified for tourist consumption. This includes researching how tourists enjoy cultural performances, arts and crafts, cuisine, music, dance, and other kinds of cultural expression.

Understanding the dynamics of cultural production in tourism can help destinations and stakeholders effectively manage and promote their cultural assets, preserve cultural heritage, and ensure sustainable tourism development. It also allows for the creation of authentic and enriching tourism experiences that respect and celebrate the diversity and uniqueness of different cultures.

In summary, tourism serves as an ideal setting for studying cultural production due to its role in facilitating cultural exchanges, providing opportunities for learning and personal growth, and promoting the

understanding and appreciation of diverse cultures. Researchers and practitioners can contribute to the development of sustainable and meaningful cultural tourism experiences by investigating the nature of cultural production in tourism.

TECHNOLOGY READINESS

The use of technology has had a significant impact on numerous market operations in the tourism sector. The way information is accessed and disseminated has changed significantly. Travellers today have easy access to a great quantity of information about destinations, lodgings, activities, and transportation alternatives thanks to the internet and smart devices. This accessibility has empowered travellers to research, plan, and make informed decisions, thereby reshaping the way they interact with the industry.

Additionally, technology has revolutionized the booking and reservation process. Online travel agencies, booking platforms, and mobile apps have made it convenient for travellers to search for and book flights, accommodations, and other travel services with just a few clicks. This has streamlined the booking process, improved efficiency, and enhanced the overall customer experience.

However, alongside the opportunities, the integration of technology also presents challenges for the travel and hospitality industries. The rapid advancement of technology requires businesses to constantly adapt and keep pace with changing consumer behaviours and preferences. This may involve investing in new technologies, training staff, and ensuring cybersecurity measures are in place to protect customer data.

Research Hypothesis

The hypothesis in the study to summarize the research question of how to determine, evaluate and identify the relationships between the independent variables and dependent variables **H 1:** Trust Has A Negative Impact On Smart Tourism.

H 2: Culture Have A Negative Impact On Smart Tourism.

H 3: Technology Readiness Has A Negative Impact On Smart Tourism.

Research Framework

The independent variable is the problem of elements influencing a memorable tourist experience and Smart Tourism behavioural goals. Three independent variables that influence the dependent variable, Smart Tourism are Trust, Culture, and Technology Readiness. Figure 2.1 shows these variables.

Figure 2.1: Conceptual Framework of Trust, Culture, Technology Readiness towards the Smart Tourism.

METHODOLOGY

Research Design

This study included causal, exploratory, and descriptive designs, all of which were quantitative techniques. Causation analysis will be used in this inquiry. This form of research tries to ascertain how a relationship between a dependent variable and an independent variable affects present norms and assumptions. A cross-sectional design is used in this investigation. Cross-sectional designs have the benefit that they concentrate on obtaining data at and around a certain period and finding connections between variables at that time. Since survey methods are quick and affordable data gathering methods, they are frequently used in cross-sectional designs.

An individual is used as the study's analytical unit. Surveys are without a doubt the most feasible method for gathering quantitative data. Self-administered surveys are a low-cost method for rapidly gathering a lot of information from a lot of individuals in a short amount of time without having to hire assessors to do in-person interviews. Therefore, self-administered questionnaires were used to collect the data for this investigation.

Population and Sample Size

Overall, there are 66 million people in Malaysia's target market, including domestic visitors. This study only includes local tourists in Malaysia as its research population. In this study, sample size calculations were made using a table based on Krejcie & Morgan (1970) for a specific demographic. By Krejcie and Morgan in 1970:

S = sample size

X^2 = the chi-square value for 1 degree of freedom in the table at the acceptable level of confidence (3.841)

N = the annual population of domestic tourists

P = the fraction of the population (assumed to be 0.5 because it would yield the largest sample size)

$$\begin{aligned}
d &= \text{the proportional representation of the accuracy level (0.5)} \\
&= \frac{x^2NP(1-P)}{d^2(N-1)+(x^2P(1-P))} \\
&= \frac{3.841(205400000)(0.5)(1 - 0.5)}{(0.05)^2(205400000 - 1) + 3.841(0.5)((1 - 0.5))} \\
&= \frac{197235300}{5135000.958} \\
&= 384.099 \\
&= 384
\end{aligned}$$

The precise sample size for the population is 384, but only 100 respondents' responses to the questionnaire were collected for data.

Data Collection

For this study, a survey will be conducted using a self-administered research questionnaire. Respondents will serve as data collectors. This method is cost-effective, standardised, and allows for a large number of participants. A pilot study with 30 respondents, including students, private or government employees, and self-employed and retired people around Malaysia will be conducted to determine feasibility and select optimal approaches. Following the pilot study, a field study or actual surveys will be conducted.

Sampling

The process of selecting representative samples from a population for research is called sampling. Probability sampling and non-probability sampling are the two types of sampling. In qualitative research, non-probability sampling—which is subject to the researcher's judgment—is widely employed. Convenience sampling, sequential sampling, quota sampling, judgemental or deliberate sampling, and snowball sampling are a few examples of different forms of sampling. Non-probability sampling approaches, in particular convenience sampling, are utilised in this study to save time and money while collecting a representative sample of the community. It is a convenient and inexpensive way to obtain information. To swiftly gather data while ensuring that the sample was representative, non-probability sampling, namely convenience sampling, was utilised in this study. Despite its limitations in terms of representativeness, this sampling strategy allows for speedy data collection and can provide significant insights in the context of the study's aims.

Research Instrument

The questions used to assess the specified research constructs were drawn from previous studies on traveller behaviour.

Figure 2: Measurement of Likert scale

Data Analysis

Descriptive statistics describe the basic characteristics of data, providing summaries of the sample and measurements. Data analysis aims to extract useful information from data for decision-making. Descriptive

statistics describe the data itself, while inferential statistics make deductions and inferences beyond the available facts. This study aims to analyze international visitor data in Malaysia, explore effective tourism strategies, and understand visitor behaviour. The study utilizes visitor data from the Malaysia Tourist Information Center, considering Malaysia's geographic location as an appealing transit point for international travellers. To maximize tourism development, the focus should be on natural, cultural, and shopping attractions.

In this study, the objective is to analyze international visitor data in Malaysia and explore effective tourism strategies while gaining insights into visitor behaviour. To achieve this, data from the Malaysia Tourist Information Center, which serves as a reliable source of visitor information, is utilized. Malaysia's strategic geographic location as a transit point for international travellers adds significance to the study, as it offers opportunities to attract and cater to a diverse range of visitors.

The analysis of visitor data aims to uncover patterns, preferences, and trends among international travellers, which can inform the development of effective tourism strategies. By focusing on natural, cultural, and shopping attractions, the study aims to capitalize on Malaysia's unique offerings and enhance tourism development.

By utilizing both descriptive and inferential statistics, this study strives to provide valuable insights and recommendations for the tourism industry in Malaysia. The analysis of visitor data and the exploration of effective strategies can contribute to enhancing the overall tourism experience and supporting sustainable tourism growth in the country.

FINDINGS

The collected data was analyzed using PLS (Partial Least Squares) and SPSS version 20.0. This approach allowed for the examination of research metrics, competencies, and dependent variables in the context of the Pakistani cultural setting. Previous studies conducted in culturally distinct Western nations, such as the Netherlands, have demonstrated the effectiveness of service innovation (Janssen, Castaldi, & Alexiev, 2015). A discriminant validity analysis was also undertaken to improve the validity of the psychometric assessment. To test the hypotheses in this study, regression-based process analysis, as described by Hayes (2017), was utilized. This analytical approach allows for a comprehensive examination of the relationships and interactions between variables, providing valuable insights into the research findings.

The study attempts to contribute to the understanding of the research topic in the specific cultural context of Pakistan by applying these analytical tools and procedures. The outcomes of this analysis are expected to improve the knowledge base surrounding the research topic and provide significant insights for future studies.

Table 1: Summary of Demographic Profile

Demographic	Categories	Frequency (N)	Percentage (%)
-------------	------------	---------------	----------------

Gender	Male	73	73%
	Female	27	27%
Age	18 – 23 years old	54	54%
	24 – 29 years old	21	21%
	30 – 36 years old	13	13%
	37 – 42 years old	7	7%
	42 years old above	5	5%
Race	Malay	53	53%
	Chinese	31	31%
	Indian	13	13%
	Others	3	3%
Education Level	Secondary / Primary School	9	9%
	Certificate/Diploma	17	17%
	Bachelor's Degree	64	64%
	Master's Degree	8	8%
	Ph.D.	2	2%

Employment Status			
	Student	64	13.8
	Self-Employed	6	21.6
	Private Sector Worker	16	18.5
	Government Sector Worker	10	45.8
	Retired	4	0.3

Based on the data presented in Table 1, the respondents' characteristics can be summarized as follows. In terms of gender distribution, out of the 100 respondents, 73% were female, while 27% were male.

In terms of age, the largest group of respondents, accounting for 54%, were between the ages of 18 and 23. The second-largest age group, with 21% of respondents, was those aged 22 to 29. The remaining age groups were 30-36 years old (13%), 37-42 years old (7%), and 42 years and older (5%).

In terms of race, the highest participation rate was among the Malay respondents, constituting 53% of the sample. Chinese respondents accounted for 31% , followed by Indians at 13% . Other racial groups represented 3% of the respondents.

In terms of education, the majority of respondents (64%), possessed a bachelor's degree. Certificate/diploma holders had the second highest educational level, accounting for 17% of respondents. Secondary/primary school students made up 9% of the sample, with master's degree holders accounting for 8% and PhD holders accounting for 2%.

In terms of employment status, the largest occupation category was students, representing 64% of the respondents. Private sector workers accounted for 16% , while government sector workers constituted 10% of the sample. Self-employed individuals represented 6% of respondents, and 4% were retired.

Overall, this information provides an overview of the gender, age, race, education level, and employment status of the respondents in the study.

Descriptive Analysis

Table 2: Descriptive Statistics

Variables	N	Mean	Standard Deviation
Smart Tourism	100	6.7890	1.69790
Trust	100	6.9685	1.63014
Culture	100	6.8880	1.71720
Technology Readiness	100	7.0628	1.65471

The mean and standard deviation analysis for the independent and dependent variables is shown in Table 2. The dependent variable was the Smart Tourism in Malaysia. Trust, Culture, and Technology Readiness were independent variables. Technology had the highest mean score, 7.0628, indicating that respondents were more in agreement with this characteristic. The variable with the lowest mean value in this study's respondents' agreement was Smart Tourism, which has a value of just 6.7890. The data set that has more dispensing values has a standard deviation of more than 1 out of 100 respondents.

Table 3: Reliability Analysis Result

Construct	Cronbach's Alpha	No of Item	N
Smart Tourism	0.914	11	100
Trust	0.897	7	100
Culture	0.890	6	100
Technology Readiness	0.913	7	100
All Variable	0.904	31	100

The test-retest reliability can be calculated by comparing the scores or responses from the first administration with those from the second administration. Statistical measures like correlation coefficients, such as Pearson's correlation or intraclass correlation, can also be used to determine the degree of agreement or consistency between the two sets of scores.

For example, a high correlation coefficient, such as 0.80 or above, indicates strong test-retest reliability, suggesting that the questionnaire produces consistent results over time. Conversely, a low correlation coefficient, below 0.50, suggests poor test-retest reliability, indicating that the questionnaire may not be consistent or stable over time.

By conducting a test-retest reliability study, researchers can evaluate whether the measurement instrument produces consistent results over time and determine if any modifications or improvements are necessary to enhance its reliability.

Pearson Correlation Hypothesis 1

H₁: There is a significant relationship between trust and smart tourism among tourism stakeholders in Malaysia.

Table 4: Correlation coefficient for trust and smart tourism among tourists in Malaysia

		Trust	Smart Tourism
Trust	Pearson Correlation	1	.744**
	Sig. (2-tailed)		.000
	N	100	100
Smart Tourism	Pearson Correlation	.744**	1

	Sig. (2-tailed)	.000	
	N	100	100

Table 4 showed the strong correlation (0.744) between trust and smart tourism among Malaysian tourist stakeholders. Significance value for trust is 0.000 (< 0.001 threshold), indicating a significant relationship. Supports H1.

Hypothesis 2

H₂: There is a significant relationship between culture and smart tourism among tourism stakeholders in Malaysia.

Table 5: Correlation coefficient for culture and smart tourism among tourists stakeholder in Malaysia

		Culture	Smart Tourism
Culture	Pearson Correlation	1	.704**
	Sig. (2-tailed)		<.000
	N	100	100
Smart Tourism	Pearson Correlation	.704**	1
	Sig. (2-tailed)	.000	
	N	100	100

Table 5 showed the moderate correlation (0.704) between culture and smart tourism among Malaysian tourism stakeholders. Significance value for trust is 0.000 (< 0.001 threshold), indicating a significant relationship. Supports H2.

Hypothesis 3

H₃: There is a significant relationship between technology readiness and smart tourism among tourism stakeholders in Malaysia.

Table 6: Correlation coefficient for technology readiness and smart tourism among tourists in Malaysia

		Technology Readiness	Smart Tourism
Technology Readiness	Pearson Correlation	1	.684
	Sig. (2-tailed)		.000
	N	100	100
Smart Tourism	Pearson Correlation	.684	1
	Sig. (2-tailed)	.000	

Table 6 showed the moderate correlation (0.684) between technology readiness and smart tourism among Malaysian tourism stakeholders. Significance value for technology readiness is 0.000 (< 0.001 threshold), indicating a significant relationship.

Table 7: Summary of Correlation Analysis

Hypothesis	Significant Value	Conclusion	Correlation Value	Conclusion
1	0.000	Accepted	0.744	High Positive Correlation
2	0.000	Accepted	0.704	High Positive Correlation
3	0.000	Accepted	0.684	High Positive Correlation

DISCUSSION AND RECOMMENDATION

The study's findings provide vital advice for Malaysian practitioners working in the subject of smart tourism. The findings suggest that improving trust, culture, and technological preparedness within organisations can greatly contribute to these enterprises' development, growth, and resilience in providing distinctive services.

Malaysia should prioritise the building of a welcoming and responsive environment in order to exploit the potential of social media in the travel and tourism business. This entails actively engaging with social media platforms and utilizing them as effective marketing tools. By actively participating in social media activities, tourism practitioners can enhance their online presence, engage with a larger target audience, and build strong relationships with potential tourists.

Furthermore, the study highlights the importance of actively seeking out innovative ideas. Managers should encourage a culture of openness and acceptance towards fresh suggestions and novel concepts. This will create an environment where innovative ideas can thrive without facing unnecessary resistance. Managers and employees should be encouraged to explore and experiment with new methods and approaches to stay competitive and adapt to changing market demands.

By following these recommendations, Malaysian smart tourism practitioners can enhance their competitiveness, deliver unique and personalized services, and keep pace with the evolving needs and preferences of tourists. Embracing trust, culture, and technological readiness, along with a focus on innovation, will position Malaysia as a dynamic and attractive destination in the global tourism landscape.

There are several restrictions on this study that may help open up new research directions. This paper focuses solely on the smart tourism sector as the leader in service innovation; however, market and educational issues are not addressed. It is suggested that a future study look at its impact. Future study on the impact of social media on technological preparedness Intelligent tourism is still a possibility. Examine the function of social media tactics, such as online knowledge marketplaces. Additionally, investigate further the potential effects of smart tourism on service quality or client happiness. Additionally, it offers crucial guidelines for brandnew study. Additionally, this work has undergone measurement and verification concepts of trustworthy travel, cultural and technical preparation, and the effects of social media only apply to Malaysia. The industry is largely in agreement and is aware of the notion of variables, but more empirical study on digital marketing and tourism in various economies is required.

CONCLUSION

In summary, the purpose of this study was to investigate the factors impacting the use of smart tourism apps among Malaysian tourism stakeholders. The study identified trust, culture, and technology readiness as key independent variables that significantly impact the adoption and usage of smart tourism among Malaysia's tourism stakeholders. These variables play a crucial role in shaping the behaviour and decision-making processes of stakeholders when it comes to using smart tourism apps.

All of the hypotheses (H1, H2, and H3) suggested in the study were supported by the analysis and findings. This suggests that trust, culture, and technological readiness all have a substantial positive impact on Malaysia's tourism stakeholders' acceptance and utilisation of smart tourism apps.

However, it is critical to recognise the research's limitations. The use of a specific sample size and sampling technique, which may not fully represent the whole population of Malaysian tourism stakeholders, is one restriction. Additionally, the study focused on specific aspects of trust, culture, and technology readiness, and there may be other factors that could also impact the use of smart tourism apps.

Given these constraints, it is suggested that future study in this area examine a bigger and more diverse sample in order to gain a more full understanding of the factors impacting smart tourism app usage. Additionally, future studies could delve deeper into other factors that may influence smart tourism adoption, such as government policies, marketing strategies, and user experiences.

Finally, this study gives useful insights into the factors influencing the use of smart tourism apps among Malaysia's tourist stakeholders. Understanding the importance of trust, culture, and technology preparedness allows stakeholders to make educated decisions and strategies to improve the acceptance and utilisation of smart tourism, ultimately contributing to the growth and development of Malaysia's tourism business.

Abstract

The determination of this study is to investigate the connection between influencing factors and tourist satisfaction with the growth of cross-border tourism in Rantau Panjang. The main objective of this study is to determine what influences tourists' satisfaction with the growing cross-border tourism industry in Rantau Panjang. A total of 378 successfully founded respondents were questioned via the online survey regarding the 5.5 million local tourists who were targeted to visit Rantau Panjang, Kelantan, in 2021. Version 29.0 of the Statistical Package for Social Science (SPSS) was used for data collection and analysis. The findings indicate a strong correlation between tourist perception, infrastructure issues, destination image, and tourist satisfaction with the cross-border tourism development in Rantau Panjang. Through this study, one can gain a deeper comprehension of the influences on tourist satisfaction of cross-border tourism development in Rantau Panjang.

Keywords: Tourist perception, infrastructure issues, destination image, tourist satisfaction.

INTRODUCTION

In chapter one of this research, we discuss the problem statement, research purpose, research question, significance of the study, and definition of terminology, and the chapter concludes with a summary. Especially in tourist areas, the tourism industry plays an important role in the economic growth and revenue of the nation. One element that contributes to the attractiveness of an area as a tourist destination is the shape of the local topography. Local culture is an important factor in a region's attractiveness to tourists. Every year, more tourists visit Malaysia and make it their favourite destination, especially in Rantau Panjang, Kelantan. This is because travellers to Kelantan use Rantau Panjang as a commercial and shopping center. In the tourism industry, "visitor pleasure is highly correlated with both visitor safety and visitor culture". Manson, (2008). Tourists are people who use commercial services to travel outside of their own country to find leisure, relaxation, and pleasure. The tourism industry is "a by product of the modern social systems that appeared in the 17th year, although its roots lie in classical antiquity". The difference between tourism and exploration is that tourists take the "beaten path," kind of from established service systems, and, as befits pleasure seekers, are often shielded from hardship, danger, and embarrassment. Tourism and other endeavors, procedures, and activities, such as pilgrimage, do, nonetheless, have certain similarities. The objective of this study is to find the relationship between tourist perception, infrastructure issues, destination image and tourist satisfaction of cross-border tourism development in Rantau Panjang.

Significance of the Study

This research is based on a study of tourist satisfaction of cross-border tourism development in Rantau Panjang. It is for this reason that this research will ease the degree of magnitude, seriousness, and intensity of the issue being studied. These are one realization that have been made since no research on tourism part analysis to discuss the feasibility of establishing the Rantau Panjang (Kelantan/Malaysia). Based on the researcher's research, more tourists might get more enjoyment in cross-border tourism development. The corporation will have the learning what are the challenges facing these on an in-between-borders level in cross-border tourism collaborations. While conducting this study, the researcher will also be

able to increase their regulation, knowledge, and exposure in the research field. In cross-border tourism partnerships, the relationship between the researcher and the traveler is established at each part during the distribution portion of the questionnaire.

In addition, the results of this study may provide the tourist industry with an opportunity to learn useful information on how to get around the difficulties associated with the growth of international tourism. The finding will also help the tourism organizations to enlarge the development and upgrade cross-border tourism and also fascinate more tourists from other states as well as fulfilling the needs of tourists.

At long last, the institution will ultimately benefit from conducting quality research in a number of ways. Establishing a solid reputation for future scientists who might choose to direct their research toward the growth of international travel. They might obtain a lot more specific information that is pertinent to the study using the already collected data. In addition, it might provide aid to a young researcher and a recent corpus of knowledge.

LITERATURE REVIEW

A type of educational writing known as a literature review exhibits knowledge and understanding of the pedagogical literature on a given subject in relation to other sources. A critical evaluation of the sources is also part of a literature review. This is due to the fact that a literature review is referred to as such rather than a literature report and because it is both an endeavor to discuss the literature and a type of writing.

This study discusses a number of studies by earlier scholars on smugglers and their impacts on the border economy. Schoenberger and Turner's (2008) "study looks at the cross-border trade networks that the Kinh, an ethnic minority in the highlands of northwestern Vietnam, and those in southwest China engage in". They discovered that through these commercial operations, access to the boundaries between the various societal elements is complicated, both in terms of domestic policy and the interactions between various ethnic groups in order to take advantage of economic opportunities.

Based on empirical data in post-socialist countries, Bruns et al. (2011) "offer their perspectives on the reasons behind small-scale, cross-border smuggling and trading operations". Even though such actions are prohibited by law, they may still take place because they have gained societal acceptance.

Most of the women participating in small-scale cross-border trade were between the ages of 20 and 40. This is because they are required to have more "economic clout in order to make judgments that could have an effect on their day-to-day life" (KOIS, 2011). Increased crossborder activity is a hallmark of the globalization of the international economy. Where a "number of scholars contend that state borders increasingly serve as porous barriers to allow cross-border contacts in business and society" (Dicken, 2000, Evans et al, 2000). But at the same time, modern borders serve as significant reminders of state authority over territorial boundaries and population shifts. In actuality, the market, globalization.

States have always played a significant role in determining cross-border flows of "goods and people, refuting the idea that our world has no borders" (Hirst and Thompson, 1995; Ohmae, 1990). State boundaries define the area over which a state exercises authority and serve as "inspection agents" to regulate what can be carried into a country between the lines of political jurisdiction. They make the case that borders should be given more "consideration in light of a number of contemporary issues, such as cross-border regions, the authority of governments, cultural landscapes, and the informal economy" (Donnan et al. and Wilson, 1994, 1999; Pavlakovich-Kochi et al., 2004; Newman, 2006).

Legislative field limits, according to Morehouse et al. (2004), "rarely reflect the reality of boundaries; rather, regional border zones and cultural landscapes are viewed from many angles". People communicate with borders, exchanges inside them, and interactions beyond limits all shape border identity. Since people near the border frequently seek practical ways to negotiate border restrictions and state laws, government efforts to create political and economic constraints for cross-border connections frequently can't totally control what happens on a daily basis.

More enforcement of the legislation against smuggling will increase the cost of commodities per unit and decrease the volume of imported goods that are smuggled" (Martin and Panagariya 1983). The actual cost of smuggled products per unit and domestic import prices will rise when anti-smuggling enforcement laws are

strengthened, but the amount and percentage of illegal imports relative to overall imports will decrease. Their model, however, is unable to account for how smuggling affects social welfare.

Tourist Perception

Perception is a group of internal sensory cognitive processes that the brain uses to detect, relate, analyze, and search for internal cognitive information at the subconscious level of cognitive function. Whether a tourist has a favorable or unfavorable attitude towards anything is referred to as their tourist perception. It is also about the previous experience of tourists. This defines tourist perception as a tourist's evaluation of a particular thing. The development of cross-border travel is hampered by visitor perceptions. Significant elements impact tourists' perceptions. A traveler, for instance, might acquire an impression of a place based on its reputation for safety, natural attractions, entertainment value, and relaxation options, as well as the general travel environment. There is a wealth of information available to tourists that they can utilize to plan cross-border trips. Finally, it is evident why it is important to cultivate visitor perceptions from a variety of angles based on their travel preferences.

Infrastructure Issue

The infrastructure of a nation, city, or other locale is the grouping of structures and mechanisms that offers the facilities and services necessary for the operation of its economy, households, and companies. Highways, trains, bridges, tunnels, water supply, sewage systems, electrical grids, and telephones are just a few examples of the public and private physical constructions that are regarded as being part of the infrastructure (which also includes Internet connectivity and broadband access).

Destination Image

Both an attribute-based component and a holistic component may be taken into account while analyzing the destination image. Because of the significant roles that cross-border development is known to play in influencing destination choice, destination image is a subject that has received extensive attention in the literature on tourism development.

Cross-Border

There are challenges associated with this influence in international travel, and there are some authors who have examined them within a tourism context. The second goal of this research is to examine the institutional challenges that cross-border tourism faces in Rantau Panjang, Kelantan. This section will go over them in greater detail. When the literature on tourist satisfaction of cross-border tourism development was examined, a rather distinct pattern emerged. The majority of tourist satisfaction are related to social, cultural, economic, political, and regulatory factors, as well as organization and governance. When these are arranged into a figure, clear themes of tourist satisfaction in cross-border tourism emerge.

Tourism Development

The study of tourism development focused on the political, economic, social, cultural, and psychological effects of borders on tourism. The majority of the literature focuses on the opportunities and satisfaction associated with cross-border situations in tourist destinations. Furthermore, he is said to have made significant contributions to the study of borders and tourism, and much of the research in the field is based on his prolific contribution.

Research hypothesis

The hypothesis is an assumption about the relationship between two or more variables that have not been proven. It is a detailed, testable hypothesis about what you expect a study to reveal. To give an example, the study's hypothesis might read, "This research is designed to value the hypothesis that sleep-deprived folks can perform lower on a test than individuals who are not sleep-deprived." Despite being a prophecy, the idea goes above and beyond typical speculation. Typically, the hypothesis begins with a query, which is then looked into through background research. Only now are scientists beginning to develop a testable hypothesis.

The framework makes it clear that every variable has a strong relationship with the others, which ultimately prompts the researcher to come up with three hypotheses as follows:

H1: There is a significant relationship between tourist perception and tourist satisfaction of cross-border tourism development in Rantau Panjang.

H2: There is a significant relationship between infrastructure issues and tourist satisfaction of cross-border tourism development in Rantau Panjang.

H3: There is a significant relationship between destination image and tourist satisfaction of cross-border tourism development in Rantau Panjang.

Research framework

A conceptual framework is represented by the relationship you anticipate seeing between your variables or the qualities or properties that you wish to investigate. The “mass crucial knickknack comprehend with regard to your scheme is that it is first and foremost a fertilization or model of the things that are currently existing that you plan to study, as well as a clarification of what is incident in the company of them and purpose, as well as an unconfirmed proposition of the experience that you breath researching”. This thesis is in the service of escorting the other module of your representation, assisting you in checking something out and honing your holy grail, creating pertinent and realistic research questions, choosing the best techniques, and spotting any threats to the validity of your findings. The three factors that make up the independent variable that will be proposed are tourist perception, risk perception and destination image towards cross-border tourism development. Cross-border tourism development challenges facing Rantau Panjang is the dependent variable.

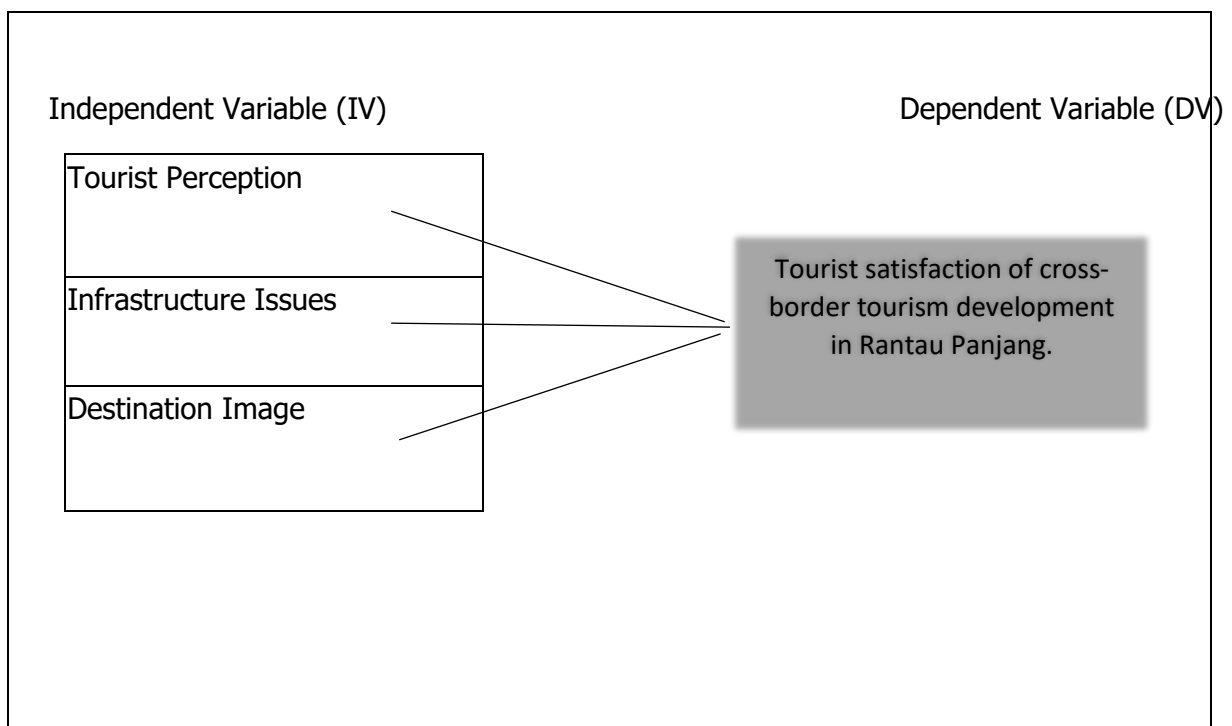

Figure 2.1: Conceptual framework of the relationship between tourist perception, infrastructure issues, and destination image in tourist satisfaction of cross-border tourism development in Rantau Panjang.

METHODOLOGY

By choosing the best and most efficient means to conduct the study while adhering to the research purpose and goals, the methodology is utilized to solve research difficulties. The strategy includes providing answers to the what, why, and how of your investigation. The research technique discusses and explains the procedures used to gather and analyze data.

All the steps involved in the investigation are outlined in this chapter. All the components of this research's methodology are covered in this chapter, from the research design and population to the sample size and sampling method to the research instrument and data analysis. In-depth explanations of the chosen mode of analysis and the data-gathering technique are also provided in this chapter.

Research Design

The research design acts as a broad method that you use to organize the many components of the research in a logical and cogent manner. Utilizing technical frameworks and procedures, “research design can combine the many research components to solve research challenges in a logical and effective manner” (Adi Bath, 2018). Researchers used quantitative research to gather data for this study. In quantitative research, “numbers and statistics are utilized to describe and evaluate results in order to find the relationship between variables” (Kumar, 2013). In order to comprehend and identify the relationship between the independent variables of tourist perception, risk perception, and destination image and the dependent variable, identifying hurdles to cross-border tourism growth in Rantau Panjang, quantitative research was used in this study. To gather data and determine the obstacles to an increase of cross-border tourism in Rantau Panjang, the researcher conducts a survey using a questionnaire.

Data collection is the process of gathering and measuring information on variables of interest in accordance with established, rigorous guidelines in order to respond to the research questions posed, test hypotheses, and evaluate results. Data collection is an efficient process for gathering and analyzing information from any of the sources in order to obtain complete and reliable data.

The primary method of data collecting is quantitative research, and real-time data is included. In quantitative research, statistics are generated by used techniques like structured questionnaires in large-scale surveys. Because it helps to boost the accuracy of the data obtained, the simple random sample method is employed in the primary data collection process. A questionnaire was also selected as the method since it allows for the quickest collection of data from respondents. The questionnaire consists of four sections matched in the dependent and independent variables. The responses are recorded for the research. The names of the respondents will not be used in this study and will be kept confidential to protect their identity and ensure their confidentiality.

Sampling

The non-probability sampling strategy used in this study is based on belief sampling. The sample is chosen from the population at random by the researchers, who only consider areas that are easily accessible to them. The researchers didn't consider selecting a sample that is typical of the whole population because these samples are simple to recruit, so they chose this sampling strategy instead. This sample is chosen because it is affordable and makes the sample more readily available.

This method is utilized to sample the target population for this study, which is the people in Rantau Panjang, Kelantan, which focuses on the public stakeholders for the growth of crossborder tourism. The survey was created with Google Forms and disseminated via internet channels like social media apps like WhatsApp and others. The researcher was able to contact respondents from Kelantan State who are challenging to meet in person by using Google Forms and social media.

Data Analysis

This study uses four data analysis types which is descriptive statistics, reliability statistics, and Pearson's correlation. The data obtained were analysed by using SPSS version 29. The use of SPSS in the study helps to achieve the research objectives and helps to process the data that has been obtained.

FINDINGS Demographic Analysis

The data analysis for this inquiry included frequency analysis. The respondents' numerous demographic data, such as gender, race, age, marital status, level of education, and state of residence, were questioned in Section A of the questionnaire. A table displaying the respondents' demographic profiles was visible.

Table 1: Demographic Analysis

Item	Frequency (n)	Percentage (%)
Gender		
<i>Male</i>	204	54.0
<i>Female</i>	174	46.0
Age Group		
<i>Below 20 years old</i>	41	10.8
<i>21-30 years old</i>	254	67.2
<i>31-40 years old</i>	69	18.3
<i>41 and above</i>	14	3.7
Race		

<i>Chinese</i>	94	24.9
<i>Indian</i>	104	27.5
<i>Malay</i>	157	41.5
<i>Others</i>	23	6.1
Status		
<i>Married</i>	76	20.1
<i>Single</i>	302	79.9
Region		
<i>Islam</i>	163	43.1
<i>Christian</i>	83	22.0
<i>Hindu</i>	87	23.0
<i>Buddha</i>	45	11.9

State		
<i>Johor</i>	36	9.5
<i>Selangor</i>	25	6.6

<i>Sarawak</i>	28	7.4
<i>Sabah</i>	8	2.1
<i>Terengganu</i>	11	2.9
<i>Kedah</i>	26	6.9
<i>Kelantan</i>	86	22.8
<i>Melaka</i>	38	10.1
<i>Negeri Sembilan</i>	39	10.3
<i>Pahang</i>	23	6.1
<i>Perak</i>	20	5.3
<i>Perlis</i>	12	3.2
<i>Pulau Pinang</i>	26	6.9

Education Background		
<i>SPM</i>	40	10.6
<i>Diploma</i>	91	24.1
<i>Degree</i>	231	61.1
<i>Master</i>	14	3.7
<i>Others</i>	2	.5

Occupation		
<i>Student</i>	263	69.6
<i>Employed</i>	97	25.7
<i>Unemployed</i>	18	4.8
Frequency of Visit		
<i>Sometimes</i>	294	77.8
<i>Every weekend</i>	58	15.3

<i>Everyday</i>	12	3.2
<i>Others</i>	14	3.7
Have you ever visit		
<i>Yes</i>	351	92.9
<i>No</i>	27	7.1
With whom do you go		
<i>Family</i>	97	25.7
<i>Friends</i>	182	48.1
<i>Spouse</i>	43	11.4
<i>Alone</i>	56	14.8
When was the last time you visited Rantau Panjang		
<i>Last year</i>	151	39.9
<i>Last month</i>	133	35.2

<i>Last week</i>	69	18.3
<i>Yesterday</i>	20	5.3
TOTAL	378	100.0

The gender of the respondents was shown in Table 4.2. Male respondents made up 204 of the total respondents, while female respondents made up 174. A total of 378 respondents participated in this survey, with 54.0% of them being men and the remaining 46.0% being women. Among the 378 respondents, 41 were under the age of 20, 254 were between the ages of 21 and 30, 69 were between the ages of 31 and 40, and 14 were over the age of 41. According to Table 4.3, respondents with an age range between 21 and 30 years made up the majority of respondents (67.2%), followed by respondents with an age range between 31 and 40 years (18.3%), and respondents with an age range between 41 and above made up the least number of respondents (3.7%). The overall number of respondents 302 for those who were single, 76 for those who were married, and 378 for all respondents was 378. Out of 378 respondents, 79.9% were single overall, while 20.1% were married participants in the survey. Malay respondents made up 157 of the 378 respondents, followed by Chinese respondents with 94, Indian respondents with 104, and others with 23. According to Table 4.6, Malay respondents made up the highest proportion of respondents (41.5%), followed by Indian respondents (27.5%), Chinese respondents (24.9%), and other respondents (6.1%), who made up the lowest proportion. The total number of respondents who identified as Muslim (163), Christians (83), Hindus (87), and Buddhists (45). Islam had the biggest percentage of respondents (43.1%), followed by Hinduism (23.0%), Christianity (22.0%), and Buddhism (11.9%), which had the lowest percentage. With 86 responses, Kelantan had the highest percentage of respondents (22.8%), followed by Negeri Sembilan with 39 respondents and 10.3%. The least were 2.1% (8 respondents) who were from primary, followed by 10.1% (38 respondents) from secondary and 9.5% (36 respondents) from Johor. Degree holders made up the majority of the respondents with a ratio of 61.1% (231 respondents), followed by Diploma holders with 61.1% (91 respondents). There were 10.6% (40 respondents) with an SPM degree, 3.7% (14 respondents) with a master's degree, and 0.5% (2 respondents) with a different level of education. There were a total of 263 respondents who identified as students, 97 who identified as employed, and 18 who identified as jobless. Out of a total of 378 respondents, 69.6% were students, 25.7% were working adults, and the remaining 4.8% were jobless adults that participated in the survey. Weekend trips to Rantau Panjang were occasionally reported by 294 respondents (77.8%) and 58 respondents (15.3%) respectively. The least number of respondents, 12 respondents with (3.2%), went to Rantau Panjang every day, while 14 respondents with 3.7% were reported as others. There were 351 responses in total who had visited, whereas 27 respondents had never done so. In a survey of 378 people, 92.9% said had travelled, and 7.1% said they had never been anywhere.

In total, 182 respondents answered the question about their friends, 97 answered it about their family, 43 answered it about their spouse, and 56 answered it about themselves. 48.1% of the 378 respondents were friends, 25.7% were relatives, 11.4% were married, and the remaining 14.8% were alone. By the end of last year, 151 respondents had visited Rantau Panjang, 133 had done so in the previous month, 69 had done so in the previous week, and 20 had done so yesterday. According to Table 4.14, the biggest percentage of replies came from the previous year (39.9%), followed by the previous month (35.2%), the previous week (18.3%), and yesterday (5.3%).

RESULT OF DESCRIPTIVE ANALYSIS Independent Variable and Dependent Variable
Table 2: Descriptive Analysis

Variable	Items	Mean Score	Standard Deviation
Tourist Perception	1. The level of community cleanliness in Rantau Panjang is very high	3.77	.994
	2. The quality of public services in Rantau Panjang is very good	3.86	.978
	3. Traffic flow in Rantau Panjang is very controlled	3.86	.970
	4. The availability of clean drinking water is very sufficient in Rantau Panjang	3.81	.995
	5. Rantau Panjang is free from drugrelated activities	3.88	.952
	6. Rantau Panjang is free from any threat of terrorism	3.87	.988
	7. Cultural activities are very popular in Rantau Panjang	3.90	.957
Infrastructure Issues	1. I feel that cross-border tourism attracts more tourist	3.93	.977
	2. Cross-border tourism creates a good impact on the tourism industry	4.01	.940
	3. Rantau Panjang has a variety of accommodation options	3.87	.957
	4. The state of infrastructure in Rantau Panjang is very satisfactory	3.86	.981

	5. There are various shop facilities in Rantau Panjang	3.89	.972
	6. A wide selection of restaurants available in Rantau Panjang	3.95	.970
	7. Tourism services in Rantau Panjang are of very high quality	3.99	.964
Destination Image	1. Natural attractions in Rantau Panjang are not affected by the development of cross-border tourism	3.85	.983
			.990
	2. The travel environment in Rantau Panjang is safe and secure	3.84	
	3. Spectacular scenery and natural uniqueness are tourist attractions in Rantau Panjang	3.80	1.000
	4. Rantau Panjang has its own history and heritage	3.92	.941
	5. Rantau Panjang has beautiful lakes and rivers	3.89	.977
	6. A calm and peaceful atmosphere in Rantau Panjang	3.85	1.031
	7. Easy to access Rantau Panjang area	3.86	.978
Tourist Satisfaction	1. I felt joy and satisfaction after visiting Rantau Panjang	3.93	.968
	2. The travel experience to the Rantau Panjang has fulfilled my expectation.	3.93	.975

3. I think that visiting Rantau Panjang was the wise choice.	3.97	.932
4. The trip to the Rantau Panjang was well worth my time and money.	4.00	.910
5. I have gained knowledge about city urban design after visiting Rantau Panjang	3.98	.954
6. I am satisfied with the price of goods sold in Rantau Panjang	3.98	.952

The mean and standard deviation analysis for the independent variable, tourists' perception, was displayed in Table 2. The respondents who agreed that the cultural events are very popular in Rantau Panjang gave item number 7, with a mean score of 3.90, the highest mean score. The responder only slightly agreed that the level of community cleanliness in Rantau Panjang, which had the lowest mean value of item number 1 at 3.77. The values near to the mean were highlighted for the data set from 378 respondents with a standard deviation most frequently lower than 1. The study of the mean and standard deviation for the independent variable, which was the state of the infrastructure, was shown in Table 2. Item number 2, where respondents agreed that cross-border travel had a positive impact on the tourism business, had the highest mean value, 4.01. The responder just slightly agreed that the infrastructure of Rantau Panjang is in very good shape, which resulted in the lowest mean value for item number 4, which was 3.86. With a standard deviation that was mostly more than 1, the data set from 378 respondents revealed values that were near to the mean. The independent variable, the destination picture, was the subject of a study of mean and standard deviation in Table 2. The respondents' agreement that Rantau Panjang has its unique history and traditions led to item number 4, which had the highest mean value at 3.92. The respondent very slightly agreed that Rantau Panjang's stunning beauty and natural uniqueness are among the city's tourism attractions, giving the item with the lowest mean value—3.80—that description. With a standard deviation that was mostly more than 1, the data set from 378 respondents revealed values that were near to the mean. The tourist satisfaction of the growth of cross-border tourism in Rantau Panjang was the dependent variable, and Table 2 displayed the mean and standard deviation analysis on it. The respondents who responded to item number 4 agreed that the journey to the Rantau Panjang was well worth my time and money, giving that item the highest mean score of 4.00. The response marginally agreed that I felt delight and satisfaction after visiting Rantau Panjang and that the travel experience to the Rantau Panjang matched my expectations. The lowest mean value was item numbers 1 and 2, which was 3.93 for the two items. The majority of the answers for the data set from 378 respondents with a standard deviation lower than 1 suggested value near to the meanwhile the standard deviation.

RELIABILITY TEST

The dependability of the surveys was evaluated using reliability analysis. According to Hair et al. (2007), the information's external and internal consistency was ensured using Cronbach's Alpha analysis. The Rules of Thumb in the table below were used to determine the size of the Cronbach's Alpha coefficient.

Table 3 Rules of Reliability Coefficient Alpha for the Independent Variable and Dependent Variable

Variable	Number of Items	Cronbach's Coefficient Alpha	Strength of Association
Tourist Perception	7	0.924	Excellent
Infrastructure Issues	7	0.938	Excellent
Destination Image	7	0.944	Excellent
Tourist Satisfaction	6	0.935	Excellent
Overall Variables	27	0.713	Acceptable

The aggregate Cronbach's Alpha Coefficient for the independent variable and dependent variable in this study was displayed in Table 4.20. We may infer from the table that all of the variables were above the value of 0.6 and that the total number of variables was 0.818. As a result, the outcome was trustworthy and appropriate for this study.

Pearson Correlation Analysis

Pearson Correlation Coefficient

The linear correlation between two random variables is determined using the Pearson's correlation coefficient vectors, which have real values. In this study, the dependent variable (tourist satisfaction with cross-border tourism development in Rantau Panjang) and the independent factors (tourist perception, infrastructural issues, and destination image) were examined to see whether any links existed. If there is a significant relationship, the researcher must decide if the association's strength was conventional.

Table 4: Pearson Correlation Analysis

Hypothesis	Result	Finding of Data Analysis
H1: There is a significant relationship between tourist perception and tourist satisfaction of cross-border tourism development in Rantau Panjang.	r = 0.851, p = 0.000 High positive	H1: supported
H2: There is a significant relationship between infrastructure issues and tourist satisfaction of cross-border tourism development in Rantau Panjang.	r = 0.867, p = 0.000 High positive	H2: supported
H3: There is a significant relationship between destination image and tourist satisfaction of cross-border tourism development in Rantau Panjang.	r = 0.831, p = 0.000 High positive	H3: supported

The total number of cases used in the study (378) and the Pearson correlation coefficient are shown in Table 4.23. The needed significance level of 0.01 was not met by the p-value of 0.000. The expansion of cross-border travel in Rantau Panjang was positively correlated with tourists' perceptions of it and their contentment, according to the 0.851 correlation coefficient. Pearson correlation coefficient, significant significance, and overall number of cases (378) used in the study. The p-value was 0.000, falling short of the required significance level of 0.01. The p-value was 0.000, falling short of the required significance level of 0.01. The significant positive association between infrastructure issues and visitor satisfaction with the expansion of cross-border tourism in Rantau Panjang was shown by the correlation coefficient of 0.867. The number of cases used in the study (378), the significant significance, and the Pearson correlation coefficient were all displayed in Table 4.25. The p-value was 0.000, falling short of the required significance level of 0.01. The p-value was 0.000, falling short of the required significance level of 0.01. The development of cross-border tourism in Rantau Panjang was strongly positively correlated with tourist satisfaction, as indicated by the correlation coefficient of 0.831.

DISCUSSION AND RECOMMENDATION

We all know that Rantau Panjang is a city on the Malaysia–Thailand border situated in the north of the state of Kelantan in the western region of the Pasir Mas colony based on chapters 1–4 of this study. It is situated next to the Golok River in Narathiwat, Thailand, 39 kilometres southwest of Kota Bharu. Rantau Panjang is

well known for its numerous retail goods and mementos. To stop the smuggling of goods including drugs, rice, sugar, and people, among other things, the Anti-Smuggling Unit, the Royal Customs and Excise Department, the Immigration Department, and the Royal Malaysian Police conduct inspections. Duty-free shopping is a well-known feature of Rantau Panjang. The suggestions in this chapter will be based on the Garis Panduan Perancangan Kawasan Perdagangan and will deal with improving the facilities so that they are more adequately supplied with essentials. Since Majlis Daerah Pasir Mas has authority over the Rantau Panjang market, Daerah Pasir Mas also has a big influence on the development of the market's facilities. Additionally, the facilities ought to make it convenient for market patrons and guests to visit Rantau Panjang.

Traffic Management

- i. Rantau Panjang market should provide pedestrian space.

Pedestrian walkways are one of the conveniences for locals and tourists to use the road. There are also pedestrian walkways accessible to prevent people from using the road as their route to go to each location. A pedestrian route is one of the essential features that must be offered in the market area. The Garis Panduan Perancangan Kawasan Perdagangan states that these pedestrians must to be present in the market area to permit easy access for locals and visitors to different locations. It also serves as a means of preventing accidents.

- ii. Upgrade the Lot Line of Car Parking

The parking lot line appears faded and some of it is congested. Utilising road signs or a parking queue will help the already-existing parking places. Visitors can park their cars more efficiently and avoid double parking thanks to this road marker. Everyone should pay attention to the lot line since it marks the boundary between parking and the necessity to prevent parking overlap.

iii. Supporting facilities
The surau needs to be renovated because of the building's deteriorating condition and faded colour. The surau needs to be updated because it can draw in the public's interest while also providing users with comfort.

CONCLUSION

Tourist satisfaction has a substantial impact on overall contentment when cross-border tourism development, with tourist perception, infrastructure issues, and destination image all playing an important factor. According to the data, practically all respondents completed the survey questions on their satisfaction with cross-border tourism development in Rantau Panjang, Kelantan. The majority of respondents firmly agreed that tourist satisfaction has a significant impact on their satisfaction while visiting cross-border tourism development. Respondents also agreed that tourist perception, infrastructure issues, and destination image play an important role when visiting Rantau Panjang, Kelantan.

ABSTRACT

Perhentian Island is a famous seaside resort in Malaysia that is the focus of tourists. This study aims to look at Factors Influencing Destination Loyalty Among Domestic Tourists in Perhentian Island, Terengganu, Malaysia. This study focuses on elements such as destination loyalty among domestic tourists such as destination attractiveness, place attachment, tourist satisfaction, and service quality that affect domestic tourists' commitment to their chosen destination. A quantitative research method was chosen, the information was gathered utilizing a survey with 384 respondents. Three types of analysis were used in the data namely, descriptive, reliability, and Pearson Correlation Analysis. As a result, all the independent variables (destination attractiveness, place attachment, tourist satisfaction, and service quality) that have been studied in this research have a significant relationship with the dependent variable (destination loyalty) among domestic tourists who visit Perhentian Island, Terengganu, Malaysia. Hopefully, the facts presented throughout this research can help related parties in generating money and profits, thereby improving the Malaysian economy.

Keywords: Destination Loyalty, Destination Attractiveness, Service Quality, Tourist Satisfaction, Place Attachment, Domestic Tourist.

INTRODUCTION

This study examines the satisfaction and loyalty of holidaymakers towards tourist destinations in Asian nations by taking Perhentian Island as the study destination. By recognising that visitor satisfaction will provide an assessment of the quality of the service and other elements that are sought to draw visitors in the future, this study is essentially finished. With the rise of the level of satisfaction, it's expected that the amount can increase holidaymaker loyalty because high satisfaction can encourage tourists to form repeat visits additionally to encouraging different tourists to visit.

Next, the results of this study may help to design marketing and customer loyalty plans for the destination by determining the precise variables that affect destination loyalty among domestic travellers in Perhentian Island. Finding any special or unusual elements that affect domestic visitors' destination loyalty on Perhentian Island could help to set the place apart from rival tourist spots. Providing insight into the characteristics and behaviors of loyal tourists in Perhentian Island, which could help to target marketing efforts and improve the overall visitor experience.

This study is important to a few sides that are involved in tourism. From the perspective of the satisfaction tourists of visiting Perhentian Island can increase the arrival of tourism to the island. The management can use the available capital to improve the Perhentian Island facilities. Tourists can also enjoy the island and learn about cultures

based on the findings of our study. Plus, the tourists who want to visit Perhentian Island will be benefited by this study.

Hence, the focus of this study was on the variables affecting Perhentian Island domestic travellers' destination loyalty. First and foremost, this chapter will explain specifically the background of the study, particularly related to the history of Perhentian Island. Next, the problem statements are also discussed in this chapter, which focuses on the issues or difficulties that exist on Perhentian Island and contribute to a downturn in local visitor arrivals. Research questions are specific questions that the research is meant to address, whereas the study's objectives represent the goals of the study. It serves as the basis for systematic research and helps to define the research process precisely. On the other side, the importance of the study describes the significance of doing the research. Additionally, every term used in the study is defined in the terms of reference section. Lastly, a summary of the whole chapter is also discussed in the last part of the chapter.

There are four objectives of this research:

1. To identify the relationship between destination loyalty and destination attractiveness.
2. To study the relationship between place attachments and destination loyalty.
3. To investigate the relationship between the tourist satisfaction and destination loyalty.
4. To investigate the relationship between service quality in waste management and destination loyalty.

Significance of The Study

By examining the attractiveness of the destination, place attachment, tourist satisfaction, and service quality, this study will enable us to better understand how to evaluate destination loyalty among local travellers to Perhentian Island, Terengganu. In Perhentian Island, Terengganu, Malaysia, we are conducting this study to determine whether elements such destination allure, place attachment, tourist satisfaction, and service quality have an impact on domestic travellers' destination loyalty. Future scholars who focus on the same subject may find this study useful in understanding tourists' intentions to return to Malaysian tourist destinations. Additionally, it will be useful for others to understand the variables that affect Malaysian domestic tourists' destination loyalty. On top of that, this study can provide new findings to other researchers and tourism industry pioneers to better improvise their business in order to get revisited from the tourists.

LITERATURE REVIEW

Destination Loyalty

Magatef & Tomalieh (2015) explained that less money is spent on destination promotion expenditures, and giving service to loyal customers is less expensive than to new ones. Destination loyalty, according to Wang et al. (2009), is the propensity of travellers to promote a place to others. This explanation speaks to the attitude component of customer loyalty. On the other hand, Chen and Tsai (2007) defined destination loyalty as the choice made by visitors of going back to the exact same place and the inclination to recommend it to others.

Destination Attractiveness

According to Xu and Zhang (2016), destination attractiveness and destination image have both been measured and utilised interchangeably. These characteristics include man-made features like theme parks and infrastructure as well as cultural and natural features like beaches, hills, and caves. These attractions play a significant role in luring travellers to a specific location. Additionally, Nasir

et al. (2020) suggest that destination appeal refers to a visitor's emotions, ideas, and opinions about the natural attractiveness, cultural attractiveness, and infrastructure inside the area satisfying specific.

Place Attachment

Place attachment, as defined by Nasir et al. (2020), is a powerful emotional bond that develops between a tourist and a certain location when the traveller values and exhibits sincere interest in the location's experiences. The outcome of subsequent assessment at a specific location is place attachment. Place attachment can be measured in two, three, or four dimensions. Hosany et al. (2017) employed two dimensions to quantify place attachment: place reliance, which assesses how well a setting supports a person's aims and aspirations, and place identification, which evaluates how strongly a person's identity is related to a specific natural location.

Tourist Satisfaction

Satisfaction among customers is able to be described as either a process that accentuates the end-state derived from the consumer experience or an outcome that underlines the perceptual, evaluative, and psychological processes that lead to customer happiness (Varvara, 1997). According to this definition, customer satisfaction is measured while services are rendered. The consumer will feel disappointed or unsatisfied if the perceived performance is below the planned performance (Kotler, 2008). According to Choi and Chu (2001), a consumer is said to be satisfied when an event matches their weighted average of hopes making them pleased.

Service Quality

The issue has generated a lot of interest and discussion in the academic literature because it is challenging to define and evaluate the quality of services since there is no agreement in either area (Wisniewski et al., 1996). Customers are dissatisfied when expectations exceed performance (Parasuraman et al., 1985). A research gap is essentially an unresolved problem or unexplored subject in an area as a result of insufficient earlier investigation. When there has been a significant quantity of prior study but the findings go in different ways, making it difficult to make firm conclusions, there may still be a research gap.

Research Hypothesis

A hypothesis needs to be testable and acceptable, taking into account the most recent findings and research methods. A hypothesis is also an assumption or an explanation of the relationship between two variables. It shows that an independent variable and a dependent variable are causally related. As a result, the study suggests:

H1: There is a considerable connection between the attractiveness of a destination and loyalty to that destination.

H2: Place attachments and destination loyalty have a significant relationship.

H3: Tourist satisfaction and destination loyalty are significantly correlated.

H4: Service quality and destination loyalty are significantly correlated.

Research Framework

Figure 1 depicts the conceptual foundation for this study. The independent variable that will be suggested is made up of four variables: tourist satisfaction, place attachment, destination attractiveness, and service quality. The dependent variable is loyalty to a destination. As a result, this paradigm will illustrate how independent and dependent variables relate to one another.

METHODOLOGY

Research Design

The study's design represents the factors that impact destination loyalty among domestic tourists in Perhentian Island. A quantitative technique will be used in this study, and data will be collected from individuals using a self-directed questionnaire. Because this study's objectives are to prove a causal relationship between variables, a causal research design was used. As a result, this study used a cross-sectional design. The acquisition of information at one period, and in relation to correlations between variables at a single period of time are two benefits of a cross-sectional design.

Data Collection

Online surveys made with Google Forms were used in the initial phase of data collection for this project. This platform of technical tools was used by the researcher because it was free and simple to use. Additionally, it makes it simple for the researcher to collect all the data from local tourists. Fieldwork was the second phase of data collecting. Actually, the main tool for acquiring data for this

study was a questionnaire. Respondents must complete all six of the sections of the questionnaire. To gather information on Malaysian tourists, a questionnaire was made available to the general public.

Sampling

Convenience sampling, a non-probability sample method, is employed in this study. The term "convenience sampling" refers to a technique used by researchers to gather data from a sample of easily available respondents for market studies. The most popular sample procedure is made possible by the fact that it is so quick, easy, and inexpensive. It is generally easy to persuade participants to participate in the sample. Additionally, the study's methodology used a quantitative approach.

Data Analysis

Five different data analysis methods, including SPSS, frequency analysis, descriptive statistics, reliability, and Pearson Correlation Coefficient Analysis, are employed by the researchers. In order to review and analyse the primary data that was collected from the respondents, we use Statistical Package for the Social Sciences (SPSS) version 25 software. SPSS is a statistical analysis programme that aids researchers in analysing their study objectives and processing the collected data.

FINDINGS

Result of Reliability Analysis

Table 1: Result of Reliability Test

Name of Variables	Cronbach's Alpha	Value N of Items	Remarks (acceptable/not acceptable)
Destination Attractiveness	0.862	8	Acceptable
Place Attachment	0.849	5	Acceptable
Tourist Satisfaction	0.878	3	Acceptable
Service Quality	0.932	8	Acceptable
Destination Loyalty	0.915	4	Acceptable

The result of reliability analysis for the independent and dependent variables of the study were shown in Table 1. Independent variables include destination attractiveness, place attachment, tourist satisfaction, and service quality while dependent variable is destination loyalty. Cronbach's Alpha value of destination attractiveness is 0.862, place attachment is 0.849, tourist satisfaction is 0.878, and service quality is 0.932. Additionally, destination loyalty resulted 0.915 of Cronbach's Alpha value. All of the independent variables results were acceptable because it is over than 0.70. Furthermore, dependent variable which is destination loyalty also acceptable because the score result is 0.915 and it's over than 0.70 value, demonstrating that the variables used were suitable and accurate for

assessing this variable. In conclusion, according to Cronbach's alpha, the reliability coefficients for the independent variables in this study were satisfactory and associated with one another.

Result of Frequency Analysis (Respondents' Demographic Information)

384 respondents completed the survey, which included filter questions, and the results of the demographic profile of the respondents were gathered and summarized. Gender, age, race, status, occupation, income, and place of origin are demographic questions that have been asked in the questionnaires.

Table 2: Result of Frequency Analysis (Demographic Analysis)

Items	Frequency (N)	Percentage (%)
Gender		
Male	103	26.8
Female	281	73.2
Age		
18 – 20 years old	13	3.4
21 – 25 years old	358	93.2
26 – 30 years old	9	2.3
31 – 35 years old	2	0.5
> 36 years old	2	0.5
Race		
Malay	362	94.3
Chinese	10	2.6
Indian	7	1.8
Other	5	1.3
Status		
Student	335	87.2
Work	47	12.2
Other	2	0.5
Occupation		
Student	332	86.5

Government Servant	10	2.6
Private Worker	23	6.0
Self-Employment	9	2.3
Others	10	2.6
Income		
< RM1,500	67	17.4
RM1,501 – RM3,000	31	8.1
RM3,001 – RM4,500	8	2.1
RM4,501 – RM6,000	2	0.5
>RM6,000	1	0.3
No Income	275	71.6
Place of Origin		
Kedah	56	14.6
Perlis	4	1.0
Pulau Pinang	16	4.2
Perak	8	2.1
Kelantan	73	19.0
Terengganu	113	29.4
Pahang	45	11.7
Selangor	17	4.4
Wilayah Persekutuan Kuala Lumpur	5	1.3
Johor	26	6.8
Melaka	5	1.3
Negeri Sembilan	3	0.8
Sarawak	6	1.6
Sabah	7	1.8
Total	384	100.0

According to Table 2 above, the total number of 384 respondents are 100% Malaysian domestic tourists that are visiting Perhentian Island, Terengganu, Malaysia. Firstly, the majority of the respondents are female 73.2% than males 26.8%. This is because most of the female respondents who answered the questionnaire stated that they are traveling more to Perhentian Island, Terengganu.

Next, the highest age group of respondents is from 21 – 25 years old with 93.2%. This is due to the intention to travel and the time freedom that they have to spend with their family and friends. Besides, 94.3% are Malays that answered the questionnaire and it is because most of the population in Perhentian Island, Terengganu are Malays. 87.2% of respondents hold status as students where they prefer to travel to Perhentian Island, Terengganu when holidays or semester break. On top of that, the highest percentage of occupation is 86.5% of students who travel in order to release their stress on studies. Next, the highest percentage of income is 71.6% that is from no income group since students are the majority community to travel to Perhentian Island. Their willingness to travel with their fellow friends makes it happen even though they don't have enough sources of income. Last but not least, is a place of origin. Respondents who come from Terengganu stated 29.4% more than other states in Malaysia. This is because, the population of the study is basically from Terengganu, Malaysia and that is why Terengganu holds the highest percentage among others.

Result of Descriptive Statistics

The researchers examined the mean and standard deviation for each variable in the study of 384 respondents who visited Perhentian Island, Terengganu.

Table 3: Descriptive Statistics of Dependent Variable and Independent Variable

Variables	Items	N	Mean Score	Standard Deviation
Destination Attractiveness	1. Easy to access transportation services.	384	3.78	0.870
	2. Good service and comfortable accommodation.	384	4.18	0.674
	3. Shopping and entertainment facility.	384	3.77	0.891
	4. Good quality and tasty food and beverages.	384	4.02	0.793
	5. Multiple historical attractions and places.	384	3.73	0.891
	6. Multiple cultural events and attractions.	384	3.93	0.817
	7. Rich in natural scenery and calmness of the places.	384	4.43	0.701
	8. Pleasant climate and full of a positive vibe environment.	384	4.25	0.723
Place Attachment	1. I like visiting Perhentian Island more than any other destination.	384	3.74	0.895
	2. For me, Perhentian Island is an excellent choice for an enjoyable vacation destination.	384	4.08	0.779
	3. I have really special memories of Perhentian Island.	384	3.81	1.01
	4. Get good feedback from outsiders about Perhentian Island.	384	4.07	0.770
	5. Have strong self-attractiveness at Perhentian Island.	384	4.30	0.713

Tourist Satisfaction	1. My overall evaluation of a vacation in Perhentian Island is well worth the money, time, and energy invested.	384	4.13	0.785
	2. Vacation satisfaction is satisfying and provides a sweet moment.	384	4.20	0.721
	3. I am satisfied with my vacation in Perhentian Island.	384	4.12	0.772
Service Quality	1. Cleanliness and easy-to-find food and beverage facilities.	384	3.99	0.768
	2. Take great care of cleanliness in public toilets.	384	3.85	0.830
	3. Customer-friendly attitude shown by the seller towards the customer.	384	3.97	0.801
	4. The seller's honesty with customers.	384	3.80	0.894
	5. Signs and information symbols that are clear and easy to understand.	384	4.03	0.726
	6. Comfortable and reasonable prices of rental vehicles.	384	3.89	0.822
	7. Cleanliness of the hotel is taken care of thoroughly.	384	4.03	0.733
	8. Maintain their food and beverage standards at the hotel.	384	3.96	0.750
Destination Loyalty	1. I will revisit Perhentian Island.	384	4.12	0.789
	2. I will probably revisit Perhentian Island in the future.	384	4.23	0.764
	3. I will recommend Perhentian Island to others.	384	4.27	0.697
	4. Perhentian Island vacation lived up to my expectations.	384	4.08	0.780

Destination attractiveness, item seven scored the highest mean value which is 4.43, where the respondents strongly agree that Perhentian Island is rich in natural scenery and calmness and it influences their loyalty to revisit that place. Item five is the lowest mean score with 3.73 where respondents agreed that multiple historical attractions and places inspired them to revisit Perhentian Island. Place attachment, item five scored the highest mean value with 4.30 where respondents strongly agree that Perhentian Island has strong self-attractiveness. In contrast, item one scored the lowest mean with 3.74 where respondents stated that they tend to visit Perhentian Island more than any other destinations. For tourist satisfaction, item two scored the highest mean with 4.20 where respondents strongly agree their vacation at Perhentian Island is satisfying and provides sweet moments that influence their loyalty to revisit that place at another time. Item three, on the other hand, score the lowest mean where respondents agree that they are satisfied with their vacation in Perhentian Island. Service quality, items five and seven scored the same highest mean with 4.03 where respondents agree that the services at Perhentian Island such as clear and understandable signs and information symbols and cleanliness of the hotel are the factors that influence them to revisit

Perhentian Island. Item four scored the lowest mean with 3.80 indicating that respondents agree to the honesty of the sellers when they are shopping at Perhentian Island. Destination loyalty, item 3 scored the highest mean with 4.27 where respondents strongly agree that they will recommend Perhentian Island to others. Item four scored the lowest mean value with 4.08 indicating that respondents agreed that Perhentian Island has fulfilled their expectations during their visits.

Result of Pearson Correlation Coefficient Analysis

Table 14: Summary of the hypothesis testing in this study

Hypothesis	Pearson's correlation results	
H ¹ : There was a positive relationship between destination attractiveness and destination loyalty.	r = 0.645, p < 0.01	Strong
H ² : There was a positive relationship between place attachment and destination loyalty.	r = 0.779, P < 0.01	Strong
H ³ : There was a positive relationship between tourist satisfaction and destination loyalty.	r = 0.775, p < 0.01	Strong
H ⁴ : There was a positive relationship between service quality and destination.	r = 0.668, p < 0.01	Strong

Hypothesis 1 (H1) p-value was 0.001, which was less than a significant level of 0.01. The correlation coefficient of 0.645 recommended a moderate correlation between destination attractiveness and destination loyalty.

Hypothesis 2 (H2) p-value was 0.001, which was less than a significant level of 0.01. The correlation coefficient of 0.779 recommended a high positive correlation between place attachment and destination loyalty.

Hypothesis 3 (H3) p-value was 0.001, which was less than a significant level of 0.01. The correlation coefficient of 0.775 recommended a high positive correlation between tourist satisfaction and destination loyalty.

Hypothesis 4 (H4) p-value was 0.001, which was less than a significant level of 0.01. The correlation coefficient of 0.668 recommended a moderate correlation between service quality and destination loyalty.

DISCUSSION AND RECOMMENDATION

The study examined the connections between Perhentian Island's attractiveness as a travel destination and factors like place attachment, visitor satisfaction, service quality, and destination

loyalty. In Perhentian Island, Terengganu, Malaysia, domestic visitors are being studied in order to determine the relationship between destination attractiveness, place attachment, tourist satisfaction, service quality, and destination loyalty.

The study suggests to tourism stakeholders that the administration of Malaysia's tourist sector needs to be aware of these characteristics and behaviours in order to maintain Perhentian Island position as the country's top island destination. In order to attract domestic tourists, they should take their preferences into consideration. Tour managers and operators risk misunderstanding market developments and ineffective resource allocation if they focus solely on foreign tourists.

In addition, the attraction of the site and having a sufficient budget might make Perhentian Island a more appealing tourist destination and impact satisfaction and intention to return. The tourist region needs stakeholders to keep up its enhancement efforts in terms of providing more alluring sites and attractions.

Furthermore, unique locations to explore will entice visitors to stay longer and spend more. Domestic tour companies and small businesses will profit from the additional revenue. There can therefore be no doubting the long-term impact which is going to benefit the tourism industry. Additionally, the entire nation gains both economically and can have an efficient growth in earnings.

Finally, for subsequent investigations, researchers might decide to use qualitative methods for collecting data because using an alternate method is done to see if the results are different from earlier studies in any way. For instance, using a qualitative approach may result in the researchers not receiving particular data, but they are more likely to acquire correct data.

CONCLUSION

In conclusion, it was found that elements like destination loyalty, place attachment, tourist satisfaction, and service quality had an impact on domestic travellers' loyalty to Perhentian Island in Terengganu, Malaysia. Based on the data gathered, all of the respondents responded to the surveys based on their loyalty and experience while visiting Terengganu's Perhentian Island. The outcomes and conclusions of this study also revealed that the majority of the respondents firmly agreed that Perhentian Island, Terengganu, Malaysia's Perhentian Island had a substantial impact on destination loyalty, particularly in terms of destination attractiveness, place attachment, visitor satisfaction, and service quality.

ABSTRACT

The pineapple (Ananas comosus) is the most economically vital plant of the bromeliad household and is a tropical plant suitable for eating fruit. This study was conducted to investigate the factors influencing the supply of pineapples in Johor, Malaysia. The independent variables in this study were farming experience, farm size, price of pineapple and cost of inputs, while the dependent variable was the quantity of pineapple supplied in Johor, Malaysia. This study had four objectives to investigate the factor farming experience in relation to the quantity of pineapple supplied in Johor, Malaysia, to analyse the farm size in relation to the quantity of pineapple supplied in Johor, Malaysia, to investigate the factor price of pineapple in relation to the quantity of pineapple supplied in Johor, Malaysia, and to investigate the factor cost of inputs in relation to the quantity of pineapple supplied in Johor, Malaysia. A questionnaire was used as the research instrument for data collection, and a quantitative research approach was used. In this study, a baseline sample of 103 respondents was collected and studied. A Google form was used for data collection. The results show that all the independent factors (farming experience, farm size, price of pineapple and cost of inputs) examined in this study have significant relationship with the dependent variable (quantity of pineapple supplied in Johor Malaysia) among Pontian farmers. This study will help to identify the factors influencing the quantity of pineapple supplied in Johor Malaysia, as well as provide a better understanding and knowledge of farming experience, farm size, price of pineapple and cost of inputs.

Keywords: Quantity of pineapple, Farming Experience, Farm size, Price of pineapple, Cost of inputs

INTRODUCTION

Pineapple is regarded as an economically significant horticulture product with significant health advantages and attractive sales potential in the worldwide market for foreign exchange profits, resulting in increased revenue for farmers. The pineapple market in Malaysia was decreasing day by day. This is because of Malaysia experiencing fierce competition with foreign countries such as Thailand, and Myanmar. Previous research on the pineapple industry in Malaysia centred mainly on chemical factors. However, several factors are involved in the decline of the pineapple market. One of them is the limited number of farmers. Many rural farmers in Malaysia suffer from the economy in light of the pineapple's market. It has proven when the whole country must witness the cases of fruit market decline, especially the pineapple now in 2022. This issue should be highlighted because it clearly shows that the collapse of the pineapple market is a big issue and it can have a bad impact for the national economy. The result of the study is helpful for farmers, traders and service providers involved in the production and marketing of fruits in the study area. In addition, the findings of the study also provide information for policy makers with a view of the whole market system that can be used as a frame-work how to formulate fruit marketing development programs and improve

efficiency of the fruit marketing system. Furthermore, the study can be used as references for further research.

Several objectives of this study were established as follows:

4. To examine the farming experience factor towards the quantity of pineapple supplied in Johor, Malaysia.
5. To analyse farm size towards the quantity of pineapple supplied in Johor, Malaysia.
6. To investigate the price of pineapple factors towards the quantity of pineapple supplied in Johor, Malaysia.
7. To examine the cost of inputs factors towards the quantity of pineapple supplied in Johor, Malaysia.

SIGNIFICANCE OF THE STUDY

Despite being a significant national export, commercial varieties of pineapple have not yet been thoroughly studied and compared in terms of their physical, chemical, biological, and organoleptic qualities. The aim of this study was to determine and compare the physicochemical parameters, bioactive substances, antioxidant capacities, enzymatic activity, and sensory traits of various commercial pineapple cultivars in Malaysia. The goal of this study is to increase pineapple consumption based on the nutritional value of different commercial cultivars of pineapple, facilitate the marketing of cultivars with known fruit qualities and potencies, and provide useful data for future hybridization among these cultivars.

LITERATURE REVIEW

Quantity supply

The range of products or services that suppliers produce and promote at a given market charge is known as the quantity supplied. Price fluctuations decide how a great deal supply producers absolutely deliver to the market, subsequently the supply quantity differs from the proper supply quantity. The rate elasticity of supply describes how supply fluctuates in response to rate changes. (Will Kenton, 2021).

Price Of Pineapple

Price is the value or money that customers give up in return for a particular item that meets their needs and wants. Prices are an economic mechanism for distributing offers to customers in the market. They also serve as an indicator of how much a supply is in demand and how much it is offered or available. A product's price is the overall value of the supply, which includes the cost of raw materials and services needed to manufacture the supply. The pricing of a service takes into account all the factors that contribute to making the service what it is. (Siddhi Kamble, 2022).

Experience

Experience is defined as information or insight gained through practical participation in an action or event. This is usually different from the kind of theoretical knowledge gained through reading books or obtaining factual information. (Yogapedia, 2022)

RESEARCH HYPOTHESIS

The literature review highlighted independent variables like farming experience, price of pineapple, farm size and cost of inputs affecting quantity of pineapple supplied in Johor, Malaysia. Based on the literature discussed, the hypotheses of this study were summarized in the following manner:

H1: There is a significant relationship between farming experience and the quantity of pineapple supplied in Johor, Malaysia.

H2: There is a significant relationship between the farm size and the quantity of pineapple supplied in Johor, Malaysia.

H3: There is a significant relationship between the price of pineapple and the quantity of pineapple supplied in Johor, Malaysia.

H4: There is a significant relationship between cost of inputs and the quantity of pineapple supplied in Johor, Malaysia.

RESEARCH FRAMEWORK

The Figure 1 below shows the research framework used for this study.

METHODOLOGY

Research Design

This study uses a quantitative method. The design of this study can be divided into three types: descriptive, exploratory and causal. The project investigates why. The goal of this research is to understand how the connection among dependent and independent factors affects current norms together with assumptions.

A cross-sectional technique was used to collect data for this investigation. This type of study is beneficial because it gathers information about correlations between factors at a specific moment in time. Surveys can be utilized for this purpose because they are relatively cheap and take very little time.

Data Collection

The major data gathering strategy in this study was a questionnaire survey. The questionnaire was passing by online. Surveys are generally considered a reliable and effective method of gathering quantitative information from large populations in a brief period of duration. In addition, self-administered questionnaires can quickly collect a large amount of information from many respondents without the need for observers. Therefore, questionnaires will be used to collect data for this study.

Target Population

The word "population is a collection of individuals, occurrences, or things that are fascinating about which researchers want to learn more (Kumar, 2013; Memon et al., 2020). Therefore, Pontian farmers were picked at random from a list of registered pineapple farmers in Pontian, Johor, by the Malaysian Pineapple Industry Board (MPIB).

The fast increase of the world populace and growing purchaser attention of the fitness advantages of fruits have led to a global extend in demand for fruits (Reid and Buisson, 2001; Sabbe et al., 2008). This advancement

generated an enormous chance to raise the fruit zone's contribution to gross national income (GNI) and improving incomes for farmers. Pineapple represents a strategically placed fruit among all fruits due to the alternate is aimed to industrialized nation such as Japan, the United States, and the European Union. (Coveca, 2002).

Sample Size

A sample is a group of respondents chosen as most representative of the general population. To get an accurate picture or improve confidence, sample size is critical. Sample size helps to understand a group of individuals selected from the wider community that is believed to accurately reflect the population under study. Sample size is usually determined by population. 103 of pineapple farmers will be chosen through random sampling from the Malaysian Pineapple Industry Board (MPIB) listing of registered pineapple farmers in Pontian, Johor. The study sample (n=140) was determined as in accordance with Krejcie and Morgan (1970) to obtain an appropriate sample size.

Sampling Method

The fourth step is to calculate the sample size. A random sample must have an acceptable size so that it can be generalized and to avoid sampling error or bias. The fifth step is data collection. The next stage is to gather data after selecting the target population, sampling frame, sampling process, and sample size. Response rate testing is the final stage of sample collection. The number of people that volunteered to participate in this study is referred to as the response rate.

Data Analysis

In this study, descriptive statistics are used to characterize the data and describe its essential characteristics. Descriptive statistics, according to Gupta et al. (2019), provide straightforward descriptions of the sample and the measures. On the other hand, the researchers also use Pearson's Correlation Coefficient Analysis in this study. Correlation is to identify both the independent and dependent variables and is a test to show whether there is a relationship between both variables. Besides that, the researcher utilized Cronbach's alpha to assess the accuracy of the questionnaire results and the quality of the output. Both dependent and independent variables were studied based on Cronbach's alpha coefficient. Therefore, the researchers had been utilized the version 28.0 of the Statistical Package for Social Science (SPSS) to analyze the data.

FINDINGS

Profile of Respondents

Demographic	Categories	Frequency (N)	Percentage (%)
AGE	21-30 years	30	29.1 34.0
	31-40 years	40	36.9
	years above	38	
RELIGION	Muslim	48	46.6 13.6
	Christianity	14	14.6
	Hinduism	15	25.2
	Buddhism	26	

ETHNICITY	Malay	50	48.5	37.9
	Chinese	39		13.6
	Indian	14		
MARITAL STATUS	Single	38	36.9	47.6
	Married	49		6.8
	Divorced	7		8.7
	Widow	9		
LEVEL EDUCATION	Pmr/pt3 Spm	18	17.5	43.7
	Diploma	45		16.5
	Degree	17		21.4
	Master	22		1.0
		1		

Table 1: Demographic Analysis

Table 1 shows 103 profiles of the respondents and most of them are at the age of 40 years above which is 36.9% from the total of the sample. The lowest frequency respondents' age is 21-30 years with 29.1%. Meanwhile for ethnicity, the highest respondents are Malay with 48.5%. The race of Indians has the lowest frequency which is 13.6%. For marital status, most of the respondents are single with 47.6% and married respondents only 36.9% of them. As for the level of education stated that 43.7% of SPM students are the majority total respondents out of 1.0% is the lowest frequency of the respondents that are MASTER students. Thus, the data accurately reflect the real demographic compilation of the factors influencing the supply of pineapples in Johor, Malaysia

Table 2: Descriptive Analysis

VARIABLE	ITEMS	N	MEAN	STANDARD DEVIATION
Farming Experience	Pineapple farming faces challenges such as weather conditions, pests and diseases that can affect crop yields.	103	3.92	0.871
	Pineapple farming requires access to proper agricultural resources such as land, water and seeds in order to grow pineapples efficiently.	103	4.04	0.803

	Pineapple farmers must constantly learn and adapt to new growing methods and technologies.	103	4.07	0.889
--	--	-----	------	-------

	Pineapple farmers face social and economic challenges, such as land tenure issues and market access, that can impact their farming experience	103	3.86	0.864
	Pineapple farmers must constantly adapt their cultivation methods to adapt to changing market demands and consumer preferences.	103	3.96	0.791

Farm Size	The quantity of pineapple planting depends on the area (hectares) of the farm.	103	4.11	0.791
	Commercial and organic fertilizers used when growing pineapples will affect the quality of fruit	103	4.09	0.781
	The quantity of pineapple production depends on the type of soil used for planting.	103	4.11	0.726
	Pineapple cultivation is not too difficult because it can be planted in all types of soil.	103	3.99	0.975
	The size of the farm is not one of the reasons for the quality of pineapples to be damaged.	103	3.96	0.874
	The larger the farm area, the more pineapples the grower can produce.	103	4.17	0.678
Price of Pineapple	Pineapple prices according to the current market.	103	4.19	0.768
	The price of pineapple varies depending on the location and season.	103	4.00	0.767
	The price of pineapple may be affected by factors such as transportation costs, import and	103	4.06	0.739

	export tariffs and demand/supply dynamics.			
--	---	--	--	--

	Pineapple prices can fluctuate over time as due to changes in weather or disasters that influence pineapple production.	103	4.18	0.789
Cost of Inputs	The cultivation of pineapples requires considerable investment in land, labor and pesticides.	103	4.01	0.773
	Due to the costly expense of enhanced planting materials, I have resorted to traditional planting materials.	103	4.02	0.779

	I use family labor due to the high costs of labor.	103	4.10	0.786
	Pineapple production involves high transportation costs due to its perishable nature.	103	3.99	0.869
	One of the main aspects of pineapple production is ground preparation, for which suitable machinery is required.	103	4.13	0.776
	Each month, many machineries and energy will be utilized for pineapple cultivation.	103	4.07	0.889

Table 2 indicated the number of respondents, as well as the mean and standard deviation of the independent and dependent variables. The highest mean for the independent variables was the price of pineapple, which was 4.1092, followed by farm size, which was 4.0712, cost of inputs, which was 4.0518, and farming experience, which was 3.9709. The dependent variable's mean was 4.0558. Descriptive statistics are particularly important because they provide an easy overview of information in numbers and graphs. Descriptive statistics, in particular, is a technique for collecting data, processing data, describing and analysing all data. The most important aspect of descriptive statistics is that they express facts in the structure of data and aid in data understanding. In descriptive statistics, there are three important measurements. It is a central tendency measure, a variation measure, and a role measure.

Table 3: Reliability Analysis

Variable	Number of Items	Cronbach's Alpha Coefficient	Strength of Association
Farming Experience	5	0.894	Very Good
Farm Size	6	0.828	Very Good
Price of Pineapple	4	0.842	Very Good

Cost of Inputs	6	0.861	Very Good
Quantity of Pineapple Supplied	4	0.800	Very Good
Overall Variables	25	0.902	Excellent

Table 4: Pearson Correlation Analysis

		QUANTITY OF PINEAPPLE SUPPLIED IN JOHOR, MALAYSIA.
Farming Experience	Pearson Correlation	.726
	Sig. (2-tailed)	.000
	N	103
Farm Size	Pearson Correlation	.647
	Sig. (2-tailed)	.000
	N	103
Price of Pineapple	Pearson Correlation	.792
	Sig. (2-tailed)	.000
	N	103
Cost of Inputs	Pearson Correlation	.683
	Sig. (2-tailed)	.000
	N	103

Discuss Finding

This study suggests that further research can be done on factors influencing the supply of pineapples in Johor, Malaysia, as this study focused on pineapple growers to see if there is any correlation in the results. Therefore, some pineapple growers may also be able to answer this questionnaire.

Furthermore, the current study only focuses on factors influencing the supply of pineapples in Johor, Malaysia. However, this study may have overlooked some important factors that are also playing a role in disrupting the supply of pineapples in the Malaysian state of Johor. Therefore, researchers may recommend other variables, such as credit acquisition, to provide new insights for future research.

The study was also limited to a sample of 103, which can be classified as a small market. Therefore, future researchers should increase the sample size to improve the accuracy and reliability of the study.

Finally, instead of having respondents answer a scale questionnaire online, you can interview them or ask them an open-ended question. Using the interview method, researchers can obtain high response rates, resolve ambiguities, and follow up on partial answers immediately. In fact, this practice can help eliminate misconceptions and produce better research results.

Conclusion

In a nutshell these variables have a significant and positive impact on pineapple supply in Johor, Malaysia. The findings of this investigation indicated that the price of pineapple influenced its supply. In simple terms, the study's goal of identifying the farming experience, farm size, cost of inputs, and price of pineapple that impact pineapple supply has been met.

This study advises that more research on variables impacting pineapple supply in Johor, Malaysia, be conducted, since this study focused on pineapple farmers to determine whether there is a correlation in the results. As a result, certain pineapple suppliers may be able to respond to this inquiry.

Furthermore, the current study focuses entirely on the factors influencing pineapple supply in Johor, Malaysia. This study, however, may have overlooked numerous key factors impacting pineapple supply in the Malaysian state of Johor. As a result, researchers may suggest that other variables, such as credit acquisition, be included in future study to give fresh insights.

ABSTRACT

The industry of tourism plays a significant role in the nation's economic development and revenue generation which is an area's topography plays a significant role in whether or not it attracts tourists and in the state of Kelantan, there is a district called Pantai Cahaya Bulan. The determination of this study is about the tourist satisfaction towards beach tourism in Pantai Cahaya Bulan. This research takes place at Pantai Cahaya Bulan in Kelantan, which is to find out more about the geography factor, environmental surrounding, and tourist perception among domestic tourists who visit Pantai Cahaya Bulan. The excellent natural beach conditions that have drawn visitors from other states to our nation make beach tourism one of the industry's special draws. The objective of this study is to examine the relationship between geography factors, environmental surroundings and tourist perception towards beach tourism in Pantai Cahaya Bulan. Data will be collected through a questionnaire survey using convenience sampling and will be analyzed by the IBM Statistical Package for Social Science (SPSS). The findings of this study will indicate the tourist attribute that focuses on geography factor, environmental surrounding, and tourist perception in Pantai Cahaya Bulan.

Keywords: Beach Tourism, Tourist Satisfaction, Perceived Value, Visitor Perception, Environment Surrounding.

INTRODUCTION

This study's introduction is covered in the first chapter, which also provides a number of measurements on the study's background, issue statement, research questions, and objectives as well as its scope, importance, report structure, and summary. Beach tourism is one of oldest types of travel in existence. It is a popular type of travel both domestically and internationally. Contrary to popular belief, leisure and tourism play a crucial role in the growth of beaches' allu attraction to the beach. Although it seems that the 3 (sea, sun and sand) attract people to the beaches, research has shown the importance of the physical characteristics of the beaches. Large day trippers on trains, vacationing families, and other foreign tourists are presently driving one of the most well-liked forms of tourism. These trends have also extended to warmer beaches. Today's developed beach tourism, where an upscale lifestyle reflects the enjoyment of sun, sea and surf, is a relatively new but highly successful concept. This research takes place at Pantai Cahaya Bulan in Kelantan, one of the beaches in Kota Bharu Kelantan. A survey is conducted among tourists in Pantai Cahaya Bulan to find out their attitude

toward beach tourism. There were three objectives of this research. This type of recreation in coastal resorts does not necessarily come from an inescapable attraction to the beach. Although it seems that the 3 (sea, sun and sand) attract people to the beaches, research has shown the importance of the physical characteristics of the beaches. Large day trippers on trains, vacationing families, and other foreign tourists are presently driving one of the most well-liked forms of tourism. These trends have also extended to warmer beaches. Today's developed beach tourism, where an upscale lifestyle reflects the enjoyment of sun, sea and surf, is a relatively new but highly successful concept. This research takes place at Pantai Cahaya Bulan in Kelantan, one of the beaches in Kota Bharu Kelantan. A survey is conducted among tourists in Pantai Cahaya Bulan to find out their attitude toward beach tourism. There were three objectives of this research:

- i. To evaluate the relationship between geography factors toward beach tourism in Pantai Cahaya Bulan Kota Bharu, Kelantan.

- ii. To investigate the relationship between environmental surroundings toward beach tourism in Pantai Cahaya Bulan Kota Bharu, Kelantan.

- iii. To determine the relationship between tourist perception towards beach tourism in Pantai Cahaya Bulan Kota Bharu, Kelantan.

SIGNIFICANCE OF THE STUDY

The importance of this study is that high visitor satisfaction is an effective marketing tactic. Tourists who are happy with their experiences are more inclined to tell others about them, resulting in positive word-of-mouth advertising. In addition to drawing more visitors and encouraging traveller loyalty, their happiness enhances the reputation and image of the place. Next, the local and national economies of many beach resorts are significantly influenced by tourism. Satisfied visitors are more likely to spend more on lodging, dining, shopping, and leisure pursuits, boosting local companies' profits. Maximising the financial advantages of beach tourism can be achieved by understanding the elements that affect visitor happiness. Tourists that are satisfied are more inclined to stay put and come back frequently. Tourism businesses can determine the elements that encourage return visits by looking at their satisfaction levels, such as the standard of the beach, cleanliness, safety, friendliness, and recreational options. Using this information, they can create plans to keep current customers and develop lasting connections with them. Studies on visitor satisfaction with beach travel offer additional insights into the effects of tourism on the environment and culture. Destinations may apply sustainable tourism practices, minimize negative effects, and conserve their attractions for future generations by learning how satisfied tourists are with sustainability practices, the preservation of natural resources, and respect for local cultures.

LITERATURE REVIEW

Weather, water quality, lodging, landscape, and safety are just a few of the variables that have frequently been looked at in research on visitor satisfaction at beach resorts (Alegre and Cladera, 2006; Kozak, 2001; Yoon and Uysal, 2005). Recently, research on the significance of amenities and recreation in the visitor experience has begun (Frampton, 2009; McKenna et al., 2011; Williams and Micallef, 2009).

Because beach tourism and recreation have grown to be a significant contributor to the Gross Domestic Product (GDP) of many countries, visitor dissatisfaction with a beach can result in tourism decreases and economic loss. Facilities and leisure must also be included, according to Frampton (2009) and Klein and Dodds (2017b), in order to achieve comprehensive beach management.

Research Hypothesis

Places like Pantai Cahaya Bulan, for example, are accessible to tourists. This is done so that visitors can see what makes Pantai Cahaya Bulan unique. As a natural environment, Pantai Cahaya Bulan is accessible at any time. Pantai Cahaya Bulan is frequently visited. As a result, the following served as the study's first hypothesis:

H1

There is a significant relationship between tourist satisfaction and tourist perception towards beach tourism in Pantai Cahaya Bulan, Kota Bharu Kelantan.

H2

There is a significant relationship between environmental surroundings and tourist perception towards beach tourism in Pantai Cahaya Bulan, Kota Bharu, Kelantan.

H3

There is a significant relationship between geography factor and tourist perception towards beach tourism in Pantai Cahaya Bulan, Kota Bharu, Kelantan.

Research Framework

The Figure 1 below shows the research framework use for this study

METHODOLOGY

Research Design

For this study, the researcher will use a quantitative method. The quantitative approach is seen to be the most effective and used to collect the study's main data. Every organization needs quantitative

analysis to design ways to grow. A population is the collective group of individuals about whom we desire to render judgment. A sample is a specific group from whom we will collect data. Every time, the sample size is smaller than the whole population. To finish the study, a sample from the target population might be chosen. The study's target population consisted of visitors to Kelantan during the past three years. The survey targeted both domestic and international visitors who had been to Pantai Cahaya Bulan, and those who responded to the questionnaire had to be at least 19 years old. Our target population consisted of 384 domestic tourists.

Data Collection

The major data source for this study was a questionnaire survey that was utilized to gather information from survey participants. Since we need a lot of data from a lot of individuals, questionnaires let us collect data quickly. The survey we used in this study offers a financial advantage. The questionnaire was made using a free Google form, making it far less expensive than alternative methods. The dependent and independent variables are used to split the set questionnaire into portions. Their names won't be used or kept a secret in this study in order to protect the respondents' identities. This is particularly true for quantitative data, which can result in databases that are more effective and efficient. We were able to find pertinent papers, dissertations, journals, and reports linked to the research online, making it possible for us to get the information more swiftly and affordably.

Sampling

Due to the fact that samples are not chosen at random, the researcher will employ the non-probability technique. 384 tourists who have visited Pantai Cahaya Bulan are among the respondents. The non-probability convenience sampling strategy was selected to gather data for the report since it is quicker to locate the required data this way. This sample method is also simple to utilise and doesn't cost anything for this research. Visitors to Pantai Cahaya answered the questionnaire as respondents. They were chosen for this poll so that researchers could examine how satisfied they were with Pantai Cahaya Bulan. The questionnaire's respondents were chosen, and all data were gathered based on their responses.

Data Analysis

These specialized methods for evaluating data include descriptive analysis, reliability testing, and inferential statistics. In quantitative data analysis, datasets are analysed statistically, mathematically, or numerically using computer and statistical techniques. Due to its usability and cutting-edge computing and data processing capabilities, IBM SPSS Statistics software was used to analyze the

survey results. The use of SPSS in the study helps to achieve the research objectives and helps to process the data that has been obtained. To examine the number of replies per question, the valid % (the percentage when missing data is omitted from the computations), and the cumulative percentage, we first enter all of our data into the SPSS application (Verma, J. P. 2012).

FINDINGS

DISCUSSION AND RECOMMENDATION

An effective research method for examining tourists' happiness with beach travel is a longitudinal study. Using this technique, researchers can gather data over a long period of time, examining changes and trends in tourists' levels of satisfaction as well as factors that affect their experiences. Longitudinal research starts by measuring visitor satisfaction at the outset. To gauge the first levels of satisfaction among beachgoers, researchers perform questionnaires or interviews. This serves as a baseline for comparisons made across the course of the research. Data collection is done over a period of months or years, often, for longitudinal investigations. When tourists visit the beach, researchers can occasionally administer questionnaires or conduct interviews with them. This makes it possible to gauge people's levels of satisfaction throughout their encounters.

Improving the local public amenities is crucial if it is to attract more tourists to visit Pantai Cahaya Bulan. Here's a thorough description of how improving basic services for the general people might draw more tourists. It is essential to improve the area's infrastructure around Pantai Cahaya Bulan. This includes enhancing parking facilities, guaranteeing efficient transportation to and from the beach, and enhancing road networks. Tourists may reach the area more easily thanks to handy transportation alternatives and well-maintained roadways. If Pantai Cahaya Bulan wants to draw in more visitors, it is imperative to upgrade the neighborhood's public amenities. Here is a detailed explanation of how enhancing fundamental services for the general public could increase tourism. The infrastructure in the area surrounding Pantai Cahaya Bulan must be improved. This includes ensuring prompt access to and from the beach, and improving road systems. Thanks to practical transit options and well-kept roads, tourists may access the area more readily.

An effective research method for examining tourists' happiness with beach travel is a longitudinal study. CONCLUSION

The findings of the questionnaire survey results are analysed using a variety of methods, including descriptive and inferential analysis.(2016) Taherdoost. Next, using the Statistical Package for the Social Science (SPSS) version 29 software programme, the findings from the preceding chapter and all of the questionnaire data were examined. The researchers utilised this software because it makes it simple to obtain results, including those of descriptive analyses and reliability tests. Last but not least, a final summary and conclusion based on the data analysis. All of the given hypotheses (H1, H2, and H3) are accepted for this study.

ABSTRACT

This study was conducted to analyze the awareness of social protection among the gig economy workers Kota Bharu, Kelantan. The primary purpose of this research is to examine the knowledge of social protection of gig economy workers in Kota Bharu, Kelantan. The selected qualitative analysis approach and the data collection method used was a personal semi-structured interview and eight respondents were involved. That is the main source of data used in the data collection method for this research. It is the easiest way to collect and gather the honest information from respondents for this research paper. The number of respondents is eight food delivery riders in the personal semi-structured interviews. Thus, this study can help other researchers in the future when they want to examine the knowledge of social protection of gig economy workers in Kota Bharu, Kelantan.

Keywords: Awareness, Knowledge, Social Protection, Gig Economy, Kota Bharu

INTRODUCTION

In a gig economy, independent workers are hired by business to fulfill temporary tasks rather than filling permanent positions. Transactions are task-ached, and the service industry employs the majority of people. Furthermore, signing long-term contracts is optional for the employees. Other names for the gig economy include peer, network, and on demand economies. On the surface, e-hailing and start-ups are critical in the gig economy. It compels many people to look for other jobs, especially in the gig economy. One of the best ways for unemployed people to make extra money or temporary income while they wait for permanent employment or for their country's economy to revive is through the gig economy platform. An autonomous or short-term contract labor market known as the "gig economy" is one in which individuals work for themselves and are aided by digital technologies.

Advertising by companies in the gig economy ecosystem is gaining popularity. P-hailing companies are creating various job opportunities, such as part-time advertising positions, contracts, and economic gigs during the Movement Control Order (MCO) period. The P-Hailing industry, similar to mushrooms sprouting after rain, has experienced significant growth due to

the pandemic. Malaysian P-Hailing market is flooded with companies like Food panda, Grab food, Bungkusit, Lalamove, and others. The Malaysian Ministry of Transport has registered over ten (10) P-Hailing companies recently, indicating a rapid increase in demand for the P-Hailing industry in Malaysia, especially during the pandemic, as stated in the TERAJU report (2021).

Social protection refers to the measures and policies put in place by governments and organizations to support individuals and communities in times of need or vulnerability. It aims to provide financial security, access to healthcare, and other social benefits to ensure the well-being of workers and their families. Furthermore, workers in the gig economy lack social protection, which encompasses various benefits such as pensions, social security, and access to programs like the Employees Provident Fund (EPF), Employment Insurance System (EIS), and medical coverage provided by the Social Security Organization (SOCSO). They are also excluded from entitlements like maternity leave and public holidays. Moreover, the prospect of being terminated without justification or not receiving severance pay is particularly distressing for these workers (Adzee Amir, 2022).

This chapter begins by providing an overview of Chapter 1, followed by an exploration of the study's background. Additionally, Chapter 1 delves into the problem statement related to the selected topic and highlights the necessity for conducting this research. Furthermore, it addresses the research questions and objectives. Subsequently, the chapter proceeds to outline the study's scope, significance, and the structure of the report. Finally, Chapter 1 concludes with a summary of the report.

This study aims to examine the level of awareness and knowledge of social protection among gig economy workers in Kota Bharu, Kelantan. The objectives of this research are:

4. To analyze the level of awareness of social protection among gig economy workers in Kota Bharu, Kelantan.
5. To examine the level of knowledge of the social protection of gig economy workers in Kota Bharu, Kelantan.
6. To propose recommendations for the gig economy workers in Kota Bharu, Kelantan.

Significance of the Study

Gig Economy Workers

With a focus on gig economy workers, specifically food delivery riders, we aim to examine the level of awareness and understanding regarding social protection among these workers. Additionally, we will underscore the significance of social protection for gig economy workers. For example, while the Social Security Organization (SOCSO) does not extend legal protection to gig workers, the Self-Employment Social Security (SESSS) does provide such coverage. Contributions to the Employment Provident Fund (EPF) are not made by employers,

and gig workers are required to make voluntary contributions to the retirement incentive program. However, the nature of their work exposes them to various risks, including workplace accidents and injuries. Consequently, gig workers should remain vigilant and aware of their rights and responsibilities during their working hours.

LITERATURE REVIEW

Gig Economy

A "gig" is the colloquial term for work held for a specific period. Musicians have long used the expression to describe live performances. Gig workers include individuals who work as project-based workers, impermanent or part-time labor, independent contractors, and freelancers employees. Gig applications and other digital technology frequently connect customers and gig workers stated by Amanda Yeo (2021). In the gig economy, there are employers, employees, and clients. Not every gig worker is created equally. Other compensated employees include part-time employees who are not employed full-time, self-employed individuals who complete tasks and deliver them under contract, and freelancers paid per task. Some temporary employees, independent contractors, project-based workers, and contractors may get project-by-project compensation as reported by Awani (2021).

According to the Awani (2021), the gig economy can enhance work-life balance from the employee's viewpoint compared to many traditional occupations. Freelance tasks that meet their tastes and schedules, give fresh prospects, and are attracted to them can be chosen by self-employed employees. They avoid being forced into a full-time position that doesn't suit them or offer the freedom they require. Additionally, these employees can choose their hours in the freelance economy, which keeps them from being dependent on a single employer.

Social Protections

Social protection aims to reduce the impact of risks and vulnerabilities on individuals and households. It involves implementing critical health services and providing cash transfers worldwide. The term refers to a set of national guarantees that address poverty, vulnerability, social exclusion, and inequality. It includes both monetary and non-monetary benefits such as pensions, job perks, and assistance with expenses. In addition to financial aid, there are various measures like tax exemptions, Social Security payments, salary subsidies, and worker loans that improve access to social and health services. In-kind assistance and other benefits are also provided to enhance access to healthcare services.

Awareness of Social Knowledge Gig Workers Protection

Awareness of social protection for gig workers, particularly those in the knowledge-based gig economy, is crucial. These workers often lack access to basic employment benefits like sick pay, paid vacation, and health insurance. They are vulnerable to exploitation and face challenges in negotiating fair compensation and working conditions. Raising awareness about the need for

social protection, advocating for policy changes, and educating gig workers about their rights and available resources are essential steps to address these issues and create a fair and inclusive work environment.

Additionally, because they are not eligible for sick pay, self-employed people may be pushed to labor through illness. Self-employment is therefore viewed as a milder variety of work. Self-employed people either may not qualify for certain job benefits like paid vacation and sick time or are not protected by work-related social protection programs like health insurance and pension insurance. According to the Department of Labour and Statistics (2021), there are four types of employment in the nation: salaried employees or people who work for others for money. Self-employed people, or people who work on their dime, unpaid contributing family members, or people who work in family businesses without getting paid, and employers who run companies with at least one employee (Department of Statistics of Malaysia, 2021).

Gig economy workers who are self-employed can relate to institutions such as the Employees Provident Fund (EPF) and the Social Security Organization (SOCSO) in terms of social security and insurance programs. However, there is a need for thorough studies and evaluations of the current programs to enhance social welfare among self-employed individuals while ensuring their protection. The existing legislation, such as the Self-Employed Social Security Act of 2017 (Act 789) and the Employment Insurance Scheme Act of 2017 (Act 800), should be revised to provide adequate safeguards for self-employed workers in the event of work-related accidents, illnesses, or loss of employment. Additionally, it is important to address the bureaucratic obstacles that prevent independent contractors from accessing essential benefits. By collaborating with government institutions like EPF and SOCSO, comprehensive reforms can be implemented to improve the social security and insurance coverage for gig economy workers who are self-employed, removing barriers and ensuring their well-being.

METHODOLOGY

Research Design

The research design informs the nature of the study and its organizational structure. The researcher will use a descriptive research approach to analyze the awareness and knowledge of social protection among gig workers in Kota Bharu, Kelantan. A qualitative research strategy will be employed to evaluate respondent perspectives and explore unique ideas more thoroughly. This approach is suitable for determining gig workers' awareness of their social rights and their actions in this study's context. Qualitative research focuses on understanding and explaining social processes, including meanings, motives, ambitions, beliefs, values, and attitudes. It encompasses a wide range of interactions, procedures, and events, going beyond operationalizing variables (Grossoehme, 2014).

Data Collection

Data collection involves intentionally obtaining information on a specific subject, emphasizing the importance of ensuring the reliability and ethical compliance of the gathered data. The integrity of a study depends on the unique methods employed to collect quantitative or qualitative data, which can involve utilizing appropriate data-gathering tools and following precise instructions to minimize errors (Pritha Bhandari, 2020). Gathering data is a vital phase in any research project, and in this study, both primary and secondary data collection methods were employed. Primary data was obtained through personal semi-structured interviews with eight gigworkers in Kota Bharu, Kelantan, using open-ended questions. This data collection process lasted approximately three weeks. Additionally, secondary data from various sources, such as magazines, websites, books, journal articles, and newspapers, had already been collected and published.

Sampling

In this study, a group of participants will be selected using a purposive sampling technique to gather data. The researcher will use their judgment to choose participants based on specific criteria. The focus of the study is on food delivery riders, specifically eight individuals, who work in the gig economy in Kota Bharu, Kelantan. By narrowing down the participants to food delivery riders, the research aims to gain in-depth insights into their experiences, challenges, and perspectives. The study intends to utilize personal semi-structured interviews as an effective method to collect qualitative data from these selected food delivery riders. This approach ensures that the study captures valuable information and provides a comprehensive understanding of the gig work in the context of food delivery in Kota Bharu, Kelantan. The sampling technique helps optimize the study's efficiency, accuracy, and cost-effectiveness, ultimately contributing to the overall quality of the research findings.

Data Analysis

Data analysis involves collecting, manipulating, cleaning, and modeling data to uncover the desired information. Sharing the results facilitates interpretation and decision-making, often through data visualization. The terms "data analysis" and "data modeling" are interchangeable. The reliability of research depends on collecting reliable data, regardless of the subject or the chosen quantitative or qualitative data definition methods. Using appropriate data collection technologies and clear instructions helps reduce errors. Data collection is a crucial phase in any research endeavor.

In a study on social protection awareness and knowledge among gig workers in Kota Bharu, Kelantan, eight gig economy employees were interviewed in person using semi-structured interviews. Four students conducted these interviews, which took approximately one week to complete and provided valuable insights into gig workers' understanding of social protection. Primary data was collected directly from the participants through experiments, surveys, interviews, and observations. Primary data offers advantages as it is specific and aligns

with the researchers' needs, allowing them to clarify their objectives, goals, and justifications. Semi-structured interviews allowed researchers to gather additional information about respondents' daily activities related to the topic. Primary research provides more control, including decisions about study participants, recruitment practices, sample size, and sampling techniques.

FINDINGS

Analysis of Theme 1

Table 1 below shows the Analysis Theme 1

Table 1: Analysis of Theme 1

Respondent Question	Interview's Transcription (8 respondents)	Theme
<p>What is social protection and how related to food delivery rider?</p>	<p>R1: Social protection is essential for food delivery riders because we don't have a fixed salary or benefits like sick leave or health insurance. We are often classified as independent contractors.</p> <p>R2: I think social protection is very important especially for female gig workers. The purpose is to protect our rights and ensure our well-being in this employment sector.</p> <p>R3: If we apply for social protection, we can guarantee to get money for treatment and compensation in the event of an accident involving the loss of life. social protection also provides additional benefits such as financial assistance for rehabilitation costs and emotional support.</p> <p>R4: Protection in the event of an accident is essential because the consequences of an accident can disrupt the family's income. Having social protection measures in place becomes crucial as it ensures a safety net, offering financial support and assistance during these challenging circumstances.</p>	<p>The level of awareness of social protection among gig economy workers</p>

	<p>R5: Social protection, such as life insurance, is an invaluable safeguard for someone like me. It would provide crucial assistance to not only myself but also my family.</p> <p>R6: In my view, social protection serves as a contingency plan for individuals confronted with unexpected emergencies. Consequently, I do not believe it necessary to acquire social protection, such as insurance, as I have diligently saved funds and possess greater confidence in my own ability.</p> <p>R7: These highly delivery riders think that they did not have any social security coverage and aren't aware of all of their rights. They do not have any form of social safety net, be it life and health insurance, emergency savings, insurance against social setbacks or retirement savings.</p> <p>R8: They work under vulnerable conditions and suffer from a lack of comprehensive social protection mechanisms while at work. These gig workers are not covered by the existing employment-related social protection system.</p>

Finding Theme 1

Table 3 below the result Findings of Theme 1

Table 3: Findings of Theme 1

No	Finding of Awareness of social protection among gig economy workers	Interviewer's Transcription
----	---	-----------------------------

1	What is social protection and how related to food delivery riders?	<i>Respondent 7 is a male food rider in the age range of 25 to 34 years old, working full-time. His monthly income is approximately between RM 2000 and RM 2499, and he has previously received benefits from social protection. Social protection is playing a big role in gig riders who work permanently. I think the most delivery riders are</i>
---	--	---

		<p><i>the most exposed and have the least protection. These highly delivery riders think that they did not have any social security coverage and aren't aware of all of their rights. They do not have any form of social safety net, be it life and health insurance, emergency savings, insurance against social setbacks or retirement savings.</i></p> <p>Researchers choose respondent 7 because this respondent answers the question more accurately and clearly. This respondent better understands the Awareness of social protection among gigeconomy workers by answering what is social protection and how related to food delivery riders and this respondent also answered all questions about this theme with more confidence. This respondent was very clever. Researchers gain a better grasp of this respondent's opinions and experiences through in-depth interviews.</p>
--	--	--

Finding Theme 2

Table 4 below the result Findings of Theme 2

Table 4: Findings of Theme 1

No	Finding of Knowledge of social protection among gig economy workers	Interviewer's Transcription
1	Steps can you take to ensure you are enrolled in the social protection programs that meet your specific needs as a food rider?	<i>Respondent 1, a 25-34-year-old male food rider with a full-time job, earns a monthly income between RM 1000 and RM 1499 and has not received any social protection before. I think it's crucial to stay informed about the social protection programs available to us. The first step is to research and identify the programs that are most relevant to our needs, such as healthcare coverage, unemployment benefits, or retirement savings options. Once we've identified these programs, we should check if we meet the eligibility criteria and then apply accordingly. It's important to keep track of the application deadlines and document requirements to avoid any delays or issues in the application process. Lastly, we can seek assistance from relevant government agencies or NGOs if we face any challenges in accessing social protection programs.</i>

		<p>Researchers choose respondent 1 because this respondent answers the question more accurately and clearly. This respondent better understands the Knowledge of social protection among gig economyworkers by answering the Steps you can take to ensure you are enrolled in the social protection programs thatmeet your specific needs as a food rider in terms of viewpoint food rider, attitude, food rider’s real life circumstance, and personal experiences. Researchers gain a better grasp of this respondent’s opinions and experiences through in-depth interviews. Researchers are acquiring a deeper understanding of this respondent 1 and learning more from this respondent. The answers from this respondent to the research questions fulfil the research objectives with more information. This was thereason researchers chose respondent 1 to do theresearch findings.</p>
--	--	--

LIMITATIONS AND RECOMMENDATIONS

During our research on social protection awareness among gig economy workers, we, as both researchers and students with packed schedules, managed to find time to pursue this study. However, we encountered limitations when interviewing eight food delivery respondents in Kota Bharu. One significant constraint was their limited time due to strict work regulations. These workers faced the risk of being banned if interviews exceeded a 15-minute limit while not actively taking or delivering orders, which greatly hindered our ability to gather information. To enhance awareness and knowledge on social protection for gig workers in Kota Bharu, it is recommended to develop targeted information campaigns. These campaigns should educate gig workers about their rights and the available social protection schemes, emphasizing benefits and eligibility criteria. This will enable gig workers to make informed decisions and access the support they are entitled to.

To enhance awareness and knowledge on social protection for gig workers in Kota Bharu, it is recommended to develop targeted information campaigns. These campaigns should educate gig workers about their rights and the available social protection schemes, emphasizing benefits and eligibility criteria. Additionally, the campaigns should provide practical guidance on how to navigate the application process and access the support they are entitled to. By doing so, gig workers will be empowered to make informed decisions and effectively utilize social protection programs tailored to their needs.

CONCLUSION

In conclusion, this study aimed to assess the awareness and knowledge of social protection among gig economy workers in Kota Bharu. The findings of this study can serve as a valuable reference for future research on this topic. The results indicate that gig economy workers in Kota Bharu have a certain level of awareness and knowledge regarding social protection. However, they do not consider it a priority. It is hoped that the information presented in this study will be useful to researchers conducting further investigations in this area.

ABSTRACT

A job is a group of positions that have similar obligations or basic tasks. In job analysis activities, a job can be occupied by one person, or several people spread out in various places. The objective of this study is to study the awareness and knowledge of right to disconnect after work among lecturers in University Malaysia Kelantan (KOTA). This study examines the impact of disturbances on lecturers at University Malaysia Kelantan, focusing on the right to unplug after work and demand remuneration for labor after hours. Digital technology has enabled remote work, but it also leads to longer workdays. Governments must protect employees and address disconnect laws to ensure work-life balance. The research aims to promote a positive and useful solution for both employees and businesses, preventing recurring issues and promoting a more harmonious work environment.

Keywords: Awareness, Knowledge, Impact, Disconnect, Employees

INTRODUCTION

A job is a group of positions that have similar obligations or basic tasks. Under Section 60 (A) (9) of the Work Act 1955, "hours of work" are defined as the time during which an employee is at the disposal of the employer and is not free to dispose of his own time and movements. Businesses have been experimenting with Alternative Work Schedules (AWS) in an effort to increase employee engagement. Labor performed after regular business hours ends is considered overtime, but work completed on weekends and federal holidays is not. All employees have the right to disconnect after work, and for employees who are instructed to work outside working hours, they are entitled to demand payment. Employees can claim Overtime Pay together with allowances for carrying out official duties at office or any place directed after normal working hours or holidays.

SIGNIFICANCE OF THE STUDY

This study is conducted to provide knowledge to academic research, educate the right awareness and knowledge to disconnect after work, and contribute to a better quality of life. It is expected to provide relief and knowledge about disturbances received after the end of working hours, as well as open the eyes of the community, especially the employer, to not disturb after the end of working hours. Unmanaged flexible working arrangements and the continued use of mobile communication technology have a measurable impact on workers' well-being.

LITERATURE REVIEW

A literature review is an essential appraisal of the most recent body of information on a subject. It involves finding relevant literature, analyzing sources, identifying themes, controversies, and gaps, establishing the framework, and writing the literature review. This study will discuss the issues of awareness and the right to disconnect after work, as well as knowledge of awareness of the right to disconnect after work. It is important because it can give exposure and knowledge to the lecturers at University Malaysia Kelantan (Campus Kota) about the definition and accurate information about the right to disconnect after work.

Discussion of the issue

Technology has improved employees' work lives by boosting productivity, gathering better records and data, and facilitating quick communication. However, it has also changed the where, when, and how frequently workers work. A 2015 study conducted in Britain provides "concrete evidence that happier employees are more productive in the workplace." Positive workplace morale fosters greater productivity, and there are both physical and psychological factors that impact employee morale. Research suggests that prospective applicants should consider work-life balance when applying for a job. The need for businesses to evaluate the expectation of workers to engage in after-hours work in a digital environment is highlighted by the ideals of Millennials and Gen Z employees.

Employees in this modern age are constantly linked to their jobs via their smartphones, laptops, tablets, and other electronic gadgets. Benoit Hamon, a former minister of education in France, claimed that "they stay linked by a sort of electronic leash, like a dog". These inquiries are being confronted by employers across all industries since they have emerged as modern workplace

concerns. The study on the right of employees not to be disturbed after working hours discusses the issue of excessive workload at home. Excessive workload occurs when employees exceed the limits they set for themselves in terms of hours worked or intensity of work.

This can be due to budget cuts, unfair treatment at work, a lack of role transparency, and a lack of managerial support. It also affects the morale of an employee, as 73% of respondents stated that work-life balance is more important than salary when assessing job opportunities. Among the detrimental impacts of an excessive workload are stress and burnout, as well as sleep disruption and acrimony in domestic personal relationships. In 2018, 76% of American employees reported that their personal relationships were impacted by work-related stress. Employees who work too hard and exceed their own capacity can be attacked by various diseases and problems either externally or internally, such as emotional stress and mental disorders.

Research on British civil servants in 2018 highlights a connection between work stress and metabolic syndrome, which increases the risk of diabetes, stroke, and heart disease. 94% of American employees in 2019 said that stress brought on by too much work was a problem. Overwork can result in burnout, which can aggravate existing conditions such as depression, anxiety, emotional tiredness, tension headaches or migraines, poor sleep, and unhealthy coping mechanisms like drug misuse. Emotional stress can affect life in terms of emotions, behavior, thinking ability, and so on. Employees who do not take care of their physical and mental health run the risk of contracting one of the many diseases that might develop.

METHODOLOGY

Research Design

Qualitative research is a collection of approaches used to gain a deeper understanding of people's perspectives, thoughts, attitudes, and real-life situations. It is used to gain a deeper understanding of people's perspectives, thoughts, attitudes, and real-life situations, as well as to produce theoretical approaches to those personal experiences. Qualitative research was used to explain the phenomena being investigated using respondents' and 23 researcher's phrases. Qualitative research provides extensive characterizations of respondents' thoughts, ideas, and personal

experiences, as well as an analysis of the relevance of their activities. It also enables the researcher to look into respondents' inner experiences and how societal and societal judgements are made.

Phenomenological studies look at personal beliefs and the explanations they give, known as "life experience," to define the meaning that each individual acquires from their interactions. Phenomenology assists researchers in developing a fundamental knowledge of how people act.

Data Collection

This text discusses the methods used to collect primary and secondary data. Primary data is specific and provides more detailed information and is current, while secondary data is obtained from books, newspapers, research journals, and observation. The main negative is that the data was acquired for another reason, making it possible that it won't be trustworthy. In a personal or face-to-face interview, a standard arranged question is utilised to ensure that nearly all participants were asked the exact same range of questions in the same order. Research studies known as surveys use participant interviews to gather data.

For this particular study, 8 lecturers underwent in-depth interviews to understand awareness and knowledge of right to disconnect after work among lecturers in University Malaysia Kelantan (Kota). An in-depth interview was the methodology employed in this study.

Sampling

The data for this study was collected in the Universiti Malaysia Kelantan (Kota) at Pengkalan Chepa, Kota Bharu, Kelantan. The main purpose of this initiative is to provide knowledge and awareness about the rights that need to be known after the end of working hours. The sample size was limited to 8 lecturers from the Universiti Malaysia Kelantan (Kota) for the data collection method, which was an in-depth interview conducted by the face-to-face. Sampling methods should be as rigorous as possible to keep errors and biases minimal and to increase maximum representation. A non-probability sampling technique was applied and a judgemental or purposive sample approach was used. Purposive sampling is a sampling technique related to the researcher's criteria, and since only Universiti Malaysia Kelantan (Kota) lecturers participated in the respondent's study, the researcher needs to go to the campus and meet the lecturers to collect data with this sampling technique.

Data Analysis

Thematic analysis is a key step in qualitative research, as it compiles and summarises common observations and perceptions of the subject, as well as justifications and textual comments to back them up. It involves reading transcripts several times, taking notes, recording the researcher's initial hypothesis, creating the initial code, and finding topics. Themes are patterns that highlight an important or fascinating aspect of data or study topics, and are used to explore those themes and draw conclusions regarding issues. It is a common error to use the primary query as the topic of the interview, as this indicates that the information has been organised and summarised rather than analysed.

FINDINGS

Analysis of Theme 1

Table 1 below shows Analysis of Theme 1

Table 1: Analysis of Theme 1

Research Question	Respondent	Theme
-------------------	------------	-------

<p>1. Are you aware that employees can take legal action if they are forced to work even after working hours have ended?</p>	<p>R1: In my opinion, not all lecturers are aware. They will feel safer. It needs to be spread so that people know. Not necessarily because there is a law. They will be positive because misbehaviour can be avoided.</p> <p>R2: Less clear with awareness. The law can protect workers in this context if they are persecuted. For example, if the company forces employees to work but they are not paid and they work during non-working hours, You can give information, but not in a backstabbing manner that tarnishes the image of any party. University Malaysia Kelantan (UMK) has its own advisor, and he will ensure the matter does not go off track. Negative because it causes one party to be wrong. Whether the positive effect is good depends on the individual.</p> <p>R3: Action can be taken against the employer. Very safe to protect employees. I agree when it comes to mental well-being. Some lecturers don't really care because they think the work can be completed as soon as possible. Can't be at will. Need authentic evidence to the detriment of health and well-being. Each party needs to be tolerant. Cooperate with each other. There must be rules to protect the rights of employees and employers.</p> <p>R4: Can take legal action when forced to become pressured. Legal action should be taken. We need to tell others so there is awareness. It is definitely safe because there is an association</p>	<p>1. Awareness to disconnect after work</p>
--	--	--

	<p>like Labor. Employees know they are safe. I agree because they have no right to be bullied and forced to cause stress at work. Can't because there needs to be tolerance. Manipulating the right to disagree. There is a positive in everything that happens.</p> <p>R5: There is no flexible time. There is no more when working as a lecturer. Can't take things for granted. It is good that there is awareness so that there is no oppression.</p> <p>R6: They are aware but is it applicable to professionals such as lecturers? It should be, yes. That's the purpose of the law created to protect oppressed workers. Of course. Creating and spreading awareness is everyone's responsibility</p> <p>R7: Yes, I am aware of that. Yes, they will feel safer. Yes, I agree, and in addition, the employer should spread awareness to all employees. It should follow the law. It surely has a positive effect on both employees and employers.</p> <p>R8: Yes, I am aware. Absolutely. Of course. Sharing something like this will create a better working environment for the staff. Depending on what you mean by arbitrarily. The majority of staff rarely take the opportunity to use their legal rights, even though they actually need them. Again, it depends on the situation.</p>	
--	--	--

Analysis of Theme 2

Table 2 below shows Analysis of Theme 2

Table 2: Analysis of Theme 2

Research Question	Respondent	Theme
<p>1. In your opinion, should a person be instructed to continue working after working hours or on weekdays</p> <p>And WhatsApp as one medium to work?</p>	<p>R1: Depending on the situation and the type of work if the work is given time to complete, then it can be postponed to the next week. WhatsApp facilitates communication, acts as a reminder, and much more. No additional fees are required. There are no interruptions. It is not mandatory to contact Used to it. Mandatory for the employer to answer.</p> <p>R2 : On weekends. If possible, the staff tries to avoid it. Had to direct other workers outside of working hours. Excellent tools. Media that makes it easy and also for supporting documents. It can be a folder to save documents. Important for work. Lecturers do not have flexible hours for overtime work. WhatsApp makes work easier, and there is no time limit. Delaying a task if it involves something important The choice is in one's own hands not to be disturbed. Can't be blamed for being out of work hours.</p> <p>R3 : It is inappropriate to be instructed outside of working hours. But it depends on the situation. There are pros and cons. Can be contacted at any time. The lecturer has no extra points. Flexible hours and no timeframe You need to limit time and need space for yourself, depending on the situation and how you manage time. Employers need to give time to their own employees.</p>	<p>2. Knowledge to disconnect after work</p>

R4 : You have to look at the situation to see if there is no problem with that. Not something formal but important. There is no need to pay. As long as there is a period of work, then it is necessary to work. The date of delivery of the work should be emphasised. No problem.

R5 : It is possible if there is an additional payment. WhatsApp is very good and helpful. Charged because the lecturer does not have overtime. Disturbing if outside working hours

R6 : There is no need because work-life balance is more important. WhatsApp is not a problem to use as a medium or a tool for work because it is easier, but the time to use it should be limited after work hours. If it is to be counted, I think it is appropriate because the lecturer's job involves a lot of cognitive things, and sometimes until the night is still facing work. Perhaps a task record system can be created for the time count and recorded payment.

R7 : No need. It helps us a lot, but we can't rely on it 100%. Yes, you must be paid if working overtime. No, because it depends on the workplace.

R8 : need .But if the instructions come with valid documents, then they have to be obeyed. Just follow the technology as it evolves. Similar to how people communicate with letters, now we communicate through WhatsApp. Of course, unless it was something that deal with the

	flexibility of how those 8 hours operated, additional payment might not be needed. Yes absolutely. Depending on the situation But most of the situations did not actually need the employer to disturb after office hours.

Findings of Theme 2

Table 4 below shows the result Finding of Theme 2

No	Knowledge of right to disconnect after work	Interview's Transcription
1	Knowledge of right to disconnect after work among lecturers at University Malaysia Kelantan(Kota)	<p>Respondent 8, 30 years old, a female lecturer No need .But if the instructions come with valid documents, then they have to be obeyed. Just follow the technology as it evolves. Similar to how people communicate with letters, now we communicate through WhatsApp. Of course, unless it was something that dealt with the flexibility of how those 8 hours operated, additional payment might not be needed. Yes absolutely. Depending on the situation But most of the situations did not actually need the employer to disturb after office hours.</p> <p>Researchers chose respondent 8 because this respondent answered the question more accurately and clearly. This respondent better understands the knowledge of right to disconnect after work. This respondent also answered all questions about this theme with more confidence. This respondent was very brilliant. Researchers gain a better grasp of this respondent's opinions and experiences through in-depth interviews. Researchers are acquiring a deeper understanding of this respondent 8 and learning more from this</p>

		<p>respondent. The answers from this respondent to the research questions fulfil the research objectives with more information. This was the reason researchers choose this respondent 8 to do the research findings.</p>
--	--	---

LIMITATION AND RECOMMENDATION

This research study faced several limitations, including time constraints, lack of previous studies on qualitative methods in awareness and knowledge of the right to disconnect after work among lecturers at University Malaysia Kelantan (Kota), and overload of tasks. Researchers recommended seeking permission from the university to conduct in-depth interviews with respondents, providing more qualitative research and secondary data sources, and using Google Forms and social media platforms to distribute study questions.

To expand the research beyond University Malaysia Kelantan (Kota), researchers should expand the study to include all university professors and obtain contact information for all professors who wish to participate. This will help eliminate misunderstandings and bias and generate better study outcomes.

Employees can propose that their employers better limit working hours, set specified boundaries, and create practices that respect work-life balance, especially if their case is built on the need to preserve health. It will be interesting to see if multinational corporations headquartered in states where there are laws protecting the right to disconnect will implement similar rules locally.

Lecturer work-life balance must be studied in the academic setting in terms of spatial and temporal flexibility, employment practices, and employee habits. Researchers across all career stages recognize the need to enhance work-life balance. Departments and institutes must help improve research practices for academics at all levels of their careers. By respecting limits and giving individuals greater authority over their own work schedule, PIs and mentors can build healthier workplaces in their laboratories.

CONCLUSION

This study aimed to analyze the awareness and knowledge of the right to disconnect after work among lecturers at University Malaysia Kelantan (Kota). Eight respondents from various faculties

were analyzed. The researchers concluded that the university can provide proper awareness and knowledge about the right to disconnect after work. They also suggested recommendations for improving awareness and knowledge among lecturers. The study's findings are accepted and will be helpful for future researchers, providing valuable sources and ideas.

Awareness and Knowledge of Academic Burnout Among Students in University Malaysia Kelantan Kampus Kota: A Qualitative Study

Nurfarahim binti Mohd Zuki, Aiman Insyirah binti Kharudin, Ain Sabrina binti Azmi, Malini A/P Baloo & Muhammad Firdaus bin Bidin

Faculty of Hospitality, Tourism and Wellness, Universiti Malaysia Kelantan

mfirdaus.b@umk.edu.my

ABSTRACT

Academic burnout entails the tiredness and disengagement students endure due to long-term exposure to specified academic expectations. Academic burnout has various negative consequences, including poor academic performance and mental health. The rate of Malaysian students suffering from mental health problems doubled in less than a decade, from 10% in 2011 to 20% in 2016. This study examined the awareness and knowledge of academic burnout among the University Malaysia Kelantan Kampus Kota students. This study also proposes recommendations and suggestions for preventing student stress and burnout. This study conducted an in-depth interview where print-out questions were given to the respondents. This study used 'purposive sampling' where only University Malaysia Kelantan Kampus Kota students participated.

Keywords: Awareness, Knowledge, Academic Burnout

INTRODUCTION

Burnout as a psychological notion has recently been understood and one of the pioneers in the study of burnout was Herbert Freudenberger. He found that a group of volunteers he worked with were becoming emotionally spent and losing motivation over time. Students may occasionally experience pressure from academic achievement, university life, and the transition experienced between adolescence and adulthood. These persistent pressures on students, particularly in Malaysia, result from the mindset of the students, who believe that a high cumulative grade point average (CGPA) in their studies is necessary to land a better career in the future. Due to the rigours of university life, this perspective leads to mental and emotional pressure, producing academic burnout in university students.

Burnout is not a new illness, although it has only been recognised as a condition since Maslach identified it in her book in 1982 (Church, 2019). Although burnout is not a disorder, according to the Diagnostic and Statistical Manual of Mental Disorders (APA, 2010), it is a 'life management' problem, per the International Statistical Classification of Diseases and Related Health Problems (WHO, 2019). Burnout frequently causes significant disruption due to people's emotional and physical exhaustion due to external and internal stresses and poor coping and adaptive capacities (Bullock et al., 2017). Burnout is also influenced by one's environment and workload (Friganović et al., 2021).

Since the COVID-19 pandemic, burnout has worsened. Lockdowns have forced the closure of schools and institutions globally, making students to have significant burnout levels during the quarantine due to stress, depression and anxiety. According to meta-analyses, 9% to 54% of students worldwide reported psychological suffering (Długosz & Liszka, 2021). The incidence of mild to profound depression, anxiety and stress in a survey of Malaysian university

students is 37.2%, 63.0%, and 23.7% for depression, anxiety, and stress, respectively (Shamsuddin et al., 2018).

To overcome stress and academic burnout, it is vital to recognise academic burnout among students at Malaysian higher education level institutes. Early diagnosis and prevention of burnout among university students are critical from a public health standpoint. This is critical for educational progress, future job growth, and the nation because today's young are tomorrow's leaders (Shamsuddin et al., 2018). Rising suicide rates have brought burnout and mental health issues into the limelight, raising awareness of burnout among Malaysians. Nevertheless, Malaysian students rarely examine burnout, indicating a need for exploration.

Therefore, this study investigates the awareness and knowledge of academic burnout among Universiti Malaysia Kelantan Kampus Kota students. The objectives of this study are

1. To examine the awareness of academic burnout among Universiti Malaysia Kelantan Kampus Kota students
2. To analyse the knowledge of academic burnout among Universiti Malaysia Kelantan Kampus Kota students
3. To propose recommendations and suggestions for preventing stress among the Universiti Malaysia Kelantan Kampus Kota students.

SIGNIFICANCE OF THE STUDY

A study's importance determines its relevance. It speaks about the study's impact on a research field and its contribution(s). The student's mental health level, the effects of stress on students, and the best way to prevent stress among the Universiti Malaysia Kelantan Kampus Kota students. The findings of this study will help prevent students from stress. Stress shields a person from physical harm and temporarily boosts performance to increase the likelihood of survival. Notably diminished are sleep and appetite, while anxiety is elevated.

LITERATURE REVIEW

Awareness of Burnout

Generally, "awareness" indicates "knowledgeable being mindful; cognizant, educated, vigilant." The condition or capacity to notice, feel, or be mindful of events, objects, or sensory patterns is known as awareness (K. Abdul Ghafor, 2012). Being aware entails knowing, realising, or showing interest in something and knowing it is significant. Knowledge of something is awareness.

Health

It has been discovered that students majoring in healthcare are more likely to experience sadness, anxiety, tension, and insomnia. The COVID-19 pandemic seems to have worsened people's mental health problems. The absence of safety and health monitoring for the students themselves, which harms patient security, consistency of care, costs of the healthcare system, and workflow, is one reason why burnout in healthcare workers is receiving attention. Providing fresh approaches to treating burnout conditions is crucial to identify potential remedies (Leo et al., 2009).

Cleanliness

According to the proverb "Cleanliness is next to Godliness," cleanliness is a positive cultural trait supporting other goals like health and beauty (Berg, 2003). Students' discomfort is impacted by

cleanliness. A student will experience burnout if the school environment is not pristine. The cleanliness of oneself, other students, and the school will affect one's mental health. Other students' stress levels will be impacted by students who do not maintain good personal hygiene. This will raise the high cognitive level.

Pollution

Air pollution was shown in several experimental and observational research that air pollution exposure was linked to behavioural problems and mental diseases. Additionally, some research discovered links between air pollution and depression, as well as mental emergencies. The better air quality will benefit our ecosystem, health, and development. Environmental and individualised factors can affect mental stress according to ecological models.

Knowledge of Burnout

In particular, the findings of this study added to the body of knowledge on how young adults, especially students with burnout, can experience it in various contexts. It is also likely that people in certain professions are more aware of emotional health issues and a great way to spot the warning symptoms of imminent burnout, which could explain why burnout is most prevalent in these sectors. Most research on personal factors has examined demographic elements like age, gender, etc. Personality, social support, and beliefs are additional unique characteristics that have drawn some attention (Maslach & Schaufeli, 1996).

Academic Burnout

Academic burnout developed from the phrase "job burnout" in the workplace. Burnout among university students is defined as weariness caused by academic expectations (emotional exhaustion), having a negative attitude and lack of interest in academic duties (cynicism), and a sense of incompetence as a student (inefficacy) (Charkhabi et al., 2013). Academic burnout is a serious issue and has a detrimental impact on students. It has also been connected with an increased risk of suicide ideation among students (Oloidi et al., 2022), lower academic achievement, low self-efficacy, perceived course load, and lower coping effectiveness (Portoghese et al., 2018).

Students in a burnout state often feel exhausted and adopt a cynical, withdrawn motivation towards their studies. Academic burnout in students results from exhaustion due to demands and academic obligations, negative emotions, lack of interest in work and experiencing incompetency. Risk factors for burnout may include unrealistic or perfectionistic expectations at work or study, heavy workload, family environment (Amelia, 2022), conflicts in the university, feeling undervalued, poor self-esteem, and poor coping skills in stress management. Academic burnout takes time to arise, and it is difficult to combat once it has occurred. Thus, the sooner one recognises and addresses the signs of stress, the higher the chance that an individual has of avoiding burnout.

Research Framework

Diagram 1: Conceptual Framework

METHODOLOGY

Research Design

This research design seeks to determine how well-aware and knowledgeable University Malaysia Kelantan Kampus Kota students are about academic burnout and make recommendations for preventing it. Qualitative research is more successful, using a small yet focused sample size and a case study approach. Data is collected through focus groups, interviews, and indirect procedures.

Data Collection

The data collection method is divided into three parts which are primary data, secondary data and in-depth interviews. Primary data was all about collecting data through Google Forms-based and print-out-based questionnaires that were distributed physically and electronically. Secondary data were collected through books, newspapers, and research articles as sources of information and direction to boost this study. Lastly, an in-depth interview with four randomly selected University students was done in an in-depth online interview due to the first wave of post-flood.

Sampling

Sampling is picking a group from which the researchers will gather the data for their study. The probability and non-probability sampling methods are the two available sampling techniques. A non-probability sampling technique has been applied in this study. In addition, a judgemental or purposive sample approach has been used in this study. When choosing participants or public members to participate in the study, the researchers use a selection technique known as "purposeful sampling," which involves using their best judgement.

Data Analysis

As for the data analysis, thematic analysis has been used throughout this study. The thematic analysis works to analyse the awareness and knowledge of academic burnout and also the suggestions and recommendations to prevent the stress among the University Malaysia Kelantan Kampus Kota students by using four respondents among the students to conduct the online survey which is a questionnaire and another four respondents had conducted an in-depth interview. Eight respondents were shown in an online survey and in-depth interview for this research.

FINDINGS

Analysis of Theme 1

Table 1 below shows the result Analysis of Theme 1

Table 1: Analysis of Theme 1

Research Question	Respondent	Theme
Malaysian students rarely examine burnout, although it is getting recognition. In your opinion, why is burnout rarely being talked about among Malaysian students?	<p>R1: Burnout is frequently perceived as typical stress that students must deal with.</p> <p>R2: In my opinion, we don't normalise discussing burnout or depression among students since the answer is typically the same when we are stressed or burnout because we have a lot of duties.</p> <p>R3: This is because students conceal their emotions and their stress so that others do not know.</p> <p>R4: This is because students have the impression that they prefer to conceal all of their troubles with professors, friends, and family.</p> <p>R5: Burnout is rarely discussed among Malaysian students because Malaysian students seem unconcerned about it.</p> <p>R6: Burnout is a relatively new notion in Malaysia, and many individuals are likely unaware of it. Burnout is a medical disorder that was just recently acknowledged. As a result, many individuals may need to be made aware of what burnout is, how to recognise it, and how to deal with it.</p> <p>R7: It is because students are preparing for high-stakes tests or writing influential academic papers.</p> <p>R8: Students nowadays are subjected to several examinations and tasks.</p>	Burnout being left out among Malaysian students

Research Question	Respondent	Theme
-------------------	------------	-------

<p>What makes you struggle to cope with university activities and study? Did you often feel it at the beginning or end of the semester?</p>	<p>R1: I struggle or experience stress after the semester due to the composition of the final assignment and other increasingly numerous assignments.</p> <p>R2: I don't find balancing university activities with studies complex because I have a routine.</p> <p>R3: It takes time to understand a topic and issue. As a result, the conclusion of the semester is felt even more keenly because the exam is approaching.</p> <p>R4: I'll notice it near the end of the semester since I usually finish my work, study, and take notes at the last minute. To be more specific, I am a 'last-minute' person.</p> <p>R5: The tasks offered by many teachers make it difficult for me to cope with university activities and academics. It's most noticeable near the conclusion of the semester.</p> <p>R6: It happens regularly near the end of the semester since so many things happen simultaneously as I prepare for the final exam.</p> <p>R7: Nothing. No.</p> <p>R8: Group projects are the most challenging part, typically at the end of the semester.</p>	<p>Students struggle to cope with university life.</p>

Analysis of Theme 4

Table 4 below shows the results Analysis of Theme 4

Table 4: Analysis of Theme 4

Research Question	Respondent	Theme
<p>From your perspective, how important is it to overcome academic burnout? What can the university do to help students overcome it?</p>	<p>R1: A student must conquer the challenge. The institution may address the issue by creating programmes and motivational camps to educate students about the significance of self-motivation and applying religious and moral principles.</p> <p>R2: Every semester, universities should offer a counselling session to students so that they may hear what the problem is. However, the counsellor must be the one who can protect the student's privacy.</p> <p>R3: Give the students time and assist the students who face difficulties.</p>	<p>Steps to overcome academic burnout</p>

	<p>R4: Counselling should be provided to students by the university, and it would be more beneficial if the university took the students on a stroll outside.</p> <p>R5: In my view, it is important to overcome the problem of academic fatigue so that students can focus on their studies.</p> <p>R6: It is essential to keep students from becoming anxious. As much as possible, the university avoids putting too much pressure on students and offers counselling to those who require it.</p> <p>R7: Very important.</p> <p>R8: It is pretty significant. Professors and students should create positive interactions at the university level.</p>

Findings of Theme 1

Table 5 below shows the results Findings of Theme 1

Table 5: Analysis of Theme 1

No	Findings of Burnout being left out	Interview's Transcription
1	Burnout being left out among Malaysian students	<p><i>Respondent 6, between 21 to 23 years old, a Malay female from faculty JDS 1st year. Burnout is a relatively new concept in Malaysia; many people may need to know it. Burnout was only recently recognised as a medical condition. So, many people may need to learn what burnout is and how to identify and address it.</i></p> <p>Researchers chose respondent six because the respondent answered well and very clearly. As we can see, the respondent has expressed her thoughts about why burnout is being left out among Malaysian students. So, from her ideas, many people don't know the term burnout until now.</p>

Findings of Theme 2

Table 6 below shows the results Findings of Theme 2

Table 6: Analysis of Theme 2

No	Findings of Students' Struggle to Cope	Interview's Transcription
1	The struggle to cope with university life among students	<p><i>Respondent 5, between 21 to 23 years old, is a Malay female from faculty FHPK 2nd year. What makes me struggle to cope with university activities and studies is the assignments given by many lecturers. I often feel it at the end of the semester.</i></p> <p>Researchers chose respondent five because this respondent answered well and very clearly. As we can see, the respondent understood well and expressed her struggle during her studies. Nowadays, it can't be denied that students have to face many challenges and obstacles during their study period. At the same time, it becomes one of the reasons why students always face academic burnout.</p>

Findings of Theme 3

Table 7 below shows the results Findings of Theme 3

Table 7: Analysis of Theme 3

No	Findings of Impact of Unsupportive Environment	Interview's Transcription
1	Impact of the unsupportive environment on academic burnout among Students	<p><i>Respondent 6, between 21 to 23 years old, a Malay female from faculty JDS 1st year. I believe that my home environment contributes to my academic burnout weariness since I am required to study at home. In contrast, I simply have to concentrate on my studies at university.</i></p> <p>Researchers chose respondent six because this respondent answered well and very clearly. As we can see, it has shown that this respondent has spoken out her opinion about the impact of the unsupportive environment on academic burnout among students. Based on this respondent's opinion, we can conclude that the unsupportive climate will affect the students, especially in their studies.</p>

Findings of Theme 4

Table 8 below shows the results Findings of Theme 4

Table 8: Analysis of Theme 4

No	Findings of Steps Overcoming Academic Burnout	Interview's Transcription
1	Steps to overcome academic burnout among Students	<p><i>Respondent 1, between 21 to 23 years old, a Malay female from faculty FKP 2nd year. A student institution must address the issue by creating programmes and motivational camps to educate students about the significance of self-motivation and the application of religious and moral principles.</i></p> <p>Researchers chose respondent one because this respondent answered well and very clearly. As we can see, this respondent understands the question well and gives her opinion about what the institution should do to overcome academic burnout among the students.</p>

DISCUSSION AND RECOMMENDATION

As for the discussion part, there are four different limitations in this study which are the first limitation is the researcher needs help conducting face-to-face, in-depth interview sessions with respondents due to the first wave of post-flood. The second limitation is the need for previous studies regarding academic burnout among students, especially in qualitative research. The third limitation is the researcher's limitations in analysing due to the limited time and sample size. The fourth limitation is some of the respondents' responses make it difficult for the researchers to assess them.

Furthermore, as for the recommendation part, there are five different recommendations in this study which are the first recommendation is the researcher can conduct the indirect meeting due to the flood. The second recommendation is that universities or other higher education institutions give more examples of qualitative research to make it easier for students to find references, especially for specific themes. The third recommendation is that future researchers utilise other platforms, such as Google Forms and social media, to distribute study questions to potential responders and gather data. Instagram, Twitter, and Facebook are among the preferred social media networks. The fourth recommendation is the students should manage and spend their time correctly. The fifth recommendation is the researcher advises pupils to be more conscious of their surroundings and current events.

CONCLUSION

Ultimately, this study aimed to shed light on the problem of academic burnout among students at Universiti Malaysia Kelantan Kampus Kota. Researchers concluded that there needed to be more knowledge concerning academic burnout among students at Universiti Malaysia Kelantan Kampus Kota. Whatever the case, raising awareness and comprehension of the danger of academic burnout is crucial.

ABSTRACT

It is crucial to highlight to children the importance of political awareness and information. The high level of student engagement in the General Election did not provide promising results, as the data shows that a decreasing number of students turned out to vote in the 2019 and 2022 elections. This essay makes an attempt to evaluate data acquired from Universiti Malaysia Kelantan in order to ascertain whether the democratic education offered by the Institute of Public Higher Education is indeed capable of teaching students to comprehend the democratic system. This study used an in-depth interview method with 20 FHPK students that were enrolled at Universiti Malaysia Kelantan. The information for this study was compiled after the 15th General Election voting day.

Keyword: Politics, Knowledge, Awareness, Students, Government

INTRODUCTION

One of the most basic needs in life is political awareness since it helps societies evolve and lays the ground for the civil society organisations to be active within such communities, both of which take constant work. Instead of speeches or writing, well-researched, rational, and scientific programmes must be developed with the aim of bringing about a shift in the level of consciousness. In fact, it is very necessary to explore how to spread these reforming ideas to such a large population, how to evaluate their impacts, and how to manage and direct them. In reality, the only means by which this can be accomplished is through specialised organisations in charge of managing the different facets of life. The Sun, 25 October 2017

The youth group is one of the important groups in the political survival of a country. This is because this youth group is the group with the largest number of voters on the fence and is decisive for the victory of a political party in Malaysia (Nur Ellyyanis and Junaidi, 2020).The university is such a cutting-edge organisation that it contributes significantly to providing its students with political awareness in terms of information, behaviours, traditions, and abilities that guarantee the individual's social and political role.

According to Alsati and Al-Ghanem (2017), educational institutions have the greatest impact on people's political awareness and practice through their educational approaches and activities, through their teachers' lectures and conferences, as well as through their educational courses and curricula.

SIGNIFICANCE OF STUDY

UNIVERSITY STUDENT

In the life of societies, political action is of tremendous importance. They are incredibly invested in each other and every aspect of their everyday lives, therefore that explains why. It is a procedure and a technique for a group to decide things, according to the definition of politics (Al Slihat, 2014). Political conduct may be found in business, academic, religious, and other organisations despite the fact that it is most frequently used to refer to the government. Political science analyses how power is used and available, including the capacity to impose one's will on others. Political conduct is the subject of this research. The whole of a person's perceptions, knowledge, and assessments make up their awareness. In actuality, consciousness evolves and expands along with the individual's existence, and as a result, is a product of the numerous cultural influences on the individual. In other words, a person's political awareness will be higher the better their political culture is (Abonu, Ogunlade,&Yunusa, 2013).

LITERATURE REVIEW

KNOWLEDGE

Knowledge are the things that individual get from many sources including reading, observation or with their experience. Knowledge also measure to rate their intelligence and memorize about something they had learning. Knowledge also are the facts, information and skill through experience by practical or theoretical. From dictionary Cambridge meaning of knowledge are understanding of or information about a subject by get the experience or study, either known by one person or by people generally.(Cambridge dictionary,2022). In this research, we need to know how the knowledge of citizen Malaysia about politic in generally or complex.

AWARENESS

To create a democratic society that is based on responsibility, openness, and effective governance, political awareness is very essential. Thus, engagement from the populace is essential to the survival and further growth of every democracy. Being critical of the government's acts, inactions, programmes, and policies helps to perpetuate democracy since politically savvy citizens do so. Politically engaged individuals ought to be able to hold their government and other public officials responsible for how the nation's affairs are run, according to Ahmad et al. (2015). Three factors have been identified as influencing political awareness: the degree of exposure to political information, the mental capacity to store and organise political knowledge, and the motivation to learn and comprehend the political news. In other words, being politically aware entails having access to political information, engaging in political activity, and using the media primarily for political material that piques one's curiosity about politics and current events. (Kuotsu, 2016).

POLITICS

The low rates of young people participating in formal and informal politics, such as voting in elections and party politics, have received a lot of attention in the literature (Robertson, 2009). The diminishing rates of young people's political involvement in recent years have raised worries and become a global phenomenon, according to Blais and Rubenson (2013, cited in Castillo et al. 2015). Currently, young people are the least likely to participate in political party activities and voting procedures. Not every university student is engaged in politics, either on or off campus. Some of them are just concerned in collecting mementos. Consider the T-shirts, shirts, lanyards, caps, and other items that various political party groups with a presence on campus have made available. Others, however, would rather be involved in actual politics, which external political groups provide as a chance to sharpen students' political abilities and put those talents to the test. A democratic group made up of students from universities and other higher education institutions is represented in the Student Union or Student Representative Council, a form of campus management (SRC).

METHODOLOGY

RESEARCH DESIGN

Research configuration guarantees the data required, from whom, and how it will respond to the examination question. Research configuration affected the level at which causal cases about the impact of intercession can be made (Jalil, 2013).

According to Kothari (2004), quantitative and qualitative research methods are commonly used in research. In this research, a qualitative study was used to find out the pattern of political awareness and knowledge among students at Universiti Malaysia Kelantan FHPK (Kota Campus). Qualitative research is multi-method in nature and takes an analytical, phenomenological approach to its topic. This suggests that qualitative researchers investigate phenomena in their natural environment, aiming to understand or comprehend events from the perspective of definitions given to them by individuals. Case studies, personal observations, introspection, personal histories, interviews, observations, histories, interpretations, and visual texts are examples of observational data used in qualitative research to describe normal and difficult situations and values in human life (Patrik Aspers & Ugo Corte, 2019).).

DATA COLLECTION

Data collection is one of the most important steps in any research project. Data collection is a difficult task that necessitates meticulous planning, hard work, tolerance, tenacity, and other qualities in order to be completed successfully (Marie Volpe, 2018). Data collection is one of the most important steps in any research project. Data collection is a difficult task that necessitates meticulous planning, hard work, tolerance, tenacity, and other qualities in order to be completed successfully. Some of the seeds of that revolution were found in approaches to data collection that used a combination of methods. This book focuses on recent advancements in mixed method strategies for collecting scientific data (WG Axinn, 2006). The process of acquiring, processing, and evaluating research data using well-established, validated procedures that incorporate both primary and secondary data is sometimes referred to as data collection (Syed Muhammad Sajjad Kabir, 2016).

SAMPLING

A sample is a small group of people chosen from a larger population so that statistical inferences may be made about them and population characteristics can be calculated. Sampling is the method of choosing the group from whom data will be gathered for the study. Using samples, one may draw conclusions about populations. Samples make data collection easier since they are practical, affordable, manageable, and simple. The two types of sampling that may be employed in research are probability sampling and non-probability sampling. With probability sampling, any group within the community has an equal chance of being selected as a representative sample. Non-probability sampling is a sampling strategy where the person who will be picked as a sample from the population is unknown.

DATA ANALYSIS

Data analysis is the act of finding and arranging interview transcripts, observation notes, and other non-textual materials obtained by the researchers to better understand the phenomena in qualitative research. The act of gathering, evaluating, and analysing data to obtain insights that improve decision-making is known as data analysis. There are a range of approaches and strategies for conducting an analysis depending on the sector and the purpose of the research (Calzon, 2021). Researchers have used thematic analysis to produce data for this study. Thematic analysis is used in this study's data analysis to pinpoint and evaluate the degree of political awareness and knowledge among students at Universiti Malaysia Kelantan's (Kota Campus) through in-depth interviews. The researcher uses in-depth interviews to gather data; specifically, the researcher uses Google Meet to conduct online interviews with open-ended questions for each respondent. In-depth interviewers typically begin by asking fundamental questions before inviting subjects to speak candidly about the issue. Another type allows for the potential of a semi-structured interview, in which the interviewer is given the choice to go more into one of the themes while still using a set of prepared questions. In-depth interviews offer a lot of data as well as chances to ask follow-up questions, elicit more data, corroborate initial replies, and make connections between various topics. Additionally, it fosters a welcoming atmosphere where people may feel more at ease starting conversations (Andre Queiros et al., 2017). As a result, 15 undergraduate students participated in this study and performed in-depth interviews. Thematic analysis was utilised to analyse the data for this study.

Findings of Theme 1

Table 3 below shows the result Findings of Theme 1

Table 3: Findings of Theme 1

NO.	Finding of awareness of politic	Interview's Transcription
1.	Awareness of politic among student	<p><i>Respondent 6, 23 years old, a Malay girl from FHPK 3 years student, yes I aware about politics because a high sense of responsibility to be an adult making decision find leader. Young voters are not familiar or member of political party. Because they fed up has seen that there been a power in struggle in previous leadership. I also not feeling that describe, not to obsessed with politics and common knowledge of politics will never run of issue. Important student participated issue or debate in this country. Lately current politic environment undesirable since the leader cannot agree on how difficult confronting the country and crisis.</i></p> <p>Researchers choose respondent 6 because the respondent answer the question more accurately and clearly. This respondent know well a lot about awareness of politic among student. This respondent was very clear to answer the question and the answer are different along other respondent.</p>

Findings of Theme 2

Table 4 below shows the result Findings of Theme 2

Table 4: Findings of Theme 2

No.	Finding knowledge in politic	Interview's Transcription
1.	Knwoledge of politic among student	<p><i>Respondent 3 , 22 years old , an Malay female from faculty FHPK 3rd year. Through social media, newspaper articles, and digital platforms, I kept up with political news and topics. Every nation need a smart and just leader, therefore voters must make their decisions based on the numerous qualities that person must possess. The largest difficulty arises when a party makes it difficult for voters to select a government because it demonstrates a lack of political cohesion. When the winning candidate is unpopular with the electorate and the election outcome is not totally representative of the electorate, it will have an impact on the nation. According to me, the newly elected government's top objective is ensuring that every state, race, and religion in the nation is treated equally.</i></p> <p>Researcher chose respondent 3 because this respondent answered the question the question accurate and clearly. This respondent understand the question and better than other respondent as well.</p>

		This respondent also had a knowledge of politics as well. This respondent was very brilliant to answer the question without make other person fell guilty.
--	--	--

LIMITATION AND RECOMMENDATION

Limitations are happened in any study as the challenge to conclude an excellent research process and it is the same in this research. Throughout the process of doing research, it is of the utmost importance for the researchers to work toward reducing the variety and scope of constraints to the greatest extent possible. Firstly, the lack of previous study on qualitative methods in political awareness and knowledge among students made it difficult for researchers to get new information. This was also a contributing factor in the difficulty of the research. There is another book with a like title, but unlike that one, it does not focus on students or the area surrounding University Malaysia Kelantan. Aside from that, there were not enough previous studies done in the area where the research was conducted. The name of this study does not yet involve conducting research in the area surrounding the Universiti Malaysia Kelantan (Campus Kota) campus. In order to conduct superior research in the future, researchers will either need to uncover new initiatives or make use of the research recommendations presented here.

Also, there was not enough of the intended population to conduct in-depth interviews with. Because of time constraints, the researcher was unable to conduct in-depth interviews with all of the students enrolled in programmes ranging from their first to their fourth years of study at the Universiti Malaysia Kelantan (Kota Campus). They are not interested in participating in this interview session since they do not have sufficient information and are not aware of the political issues that are being discussed. As a result of this, the researcher had a tough time interacting and communicating with the students so that they could more effectively take part in this interview session. In addition to this, one of the difficulties that the researchers have encountered while carrying out their research is a shortage of time. As a result of the researchers and respondents being busy with their own studies, the coursework for each subject, and their online learning on a tight schedule, the time available for in-depth interview sessions was limited. This is due to the fact that researchers have a hard time getting respondents' time for the purpose of conducting interviews. Because of this, finishing this research paper will take a significant amount of time.

Conclusion

It is recommended that all universities publish multiple qualitative research and samples of qualitative research reports on fast-food consumption among Malaysian students as a reference in the future. Every single university Many secondary data sources, such as research material in textbooks, journal articles, conferences, seminars, and dissertations, both published and unpublished, must be available in the library in order to gain knowledge for qualitative research. Other than Universiti Malaysia Kelantan (Campus Kota), the research should be increased. Because this study focused on samples collected at Universiti Malaysia Kelantan (Campus Kota), data obtained from other Malaysian sites may be better or different.

ABSTRACT

The analysis revealed that performance green consumerism, perceived value, perceived quality, and product price positively influence consumers' revisit intention in the green restaurant. The findings revealed that perceived value had the biggest effect on diners' inclination to return to green restaurants. Other theories may be used to direct future research into the elements that motivate a green restaurant is environmentally friendly in all food production and sales areas. There needs to be more existing research on the demand for green practices within the food service sector from the consumers' perspectives in Malaysia. Therefore, this study aims to determine the factors influencing consumers' intention to revisit green restaurants. This study employed a correlational cross-sectional survey through purposive sampling to collect information concerning the intention to revisit green restaurants. The proposed model is an extension of UTAUT and was empirically tested using data obtained from an online survey of revisit intention (n=250). 250 data were analyzed using Statistical Package for social science (SPSS) version 28.0. ate patrons to return to green eateries.

Keywords: Green Consumerism, Perceived value, Perceived Quality, Product Price, Revisit Intention

INTRODUCTION

A green restaurant, known as a sustainable or eco-friendly restaurant, is an establishment that incorporates environmentally friendly practices and principles into its operations and overall ethos. The term "green" in this context refers to the focus on reducing the environmental impact of the restaurant's activities, promoting sustainability, and supporting the well-being of the planet. The main objective of green restaurant is to examine the factors that influence green restaurant to revisit intention among consumers in Malaysia.

Looking at the Malaysian restaurant industry, green practices are still in their early stages, with little consumer interest. This can be seen in the fact that very few restaurants in Malaysia Restaurant's green practices. However, restaurant operators in Malaysia will adopt green practices if there is increased awareness among entrepreneurs and the public, complete government guidance and support, and expert monitoring of green practice operations (Langgat, 2019.)

Therefore, this study aims to investigate the factors influencing green restaurant revisit intention among consumers in Malaysia. The findings of this study helped the researchers to comprehend how customers and green eateries interact. There were five goals for this study:

- 1: To determine the influence between green consumerism and revisit the intention of green restaurants in Malaysia
- 2: To determine the influence between green perceived value and revisit the intention of green restaurants in Malaysia.
- 3: To determine the influence between green perceived quality and revisit the intention of green restaurants in Malaysia.
- 4: To determine the influence between product price and revisit intention of green restaurants in Malaysia.

SIGNIFICANCE OF THE STUDY

Future Research

The relevance of this study becomes a guide and source for future research on revisiting the intention of green restaurants among consumers in Malaysia. Other researchers can also improve this study and rearrange the old study to be used as a new one and get a better idea about the scope of this study's investigation based on the result that will be obtained.

Policy

The findings of this research will provide various information on the existing policy of green food to take appropriate action. This study can give ideas to the related agency to implement various related programs such as the implementation of go green program, green procurement implementation seminars, Worldwide Green Energy & Environmentally Sound Products Exhibition & Conference Malaysia (IGEM), and the 3R program's implementation (reduce, reuse, recycle). In daily life, this program can help users get information related to green restaurants in Malaysia.

Consumer

The findings will directly benefit consumers in Malaysia in enhancing awareness about green restaurants by enhancing their green consumerism, the green perceived value, green perceived quality, and product price, which can enhance revisit intention toward green restaurants in Malaysia.

Restaurant Entrepreneur

The significance of this study benefits restaurant operators because the government serves as an alternative platform for educating Malaysian consumers about the value of environmentally friendly restaurants for them to support green restaurant operators in Malaysia by enforcing environmental legislation and regulations (Kasim et al., 2015). Consequently, environmental issues may be reduced to aid in environmental sustainability, resulting in a natural environment for the community, and more customers may reconsider Malaysian green restaurants.

LITERATURE REVIEW

Relationship Between Green Consumerism And Revisit Intention

Customers become more worried about the environmental impact of commercial activities that are becoming popular vocal supporters of responsible individual behavior (Warburg et al., 2021). Green consumerism refers to customer awareness of the climate change crisis, as well as consumer initiatives or movements aimed at protecting the surroundings and reducing consumption's negative impact (Rizomyliotis et al., 2021). According to previous literature, many studies have been carried out to look into what influences green restaurant revisit intention among Malaysian consumers (Atzori et al., 2018). Consumers are becoming environmentally conscious even more probable to practise continual consumerism (Kim & Park, 2020). Consumers develop favorable attitudes toward green restaurants because of environmental concerns. Positive attitudes refer to the underlying theory (Perugini et al., 2001), which can lead to consumer revisit intention (Yadav., 2017). Previous research has found that the consumer purchase decisions are influenced by a variety of factors, including perceived effectiveness of eco-friendly behaviour, everyday green consumption habits, environmental knowledge, and a company's green reputation. (Han, 2021). However, little study has been conducted on green consumerism.

Relationship Between Green Perceived Value And Revisit Intention

A consumer's overall assessment of the worth of a certain good, service, or market offering is known as perceived value (Patterson., 1997). Green restaurant revisits intent is significantly predicted by consumer perceived value (Teng & Wu, 2019). Based on their environmental sustainability demands, expectations, and aspirations, consumers evaluate the total value of a market product, which are referred to like perceived value of green (Juliana et al., 2020). According to existing research, destination loyalty is predicted by perceived value, and perceived value is derived from product or brand experience (Teng & Wu, 2019). In addition, grasp customer intention requires a grasp of perceived value (Jiang & Hong, 2021). Several studies have been conducted to investigate customers' behavioural intentions in relation to green marketing efforts such as environmental, green innovation, and restaurant green programmes (Nicolau et al., 2020). According to extensive study, perceived worth and characteristic intention are positively correlated that influences prospective purchasing intention by increasing trust in the purchased item, and optimism influences consumers' future intentions (Chen., 2012).

Relationship Between Green Perceived Quality And Revisit Intention

Consumers' overall assessment of a company's differences or dominance is perceived quality (Alamsyah et al., 2021). Most restaurants base their satisfaction level on perceived quality (Agnihotri & Chaturvedi, 2018). The phrase "customer general assessment of a product's overall environmental quality or superiority" is used to describe products' green perceived quality by Wasaya et al. (2021), and it is a distinguishing feature that frequently influences consumers' opinions of that product's greenness (Alams et al., 2021). The success of the green quality's perception is supported by extensive study. Customers respond positively to it, and it also makes them more likely to make purchases (Wasaya et al., 2021). Customers who are environmentally conscious are more inclined to frequent eateries that are considered as having a high level of green quality (Ahn & Kwon, 2020). In addition, perceived quality is a well-known advertising concept, with research

indicating a positive relationship with customer loyalty. As a result, customer intent to return should be predicted by green perceived quality. It is reasonable to expect a stronger link between green values and revisit intentions when the perceived level of greenness is high.

Relationship Between Product Price And Revisit Intention

According to Zeithaml (1988), "price is an element that is compromised when it comes to satisfying consumer needs," and the product price is unavoidable in determining the impact of revisit intention. Customers are typically price conscious as a sign of thriftiness, and they form their opinion of a supplier by comparing price differences between products or services (Raji., 2017). Despite differences in consumer experience under different conditions, product price influences consumer attitudes and, as a result, customer revisits intention is prevalent in green restaurants. Product price variations influence customer expectations, evaluation, and decision-making in the green restaurant industry (Bhattacharjee et al., 2018). The fourth hypothesis contends that green restaurant products' prices influence consumers' willingness to return. As a result, to retain and attract customers, the price of goods or services must be reasonably compared to the quality of the goods or services (Han., 2015). Customers who dine at green restaurants are usually aware that they cannot afford to spend more money than they have. As a result, product pricing may influence a customer's purchasing decisions (Polas, Imtiaz, Mahbub, & Khan, 2019). Above all, the type and frequency of price fluctuations increase customer vulnerability in Malaysian green restaurants. This flaw perplexes the customer, influencing his or her decision to purchase the product or service (Tayara & Raju, 2020)

Research Hypothesis

According to the research analysis, independent factors such Green Consumerism, Green perceived value, Green Perceived Quality, and Product Price do affect the consumers to Revisit Intention in Green Restaurants The study's hypotheses were outlined as follows in light of the literature reviewed:

H₁ There is a relationship between green consumerism and revisit intention.

H₂ There is a relationship between green perceived value and revisit intention.

H₃ There is a relationship between perceived quality and revisit intention.

H₄ There is a relationship between product price and revisit intention.

Research Framework

Conceptual framework describes the significant factors that influence the revisit intention of a green restaurant in Malaysia using references from the literature review. Figure 1.1 depicts the conceptual framework for this study. Green consumerism, green perceived value, green perceived quality, and product price are the four independent variables. The dependent variable is the intention to revisit green restaurant in Malaysia.

Figure 1.1 Conceptual Framework

METHODOLOGY

Research Design

As a result, this study used a correlational research design rather than a causal design. This study uses a cross-sectional survey method to gather information on the Malaysian consumers intend to go to more green restaurants.

Data Collection

This study conducted by self-administered questionnaire and consisted of a five-point interval scale for respondents to choose. The questionnaire was distributed among 250 Malaysian consumers (18 years and above) who have visited a green restaurant in Malaysia at least once. The questionnaire was collected through online surveys to reach the respondent in Malaysia.

Sampling

A quantitative researcher tends to use a type of sampling method based on the criterion suitable for the study which is probability sampling or non-probability sampling methods. In probability sampling, each subject has a known chance or non-zero chance of being selected from the population as a subject in the survey. In this study, it was decided to adopt non-probability sampling methods through the purposive sampling method. Purposive sampling was used in this study because the researcher is aware of the specific characteristics of the population of respondents.

Data Analysis

The data in this study were analyzed using with Statistical Package for Social Sciences (SPSS) version 28.0 to analyze the data for descriptive analysis and correlational analysis. SPSS is computer software to help researchers analyze and transform data into graphs or tables. It helped the researcher to reduce the time it took to calculate the primary data. When many constructs are unobservable, SPSS is a valuable tool in the behavioral and social sciences. SPSS helps researchers determine each concept's one-dimensionality, reliability, and validity. As a result, SPSS was used for data analysis in this study to answer the research questions and objectives.

FINDINGS

Respondent Profile

Most respondents are consumers in Malaysia. Most were female (62.4%), and the remaining respondents (37.6%) were male. Regarding their age, the age of the respondents varied between 18 and 25 years; more than half of the respondents (38.8%) were aged between 26 and 35 years, (and 35.6%) of them were aged between 36 and 45 years (20.4%) and lowered the age of this frequency is analysis the respondents aged 46 years above which is (5.2%). As for the respondents' ethnicity, most were Malay (36.8%) compared to Chinese (36.4%), Indian (26.0%), and others (0.8%). The Marital Status of 250 respondents showed that single is more respondents percentage (58.0%) compared to married respondents (42.0%). Regarding the highest education, more than half of the respondents held a degree (52.4%), with (24.4%) being a diploma. Only (0.4%) of respondents were Masters. Most respondents were from SPM (12.8%) and STPM (10.0%). Regarding occupation, the higher occupation respondent who revisits intention in Green Restaurant is employed (44.0%). The second higher revisit intention green restaurant is a student (30.8%) compared to self-employed (22.0%), and fewer respondent is unemployed (0.4%). Lastly, the descriptive analysis revealed that for most of the

respondent's household income, more than half of the respondent's income months were less than RM1000 – RM2000 (46.6%), with (26.8%) being income months from RM2001 – RM3000. The less respondent revisit intention in green restaurant income month more than RM5001, which is (10.4%)

Table 1: Respondent Profile

Demographic Profile		Frequency (N=250)	Percentage (%)
Gender	Male	94	37.6
	Female	156	62.4
Age	18-25 years	97	38.8
	26-35 years	89	35.6
	36-45 years	51	20.4
	46 years above	13	5.2
Race	Malay	92	36.8
	Chinese	91	36.4
	Indian	65	26.0
	Others	2	0.8
Marital Status	Single	145	58.0
	Married	105	42.0
Highest Education	SPM	32	12.8
	STPM	25	10.0
	Diploma	61	24.4

	Degree	131	52.4
	Others	1	.4
Occupation	Student	77	30.8
	Employed	110	44.0
	Self-employed	55	22.0
	Unemployed	8	3.2
Household Income (per month)	< RM1000 – RM2000	104	41.6
	RM2001 – RM3000	67	26.8
	RM4001 – RM5000	43	17.2
	> RM5001	26	10.4
	Others	6	4.0

Result of Descriptive Analysis

The following criteria based on the mean scores were used to determine the levels of agreement for each variable. A mean score less than 2.49 were categorised as ‘low’, between 2.50 to 3.49 as ‘moderate’ and more than 3.50 as ‘high’.

The result in Table 2 shows descriptive analysis with an independent variable that the item of perceived value has the highest mean score (4.66), (0.51). Meanwhile, the item on green consumerism shows the lowest mean score (4.5864), (0.56878). As for the item of product price, the score means (4.6568), (0.54291). The lowest score means for the independent variable shows perceived quality (4.6304), (0.54665). Meanwhile, the score means dependent variable in item Revisit intention shows (5.8880), (1.10469).

Table 2: Descriptive Analysis

Variables	No of Items	Mean Score (M)	Standard Deviation (SD)
Green Consumerism	5	4.59	.56878
Green Perceived quality	5	4.63	.54665
Green Perceived Value	5	4.67	0.51
Product Price	5	4.66	.54291
Revisit Intention	4	5.89	1.10469

Result Correlation Analysis

One of the essential statistical methods for determining the linear relationship between two numerical variables is the Pearson correlation test. Pearson’s correlation is used to provide a more accurate measure of whether the correlation coefficient is significant. According to Hair (2010), the correlations between the variables were analyzed to examine the relationships between the variable of the model (significant and positive correlations). Correlation (**) means the relationship is at 95% confidence. A significant level is generated when the Sig values are obtained more or less than 0.05. Pearson correlation was used to analyze the data to identify the relationship between two variables in which the

lower scale (or both) is on the scale of the interval. The strength of the relationship is represented by the value of the coefficients of correlation as follows:

Table 3: Show the coefficient range, r

Coefficient range, r	Strength of association
0.91 to 1.0 / - 0.91 to -1.0	Very strong
0.71 to 0.90 / - 0.71 to - 0.90	High
0.51 to 0.70 / - 0.51 to - 0.70	Moderate
0.31 to 0.50 / - 0.31 to - 0.50	Small but define relationship/weak
0.01 to 0.30 / - 0.01 to - 0.30	Slight, almost negligible

Source: Konting, 2000

Table 4 points out a significant link between each independent variable (Green Consumerism, Green Perceived Quality, Green Perceived Value, Product Price) with the dependent variable, revisit intention on green restaurant. Based on the result, there is a relationship between independent and dependent variables. Thus, the following hypotheses are accepted:

Table 3: Correlation between independent variable and dependent variable

		REVISIT INTENTION	GREEN CONSUMERISM	PERCEIVED QUALITY	PERCEIVED VALUE	PRICE PRODUCT
INTENTION	Correlation	1	.637**	.487**	.493**	.510**

DISCUSSION AND RECOMMENDATION

A green restaurant has better chances of getting repeat business that demonstrates a commitment that satisfies their subconscious expectations during their visit. First of all, There is no physical interaction because the study's data was only gathered online and reduces our experience connection. There is a association between green consumerism and revisit intention of green restaurants in Malaysia. This study supported by (Warburg et al, 2021) that customer become more worried about the environmental impact of commercial activities that are becoming popular vocal supporter of responsible individual behaviour. Second attribution accepted. There is a association between green perceived value and the revisit intention of green restaurants in Malaysia. According to (Juliana et al., 2020) Customers' overall evaluation a market offering's received benefit is based on their needs, wants, and expectations with regard to sustainability, which are referred to as green perceived value.

Hence, hypothesis 3 accepted. There is a connection between a green restaurant's will to return and its perceived green qualities in Malaysia. In this study of (Ahn & Kwon, 2020) evidence suggests that ecologically conscientious customers are more likely to visit restaurants that are considered as having a high level of green quality. Next, this study supported by (Bhattacharjee et al., 2018) that Price variations influence customer expectations, evaluation, and decision-making in the green restaurant industry.

In the future, our recommendation could emphasize connection between people in person and online, perhaps producing intriguing outcomes. Second, Participants were asked to answer based on their most recent encounter with green consumption and the cost of the item. Due to the time-lapse, A large portion of the participants struggled to remember the occurrence, and a small number of them could only recall a few details relating to the green practice rather than all of them. This study also employs a cross-sectional research design, with participants responding only once. As a result, the current study suggests expanding the investigation using a long-term research approach, in which the same respondents may be questioned more than once over time.

Additionally, the current study included green restaurants from a variety of cultures and communities, uniformly supporting the idea that patrons choose green restaurants based on their environmental value, quality, and product price. Future research could also concentrate on the divergence of service failure based on consumers experiences in green restaurants in Peninsular Malaysia. In future studies, we may consider increasing the sample size and including other factors influencing green restaurant revisit intention among consumers to improve the advanced model of the research study.

CONCLUSION

The analysis revealed that performance green consumerism, perceived value, perceived quality, and product price positively influence consumers' revisit intention in the green restaurant. The findings revealed that perceived value had among the most important impact regarding the desire to dine at green restaurants again. It is possible to use additional

hypotheses to direct future research into the characteristics that motivate customers to return to green restaurants.

ABSTRACT

E-commerce is a growing market, the number of retailers and the growth in online shopping has built up a competitive market. In Malaysia, online repurchasing shows encouraging progress among consumers. The convenience side of online shopping, such as practicality, has strengthened shoppers' intentions to repurchase online. Therefore, this study aims to determine the factors that influence cosmetic consumers' intention to online repurchase the cosmetic products. This study employed a cross-sectional research design by using a non-probability sampling method. The proposed model is an extension UTAUT and was empirically tested using data obtained from an online survey of online cosmetic shoppers (n=256). A total of 256 data were analyzed using the Statistical Package for the Social Sciences (SPSS). The analysis revealed that security, trust, ease of use, privacy concern and product price has a positive influence on the online repurchase intention among cosmetic consumer. The findings revealed that security had the greatest impact on the intentions to online repurchase among cosmetic consumer. Other theories can be applied to guide future studies to discover more factors that influence online cosmetic shopper to repurchase.

Keyword: Repurchase Intention of Cosmetic Consumer, Security, Trust, Ease of Use (EOU), Privacy Concerns, Product Price.

INTRODUCTION

Repurchase intention is defined as a "the subjective probability that a consumer or an experienced customer will continue to purchase a product from the same online supplier" (Chiu et al.,2015). Previous studies have defined that price and safety factors are one of the most important aspects in buying products online. This is because the price is one aspect that reflects the quality of the product and influences the image of the product so that customers or experienced users continue to buy products online. Online repurchasing is very useful to customers or consumers as they can shop anytime and anywhere.

Therefore, this study is aimed to assess the factor influencing online repurchase intention among cosmetic consumers In Malaysia. The outcomes of this study were useful for the researchers to understand the relationship between security, privacy concerns, trust, ease of use (EOU), product price, and repurchase intention.

There were five objectives of this research:

To identify the relationship between security and repurchase intention among online cosmetics consumer in Malaysia.

To determine the relationship between trust and repurchase intention among online cosmetics consumer in Malaysia.

To identify the relationship between ease of use and repurchase intention among online cosmetics consumer in Malaysia.

To determine the relationship between privacy concern and repurchase intention among online cosmetics consumer in Malaysia.

To determine the relationship between product price and repurchase intention among online cosmetics consumer in Malaysia.

SIGNIFICATION OF THE STUDY

Health Ministry

The importance of this study will be able to provide various information to the Ministry of Health to take appropriate action to cosmetic users in Malaysia. This study also gives ideas to the government to implement various related programs such as online cosmetics purchasing programs, cosmetic user implementation seminars, cosmetic product exhibitions and conferences. In daily life, this program can help users to get more in-depth information about the purchasing intentions of cosmetic users in Malaysia.

Consumers

This researcher can directly benefit consumers in Malaysia to raise awareness about the intention to make online purchases among cosmetic consumers because security, trust, ease of use, privacy concern and product price can give consumers the opportunity to review their intentions towards cosmetic consumers in Malaysia.

LITERATURE REVIEW

Repurchase Intention of Cosmetic Consumers

Repurchase intention can be defined as the judgment made by each consumer regarding repurchase in the same company William & Auchil et al., (2021). The customer has a certain reason to make such a decision because for the customer to choose a service provider and buy each of the same services is one of their previous experiences. This repurchase intention is one of the individual's or customer's judgments about the same company that has met the needs and evaluation of a good and current service situation McDougall & Levesque et al., (2020). Repurchase intention among customers depends on the value obtained in their past transactions when making a purchase for example appropriate performance criteria (product benefits), competition and cost considerations. Kaynak et al., (2021). The intention to repurchase in the future also has a significant relationship with customer satisfaction Durvasula et al., (2018). Overall from this study, customers have intentions to repurchase in the future based on the value they get from previous contacts or from the services provided.

Security

Security is one of the main challenges in e-business, according to Kalakota and Whinston et al., (2015) it is one of "situations, circumstances, or events that have the potential to cause financial difficulties to data or network resources through destruction, exposure, alteration, denial of service, or abuse, waste and fraud. Security is an electronic channel that relies on various elements of online technology including encryption, digital signatures and certificates, according to Klang et al., (2020). E-commerce businesses should be concerned about measures security in a way that inspires customers to buy cosmetics online and gives them confidence that the danger of fraud can be reduced. A study by Hartono et al., (2015) found that websites with a higher level of security can protect their users from financial loss due to security issues. For example, credit card information leaks. Theoretically, many academics have drawn conclusions about the

relationship between customers' propensity to repurchase cosmetics and safety. The researchers concluded that when there is a high level of security, cosmetic customers are more likely to make repeat purchases when they are satisfied with the security offered by e-commerce businesses. Therefore, good safety can influence consumers' propensity to repurchase cosmetics.

Trust

Trust is a person's willingness to be exposed to the actions of another party with the expectation that the other party will act in a manner related to the Trustee, according to (Mayer, Davis, and Schoorman 2015). According to (Morgan and Hunt 2019), a trustee is someone who will act in the interests of the trust and without malicious intent. Trust is one of the important elements that determine a person's commitment to a relationship. Moreover, it claims that trust has a great impact on the commitment of each user. This confidence is essential for business success. Consumers' confidence in the ability of internet companies to act responsibly is greatly influenced

by their level of trust. Many researchers have concluded that one of the initial actions that consumers should take when accessing a website is to confirm its credibility in order to foster the confidence necessary for consumers to continue visiting the site since trust is important and has a great influence on repurchase intentions. . Building a strong reputation should be the main goal for businesses involved in e-commerce because it can win customers' trust and motivate them to make additional purchases.

Ease Of Use (EOU)

EOU has a significant impact on the extent to which technology is accepted. A technology will be chosen over an alternative if it is easy to use. EOU has an indirect effect on attitude intention, but this effect is due to an indirect mediating effect on perceived usefulness, according to the TAM stated in the 2019 study. A significant negative correlation between risk perception and attitude towards online purchases was shown in Van's study Heijden et al., (2015). This implies that as perceived risk increases, customer attitudes toward online shopping will become less favorable. Consumers' willingness to make additional purchases will undoubtedly suffer if using online marketplaces is plagued by major technology issues

Privacy Concern

According to Belanger et al., (2020) "The willingness of users to provide information through the Internet that enables purchases to be made" is one way to determine privacy. Personal information online is usually a problem for privacy. Online businesses can create privacy policies that consider notification, transparency and customer preferences or consent to address privacy concerns. Some privacy concerns, including the need for secure third-party authentication or laws and regulations generated by an efficient e-business infrastructure, can help win consumer trust in online marketplaces. Additionally, many studies have shown that privacy has a significant impact on online purchase intentions to purchase and repurchase. The findings of Klang et.al (2020) reveal that although recent advances in technology and legal means to protect identity and payments have evolved, the impact on electronic transactions has been disappointing. The danger associated with online purchases is that users' personal information may be voluntarily provided or may be stolen and used by third parties to send spam to users. Due to this, user privacy is affected. Although the impact of a privacy breach may not be as severe as the loss of financial data, it results in consumers' distrust of online retailers and affects their intention to repurchase cosmetics.

Product Price

Price is defined as the customer's money exchange in terms of service or product, or the value they receive Kotler and Armstrong et al., (2020). It is important for companies to retain loyal customers who are willing to pay higher prices for their favourite brands and not buy based on lower prices. Wickliffe & Pysarchik et al., (2021) introduced product aspects as characteristics that have an inherent effect on repurchase intentions such as brand and price. these two factors include the main part of the product characteristics. Price is one of the important factors in customer repurchase, thus consumer satisfaction is influenced by the perception of product price. directly it is affected by price fairness indirectly. In another study, lee et al., (2018) examined the effect of consumers' perception of price fairness on their purchase decisions and referred to it as a suitable predictor for consumers' repurchase decisions. (Jehri and Sahaskmontri 2018) also stated good value in exchange for receiving money among the criteria taken into account by consumers. According to Khraim et.,al (2021) product price has a significant effect on brand loyalty which in turn affects customers for repurchase intentions

Research Hypothesis

The literature review highlights that independent variables such as Security, Trust, Ease of Use, Privacy Concern and Product Price influence the repurchase Intention of cosmetic consumer. Based on the literature discussed, the hypothesis of this study is summarized as follows:

H₁ There is a positive relationship between security and online repurchase intention.

H₂ There is a positive relationship between trust and online repurchase intention

H₃ There is a positive relationship between ease of use and online repurchase intention

H₄ There is a positive relationship between privacy concerns and online repurchase intention

H₅ There is a positive relationship between product price and online repurchase intention

Research Framework

The research framework is illustrated as shown in Figure 1 to investigate the relationship between Security, Trust, Ease of Use, Privacy Concern and Product Price to repurchase Intention of cosmetic consumers. The independent variables are Security, Trust, Ease of Use, Privacy Concern, and Product Price. The dependent variable is Repurchase Intention of Cosmetic Consumer.

Figure 1 : Research framework

METHODOLOGY

Research Design

This research study is about the factors that influence online repurchase intentions among cosmetic consumers in Malaysia. The study design is a cross-sectional study. Cross sectional study research design had been used in this research proposal. The research strategy through survey research has been used for getting information. The researcher has used a questionnaire to identify the level of online repurchase intention among cosmetic consumers in Malaysia.

Data Collection

The data of this study will be collected according to the random sampling method. Data collection will highlight the factors that influence online repurchase intentions among cosmetic consumers, and there are 250 questionnaires that will be given to cosmetic consumers who often make online purchases in Malaysia. It will use a platform through Google forms to make it easier for respondents to answer. Data collection will be processed when the researcher searches for data information through reading and observation to record the data obtained.

Sampling

Purposive sampling is a type of non-likelihood sampling strategy in which experts use their own judgement in selecting persons from the population to participate in their investigations. In general, non-probability sampling techniques are appropriate for studies assessing the theoretical influence based on a conceptual framework.

Data Analysis

This research was the primary data and the data collected through the questionnaire. The data in this study was analysed using the Statistical Package for the Social Sciences (SPSS) version 22.0. SPSS is a computer software to help researchers analyze the data and transform data to the graph or tables. It helped researchers to reduce the Strongly Agree Strongly Disagree time to calculate the primary data. The researcher coded the questionnaire and key into the data file.

After key in, researchers moved to the next procedure. The data analysis collection was categorized by descriptive statistics and multiple regressions.

FINDINGS

Results of Frequency Analysis

Most respondents were young adults in Malaysia; the majority were female (61.8%), and the remaining respondents (38.2%) were male. Regarding their age, the age of the respondents varied between 18 until 56 years. More than half of the respondents (63.3%) aged between 18 and 25 years, (18.7%) of them aged from 26 and 35 years, (15.1%) of them are aged from 36 and 45 years old. As for the respondents' ethnicity, most were Malay (56.2%) compared to Chinese (26.3%), Indian (6.8%), and others (4.2%). In terms of education, more than half of the respondents held a degree (57.4%), with (25%) being diploma. Only (1.3%) of respondents were doctoral. Most of the respondents from SPM (12.8%) and master (3.5%). In terms of Residential area, more than half of the respondents held an urban (46.2%), with (21.5%) being suburban. Only (32.4%) of respondents were rural. Lastly, the descriptive analysis revealed that most of the respondents Religion, most were Muslim (51.3%) compared to Buddha (15.7%), Hindu (27.6%), Christian (3.8 %) and others (1.6%).

Table 1: Frequency Analysis

	Demographic Profile	Frequency	Percentage (%)
Gender	Male	96	38.2
	Female	155	61.8
Age	18-25 years	159	63.3
	26-35 years	47	18.7
	36-45 years	38	15.1
	46-55 years	5	2.0
	56 years above	2	8
Religion	Malay	141	56.2
	Chinese	66	26.3
	Indian	17	6.8
Status	Married	69	27.5
	Single	182	72.5
	Others		
Highest Education Level	Degree	159	63.3
	Diploma	41	16.3
	Matrikulasi	1	.4
	SPM	15	6.0
	STPM	35	13.9
Employment status	Employed	49	19.5

	Self-Employed	48	19.1
	Student	145	57.8
	Unemployed	9	3.6
Income	Below RM1000	128	50.0
	RM 1001- RM 2000	52	20.3
	RM2001- RM3000	33	12.9
	Above RM4001	43	16.8

Result of Descriptive Analysis

The mean score and standard deviation of the variable are shown in Table 2. The following criteria are based on the mean scores were used to determine the levels of agreement for each variables. The factors can be considered low if the mean score is form 1.00 to 1.99 and high if the mean score from 2.00 to 4.00. Table 2 shows result of descriptive analysis:

Table 2: Descriptive Analysis for Each Construct

Variables	No of Items	Mean Score (M)	Standard Deviation (SD)
Repurchase Intention of Cosmetic Consumers	4	4.8145	1.29052
Security	4	3.5410	.79661
Trust	4	3.6416	.79596
Ease of Use (EOU)	4	3.7402	.88943
Privacy Concern	4	3.7402	.88943
Product Price	4	4.0381	.85363

Table 2 shows the mean and standard deviation of 24 statements under five independent variables and four statements under dependent variables based on a survey involving 256 respondents. The results in table 2 above show that the Security item has the lowest mean score ($3.5410 \pm .79661$). For the Trust variable, it has the lowest mean score ($3.6416 \pm .79596$). Furthermore, the Ease of Use variable showed the highest mean score ($3.7402 \pm .88943$). For the Privacy Concern variable, the mean score is the same as the Ease of Use variable ($3.7402 \pm .88943$) while for Product Price it shows the highest mean score ($4.0381 \pm .85363$). The last one for the dependent variable for the cosmetic consumer showed the highest mean score (4.8145 ± 1.29052).

Result of Convergent Reliability

	CC 4	0.519	

The measurement model can be confirmed valid and reliable if the loading is higher than 0.5, the average variance extracted (AVE) is higher than 0.5, and the composite reliability is higher than 0.7, respectively (Hair et al., 2017). Table 4 clearly illustrates that all the requirements to establish convergent validity have been fulfilled; hence, the study concludes that convergent validity was not a problematic issue for the study. The summary of convergent validity for the measurement model was summarized.

Pearson Correlation Analysis

One of the essential statistical methods for determining the linear relationship between two numerical variables is the Pearson correlation test. Pearson's correlation is used to provide a more accurate measure of whether the correlation coefficient is significant. According to Hair (2010), the correlations between the variables were analysed to examine the relationships between the variable of the model (significant and positive correlations). Correlation (**) means the relationship is at 95% confidence. A significant level is generated when the Sig values are obtained more or less than 0.05. Pearson correlation was used to analyse the data to identify the relationship between two variables in which the lower scale (or both) is on the scale of the interval. The strength of the relationship is represented by the value of the coefficients of correlation as follows:

Table 4: Show the coefficient range, r

Coefficient range, r	Strength of association
0.91 to 1.0 / -0.91 to -1.0	Very strong

0.71 to 0.90 / -0.71 to -0.90	High
0.51 to 0.70 / -0.51 to -0.70	Moderate
0.31 to 0.50 / -0.31 to -0.50	Small but define relationship/weak
0.01 to 0.30 / -0.01 to -0.30	Slight, Almost negligible

Source: Konting, 2000

Table 4 points out a significant link between each independent variable (Security, Trust, Ease of Use, Privacy Concerns, and Product Price to repurchase Intention of cosmetic products) with the dependent variable, repurchase intention of cosmetics products. Based on the result, there is a relationship between independent and dependent variables. Thus, the following hypotheses are accepted:

Table 4.1 : Correlation between independent variable and dependent variable

	CP	IV1	IV2	IV3	IV4	IV5

DISCUSSION & RECOMMENDATIONS

The findings of this study indicate that a variety of factors influence online repurchase intention among Malaysian cosmetic customers. The first research goal was to determine the association between security and repurchase intention among Malaysian online cosmetics users. According to the findings, there is a relationship between security and online repurchase intention. The aftereffects of this examination are in accordance with research led by Raman and Viswanathan (2011), Belanger (2002), and research by Alwafi (2016), the principal theory can be acknowledged.

The second goal is to examine the relationship between trust and repurchase intention among Malaysian online cosmetics consumers. According to the data, the association between trust and purchasing cosmetics online is quite beneficial. Moreover, trust significantly influenced the purchase intention of consumers' products as well as services (Chang et al., 2014; Rahman et al., 2020). Hence, advertising trust is one of the variables to assess in this study that may influence consumers' purchase intention on local cosmetic brands.

The research purpose was to determine the association between ease of use and repurchase intention among Malaysian online cosmetics consumers. There is a relationship between ease of use and repurchase intention. The results also revealed that perceived ease of use has a significant effect on the respondent's online repurchase intention through social media. The results seem to suggest that the respondents may tend to buy online through social media if the process of using social media in terms of ordering and delivering products or services is simple and easy to understand. (See Siew Sin, Khalil Md Nor, Ameen M Al-Agag1a,2012)

The fourth goal is to examine the association between privacy concerns and repurchase intention among Malaysian online cosmetics users. According to the findings, there is a relationship between privacy concerns and repurchase intention. These findings corroborate the results obtained in studies of Eastlick et al. (2006), Pavlou and Fygenon (2006), Van Slyke et al. (2006), and Venkatesh et al. (2002) in the context of online shopping. The strongest direct effect of privacy concerns is felt on repurchase intention.

In addition to the study's research purpose, researchers sought to evaluate the association between product pricing and repurchase intention among Malaysian online cosmetics users. The findings demonstrated that online shopping characteristics such as price had a relationship with the propensity to purchase cosmetic products online. Based on Bauboniene and Guleviciute, prices affect consumers' shopping online. Sociodemographic results show that consumer shop online more often due to low prices (Bauboniene & Guleviciute, 2015). It was identified that the reason consumers are shopping online is because consumers can compare prices and shop at lower prices. Consumer purchasing decisions are influenced by high or low prices. Purchase decisions are affected by the number of reviews only if the price level is high.

The recommendation is future research should expand the geographic coverage of the study with respect to the population and distribution of the questionnaire. The current study only focused on shoppers who have bought online among cosmetic consumers in Malaysia. Moreover, future research could extend the work of this study by using other study designs, such as an experimental study with an intervention to examine the causal relationships between the predictors and intention. Besides that, future research could use multiple informants to enhance the validity of the research findings as well. Furthermore, it suggested for future study to explore the effect of other psychological capital with respect to personal resources such as optimism and hope as a moderating role in strengthening the positive relationship intention to online repurchase. Finally, future work should examine whether adding other factors related to the

intention to online repurchase the cosmetic product and in turn improve the advanced model of the research framework.

CONCLUSION

In conclusion, all independent variables such as Security, Trust, Ease of Use, Privacy Concerns and Product Price have a positive correlation with the dependent variable which is Repurchase Intention of Cosmetic Consumer. As a result, the analysis revealed that safety, trust, ease of use, privacy concerns and product price have a positive influence on online repurchase intentions among cosmetic consumers in Malaysia.

ABSTRACT

The objective of this research is to investigate the determinants of consumer purchase intention towards organic beauty product. Thus, the main objective of this study is to examine the influence of green ads, trust, attitude and green knowledge toward organic beauty product purchase intention among women in Malaysia. Using quantitative method this study employs online questionnaire survey to women in Malaysia. 384 data have been collected using purposive sampling and analysed using the SPSS 28 version. The results show that there were significant positive correlations between green ads, trusts, attitude and green knowledge with consumer purchase intention. Significance of this study is the expansion of knowledge on the factors that lead to purchase intention towards organic beauty products. Future research can expand this study by investigating other factors using qualitative methods and different respondents.

Keywords: Green Ads, Trust, Attitude, Green Knowledge, Purchase Intention

INTRODUCTION

Organic beauty products can be classified as ‘experience goods’ because consumers generally learn about their quality and attributes during the pre-purchase and pre-consumption process. Thus, helping the organic beauty product industries increase their sales rate. Based on Kim and Chung’s (2011) study found that health consciousness partially supported the consumers’ purchase intention toward organic beauty products among women.

The market for organic beauty products was estimated to be worth over USD 34.5 billion in 2018 and is expected to increase at a compound annual growth rate of 5.2% from 2018 to 2027 when it will reach USD 54.5 billion. Consumers are more aware of the negative consequences of beauty products loaded with inorganic material because using personal care

products is a common practice (Al Mamun et al., 2018; Rani et al., 2018). Since organic beauty products help protect human skin while having a little negative impact on the environment, many women in particular feel compelled to buy them (Khan et al., 2021). Sometimes, even non-users of organic beauty products (people who have never used organic beauty products) purchase organic beauty products (Munerah et al., 2021).

Even though the organic beauty market is still in its infancy, researchers who are more interested in this issue have found a wide range of factors that affect consumers' intentions to purchase organic beauty products through green advertisements, trust, attitude, and knowledge. But few studies, particularly in the context of developing economies, have focused on the theoretical frameworks that predict consumers' propensity to buy organic beauty products (Ghazali et al., 2017; Suphasomboon et al., 2022).

Therefore, this study aims to investigate the determinants of consumers purchase intention toward organic beauty products among women in Malaysia. The outcomes of this study were useful for the researchers to understand the relationship between consumers and organic beauty products. There were four objectives of this research:

1. To investigate the relationship between green ads towards organic beauty products purchase intention among women.
2. To examine the relationship between trust towards organic beauty products purchase intention among women.
3. To study the relationship between attitude towards organic beauty products purchase intention among women.
4. To examine the relationship between green knowledge towards organic beauty products purchase intention among women.

SIGNIFICANCE OF THE STUDY

Academic contributions

Additionally, this study will be helpful to women since it will enhance their awareness of organic beauty products, which are now all but extinct and are nearly completely lost. Learning about

organic beauty products is fascinating and great in so many ways. The chance to learn more about organic beauty products and their advantages may make them feel

fortunate. They will be intrigued and have fun when they talk to you about it. The opportunity to learn about organic beauty products will be provided to the women.

Besides, positive consumer feedback has a role to play in the better practices of organic beauty products. Research from the past, however, indicates that certain communities are still hesitant to develop the practice of eating more natural and environmentally friendly goods. This is because of a number of factors, including the failure to recognize the potential for change that these products could bring about the high level of product loyalty to current (synthetic) products and the inadequacy of information and promotion through media campaigns.

Additionally, this research may aid in accelerating Malaysia's economic expansion. The continued growth of the organic beauty sector can ultimately support Malaysia's economic expansion while also enhancing its standing as a top destination for high-quality beauty treatments abroad. Additionally, customers who purchase quality organic beauty products in Malaysia have the propensity to return and promote favourable word of mouth among their friends and family.

Practical contributions

Women today are more focused on maintaining their youth, being healthy, and finding high-quality items. Since organic beauty products are goods that help protect human skin while having little to no negative environmental effects, many women, especially, are compelled to buy them. In addition, rather than producing local makeup goods. The majority of research on the market for organic beauty products is centred on organic and natural beauty products. Based on Kim and Chung's (2011) study found that health consciousness partially supported the consumers' purchase intention toward organic beauty products among women.

Furthermore, the consumer purchase intention toward organic beauty products among women is inconclusive. Therefore, this study aims to identify the relationship between green ads, trust, attitude, and green knowledge to purchase intention toward organic beauty products among women. The research finding will broaden our understanding of how it influences the purchase intention toward organic beauty products among women and adds to the literature in this area. Therefore, from the findings, organic beauty products are safe to use, so consumers are found to have no hesitation in purchasing organic beauty products. Upgrading the organic

products and the quality of the products will likely lead to an enhancement of consumers' purchase intentions.

LITERATURE REVIEW

Green Ads

Green advertising emphasises the connection between services and products and the environment, encourages eco-friendly living, and conveys a great image of collective environmental stewardship (Banerjee et al., 1995). Green advertising can influence consumers' purchasing intentions by fostering consumer trust and raising knowledge of organic products (Fuerst et al., 2016; Rahmi et al., 2017). Along with promotional tactics, brand value is created by cultivating customer trust (Rizomyliotis et al., 2021) this influences consumers' buying intentions for organic beauty products (Jayaram et al., 2015). Although lots of products with the organic label are inexpensive, consumers are less likely to trust goods without a strong green label. According to Jaiswal et al., (2018), consumers assess organic beauty products depending on the products' details, environmental, and green packaging. However, women's desire to buy organic beauty products is harmed by their misgivings about green social media advertising. Thus, during the research process, green advertisements have a favourable effect on consumers' trust in organic beauty products. Consumer perceptions of organic beauty products are positively impacted by green advertising.

Trust

Trust is an emotional brain state, not merely a behavioural expectation, and it is an essential component of all human connections, including love relationships, family life, corporate operations, politics, and medical procedures (Thagard, 2018). Previous research has been shown that trust appears to have an impact on the choice to choose a renewable power source. Customer trust is one of the factors that influence behaviour related to customer perceptions of the company's organic goods (Lavuri et al., 2022). According to Wang et al. (2022), trust can reduce a consumer's potential risk while increasing the possibility of purchasing at the time of transaction processing. Trust minimises the possibility that an exchange relationship would act opportunistically, increases transaction worth, and increases the likelihood that a purchase will be made (Wang et al., 2022). According to Lavuri et al. (2022), when customers trust in the offerings and believe that the organic items are eco-friendly, they will expand a favourable attitude toward purchase intent.

Attitude

In general, attitudes are mental states, and implicit attitudes are distinct from explicit attitudes on two fronts: they are automatic and not discoverable through introspection (Machery, 2016). According to Tewary et al., (2021), that environmental and health concerns have a substantial influence on young working women's attitudes toward buying organic cosmetic products. According to Tarkiainen et al., (2005), there is a positive relationship between the attitude toward purchasing organic beauty products and the intention to buy them. According to (Basheera Bibi Khan 2021) The positive relationship between attitude and purchase intention is strengthened by customer involvement.

Green Knowledge

Green product knowledge refers to a customer's subjective comprehension of a green product's environmental features and environmental implications. Customers' attitudes and behaviors may be at odds if they are unaware of green products (Wang et al., 2019). Knowledge about the brand and the product is a key factor in the intention to buy green products (Limbu et al., 2022). Consumers' opinions about purchasing eco-friendly cosmetics are positively impacted by their understanding about sustainable personal care goods, which in turn influences their propensity to do so. In other words, a young female consumer's power to buy green cosmetics increases with her level of awareness about green cosmetics. Higher behavioral skill levels in relation to buying green cosmetics are likely to increase the intention to buy green cosmetics.

Research Hypothesis

The literature review showed that factors like green advertisements, trust, attitude, and green knowledge have an impact on consumers' purchase intentions toward organic beauty products. The study's hypotheses have been simplified in the following way based on the literature reviewed:

H₁ There is a positive relationship between green ads with consumer purchase intention toward organic products.

H₂ There is a positive relationship between trust with consumer purchase intention toward organic products.

H3 There is a positive relationship between attitude with consumer purchase intention toward organic products.

H4 There is a positive relationship between green knowledge with consumer purchase intention toward organic products.

Research Framework

A conceptual framework describes the significant determinants of consumer purchase intention toward organic beauty products by using references from the literature review. Figure 1.1 depicts the conceptual framework for this study. Green ads, trust, attitude, and green knowledge are the four independent variables. The dependent variable is the purchase intention toward organic beauty products among women in Malaysia.

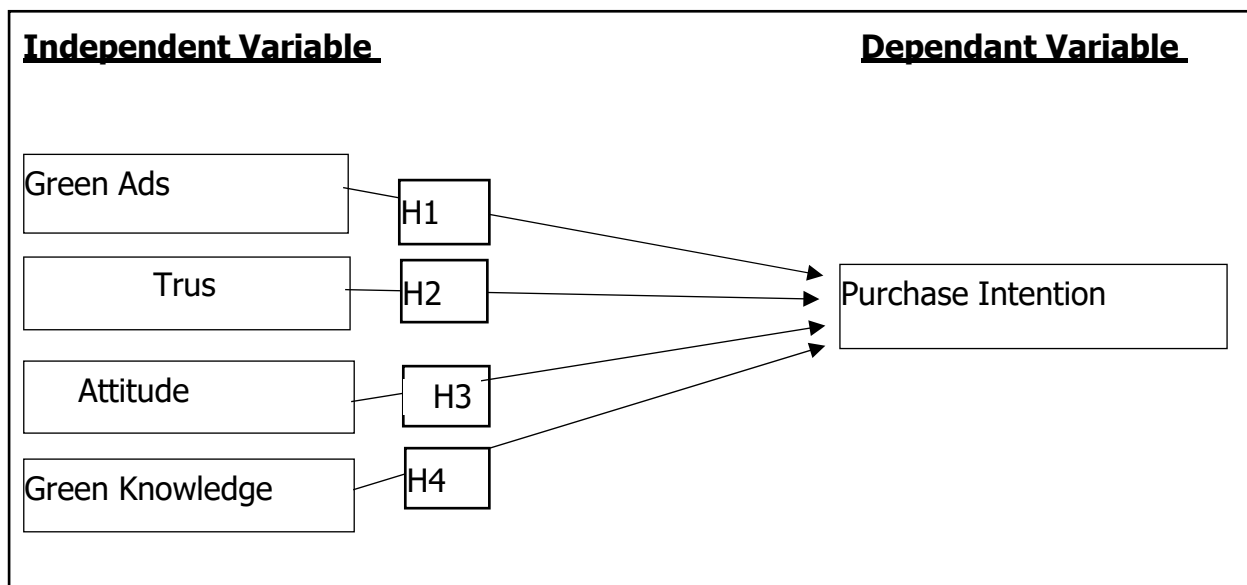

Figure 1: Conceptual Framework

METHODOLOGY

Research Design

In order to achieve the objectives, this study has used quantitative method an online questionnaire survey method to gather information on consumer purchase intention toward organic beauty products among women in Malaysia.

Data Collection

The closed-ended questionnaire consisted of a five-point interval scale for respondents to choose from. The questionnaire was distributed among 384 women Malaysian consumers (18 years and above) who have used organic beauty products at least once. The questionnaire was collected through online surveys to reach the women respondents in Malaysia.

Sampling

Sampling method that is the best and suitable for this research is non-probability sampling (or non-random sampling). This is because it offers a variety of sample selection procedures, the majority of which incorporate an element of subjective judgement. Furthermore, with the increasing expansion of online questionnaires, non-probability samples have become significantly more widespread (Saunders et al., 2019). In this study, purposive sampling will be used as a technique to find and collect the respondent. The collecting of information from people of the society who are easily available to supply it is referred to as purposive sampling. Purposive sampling is most frequently employed during the experimentation stage of a research study and is maybe the greatest technique to rapidly and efficiently get some basic information (Sekaran et al., 2016).

Data Analysis

In order to analyse the data for this study, the Statistical Package for Social Sciences (SPSS) version 28.0 was used. Researchers can assess each concept's one-dimensionality, reliability, and validity using SPSS. In order to respond to the research questions and objectives, SPSS was utilized for the data analysis in this study. Data was analysed for descriptive, reliability and correlation analysis.

FINDINGS

384 women data were gathered during the data collection period. In terms of age, majority of the respondents ranged from 18 to 25 years old (38.8%), followed by those between 24 and 34 years old (38%), (18.3%) are those between 35 and 54 years old and (4.9%) only respondents are those over 55 years old. In term of race, majority of the respondents are Malays (71.9%),

followed by Indians (17.9%), and Chinese (9.6%). Most of them are single (64%) and only (35.4%) are married. Regarding occupation, students (38%) are the highest occupation response who use organic beauty products, followed by private employees (31.5%), government employees (18%), and self-employed (7.6%), with others (4.9%) are the lowest. More respondents with a degree (61.7%) than respondents with a diploma (27.9%). Only (7.6%) of the respondents had their SPM, while others (2.9%) had no formal education. Most of the respondents with the highest monthly incomes were between RM1001 and RM4000 with(88.3%), followed by the lowest monthly are RM10,000 and above with (0.5%). Lastly, majority of respondents responded they have experience using organic beauty products (86.7%), compared to only (13.3%) of those who did not.

Table 1: Respondents Demographic Profile

Characteristics	Frequency	Percentage (%)
Age		
18-24 years old	149	38.8
25-34 years old	146	38
35-44 years old	34	8.9
45-54 years old	36	9.4
55 years old and above	19	4.9
Race		
Malay	276	71.9
Indian	67	17.4
Chinese	37	9.6
Others	4	1
Marital Status		
Single	246	64
Married	136	35.4
Others	2	0.5
Occupation		
Student	146	38
Government Employee	69	18
Private Employee	121	31.5
Self-employed	29	7.6

Diploma	107	27.9
Degree	237	61.7
Others	11	2.9
Monthly Income		
RM1000 and below	29	7.6
RM1001-RM4000	147	88.3

RM4001-RM6000	36	9.4
RM6001-RM8000	29	7.6
RM8001-RM10,000	8	2.1
RM10,001 and above	2	0.5
None	133	34.6
Experience by Using Organic Beauty Products		
Yes	333	86.7
No	51	13.3

Descriptive Analysis

The following criteria based on the mean scores were used to determine the levels of agreement for each variable. A mean score of 2.49 or less was considered "low," 2.50 to 3.49 was considered "moderate," and 3.50 or more was considered "high."

Table 2: Descriptive Analysis

Variables	Items	Mean Score (M)	Standard Deviation (SD)
Green Ads	I think that green advertising can give awareness about the importance of organic beauty products.	4.5625	.69406
	I believe that using green advertising could help make organic beauty products more well-known to many people.	4.5573	.68314
	I think that green advertising makes me more environmentally aware.	4.5443	.70294
	I believe green advertising makes me more likely to buy organic beauty products.	4.4792	.78136
	I believe that green advertising can help to promote organic beauty products.	4.5026	.73694
	I believe that green advertising can be beneficial to organic beauty products.	4.5391	.68060
Trust	I trust there are no dangerous chemical residues in organic beauty products.	4.1849	.83630
	I trust the idea of using organic beauty products.	4.2812	.70734
	I trust that using organic beauty products has a beneficial effect on health.	4.2604	.72255
	I trust buying organic beauty products is a trustworthy choice.	4.2734	.74450

	I trust using organic beauty products helps me live a healthy life.	4.2266	.77374
	I trust the use of ingredients in organic beauty products.	4.2318	.76198
Attitude	I'm aware of organic beauty products and also use them.	4.1849	.86092
	I believe it is a terrific idea to give my family, friends, and acquaintances organic beauty products.	4.4010	.71944
	I consciously prefer to use organic beauty products.	4.3307	.75962
	I recommend to my friends and family regarding the organic beauty products.	4.3151	.81255
	I believe using organic beauty products makes my skin look healthy and glowing.	4.2552	.77660
	I always do a pricing check before purchasing any organic beauty products.	4.2786	.77018
Green Knowledge	I know a lot about organic beauty products.	3.9557	.93698
	I am familiar with the green terms in organic beauty products.	4.0391	.90316
	I am conscious of the advantages and qualities of organic beauty products.	4.1745	.78715
	I think that I am more knowledgeable in understanding organic beauty products compared to other products.	3.9816	.95817
	I believe that women who are pregnant or nursing can safely utilize organic beauty products.	4.1641	.78939
	I believe that green knowledge can help me to identify organic beauty products and animal base products.	4.1563	.77934
Purchase Intention	I am willing to purchase organic beauty products while shopping.	4.0417	.87216
	I'm going to start buying organic beauty products.	4.1406	.77562
	I will purchase more organic beauty products.	4.0495	.82718
	I'm willing to spend more money on organic beauty products.	3.8724	1.01779
	I will purchase organic beauty products to protect the environment.	4.2292	.6890
	I would like to purchase organic beauty products as soon as I run out of them.	4.1198	.80548

The independent variable, green ads, was the focus of mean and standard deviation analysis. The maximum mean value was 4.5625, and respondents strongly agreed that organic beauty products are good for fulfilling cosmetic needs.

The independent variable, trust, received the highest mean score of 4.2812 in the mean and standard deviation analyses, supporting the claim that respondents believe their confidence in natural beauty products is correlated with its advantages.

According to the independent variable's mean and standard deviation analysis, respondents who frequently thought about their beauty products strongly agreed with the attitude item with the highest mean, 4.4010.

The statement "I am conscious of the advantages and qualities of organic beauty products" had a mean value of 4.1745 in the mean and standard deviation analyses on the independent variable, "green knowledge."

The mean and standard deviation analysis of the respondent on the dependent variable is purchase intention towards organic beauty products where item 5 shows the highest mean value score was 4.2292, that respondents strongly agreed Organic beauty products are products that protect the environment.

Reliability Test

Table 3: Reliability Test

Variable	Number of Items	Cronbach's Alpha coefficient	Strength of Association
Green Ads	6	.950	Excellent
Trust	6	.958	Excellent
Attitude	6	.936	Excellent
Green Knowledge	6	.943	Excellent
Purchase Intention	6	.953	Excellent

Cronbach's Alpha Coefficient values for the independent variables in this study are shown in Table 3 to demonstrate their reliability. The totality of the data supports the reliability of Cronbach's Alpha.

Trust has the highest Cronbach's Alpha value, which is 0.958. Followed by purchase intention towards organic beauty products among women in Malaysia is the second highest

value at 0.953. The third highest was green ads with a value score is 0.950. Followed by green knowledge with (0.943). Attitude had the lowest Cronbach's Alpha score which is 0.936. As a result, all item for variables is trustworthy.

Pearson Correlation

The strength of the association between the dependent variables (purchase intention) and independent variables (green ads, trust, attitude, and green knowledge) was assessed using the Pearson correlation test. The interpretation of the correlation coefficient is shown in the table below.

Table 4: Pearson Correlation Analysis

Hypothesis	P-Value	Interpretation	Result
H ₁ : There is a positive relationship between green ads and consumers' purchase intention towards organic beauty products.	0.527	Moderate (positive)	Accepted
H ₂ : There is a positive relationship between trust and consumers' purchase intention towards organic beauty products.	0.680	Moderate (positive)	Accepted
H ₃ : There is a positive relationship between attitude and consumers' purchase intention towards organic beauty products.	0.703	Strong (positive)	Accepted
H ₄ : There is a positive relationship between green knowledge and consumers' purchase intention towards organic beauty products.	0.785	Strong (positive)	Accepted

Table 4 shows the results of the Pearson Correlation Analysis, along with the significant value and total number of respondents (384) for green ads. The p-value was 0.000, which is less significant at the 0.01 level. With a correlation of 0.527, trust in organic beauty products is positively correlated with consumer' purchase intention toward organic beauty products.

Next, the important value of trust is followed by the overall (384) response count. The p-value was 0.000, which is less than the significance threshold of 0.01. A significant association between trust with consumer' purchase intention toward organic beauty products was found by the correlation value of 0.680.

In addition, the attitude had a substantial value and had 384 respondents overall. The p-value was 0.000, which is less than the significance level of 0.01. A good relationship between attitude and customer' purchase intention for organic beauty products was found, with a correlation value of 0.703.

Furthermore, for green knowledge, the significant value and total number of respondents (384). The p-value was 0.000, which is less than the 0.01 level of significance. green knowledge with consumer purchase intention toward organic beauty products has a strong correlation value of 0.785, which shows the positive relationship.

DISCUSSION AND RECOMMENDATION

This study found that when it comes to making conscious purchases of organic beauty products, there are strong positive relationships between green ads, trust, attitude, and green knowledge. Therefore, all of the research's goals have been achieved. This research is consistent with previous research into the factors that influence consumers' intentions to buy organic beauty products (Rambabu Lavuri et al., 2021 and Yam B. Limbu et al., 2022).

After carrying out this investigation, the researchers can expand the results of this study by studying other genders, which is men. This is because not only women use beauty products based on organic ingredients. However, there are many men who also use it and this will make the findings of the study more interesting.

Moreover, the researchers need to study and use the best variety of articles before continuing the study. This is because it can prevent researchers from making mistakes in terms of independent variable, dependent variable and theory.

Finally, researchers can narrow the scope in terms of state and age of respondent because this can make it easier for researchers to find respondents by using online surveys or interview surveys. Also the outcome of the study will be better and accurate.

CONCLUSION

The objectives of the research have been achieved whereby the independent variables which are green ads, trust, attitude, and green knowledge were found to significantly contribute to the dependent variable which is purchase intention. The researcher had to translate the questionnaire used in the prior study because it was only available in English and include at least one bilingual statement (in Malay). As a result, this work adds innovation to the field of organic beauty products by making theoretical and applied contributions.

ruzanifah@umk.edu.my

ABSTRACT

Previous research has shown that organic food products has gain attention among consumers. However, studies on youth motivation towards consuming organic food products are still scarce. Therefore the objective of this study is to investigate motivation to consume organic food products by examining the relationship between consumer attitude, price perception, health concern and environmental concern towards motivation to consume organic food products among public university students in Kelantan. Using quantitative method, questionnaire survey were distributed to students from 3 public universities in Kelantan. 235 data were gathered and analyzed for descriptive, reliability and correlation analysis using SPSS version 26. The study found that consumer attitude, price perception, health concern, and environment concern were significantly correlated with the motivation to consume organic food products. This research will contribute to the factors that motivate youth in consuming organic food products, provide information and resources for public universities in the selection of food for students and for the benefits of food industry. Future studies can try qualitative methods to conduct research, try other factors and expand the scope of the population to a larger one.

Keywords: consumer attitude, price perception, health concern, environment concern, organic food product

INTRODUCTION

Organic food products is one type of food products that supports consumers health because it is produced using natural and organic ingredients. The ingredients of organic food products come from sources that are believed to be safe because the production process start from the cultivation of ingredients using organic farming techniques. David et al., (2020) it was found that using organic farming techniques is a method that farmers will use to produce organic food products. According to Nguyen & Truong, (2020) study, based on statements from the World Health Organization (WHO), organic food is considered to be the result of natural gardening where the fertilizer used is made organically without mixed materials and and the way to prevent insects is to use biological methods. Sulaiman et al., (2020) organic food has become a growing priority among the community. Demand for organic food products increased because of due to consumers' awareness of the importance of their health (Melovic et al.,2020). In 2017, the sale of organic food products reached 97 billion US dollars, with the US, Germany, France, and China having the largest market. Organic food products have advantages such as being free from harmful substances and having content that is believed to be safe, making people reluctant to buy. This study was carried out because it looked at the statistics of deaths in the community in Malaysia caused by suffering from various health problems such as diabetes. This happens due to irregular eating habits and they don't really care about their health. Not only that, conducting research in Kelantan is because it is one of the states that have various foods that contain a large amount of sugar which makes the food sweet and causes them to receive the effects of that. One of the reason for this is due to high sugar which can cause health problems such as diabetes.

Numerous studies on organic food products have been conducted, and have revealed a connection

between consumers' health concerns and their propensity to consume organic foods. An example of a study from Singh & Verma, (2017) makes price health concern and perception as a factor in consumer behavior to buy organic food products. Ditlevsen et al., (2019) have also carried out research related to the topic of organic food products but it is more focused on the health of consumers when using organic products. Previous studies have found that consumption attitude, price perception, health concern and environmental concern influence the motivation to use organic food products as in the study by Yang, Shaaban & Nguyen., (2014); Singh & Verma, (2017); Sulaiman et al., (2020) and Nguyen & Truong, (2020). However, studies that link the above factors with the motivation to use organic food products for university students are still limited. Therefore this study will investigate what factors motivate university students to consume organic products.

This study has four objectives that have been set:

To investigate the relationship between consumer attitude with motivation to consume organic food products.

To determine the relationship between price perception with motivation to consume organic food products.

To examine the relationship between health concerns with motivation to consume organic food products.

To investigate the relationship between environment concerns with motivation to consume organic food products.

SIGNIFICANCE OF THE STUDY

Academic Contributions

This research will contribute to the motivation to consume organic food products among university students. This is because the awareness among university students to eat organic food or nutritious food is higher than before. In addition, people are encouraged to stick with chemical-free organic food products because they are healthier for them. This is because it is caused by consumers from the youth group, namely university students who are beginning to care and focus on the nutritional value of the food they take. On the box label, consumers can also see the organic purity. the food, giving more assurance to young people to eat organic food.

Practical Contributions

This study can be used as a resource for the food industry to determine what influences university students' dietary decisions and to increase the size of its market in Malaysia. This healthy diet can help students improve their performance in learning and encourage positive behavior. Improving food quality can provide students with good body health. Improving food to better quality can provide students with good body health (YH Chen, 2017).

LITERATURE REVIEW

Organic food product

The production of organic food started from cultivation methods that do not use chemicals. According to USDA, (2019) organic food will be processed according to the rules that have been set by agencies related to the organic sector. Organic food is produced using biological, mechanical and physical procedures that preserve the essential quality of each component and the final product (IFOAM, 2006).

When consumers have a sense of concern for environmental issues, it will caused them to be motivated to use organic food products (Diekmann & Franzen, 1999). The growth of organic products is partly because of developing marketing trends where consumers were exposed to information of what organic products are and the benefits before they decide to make a purchase (Thogersen, 2016). According to a study by Singh & Verma, (2017) found that the factors of health awareness, knowledge, subjective norms and price are factors that have influenced consumers to use organic food products. Organic foods are increasingly preferred over conventional. The rise in the prevalence of lifestyle conditions like heart disease and depression significantly impacts how modern consumers are changing (Rana & Paul, 2017).

Consumer Attitude

Pang et al., (2021) study found that the attitude of consumers will depend on their knowledge of something known as cognitive component while after that will involve the feelings and emotions of consumers about something that refers to effective component. Then the way they act will be involved and it is called behavioral component. According to a study by Sulaiman et al., (2020), consumer attitudes have encouraged them to buy.

Consumers' positive attitude towards buying organic food products will encourage them to evaluate the product and determine whether it is good or bad for them if they buy it. When a student has a positive attitude towards organic food, they will be more motivated to consume organic food on campus, at home and so on (Dahm et al., 2009). (Rana & Paul, 2017; Adamtey et al., 2016) have stated that the change in the attitude of each consumer towards organic food products is due to products that meet the tastes of modern consumers. A better attitude is related to behavior. If you have a good attitude towards something then there will be an intention to behave towards that matter (Ajzen, 2015).

Price Perception

The terms "perception" have meanings that are acknowledged in the literature on marketing. The act of choosing, compiling, and interpreting sensations into a coherent whole is called perception. The frame of reference of the individual affects this process, which is very subjective (Hanna et al., 2009). Marketers are keenly aware of consumer impressions since they are crucial to businesses. In actuality, the only reality that counts in the market is the one that is created in the minds of the consumers, who are the (fair or unfair) judges of the goods and the masters of their own decisions.

Here, this study investigated how individuals view the qualities of organic food. The majority of research studies in the area of organic consumer behaviour focus on customers' buying motivations, values that guide their decisions to buy organic food, and an analysis of factors such as health, nutritional value, flavour, or environmental concerns. According to an Italian study, customers identify organic products with health and the pursuit of good, delectable, and nourishing goods (Zanoli & Naspetti, 2002). According to Tobler et al. (2011), the primary reasons people choose to eat sustainably are health and flavour. Based on thorough literature study, Hughner et al., (2007); Bourn & Prescott, (2002) say about the elements that influence the consumer's decision to buy and consume organic food or not.

Health Concern

Previous studies by Nguyen et al., (2019) said that Individuals' health consciousness reflects their attitudes toward health issues and their willingness to take action to protect their health. Consumers are becoming increasingly concerned about food safety and nutrition. Organic foods are thought to be healthier to eat because they are high in nutrition and free of chemicals. According to Brya the most important feature of organic food for Polish consumers is its healthiness. Research findings from Tsakiridou et al., (2019) found that as many as 87.6% of his respondents believed that this organic product was healthier for them than other products. Therefore it can be said that concern for health has led or encouraged a consumer to use organic food because of the authenticity of the product that can be trusted. Here researcher can see the relationship between health concerns and the use of organic food.

Environmental Concern

Consumer awareness and perception of ecosystem damage and the depletion of natural resources are considered environmental concern (Kalafatis et al., 1999). Additionally, environmental care is described as one's individual opinions, attitudes, and degrees of environmental concern (Ahmadun, 2003). As people's concern for the natural environment has grown, consumers are looking for products that have a "green element," as well as those that have a positive impact on the environment. On the other side, people are increasingly concerned about their health while purchasing things, particularly food. This element has emerged as the primary motivator for people to purchase organic food (Yin, 2010). Organic foods assist to protect the environment because the manufacturing and selling processes do not employ polluting chemicals and technology. As a result, environmental concern is regarded as one of the factors influencing whether or not consumers use organic products (Winter & Davis, 2006).

Research Hypothesis

There are four hypotheses that have been developed for this study which were developed to find out whether there is a relationship or correlation between two variables, namely the dependent variable and the independent variable:

In most previous studies, it has been shown that the relationship between consumer attitudes and motivation to use organic food products is positive. This is because the two things are very closely related. According to what is in the study of Ekasari., (2021) concluded that consumer attitudes have had a positive effect on the consumer's decision to use organic food products and the same statement is found in the study by Pang et al., (2021). Therefore this proves that consumer attitudes have a great impact on encouraging the use of organic food products.

H1: There is a significant relationship between consumer attitude with motivation to consume organic food products.

In most previous studies, it has been shown that the relationship between price perception and motivation to use organic food products is positive. This is because the two things are very closely related. The findings of the study by Ekasari et al., (2021) stated that price perception can be the reason for customer purchases of certain foods. Where this can be explained by the statement given by Suprpto & Wijaya, (2012) which states that consumers will decide to buy depending on the price of organic food items. This can be deduced that there is a positive relationship between price perception and the motivation that influences them to use organic food products.

H2: There is a significant relationship between price perception with motivation to consume organic food products

It has been demonstrated in the majority of earlier studies that there is a strong correlation between motivation to consume organic food products and concerns about one's health. This is due to how tightly related the two items are. The study by Nguyen, (2019) indicates that health concerns are a key driver of the use of organic foods. Although Tarkiainen and Sundqvist find that attitudes about buying organic food are unaffected by health consciousness, the vast majority of prior research supports a strong and favourable link between these variables.

H3: There is a significant relationship between health concern with motivation to consume organic food products.

Most prior studies have found a favourable association between environmental concerns and inclination to purchase organic food items. Up to 89% of respondents admitted, it was found, that they paid close attention to how using food products affected the environment (Magnusson, 2001). Customers of organic food exhibit a willingness to safeguard the natural manufacturing process and the environment. Empirical research shows that views about purchasing organic food are positively influenced by environmental concern in both industrialised and emerging nations like Australia, Taiwan, and India (Squires, 2001). Concern for the environment is one of the primary drivers of organic food purchases. Since they are produced and distributed without the use of harmful chemicals or technologies, organic foods contribute to environmental protection. More consumers are realising how important it is to safeguard the environment in every way they can.

H4: There is a significant relationship between environment concern with motivation to consume organic food products.

Research Framework

Figure 1 : Conceptual Framework

METHODOLOGY

Research Design

The researcher's ability to gather data and interpret it depends on their research design. Quantitative methods were used to examine the motivation to consume organic food products among university students in Kelantan. White & Millar, (2014) and Creswell, (2011) both agree that quantitative research is statistical to answer questions related to who, what, when, where, how much, and how to explain events. In order to collect data from respondents regarding the study, the researcher opted to employ a quantitative method called a survey.

Data Collection

In this study, researchers have used several methods to collect data. For this study primary data has been used which is the data obtained directly from the respondents. This primary data is said to be reliable because we get information directly through the respondents. Therefore, the primary data in this study is from university students in Kelantan namely Universiti Malaysia Kelantan (UMK), Universiti Sains Malaysia (USM) and Universiti Teknologi Mara (UITM). A questionnaire through google form was used as a tool for this study. This questionnaire aims to collect as much information as possible regarding the factors that motivate youth to consume organic food products. The questionnaire was distributed using existing social media sites such as WhatsApp, Facebook and so on. This is because it makes it easier for us to get respondents faster and save time and we also went to each university to collect data.

Sampling

According to Periodicals, (2019), Sampling is the process of choosing a portion of the target population for a research project. A smaller group is used for data collecting in the great majority of research projects because it is impossible to recruit the involvement of the full population of interest. Instead of attempting to contact every person in the community, sampling from the population is frequently more realistic and enables data to be obtained faster and at a lesser cost. In a research study, the researcher can choose to use one of the available sampling methods, namely probability sampling and non probability sampling. When using probability sampling, a researcher defines a range of criteria and chooses a respondent at random. It is simple to acquire the sampling frame. The idea behind probability sampling is to choose responders at random while employing this kind of sample, where everyone has the chance to participate as a respondent Taherdoost, (2016). While the likelihood of receiving an unfavourable sample is thought to be higher for non-probability sampling (Skhukla, 2020). The benefit of utilising this kind of sampling is that the population will have a fair chance of being utilised as a sample in the study and the researcher can choose respondents in a subjective manner.

For this study, convenience sampling will be used. It is one of the types of samples included in the non-probability sampling method. This method will assist in time and resource savings. Convenience sampling is a sampling that takes into account the elements' accessibility and simplicity of acquisition. Because the sample is present at the appropriate location and time, it is taken or chosen. Although this strategy is unreliable, it is the quickest and least expensive to carry out because researchers are free to choose who they interact with. The removal of this sample is advantageous since it can be used in a preliminary exploratory study to identify early cues of an attention-grabbing circumstance. Results acquired in this manner frequently offer sufficient support.

Data Analysis

Data analysis is done to better understand the relationship between the independent variable (IV), which is separated into four dimensions, consumer attitude, price perception, health concern and environment concern the dependent variable (DV), which is motivation to consume organic food products. There are numerous ways that information on all of the motivation to consume organic food product among university students in Kelantan can be utilized. Data analysis is a technique for assessing the gathered data. In most cases, it includes an examination of the data created by applying analytical abilities in order to spot trends, correlations, or patterns. Following the completion of the information-gathering process with the respondents, data will be generated using SPSS software. The steps in this study's data analysis are listed below. The process begins with a descriptive study of the data, is followed by a reliability analysis, and is completed with a Pearson correlation test of the hypothesis

FINDINGS

Result of Demographic Analysis

Characteristics		Frequency	%	
Gender	Male	181	77.0	
	Female	54	23.0	
Age	18-20 years old	41	17.4	
	21-23 years old	184	78.3	
	24-26 years old	9	3.8	
	27 years and above	1	0.4	
Marital Status	Married	8	3.4	
	Single	227	96.6	
Race	Malaysia	216	2.1	
	Indian	8	3.4	
	Chinese	5	91.9	
	Other	6	2.6	
Education Level	Bachelor of Degree	216	91.9	
	Diploma	18	7.7	
	Master Degree	1	0.4	
Institution	University Malaysia Kelantan (UMK)	123	52.3	
	University Teknologi Mara (UITM)	61	26.0	
	University Sains Malaysia (USM)	41	17.4	
	Others	10	4.3	
	Year 1	33	14.0	
	Year 2	34	14.5	
Years of study	Year 3	145	61.7	
	Year 4	23	9.8	
	States	Johor	16	6.8
		Kedah	22	9.4
Kelantan		115	48.9	
Kuala Lumpur		1	0.4	
Melaka		1	0.4	
Negeri Sembilan		3	1.3	
Pahang		18	7.7	
Perak		3	1.3	
Perlis		5	2.1	
Pulau Pinang		9	3.8	
Sabah		3	1.3	
Sarawak		4	1.7	
Selangor		11	4.7	
Terangganu		24	10.2	
		17	4.4	

The respondent profile is summarized in Table 2. For male respondents totaling 54 people makes male respondents get 23.0% while for female respondents totaling 181 people who get 77.0%. The most lagging behind age group is 21 to 23 with 78.3%, followed by 18 to 20 with 17.4%, 24 to 26 with 3.8%, and 27 and above with 0.4%. These age groups are easier to find due to their presence with more researchers. The single group had more respondents than the married group, single group have respondent 227 with 96.6% and married group

have respondent 8 with 3.4% as they were still studying and had more time to answer the questionnaire.

Next, the racial distribution of 384 respondents. ‘Malay’ respondents have the highest percentage where 91.95% with 216 number of respondents, followed by ‘Indians’ with 8 respondent at 3.4%. Then there are other races with 6 people at 2.6% and the least is ‘Chinese’ with 2.1% a total of 5 respondents. The number and percentage for the level of education for the respondents who answered this questionnaire are displayed. Which number from the degree level is the one that gets the highest number, which is (216 respondents) with 91.9%. While the second position is from the diploma level as many as (18 respondents) with 7.7% and the last one is from the master's which is only (1 respondent) with 0.4%. In this study there are four levels of study years involved where according to students who are in year 3 are the most dominant who answered the questionnaire that was distributed with 61.7% of 145 respondents. Next there is 14.5% with 34 respondents from year two. While 14.0% with 33 respondents and the least is from year 4 which is 9.8% with 23 respondents.

For each respondent's home state. The state of Kelantan is ranked highest at 48.9% with 115 respondents while the second highest is Terengganu at 10.2% with 24 respondents while Kedah gets 9.4% with 22 respondents, 2 less than Terengganu respondents. For the state of Pahang, it got 7.7% with 18 respondents. After that, for the state of Johor there is 6.8% for that state with 16 respondents. Selangor has 4.7% with 11 respondents followed by Penang 3.8% which means the total number of respondents is 9 people. Perlis is equivalent to 2.1% with a total of 5 respondents. While for the state of Sembilan, Perak and Sabah share 1.3% with 3 respondents. Likewise, Kuala Lumpur and Melaka have the same percentage of 0.4% with 1 respondent.

Result of Descriptive Analysis

This study has analysed the mean and standard deviation for section of the questionnaires.

Table 3: Descriptive Statistics

Variable	Items	Mean Score	Standard Deviation
Consumer Attitude	I think buying organic food product is beneficial?	4.02	.889
	I think buying organic food product is a wise choice?	4.23	.814
	Buying organic food product make me feel good?	3.95	.818
	I believe organic food products is very useful to meet the nutritional needs	4.27	.844
	Buying organic food product make me feel pleased.	3.92	.836
Price Perception	I always choose the healthiest option although it is more expensive.	3.79	.968
	I think the price of organic food products is not a barrier to purchasing it.	3.71	1.005
	I think everyone should buy organic food	3.51	1.023

	products, even though they are more expensive.		
	I think the price of the organic food products is in accordance with the benefits.	4.01	.822
	I think the price of organic food product is high.	3.94	.868
Health Concern	I think often about my health.	4.31	.823
	I choose organic food product carefully to ensure good health.	4.18	.830
	I think organic food products have a beneficial effect on my health.	4.19	.746
	I think of myself as a health-conscious consumer.	4.19	.826
	I am concerned about the type and amount of nutrition in the food that I consume daily.	3.86	.936
Environment Concern	The balance of nature is very delicate and can be easily upset.	3.92	.834
	I pay a lot of intention to the environment.	4.20	.801
	I think environmental aspect is very important in my food choice.	4.25	.744
	I believe that organic food is more environmental friendly than conventional food.	4.07	.834
	I think humans must maintain a balance with nature in order to live a healthy life.	4.23	.767
Motivation to Consume Organic Food Product	Organic food products is good for the health.	4.22	.764
	Organic food products does not contain any chemicals.	4.10	.849
	Organic food products have more nutritional value than conventional food.	4.09	.796
	Organic food products consumption will help to protect the environment.	4.13	.814
	I would buy organic food products because of their quality.	4.20	.748

The mean and standard deviation analyses on the independent variable, consumer attitude. The maximum mean value was 4.27, where respondent strongly agreed is they believe organic food product is a very useful to meet the nutritional needs.

The mean and standard deviation analyses on the independent variable, price perception the highest mean score of 4.01, with the statement respondent think the price of the organic food products is in accordance with the benefits.

The mean and standard deviation analyses on the independent variable, health concern, item with the highest mean is 4.31, that strongly agreed by respondent think often about my health.

The mean and standard deviation analyses on the independent variable, environment concern, the highest mean value was 4.25, with statement " I think environmental aspect is very important in my food choice".

The mean and standard deviation analysis of respondent on the dependent variable, is motivation to consume organic food product where the item 1 shows the highest mean value score was 4.22, that respondent strongly agreed Organic food products is good for the health.

Result of Reliability Test

Table 4: Results of Reliability Test

Variable	Number of items	Cronbach's Alpha coefficient	Strength of Association
Consumer attitude	5	.909	Excellent
Price perception	5	.799	Acceptable
Health concern	5	.858	Good
Environment concern	5	.822	Good
Motivation to consume organic food product	5	.896	Good

Table 4 show the reliability Cronbach's Alpha Coefficient values for the independent variables in this study. The data whole demonstrates the validity of Cronbach's Alpha.

Consumer attitude has the highest Cronbach's Alpha value, which is 0.909. Followed by motivation to consume organic food product among university in Kelantan. The second highest value at 0.896. The third highest was health concern with value score is 0.858. Followed by environment concern (0.822). Price perception had the lowest Cronbach's Alpha score which is 0.813. As a result all item for variables is trustworthy.

Pearson Correlation

In this study, pearson correlation is intended to be used as a measure of the strength of the relationship between dependent variables (Motivation to Consume Organic Food Product) and independent variables (consumer attitude, price perception, health concern and environment concern). The table below show the interpretation of the correlation coefficient.

Table 5: Pearson Correlation Analysis

Hypothesis	Pearson's correlation	Result (Supported/Not Supported)
H ₁ : There is a significant relationship between consumer attitude with motivation to consume organic food product.	r = 0.620, p < 0.01	H ₁ is supported.
H ₂ : There is significant relationship between price perception with motivation to consume organic food product	r = 0.453, p < 0.01	H ₂ is supported.
H ₃ : There is signification relationship between health concern with motivation to consume organic food product	r = 0.678, p < 0.01	H ₃ is supported
H ₄ : There is signification relationship between environment concern with motivation to consume organic food product.	r = 0.639, p < 0.01	H ₄ is supported

Table 5 show the result of Pearson Correlation Analysis, for consumer attitude, the significant value, and the total number of respondent (235). The p-value was $0.000 < 0.01$ level of significant. The consumer attitude and motivation to consume organic food product a positive with a correlation value of 0.620.

Next, for the price perception the significant value, and the total number of respondent (235). The p-value was $0.000 < 0.01$ level of significant. The correlation value of 0.453 revealed positive relationship between price perception and motivation to consume organic food product.

Beside that, for the health concern, the significant value and total of respondent (235). The p-value was $0.000 < 0.01$ level of significant. The correlation value of 0.678, there was positive between health concern and motivation to consume organic food product.

After that, for the environment concern, the significant value and total number of respondent (235). The p-value was $0.000 < 0.01$ level of significant. Price perception and motivation to consume organic food have moderate correlation value of 0.639, it shows the positive relationship between environment concern and motivation to consume organic food product.

DISCUSSION AND RECOMMENDATION

This study discovered that there are significant positive correlations between customer attitude, price perception, health concern, and environmental concern when it comes to purchasing organic food products. As a result, all of the research objectives have been met. This study inline with previous studies on motivation to consume organic food products (Rana & Paul, 2017); (Nguyen et al., 2019) & Ekasari et al., (2021).

After conducting this study, the researcher gave some recommendations for future research related to the topic covered in this study. Among the suggestions that future researchers can make is to further expand the target respondents for this study. Which is trying to research the use of organic food products among university students throughout Malaysia. Not only that, change to other populations such as among schools to see if school children already know about this organic food product. Using qualitative method for future research may enhanced the body of knowledge in organic food products by exploring other factors contributing to purchase intention. This is because in this study the quantitative method has already been used, therefore it is not wrong to try to use another available method which is qualitative to do research related to this organic food product.

Another suggestion is to change the other variables. What he needs to see is that there are still more variables that are more significant in this study. It is to ensure more research on these organic food products. In addition, new researchers can also try to make a pilot test first for the selected variable in order to see the results of the selected variable whether it is significant or not. The pilot test also aims to see whether the developed questionnaire is understood by the respondents or not. This is to ensure that the real respondents are not confused by the questions that will be distributed later.

CONCLUSION

The objective of this research is to investigate the factors that contribute towards motivation to consume organic food products among university students. Findings from this quantitative study showed that all independent variables were significantly influencing students' motivation to consume organic food products. Thus this study provides novelty by providing academic and practical contributions in the area of healthy food consumption.

The Exploring Study Of Postpartum Depression Prevalence Among Women In Kelantan

Aimeeliya Binti Mohd Sham, Chan Pei Ling, Muhammad Khuzaimi Bin Zamuri, Nik Nor Shahieda Binti Nik Mood

Dr. Ahmad Fahme Bin Mohd Ali

Faculty of Hospitality, Tourism and Wellness, Universiti Malaysia Kelantan Corresponding email:

ABSTRACT

Postpartum depression is a very serious and well-known type of depression, especially among women around the world. This study shows the symptoms that contribute to postpartum depression, the risk of postpartum depression and the impact of postpartum depression. Therefore, this study aims to examine the symptoms that contribute to postpartum depression, the risk of postpartum depression and the impact of postpartum depression. This study has used a quantitative method by using "google form" to examine the questionnaire which is a variable that has been created where all the variables have a significant relationship with postpartum depression. All the data provided in this study will provide assistance to the parties concerned to help reduce this health problem. If the results obtained are positive then Malaysian women agree with the statement.

Keywords: Postpartum Depression, Symptoms, Risk, Impact

INTRODUCTION

According to Debra Fulghum Bruce (2022) postpartum depression is a complicated combination of alterations in behaviour, emotion, and physical health. Postpartum Depression is a type of severe depression that starts four weeks after giving delivery, according to the manual used to identify mental disease (Debra Fulghum Bruce, 2022). Based on the condition's severity and the time between delivery and onset, postpartum depression is diagnosed. Postpartum depression may be related to the biological, social, and psychological changes that take place while having a kid. This phrase can be used to describe the many emotional and physical changes that many new mothers go through. Therefore, this study proposes three research objectives to explain the statement.

To investigate the type of postpartum depression symptom among women

To investigate the risk factors that contribute to postpartum depression among women

To investigate the Impact of depression postpartum among women **Significance of The Study**

This study is important for women as the prevalence of postpartum depression among women is one in seven, and that number only includes those who have received a diagnosis of Postpartum Depression (PPD). It is clear to educate women about postpartum depression and receive depression treatment. Before giving birth, giving women exposure to help identify the signs of postpartum depression and seek treatment without feeling ashamed of their feelings. Not exposing women who suffer from postpartum depression will leave them vulnerable to relapse of mental illness and in some cases suicide. By informing women and their partners about early symptoms and signs, childbirth educators can play an important role in helping women end this silence (Norhayati et al., 2015).

LITERATURE REVIEW

Postpartum depression- A psychological disorder after childbirth that is at a high level that can affect as much as 13% of mothers who have just given birth.

Symptom- There are studies that show that depression and obesity have a close relationship. The evidence is that the risk of depression increases by 37% due to obesity among women. It is common for women to gain excess weight during pregnancy and after giving birth.

Risk factor- Some of the risk factors for a history of depression, depression during pregnancy, prenatal anxiety, stressful life events, low self-esteem, a lack of social support, and low income are all risk factors for postpartum depression.

Impact - Postpartum depressed mothers commonly experience suicide thoughts, are less emotionally present for their kids, and have babies with looser attachments.

Research Hypothesis

The hypothesis is also a provisional response to your untested research questions. It's crucial to base your hypothesis on the research goal as well. The independent and dependent variables will be used in the study to help the researcher construct the hypothesis. Therefore, a hypothesis must contain the following four components: a research purpose, an independent variable, and a dependent variable. For this research paper which is titled "Postnatal depression among women".

H1: There is a relationship between the type of postpartum depression and the occurrence symptoms of postpartum depression.

H2: There is a relationship between risk factors and the occurrence of postpartum depression.

H3: There is a relationship between the occurrence of impact and postpartum depression.

Research Framework

People who looked at the literature came up with a way to look at the relationship between the factors and how they faced the problems. It looks like this in Figure 2.1: symptoms of depression, risk factor, and impact of depression are three of the three independent variables that have been suggested as possible factors. The dependent variable is postnatal depression among women.

Independent Variables

Dependent Variables

METHODOLOGY

In this chapter, we will use systematic techniques to achieve the research requirements, scientific and quality methods. In addition, this chapter will also discuss how to carry out this study to obtain information in order to achieve the objectives and goals of the study. With this, all steps or procedures set must achieve the objective of this study by undergoing some necessary methods.

Research Design

We will use a quantitative approach as a research design to the study we conducted to examine the perception of postpartum depression among women. The quantitative approach we will use is to provide a questionnaire to the respondents. We selected this quantitative approach in part because it is testable and verifiable. This is because it necessitates thorough study design, which will increase the reliability of the data obtained and reduce the likelihood of disagreements, controversies, and objections (Gigi DeVault, 2020). This technique also has the ability to display the analysis directly. This is so that we can determine which statistical test to perform while gathering quantitative data based on the type of results. Because of this, analysing and presenting the data is simple and less vulnerable to inaccuracy and subjectivity (Gigi Devault, 2020).

Data Collection

• Primary data

Information that is obtained for the first time with the goal of resolving a problem is referred to as primary data. Surveys, tests, questions, focus groups, interviews, and questionnaires are a few examples of primary data sources. Respondents are given questionnaires as the main method of data gathering in this study. The major data source, according to Ajayi (2017), is a questionnaire that asks respondents a series of questions.

• Secondary data

Any material from published sources that has been gathered specifically for the current study topic is referred to as secondary data. Publications like books, journals, articles, websites, and blogs are examples of secondary data sources. To make decisions more understandable, secondary data is employed to fill in the holes in descriptions. Additionally, this study may be used to manage information libraries for pertinent sources in internet sources like Newspaper online and Emerald.

• Research instrument

The instrument that will be utilised to gather the data for this study is a survey questionnaire. Respondents in Kelantan will get the questionnaire, which will then be assessed. There are two sections to the questionnaire: part A, part B, and part C. Part A asks questions about the respondents' sociodemographic characteristics, such as their gender, age, religion, employment, and races. Parts B and C of the questionnaire ask respondents in Kelantan about postpartum depression-related characteristics.

Sampling

Non-probability sampling will be used in this study, and also the researcher uses random sampling. Questionnaire forms will be distributed to respondents at the Kelantan to ask respondents to answer the questionnaire. The researcher will ask if the respondent has known or experienced postpartum depression.

Data Analysis

Data analysis is the intentional application of logical and/or statistical approaches to describe and illustrate, summarise and assess, and analyse data. Data analysis, according to Copper, Schindler, and Sun (2006), is the act of editing and limiting data that is necessary to evaluate the results and answer the research question. In this study, descriptive analysis, correlation analysis, and reliability and validity analysis were used to examine the data collected from questionnaires given to respondents. SPSS software was then used to assess the data.

FINDINGS

This chapter will look at the results and recommendations of the data analysis done on the survey information received from the 384 research participants. The information that was processed to find out how common postpartum depression is among women in Kelantan. In addition, the hypothesis might be tested, and the study's research goal may be satisfied. The data are analysed using SPSS version 26.

Demographic Characteristics of Respondents

Age

There were 384 respondents, who consist of age from 18 to 29 years old is 97 respondents (25.3%). The respondent age from 30 to 39 years old is 171 respondents (44.5%). The respondents age from 40

to 49 years old is 66 respondents (17.2%). While, the respondents age from 50 to 59 years old is 39 respondents (10.2%) and the respondents age from 60 above years old is 11 respondents (2.9%).

Race

This shows that the highest age of respondents is 30 – 39 years old which is 171 respondents (44.5%). Meanwhile, the lowest age of respondents is 60 years old above which is 11 respondents (2.9%). The information shows that the highest frequency is Malay which is 302 respondents (78.6%). The second highest frequency of race is Chinese which is 69 respondents (18.0%). Meanwhile, the lowest frequency of race is Indian which is 11 respondents (2.9%). The second lowest frequency of race is Others which is 2 respondents (5%).

Education Status

The highest education status of respondents is SPM which is 172 respondents (44.8%). The second highest education status of respondents is Bachelor which is 74 respondents (19.3%). Next, the third highest education status of respondents is STPM / Sijil / Diploma / Foundation / Matriculation which is 66 respondents (17.2%). The fourth highest education status of respondents is Primary School which is 20 respondents (5.2%). The lowest education status of respondents is PMR / PT3 which is 19 respondents (4.9%). The second lowest education status of respondents is Master which is 14 respondents (3.6%). Next, the third lowest education status of respondents is who are does not go to school which is 13 respondents (8.2%). Last but not least, the extremely lowest education status is Phd which is 6 respondents (1.6%).

Employment Status

Respondent who are not working has the highest data which is 118 respondents (30.7%). Respondents who work in government sector has 102 respondents (26.6%). Respondents who work in private sector has 69 respondents (18%) while respondents who work in self-employed has 54 respondents (14.1%). The second lowest employment status of respondents is student which is 27 respondents (7%) and the first lowest employment status of respondents is retired which is 14 respondents (3.6%) in 384 respondents.

Residential Area

The total number of respondents for who are at city area was 214 respondents while the number of respondents for who are at rural area was 170 respondents. Out of 384 respondents, 55.7% of total respondents were at city area. Meanwhile, 44.3% were respondents at rural area.

Marital Status

The total number of respondents for mother gave birth after marriage was the highest number of respondent which is 369 respondents (96.1%). Meanwhile, the total number of respondents for mother gave birth before marriage was the lowest number of respondent which is 15 respondents (3.9%).

Number of Children

Respondent who have 1 child in family has 45 respondents (11.7%). Respondents who have 2 child in family has 95 respondents (24.7%). Respondents who have 3 child in family has 133 respondents (34.6%). Respondents who have 4 child in family has 69 respondents (18.0%). Respondents that who have 5 child in family has 15 respondents (3.9%) and 6 child in family has 19 respondents (4.9%).

Lastly, the respondents that who have more than 6 child in family has 8 respondents (2.1%). This can be show that the highest number of children of respondent is 3 child in family which is 133 respondents (34.6%). Meanwhile, the lowest number of children of respondents is more than 6 child in family which is 8 respondents (2.1%).

Mental Health Screening

The group of respondents who get the mental health screening is 22 respondents (5.7%). There were 362 respondents (94.3%) who did not get the mental health screening during pregnancy.

Pregnant Status

The group of respondents who was pregnant is 18 respondents (4.7%). There were 366 respondents (95.3%) who not pregnant.

Result of Descriptive Analysis

Table 4.10: Descriptive Analysis.

Variables	N	Mean	Standard Deviation
Postpartum Depression	384	2.5036	0.92891
Symptoms of Postpartum Depression	384	2.4365	0.89320
Risks Factors of Postpartum Depression	384	2.7240	0.73315
Impact of Postpartum Depression	384	2.6090	0.79701

The value of the respondents, mean and the standard deviation of the dependent variable and independent variables. The highest mean for the variables is Risk Factors of Postpartum Depression which is 2.72. The second highest mean for the variables is Impact of Postpartum Depression which is 2.61. The third ranking for the variables is Postpartum Depression which is 2.50 and the last ranking for the variables is Symptoms of Postpartum Depression which is 2.44.

Postpartum Depression (DV)

The mean, standard deviation and the ranking of the Postpartum Depression (Dependent Variable) in this research paper. The result based on the table above shows that respondent are strongly agreed that “I still can able to laugh and see the funny side of things after giving birth”, this is because it has the highest value of 2.88. Besides, the respondent also agreed with the statement “I will feel fear or panic for no good reason”, it is because the second highest value of this statement is 2.55. The third highest mean of the statement is “I would feel so unhappy that is would cause they to cry for no reason” to a mean score of 2.50. Next, followed by a score of 2.44 is “Thoughts of hurting myself would cross my mind after giving birth” then “I would blame myself for no reason when I had problems”, “I will feel anxious or worried for no good reason after giving birth” and “ I would feel so unhappy that I would

have difficulty sleeping after giving birth” with a score of 2.42. Lastly, the lowest score of the statement is “I felt very sad and miserable after giving birth” which is 2.40. In conclusion, the average mean of the Postpartum Depression (Dependent Variable) is 2.88 the highest score which is this indicates that respondents are strongly agree with this statement.

Symptoms of Postpartum Depression (IV1)

The mean, standard deviation and the ranking of the Symptoms of Postpartum Depression (Independent Variable) in this research paper. The result based on the table above shows that respondent are strongly agreed that “I have trouble falling asleep or sleeping too much”, this is because it has the highest value of 2.84. Besides, the respondent also agreed with the statement “I feel completely overwhelmed, as though I will never be a good mom”, it is because the second highest value of this statement is 2.59. The third highest mean of the statement is “I feel constantly irritated or angry, and have zero patience” to a mean score of 2.42. Next, followed by a score of 2.39 is “I have thoughts of harming myself or baby” then “I feel out of focus and can't concentrate on anything, least of all my newborn” and “I feel alone, despite just having added a baby to my life” with a score of 2.33. Next, followed by a score of 2.31 is “I feel no bond or connection to this new life I helped create” Lastly, the lowest score of the statement is “I feel uncontrollably sad and can't stop crying or shake off feelings of sadness” which is 2.28. In conclusion, the average mean of the Symptoms of Postpartum Depression (Independent Variable) is 2.84 the highest score which is this indicates that respondents are strongly agree with this statement.

Risk Factors of Postpartum Depression (IV2)

In this study work, the mean, standard deviation, and ranking of the Risk of Postpartum Depression (Independent Variable) are presented. According to the table above, respondents strongly agree that "I received support from my family members after giving birth," which has the highest score of 3.09. Furthermore, the respondent agreed with the statement "My lifestyle changed after I gave birth" because it has the second highest value of 2.99. The third highest mean of the statement is “I experienced physical changes after giving birth” to a mean score of 2.96. Next, followed by a score of 2.94 is “I have a history of depression in my family” then “I had problems breastfeeding after giving birth” with a score of 2.80. "I faced high life pressure after giving birth," followed by a score of 2.44, comes next. Finally, the statement with the lowest score is "I experienced a lack of social support after giving birth" and "I always feel worried and sad after giving birth," which has a score of 2.43. In conclusion, the average mean of the Risks of Postpartum Depression (Independent Variable) is 3.09 the highest score which is this indicates that respondents are strongly agree with this statement.

Impact of Postpartum Depression (IV3)

The mean, standard deviation and the ranking of the Impact of Postpartum Depression (Independent Variable) in this research paper. The result based on the table above shows that respondent are strongly agreed that “Anyone can get postpartum depression”, this is because it has the highest value of 3.32. Furthermore, because the second highest value of this item is 3.10, the respondent agreed with the statement "Postpartum depression can have an effect on children." The third highest mean of the statement is “Risk factors are things that make it more likely that I will get illness as compared to someone else” to a mean score of 2.50. Next, followed by a score of 2.47 is “I'm worry that I might hurt myself or others” then “I start a support group for women with perinatal mood and anxiety disorder” and “I don't feel bonded to my baby” with a score of 2.40. "I have taken medication to be treated for postpartum depression," followed by a score of 2.36, comes next. Finally, the statement with the lowest score is "I get postpartum depression much later after the birth of my child," which has a score of 2.33. In conclusion, the average mean of the Impact of Postpartum Depression (Independent Variable) is 3.32 the highest score which is this indicates that respondents are strongly agree with this statement.

Reliability Analysis

Reliability analysis was used to evaluate the validity of the survey. Cronbach's Alpha analysis was used to test the data to make sure it was reliable and accurate on the inside as well. The size of the Cronbach's Alpha coefficient according to the Rules of Thumb from Hair et al. (2007). The dependent and independent variables performed overall. Before being distributed online to 384 people, the survey was piloted with 30 participants.

Table 4.16: Result of Reliability Coefficient Alpha for the Independent Variables and Dependent Variable.

Variable	Number of Item	Cronbach's Alpha Coefficient	Strength of Association
Postpartum Depression	8	0.909	Excellent
Symptoms	8	0.934	Excellent
Risk Factors	8	0.752	Good
Impact	8	0.706	Good
Overall Variable	32	3.30	Excellent

The total Cronbach's Alpha Coefficient for the survey variables used in the study. The table shows that the total number of variables was 3.30 and that every variable had a value greater than 0.70. The question in this section had a Cronbach's Alpha of 0.909, which is considered to be extremely excellent. For the queries containing the personal variable, the coefficients produced were precise. There were eight surveys used to gauge how postpartum mothers in Kelantan were feeling. The Cronbach's Alpha score for this part, 0.934, is regarded as being quite high. As a result, the coefficient produced for the symptoms questions was precise and appropriate for use in this study. The risk factors that influenced postpartum mothers in Kelantan were also evaluated using eight questionnaires. The question in this area had a very strong Cronbach's Alpha rating of 0.752. The coefficient calculated for the risk factors variable questions was accurate as a consequence. The information regarding the postpartum in Kelantan was gathered using eight questions, and the Cronbach's Alpha value for this section's question was 0.706, which is good. As a result, the coefficient discovered for this inquiry regarding postpartum depression's influence among postpartum women in Kelantan was also reliable.

Pearson's Correlation Coefficient

Depending on the level of the correlation, Pearson's correlation is used to assess the strength of the relationship between the independent and dependent variables (Piaw, 2006).

Table 4.21: Overall of The Exploring Study Of Postpartum Depression Prevalence Among Women In Kelantan.

		Symptoms of Postpartum Depression	Risk Factor of Postpartum Depression	Impact of Postpartum Depression	Postpartum Depression
Symptoms of Postpartum Depression	Pearson Correlation	1	.634**	.772**	.794**
	Sig. (2tailed)		.000	.000	.000
	<i>N</i>	384	384	384	384
Risk Factor of Postpartum Depression	Pearson Correlation	.634**	1	.685**	.580**
	Sig. (2tailed)	.000		.000	.000
	<i>N</i>	384	384	384	384
Impact of Postpartum Depression	Pearson Correlation	.772**	.685**	1	.696**
	Sig. (2tailed)	.000	.000		.000
	<i>N</i>	384	384	384	384
Postpartum Depression	Pearson Correlation	.794**	.580**	.696**	1
	Sig. (2tailed)	.000	.000	.000	
	<i>N</i>	384	384	384	384

H1: There is a relationship between the type of postpartum depression and the occurrence symptoms of postpartum depression.

With a correlation coefficient value of .794**, postpartum depression symptoms and kind are somewhat positively correlated with one another among women in Kelantan. This demonstrates that postpartum depression symptoms are mildly positive and consistent with the sort of postpartum depression experienced by women in Kelantan. The postpartum depression type's p value for the symptoms is .000, which is less than the very significant level of .001.

H2: There is a relationship between risk factors and the occurrence of postpartum depression.

With a correlation coefficient value of .580**, the association between risk variables and the occurrence of postpartum depression among women in Kelantan is moderately positive. This demonstrates that there is a modestly favourable link between postpartum depression risk factors and the prevalence of the condition among mothers in Kelantan. The risk factor for postpartum depression has a p value of .000, which is lower than the very significant threshold of .001 for postpartum depression.

H3: There is a relationship between the occurrence of impact and postpartum depression.

The relationship between the relationship between the occurrence of impact and postpartum depression among women in Kelantan is moderately positive with a correlation coefficient value is .696**. This shows that the relationship between the occurrence of impact and postpartum depression is positive and moderately in relation to the postpartum depression among women in Kelantan. The p value on the occurrence of impact in postpartum depression is .000 which is less than the very significant level at .001.

Overall Of The Exploring Study Of Postpartum Depression Prevalence Among Women In Kelantan.

The association between postpartum depression, the dependent variable, and symptoms, risk factors, and the impact of postpartum depression among women in Kelantan, the independent variable. With a correlation coefficient of .794**, it can be seen that postpartum depression is positive and moderately related to symptoms of postpartum depression among women in Kelantan. With a correlation value of .580**, postpartum depression is positive and modestly related to postpartum depression risk variables among women in Kelantan. With a correlation coefficient of .696**, postpartum depression is also positively related to the effects of postpartum depression on women in Kelantan. The p value of the postpartum depression, symptoms, risk factor and impact of postpartum depression is .000 which is less than the highly significant level .001.

DISCUSSION AND RECOMMENDATION

To Investigate A Relationship Between The Type Of Postpartum Depression And The Occurrence Symptom Of Postpartum Depression.

The first objective is to investigate the relationship between types of postpartum depression among women. Based on the results obtained, the mean average is 2.44. Most of the respondents with experience of giving birth strongly agree with the statement that indicates having a postpartum

depression system. Women must be educated about postpartum depression and receive treatment for depression before giving birth. Before giving birth, getting to know women will help them identify the signs of postpartum depression and seek treatment instead of feeling ashamed of their feelings.

To Investigate A Relationship Between Risk Factors And The Occurrence Postpartum Depression.

The second objective is to investigate the relationship between risk factors that contribute to postpartum depression among women. Based on the results obtained, the average mean is 2.72. Most respondents strongly agreed with the statement that there are risks that contribute to postpartum depression. Women with postpartum depression are often undiagnosed and may hide their symptoms, leaving them to suffer in silence. By informing women and their partners about the early symptoms and signs of postpartum depression, maternity educators can play an important role in helping women end it, it is impossible to predict whether women will develop postpartum depression after silence (Norhayati et al., 2015).

To Investigate A Relationship Between The Occurrence Of Impact And Depression Postpartum.

The third goal is to look into the connections between postpartum depression in women and its repercussions. Based on the results obtained, the average mean is 2.61. Most of the respondents who experienced childbirth strongly agreed with the statement showing the effects of postpartum depression. When a woman is not treated for postpartum depression, the consequences can cause several marital diseases, susceptibility to mental relapses and relapses, in cases, suicide (Norhayati et al., 2015).

Based on the previous chapter, some empirical The Exploring Study of Postpartum Depression Prevalence Among Women in Kelantan. As a result, some recommendations improving the research for future study to increase the number of respondents based on pregnant women researchers can broaden the study area from one state to another (for example, Malaysia). This will increase the number of respondents, which may improve the results. Even the number of questions in each section can be increased by comparing places researched by demographics elsewhere.

CONCLUSION

In conclusion, the purpose of this study was to examine the associations between postpartum depression symptoms, risk factors, and effects in postpartum women in Kelantan. The studied material is used to create the conceptual framework. The link between the independent and dependent variables was the subject of the investigation. 384 people responded to the online survey, which was carried out. Using SPSS software version 28, descriptive statistics, reliability analysis, and correlation analysis were used to collect and evaluate the data. The reliability study revealed that the total variables were 0.934. The provided finding is therefore reliable and suitable for inclusion in this study.

THE EFFECT OF ONLINE GAMING ON MENTAL HEALTH, FINANCE AND ACADEMIC PERFORMANCE AMONG UNIVERSITY STUDENT

Mohamad Dhoiyaul Mukmin Al-Muiynuddin Bin Berhim, Najah Binti Mohd Yusof and

Nor Hazwani Binti Anur

Faculty of Hospitality, Tourism and Wellness, Universiti Malaysia Kelantan

Corresponding email:

ABSTRACT

Online gaming refers to the activity of playing video games over the internet either with or against other players. It involves connecting to a server or game platform using a computer or mobile device with an internet connection. Online gaming has grown significantly with the advancement of technology and the popularity of multiplayer games. Online games go beyond entertainment and leisure. It has become an important aspect of modern game culture and has created new avenues for social interaction, communication and collaboration. The purpose of this study is to examine the relationship between online games and mental health, finances and academic performance among university students. The main objective of this study is the effect online gaming on mental health, finance and academic performance among university students. This study has used quantitative methods to achieve the main objective of the study. Researchers have used Google Form to survey the questionnaire which contains 3 parts to 384 respondents. SPSS, or the Statistical Package for Social Science, was used to compile and analyse the data. For better performance and decision-making, SPSS handles the complete statistical analysis process, including planning, data collection, analysis, and reporting. This study examined the impact of online games on university students' mental health, financial situation, and academic achievement using Pearson's coefficient. The study's findings demonstrate the close connection between students' academic performance, financial stability, and mental health. This study examined the impact of online games on university students' mental health, financial situation, and academic achievement using Pearson's coefficient. The results of the study show the strength of the relationship on mental health, finances and academic performance among students.

Keywords: Online games among university students, mental health, finance and academic performance

INTRODUCTION

Online gaming is an electronic game played over a network of computer and smartphones especially over the internet. Addicting to online gaming are now becoming more serious and worrying especially among students.

PROBLEM STATEMENT

Mental Health

According to Ahmad Farid (2021), the effects of video games had an impact on mental health. For example, A young man murdered a woman purely for the purpose of killing in the real world. All of this can be attributed to the effects of violent video games. Roshlawaty Md. Raieh (2021) has found that those who are addicted to mobile gaming are more likely to face depression, anxiety, and loneliness.

Finance

The phenomenon of playing video games also causes students to become excessively addicted to online games. This demonstrates that they spent a significant amount of time each day with smartphones and laptop computers. Maulana Ramadhan (2021) said that a young man in Mumbai, India, had spent 10 lakh rupees of his mother's bank savings online gaming.

Academic Performance

According to The Inspirasi (2021), students are more likely to spend time playing online games than reviewing learning. Playing video games for hours has affected my performance as a student. Studies show that more time spent playing games on the screen can be linked to lower academic performance

SIGNIFICANCE OF THE STUDY

LITERATURE REVIEW

Research Framework

Independent Variable

Dependent Variable

METHODOLOGY

Research Design

For this study, the quantitative methods are selected to study the effect of online gaming on mental health, finance, and education among university students. Quantitative research uses systematic and simple to grasp data collection methods to demonstrate how variables can be assessed through observation and coding, for instance.

Population

The term "population" describes the complete group of people, activities, or objects of interest that researchers will be analysing (Kumar, 2011). Local Malaysian students make up the study's population. In this study, IPTA students in Malaysia are the main subjects.

Sample Size

In this study, the sample size is 384 respondents that student who playing online gaming.

Data Collection

Primary data & secondary data

Survey questionnaire is online survey (Google Form)

Sampling Method

The probability sampling method is used. The objective when selecting a probability sample design is to save survey time and expense while simultaneously minimising the sampling error of the most crucial survey variables.

Research Instrument

Online questionnaire is undertaken to save costs and simplify the work of researchers. The created questionnaire has three part that respondents must complete.

In this study we use a likert.

Data Analysis

Descriptive Analysis

Reliability Test

Pearson Correlation

FINDINGS

RESULT

	Hypothesis	Person correlation result	
H1	A positive hypothesis exists between the online gaming with mental health	($r = .482^{**}$, $p < .000$)	Supported
H2	A positive hypothesis exists between the online gaming with finance	($r = .365^{**}$, $p < .000$)	Supported
H3	A positive hypothesis exists between the online gaming with education performance	($r = .380^{**}$, $p < .000$)	Supported

DISCUSSION AND RECOMMENDATION

H1 - Relationship between Online Gaming and mental health among university students

To respond to RQ1, the findings of Hypothesis H1 in Chapter 4 were evaluated. According to H1, there is a considerable connection between online gaming and students' mental health. The results demonstrate a positively significant correlation coefficient value of.482**, while a p-value of.000, which is below the highly significant level of.001, is also present. H1 was therefore approved.

H2 - Relationship between online gaming and finance among university students

In order to address research question 2 (RQ2), the findings of hypothesis H2 in Chapter 4 were reviewed. The results demonstrate a strongly positive connection with a coefficient value of.385**. The p-value for financial online gambling among college students is.000, which is lower than the significant level of.001. As a result, there is a considerable correlation between the impact of online gaming and student finances. H2 was approved as a result.

H3 - Relationship between online gaming and academic performance among university students

The research question 3 (RQ3) from the previous chapter will be in line with the hypothesis (H3) depending on the outcome of the data analysis. Based on the findings, there is a moderately positive association between online gaming and academic achievement among university students, with a correlation coefficient of.380**. According to the findings, academic success among university students is favourable and strongly correlated with travel happiness.

RECOMMENDATION

Using both qualitative and quantitative techniques will improve the effectiveness of this investigation. This is because it can assist researchers in conducting future studies that are more precise and of higher quality.

Distribute survey questionnaires in a more official manner if they are distributed online. In addition, a letter of approval from the university or superiors is required along with the questionnaires in order to perform the study.

Additionally, the researcher might narrow the scope of the target respondent or find a more focused respondent.

Maintain a balanced lifestyle by engaging in a variety of activities beyond gaming to promote a balanced lifestyle. Pursue other hobbies, engage in physical exercise, spend time with friends and family, and participate in academic and extracurricular activities.

CONCLUSION

In conclusion, this study has been carried out to explore the effect of online gaming on mental health, finances, and academic performance among university students. The reviewed literature is used to develop the conceptual framework. The relationship between these independent variables and the dependent variables was the subject of the study. The overall variable for the reliability analysis result is 0.966. Additionally, the outcome is credible and appropriate for this study. The goal of the study is to understand how university students' academic achievement, financial stability, and mental health are related to online gaming. The result of the research objectives, which is the relationship between online gaming and mental health, finances, and academic performance among university students, is accepted.

THE FACTORS INFLUENCING NURSES MENTAL HEALTH IN HOSPITAL RAJA PEREMPUAN ZAINAB II (HRPZ II)

Nur Ain Hakimah Binti Kamal, Nur Ain Solehah Binti Ghazali, Nur Athirah Binti Azman, Mohamad Faizhan Bin Mohd Fauzi, Norsyamlina Binti Che Abdul Rahim*

Faculty Hospitality, Tourism and Wellness of University Malaysia Kelantan

CORRESPONDING EMAIL: norsyamlina@umk.edu.my

ABSTRACT

Nursing staff job procedures have been connected to emotions of worry, sadness, psychological discomfort, sleep problems, weariness, and other body ailments, all of which have a significant impact on these healthcare professionals' emotional health. The purpose of this study was to determine the effects of organization, personal problem, stress level, sleep quality, and financial issues on the mental health among nurses in HRPZ II. This was a cross-sectional descriptive study that was conducted among 104 nurses in HRPZ II. Data were obtained using online questionnaire and processed using the SPSS 26.0 software. The results showed that the majority of the respondents were not overburdened by their daily responsibilities and have good mental health. A strong culture that promotes high ethical standards can have a positive impact on employee behavioral.

KEYWORDS: Mental Health, Nurses, Quantitative, Workplace, HRPZ II.

INTRODUCTION

The text discusses the factors impacting the mental health of nurses at Hospital Raja Perempuan Zainab (HRPZ) II. It starts with an introduction to the study's historical framework, the requirements for conducting the study, and the problem statement for the chosen topic. The purpose of this study was to determine factors influence the mental health among nurses in HRPZ. Organization, personal problem, stress level, sleep quality, and financial issues are all components of mental health issues.

Significance of the Study

The importance of a study is determined by its influence and contribution to a specific field of study. This study identified a mental health gap among healthcare workers and identified coping skills that can help nurses avoid or treat mental health problems. The results can also aid future study on nurses' mental health prevention.

LITERATURE REVIEW

Independent variable 1 (organization): An organization's strong culture was once envisioned as a unified collection of views, values, presumptions, and practices shared by the majority of its people. The degree of consistency of beliefs, values, assumptions, and practices was stressed, as well as the prevalence (or quantity) of consistent beliefs, values, assumptions, and practices among organizational members. However, some pointed out potential problems with a strong culture, such as the potential for people to place unreasonable demands on themselves and prevent them from adapting to change. Additionally, addressing work stress and psychosocial risks should be part of safety and health strategies to reduce accidents and injuries at work. Organizational weaknesses also have an impact when there is an extreme workload or conflicting tasks where there is no cooperation between other employees.

Independent variable 2 (personal problem): Direct and indirect patient care are both negatively impacted by insufficient nurse staffing. Nurse morale may deteriorate and care may not be provided in line with set standards if the correct nurse leaves and is replaced by someone unfamiliar with the routine. This may result in working with an inadequate number of nurses or putting in extra hours to cover for absent nurses, both of which can be physically and mentally taxing. Usually, substitute nurses need additional oversight, which can be costly as well as detrimental to productivity and patient care quality. Co-workers may unintentionally feel annoyed about having to take on more work or feel under pressure to put in extra hours.

Independent variable 3 (stress level): Nurses have a variety of responsibilities, including teaching, communicating, and caring. Stress is caused by work-life balance, inadequate work organization, job overload, poor management, personal issues, unsatisfactory working conditions, and poor relationships at work. It has an adverse effect on the individual and has a detrimental impact on the business as a whole. Job discontent is high for nurses.

Independent variable 4 (sleep quality): Nurses with poor mental and physical health are more likely to experience depression than those with good mental and physical health. This is due to their physical and mental frailty, which makes them feel stressed out and promotes depression. To improve the quality of nurses' sleep, it is important to pay attention to the function of cognitive and metacognitive processes. Another study revealed that those who struggle with depression would benefit from exercising.

Independent variable 5 (financial): Nurses are highly trained medical professionals who are often the first response and the last line of defense between life and death. Low pay has contributed to an unhealthy lifestyle and had a significant negative impact on nurses' relationships, connections with co-workers, and general quality of life. Financial problems can leave people feeling angry, ashamed, or afraid, and can also cause tension and disagreements with their closest friends and family. Inaction is necessary for both health and wealth, and is necessary for both social and mental wellbeing.

Dependent variable: Nursing professionals are more likely to experience mental health issues due to high-stress scenarios at work, such as severe workloads, personal issues, financial stress, a

lack of staff, team friction, and witnessing patient suffering and death. This is important because nurses play a significant influence in the 3.6 million patient fatalities and 136 million adverse events that occur each year across the globe. Reassessing and understanding the connection between nurse reported mental health and perceived safety and quality of patient care is urgently required. The prevalence of mental health issues among healthcare professionals, particularly nurses, has increased.

Study Hypothesis

H1: There is a significant relationship between organizations and mental health among nurses at Hospital Raja Perempuan Zainab II (HRPZ II).

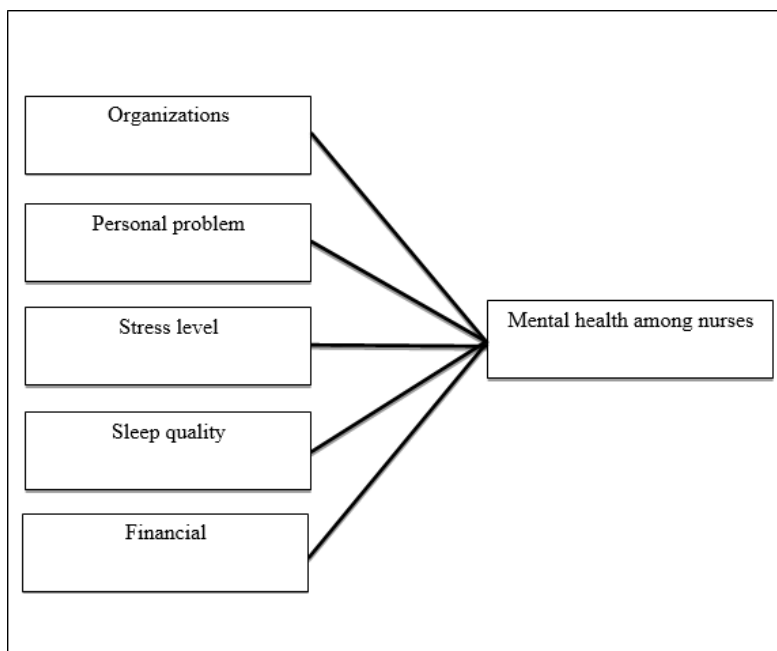

H2: There is a significant relationship between personal problems and mental health among nurses at Hospital Raja Perempuan Zainab II (HRPZ II).

H3: There is a significant relationship between stress level and mental health among nurses at Hospital Raja Perempuan Zainab II (HRPZ II).

H4: There is a significant relationship between sleep quality and mental health among nurses at Hospital Raja Perempuan Zainab II (HRPZ II).

H5: There is a significant relationship between financial and mental health among nurses at Hospital Raja Perempuan Zainab II (HRPZ II).

Study Framework

Figures 1.1

METHODOLOGY

Study Design

The design process of a study is to examine and gather information about generalizations in order to address the issue. This study uses quantitative study techniques such as numerical, continuous and differential data. The researchers intend to find data about the personal relationship of nurses with their service as nurses and how it leads to mental health among nurses in HRPZ II hospitals. The main categories of quantitative data are sensing, measuring, counting, quantifying, calculating, estimating and predicting.

Data Collection

The data collection method is the process of collecting information for the targeted variables in an organized method. Data can be divided into main categories which are primary data and secondary data. For this research, primary data will be used, and the data collected through an online survey which is an online questionnaire. The questionnaires will be distributed to share surveys on WhatsApp randomly to the respondents who work at (HRPZ II). In this way, researchers may provide the most direct and simple technique of collecting extensive and in-depth data regarding a certain event. When deciding on the type of questions to employ to collect data, consider study questions, participant characteristics, and the researchers preferred approach.

Sampling

Since there were 104 nurses total at HRPZ II, which is less than 201, the researcher's chose the entire population to serve as the sample for this study. According to Sugiyono (2007: 124), Total sampling is a method of data collection when the total sample size resembles the entire population. In order to fill out the surveys, the entire population served as the representative respondents.

Sampling is the practice of taking a representative sample from a population in order to examine the sample and ascertain its qualities or characteristics before extrapolating those traits to the complete population. There are two different types of sampling techniques. A researcher's uses the sampling method known as probability sampling to choose samples from a larger population using a method based on probability theory. A participant must be picked at random if they are to be carefully investigated as a probability sample. According to the definition given below, non-probability sampling is a sampling strategy in which samples are selected depending on the researcher's judgement rather than by chance. It assumes a more hospitable stance. This sampling technique gives the researcher's knowledge a fundamental framework. It is employed in quantitative study and mostly involves observational approaches.

Data Analysis

Data analysis is a systematic collection of mathematical, statistical, and logical approaches that can be used to characterize the data context, modularize the data structure, condense the data representation, highlight statistical tendencies, gather useful data, and draw conclusions. By eliminating the extraneous noise that the rest of the data creates, these analytical techniques help us to get the underlying insight from the data. Data analysis is a continuous, iterative process in which data collection and analysis occur continually since data production is a continuous activity. One of the most important aspects of data analysis is data integrity.

This study made use of the Statistical Package for Social Science (SPSS). A group of software applications have been compiled into a single package called SPSS. The study of scientific evidence in social science is the main application of this curriculum. Data analysis, surveys, and marketing strategy may all benefit from this information. Studiers may swiftly comprehend market demand for a product using the statistical data they have obtained and change their strategy.

FINDINGS

Demographic	Categories	Frequency (n)	Percentage (%)
Gender	Male	39	37.5
	Female	65	62.5
Age	18 – 21 years old	8	7.7
	22 – 25 years old	28	26.9
	26 – 29 years old	33	31.7
	30 years old and above	35	33.7
Marital Status	Single	47	45.2
	Married	57	54.8

Demographic	Categories	Frequency (n)	Percentage (%)
Race	Malay Chinese	80	76.9
	Indian Iban	15	14.4
		8	7.7
		1	1.0
Religion	Muslim Buddha	82	78.8
	Christian	13	12.5
		9	8.7

The table displays the gender distribution of the respondents based on the results from the table. There are 104 responders in all. In this survey, there were more female respondents than male respondents, with 62.5% (n=65) respondents as opposed to 37.5% (n=39).

Table displays the distribution of ages. Four age categories were assigned to the respondents. With 33.7% (n=35) of the total respondents, the group of respondents aged 30 and older had the greatest response rate, followed by the group of respondents aged 26 to 29 who had 31.7% (n=33) of the total respondents. With 26.9% (n=28) respondents, the 22–25 age group is the third-highest group, followed by the 18–21 age group with 7.7% (n=8) respondents.

The marital status of the respondents is shown in the table. The percentage of married nurses is 54.8% (n=57) responders. In the meanwhile, 47 respondents, or 45.2%, reported being single.

The table shows how respondents were distributed by race. Malay respondents made up 76.9% of the survey's total (n=80), while Chinese respondents came in second with 14.4% (n=15). Indians are the third most prevalent group race, with 7.7% (n=8) respondents, followed by Iban with 1.0% (n=1) respondents.

The table also displays the respondent's religion as a percentage. Muslim respondents make up 78.8% of the total (n=82), while Buddhist respondents make up 12.5% (n=13). Last but not least, Christian had the lowest response rate (8.7%; n=9).

RESULT OF DESCRIPTIVE ANALYSIS

The 104 nurses working at Hospital Raja Perempuan Zainab II who responded to the survey are shown in the table below along with the mean and standard deviation for each variable.

Organization

Descriptive statistics of Organization

Variables	N	Mean	Standard Deviation
Do you work according to a set schedule?	104	3.41	1.391
You often work overtime in a month.	104	3.50	1.215
There are still nurses doing other people's work.	104	3.69	1.175

The mean and standard deviation statistics of the responses to the organization are displayed in the table. The organizational element "there are still nurses doing other people's work" had the highest mean value, 3.69, and the respondents strongly agreed that it had contributed to the mental health issues of the nursing staff at HRPZ II. The question "do you work according to a set schedule?" had the lowest mean, with a mean value of 3.41, and respondents strongly agreed that this organizational feature has contributed to respondents' mental health issues. The respondents' impartial agreement that "you often work overtime in a month" can affect nurses' mental health was represented by a mean value of 3.50 for the statement. Additionally, the diversity of "Do you work according to a set schedule?" has a greater standard deviation of 1.391. Greater data dispersion is indicated by higher standard deviation values. In light of these criteria, respondents have provided information.

Personal Problem

Descriptive statistics of Personal Problem

Variables	N	Mean	Standard Deviation
Most nurses will have conflicts with co-workers or family members.	104	3.32	1.264
Living far away from work places a high workload on you.	104	3.89	1.131
A less conducive environment at work will disturb your emotions while working.	104	3.85	1.189

The respondents' mean and standard deviation data for the personal problem are shown in the table. Living far from work throws a severe workload on you, and respondents strongly agreed that this has contributed to mental health issues among nurses. This statement had the highest mean value, which was 3.89. The respondents lukewarmly agreed that personal issues of "most nurses will have conflicts with co-workers or family members" might lead to mental health, while the lowest mean was "most nurses will have conflicts with co-workers or family members" with a mean value of 3.32. Additionally, the phrase "a less conducive environment at work will disturb your emotions while working" had a mean score of 3.85, indicating that respondents are gradually coming to believe that this phrase can cause nurses to encounter mental health issues. Additionally, "most nurses will have conflicts with coworkers or family members" has a greater standard deviation of 1.264. The wider range of the data is indicated by a higher standard deviation number.

Stress Level

Descriptive statistics of Stress Level

Variables	N	Mean	Standard Deviation
Job stress can affect your physical and psychological health.	104	3.93	1.176
Stress can reduce your organizational productivity and job satisfaction.	104	3.79	1.228
The patient's irrational behaviour can affect your performance.	104	3.63	1.166
Excessive work stress that occurs in the workplace can cause chronic health problems.	104	3.71	1.188
Stress can affect productivity and impact productivity in your workplace.	104	3.88	1.160

The respondents' mean and standard deviation data for their degree of stress are shown in the table. The respondents highly agreed that "job stress can affect your physical and psychological health" has caused the nurses to experience mental health, and this significantly correlated with the statement's highest mean value, which was 3.93. The respondents agreed that the stress level of "the patient's irrational behaviour can affect your performance" can only mildly harm respondents' mental health, while the lowest mean was "the patient's irrational behaviour can affect your performance," with a mean value of 3.63. Additionally, the statement "stress can lower your organizational productivity and job satisfaction" had a greater standard deviation of 1.228. The wider range of the data is indicated by a higher standard deviation number. The higher standard deviation value indicates the greater spread in the data.

Sleep Quality

Descriptive statistics of Sleep Quality

Variables	N	Mean	Standard Deviation
Less of sleep can affects your quality of life and work productivity.	104	3.87	1.315
Nursing is an occupational that is more prone to insufficient sleep quality.	104	3.81	1.231

The respondents' mean and standard deviation data for sleep quality are shown in the table. The biggest mean score for the statement "Less of sleep can affects your quality of life and work productivity" was 3.87, and the respondents overwhelmingly agreed that poor sleep quality can harm nurses' mental health. Meanwhile, the lowest mean "nursing is an occupational that is more prone to insufficient sleep quality" with a mean value of 3.81, where the respondents agreed that sleep quality of "nursing is an occupational that is more prone to insufficient sleep quality" can led the nurses to experience the mental health. In addition, the larger standard deviation 1.315 was "less sleep can affect your quality of life and work productivity". The wider range of the data is indicated by a higher standard deviation number.

Financial

Descriptive statistics of Financial

Variables	N	Mean	Standard Deviation
You are satisfied with your current salary.	104	3.09	1.337
Your current salary enough to support you and your family.	104	3.24	1.273
You will change your career as a nurse if the salary earned is not satisfactory.	104	3.33	1.265

The financial survey respondents' mean and standard deviation data are shown in the table. The response "You will change your career as a nurse if the salary earned is not satisfactory" had the highest mean value, 3.33, and the respondents strongly agreed that financial factors were the ones that had the most of an impact on the mental health of the nurses in HRPZ II. The respondents agreed that financial circumstances related to "you are satisfied with your current salary" might affect nurses' mental health, whereas the lowest mean was "you are satisfied with your current salary," with a mean value of 3.09. Additionally, "you are satisfied with your current salary" had a greater standard deviation of 1.337. The wider range of the data is indicated by a higher standard deviation number.

Mental Health

Descriptive statistics of Mental Health

Variables	N	Mean	Standard Deviation
Mental health issue are common among you.	104	4.41	0.705
Your productivity at work will suffer if you suffer from mental health problems.	104	4.36	0.749
Increased awareness of mental health will impact and help your health	104	4.17	0.830

The respondents' mean and standard deviation data for mental health are shown in the table. The respondents firmly agreed that the mental health of "mental health issue is common among you" lead the mental health among the nurses in HRPZ II. "Mental health issue are common among you" recorded the highest mean value, which was 4.41. The respondents agreed that mental health factors of "increased awareness of mental health will impact and help your health" can cause nurses to experience the mental health, while the lowest mean was "increased awareness of mental health will impact and help your health," with a mean value of 4.17. Additionally, the greater standard deviation, which was 0.830, is "increased awareness of mental health will impact and help your health". The wider range of the data is indicated by a higher standard deviation number.

Dependent and Independent Descriptive

Dependent and independent variable

Variables	N	Mean	Standard Deviation
Organization	104	3.53	0.943
Personal Problem	104	3.69	1.023
Stress Level	104	3.79	1.022
Sleep Quality	104	3.84	1.171
Financial	104	3.22	1.075
Mental Health	104	4.31	0.614

The independent variables (IV) and dependent variable (DV) mean, standard deviation, and number of respondents are all displayed in the table. The mean score for the independent variables (IV) for sleep quality was 3.84, followed by stress level (3.79), personal issue (3.69), organisation (3.53), and money (3.22). The mental health dependent variable's (DV) mean score is 4.31.

The biggest standard deviation among the independent variables (IV) is for sleep quality, with a value of 1.171, followed by finances (1.075), personal issues (1.023), stress levels (1.022), and organisation (0.943). The mental health of the dependent variable (DV) has a standard deviation of 0.614.

DISCUSSION AND RECOMMENDATION

Discussion

Research Objective 1 & Research Question 1

Research Objectives (RO)	Research Question (RQ)
To identify the relationship of organizations on mental health among nurses in HRPZ II.	What is the relationship between organizations and mental health among the nurses in HRPZ II?
H1: There is a significant relationship between organizations and mental health among nurses at Hospital Raja Perempuan Zainab II (HRPZ II).	

To respond to research question 1, the findings of hypothesis H1 in the preceding chapter were examined. Additionally, according to H1 (HRPZ II), there is a tenuous link between organisational performance and staff nurses' mental health. With a correlation value of 0.372, the study's results demonstrate that organisation among hospital nurses is beneficial and unrelated to mental health. Additionally, there is no correlation between organisational structure and nurses' mental health at HRPZ II. H1 is therefore rejected.

Research Objective 2 & Research Question 2

Research Objectives (RO)	Research Question (RQ)
To determine the relationship of personal problems to mental health among nurses in HRPZ II.	Is there any relationship between personal problems and mental health among nurses in HRPZ II?
H2: There is a significant relationship between personal problems and mental health among nurses at Hospital Raja Perempuan Zainab II (HRPZ II).	

To address research question 2, the conclusion of hypothesis H2 in the preceding chapter was evaluated. In addition, according to H2, there is a connection between individual issues and nurses' mental health at Hospital Raja Perempuan Zainab II (HRPZ II). According to the results, personal issues among nurses at Hospital Raja Perempuan Zainab II (HRPZ II) are beneficial and unrelated to mental health, with a correlation value of 0.310. Additionally, there is no connection between nurses' personal issues and their mental health at Hospital Raja Perempuan Zainab II (HRPZ II). Therefore, H2 rejected.

Research Objective 3 & Research Question 3

Research Objectives (RO)	Research Question (RQ)
To identify the effect of stress level on mental health nurses in HRPZ II.	Does there any effect of stress level on mental health among nurses in HRPZ II
H3: There is a significant relationship between stress level and mental health among nurses at Hospital Raja Perempuan Zainab II (HRPZ II).	

To address research question 3, the outcome of hypothesis H3 in the preceding chapter was evaluated. In addition, H3 reported that stress levels and nurses' mental health at Hospital Raja Perempuan Zainab II are related. The results demonstrate that among nurses in HRPZ II, stress level is positive and unrelated to mental health, with a correlation value of 0.413. Additionally, there is no connection between nurses' mental health and their sleep quality in HRPZ II. Therefore, H3 are not significant and rejected.

Research Objective 4 & Research Question 4

Research Objectives (RO)	Research Question (RQ)
To examine the relationship between quality of sleeping and mental health among nurses in HRPZ II.	Is there any relationship between quality of sleeping and mental health among nurses in HRPZ II?
H4: There is a significant relationship between sleep quality and mental health among nurses at Hospital Raja Perempuan Zainab II (HRPZ II).	

To address research question 4, the conclusion of hypothesis H4 in the preceding chapter was evaluated. Additionally, according to H4, there is a connection between nurses' mental health and the quality of their sleep at Hospital Raja Perempuan Zainab II. With a correlation value of 0.358, the results demonstrate that sleep quality is good and unrelated to mental health among nurses in HRPZ II. Additionally, among nurses in HRPZ II, there is no connection between sleep quality and mental health. Therefore, H4 are not significant and rejected.

Research Objective 5 & Research Question 5

Research Objectives (RO)	Research Question (RQ)
To identify the effect of financial to mental health among nurses in HRPZ II	What is the relationship between financial and mental health among the nurses in HRPZ II?
H5: There is a significant relationship between financial and mental health among nurses at Hospital Raja Perempuan Zainab II (HRPZ II).	

To address research question 5, the outcome of hypothesis H5 in the preceding chapter was evaluated. In addition, H5 reported that in Hospital Raja Perempuan Zainab II, there is a connection between financial stability and nurses' mental health. According to the results, financial status among nurses in HRPZ II is favorable and unrelated to mental health, with a correlation value of 0.196. Furthermore, among nurses in HRPZ II, there is no connection between financial status and mental health. Therefore, H5 are not significant and rejected.

Recommendation

Studying the factors influencing nurses' mental health is crucial as it directly impacts their ability to provide quality care and job satisfaction. Future research should focus on job stress, workplace environment, work-life balance, social support systems, technology, and workload. Job stressors, such as high workload, emotional demands, lack of control, organizational culture, and interprofessional conflict, can contribute to nurses' mental health issues, such as fatigue, anxiety, depression, and job satisfaction. Work-life balance should be emphasized, with factors such as flexible schedules, family support, childcare arrangements, and availability of time off affecting nurses' ability to manage stress and maintain a healthy work-life balance. Social support systems, such as peer support programs, mentoring, and counseling services, can also help reduce stress and promote mental well-being.

Technology implementation, such as electronic health records and digital documentation systems, should also be investigated to assess the impact of increased workload, information overload, and blurring of work-life boundaries due to technological advances. These recommendations provide a starting point for future research in understanding the factors influencing nurses' mental health, allowing for the development of evidence-based strategies and interventions to improve the quality of healthcare delivery.

CONCLUSION

This study explores how HRPZ II nurses can operate more effectively. It defines the words "mental health", "organization", "personal problems", "sleep quality", "financial status", and "stress levels". The study questions and objectives relate to mental health as the dependent variable and personal difficulties, sleep quality, finances, and stress levels as the independent variables. The definition of words is discussed last, and a summary of how the researcher's determined the value of the programmed created to increase nurses' awareness of how to deal with mental health difficulties follows.

ABSTRACT

Fast food is among the fastest-growing food categories in the world. It currently accounts for nearly half of restaurant sales in developed nations and will continue to grow there and in numerous other industrialized nations over the next few years. The most rapid expansion, however, is occurring in the poor world, where it is dramatically altering the way people consume. People purchase fast food because it is inexpensive, simple to prepare, and extensively advertised. A qualitative study was conducted to identify the factors that influence the consumption of fast food among teenagers in Pengkalan Chepa, Kelantan. The information on the respondents had gathered through 12 interviews via purposive sampling. The study indicated that personal lifestyle including trend, sleep pattern; price quality inference which is service and food quality; as well as promotion like advertising and sales promotion leads to fast-food consumption among teenagers in Pengkalan Chepa, Kota Bharu, Kelantan.

Keywords: Fast Food, Teenagers, Personal Lifestyle, Price Quality Inference, Promotion

INTRODUCTION

Fast food is well-known for being popular, convenient for customers, tasty, and inexpensive. Today, fast food is recognized for its accessibility, efficiency, and delectability. Moreover, fast food establishments' marketing generally promotes fast food as healthy, making customers open to persuasion. According to Goyal and Singh (2007), fast food is the food sector with the most rapid growth worldwide. This may be because fast food requires immediate renewals and limited-service renewals for dining and takeout facilities. Fast food is a food that can be served and prepared quickly. Their predilection for fast food over home-cooked meals is primarily attributable to their hectic lifestyles, especially in dual-income households with children (Atkins and Bowler 2001). This was further supported by Farzana Quoquab et al. (2011), who concurred that the customers' limited time because of their long working hours, hectic lifestyle, employment, and family responsibilities. Due to the speedy preparation of meals, which enables customers to eat in a short amount of time, the fast-food industry has become the most popular option in Malaysia.

Consequently, the shifting client preferences have presented the Malaysian food industry with a chance to grow their operations. American fast-food brands such as Domino's Pizza, McDonald's, A&W, Mary Brown Kentucky Fried Chicken (KFC), Burger King, Subway, and Pizza Hut dominate the Malaysian fast-food market, according to Habib et al. (2011). These fast-food franchises have achieved great notoriety throughout the Malaysian Generation. In addition, according to the Malaysian Department of Statistics (2016), Generation Y students make up the greatest fraction of Malaysia's population of 12,67 million. Due to their lifestyle and eating habits, which impact their choices in the fast-food sector, Generation Y students are recognized as the most crucial market category. In addition, Generation Y eats out regularly and buys takeout from fast food restaurants; as a result, they

are always seeking production facilities that meet their needs. Generation Y students were selected as the acceptable target demographic for this inquiry.

Significance Of the Study

The fast-food consumption behaviour

Food that is made rapidly and in a short period of time is commonly referred to as fast food. People enjoy fried and roasted foods, particularly adolescents. Multiple studies have demonstrated that people prefer fast food for a variety of reasons, including flavour, convenience, social contact, and enjoyment.

Consumption of several dietary categories by adolescent in Malaysia

Fast-food consumption is a negative eating habit since it increases the risk of diet-related chronic diseases. We were interested in the sociodemographic traits, body mass index (BMI) for age, eating behaviours when away from home, and consumption of the main food categories among Malaysian teens.

Sociodemographic parameters

Students in universities are among the populations most at risk for nutritional diseases due to their way of life and social environment. This study's objectives include measuring fast food consumption among college students and evaluating variables including socio demographic traits, BMI, and dietary habits that may have an impact.

Increased Adolescent Obesity

Due to the general hurried lifestyle, consuming fast food has become increasingly widespread today, where it has also become ingrained in metropolitan areas. According to Habib et al., 84 percent of university students in Malaysia eat fast food. Moore et al. (2009) found that individuals with the lowest levels of wealth and educational achievement were more likely to consume fast food than those with the greatest levels.

Frequency of eating

Three cognitive variables mindfulness disposition, self-efficacy, and nutrition knowledge were evaluated as independent variables, with frequency of dining out serving as the outcome variable. The relationship between cognitive characteristics and eating out frequently was evaluated using multinomial models.

LITERATURE REVIEW

Personal Lifestyle

Making healthy lifestyle choices is known as prudent regardless of age and because of that individuals of all ages sometimes have difficulty choosing the healthy option (Tasdemir et al., 2016). It is also pointed out that older people indicated greater intention particularly to make healthy choices in their current life rather than the younger generation did. Moreover, the individual's perspective on the future has shown to be a vital multidimensional construct affecting daily healthy lifestyle choices especially for teenagers and adults. Therefore, lifestyle modification involving physical activity, diet have been widely disseminated particularly for the treatment and prevention of disease (Deanna M. Minich, 2013).

Price-Quality Inference

The price and quality of the product or service offered to customers will have a significant impact on the operations of a company. According to Goetsch and Davis (2014), quality encompasses every area of a business and is fundamentally a consumer's emotional experience. Consumers require a sense of satisfaction with their purchases, also known as the customer's perceived value, which is the emotion they should have had when they purchased an item at the best price. Therefore, consumers will take pride in their relationship with a company that has an excellent reputation. In addition, according to Oakland (2000), its use is far larger than assuring product or service quality, as it is a method of supervising corporate processes and ensuring complete consumer happiness at every level, both internally and externally.

Promotions

The promotions mix (marketing and communications mix) is the exact combination of promotion tactics that the company employs to effectively communicate customer value and cultivate customer relationships. (Kotler et al. 2010). Promotion can be defined as the mode of communication often employed by a marketer in the marketplace. Additionally, promotion can be divided into four unique elements: advertising, public relations, word-of-mouth, and point of sale. Advertising encompasses all paid forms of communication, ranging from television advertisements, radio, and Internet pop-ups to newspapers and billboards. Moreover, public relations are a kind of communication that is not directly paid for, and this includes news releases, conferences, sponsorship, exhibition, events, and seminars. In addition, word-of-mouth is an ostensibly informal communication about a product by ordinary people, satisfied consumers, or those specifically engaged to develop word-of-mouth momentum.

Research Framework

The Figure 1 below shows the research framework use for this study.

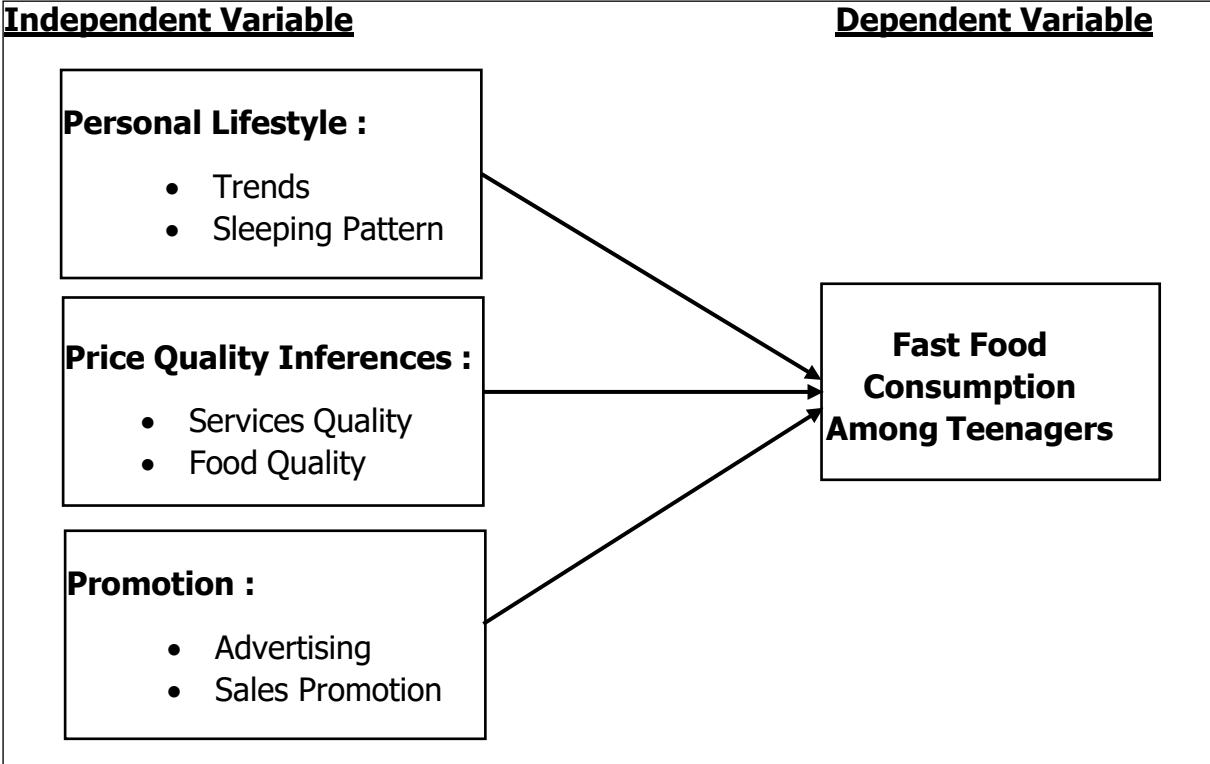

Figure 1: Research Framework

METHODOLOGY

Research Design

This research is using qualitative as a primary tool to collect respondents' data. The research focused on a qualitative analysis process that attempts to explain a social or human question from a range of perspectives.

Data Collection

The interview is a strategy for methodically gathering data or observations. Fact gathering enables you to obtain first-hand knowledge and insights on a research issue whether you are working on a project for the corporate, government, or educational sectors. Although techniques and objectives may vary per industry, the overall approach to data collecting remains much the same (Bhandari, 2020). Interviews are a tried-and-true way of collecting qualitative data and have several benefits over other methods. Male or female voices might be used to conduct an interview. Body language may be seen during interviews, and either a guy or woman should use the proper approach (Rutakumwa et al., 2019).

Sampling

The purposive sampling technique used to identify respondent with fast food consumption among teenagers. This sampling technique has used to achieve the aim objective for this research and to obtain data from the respondent. The teenagers of Pengkalan Chepa that was selected for this study, with 12 respondents.

Data Analysis

Using Content Analysis to analyse the data. Content analysis is one of the most common qualitative research methodologies. The researcher must transcribe the interview and peruse the transcripts multiple times to gain an overview.

FINDINGS

In this study, the researcher chooses purposive sampling which is the type of non – probability sampling technique. Purposive sampling is a means that the researcher used their own decisions about respondents to choose and picks those who best suit the purpose of the study and chooses (12) teenagers from Pengkalan Chepa.

Personal Lifestyle

Trends

Trends are something that develops over time. Today is recognized as the moment of a hectic life, and most people move quickly (Dragana M et al., 2020). Based on the interviews that were conducted. Most respondents responded that eating at fast food restaurants is not a trend. The following is a portion of the interview conversation.

“Eating at a fast-food restaurant is not hipster because people consume there.....”
(Respondent 1)

“Fast food is typically regarded as mainstream and lacking in authenticity, whereas hipster culture tends to value unique, artisanal experiences. ...” (Respondent 2)

“Eating at a fast-food joint is not considered a hipster trend these days. In fact, fast food is a popular and widely accessible option for many people due to its affordability, convenience, and speed. ” (Respondent 3)

“Personally, I do not think eating fast food is a hipster these days. ” (Respondent 4)

“No, eating at a fast-food restaurant is not regarded as a "hipster" activity. Eating at a chain restaurant that sells mass-produced food may not be consistent with hipster culture's values of authenticity. ” (Respondent 7)

“I do think that eating at a fast-food joint is a hipster these days. Nowadays, eating at a fast-food joint is also a trend and today's generation loves to follow the trend. ...” (Respondent 8)

“Eating at a fast-food joint is not typically considered hipster. In fact, hipsters often seek out trendy, artisanal restaurants that offer unique and locally sourced menu options. ...” (Respondent 10)

“Eating at a fast-food joint is not considered hipster these days. In fact, many hipsters tend to avoid fast food chains and opt for more unique and artisanal food experience. ...” (Respondent 11)

Fast food consumption is not hipster or trendy, according to Eight (8) of the twelve (12) respondents. It is not hipster or trendy to dine at this fast-food restaurant. This is because when people arrive at the fast-food restaurant, they are hungry. Not for the fashionable or hipsters. So, this contradicts literature review.

Sleeping pattern

Another prevalence of fast-food consumption among teenagers is related to sleeping patterns. Sleeping patterns among teenagers have influenced them to increasingly consume fast-food. Hormones like a lack of leptin and an increase in ghrelin levels, which can cause an increase in appetite, may be one of the potential causes of sleep deprivation in combination with the consumption of higher energy meals (Gonnissen HK et al., 2013).

“There were times when I would order fast food from McDonald to eat because I was hungry late at night. ...” (Respondent 1)

“Sleep patterns can influence someone to come to a fast-food joint late at night. People who work night shifts or have other schedules that require them to be awake and active during the night may also be more likely to visit fast-food joints late at night as they may not have access to other food options during their work hours. ...” (Respondent 2)

“Sleep patterns can influence someone to come to a fast-food joint late at night. People who have irregular or disrupted sleep patterns may experience changes in their hunger and cravings, and they may feel hungry late at night when many other food options are not available. ...” (Respondent 3)

“I think it is true that sleep pattern related to someone coming to Fast-Food Joint late at night because someone who stays up may be hungry and they may choose the easiest way which is fast food. ...” (Respondent 4)

“There are still fast-food restaurants that operate more than 24 hours. No wonder if at 12pm there are still customers ordering food there. ...” (Respondent 6)

“Sleep habits can affect a person's decision to go to a fast-food restaurant after midnight. ...” (Respondent 7)

“I think sleep pattern does influence someone to come to fast food joint late at night. ...” (Respondent 8)

“Sleep patterns and fast-food consumption are interrelated. When we stay up late at night, food intake will increase. ...” (Respondent 9)

Nine (9) of the twelve (12) respondents agreed with the sleeping pattern. They feel that teenagers are now sleeping late at night and eating fast food at midnight. These are related to the previous research that teenagers were ordering their fast-food by food service app such as Food panda that known as popular food service application (Adam, 2021).

Price Quality Inference

Service Quality

One of the prevalence of price – quality inference effects is shown by service quality. Most teenagers are satisfied with the service quality at fast-food joints. From the interviews conducted, most respondents stated that satisfaction with service quality. It is vital since a customer's cumulative experiences might result in either satisfaction or discontentment (K. Hussain, Jing, Junaid, Bukhari, & Shi, 2019) and in addition, previous research (Shurair & Pokharel, 2019) demonstrates that service providers must provide adequate seating and space for clients. Below is part of the conversation involved from interview.

“The service quality is, in my opinion, quite swift and great. I received polite treatment from the company's trained staff...” (Respondent 1)

“Based on my experience, all fast-food service quality at Pengkalan Chepa is good. The service provided is very good, satisfying and the service is fast...” (Respondent 2)

“Fast-food joints are known for providing quick, convenient, and affordable food options to their customers. They usually offer a limited menu of standardized items that can be prepared and served quickly, allowing customers to get in and out of the restaurant within a short period of time...” (Respondent 3)

“The services carried out in the Fast-Food Joint depend on the franchise, some of them are good but some are otherwise. So far, the services that I receive from the Mc Donald totally satisfy me because their staff is very easy to ask anything such as how to redeem the food in the Mc Donald's application...” (Respondent 4)

“Personally, I think they just make a good service just like MCD and KFC. This is because the service quality can vary at fast food joints depending on the specific location and management...” (Respondent 5)

“In my opinion, the quality of service at fast food is very good quality of service because their staff are agile in doing their work...” (Respondent 6)

“Fast food restaurants typically place a high priority on speed and convenience. For me, I would rather place their order while relaxing in their car, they frequently have a drive-through as well as indoor and outdoor seats...” (Respondent 7)

“About the services carried out in the fast-food joint, I could say that it is quite satisfying...” (Respondent 8)

“I think the services carried out in the fast-food joints have improved a lot. A good service will give a positive impression and excellent experience to the customers...” (Respondent 9)

“Fast-food joints offer quick and easy food services that cater to individuals who may not have the time or resources to prepare a meal themselves...” (Respondent 10)

“Generally, fast-food joints are known for providing quick and convenient services to customers. This is particularly appealing for people who are in a hurry and do not have much time to spare for a meal...” (Respondent 11)

“However, in general, it is important that the staff are courteous, efficient and provide quality customer service...” (Respondent 12)

All twelve (12) respondents agreed with the given query, which relates to the relationship between service quality and price quality inference. Many respondents agree that the service quality at Fast Food Joint is satisfactory and sanitary. This supports the literature review's conclusion about price quality, which is service quality.

Food Quality

Food quality demonstrates the prevalence of price-quality inference effects. Most teenagers are pleased with the food quality at quick food restaurants. The reason being the reasonable price. Most respondents who were interviewed expressed satisfaction with the service quality. According to Jun et al. (2017), customers desired nutritionally sufficient food. It is the responsibility of the service provider to utilize high-quality energy-supplying materials. The following is a transcript of a conversation from the interview.

“In my opinion “Excellent service, good menu, not too extensive. The food is excellent quality all around. They know how to make fries and their omelet sandwiches are the best...” Respondent 1)

“Based on my experience, the food is fast food, it is very satisfying. Besides, the quality of the food is great and worth it for me...” (Respondent 2)

“In general, fast-food franchises strive to maintain a consistent level of quality across all their locations, which is achieved through standardized food preparation methods, quality control measures, and regular training for employees...” (Respondent 3)

“The food at the franchise is nothing to complain about, as for my experiences the food that I ate at fast food restaurant are very good and I always repeat for it...” (Respondent 4)

“In my opinion, the food at the franchise was very good, especially “Nasi Lemak” MCD. Additionally, there are so many choices of food that I can choose there...” (Respondent 5)

“Personally, I think franchise food has a variety that is different from other types of food. I admit franchise food is much tastier than other food...” (Respondent 6)

“Fast food chains are renowned for providing a small selection of options that are quick...” (Respondent 7)

“Honestly, I enjoy the food at the fast-food joint and the food at the franchise is good and variety...” (Respondent 8)

“I think the food at the franchise provides a variety of choices. Different types of menus and first-class services are my top priorities...” (Respondent 9)

“The food quality at a franchise can vary based on the individual location, the menu options, and the preferences of the customers...” (Respondent 10)

“Some customers find the food to be delicious, with generous servings and good value for the price. Others may find the food to be average or below average in terms of quality or taste...” (Respondent 11)

“The quality of the food at Fast-Food Joint can also vary depending on the location and the specific items being ordered...” (Respondents 12)

All twelve (12) respondents agreed with the given query, which relates to the relationship between food quality. Many respondents agree that the food quality at Fast Food Joint is satisfactory and sanitary. This is because the quality of the food provided is satisfactory, the price is low, and it is delicious. This supports the literature review's conclusion about price quality, which is food quality.

Promotion

Advertising

Each quick food restaurant engages in advertising. With this advertising, they hope to attract consumers to their fast-food restaurants. This interview was conducted by us, and the response to advertising is provided below.

“Because I frequently consume fast food, my peers occasionally invite me to eat nearby. My sister once took me to a McDonald's nearby to sample the new. ” (Respondent 1)

“Fast food joints use various advertising tactics to promote their products and services to potential customers, such as television commercials, online ads, billboards, social media promotions, and more. These advertisements are designed to create brand awareness. ” (Respondent 2)

“In my opinion, advertising can make people come to fast-food joints. Advertising is a powerful tool that can help fast-food joints create brand awareness. ” (Respondent 3)

“The reason why I came to Fast-Food Joint is because of viral. It attracts me to try the new food or new menu that viral on the internet. ” (Respondent 4)

“The reason why I came to Fast-Food Joint is because when I scroll on my social media, it always appears an advertisement such as a new menu ” (Respondent 5)

“I go to fast food because the advertisement or marketing made it look appetizing and fast food is also on my visit ” (Respondent 6)

“It is possible that we came to the fast-food joint for a quick and convenient meal. Fast-food restaurants are known for their speed and accessibility ” (Respondent 10)

“It is possible that they came to Fast-Food Joint because it was nearby and convenient for them. It is also possible that they came for the specific food items offered by Fast-Food Joint that they enjoy. ” (Respondent 11)

“The reasons why someone chooses to visit Fast-Food Joint can be multifaceted. Some people may choose to visit for convenience, particularly if they are short of time and need a quick meal. ” (Respondent 12)

Nine (9) of twelve (12) respondents stated that they visited this quick food restaurant due to the advertisement. People visit quick food restaurants due to advertisements on television and on social media. However, three (3) respondents disagreed; they did not visit the quick food restaurant because of the advertisement. Consequently, most respondents support advertising. This proves that the Literature review is supported by evidence.

Sales Promotion

Sales promotion is a promotion run by fast food to attract customers. According to Cannon, et al. (2009), sales promotion is defined as promotional efforts that spur curiosity, experimentation, or purchases from end users or other channel participants in addition to advertising, publicity, and personal sales.

“That's correct, I also visited McDonald's because of a promotion. Because I have the McDonald's app installed, I occasionally receive discounts. ” (Respondent 1)

“Yes, sales promotions can inspire individuals to patronize fast-food restaurants. Sales promotions can also be effective in attracting new customers, ” (Respondent 2)

“Yes, sales promotions can make people come to fast-food joints. Sales promotions, such as discounts, coupons, or special deals, can be very effective in attracting..... ” (Respondent 3)

“The sales promotion makes anyone come to the Fast-Food Joint because people can get affordable prices especially for the food they like. ” (Respondent 4)

“Sales promotions can be effective in drawing in customers, as they offer discounts or deals that incentivize people to visit..... ” (Respondent 5)

“In my opinion, the sales promotion that is done is also one of the reasons why fast-food restaurants get quite good visitors today. ” (Respondent 6)

“Yes, using promotional offers draws people to fast food restaurants. Sales promotions, such as reduced rates, time-limited deals can generate excitement for me. ” (Respondent 7)

“The sales promotion makes people come to the fast-food joint. I think it is because whenever this franchise has a promotion, people are always exposed to it. Nowadays, people always have their phone in their hands. ” (Respondent 8)

“Sale promotion is an excellent marketing strategy to attract customers. For example, a special price on certain meals invites the customers to purchase the products or services. ...” (Respondent 9)

“It is possible that the sales promotion may entice some customers to come to the Fast-Food Joint. This is because customers are often attracted to special offers and discounts, which can make the Fast-Food Joint more appealing than its competitors. ” (Respondent 10)

“It depends on the effectiveness of the sales promotion. If the promotion is appealing enough to the target audience, it has the potential to attract customers to the Fast-Food Joint. However, if the promotion is unclear, uninteresting, or poorly executed, it may not have a significant impact on the number of customers visiting. ” (Respondent 11)

“Sales promotions can be a significant factor in driving customers to Fast-Food Joint. Promotions and discounts may offer a more significant incentive for customers who are price-conscious and may encourage them to visit more frequently. ” (Respondent 12)

All twelve (12) respondents visit fast food restaurants because of the sale. All respondents concurred that this sale promotion drove them to quick food restaurants. Therefore, this sales promotion supports the Literature review, as the interview we conducted prior to conducting the Literature review concurred with the Literature review.

DISCUSSION

There are various thoughts and views that have been collected during the interview of 8 Community in Pengkalan Chepa which specifically teenagers toward fast food consumption among teenagers in Pengkalan Chepa, Kelantan.

Trends

Based on this research, throughout the in-depth interview with the eight respondents, three main objectives have been addressed. The first objective is to explore the fast-food consumption among teenagers in Pengkalan Chepa, Kota Bharu. Based on the findings, it shows many contradictory trends. Most of them contradictory trends. For example, which was quoted by respondents 2.” Fast food is typically regarded as mainstream and lacking in authenticity, whereas hipster culture tends to value unique, artisanal experiences.” This is not supported by the statement fast food consumption among teenagers. Most respondents do not frequent fast food restaurants for the latest trends. They visit the quick food restaurant due to their hunger.

Sleeping Pattern

When the respondent was asked about sleeping pattern, similar answers were given by the respondent. The finding showed that of twelve (12) respondents only (11) respondents have

sleeping patterns of fast-food consumption among teenagers. People with disrupted or irregular sleeping patterns, such as those who stay up late or work night shifts, may experience late-night cravings for food. Fast food joints often remain open late or even 24 hours, making them convenient options for satisfying those cravings. This is supporting literature review because most respondents agreed with sleeping patterns.

Service Quality

The second objective that has been addressed is explore the price quality inference of fast-food consumption among teenagers. The respondent was asked about the service quality that can trigger fast food consumption. This study covered all respondents. All the respondents said the service quality is good and fast. For example, quote from respondents 3. "Fast-food joints are known for providing quick, convenient, and affordable food options to their customers. They usually offer a limited menu of standardized items that can be prepared and served quickly, allowing customers to get in and out of the restaurant within a short period of time..." All respondents supported service quality run by a fast-food joint. This is very important to discuss the service quality carried out by each fast-food joint.

Food Quality

The respondents were asked about the food quality that can be a predictor of fast-food consumption. This study discovered twelve (12) respondents were satisfied with the food quality provided by the fast-food joints. The cuisine at the fast-food restaurant is inexpensive, tasty, and varied. There are fast food restaurants on every continent, making quick food readily available. Quality ingredients, it was evident that this fast-food joint prioritizes the use of quality ingredients. The meats were of a noticeably higher standard compared to what one might expect from fast food. The chicken was tender and juicy, while the beef had a rich and robust flavor. Additionally, the cheese, sauces, and condiments complemented the overall taste profile, providing a satisfying and enjoyable dining experience. For example, quote from respondents 6. "Personally, I think franchise food has a variety that is different from other types of food." Therefore, this has demonstrated support for literature review.

Advertising

The last objective that has been addressed is to explore the promotion of fast-food consumption among teenagers in Pengkalan Chepa, Kota Bharu. This study discovered that of 12 respondents, 3 respondents did not agree with advertising for fast food. Meanwhile 9 respondents agree with going to fast food joints causes advertising. Advertising can be a significant factor in influencing consumer behavior and driving people to visit fast-food joints. Effective advertising campaigns can create awareness, generate interest, and entice individuals to try a particular fast-food restaurant. Advertising can showcase the menu items, highlight promotions or deals, and create a desire for the food being advertised. Aside from that, nine (9) respondents concurred with advertising; therefore, this advertising supports the literature review.

Sales Promotion

Respondents were asked about the sales promotion of Fast food is an important part of my thesis. This study discovered all respondents (12). All respondents understood the sales promotion conducted by the fast-food restaurant. Sales promotions, such as discounts, coupons, limited time offers, or combo deals, are designed to create a sense of urgency and incentivize customers to make a purchase. When a fast-food joint offers an appealing sales promotion, it can capture the attention of potential customers who may be enticed by the perceived value or cost savings. Sales promotions can be effective in attracting both new customers and

encouraging repeat visits from existing customers. The allure of a special deal or discount can motivate individuals to choose a particular fast-food joint over others, especially when they feel they are getting a good deal or saving money. This makes teenagers more interested because it saves them money. Therefore, this Literature review is supported because all respondents agree with the sale promotion.

RECOMMENDATION

Based on the research, most of the respondents disagree and are aware that prevalence of fast-food joints is not a trend. Other than that, there were a few respondents who agree that fast-food joints are a trend. Based on this research, most of the respondents support sleeping patterns because as teenagers they frequently stay up at night and easily feel hungry when studying. Those who feel hungry will order fast food because at late night most restaurants have been closed. It is recommended for teenagers to order fast food at night to help relieve stress while doing homework and studying. It also helps them to keep focused on doing their business.

Besides, based on the interview among all the respondents, the majority states that service quality can be defined as meeting or exceeding customers' expectations regarding delivery of service. They believed it is the major factors that involved service quality which is speed of service, cleanliness, staff friendliness, and overall customer experience

CONCLUSION

This study explored the fast-food consumption among teenagers in Pengkalan Chepa, Kota Bharu, Kelantan. The information on the respondents had gathered through 12 interviews via purposive sampling. The study indicated that personal lifestyle including trend, sleep pattern; price quality inference which is service quality and food quality, as well as promotion like advertising and sales promotion leads to fast-food consumption among teenagers in Pengkalan Chepa, Kota Bharu, Kelantan.

ABSTRACT

Society's culture and belief system play an important role in the perception of health, behavior and individual response to illness and treatment methods. Almost all societies in the world combine several methods in the treatment of a disease, especially the use of traditional and alternative treatment methods, as well as modern medicine. The issue of customer satisfaction with Traditional and Complementary Medicine is the most important obstacle to any medicine. A qualitative study was conducted to identify the factors that influence customers toward Traditional and Complementary Medicine in the community of Pengkalan Chepa, Kelantan. In-depth interviews were conducted with 8 respondents. The data obtained were analyzed using the content analysis method. The findings of the study show that the community in Pengkalan Chepa, Kelantan has a problem of satisfaction with this Traditional and Complementary Medicine. The findings of this study also show that the community of Pengkalan Chepa, Kelantan is aware of the importance of traditional and complementary medicine.

Keywords: *Traditional and Complementary treatment method, Factors that influence customers towards Traditional and Complementary Medicine Society in Pengkalan Chepa, Kelantan.*

INTRODUCTION

Traditional and Complementary Medicine Act 2016 (Act 775) defines traditional and complementary medicine practices as a form of practice related to health aimed at preventing, treating, or managing illness or disease or preserving the physical and mental well-being of individuals. Traditional medicines can be the "mainstay" of healthcare delivery in the "developing" world, particularly in remote or rural areas (WHO 2017). The use of complementary medicine (CM), defined as products and practices outside of the dominant medical paradigm, is popular in many parts of the world and is recognized as a significant public health issue by the World Health Organization. CM is broadly classified into one of two categories, mind-body practices (i.e. yoga, meditation) and natural products (i.e. vitamins, and herbal medicines) (Amie Steel et al., 2018). Traditional, complementary, and alternative medicine practices emphasize the holistic approach and include medicinal plants. Herbal medicines, as well as complementary and alternative medicine, are becoming more popular in industrialized countries for disease prevention and health maintenance (Bodeker et al., 2005).

SIGNIFICANCE OF THE STUDY

Industry

The importance of this study aims to explain the acceptance of Traditional and Complementary Medicine in the industry. Traditional medicine in Malaysia is unique because it has own history based on the diversity of heritage, culture, language, and race. The traditional and complementary medicine industry will be professionalized with the medical services being ensured to be safe, quality, and accessible to all. Committed to developing the field of traditional and complementary medicine, along with integrating it with the field of modern medicine.

Community

This research may aid in the delivery of healthcare to people. The use of Traditional and Complementary Medicine (TCM) in the community for illness prevention and treatment has grown in popularity. Along with modern medicine, traditional and complementary medicine may play a significant role in improving the health and quality of life of Malaysians in this nation's healthcare system.

Operator Traditional and Complementary Medicine

Besides that, in this study, Traditional and Complementary Medicine practitioners can also be improved in terms of service quality. This can be seen when every practitioner must be registered, recognized, and controlled to ensure that the services provided are safe. Therefore, the strategy that needs to be carried out to achieve objectives such as promoting traditional medicine training programs and complementing each other between domestic and foreign institutions.

LITERATURE REVIEW

Treatment Effects

Previous studies have shown that there are positive results obtained from traditional and complementary medicine such as acupuncture. The review included thirty studies, 93% of which demonstrated positive treatment effects of acupuncture in improving various aspects of sleep.(Daniel et al., 2017). Traditional Indian Medicine, or Ayurveda, has also contributed to the growing list of valuable compounds. Ancient remedies for nervous system disorders, including memory-related conditions like dementia, have been validated by the findings. Attempts have been made to conduct experimental studies on Ayurvedic medicine in order to better understand its effects on geriatric diseases such as Alzheimer's (M. Tateno et al., 2008). A study shows that the direct effect of cupping suction on the area increases local blood and lymph flow (David et al., 2002). Local increases in blood and lymph flow will help with local myofascial pain (Jafri MS., 2014).

Service Quality

In Malaysia, a national survey revealed that 21.5% of people had used T&CM services in the previous 12 months, and 29.3% had used T&CM services in some capacity over the course of their lifetime. Males in Malaysia reported using T&CM services 19.3% more often than females (23.9%), and the urban population used T&CM services at a higher rate (22.6%) than the rural population (18.2%). Currently, the private sector (primarily sole proprietors) dominates the provision of T&CM services in Malaysia, with the public sector playing a relatively small role. Malaysia reported that in 2014, T&CM services accounted for Ringgit Malaysia (RM) 2084 million in total out-of-pocket health spending (OOP), or 11.0% of all OOP spending at private health facilities. For the majority of T&CM services, the median OOP expenditure per person was less than RM 60.70 (Complementary Therapies in Medicine, 2019).

Knowledge of Treatment

The term "TCM products" refers to complementary and alternative medicine products, dietary supplements, herbal medicine, health supplement, vitamins, minerals, and natural products. TCM products have grown in popularity across the globe. TCM is thought to be used by hundreds of millions of people in the European Union (EU), with estimates ranging as high as 90% of the population in some countries (E. Ben-Arye et al., 2012).

Some oncology patients, as well as renal and liver transplant recipients, may use TM/CM products to improve the efficacy and side effects of conventional medications or to help improve their overall well-being (Foronczewicz et al., 2011).

Research Framework

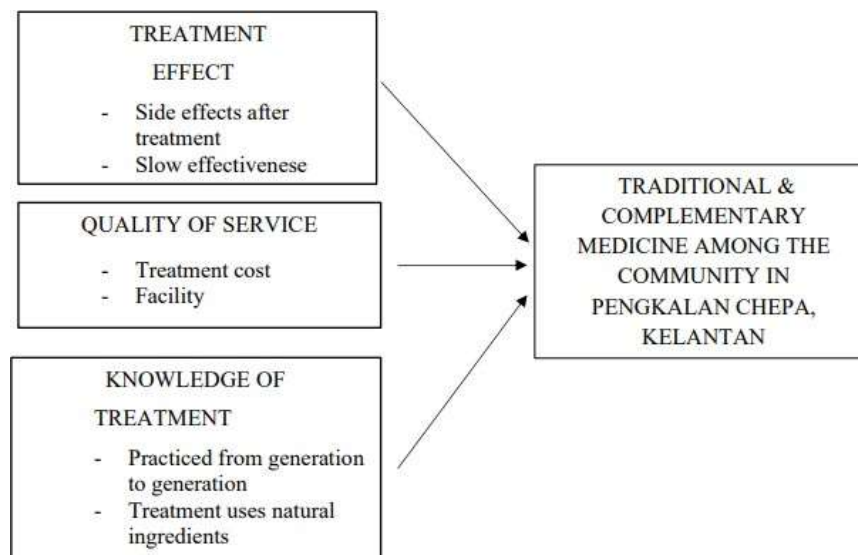

Figure 1 below shows the research framework used for this study.

It is discussed the factors that affect customer satisfaction with Traditional & Complementary Medicine in the community of Kelantan. The impact is due to treatment effects, quality of service, and knowledge of treatment.

METHODOLOGY

Research Design

This study employs qualitative data collection as a primary strategy for collecting respondent data, including the use of multiple data sources such as interviews and observations. The contents or formats of a research proposal vary depending on the needs of the assessment committee and are typically provided by the committee or the university (Devika et al., 2016). It was gathering qualitative data through methods such as interviews and observations, as well as guiding questions that could reveal the quality of a product. The interview questions will be open-ended to allow participants to fully express themselves (Gaudet & Robert, 2018).

The research is critical for linking data collection, analysis, and acquiring results and conclusions to determine the research's main objectives (Riley et al., 2015).

Data Collection

The interview is a method of collecting observations or measurements in a methodical manner. Interviews are a tried-and-true method of gathering qualitative data, with many advantages over other types of data collecting.

An interview can be conducted in either male or female voices, via a smartphone with a dependable cloud or hosted PBX system, or via video call. Because the interviewer can see body language, in man or woman method is appropriate.

In this study, the interview method was used for this research by obtaining respondents. We conducted face-to-face interviews to obtain information on customer satisfaction with Traditional & Complimentary Medicine in the community of Pengkalan Chepa, Kelantan.

Sampling

The researcher wants to identify customer satisfaction about Traditional & Complementary Medicine among the community at Pengkalan Chepa, Kelantan and only the study subjects who have used traditional & complementary medical services are selected as respondents.

Objective techniques are used to identify people who are dissatisfied with Traditional and Complementary Medicine.

Multiple embedded are used to determine customer satisfaction using TCM services among residents of Pengkalan Chepa. All respondents consist of 6-12 respondents from Pengkalan Chepa who have received TCM treatment.

Data Analysis

The data analysis process is the manner of gathering, analyzing, manipulating, and modeling facts to extract usable information, draw conclusions, and useful resource decision-making. All the interview transcripts from the respondents will appropriately be analyzed to seize the experience of the complete data.

In addition, the data analysis process included thematic analysis. Thematic analysis refers to analysis that usually involves qualitative analysis methods that include reading through data sets (such as transcripts from interviews) and identifying patterns of meaning across the data, especially to obtain themes. The thematic analysis began by searching for data coding based on the objective of the study explores the treatment effects, quality of the service and the knowledge of treatments among the community in Pengkalan Chepa, Kelantan.

FINDINGS

In this study, the researcher chooses purposive sampling which is a type of non – probability sampling technique. Purposive sampling is a means that the researcher used their own decisions about respondents to choose and picks those who best suit the purpose of the study and chooses 8 teenagers from Pengkalan Chepa.

Treatments Effect

i. Side Effects After Treatments

One of the prevalences of TCM treatment effects is shown by side effects after treatment. Most spa clients have no side effects while some spa clients have side effects. From the interviews conducted, most respondents stated that they did not have such severe side effects. Below are part of the conversation involved from the interview.

“After receiving this treatment, I did not experience any harmful side effects and my body felt lighter ..” (Respondent 1)

“I have had no side effects after receiving this treatment.” (Respondent 2)

“After doing this chiropractic treatment, I feel relieved and not tired anymore. I have not experienced any side effects.” (Respondent 3)

“I did not experience harmful side effects after doing this cupping treatment ..” (Respondent 4)

“After receiving this cupping treatment, I did not experience any harmful side effects .. ” (Respondent 7)

Five (5) out of eight (8) respondents mentioned that they have no side effect after treatments towards Traditional & Complimentary Medicine (TCM). Generally, traditional and complementary medicine appears as a safe treatment and doesn't have a side effect. Most people feel relaxed and release their tension after treatment. However, some people shouldn't have the treatments of traditional and complementary medicine such as digestive issues.

ii. Slow Effectiveness

Another prevalence of Traditional & Complimentary Medicine (TCM) is related to slow effectiveness. The effectiveness of TCM may depend on several factors, including the type and severity of the condition being treated, the individual's overall health, and the specific TCM treatments being used (Lipton et al., 2017). Below are part of the conversation involved in the interview.

“After receiving this treatment, my body is less painful and no longer has inflammation. Its effectiveness takes a relatively short time to heal.” (Respondent 2)

“My body feels better than before the treatment. Shoulders and neck feel comfortable and no longer tense. The whole body feels lighter and more comfortable ..” (Respondent 3)

“After this treatment, my body feels lighter and more energetic.” (Respondent 4)

“I have done this treatment more than three times. This is because it makes my body feel lighter and more comfortable ..” (Respondent 5)

“For me, this treatment is effective for my body because after doing this treatment, my body feels lighter and fitter..” (Respondent 6)

“After doing this treatment, my body feels relieved and lighter. It has a positive effect on my body.” (Respondent 7)

“After performing this treatment, my body feels effectiveness relieved and comfortable. The moaning I experienced is gone..” (Respondent 8)

Seven (7) out of eight (8) respondents mentioned that Traditional & Complimentary Medicine (TCM) have effectiveness on their body. Traditional and Complementary Medicine (TCM) treatments often involve the use of natural remedies and therapies to help the body heal itself. While TCM treatments can be effective for many people, they may not work as quickly as conventional Western medicine.

Service Quality

i. Treatment Cost

The cost of Traditional and Complementary Medicine (TCM) treatment can vary widely depending on the type of treatment, the practitioner, and the location. There are many respondents who agree that the cost of the treatment provided at the spa is very worthwhile and the price is reasonable. Below are part of the conversation involved from the interview.

“ The service here is very worth the price offered .. ” (Respondent 1)

“ For me, the service provided is worth the price offered. I am very satisfied with the service and hospitality provided ..” (Respondent 2)

“The price offered is reasonable with the service provided. I have had treatment here twice ..” (Respondent 3)

“ For me the price offered is reasonable. It's not expensive and it's standard for me ..” (Respondent 4)

“ I am satisfied with the cupping treatment here because it is effective for my body. ” (Respondent 5)

“ The price offered is also quite cheap and reasonable ..” (Respondent 6)

“The price of this treatment for me is reasonable with the service provided .. ” (Respondent 7)

“ The price of body massage treatment here is reasonable. It is not expensive for me .. ” (Respondent 8)

All eight (8) respondents agreed with the given question which are treatment cost of the TCM is affordable. In general, TCM treatments tend to be cheaper than conventional Western medical treatments, although this may not always be the case.

ii. Facility

One of the customer satisfaction towards Traditional & Complimentary Medicine (TCM) is shown by the facility provided by the Spa. A spa should be in a good location, comfortable and at the same time not cause any damage or danger to health or be close to a place of worship. Below are part of the conversation involved from the interview.

“The equipment provided is very sufficient with good treatment for me and my baby.” (Respondent 1)

“The equipment provided in this spa is quite good. The rooms and massage beds provided are very comfortable ..” (Respondent 2)

“The rooms provided are also comfortable. The treatment equipment is also complete and safe to use ...” (Respondent 3)

“The equipment provided is also complete and the treatment place is also comfortable and clean.” (Respondent 4)

“The tools used are also safe and clean. The rooms and beds provided are also very comfortable and the environment is clean and tidy.” (Respondent 5)

“The treatment rooms and beds provided are also comfortable and clean.” (Respondent 6)

“Equipment for treatment is well prepared. The treatment room and bed are comfortable.” (Respondent 7)

“The treatment room and beds provided are also comfortable. The room is not very spacious but it is quite comfortable ..” (Respondent 8)

All of the eight (8) respondents are very satisfied with all the facilities provided by the spa. The Spa area must also have sufficient lighting to carry out a service and have an adequate ventilation system for the comfort of customers who come to get services.

Knowledge of treatment

i. Practiced from generation to generation

Practiced from generation to generation is one of the big predictors of Traditional & Complimentary Medicine (TCM). Traditional and Complementary Medicine (TCM) encompasses a range of healing practices that have been passed down from generation to generation in many cultures around the world. Below are part of the conversation involved from the interview.

“I found out about the services here through my sister who used to get treatment here..”

(Respondent 1)

“I found out about the treatment and services here through my son. My daughter used to get treatment here ..” (Respondent 3)

“I found out about the treatment and services here through my son. My daughter used to get treatment here. My daughter has a painful and crooked spine ..” (Respondent 4)

“I found out about the cupping treatment here through my neighbor..”

(Respondent 7)

Four (4) out of eight (8) respondents still practice this TCM from generation to generation. Traditional & Complimentary Medicine is a type of medicine or treatment inherited from our ancestors and inherited from one generation to another. This TCM is specific to the Malays and is more typical based on certain areas. It also different from the medicine practiced today because this type of medicine was used at the time specifically with the purpose of health care and suitable for a certain community.

ii. Treatment uses natural ingredients

The treatment uses natural ingredients that have also been identified on Traditional & Complimentary Medicine. One of the key principles of Traditional and Complementary Medicine (TCM) is the use of natural ingredients to promote healing and balance in the body. Below are part of the conversation involved in the interview.

“The spa uses completely natural ingredients in its treatments such as herbal oils for massage. This spa also uses their own products which are traditional herbs for various internal problems produced 100% from organic herbs ..” (Respondent 1)

“This spa makes full use of natural ingredients in this treatment by using herbal oils”
(Respondent 2)

“This spa also uses completely natural ingredients in the treatment by using herbal oils produced from trees.” (Respondent 3)

“In this treatment, the spa not only uses cupping tools, it also uses organic ingredients such as olive oil.” (Respondent 4)

“In addition to using cupping tools, this treatment also uses an organic material which is the original *but-but* oil (HPA Oil).” (Respondent 5)

“In this treatment, the spa uses only herbal oils for massage. No other drugs and no needles or other tools. It's just a sequence.” (Respondent 6)

“This cupping treatment uses cupping tools such as knives, needles, cups and several other tools. This treatment also uses organic ingredients such as olive oil.”
(Respondent 7)

“For the massage performed by this spa, only traditional massages and herbal oils and the spa's own products are used. The ingredients used for massage oil are only natural ingredients..” (Respondent 8)

All of eight (8) respondents said that the treatment used natural ingredients. Many TCM treatments utilize herbs, plants, and other natural substances to create remedies and therapies that are believed to have medicinal properties. Some common natural ingredients used in TCM treatments include herbal remedies, cupping, massage therapy and acupuncture.

DISCUSSION

There are various thoughts and views that have been collected during the interview of 8 Community in Pengkalan Chepa which specifically teenagers toward fast food consumption among teenagers in Pengkalan Chepa, Kelantan.

Side Effects After Treatments

Based on this research, throughout the in-depth interview with eight respondents, three main objectives have been addressed. The first objective is the effect of the treatment. Based on the findings, it shows the side effects after treatment in most respondents. Most of them have no side effects after treatment. For example, which was quoted by respondent 1, "After receiving this treatment, I did not experience any harmful side effects and my body felt lighter and I was able to exercise a lot after the massage." This is supported by the statement Traditional & Complementary Medicine appears as a safe treatment and doesn't have side effects. Most people feel relaxed and release their tension after treatment. (Tabish, S. A. (2008).

Effectiveness

When the respondents were asked about the effectiveness, similar answers were given by the respondents. The finding showed that of eight (8) participants have effective treatment of TCM. Traditional & Complementary Medicine (TCM) treatments often involve the use of natural remedies and therapies to help the body heal itself. While TCM treatments can be effective for many people, they may not work as quickly as conventional Western medicine. The effectiveness of TCM may depend on several factors, including the type and severity of the condition being treated, the individual's overall health, and the specific TCM treatments being used. Some TCM treatments, such as acupuncture or massage therapy, may provide immediate relief for certain symptoms, while others, such as herbal remedies, may take longer to take effect. It's important to note that TCM treatments often take a more holistic approach to treating health conditions, meaning that they may focus on treating the underlying causes of the condition rather than just treating the symptoms.

Treatment Cost

The second objective that has been addressed is the service quality of Traditional & Complimentary Medicine. The respondents were asked about the treatment cost that can trigger TCM. This study covered 8 respondents, all of the respondents said that TCM is affordable price with treatment. The cost of Traditional and Complementary Medicine (TCM) treatment can vary widely depending on the type of treatment, the practitioner, and the location. In

general, TCM treatments tend to be less expensive than conventional Western medicine treatments, although this may not always be the case. If you're interested in exploring TCM treatment options, it's a good idea to research practitioners in your area, compare costs and services, and check with your health insurance provider or employer to see if TCM treatments are covered.

Facility

The respondents were asked about the facility that can be a predictor of Traditional & Complimentary Medicine. This study discovered eight respondents and all the respondents were satisfied with all facilities provided by the spa. A spa should be in a good location, comfortable and at the same time not cause any damage or danger to health or be close to a place of worship. If the Spa in question operates in the same building where other businesses operate, the Spa area must be marked and labeled clearly (clearly specified) and each area must meet the service standards that have been set. Areas for massage services must not be hidden or obscured. All areas inside and outside the Spa should always be clean and tidy. In addition, the Spa area must also have sufficient lighting to carry out a service and have an adequate ventilation system for the comfort of customers who come to get services. The spa supervisor must provide a clinical waste management system that complies with established standards, ie any waste contaminated with blood or body fluids must be disposed of in a biohazard plastic bag.

Practices from Generation to Generation

The last objective that has been addressed is the knowledge of the treatment that affects customer satisfaction of Traditional & Complimentary Medicine. This study discovered from 8 respondents, 4 respondents have practices from generation to generation of Traditional & Complementary Medicine (TCM). Traditional and Complementary Medicine (TCM) encompasses a range of healing practices that have been passed down from generation to generation in many cultures around the world. These practices often involve the use of natural remedies and therapies to promote healing and balance in the body. In many cases, TCM practices have been developed over hundreds or even thousands of years, with knowledge and techniques passed down through families and communities. For example, traditional Chinese medicine, one of the most well-known forms of TCM, has been practiced for over 2,500 years and has evolved over time to incorporate new knowledge and techniques. Other forms of TCM, such as Ayurvedic medicine from India or traditional healing practices from Africa, have

similarly been passed down through generations and may have different techniques and remedies specific to their cultural traditions. The transmission of knowledge and practices in TCM often involves an apprenticeship model, where a master practitioner passes on their knowledge and techniques to a younger apprentice.

Treatments Use Natural Ingredients

Respondents were asked about the treatments use natural ingredients of Traditional & Complementary Medicine (TCM) is an important part of my thesis. This study discovered from 8 respondents,8 respondents understood the ingredients used by the therapist is very safe to use. One of the key principles of Traditional and Complementary Medicine (TCM) is the use of natural ingredients to promote healing and balance in the body. Many TCM treatments utilize herbs, plants, and other natural substances to create remedies and therapies that are believed to have medicinal properties. Some common natural ingredients used in TCM treatments include herbal remedies, acupuncture, massage therapy and cupping therapy. It's important to note that while natural ingredients used in TCM treatments may be effective for certain health conditions, they can also have side effects and may interact with other medications or health conditions. It's important to always discuss any TCM treatments with a qualified practitioner and to disclose any other medications or health conditions you may have.

RECOMMENDATION

This study makes a few recommendations based on the findings. It is related to the government's action plans. International awareness-raising actions can help national and local initiatives by giving direction and information resources that can be customized to improve the effectiveness of local campaigns. Information campaigns are an important aspect of creating awareness. Target audiences such as the general public, health experts, social workers, and potential users should be identified before initiating a campaign.

Furthermore, the Ministry of Tourism, Arts, and Culture (MOTAC) must oversee skilled TCM treatments in Malaysia in terms of practitioner credentials and certificates to ensure that the treatments done are safe and effective for consumers who come for treatment. This is critical in order to give successful TCM treatment to clients

In addition, TCM treatment practitioners can integrate into hospitals to increase customer happiness and the quality of TCM treatment services since it helps to know more about the precautions in managing clients according to the processes to treat them.

CONCLUSION

This study aims to examine customer satisfaction with Traditional Complimentary and Medicine (TCM) treatment in Pengkalan Chepa, Kelantan. This research found customer satisfaction in terms of treatment effectiveness, quality of service and customer knowledge of the treatment performed. Data was collected face-to-face using semi-structured interviews among five TCM spas in Pengkalan Chepa Kelantan. This uses purposive sampling and snowball sampling in five TCM spas. Purposive sampling is a spa located in Pengkalan Chepa and the snowball is a customer who seeks treatment at the spa to meet. The data collected from the interviews were analyzed using Thematic Analysis which started familiarizing the data, general start code, finding a theme, reviewing themes, defining and naming themes and generating reports.

UNHEALTHY LIFESTYLE AMONG YOUTH IN KEDAH AND JOHOR

NORAINA NAJIWA BINTI ASFULRIZAL

NORAMIRA HANUM BINTI MOHD NASIR

NUR FARISHA ELYANA BINTI MOHAMAD ASRI

NUR HASNA ZAHIRAH BINTI MOHD ZAKI

ABSTRACT

The present study aimed to assess the association between smoking, short and insufficient sleep, lack of exercise and unhealthy lifestyle among young in Kedah and Johor. A web-based survey was given at Kedah and Johor, with 384 youth responding. The findings support the study's hypotheses that smoking, short and insufficient sleep and lack of exercise substantially impact the unhealthy lifestyle of youth in Kedah and Johor. Therefore, future research should confirm these findings using larger sample size and moderating variables.

Keywords: Unhealthy Lifestyle, Smoking, Short and Insufficient Sleep, Lack Of exercise, Youth in Kedah, and Johor

INTRODUCTION

The research being conducted seeks to investigate the factors that contribute to an unhealthy lifestyle among Kedah and Johor's youth. There is evidence that risk factors are responsible for most noncommunicable diseases, which account for one-third of total mortality. Psychosomatic health problems (PHP) are more prevalent among youth who engage in hazardous lifestyle behaviours. The primary predictors of psychosomatic health complaints are hazardous behaviours, inactivity, obesity, poor body image, low self-esteem, a negative perception of health, a diminished sense of coherence, problematic internet use, online gaming for escape purposes, and perceived psychosocial stress. According to the World Health Organisation (WHO), a hazardous lifestyle is characterised by physical inactivity, smoking, a sedentary lifestyle, and alcohol consumption.

In Malaysia, the most prevalent unhealthy lifestyle factor was a lack of regular exercise (33.1%), followed by smoking (6.5%) and excessive alcohol consumption (6.1%). Smoking was associated with a slight increase in the incidence of atrial fibrillation, whereas excessive alcohol consumption did not result in a statistically significant increase. With a prevalence of 23.1% in Malaysia, smoking is the most significant factor of a harmful lifestyle. An unhealthy lifestyle is associated with inactivity, smoking, alcohol consumption, heart disease, obesity, high blood pressure, elevated cholesterol, and type 2 diabetes. Sleep is a risk factor as well.

There were some objectives of this research:

- i. To determine the factors of smoking related to unhealthy lifestyles among youth in Kedah and Johor.
- ii. To examine relationship between short sleep and lifestyles among youth in Kedah and Johor.
- iii. To investigate the relationship between lack of exercise associated with unhealthy lifestyles among youth in Johor and Kedah.

SIGNIFICANCE OF THE STUDY

This study contributes to body knowledge by providing a full understanding of the reasons for unhealthy lifestyle among young in Kedah and Johor by its elaborative literature analysis and empirical data. Second, it improves the researcher's ability to gain a deeper understanding of the factor of unhealthy lifestyles among youth in Kedah and Johor. Unhealthy eating habits are one of the health concerns that can lead to chronic illnesses and death in a person's later years. Aside from the foregoing, the empirical findings of the study will serve as guidelines for Malaysian policymakers in the health and wellness sector. Finally, this study provides guidance for future research in the field of unhealthy lifestyles.

LITERATURE REVIEW

UNHEALTHY LIFESTYLE

A bad lifestyle, on the other hand, could transform a robust individual into a patient. It is a lifestyle characterized by health-damaging behaviors such as skipping breakfast or eating too much or too quickly, drinking too much, or spending too much time in front of the television, smoking, not exercising, eating unhealthy foods, and failing to maintain a healthy weight. In addition, you

are perpetually exposed to thousands of chemicals at work, at home, in the air, and in the food you eat. More than ever, you consume processed and hurried foods. You regularly abuse your body with unnecessary medications (Johnsen, N., 2018).

Cluster headache is among the most excruciating medical conditions known to man. Extreme episodes of unilateral periorbital pain are accompanied by agitation and autonomic symptoms of the head. Observational studies have revealed that cluster headache sufferers have poor lifestyle factors. The most frequently reported problems are excessive smoking and harmful alcohol consumption (Steinberg, 2018). Due to the close association between cluster headaches and smoking, it has been suggested that smoking may play a role in cluster headache onset. In contrast, it has been argued that patients with cluster migraines have psychological characteristics that make them more prone to making poor lifestyle decisions. Men with cluster headache were found to consume more illegal substances, such as cannabis and cocaine, than controls, whereas women showed no difference (Fourier, 2018).

SMOKING

People recognize that, from their own perspective, many people do not embrace a healthy lifestyle due to attitude components of personal, social, and family history, according to Majabadi et al. (2016). This is due to the high number of people who do not live a healthy lifestyle in their daily lives because of external environmental variables that affect them rather than their internal demands and desire to live a healthy lifestyle. As a result of health concerns and ailments, most people adopt harmful lifestyle patterns. For example, 38.7% of smokers who attempted to quit smoking in the previous 12 months, as well as 26.6% of smokers who suffered serious illness in 2018, are concerned about their future health.

SHORT AND INSUFFICIENT SLEEP

Sleep patterns, such as regenerative and undisturbed sleep, sleep onset latency, or how long it takes the person to fall asleep, the number of awakenings during the night, or how many times the person wakes up during the night, and fatigue during daytime concentration, all reflect a person's sleep quality. Insufficient sleep-in youth were identified as a serious health risk in a joint resolution sponsored by the American Medical Association and the American Academy of Sleep Medicine in 2010. Furthermore, one of the objectives for Sleep Health, a new topic in Healthy People 2023, is to reduce adolescent sleep loss: "SH-3: Increase the proportion of students in grades 9–12 who get enough sleep" (defined as ≥ 8 hours). Inadequate sleep has been associated with a variety of unfavorable consequences in adolescent health, including physical and mental

health, as well as academic success. Inadequate sleep duration is linked to various cardiometabolic risk factors in children and youth, including dyslipidemia, glucose homeostasis, and high blood pressure, according to Owens J (2014)

LACK OF EXERCISE

Morning, evening, and night activities are encouraged, whereas afternoon sports are discouraged, according to the National Sports Institution (2016). Morning exercise can create a sense of freshness, burn excess fat, enhance energy, and deliver continual calorie burning. Exercising in the morning can burn 420 calories of energy, with an additional 190 calories expended even if you do not move again that morning. This will increase your energy and fitness level, allowing you to participate in a variety of activities later on. If you are unable to exercise first thing in the morning, The National Sports Institution recommends that you exercise in the evenings and at night. Evening and evening sports can aid in the reduction of brain stress and the improvement of physical fitness. One of the reasons Malaysians are at danger of metabolic syndrome, according to Dr Lim Kien Chien, Clinical Cardiologist at the National Heart Institute, is a lack of exercise and bad eating habits.

Research Hypothesis

In this study, there were four hypotheses related to identify unhealthy lifestyle among youth Kedah and Johor.

H1: There is significant relationship between impact of smoking related to media social and unhealthy lifestyle among youth in Kedah and Johor.

H2: There is significant relationship between short sleeps factor can give negative impact and unhealthy lifestyle among youth in Kedah and Johor.

H3: There is significant relationship between lack of exercise associated to unhealthy lifestyle among youth in Kedah and Johor.

Research Framework

A research framework was developed to investigate the relationship between factor and unhealthy lifestyle among youth in Kedah and Johor. The dependent variable is an unhealthy lifestyle among Kedah and Johor youngsters. The proposed independent variable consists of three factors: smoking, short sleeps, and lack of exercise.

Figure 1: Research Framework of Unhealthy Lifestyle Among Youth in Kedah and Johor.

METHODOLOGY

Research Design

In this research, a quantitative approach was used. As study design, descriptive research design was utilised.

Data Collection

The data collection method was an online questionnaire. 384 adolescents in the Malaysian states of Kedah and Johor were administered a questionnaire via a Google form. The questionnaire is divided into five sections: socio-demographic, unhealthy lifestyle, smoking, brief and insufficient sleep, and lack of exercise.

Sampling

In this research, a sampling method based on convenience was used. Convenience sampling is a non-probability method for selecting study participants.

Data Analysis

For data analysis in this investigation, reliability tests, descriptive analysis, and Pearson Correlation were performed. Using Pearson Correlation, the coefficient relationship between variables was determined. During data analysis, the most recent version of the Software Package for Social Science (SPSS), Statistic 26, was utilised.

FINDINGS

I. DESCRIPTIVE

The socio-demographic of respondents were shown in the Table 1.1. The average gender frequency of respondents is female was 57%. The average by occupational frequency of respondents is students was 77.6%. Majority of respondents that we get were age around 22-24 with 70.3%, meanwhile for the educational level youth with degree is 77.6% and the youth come from Kedah with 38.5%.

Table 1.1: Socio-demographic characteristics of respondents

Socio-demographic characteristic	Frequency (n)	Percentage (%)
Gender		
Female	219	57
Male	165	43
Occupational		
Student	19	77.6
Working	298	17.4
Not working	67	4.9
State		
Johor	147	38.3
Kedah	148	38.5
Others	89	23.2
Level Education		
Degree	294	76.6
Master/ PHD	14	3.6
SPM	37	9.6
Diploma/STPM/STAM/ Foundation	39	10.2
Age		
18-21	73	19.0
22-24	270	70.3
25-28	41	10.7

This research examined the relationship between smoking, short and insufficient sleep, and lack of exercise to unhealthy lifestyle among youth in Kedah and Johor. The questionnaire consisted of 29 questions and 348 respondents answered through Google Form. The results showed that the unhealthy lifestyle correlation was 0.477, suggesting a significant positive impact between unhealthy lifestyle to smoking on social media among youth in Kedah and Johor. Studies found that people who saw social media containing tobacco content were more likely to report using tobacco and more likely to use it in the future. Short sleeps factor had a negative impact on unhealthy lifestyle among youth in Kedah and Johor, with a correlation of 0.510 suggesting a positive significant impacts.

Adequate and required sleep is 8 hours each day. Sleep duration and quality are essential for physical and mental health. Lack of exercise is associated with an unhealthy lifestyle among youth in Kedah and Johor, with a positive significant impact. Being physically active can improve brain health, manage weight, reduce risk of disease, strengthen bones and muscles, and improve ability to do everyday activities.

Table 1.2: The relationship between smoking, short and insufficient sleeps, and lack of exercise with unhealthy lifestyle among youth

Impact unhealthy lifestyle	P-value	(95% CI) (Lower)	(95% CI) (Upper)
Smoking	0.477	0.467	3.447
Short and insufficient sleeps	0.510	0.634	3.914
Lack of exercise	0.316	0.629	4.047

DISCUSSION AND RECOMMENDATION

This topic is very interesting to study. There are some recommendations for prospective researchers so that they can better comprehend the relevant research field. First, the respondent type can be altered to be open to all groups and the entirety of Malaysia. This can assist us in determining the relationship between adolescent knowledge, awareness, and attitudes regarding the effects of unhealthy lifestyles. These studies found that there is a greater consensus that people are aware that smoking is harmful. Researchers analysed

29 previously published studies and found that those who saw tobacco-related content on social media were more than twice as likely to report using tobacco and more likely to use it in the future compared to those who never saw it. It is essential to ensure that social media marketing has a significant impact on consumer behaviour and awareness, especially when attempting to combat a habit such as smoking. Social media marketing plays a significant role for residents and societies when a campaign with effective content is directed to transform consumer behaviour and encourage it to adopt new behaviours.

Furthermore, these studies have revealed that participants are aware that 8 hours of sleep per day is the minimum necessary for quality rest. Length and quality of sleep are essential for physical and mental health. For cancer patients, adequate sleep duration of 7-8 hours is required for physical strength, diurnal vitality, and immune enhancement. The quality of sleep, which refers to the duration and efficiency of slumber, is another crucial factor. Numerous pharmacological and non-pharmacological therapy options are available for enhancing the quantity and character of sleep.

In addition, there was a significant correlation between dearth of exercise and an unhealthy lifestyle among Kedah and Johor youth. Clearly, daily exercise is required to increase our stamina and defend our health from disease. Being physically active can improve mental health, aid in weight management, reduce disease risk, strengthen bones and muscles, and enhance your ability to perform daily tasks. Some health benefits accrue to adults who sit less and engage in any quantity of moderate-to-vigorous physical activity.

CONCLUSION

The aim of this study was to determine the impact that influenced unhealthy lifestyle among youth in Kedah and Johor. In this study unhealthy lifestyle was influenced by lack of exercise youth among Kedah and Johor. The results shows there was association between unhealthy lifestyle and lack of exercise. In conclusion, the finding of this study proven that there was association between lack of exercise and unhealthy lifestyle among youth Kedah and Johor.

ABSTRACT

Purpose: To review the factors that influence sleep quality among students Universiti Malaysia KELANTAN (UMK), City Campus.

Method: A cross-sectional study was conducted among FHPK students at Universiti Malaysia Kelantan, City Campus. The sociodemographic data were obtained from a simple random sampling that take 365 of random students, age range from 18 to 30 years and above, including both genders. All participants completed six sections of questionnaires. A questionnaire was evaluated to identify the quality of sleep among students at Universiti Malaysia Kelantan, City Campus. Analyses were conducted with Statistical Package Social Sciences (SPSS) version 26.

Result: There are many studies that have been identified to be classified according to the investigated factors of sleep quality. Physical factors and lifestyle are healthy factors that improve sleep quality, while mental health and social factors reduce sleep quality.

Conclusion: University students are exposed to different risk factors for sleep quality. When designing interventions to improve sleep quality among university students, each of these factors needs to be addressed.

Keywords: Quality Sleep, Lifestyle, Mental Health, Social, and Physical Factors

INTRODUCTION

According to research, sleep is a crucial mental state for preserving vitality and regaining physiological function. The quality of sleep has a significant influence on health and is regarded as a major public health issue. (Ruiz-Zaldibar et al., 2022). According to (Nelson et al., 2022), there are five factors that influence sleep quality which are sleep disruption, actual sleep, or how long it takes for someone to go from being awake to falling asleep, sleep duration in 24 hours, and waking after sleep onset, or how long it takes for someone to become fully awake. This proportion of total sleep time to total time in bed is known as sleep efficiency.

A good night's sleep is a good measure of one's overall health, including both mental and physical well-being. However, studies have shown a link between inadequate sleep quality, as indicated by a bad subjective sense of sleep, sleep start timings, shorter sleep, and difficulties balancing sleep and daily activities, and psychiatric disorders like stress, panic, and cognitive challenges, as well as decreased physical health, premature aging, and lower productivity at work (Chandler et al., 2022).

There were four objectives of this research:

1. To identify the relationship between lifestyle and sleep quality among students at Universiti Malaysia Kelantan, City Campus.
2. To analyze the relationship between mental health and sleep quality among students at Universiti Malaysia Kelantan, City Campus
3. To analyze the relationship between social factors and sleep quality among students at Universiti Malaysia Kelantan, City Campus
4. To identify the relationship between physical factors and sleep quality among students at Universiti Malaysia Kelantan, City Campus

Significance Of the Study

The purpose of this study is to shed new light on this evidence through an investigation of the relationship between lifestyle, mental health, social factors, physical factors, and quality of sleep among university students. The health authorities will also play an appropriate role as

this study has opened the minds and opportunities for the food industry as well as the public to do detailed research based on the factors available to serve as a guide in the study.

LITERATURE REVIEW

Sleep Quality

According to Nelson, Davis, and Cobbert (2021), a person's satisfaction with each aspect of their sleep experience determines the quality of their sleep. The four elements of restful sleep are sleep efficiency, sleep latency, sleep length, and awakening after sleep begins. Sleep quality and outcomes for both physical and mental health are strongly correlated. Due to both biological and social factors, a person's sleep quality changes over the course of their life.

This sleep latency represents the amount of time it takes you to fall asleep. If you fall asleep in 30 minutes or less when you go to sleep, your sleep is probably of high quality. Sleep latency, sometimes referred to as sleep onset latency, is the length of time it takes for someone to fall asleep after turning out the lights. A healthy person typically needs between 10 and 20 minutes to fall asleep. Sleep latency below eight minutes is quite brief, even though every person's sleep pattern is different (Pacheco, 2022).

Lifestyle

One of the key elements affecting students' sleep quality is lifestyle. According to the WHO, lifestyle factors account for 60% of the variables affecting a person's health and quality of life. This is because smoking and alcohol drinking, participating in physical activities, unhealthy eating habits and excessive media habits affect the sleep quality of students every day. Excessive media use habits are also related to unhealthy lifestyles. Young people's addiction to social media is a significant problem that has had devastating outcomes. While regularly using a smartphone and monitoring social media is acceptable, excessive use reduces efficiency (Simplilearn, 2022).

Mental Health

Mental health is one potential element that might have an impact on the quality of sleep that University of Malaysia Kelantan (UMK), City Campus students get. According to WHO Director-General Dr. Tedros Adhanom Ghebreyesus, the 13th General Programme of Work (GPW13), which covers 2019–2023, has designated mental health for immediate implementation. Acting now will help communities and individuals achieve the highest degree of health, which is only possible when people's rights are upheld, their mental health and well-

being are guaranteed, and their mental health is given the attention it deserves. This is so that everyone can have the best possible mental health and well-being (WHO Special Initiative for Mental Health, 2022). According to a recent survey by The American College Health Association, 36% of all students are mentally weary in 2019, despite the fact that 36% of Americans attend institutions. For instance, a study conducted by Jizan University in Saudi Arabia on medical students revealed that stress was common (71.9%), with women reporting higher levels of stress than men (64%), on average.

Social Factor

Social factors are one of the possible variables that might affect the quantity of sleep among students at Universiti Malaysia Kelantan (UMK), City Campus. Social determinants of health include factors including socioeconomic status, education, access to healthcare, and physical and occupational conditions. Social issues that are associated to health must be addressed if health is to improve and persisting inequities in health and healthcare are to be reduced (Artiga & Hinton, 2018).

Physical Factor

Physical factors are one of the key elements that affect how well students at Universiti Malaysia Kelantan's City Campus sleep. Pain is defined as an unpleasant feeling, such as one that throbs, aches, or pinches. Pain can lower the quality of your sleep by making it harder for you to fall asleep or causing you to wake up in the middle of the night. The most common causes of suffering include arthritis, backaches, and neck pain. If you experience pain that keeps you from falling asleep, invest in a mattress with the highest level of support so that your spine maintains a healthy alignment. Proper spine alignment is one of the best ways to prevent pain from arising or escalating. Joint discomfort is a prevalent symptom of arthritis. In light of this, a mattress with pressure-relieving materials like memory foam ought to be advantageous for them (Zwarenstejn, 2022).

Research Hypothesis

There were four hypotheses in this study that tried to identify the factors influencing students at Universiti Malaysia Kelantan's City Campus's quality of sleep.

Hypothesis 1: There is a significant relationship between lifestyle that influence sleep quality among student in Universiti Malaysia Kelantan, City Campus.

Hypothesis 2: There is a significant relationship between mental health influencing sleep quality among students at Universiti Malaysia Kelantan, City Campus.

Hypothesis 3: There is a significant relationship between social factors that influence sleep quality among university students at Universiti Malaysia Kelantan, City Campus.

Hypothesis 4: There is a significant relationship between physical factors that influence sleep quality among university students at Universiti Malaysia Kelantan, City Campus.

Research Framework

To explore the relationship between lifestyle, mental health, social factors, and physical factors towards sleep quality among students at Universiti Malaysia Kelantan, City Campus, a research framework has been provided. The independent variables are lifestyle, mental health, social factors, and physical factors. The dependent variable is sleeping quality among student universities in Universiti Malaysia Kelantan, City Campus.

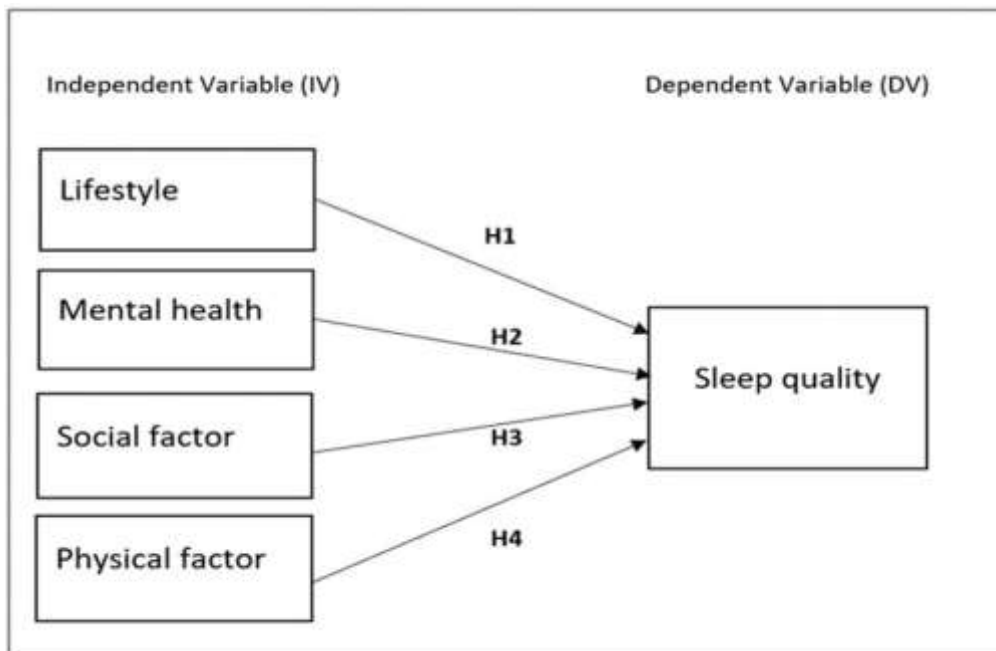

Figure 1: Conceptual Framework

METHODOLOGY

Research Design

In this research, a quantitative methodology was used. The data collection method used was cross-sectional research.

Data Collection

An online questionnaire was used to gather the data. All FHPK students at Universiti Malaysia Kelantan, City Campus, were given the questionnaire that was distributed on Google

Forms as a platform for collecting data. The questionnaire consisted of six sections which are demographic profile, lifestyle, mental health, social factors, physical factors, and sleep quality for parts A, B, C, D, E, and F respectively.

Sampling

In this research, a simple random sampling methodology was chosen. Simple random sampling uses probability sampling to choose the study's respondents as its sampling unit. The sample size for this study was calculated using an equation from Krejcie & Morgan (1970) to get a valid and trustworthy sample. According to Krejcie & Morgan (1970), researchers selected 365 randomly chosen students from the Faculty of Hospitality, Tourism and Wellness (FHPK) at Universiti Malaysia Kelantan, City Campus as the proper sample size for this study.

Data Analysis

In order to analyse the data, this study uses three distinct types of data: descriptive statistics, reliability tests, and Pearson correlation tests. The most recent software programme, Statistical Package Social Sciences (SPSS) version 26 was used to analyse the data in order to determine the link between the independent variables and dependent variables.

FINDINGS

Demographic Analysis

Table 1: Demographic Profile

Demographic	Categories	Frequency	Percentage
Gender	Male	212	58.1
	Female	153	41.9
Race	Malay	283	77.5
	Chinese	58	15.9
	Indian	22	6.0
	Others	2	0.5
Age	18-21 years old	120	32.9
	22- 25 years old	242	66.3
	26-29 years old	3	0.8
	30 years and above	0	0
Marital Status	Single	363	99.5
	Married	2	0.5
Religion	Muslim	297	81.4
	Buddha	44	12.1
	Hindu	22	6.0
	Others	2	0.5
Education Level	Diploma	19	5.2
	Degree	344	94.2
	Master	0	0
	Others	2	0.5
Year of Education	1 st year	132	36.2
	2 nd year	40	11.0
	3 rd year	74	20.3
	4 th year	119	32.6

Out of 365 respondents, table 1 shows the respondent's profile. Majority of the respondents were male and female where males were 58.1% and females at 41.9% overall. Meanwhile, in terms of race, most of the Malay. 77.5% and followed by China as much 15.9%. Next is India as much as 6.0% and others as much 0.5%. in terms of the respondents by age, for 18-21 years old by 32.9% and for 22-25 years old 66.3% while for 26-29 years old by 0.8% and for 30 years and above was 0%. Next is the respondent to marital status. For those with single status it is 99.5% and for those who marry it is 0.5%. For Religion, the Malay were 81.4% and for Buddha at 12.1% and followed by Hindu at 6.0% and for others at 0.5%. in terms of respondents by educational level, out of 365 respondents. Diploma at 5.2% and for degrees by 94.2% while for bachelor Master by 0% and for others by 0.5%. For Year OF Education was selected from year 1 to year 4, for year 1 by 36.2 percent and for the second year by 11.0% while for year 3 20.3% of respondents answered and for year 4 by 32.6 percent of respondents. This statistic nearly represents the actual demographic tabulation awareness of the Factors That Influence Sleep Quality Among Students University Malaysia Kelantan (UMK), City Campus

Descriptive Analysis

Variable	Items	Mean Score	Standard Deviation
Lifestyle	Is smoking regularly affect the duration of sleep?	3.95	0.923
	Does using media such as phones, laptops, tabs for long hours effect the satisfaction of sleep every day?	3.95	1.000
	Are you involved in extracurricular activities regularly?	3.04	0.863
	Are you craving for high calorie food regularly?	3.80	0.973
	Are you experiencing drastic changes in body weight in the past 1 year?	3.60	1.145
Mental Health	Do you feel the anxiety regularly?	3.18	0.961
	Are you having headaches more regularly?	3.11	0.899
	How often you had experience panic attacks during sleep time?	2.74	0.990
	Do you experience anger more regularly	3.13	0.902
	Does feeling sad make you sleep late?	3.24	0.989

Social Factors	Is that you overthink your studies which make you feel awake for long hours?	3.87	0.949
	Are you going late to class regularly?	2.61	1.098
	Are financial issues of the family make you have poor sleep quality every day?	3.38	1.006
	Is that financial strain includes difficulty covering daily expenses leading to poor quality of sleep?	3.43	1.021
	Is that your interpersonal interaction such as aggressive behaviour affect sleep quality?	2.94	0.939
Physical Factors	Do you often suffer from back pain, and it affects your sleep pattern?	3.75	1.013
	Are you consuming sleep medication regularly to get enough sleep every day?	2.44	1.148
	Are you having any chronic illnesses which disturb your sleeping routine?	2.60	1.043

	Are you having musculoskeletal pain more regularly?	2.86	1.052
	Do you have any neuropathic disease that disturbs your sleep?	2.57	1.086
Sleep Quality	Are you always excessively sleepy during the day?	3.12	1.052
	My sleep quality is good every day.	3.54	0.956
	My amount of sleep is sufficient	3.53	1.042
	My sleep was restless.	2.98	0.984
	I had difficulty falling asleep	3.21	1.071

Results of the descriptive analysis are shown in Table 2. The result aimed to assess the frequency, mean, and standard deviation of various items used to measure various aspects of sleep quality. The Lifestyle items had a mean range of 3.04 to 3.95, with a standard deviation of 0.863 to 1.145. The highest mean values were observed for items L1 and L2 on the questions 'Is smoking regularly affect the duration of sleep?' and 'Does using media such as phones, laptops, tabs for long hours affect the satisfaction of sleep every day?'. The lowest mean was found for items L3 on the questions 'Are you involved in extracurricular activities regularly?'. The Mental Health items had a mean range of 2.74 to 3.24, with a standard deviation of 0.899 to 0.989. The highest mean value was for item MH5, which asked if feeling sad makes you sleep late. Out of 322 respondents, 165 strongly agreed and agreed on item MH5. The lowest mean value was for items MH3 on the question 'How often you had experience panic attacks during sleep time?'. The Social Factors items had a mean range of 2.61 to 3.87, with a standard deviation of 0.949 to 1.098. The highest mean value was for item SF1 on the question 'Is that you overthink your studies which make you feel awake for long hours?', followed by PF1 on the question 'Do you often suffer from back pain, and it affects your sleep pattern?' and PF2 on the question 'Are you consuming sleep medication regularly to get enough sleep every day?'. The Sleep Quality items had a mean range of 2.98 to 3.54, with the highest mean for item SQ2 on the statement 'My sleep quality is good every day'. The lowest mean was for item SQ4 on the statement 'My sleep was restless', with 29.3% of respondents strongly disagreeing and disagreeing on item SQ4. Overall, the study provided valuable insights into the factors affecting sleep quality and overall sleep quality.

Reliability Analysis

Table 3: Reliability Analysis

Variable	Number of items	Cronbach's Alpha Coefficient
Lifestyle	5	0.633
Mental Health	5	0.821
Social Factors	5	0.668
Physical Factors	5	0.751
Sleep Quality	5	0.296

Table 3 shows the results of the reliability test. High internal consistency for all questionnaires used for this study had been demonstrated (Cronbach's α ranging from 0.296 to 0.821 alpha coefficients). Reliability analysis which ranged by lifestyle, mental health, social factors, physical factors, and quality sleep (0.633, 0.821, 0.668, 0.751 and 0.296). In measuring the variables that influence lifestyle, mental health, social factors and physical factors, the result of Cronbach's Alpha has shown that the coefficient obtained from the Likert- Scale is reliable. But for variables that influence quality sleep has shown that it is not reliable for this study.

Pearson Correlation Analysis

Table 4: Results of Pearson Correlation Analysis

Pearson Correlation	Sleep Quality	Lifestyle	Mental Health	Social Factor	Physical Factor
Sig (2-tailed)		.000	.000	.000	
Sleep Quality	1				
Lifestyle	0.315	1			
Mental Health	0.450	0.292	1		
Social Factor	0.483	0.471	0.615	1	
Physical Factor	0.531	0.140	0.559	0.487	1

** Correlation is significant at the 0.01 level (2- tailed)

Table 4 shows the objective of this analysis is to study the relationship between lifestyle, mental health, social factors, physical factors, and sleep quality among students at FHPK University Malaysia Kelantan is low positive, with a Pearson Correlation value of 0.315. This indicates a low positive correlation between lifestyle and sleep quality, with a statistically significant effect at a 0.000% level. Mental health has a low positive correlation of 0.450, with a 0.0000% level of effect. Social factors have a low positive correlation of 0.483, with a 0.0000% level of effect. Physical factors have a low positive correlation of 0.531, with a 0.0000% level of effect. Overall, the relationship between lifestyle, mental health, social factors, physical factors, and mental health at FHPK University Malaysia Kelantan is not strong, suggesting that more research is needed to better understand the factors influencing sleep quality and overall well-being among students.

DISCUSSION AND RECOMMENDATION

Studying this topic is quite interesting. For students in the future to have a better understanding of linked subject fields, they offer some recommendations for those who will follow them. This advice and suggestions may help future research by other academics.

First, the respondents' categorization could be changed to exclude people from a certain region near Kota Bharu, Kelantan. The questionnaire that was previously sent garnered 365 responses. This can help us understand how sleep quality, mental health, social factors, physical factors, and lifestyle factors are related.

The scope of the questionnaire may also be widened, and it might not simply be limited to the students in Kota Bharu, Kelantan. The results of the questionnaire will be more detailed and precise if this is done.

Second, future studies should give questionnaires more time to circulate so that researchers may find people who are better suited and equipped to respond. For instance, with a sample size of 365 respondents, it is difficult to finish data collecting in a short amount of time. Afterward, researchers may clarify the questions or the goal of the study to respondents if they have any difficulties comprehending. To prevent responders from just giving the questions and answers, this is crucial. The researchers may need to offer additional clarity and explication to obtain more accurate and trustworthy data.

The last piece of guidance for potential researchers is to become familiar with analysis tools like SPSS, which is what we do. SPSS (a statistical tool for the social sciences) was used to analyze the replies, or as we might refer to them, the specifics of the respondents' input. Because there are no recommendations for the most effective methods of data analysis, learning how to utilize SPSS requires a lot of study. The assessment assumes a significant role after the data have been summarized and analyzed. The analytical system that will be utilized for future researchers' study should be properly reviewed and understood.

CONCLUSION

The purpose of this study is to identify the factors affecting students at University Malaysia Kelantan's (UMK) City's sleep quality. We used the IV and DV methodologies in this study, where IV stands for lifestyle, mental health, social component, and physical element. The findings imply a connection between the issues students have with their sleep and those problems. The results of this study demonstrate that a variety of factors influence students at the University Malaysia Kelantan (UMK) city campus's ability to get a good night's sleep.

ABSTRACT

Learning may be hampered by students' mental health. It is critical that we understand how to effectively serve this demographic given the rising number of complaints of mental health issues among university students so that they can learn and achieve. Given the plethora of evidence demonstrating how mental illness can impede academic achievement and degree persistence, this is very significant. There are numerous types of help that can be offered in the classroom, incorporated into current practises and learning opportunities for all children worldwide, to better serve this rising group. This article discusses the connection between learning and mental health, along with practical implications and future research objectives.

Keywords: Mental health, psychosocial, moral support, academic performance

INTRODUCTION

When someone can work well, contribute to society, manage stress well, and has confidence in their own abilities, they are in a state of good mental health. The World Health Organisation (WHO) defines health as a condition that includes one's physical, mental, and social well-being and extends beyond simply being free from disease. To function normally, people must all have adequate mental health. There are numerous categories for dividing up mental health problems like anxiety, depression, and eating disorders.

University students are a group that is more susceptible to mental disease, claims Nsereko ND. (2018). Although the prevalence of mental health issues among students is not a recent development, students may suffer if the matter is ignored (Abdul Rahid, 2021). In terms of academic, environmental, social, and psychological adjustment in a new environment, continuing studies is challenging for students, according to Yikealo (2018), and this will impair psychosocial wellbeing and student learning results.

According to the Royal Malaysian Police, there were 1708 suicide cases in Malaysia between January 2019 and May 2021. 872 of those incidents involved minors between the ages of 15 and 18. This demonstrates that children and teenagers made up up to 51% of all suicide cases in Malaysia at the time

The Mental Health research from 2019 shows that among the 5.5 million youth in this country, at least one in ten (or 10 percent) have had suicidal thoughts. In addition, 1 in 5 adolescents experience depression, and 1 in 10 teenagers experience stress. This situation is quite concerning because it demonstrates the seriousness of the mental health issues that young people and teenagers are experiencing.

SIGNIFICANCE OF THE STUDY

The University of Malaysia Kelantan (UMK) Kota Campus's FHPK students' mental health factors are addressed in this study. By illuminating the connection between moral support, psychosocial behaviour, academic performance, and mental health among students, this study contributes to the body of knowledge. This research will act as a manual for policy makers in Malaysia's health and wellness sector on how to manage issues relating efficiently and effectively to mental health.

LITERATURE REVIEW

Mental health

A dynamic internal balance that enables people to use their skills in keeping with society's broader goals is the concept of mental health. Basic cognitive and social skills, the ability to recognise, express, and control one's own emotions as well as empathise with others, flexibility and the ability to deal with unfavourable life events and fulfil social roles, as well as a harmonious connection between body and mind, are all significant aspects of mental health that, to varying degrees, contribute to the state of internal equilibrium.

Moral support

A person's life depends on moral support, particularly from family, friends, and even intimate acquaintances. This is since for us to continue to be excited about pursuing or attaining what we desire in life, as human beings, we need the support and encouragement of others. They require moral support as a student to maintain motivation and get good achievements in their studies. All parties must take student mental health concerns seriously since strong social support can shield pupils from mental health challenges.

Psychosocial

According to Foubert and Grainger (2006), this psychosocial development has encompassed components of behaviour and individual attitudes from a person's personal, interpersonal, physical, and psychological dimensions. A person's attitude and mindset can also be impacted by the changes in our environment. A learner will be negatively impacted by this. Extreme pressure that results from this emotional disturbance's impacts can also lead to psychological issues in a person. University students typically experience an upsurge in mental health problems, which affects their stage of life.

Academic performance

Since academic issues now divert students' attention from performance, academic performance among university students at UMK Campus Kota happens. Because it is challenging to find the drive to study and because of these issues, academic performance is primarily a problem for pupils. However, poor academic achievement can impact a person's physiological health, impairing their personality, abilities, and social skills. These papers talk about the relationship between academic success and mental health.

Research Hypothesis

The research's concept is based on study variables such moral support, psychosocial functioning, and academic performance that influence the mental health of students at UMK.

H1: There is a relationship between moral support with mental health among students UMK Kampus Kota.

H2: There is a relationship between psychosocial with mental health among students UMK Kampus Kota.

H3: There is a relationship between academic performance with mental health among students UMK Kampus Kota.

Research Framework

For the purpose of examining the relationships between academic success, psychological well-being and moral support and mental health among UMK campus Kota students, a research framework has been illustrated. Academic performance, psychological support, and moral support are the independent factors. The dependent variables are the students at the UMK campus in Kota's mental health.

Figure 1: research framework of Mental Health Among UMK Campus Kota Student

METHODOLOGY

Research Design

This study employed a cross-sectional study design and a quantitative methodology.

Data Collection

The process of gathering information for the specified variables in a systematic fashion is known as the data collection method. Primary data will be used in this study, and data will be gathered using an online survey that will be given to University Malaysia Kelantan students who have been chosen at random. Six components, including a socio-demographic portion, section A, section B, section C, section D, and finally open questions, make up the questionnaire.

Sampling

The sample method used for this investigation was simple random sampling, a type of probability sampling. Using simple random selection, the researcher chooses participants from a population at random. Everyone in the population has the same chance of being chosen. Then, data is collected from as many members of this subset that was randomly selected as is practical. The researchers computed the sampling in order to obtain a valid and trustworthy sample for this experiment using the Krejcie & Morgan Table.

Data Analysis

Reliability analysis, descriptive analysis, Pearson Correlation analysis, hypothesis testing, and summary are all covered in this chapter. At FHPK students in UMK Kampus Kota, 179 respondents received a total of 22 questionnaires. Prior to administering the actual test questionnaire, a pilot test was carried out using SPSS to analyse the results.

FINDINGS

Socio-demographic characteristic	Frequency (n)	Percentage(%)
Gender:		
Male	53	29.6%
Female	126	70.4%
Age:		
5.21 years old	55	30.7%
22- 24 years old	114	63.7%
25-27 years old	7	3.9%
29-30 years old	3	1.7%
Race:		
Chinese	9	5%
Indian	10	5.6%
Malay	158	88.3%
Others	2	1.1%
Course:		

SAH	29	16.2%
SAP	72	40.2%
SAS/SAW	78	43.6%

TOTAL (respondents)	179	100%
---------------------	-----	------

The reliability test for accuracy and repeatability was conducted with 179 random participants. The coefficient is good and excellent, with Moral support having 0.685, Psychosocial 0.785, Academic Performance 0.646 and Mental Health 0.635. When the score is more than or equal to 0.5, the survey may be administered according to the rule of thumb.

An essential analysis used to gauge the strength of the linear relationship between the independent variables (IV) and the dependent variable (DV) is the Pearson correlation coefficient analysis. With $r = 0.347$, $p 0.01$, the findings revealed a substantial correlation between moral support and mental health. Mental and psychosocial well-being, with $r = 0.290$, $p 0.01$. Additionally, there is a strong association ($r = 0.296$, $p 0.01$ strongly positives) between academic ability and mental health.

DISCUSSION AND RECOMMENDATION

The research had shown that the variables which are mental health (dependent variable) and moral support, psychosocial and academic performance (independent variable) were correlated with the dependent variable and have low negative correlation relationship. For the future research regarding this topic is highly recommended to adopt a mix method approach which is the combination of quantitative and qualitative methods rather than the qualitative method alone to collect data from respondents. This combination method will enhance the depth and width of the research information.

The future research also suggested increasing the number of the sample size to a wider population across Malaysia to ensure the generalisation of the research findings. This is because the chosen population was among Universiti Malaysia Kelantan's students in City Campus with a total of 328 students from every course. In addition, the future research can be conducted using the students from other Malaysian Universities too. It would be great research if the target student is someone who has been diagnosed with a mental health issue and does an interview face to face that can provide more truthful information in this research.

CONCLUSION

The results of the survey responses in the questionnaire were analysed using a variety of methods, such as descriptive and inferential analysis. The results from the preceding chapter and the information from the questionnaire were next assessed using the statistical programme SPSS. For this investigation, H1, H2, and H3 are all viable possibilities. We also provided limitations and suggestions for this study that we believe will be beneficial for future research. It is therefore believed that the information supplied in this study will be valuable for future research.

The Factor That Influence the Daily Diet among Wellness Student in Universiti Malaysia Kelantan, Kampus Kota

Fazlin Anita binti Ahmad, Nur Fatin binti Azranuddin, Nur Shayhira Binti Shamsuddin, Nur Umirah binti Saffian & *Encik Mohd Hafzal bin Abdul Halim

Faculty of Hospitality, Tourism and Wellness, Universiti Malaysia Kelantan

Corresponding email: hafzal@umk.edu.my

ABSTRACT

Daily diet is a way to reduce the obesity problem that is happening now. Those who practice a daily diet should take their food according to the correct portion. A balanced diet can be referred to through the food pyramid. For example, bread, meat, milk and so on. This study took about 2 months, from November 2022 until January 2023. This study was conducted to identify factors that influence daily diet among Wellness students at the Universiti Malaysia Kelantan, Kampus Kota. A pilot study conducted on Wellness students totaling 124 people as a respondent at Universiti Malaysia Kelantan, Kampus Kota. This data was collected through the distribution of survey forms which showed a good response rate. The results of this study were done to give awareness to students, especially Wellness students, about the factors that affect their daily nutrition. The results of this study can also be used as a reference to health centers or nutritionists.

Keywords: Daily Diet, Individual Factors, Social Factors, Environment Factors

INTRODUCTION

Studying at a higher level after finishing high school leads to changes for teenagers. Now, the personality attitude of a person's increasing workload causes students to be stressed and have to face various changes. In particular, migration occurs to families for those who study outside the area. With the occurrence of separation from the family, the students do not choose food to eat and eat whatever is served. This change occurs so that the attitude among teenagers who practice physical activity and food consumption in healthy eating habits can prevent obesity from occurring. Although, there are some habits that exist in a person that are associated with a person's attitude to face the possibility of change.

The body will receive the nutrients it needs to operate properly from a balanced diet (Krans, 2020). These young adults are at a critical juncture in their development and maintenance of numerous behaviours that affect their health. A study center that has a variety of newly learned patterns to replace the old or existing ones (Suliga, 2020).

Many factors, such as personal ones such as a unable to control himself or too busy), social ones such as peer pressure or parental oversight, local such as easy to find or application and cost to particular products, larger ones such as advertising, can have an impact on how university students eat (Velex-Toral et al., 2020). Social factors can also be related to university students such as living alone (Bárbara et al, 2020) gender, academic performance satisfaction (Whatnall et al., 2019), information adequacy (El Hajj et al., 2021) as well as anxiety and depression (Wattick et al., 2018).

There is a dietary pattern used which is the use of a type of primary Hepatocellular Carcinoma (HCC) and hepatitis B virus and hepatitis C virus infection. The eating pattern is reversed and based

on vegetables. It is also associated with a high Hepatocellular Carcinoma (HCC) which is 0.66, 95% CI 0.46 - 0.94) compared to tertiles. There are potential findings as to the role of diet to control HCC and clinical management.

There were three objective of this research:

1. To investigate the relationship between individual factors and daily diet among Wellness students in Universiti Malaysia Kelantan, Kampus Kota.
2. To investigate the relationship between social culture factors and daily diet among Wellness students in Universiti Malaysia Kelantan, Kampus Kota.
3. To investigate the relationship between environment factors and daily diet among Wellness students in Universiti Malaysia Kelantan, Kampus Kota.

SIGNIFICANT OF STUDY

Help researchers.

In the research, it helps the researchers to understand how to manage a diet properly. The researchers have found out the issues and reveal in more detail the influencing factors daily diet among Wellness students and to reduce the factor that influences the daily diet among Wellness students in Universiti Malaysia Kelantan Kampus Kota. Lecturers should play a role of providing information about the benefits of practicing a proper daily diet.

Help the Ministry of Health Malaysia.

In addition, it can help the Ministry of Health Malaysia to provide exposure to students about the benefits of practicing a daily diet. With that, various methods that researchers will do to students, especially wellness students at Universiti Malaysia Kelantan at Kampus Kota, are to hold campaigns or lectures. Therefore, it will facilitate the work of the Ministry of Health Malaysia due to the existence of studies that provide benefits.

Help the Universiti Malaysia Kelantan Kampus Kota counseling unit.

Some of the wellness students who want to practice the right daily diet will meet face to face to get suggestions or views from them. With that, the researcher will conduct an online interview with the wellness student to reveal details related to the daily diet. Therefore, the researcher can help the counseling to solve this problem.

Parent's responsibility.

Parents should take responsibility in attracting children's interest in nutrition. Parents should set an example for their children so that they are more influenced by their parents' nutritional practices from birth to adulthood. Through this study, it is hoped that students will gain knowledge about healthy eating practices so that their health and personal development are perfect. This study also aims to make parents aware of the importance of good nutritional practices in their children's learning.

LITERATURE REVIEW

Individual Factor

Individual factors are the main cause of a student's eating habits. The attitude of students who are skilled in cooking either heavy or light food makes it difficult for students to practice a balanced diet. In addition, some students who have problems or have stress can also result in students taking excessive food without following the time (Kabir et al., 2018). Although adopting good lifestyle habits is important for people at all stages of life, youth is the most important time. Behavioral development in adulthood is important and can be linked to various chronic disease risks that are increasing.

Most teenagers like university students are good at making decisions in choosing food and also the preparation of eating interesting food causes them to feel challenged. The behavior and attitude of students vary according to where they live, student conditions and so on. and not only that, factors such as complete facilities, free time, social networks and social media that are becoming more and more prevalent with viral foods that cause students to be influenced. Therefore, responsible superiors such as administrators need to provide advice or information to students to reduce the problem of obesity. In addition, social media that displays healthy food preparation menus should be encouraged to increase discipline in students and be wise to control themselves and be wise to manage time properly. University life may encourage students to relax and overeat low-quality food (Ramón et al., 2021).

Social Culture Factor

Food habits are impacted by socio-cultural background, religious beliefs and conventions, and personal preference in general. However, there may be some more reasons for teenagers and youth to embrace fast food culture. As a result, the current investigation was done with the aims in mind. To investigate the eating patterns of teenagers and young people in relation to fast food intake. To investigate the sociocultural, demographic, and other features of fast food customers. To evaluate the nutritional characteristics of fast food consumers (Lolokote, 2017).

Food selection is a process where students think, taste, and eat the food before buying it. Therefore, there are various negative effects on their health and well-being even up to the global level. The purpose of this qualitative investigation is to study the opinions of the residents of Tehran and their life experiences related to the psychological, social and cultural variables of food choices (Haghighian, 2017).

Sociocultural variables, which include ethnicity and religion such as age, gender, and education are mediated by individuals' attitudes and beliefs, contribute to food selection and eating practises, influencing purchasing behaviours. There are several studies on variables related to food choices that have shown the main effect of socio-cultural determinants in choosing various cuisines around the world. (Islam, 2019).

Environment Culture

Existing environmental elements have influenced students' daily diets, particularly food selection, food pricing, and the conditions of establishments that sell food, as well as transportation gaps. Climate change disrupts food supplies, raises food prices, and ultimately limits some people' access to nutrient-dense and nutritious meals (Willett, 2019).

Furthermore, the location of a restaurant or cafe is important to students. The lack of access to transportation also has an impact on students' daily nutrition. This is because if the restaurant is a long distance away, they may hire Grabcar, which has a hefty delivery cost. Most students will be hesitant and lethargic to travel to locations that are too far away (Irwan, 2017). Kiara (2017) deduced

from the present phenomenon how adaptable or diverse today's youth's food preferences are. As a result, a restaurant or cafe must grasp the desires or expectations of visiting consumers in order for restaurants or cafes that target youth to match the demand of the target market.

Students frequently claimed that food cost was a major factor in deciding their dietary intake (Sogari, 2018). Most students skipped breakfast in favor of lunch to save money (Fazal, 2019). Pocket money is only provided in small amounts by families because the majority of students in public colleges are from the lower middle socioeconomic class in order to help them get on with their lives. Thus, their expenses are reduced so that not having breakfast is a strategy to continue survival (Kabir et al., 2018).

Daily diet

Changes in daily diet in environmental factors have an unfavorable impact on diet quality and eating habits, which can raise rates of overweight and obesity as well as metabolic risk factors in people of all ages (Hwalla et al., 2017). Intervention from psychology to support a healthy diet is part of the definition of that diet which reduces the problem of obesity as well as chronic diseases (De Ridder et al., 2017). Operationally, several factors that affect a person's daily diet, namely individual factors, social factors or environmental factors that are measured by Food Frequency Questionnaire (FFQ).

Research Hypotheses

Hypothesis 1: There is a significant relationship between individual factors and daily diet among Wellness students in Universiti Malaysia Kelantan.

Hypothesis 2: There is a significant relationship between social culture factors and daily diet among Wellness students in Universiti Malaysia Kelantan.

Hypothesis 3: There is a significant relationship between environment factors and daily diet among Wellness students in Universiti Malaysia Kelantan.

Research Framework

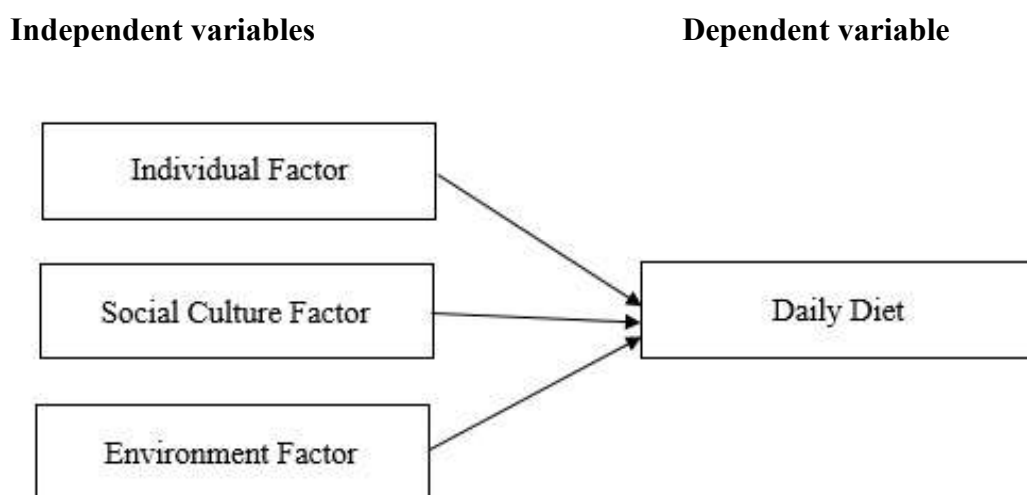

Figure 1: Conceptual Framework

The conceptual framework that has independent variables and dependent variables. In the conceptual framework, independent variables which are individual factors, socio-cultural factors and environmental factors are influenced by dependent variables which are daily diet.

METHODOLOGY

Research Design

The research design serves the purpose of ensuring that the data collected allows researchers to effectively address the current challenges of the study. In this research, quantitative methods are being used as the primary tool for gathering data from the respondents. This approach takes advantage of the numerical data collected through the survey. The information obtained will assist the analyst in understanding the relationship between independent and dependent variables within the framework of this investigation. The research is categorized as descriptive research, and a questionnaire will be utilized to gather data from a total of 248 respondents who are Wellness students from the Faculty of Hospitality, Tourism, and Wellness at Universiti Malaysia Kelantan, Kampus Kota.

Data Collection

Data collection is the process of collecting, measuring and interpreting accurate research-related information using accepted, established methods. A survey which is Google Form is used as the main research instrument. The questionnaire was administered online, allowing respondents to respond quickly. It will give convenience to the respondents and bring them to answer the questionnaire without any strain and also be suitable to give honest and accurate information. The researchers choose Google form because it makes it easier to distribute the questionnaire more quickly when the researcher shares the Google form link with the questions on it to the respondents. A total of 248 respondents were given the same set of questionnaires to obtain information about dietary practices and their responses to matters related to nutrition. The demographic profile, dependent variable, and three independent variables are included in the three sections of the questionnaire. This questionnaire is distributed specifically to Wellness students in University Malaysia Kelantan, Kampus Kota.

In addition, this questionnaire contains a nominal scale which is for Part A which focuses on the demographic profile of the respondents. This research used a Likert scale for Part B which is the dependent variable, and Part C consists of three independent variables for this study. The questionnaire is divided into three different parts. In section A, the questions are about respondents' racial and gender identity, as well as their age, education level, religion and marital status. In section B, the dependent variable which is the daily diet question. In section C, there are 3 factors in this part. The first independent variable, which is an individual factor, is shown in section C (i). The social cultural factor, the second independent variable in the questionnaire section C (ii). The third independent factor, the environment factor, is presented in section C (iii). The questionnaire consists of several items scored on Likert scale like 1 for strongly disagree, 2 for disagree, 3 for not at all, 4 for agree and 5 for strongly agree.

Sampling

This study used convenience sampling for this study. A non-high probability sampling method called convenience sampling involves choosing the units that be a part of the sample. This is said to

be so because it is the easiest method for researchers to do which can also be due to geographical location, availability at a certain time and so on. This sampling is convincing and makes it easier for researchers to get respondents. The selected respondents are Wellness students at Universiti Malaysia Kelantan at the Kampus Kota which has 700 people as respondents. In addition, the researcher chose well-being students because they are more vulnerable in relation to health and also have in-depth knowledge about health compared to other people.

Data Analysis

Data analysis is the process of collecting and analyzing data to find out what it means. It is also the technique used by researchers to break down and interpret data to derive insights, offer suggestions, and support decision making. The information collected by the researchers was processed and used in the study. There are various sources that have been used to gather all the data. SPSS or also known as The Statistical Package for Social Science will be used to analyse the data that researchers collect in this study. Therefore, researchers from a variety of fields utilise the IBM SPSS Version 25 software for quantitative analysis of complex data. These statistical tools can be used in processing statistical data and it also can be used to provide the answer for the purpose of this study.

Descriptive analysis also known as descriptive statistics. Data are attempted to be explained or summarised with descriptive analysis. It makes data utilisation simpler, which can facilitate action by analysts and aid in the weeding out of useless data. Frequency, central tendency, dispersion or variation, and position are the four components of descriptive analysis. Depending on what researchers are trying to find, descriptive analysis can be done in a variety of ways, but often entails gathering, cleaning, and then analysing data.

This researcher also used reliability analysis to determine how well a measuring approach to gather data for this study. A study's measurement process has to be trustworthy before the findings can be regarded as valid. Consistency, or the extent to which survey questions are asking respondents the same kinds of questions repeatedly, is what reliability is all about. In this study, the reliability scale and internal consistency are measured using Cronbach's Alpha.

Not only that, researchers also used Pearson's correlation coefficient to determine the relationship between two continuous variables. This statistic uses the concept of covariance, which is recognized as the best technique for studying the relationship between variables. It shows how many links exist between two variables, as well as the direction of the relationship. It is used to assess the strength of a link between two numerical variables (at least interval scale). Correlation strength can be determined within positive (+) and negative (-).

FINDINGS

Demographic Analysis

Table 1: Demographic Analysis

CHARACTERISTIC	FREQUENCY (n)	PERCENTAGE (%)
1. Gender		
Male	61	24.6
Female	187	75.4

2. Age		
18-21 years	26	10.48
22-25 years	207	83.47
26-29 years	15	6.05
<hr/>		
3. Marital Status		
Single	227	91.53
Married	21	8.47
<hr/>		
4. Race		
Malay	221	89.11
Chinese	12	4.84
Indian	12	4.84
Other	3	1.21
<hr/>		
5. Religion		
Muslim	222	89.52
Buddha	20	8.06
Christian	5	2.02
Other	1	0.20
<hr/>		
6. Educational Level		
Degree	240	96.77
Diploma	8	3.23
<hr/>		

Table above shows the result of frequency and percentage analysis of respondents. The research focuses on Wellness students in Universiti Malaysia Kelantan, Kampus Kota. Respondents in this study consisted of Wellness students Year 1 to Year 4. A total of 187 female respondents (75.40%) and 61 male respondents (26.60%) participated in the study that focuses on Wellness students. Based on the age of respondents that were shown 26 respondents (10.48%) between 18-21 years old, 207 respondents of 22-25 years old (83.47%) and 15 respondents (6.05%) of 26-29 years old. When it comes to respondents' marital status, the majority of the respondents are single 227 (91.53%) and 21 (8.47%) of the respondents are married. For the respondent's background of races, the total of Malay are 221 (89.11%). The total of Chinese and Indian are 12 (4.84%) and the other races, Iban, are 3 of the respondents (1.21%). Based on the analysis of the religion, the total of the Muslim respondents are 222 (89.52%), 20 respondents (8.06%) of Buddha, 5 respondents of Christian (2.02%) and the other religion of respondents are Hindu only 1 (0.40%). Lastly, the respondents of educational level. The level of Degree is 240 (96.77%) and the Diploma is 8 of respondents (3.23%).

Descriptive Analysis

Table 2: Descriptive Analysis

Variable	Items	Mean Score	Standard Deviation
Daily Diet	I have a lack of nutrition knowledge.	3.40	1.331
	I skip meals.	3.34	1.322
	I eat too much food late at night.	3.30	1.371
	There is a lack of healthy food options on campus.	3.69	1.192
	I eat too much junk food.	3.44	1.245
	I have no time to eat healthy.	3.13	1.320
	I usually choose my favourite food rather than nutritious one.	3.59	1.247
	I will try to take the food for health, even though it is not familiar with me.	3.66	1.176
	I think that I do not need to change as far as I am satisfied with present diet.	3.46	1.216
	I enjoy the food that are known to be good for health.	3.83	1.105
Individual Factor	I practice a low-salt diet.	3.94	1.024
	I like to eat vegetables.	4.04	1.037
	I often exercise in the evening	3.64	1.186
	I don't eat fast food.	3.73	1.139
	I make fruits as my side food.	4.06	0.861
	I always carry out health checks.	3.64	1.141
	I always take supplements.	3.81	1.124
	I always practice a healthy lifestyle.	3.97	0.899
	I always eat foods that are high in sugar.	3.56	1.242
	I often drink carbonated drinks.	3.28	1.397
Social Culture Factor	I usually eat food that is trendy.	3.77	1.173
	I eat certain foods because other people such as family, friends also eat it.	3.87	0.962

	Eating the way I do gives me a sense of satisfaction.	3.99	0.992
	I like to try new foods which I am not accustomed eat.	3.79	1.090
	I choose the foods I eat because it fits the reason.	4.13	0.900
	It is important to me that the food I eat is similar to the food I ate when I was a child.	3.69	1.055
	I eat certain foods because I am expected to eat them.	3.74	1.080
	My eating habits are superior to others.	3.61	1.147
	Unhealthy eating is a source of stress in relationships with people.	3.89	1.047
	I will think about healthy food when engaging in activities with the Malaysian Ministry of Health together with the local community on how to manage a healthy diet.	4.07	0.960
Environment Factor	When I cook, I have in mind the quantities to avoid food waste.	4.73	0.819
	My schedule is overloaded. I look for food I can quickly buy, make and swallow.	4.01	0.856
	It is important to me that the food I eat is prepared/packed in an environmental friendly way.	4.10	0.898
	It is important to me that the food I eat comes from my own country.	3.95	0.968
	I do not care about the country of origin when I consume or buy the food.	3.71	1.137
	I choose food that have been produced in countries where human right are not violated.	4.17	0.837
	I prefer to eat food that has been produced in a way that animal's rights have been respected.	4.13	0.888
	I choose the food that has certification from the government.	4.33	0.776
	I more prefer food that can be bought in shops close to where I live.	4.02	0.918
	I usually cook my own food.	4.18	0.825

The table above shows that the daily diet respondent 10 (I enjoy food known to be good for health) had the highest mean score which is (M = 3.83, SD = 1.105). Meanwhile, respondent daily diet item 6 (I don't have time to eat healthy) had the lowest mean score which is (M = 3.13, SD = 1.320). For individual factor 5 (I make fruits as my side food) had the highest mean score which is (M = 4.06, SD = 0.861). Whereas, respondent individual factor 10 (I often drink carbonated drinks) had the lowest mean score which is (M = 3.28, SD = 1.397). The results reveal that the respondent for social culture factor 5 (I choose the food I eat because it fits the reason) had the highest mean score which is (M = 4.13, SD = 0.900). While respondents of social culture factor 8 (My eating habits are higher than others) had the lowest mean score which is (M = 3.61, SD = 1.147).

Reliability Analysis

Table 3: Reliability Analysis

Variable	Number of Items	Cronbach's Alpha
Daily Diet	10	0.925
Individual Factors	10	0.903
Social Culture Factors	10	0.906
Environment Factors	10	0.857

Table 3 shows the reliability dependent variable of daily diet is the highest value which is 0.925. For the independent variable of individual factors with 10 questions is 0.903 the Cronbach's Alpha value. The second independent variable is social factors and the value is 0.906 with 10 questions. The third of the independent variables is environmental factors and the value is 0.857 with 10 questions.

Pearson Correlation Analysis

Table 4: Pearson Correlation Analysis

Pearson Correlation				
	Daily Diet	Individual Factors	Social Culture Factors	Environment Factors

Daily Diet	Pearson Correlation	1	.004	.218**	-.034
	Sig. (2-tailed)		.950	.001	.599
	N	248	248	248	248
<hr/>					
Individual Factor	Pearson Correlation	.004	1	.518**	.517**
	Sig. (2-tailed)	.950		.000	.000
	N	248	248	248	248
<hr/>					
Social Culture Factor	Pearson Correlation	.218**	.518**	1	.646**
	Sig. (2-tailed)	.001	.000		.000
	N	248	248	248	248
<hr/>					
Environment Factor	Pearson Correlation	-.034	.517**	.646**	1
	Sig. (2-tailed)	.599	.000	.000	
	N	248	248	248	248

HYPOTHESIS 1: DAILY DIET AND INDIVIDUAL FACTOR

H1: There is a relationship between daily diet and individual factor.

The significant value for each individual factor is over 0.05 based on the results, while the p value is below 0.05. The alternative hypothesis is disproved and the null hypothesis is accepted. It reveals that there is no causal connection between individual factor and daily diet among Wellness students at Kampus Kota, Universiti Malaysia Kelantan. The individual factor and daily diet only have a very weak link, as seen by the Pearson correlation value of 0.004 for this relationship. H1 was therefore rejected.

HYPOTHESIS 2: DAILY DIET AND SOCIAL CULTURE FACTOR

H2: There is a relationship between daily diet and social culture factor.

For p-value is greater than 0.05, whereas the social culture factor' significant value is less than 0.05. The alternative hypothesis is also accepted, despite the null hypothesis being rejected. The daily diet of Wellness students at Universiti Malaysia Kelantan, Kampus Kota, is significantly influenced by social cultural aspects. A weak link exists between social culture and daily diet as shown by the Pearson correlation value of 0.218. H2 was therefore accepted.

HYPOTHESIS 3: DAILY DIET AND ENVIRONMENT FACTOR.

H3: There is a relationship between daily diet and environment factor.

The results show the significant level of the the p-value is lower than 0.05, and values for each individual factor are more than 0.05. The alternative hypothesis is disproved and the null hypothesis is accepted. This table demonstrates that no significant between environmental factors and daily diet. It proved that is no correlation between environmental influences and daily diet, according to the Pearson correlation coefficient of -0.034. H3 was therefore rejected.

DISCUSSION AND RECOMMENDATION

The purpose of discussion is to explain the relationship between daily diet, individuals, social culture factors, and environment factors among Wellness students at the Universiti Malaysia Kelantan, Kampus Kota. Data analysis shows a significant relationship between daily diet and social and cultural characteristics. There is no correlative validation between individuals and environments of daily diet. But previous studies have shown a relationship between daily diet and individual, social culture and environmental variables. Next, Pearson correlation values show the individual factors which are very weak and environment factors have no correlation ($0.218 > 0.004 > -0.034$).

RECOMMENDATION

There are many recommendations for the next research. The first suggestion is that in order to get the best results, the target audience should be expanded to include Fakulti Keusahawanan dan Perniagaan (FKP). This is due to the fact that the students should be better knowledgeable about diet, nutrition, and contemporary nutritional issues that may be relevant to their research. In order to get better outcomes from their future studies, it can also be helpful. The researcher can utilize a variety of survey methods to respond to the questionnaire, which is the second piece of advice. To receive the quickest answer from the respondents, for instance, the researcher can employ a telephone survey or a personal interview that takes place face to face. The respondents will find it simple to ask the specified questions during personal interviews and telephone surveys, and both methods also allow for the provision of additional explanation if necessary. Additionally, it can broaden respondents' understanding and make them aware of the need for a healthy diet. The results will be more precise and useful if several survey methodologies are used. Finally, the questionnaire can be created in multiple languages, such as Mandarin and Tamil. Only English and Malay were used as the languages for the majority of the questionnaire. The respondents from different races can utilize their own languages to comprehend the questionnaire effectively and to make it easier for them to respond. As a result, the outcome will be more dependable and efficient.

CONCLUSION

In conclusion, this study examines the variables affecting daily eating among Wellness students at Kampus Kota, Universiti Malaysia Kelantan. Independent variables are created from personal, social, cultural, and environmental aspects. The daily diet is the dependent variable that is impacted by this variable. The association between the dependent variable and the three independent variables is one significant and two not significant. According to the results of recapitulation, the social component is the weakest, followed by a very weak individual factor and uncorrelated environmental elements ($0.218 > 0.004 > -0.034$). Additionally, it demonstrates that the three independent variables' p values are 0.950 for the individual factor, 0.001 for the social culture element, and 0.599 for the environment factor. The results are stronger and more reliable thanks to the numerous study publications in this part. In this study, H2 was accepted whereas H1 and H3 were denied. It was discovered that Wellness students at Universiti Malaysia Kelantan Kampus Kota had difficulty comprehending the surveys and showing interest in them. The target audience should be

expanded, additional survey methods should be used and more languages should be used. According to the research proposal, this will produce a very valuable study that will be very helpful in the future.

ABSTRACT

Obesity has been one of the issues that keeps growing concern in Malaysia. This research with the highest prevalent of obesity in Malaysia, the researcher wishes to look at how students at Universiti Malaysia Kelantan (UMK) may manage their weight through exercise. The research objectives of this study are to investigate the relationship between unhealthy lifestyle, environment factors and control over behaviour on obesity in Universiti Malaysia Kelantan (UMK). The study was conducted using a quantitative research approach which is through online questionnaire to collect the data. There were 120 respondents participated in this study. The study proven that there is significant relationship between unhealthy lifestyle, environment, control over behaviour and obesity among students in Universiti Malaysia Kelantan (UMK). Throughout the whole research, there are a few attentions and discussion about the limitation should be emphasized in this study. The implication of this study were lacking of current studies on related subject and there were some respondents who did not give full cooperation in the data collection process which makes it difficult for the researcher to continue the study in a short period of time.

Keywords: Obesity, Unhealthy Lifestyle, Environment, Control Over Behaviour

INTRODUCTION

Obesity has been one of the issues that keeps growing concern in Malaysia. 17.4% of respondents report eating fast food at least once a week. But the majority of them claimed to eat fast food at least once a month. Moreover, it was shown that younger age groups, Malay people, and childless people were more significantly likely to consume fast food weekly. Compared to other ethnic groups, Malay people eat fast food more frequently. Most of the participants were overweight. Only 13.8% of obese people said they ate fast food weekly, and only 50.8% said they did so monthly. There is little correlation between fast food consumption frequency and obesity. Fast food eating on a regular basis is really concerning. Increased usage is significantly influenced by accessibility (Abdullah et al.,2017).

Other findings showed that It is important to prevent obesity and all students should strengthen positive behavioral habits, increase awareness, and promote workable prevention methods. For preventing overweight and obesity is to raise public awareness. Strong school- based policies,

successful curricula, and knowledgeable mentors in spreading healthy eating and physical activity programmes in schools. Similar significance was noted in recent studies, which claimed that school-based intervention strategies led to behavioral change in terms of an increase in dietary intake of nutritious foods and a decrease in consumption of unhealthy foods among the younger generation (Tong et al., 2022). Therefore, the main focus of this study is to find out Weight Management Of Obesity Among Student In Universiti Malaysia Kelantan (UMK).

There were three objectives of this research:

1. To investigate the relationship between unhealthy lifestyle and obesity of students in Universiti Malaysia Kelantan (UMK).
2. To investigate the relationship between environment factors and obesity of students in Universiti Malaysia Kelantan (UMK).
3. To investigate the relationship between the control over behavior and obesity students in Universiti Malaysia Kelantan (UMK).

SIGNIFICANCE OF THE STUDY

University Students

This study is made available to students at all institutions so they may conduct a detailed analysis of obesity weight management and learn how to regulate their behaviour while consuming foods that might contribute to obesity. The advantages of this study might encourage obese persons to maintain a healthy diet and weight. Improvements in risk variables that can be brought about by nutrition, exercise, and behavior management can be included.

Pusat Kesihatan Universiti (PKU)

The significance of the study conduct by this research is expected to make it a guideline to get sort of data about students who are in obesity class. By data and targeted students, Pusat Kesihatan Universiti (PKU) can create a medical check-up event to be aware of obesity in students. This event can create health awareness among students and staff of Universiti Malaysia Kelantan (UMK). Lecture could be an important role to play in attracting more students and becoming a more healthy person. This could be one of steps to create a healthy community in Malaysia.

Guidance and Counseling To Create A University Program

From the study, they can create a healthy program at the university. This is because this program can attract students to know their health level and can create a healthy community in the future. This program can make students sensitive and aware of situations where any unhealthy activities can affect their learning and lifestyle. Guidance and counseling play a role in advising students to always be healthy.

Institut Jantung Negara (IJN)

From the research Institut Jantung Negara can play the role of guiding the community by using this research to create an event related to obesity. This data from the research could be used to find the fact that could affect the human body. Programs that involve the community can give health

warnings about obesity that could affect the human body. This way can create more health to the community by providing the event and advice to the community.

LITERATURE REVIEW

Unhealthy Lifestyle

It's completely obvious that university students live unhealthy lifestyles. Poor diet, excessive drinking, smoking, and insufficient sleep are all contributors to this. Therefore, given their hectic schedules, many students' health may ultimately suffer from a diet that lacks diversity and nutritious value, which is not ideal. (Griffin, 2016).

In connection with this, smoking is another bad habit that has an impact on kids. Students who only smoke when they go out on dates or socialize are known as "social smokers." The hazards of smoking do not go away even if you just smoke sometimes and "socially." Each cigarette raises the chance of developing lung, heart, and cancer problems, which together take up to six million lives annually. Even if they are only doing it "socially," Students must stop smoking since it is one of the biggest causes of mortality in the country. This is a likely scenario given that several countries throughout the world are supporting tobacco bans and beginning to oppose multinational cigarette companies (Chan, 2016).

Environment

Social media is an environment that could have an impact on obesity. These days, social media, television shows, and smartphone applications heavily influence our eating habits and decision-making processes. Among the evidence, taking pictures of food for Instagram before eating, standing in long queues to buy the hot food or drink online, even filming their dinner live. This is usually driven by the desire to get "likes" and comments, which is a sense of enjoyment from the virtual world's attention. Sometimes trying new foods with friends is not wrong, but we need to be careful to what extent our food intake is influenced by social media and how not to be deceived (Yap, 2019).

Next, the pressure of environment also will face by students is mainly in terms of time and no breaks enough to cause them to choose to reduce stress by having fun and practicing unhealthy eating. The students will be extremely busy especially during exam week, because of that they will not maintain a good eating schedule, instead they will replace it with smoking and fast food. Some students do not eat during the day because they are busy with their assignments and they will fill the empty stomach with a late dinner, which is less than two hours before bedtime. In addition, there are also among students, especially male students who like to hang out in stalls or restaurants late at night.

Control Over Behaviour

The core components of weight-control therapy for overweight and obese patients are behavioral modifications with an emphasis on dietary and physical activity improvements. At least temporarily, behavioral changes can aid in weight loss and improve their health. This list of behavioural treatments for managing student obesity is provided. A structured approach to changing lifestyle behaviours that may affect behaviour includes disciplines like exercise, food, and others. Goal-setting, stimulus control, stress factor legislation, ego, reorganisation of thought, stress management, figuring out solutions, and support systems are elements of behaviour modification.

More efficient and durable weight management can be accomplished by exercise, dietary modifications, and behavioural therapy. (Olateju et al., 2021). According to Radzi (2019), tension-producing situations not just the lack of social confidence and poor behavioral control among university students, but also elements like inadequate or disturbed sleep that can lead to obesity.

Obesity

One in five young people suffer from obesity, a complex chronic condition. Numerous pediatric treatment interventions concentrate on attempts to modify behaviour or lead healthier lifestyles, but they are constrained by their intensity and rendered ineffective by their inability to address the social circumstances of obesity. The study's main goal was to examine the existing treatment methods for obese patients by pediatric primary care providers (Johnson et al., 2022). Obesity that is chronic or non-communicable is now largely acknowledged as a disease. Recent research is shedding new light on the pathophysiology of unwelcome weight gain, the mechanisms by which obesity persists in the face of reasonable attempts to alter lifestyle choices, and the detrimental impact of both central and widespread obesity on health (Purnell, 2018). Males in the lowest income group (31.5%) and highest income bracket (32.6%) had the same frequency of obesity, whereas obesity rates of women dropped with rising income (from 45.2% to 29.7%) (Hales et al., 2017).

Research Hypothesis

Literature review shows that independent variables such as unhealthy lifestyle, environment, and control over behaviour that influence weight management of obesity among student in Universiti Malaysia Kelantan. Therefore, the study proposes to examine the level of factors among these variables. Based on the literature discussed, the hypothesis of this study is summarized as follows:

H1 There is a significant relationship between unhealthy lifestyle and obesity among student Universiti Malaysia Kelantan.

H2 There is a significant relationship between environment and obesity among student Universiti Malaysia Kelantan.

H3 There is a significant relationship between control over behaviour and obesity among student Universiti Malaysia Kelantan.

Research Framework

The figure 1 below shows the research framework use for this study.

Figure 1: Research Framework

METHODOLOGY

Research Design

This research design is a framework that has been created to find the overall answers to the research questions conducted. The approach of this study is to use quantitative methods. A quantitative research approach has been used for weight management of obesity among student in Universiti Malaysia Kelantan. The quantitative approach means that it prioritises quantity. This is because this research will involve numbers, numerical or statistical data. The quantitative approach is structured, has clear scheduling, and focuses on results.

Data Collection

Researchers collect primary data directly from primary sources such as survey like used a questionnaire through the Google form. The questionnaire is applied to collect the information regarding that lead to the factors that affecting weight management of obesity among student in Universiti Malaysia Kelantan. The questionnaire was distributed using an online platform to all students at Universiti Malaysia Kelantan. The questionnaire was distributed through online and social media like WhatsApp and collected data among the student.

Sampling

The researchers use non-probability convenient sampling that include of factor related to Weight Management of Obesity among 120 respondent students in University Malaysia Kelantan from the population of 11 965 students. The researchers preferred to use this non- probability convenient sampling compared to probability samples which utilize mathematical procedures. In addition, this sampling technique is easy to do and does not use any cost required for this research. Respondents from the questionnaire were students in Universiti Malaysia Kelantan were selected for this survey. Respondents were selected to answer this questionnaire and all data were collected based on their answers.

Data Analysis

Data analysis is a core element of the data analysis and Business Intelligence (BI) and is the method of gaining insights that guide business decisions making. A tool that is used in analyzing the data is a tool for Statistical Package Social Science (SPSS) version 29 programmed operation software. (SPSS) data, including such valid percentage and cumulative percentage, will be processed into statistics. To analyze the data, researchers have chosen easy descriptive analysis. The objective is to achieve a range of respondents correlated with different values of a single variable and to express these numbers in percentages. This technique is used by researchers because it is about interpreting and analyzing.

FINDINGS

Result of Frequency Analysis

Table 1 shows the result of frequency analysis of respondents.

Table 1: Frequency Analysis

Demographic characteristics	Frequency	Percentage (%)
Gender		
Male	60	50.0
Female	60	50.0
Years of study		
Year 1	15	12.5
Year 2	35	29.2
Year 3	64	53.3
Year 4	6	5.0
Campus		

Campus Bachok	38	31.7
Campus Jeli	20	16.7
Campus Kota	62	51.7
<hr/>		
Age		
18 – 21 years old	26	21.7
22 – 24 years old	87	72.5
25 and above	7	5.8
<hr/>		
Race		
Chinese	34	28.3
Indian	27	22.5
Malay	59	49.2
<hr/>		
Religion		
Buddha	25	20.8
Christian	11	9.2
Hindu	26	21.7
Muslim	58	48.3
<hr/>		
Education Level		
Degree	117	97.5
STPM/ Diploma	3	2.5
<hr/>		

Table 1 shows the result of frequency analysis of respondents. The research focus on student in Universiti Malaysia Kelantan. The result shows that the respondents were same on both which is 60 respondent (50%) for each genders. Next, majority of respondent come from year 3 which is 64 respondents which is (53.3%) while year 1 is 15 respondents with (12.5%), year 2 students with 35 respondents with (29.2%) and year 4 students with 6 respondents (5%). Next, the respondents mostly same from *Kampus Kota* which is 62 respondents which is (51.7%) while *Kampus Bachok* is 38 respondents which is (31.7%) and lastly *Kampus Jeli* is 20 respondents which is (16.7%). In addition, the ages of this result shows that from the ages 18 to 21 years old have 26 respondents which is (21.7%), 22 to 24 years old have 87 respondents which is (72.5%) and lastly 25 years old

have 7 respondents which are (7.8%). Next. The race of this result shows that mostly Malay have the highest which is 59 respondents which is (49.2%), Chinese is 34 respondents which is (28.3%) and lastly Indian which is 27 respondents with (22.5%). Next, the religion is show that muslim had the highest respons which is 58 respondents which is (48.3%) followed by Christian which is 11 respondents with (9.2%), Buddha with 25 respondents which is (20.8%) and lastly Hindu with 26 respondents with (48.3%). Lastly we have for educational level which is from degree there is 117 respondents which is (97.5%) and STPM/ Diploma with 3 respondents which is (2.5%).

Result of Descriptive Analysis

Table 2 shows the result of descriptive analysis of variable.

Table 2: Descriptive Analysis

Variable	Items	Mean Score	Standard Deviation
Obesity	Do you believe your eating habits are the cause of your obesity condition?	4.66	0.572
	Is your physical health affected by obesity?	4.83	0.417
	Have your social life been limited because of obesity?	4.60	0.691
	Are you depressed because you are obese?	4.70	0.495
	Do you believe obesity has triggered depression?	4.66	0.615
	Do you believe that you can lose weight?	4.59	0.692
	Do you believe exercise will help you lose weight?	4.58	0.657
	Do you believe that eating too often is the cause of Obesity?	4.71	0.640
	I feel fun when I do exercise.	4.29	0.873
Unhealthy Lifestyle	I feel tired when I exercise regularly.	4.53	0.756
	I smoke cigarettes every day.	3.97	1.275
	I drink alcohol every day.	3.64	1.295
	I often eat fast food when I'm bored.	4.53	0.829
	I often eat foods high in sugar.	4.57	0.817

	I don't practice eating according to the food pyramid.	4.48	0.840
	I exercise less than 30 minutes a week.	4.50	0.879
Environment	I often eat excessively at night because I am tired and hungry when I get home.	4.52	0.733
	I often spend my free time playing video games, surfing the internet and watching television all day.	4.52	0.733
	I feel stress every day.	4.46	0.955
	I often go out gardening or walking in the park every evening.	4.08	0.161
	I exercise less than 30 minutes a day even on holidays.	4.38	0.989
	I regularly participate in doing household chores such as cooking, laundry and cleaning the home area.	4.19	0.955
	I often take 3 types of side dishes such as chicken, meat and eggs at the same time.	4.58	0.740
	I often eat rice in a day.	4.73	0.546
Control Over behavior	I always eat late at night when I come home tired.	4.52	0.778
	I always feel hungry even after eating.	4.45	0.915
	I don't see the benefit of doing exercise in my daily routine	4.38	1.046
	I have other work that must be completed instead of exercising.	4.53	0.756
	I feel not confident with myself every time doing an exercise in public.	4.63	0.607
	I feel fun when I do exercise everyday.	4.31	0.968
	I feel tired when do not doing my exercise regularly.	4.34	0.948
	I enjoy doing my exercising.	4.29	0.902

Table 2 was represented the descriptive analysis of variable. Based on dependent variable of this study, obesity descriptive analysis, the highest mean score is 4.83 it is "Is your physical

health affected by obesity” with standard deviation is (0.417) in our 52 research. Other than that, for the questions “Do you believe exercise will help you lose weight” has 4.58 the lowest mean score with (0.657) at standard deviation. Next, for the first independent variable, unhealthy lifestyle, questions number 6 " I often eat foods high in sugar” were showed the highest mean score, it is 4.57 with standard deviation is (0.817) in our research. In addition, for lowest of the mean score, which is “I drink alcohol everyday” which is 3.64 with standard deviation (1.295). Besides, for the second independent variable which is environment, the results of the highest mean score stated that question number 7, “I often take 3 types of side dishes such as chicken, meat and eggs at the same time.” With mean 4.58 SD= 0.740) while the results of the lowest mean score was stated that question number 4, “I often go out gardening or walking in the park every evening.” With (M= 4.08, SD= 1.161). Lastly, for the third independent variable which is control over behavior, the question number 4 with the greatest average score was "I have other work that must be completed instead of exercising." (Mean 4.53 SD= 0.756), while the question with the lowest average score was "I enjoy doing my exercising." (Mean 4.29 SD= 0.902).

Result of Reliability Analysis

Table 3 shows the result of reliability analysis based on dependent variable and independent variable.

Table 3: Reliability Analysis

Variable	Number of Items	Cronbach’s Alpha
Obesity	8	0.743
Unhealthy Lifestyle	8	0.894
Environment	8	0.908
Control Over Behavior	8	0.902

Table 3 showed the results of the reliability analysis based on the dependent variable and each independent variable. The dependent variable which is obesity with 8 questions has Cronbach’s Alpha value of 0.743 which is good and acceptable. For the first independent variable, unhealthy lifestyle with 8 questions shows Cronbach’s Alpha value of 0.894 which is good, reliable and acceptable. The second independent variable, environment which contains 8 questions shows the Cronbach’s Alpha value of 0.908 which has very good internal consistency. The third independent variable, control over behavior with 8 questions in the questionnaire provided has Cronbach’s Alpha value of 0.902 which is reliable and very good.

Result of Pearson Correlation Analysis

Table 4 shows the result of Pearson correlation analysis based on the hypothesis.

Table 4: Pearson Correlation Analysis

Hypothesis	P-Value	Result (Supported/ Not Supported)
H1 - There is a significant relationship between unhealthy lifestyle and obesity among student Universiti Malaysia Kelantan.	0.001	H1 is supported
H2 - There is a significant relationship between environment and obesity among student Universiti Malaysia Kelantan.	0.001	H2 is supported
H3 - There is a significant relationship between control over behaviour and obesity among student Universiti Malaysia Kelantan.	0.001	H3 is supported

Table 4 shows the result of Pearson correlation analysis based on the hypothesis. According to the results, the significant p-value of H1 is 0.001 which is below 0.05 and the p-value is under

0.05. Thus, the study can reject the null hypothesis. Pearson Correlation value of 0.497 stipulates the strength of the relationship between unhealthy lifestyle and obesity is moderate and the result is supported. Next, the significant p-value of H2 is 0.001 which is below 0.05 and the p-value is under 0.05. Thus, the study can reject the null hypothesis. Pearson correlation value of 0.560 stipulates the strength of the relationship between environment and obesity is strong and the result is supported. Lastly, the significant p-value of H3 is 0.001 which is below

0.05 and the p-value is under 0.05. Thus, the study can reject the null hypothesis. Pearson Correlation value of 0.55 stipulates the strength of relationship between control over behavior and obesity is moderate and the results also is supported.

DISCUSSION AND RECOMMENDATION

Discussions are aimed at solving questions and addressing hypotheses as mentioned in the first chapter of this study. In general, the study has extensively researched weight management of obesity among student in Universiti Malaysia Kelantan. The data collection of this purpose study is about how environment, control over factors and unhealthy lifestyle could bring obesity to an issue among students of Universiti Malaysia Kelantan. The data collection is using non probability convenience sampling.

The unhealthy lifestyle is the term where people are not following the guideline of being healthy by government or any sources. The student of student at Universiti Malaysia Kelantan. Just keep to unhealthy ways like eating junk foods, smoking and also less exercise. Unhealthy lifestyle can be measured using a food frequency questionnaire K:10. This questionnaire can be used to find the answer in this research. The environmental fact that causes obesity is by their surroundings. This is because of the location, curious nature, and also mindset. The strategic business location of a certain place that can allow people easily access it also can make obesity among students in Universiti Malaysia Kelantan.

Next, the curious nature of trying something new also could lead to obesity when trying almost all foods that attract people's appetite. Other than that, the mindset also could be one of the reasons why students in Universiti Malaysia Kelantan are having obesity problems. Next, the control over behavior is also one of the factors that cause obesity among students in Universiti Malaysia Kelantan. The behavior is more on physical inactivity, unproductive sport and also unhealthy diet. All these reasons could lead to obesity.

Several suggestions have been made to enhance our research for next studies. Future study on how to effectively control obesity among responders might be beneficial to other researchers. In order to attract attention throughout the whole study process, from conception to dispersal, we first considered to have a target for a long time period as researchers in order to demonstrate an extraordinary finding at the onclusion of study. Next, because of the limited time available, it is proposed that future researchers broaden the unit's scope in order to generate their studies with a bigger target audience from only one particular course of students at Universiti Malaysia Kelantan (UMK). Future researchers intend to use other independent variables to affect how important weight management is to our continued existence in society. The surroundings significantly contributes to promoting weight management and simplifying daily movement plans. This would be an appropriate proposal given the importance of the independent variables. Lastly, future researchers shouldn't depend just on surveys for gathering

results. Face-to-face interviews will be employed in the future to get direct information from respondents. As a result, it was possible to contribute to the study with data than was more precise, reliable, and valuable.

CONCLUSION

In conclusion, the study has been accomplished to discover the factors that affecting weight management of obesity among student in Universiti Malaysia Kelantan. Three independent variables, namely unhealthy lifestyle, environment and control over behaviour have been chosen to examine their relationships with the dependent variable, which is obesity. A total of 120 respondents from the age of 18 years old and 25 years above were selected from students in Universiti Malaysia Kelantan. Overall, based on Pearson's correlation analysis, environment factors have the strongest correlation compared to another factors which is followed by control over behaviour factors and the least unhealthy lifestyle factors.

ABSTRACT

Stress is a mental strain for actual people dealing with the environmental and societal factors that influence so many disorders. Young age is an important stage since young individuals are undergoing many changes at this age. Consequently, it's important to understand the causes of stress, which mainly include the following: academic, family issues, and peer pressure. Sometimes such stress can result in behavior, physical, and psychological problems. In addition, to ensure the contributing stress of each student is guaranteed the person must carry out a research method which is the factors that affect stress among first-year students of Fakulti Hospitaliti, Pelancongan dan Kesejahteraan (FHPK) at Universiti Malaysia Kelantan. This research is also done qualitatively. This method is crucial in determining what kind of observation should be used to obtain information on factors that affect stress among first-year students of Fakulti Hospitaliti, Pelancongan dan Kesejahteraan. The purpose of the research methodology is to data collection, processing, and analysis in an organized and effective manner to finish a study.

Keywords: Academic, Family Issues, Peer Pressure, Stress

INTRODUCTION

Elizabeth (2020) defines stress as any type of shift that results in tension in the body, mind, or emotions. Stress also refers to anything that stimulates the body to react with inquiry or reaction. Nevertheless, students who pursue higher education in Malaysia face a lot of responsibility and pressure since they must undergo the process of adapting to a new social and educational environment (Malarvili & Dhanapal, 2018). Therefore, if the issue persists, it can eventually result in stress-related illnesses like depression, anxiety, insomnia, loneliness, interpersonal and intrapersonal disputes, and other mental health issues.

Next, students who experience too much stress face physical problems such as sweating for no reason, headaches, fatigue, stomach aches, and difficulty or lack of sleep (Felman, 2020). Hence, these students also mentioned that they felt they needed to put their assessment on wait to participate in social, physical, and restorative activities that could promote their well-being and healthy self-growth. The students' inability to maintain a balance had a negative impact on their concentration towards their academic pursuits. Therefore, the primary goal of this study is to investigate the factors that affect stress levels in first-year students enrolled in the Faculty of Hospitality, Tourism, and Wellness (FHPK) at Universiti Malaysia Kelantan. There were three objectives of this research:

1. To investigate the relationship between academic factors with the stress faced among first-year students of Fakulti Hospitaliti, Pelancongan and Kesejahteraan (FHPK) at Universiti Malaysia Kelantan.
2. To investigate the relationship between family issue factors with the stress faced among first-year students of Fakulti Hospitaliti, Pelancongan and Kesejahteraan (FHPK) at Universiti Malaysia Kelantan.
3. To investigate the relationship between peer pressure factors with the stress faced among first-year students of Fakulti Hospitaliti, Pelancongan and Kesejahteraan (FHPK) at Universiti Malaysia Kelantan.

SIGNIFICANCE OF THE STUDY

Malaysian Ministry of Higher Education (MOHE)

The Malaysian Ministry of Higher Education (MOHE) can identify the stress factors faced by students who have just entered University. Therefore, the MOHE must seriously consider the stressors that Malaysian Higher Education Institutions' students face, and it must develop thoughtful initiatives, like awareness campaigns. This is crucial to reduce the signs of stress in first-year university students.

Faculty at Universiti Malaysia Kelantan

This study also helps the faculty at each campus of Universiti Malaysia Kelantan to find out that academic factors, family problems, and peer pressure affect the stress faced by first-year students who live in residential colleges.

Counseling Department

This study can help the counseling department to identify students who experience stress during their stay at the residential college at Universiti Malaysia Kelantan. Hence, the counseling department should conduct awareness campaigns periodically by providing counseling services for those who experience stress during their studies at Universiti Malaysia Kelantan.

Family Institutions

Family is the closest person to every university student (Stacy, 2020). As such, family institutions play an important role in providing moral support for children so that they can overcome stress problems throughout their studies at the university level.

LITERATURE REVIEW

Stress

First-year university students frequently experience stress. According to Garrett et al. (2017), female undergraduate students are more stressed than their male peers, and several academic majors such as engineering and medicine are also linked to higher stress levels. Stress can have a variety of severe effects on undergraduate students, including inadequate academic performance, health issues, increased depression,

increased alcohol, drug, and use of stimulants, a low sense of value, and suicide thoughts.

Besides that, students who experience too much stress face physical problems such as sweating for no reason, headaches, fatigue, stomach aches, and difficulty or lack of sleep (Felman, 2020). Hence, these students also mentioned that they felt they needed to put their assessment on wait to participate in social, physical, and restorative activities that could promote their well-being and healthy self-growth. This lack of balance affected their ability to focus on their studies. Furthermore, undergraduate students experience higher rates of depression, anxiety, and stress, as reported by Choon et al. in 2015. This can be linked to various factors such as the immense volume of material they need to grasp within limited time frames, unexpected alterations in their study routines, concerns about their performance and the possibility of failure in exams, and the lack of allocated time for clinical postings..

Academic

In a study conducted by Johari and Ahmad (2019), it was found that stress among college students primarily arises from academic factors, which serve as the main contributors. There are also a number of other elements, including social and physical aspects. Similarly, Irshad et al. (2015) stated that students often experience pressure related to their workload, relationships with friends, family, and professors. This pressure stems from the need to consistently produce good results and complete assignments punctually without any shortcomings. In addition, a study in South Africa found that to overcome academic pressure is to use prohibited substances that students tend to use (Olufunke, 2017). Nevertheless, the use of alcohol also often happens to some students because it is a way for students to reduce stress when studying (Metzger et al., 2017). Students frequently employ this technique because they believe it will help them cope with the pressure of studying, especially those with high levels of stress who may experience low energy, loss of appetite, headaches, insomnia, or digestive issues because of the academic pressure they are under (Malarvili & Dhanapal, 2018).

According to Mofatteh (2021) studied the effects of excessive academic pressure on mental health, including depression, anxiety, and suicide ideation. Apart from that, the educational system may also play a role in increasing stress levels. Overcrowding in lecture halls, insufficient resources and facilities, long hours, and rote learning expectations are some of the sources of stress in the educational system (Deb et al., 2015). This is because these causes are one of the things that students often experience, especially first-year students who have not yet been able to adapt to the system, thus having a big impact on the students. Academic pressure consequently becomes one of the factors that university students, particularly first-year students who must adjust to new circumstances, encounter when they are stressed.

Family Issues

The term "stress" is frequently used to describe situations that make students feel anxious and frustrated because they are beyond the capacity for effective coping. According to Spinelli et al. (2020), there is strong evidence that family issues have an impact on stress levels. Researchers discovered that most stressed-out students came from families that have divorced. Parental separation can occur for a number of reasons, including poor communication and financial difficulties. When these issues arise, the marriage becomes stressed and separated, which has a significant effect on their children. Apart from that, according to Pedersen (2022), since it is generally recognized that both levels of stress may negatively impact children's well-being, researchers

looked at both individual parents' stress and dyadic perceptions of stress. However, (Haimi & Lerner 2016) found that 19 family conflict occurrences may exacerbate parents' psychological issues, including stress on an individual and dyadic level, with a negative impact on children's emotional and behavioral health as a result.

In addition, researchers look at the difficulties that students confront when they have family members who abuse alcohol and or drugs. Ólafsdóttir et al., (2018) proved that there is a direct link between family relationship addiction and disturbance, as well as important psycho-social and physical repercussions on family members like depression, anxiety, and stress. The emotional, physical, and social needs of the children may be neglected as a result of the depression of a parent who cohabits with a partner who uses drugs or alcohol, which heightens family conflict and anxiety. Besides that, the sadness of the parent who shares a home with a partner who has a substance use disorder (SUD) may result in the emotional, physical, and social neglect of the family's children, which increases anxiety and tension in the household. However, according to Lassonde (2022), children who observe parental conflict, illness, and financial difficulty as the source of the subpar living conditions the family must endure generally have a traumatic family experience with adverse psycho social impacts.

Peer Pressure

According to Khanagha et al. (2021), Peer pressure is the process by which a social group exerts influence over an individual. Peer pressure is a social dynamic that people have encountered, and it is a result of the daily interactions that students have with other people. Students experience peer pressure to fit in with the group of peers they hang out with (Dhull & Beniwal, 2017). However, there are situations when students' peers are the cause of their stress. They might exert pressure on them to do things they don't want to, such as shoplifting, smoking cigarettes or alcohol, impersonating someone else while driving, and more. Hence, students may be teased by a peer to imitate their actions. Furthermore, sometimes peers would not even speak to the students. Instead, they may pressure them by labeling them as outcasts or ignoring them. This behavior also caused stress among the students. Glass (2020) stated that when someone ignores someone, they experience a variety of conflicting feelings. They might experience a variety of emotions at once, including sadness, loneliness, guilt, and anger. Naturally, such an emotional crisis might hurt their mental health. It also can cause emotional trauma to first-year students and leads to stress.

Research Hypothesis

The literature review highlighted independent variables like academic, family issues, and peer pressure affecting stress among first-year students of Fakulti Hospitaliti, Pelancongan & Kesejahteraan (FHPK) at Universiti Malaysia Kelantan. Based on the literature discussed, the hypotheses of this study were summarized in the following manner:

H₁ There is a significant relationship between academic factors with the stress faced among first-year students of Fakulti Hospitaliti, Pelancongan & Kesejahteraan (FHPK) at Universiti Malaysia Kelantan.

H₂ There is a significant relationship between family issue factors with the stress faced among first-year students of Fakulti Hospitaliti, Pelancongan & Kesejahteraan (FHPK) at Universiti Malaysia Kelantan.

H₃ There is a significant relationship between peer pressure factors with the stress faced among first-year students of Fakulti Hospitaliti, Pelancongan & Kesejahteraan (FHPK) at Universiti Malaysia Kelantan.

Research Framework

Figure 1 Research Framework

Figure 1 displays the study's research framework, emphasizing the independent variable (IV) and dependent variable (DV). The study focuses on first-year students at Universiti Malaysia Kelantan's Fakulti Hospitaliti, Pelancongan & Kesejahteraan (FHPK), and investigates the elements that influence stress. Academic factors, familial issues, and peer pressure are the three key independent variables. The stress experienced by FHPK first-year students is the dependent variable. The graph depicts the association between these variables and the pupils' stress levels. It emphasizes the relationship between the independent variable and the dependent variable, providing insights into the interplay between the factors that influence stress levels in first-year students from the FHPK group at Universiti Malaysia Kelantan.

METHODOLOGY

Research Design

This study used a quantitative research approach to collect significant data. Since quantitative surveys use closed-ended questions, the results can easily be turned into numbers, statistics, graphs, and charts (Thakur 2021).

Data Collection

In this study, the primary approach for gathering data is through the use of a questionnaire. The researcher opted to utilize Google Forms as the platform for distributing the questionnaire due to its convenience and efficiency in reaching a larger number of participants in a shorter period. Specifically, the questionnaire was targeted at first-year students of FHPK at Universiti Malaysia Kelantan. The aim of the questionnaire was to gain insights into the stress experiences encountered by these students.

Sampling

The researchers used non-probability sampling techniques, which means that instead of selecting samples randomly, the researcher chose samples based on their own judgment and assessment. Additionally, convenience sampling was also a component of the non-probability sampling strategy that the researchers employed for this study.

Therefore, convenience sampling is the practice of selecting 260 respondents from the population among first-year students of FHPK Universiti Malaysia Kelantan only. This is because the samples are convenient for the researchers.

Data Analysis

This study utilizes descriptive statistics to analyze the data and understand its fundamental characteristics. Gupta et al. (2019) state that descriptive statistics offer simple explanations of the sample and measurements. However, in this study, the researchers also employ Pearson's Correlation, which examines the relationship between independent and dependent variables. Additionally, Cronbach's alpha is used to assess the accuracy of the questionnaire findings and the quality of the output. Both dependent and independent variables are investigated using Cronbach's alpha coefficient. The data analysis was conducted using Statistical Package for Social Science (SPSS) version 26.0.

FINDINGS

Demographic Analysis

Table 1 Demographic Analysis

Demographic Profile	Frequency	Percentage (%)
Gender		
Male	98	37.7
Female	162	62.3
Age		
18 – 21 years old	205	78.8
22 – 24 years old	49	18.8
25 years old and above	6	2.3
Marital Status		
Single	253	97.3
Married	7	2.7
Ethnicity		
Malay	154	59.2
Chinese	38	14.6
Indian	55	21.2
Other	13	5.0
Course		
SAH	69	26.5
SAP	95	36.5
SAS	96	36.9
Stress Level		
Never	32	12.3
Seldom	120	46.2
Frequent	88	33.8
Very Often	20	7.7

Table 1 indicates the frequency of demographic analysis, with 162 female respondents (62.3%) outnumbering male respondents (98 with 37.7%). In terms of age, 18 - 21 year old accounted for 205 respondents, accounting for 78.8% of the total. 49 respondents (18.8%) represented respondents who were between the ages of 22 to 24. Furthermore, respondents aged 25 and up reported 6 people (2.3%). According on the statistics on respondents' marital status, the majority of single respondents (97.3%) and 7 married respondents (2.7%) answered this questionnaire. Next, the majority of Malays responded to this survey, with a total of 154 people (59.2%), followed by

Indians 55 people (21.2%). Meanwhile, the Chinese showed 38 respondents answering this survey with 14.6% of and other races as many as 13 respondents (5.0%). For respondent data from the costs found in the FHPK shows a total of 69 respondents from the Ijazah Sarjana Muda (Hospitaliti) Dengan Kepujian (SAH) course shows 69 respondents (26.5%), the Ijazah Sarjana Muda Pelancongan) Dengan Kepujian (SAP) course shows 95 respondents (36.5%) and lastly from the Ijazah Sarjana Muda (Kesejahteraan) Dengan Kepujian (SAS) course showed a total of 96 respondents with 376.9%. The number of first-year students who reported experiencing stress ranged from 32 respondents (12.3%) to 120 respondents (46.2%), from 88 respondents (33.8%) to 20 respondents (7.7%), and from never to 120 to often to often.

Descriptive Analysis

Table 2 Descriptive Analysis.

Variables	Items	Mean Score (M)	Standard Deviation (SD)
Stress	I find it hard to keep calm.	3.17	1.279
	I tend to overreact to a situation.	2.94	1.197
	I think I am too nervous.	3.02	1.195
	I get restless easily.	3.12	1.235
	I find it hard to relax.	2.97	1.225
	I cannot accept anything that stops me from continuing what I'm doing.	2.99	1.149
	I am easily offended.	3.14	1.147
	I feel loaded down with responsibility.	3.18	1.171
	I'm easily feel discouraged.	3.16	1.133
	I have not enough time for myself.	3.14	1.197
Academic	I have a financial problem because of the expenses of the university	3.36	1.255
	I find it difficult to juggle time between study and social activity.	3.04	1.100
	I feel nervous about delivering the class presentation.	3.47	1.144
	I feel stressed as the submission deadline neared.	3.33	1.121
	I feel stressed to sit for the examination.	3.27	1.107
	I find it difficult to juggle time between study and society involvement.	3.15	1.088
	I lost interest in courses.	2.95	1.145
	I feel burdened by academic workloads.	3.24	1.144
	I feel stressed dealing with a difficult subject.	3.41	1.110
	I feel difficult in managing my academic problem.	3.20	1.086
Family Issue	My families are not supportive.	1.84	1.106
	I had trouble with my siblings.	1.97	1.074
	My parents frequently argue at home.	1.84	1.048
	My parents regularly make comparisons to other people.	2.08	1.098
	I have been arguing more with my parents.	1.94	1.078
	My family and I have financial difficulties.	2.30	1.193
	My parents expecting too much of me.	2.52	1.284
	I feel so bad if I don't measure up to my parent's expectations.	2.94	1.439
	I am treated like a helpless person by my family.	1.92	1.055
I never had the freedom to choose in my life because my parents always made decisions for me.	1.96	1.039	
Peer Pressure	I have friends that influence how I think.	3.45	1.292
	I make decisions based on peer pressure.	3.09	1.350
	I follow what my peers are telling me to do.	2.98	1.300
	I experience stress because my peers avoid me.	3.17	1.321
	I miss home because of my peer's pressure.	3.12	1.336

My friends pressure me to act in a harmful way.	2.92	1.428
I am stressed out because one of my friends convinced me to skip class.	2.81	1.375
I act differently when I am with my friends than when I'm at home.	3.22	1.318
I am stressed out because my friend talks behind me and betrays me.	3.22	1.343
I am anxious because I let a friend to steal my work, and I'm concerned that my lecturer will find out.	3.22	1.312

Table 2 presents a descriptive analysis of the stress variable. It reveals that the item "I have friends that influence how I think" received the highest mean score (M=3.18, SD=1.171), indicating a significant impact on stress levels. Conversely, the item "I tend to overreact to a situation" received the lowest mean score (M=2.94, SD=1.197), suggesting a relatively lower influence on stress. Regarding the independent variable of academic factors, the item "I feel stressed dealing with a difficult subject" obtained the highest mean score (M=3.41, SD=1.110), indicating a substantial impact on stress related to academics. On the other hand, the item "I lost interest in courses" received the lowest mean score (M=2.95, SD=1.145), suggesting a relatively lesser impact on academic stress. For family issues, the item "I feel so bad if I don't measure up to my parent's expectations" received the highest mean score (M=2.94, SD=1.439), indicating a significant impact on stress related to family expectations. However, the items "My families are not supportive" (M=1.84, SD=1.106) and "My parents frequently argue at home" (M=1.84, SD=1.048) received the lowest mean scores, indicating a relatively lower impact on stress within the family context. Lastly, in terms of peer pressure, the item "I have friends that influence how I think" obtained the highest mean score (M=3.45, SD=1.292), suggesting a strong influence on stress levels. On the other hand, the statement "I feel stressed because a friend persuaded me to miss class" had the lowest average rating (M=2.81, SD=1.375), suggesting that it had a relatively minor effect on stress resulting from peer influence.

Reliability Analysis

Table 3 Reliability Analysis

Variables	Cronbach's Alpha	No. of Items
Academic	.920	10
Family issues	.903	10
Peer pressure	.954	10
Stress	.922	10

Table 3 showed the results of the reliability analysis based on the independent variable and dependent variable which include academic (0.920), family issues (0.903), peer pressure (0.954), and stress (0.922). According to Cronbach's Alpha coefficient scale, all these variables show excellent coefficient and the questionnaire were reliable to use.

Pearson Correlation Analysis

Table 4 Pearson Correlation Analysis

Hypothesis	P-Value	Result (Supported/ Not Supported)
H ₁ There is a significant relationship between academic factors with the stress faced among first-year students of Fakulti Hospitaliti, Pelancongan & Kesejahteraan (FHPK) at Universiti Malaysia Kelantan.	0.000	H ₁ is supported

H₂ There is a significant relationship between family issue factors with the stress faced among first-year students of Fakulti Hospitaliti, Pelancongan & Kesejahteraan (FHPK) at Universiti Malaysia Kelantan.	0.013	H2 is supported
H₃ There is a significant relationship between peer pressure factors with the stress faced among first-year students of Fakulti Hospitaliti, Pelancongan & Kesejahteraan (FHPK) at Universiti Malaysia Kelantan.	0.000	H3 is supported

Table 4 presents the results of a Pearson correlation analysis conducted to test specific hypotheses. The findings demonstrate the statistical significance of the hypotheses under investigation. Hypothesis 1 (H1) yielded a significant value of less than 0.05. When the p-value falls below this threshold, researchers accept the alternative hypothesis in favor of the null hypothesis. In this case, the p-value being less than 0.05 suggests a significant association, and therefore, the alternative hypothesis is supported. Similarly, Hypothesis 2 (H2) produced a significant value of 0.013, which is also below the 0.05 threshold. Consequently, researchers reject the null hypothesis and accept the alternative hypothesis, indicating a meaningful relationship between the variables. Furthermore, Hypothesis 3 (H3) exhibited a significant value of less than 0.05, indicating a highly significant association. With the p-value being less than 0.05, researchers accept the alternative hypothesis and reject the null hypothesis, suggesting a strong relationship between the variables. Ultimately, since all the hypotheses yielded p-values below 0.05, they are considered supported. The significance level of 0.05 is commonly used as a threshold in statistical analyses to determine the strength of evidence against the null hypothesis.

DISCUSSION AND RECOMMENDATION

The discussion is to investigate the link between academic, family issues, and peer pressure elements and stress among first-year students at Fakulti Hospitaliti, Pelancongan, and Kesejahteraan (FHPK) at Universiti Malaysia Kelantan. The study's key findings reveal that academic, family issues and peer pressure had a significant association with stress in this study. Subsequently, previous research showed a significant relationship between academic, family, and peer pressure with stress.

The recommendation is to distribute the questionnaire physically or face to face to collect data. This is because it is simpler to persuade responders to spend the time to complete the questionnaire. Furthermore, respondents cannot give inaccurate information throughout the inquiry, such as gender, age, or race. In online and mobile surveys, the provision of incentives can lead to people falsifying their responses. This is because individuals might provide incorrect demographic information in order to complete the questionnaire quickly and receive the incentive.

Next the questions asked must use a language or reduce questions that are easier to understand. This is because the researcher has examined that there is a small number of respondents who do not understand the questions presented and choose not to answer. The questions that need to be submitted for future studies must be brief and related to a specific study. Third, reduce the number of respondents for the target population. This is because the researcher took a long time to find respondents due to the relatively large number. The target population should be changed from the entire first-year students to the student population for each course, for example, a study of first-year students from a wellness course. This helps researchers obtain and analyze data easily.

CONCLUSION

First-year students in the Fakulti Hospitaliti, Pelancongan & Kesejahteraan (FHPK) at Universiti Malaysia Kelantan often face challenges related to stress, which can have adverse effects on their well-being. However, these individuals can potentially overcome this issue by employing effective coping techniques. Stress is a common problem experienced by university students on a daily basis, stemming from various factors such as academic pressure, peer pressure, and family issues. The stressors associated with academic performance, maintaining peer relationships, and dealing with family problems can all contribute to the overall stress levels. It is crucial to address stress promptly, as untreated stress may escalate into more severe mental conditions like depression or anxiety disorders.

ABSTRACT

The study aims to identify the factors that affect fast food consumption among students at the Universiti Malaysia Kelantan, City Campus. The primary goal of the researcher in this study is to identify the characteristics that influence fast food consumption among students at Universiti Malaysia Kelantan, City Campus, which is becoming more prevalent over time. Therefore, the study aims to investigate the factors that affect fast food consumption among students at Universiti Malaysia Kelantan, City Campus. There are four research objectives discussed. To examine the effect of time management, financial factors, knowledge about fast food impacts and physical activities on fast-food consumption among students in Universiti Malaysia Kelantan, City Campus. The study was conducted using a quantitative research approach which is through online questionnaire to collect the data. There were 364 respondents participated in the study which had been conducted through social media like WhatsApp and it focused on the all three faculties in City Campus.

Keywords: Fast Food, Time, Financial, Knowledge, Physical

INTRODUCTION

Fast food is characterized as hot, easily prepared, or already cooked food, such as hamburgers, served in restaurants within a short time (Dictionary C. Fast Food, 2020). The world has adopted the fast-food culture thanks in part to the fast-food sector. Fast food establishments and vendors have expanded in industrialized and developing countries despite rising awareness of the negative health impacts of a diet rich in fat, salt, and sugar. Even though the adverse health effects of a diet high in fat, salt, and sugar are becoming more widely known, the number of fast-food restaurants and dealers has increased in both developed and developing countries. Due to rapid economic development, urbanization, and the influence of Western cultures, Malaysians' lifestyles have undergone tremendous change during the past three decades. The 1980s witnessed the first observable shifts in food patterns as a result of Malaysia's rapid economic expansion and changes in employment tendencies (Noor MI, 2002). As a result, the fast-food business saw significant expansion in the 1990s (Soon JM and Tee ES, 2014). According to the Department of Statistics Malaysia, there were 1621 fast food restaurants in Malaysia in 2010 and 2597 in 2015 (Department of Statistics Malaysia, 2017).

Teenagers who consume unhealthy diets, such as those high in energy-dense foods and low in fruits and milk, are more likely to frequently eat fast food (Sebastian RS and Enns CW, et al., 2009). Since dietary habits formed during adolescence may last throughout adulthood, poor eating habits in adolescents can result in excessive weight gain and raise the risk of obesity. According to previous research from other nations, fast food consumption is more common among younger people, households with higher incomes, adults with higher body mass index (BMI), and men (Mohr P and Wilson C,

et al., 2007). Between 2004 and 2009, the proportion of Chinese adolescents aged 13 to 17 who reported eating fast food rose quickly from 17.9 to 26.3% (Xue H and Wu Y, et al., 2016). Investigating fast food consumption patterns among teenagers in Malaysia would therefore be intriguing. Therefore, the main focus of this study is to find out the factors that affect fast-food consumption among students in Universiti Malaysia Kelantan (UMK), City Campus. There were three objectives of this research:

1. To examine the influence of time management on fast food consumption among students in Universiti Malaysia Kelantan, City Campus.
2. To examine the influence of financial factors on fast food consumption among students in Universiti Malaysia Kelantan, City Campus.
3. To examine the influence of knowledge about fast food impacts on fast-food consumption among students in Universiti Malaysia Kelantan, City Campus.
4. To examine the influence of physical activities on fast food consumption among students in Universiti Malaysia Kelantan, City Campus.

SIGNIFICANCE OF THE STUDY

Following the topic chosen, researchers have looked into the relationships between independent and dependent variables, such as time management, financial factors, knowledge about fast food impacts, and physical activity. A fast-food consumption solution would benefit many people, including future researchers, students at Universiti Malaysia Kelantan, City Campus and others.

LITERATURE REVIEW

Time Management

Fast food consumption has a history of having negative consequences on dietary intake and overall health. Fast food is most frequently consumed by those in their twenties, probably because these meals are convenient, quick, and reasonably priced (Seo HS et al.,2011). In a Pusan study by Lee, 40.5% of high school students and 38.5% of primary school students reported eating fast food once or twice per month, which is greater than the percentage seen in people in their forties or fifties (Lee JS.,2007). Fast-food consumption among students is a result of poor time management. According to Bipasha and Goon's 2014 research, 54% of students at a private university in Bangladesh skipped breakfast due to time constraints and commitments to classes, as well as the variety of food available at a fast-food restaurant. Due to time restrictions, many students had switched from eating home-cooked or healthy meals to fast food to fit everything into their busy schedules. As a result, when they are hungry, they eat fast food to satisfy their need. To simplify, living as a student is not easy. For example, due to the tight schedule of lectures and assignments, students choose to eat on the go rather than eat clean, simply choosing for fast-food because it is more convenient and can save more time (De AP et al.,2015).

The way our brains are wired causes some people to be frequently labelled as lazy, according to researchers who have shown that inactivity is a natural tendency of the brain. Even though we all possess this mentality of laziness, only the individual may

decide whether or not they are lazy. Most college students who enjoy fast food do so because of laziness and a desire to save time. Fast food is everything quick, tasty, handy, and trendy. People, primarily students, become addicted to fast food due to clever snack advertising and the appeal of convenience and taste. Potato wafers and Cheetos are food that does not require cooking or heating. Not only that, but people also enjoy eating pizza and hamburgers while watching TV or doing their homework because it saves them a tremendous amount of stress and time when they are short of time. The only thing left to do is wait for these meals to be made and delivered to their door while still hot and ready to eat (Bhaskar et al.,2012). As a result, efficient time management is essential in everyday life because it allows people to do more in less time and feel calmer and less stressed over time.

Financial Factors

Customers' perceptions of the pricing and quality of a product or service will significantly impact a company's bottom line. Customer-perceived value is the expectation that a customer can purchase with confidence. It is the emotion purchasers should have had after purchasing something of high value. As a result, customers will be proud to associate with a company with a quality image. Furthermore, it has a broader scope of applicability than ensuring product or service quality. It's also a means to keep track of corporate procedures and ensure that customer satisfaction is always excellent, both internally and externally. It is to provide the highest level of client happiness.

Fast-food restaurants have chosen to focus on providing high-quality products at low prices. They believe that excellent quality comes from the best fresh ingredients, and excellent quality comes from the best ingredients. Additionally, fast-food chains collaborate closely with the Malaysian government to assemble specialists from across the globe in order to identify the most successful and modern programmes and policies to guarantee that food safety requirements are not compromised. Additionally, the fast-food restaurant offers reasonably priced, excellent lunch and supper sets, which is quite popular with Malaysian customers, especially teens who place a high value on getting the best deal.

Knowledge about Fast Food Impacts

A well-known microbiologist named Dr. Michael F. Jacobson invented "Junk Food" in 1972 to describe unhealthy or un-nutritious food. Junk food must contain various ingredients, some of which can be unhealthy. For instance, Monosodium glutamate (MSG), a flavour enhancer frequently added to processed meats, canned vegetables, soups, and Chinese food, causes hypothyroidism, headaches, nausea, weakness, difficulty breathing, drowsiness, and rapid heartbeat.

Fast-food restaurants and other stores are regular destinations for teenagers after school. Allowing a youngster to study information about junk food is the best way to convince them to eat healthier foods. Children can learn much about junk food from websites, schools, magazines, and other sources. Parents that provide their kids access to such information encourage their kids to adopt healthier eating practices by raising awareness of the issue.

Physical Activities

Living on the marcapada involves many responsibilities that must be fulfilled and take up a person's time, making simple tasks like eating and drinking increasingly challenging. Since eating fast food regularly makes it easier for us to engage in daily physical activities, we neglect to take nutrition seriously since we are too busy chasing our objectives or life ambitions. The health benefits of exercise cannot be overstated. White-collar occupations and modern life's amenities make us more sedentary, which is terrible for our health.

Additionally, physical activity covers any bodily motions that require energy in daily life, such as brisk walking, jogging, and running. A person will reportedly feel better after engaging in physical activity because endorphin, the happy hormone, and the stress hormone will be created more, increasing both the body's function and social activity since physical activity is typically more enjoyable when done in groups or pairs. Burgers and instant noodles are examples of fast food that have been processed and contain many chemicals that can improve nutrition and extend the shelf life of the item. The key factor contributing to the drawbacks of eating fast food frequently is the food's composition.

Consuming fast food affects physical activity, such as can reduce a person's productivity. For example, university students who often eat instant noodles to save on daily expenses will face a recession in their daily activities due to a lack of energy and nutrients. The students should give priority to themselves so that they have good skills and are convincing. Therefore, a balanced and healthy diet can guarantee the effectiveness of students in class and also the ability to do physical activities in healthy conditions. Furthermore, food delivery applications that are growing today also make our people even lazier if viewed from a negative angle. The bottom line is that technological convenience and economic turmoil must be faced wisely to gain positive and profitable benefits.

Fast-food Consumption

According to research, college is a crucial time for students to change their eating habits unhealthily. University students are also more likely to have a lousy diet intake (Von Ah D and Ebert S, et al. 2004). Students who first enroll in college frequently experience the strains of shifting academic burdens, attempting to adapt to their new environment, building networks, and taking on unexpected obligations. University students today have more flexibility and control over their lives than ever before, which can lead to poor nutritional decisions like a regular fast-food diet (Ngamvitroj A and Park N et al., 2004).

The fast-food culture among students may cause a demographic shift away from traditional foods and home-cooked meals. These nutritional transition patterns in the population are linked to a decline in diet quality and the loss of cultural traditions and family customs (Zaghloul S and Al-Hooti SN et al., 2013).

The reasons college students eat at fast-food outlets have not been the subject of much research. Advertising and media, lack of parental supervision, taste preferences, self-control, time constraints, and the physical environment - such as availability and accessibility, costs, and decent menu options - can all have an impact on food choices. Including options in fast-food orders could improve the quality of their diet since some menu selections in fast-food places offer fruits and vegetables (Tom Deliens and Clarys P, et al., 2014).

The term "fast food" was used to describe meals that are prepared rapidly, offer takeaway options, have little to no wait staff, and demand payment before being delivered (Block J and Scribner R, et al., 2004).

Research Hypothesis

The literature analysis showed that factors influencing fast-food consumption among students in Universiti Malaysia Kelantan, City Campus, include time management, financial factors, knowledge about fast food impacts, and physical activity. As a result, the study intended to look at the relative importance of these variables. The study's hypotheses were outlined as follows:

H₁: There is a significant influence of time management on fast-food consumption among students at Universiti Malaysia Kelantan, City Campus.

H₂: There is a significant influence of financial factors on fast-food consumption among students at Universiti Malaysia Kelantan, City Campus.

H₃: There is a significant influence of knowledge about fast-food impacts on fast-food consumption among students at Universiti Malaysia Kelantan, City Campus.

H₄: There is a significant influence of physical activities on fast-food consumption among students at Universiti Malaysia Kelantan, City Campus.

Research Framework

The Figure 1 below shows the research framework use for this study:

METHODOLOGY

Research Design

The goal and intent of research design are to make sure that the data obtained enables researchers to solve the study challenge at hand correctly. An interpretative methodology known as research design can be regarded as the best approach for the investigation. The questionnaires utilized in this study's examination structure follow a quantitative methodology, and all of the information collected from respondents will be used as the study's primary data. Through this examination framework, which includes setting up and organizing a research strategy, the material acquired will assist an analyst in understanding the relationship between independent and dependent variables. The quantitative data acquired by the survey is used in this assessment technique. The survey includes age, gender, study profile, ethnicity, year of study, and other factors. The four components of the questionnaires—A, B, C, and D—are related to demographic variables, dependent variables, and independent variables. 364 students from Universiti Malaysia Kelantan, City Campus will be among the approximately 364 respondents whose responses will be chosen for this study.

Data Collection

One form of data gathering approach is primary data, which is collected expressly for the design aspect. It is the raw data gathered during the study procedure. It's also a secure data collection system because researchers know where the information came from and was compiled by researchers. To contain data for this study, researchers engaged the questionnaire approach. Questionnaires were chosen because, compared to other methods, they can provide quicker responses from a more significant number of respondents, providing more accurate and reliable results for the entire research project. The questionnaire was administered online, allowing respondents to respond quickly. It will give convenience to the respondents and bring them to answer the questionnaire without any strain and also be suitable to give honest and accurate information.

A quick and inexpensive method to obtain information from moving sources is to use secondary data, often known as data analysis. This type of data analysis is much more cost-effective in conducting research projects. It is also a wise approach to initiate research using secondary data to help design research projects. Journals from academic handbooks and databases like Google Scholar were used as secondary data in this study.

Sampling

Researchers will use probability sampling in this study. Since each respondent has an equal chance of being chosen, researchers will utilize simple random sampling to choose several respondents from each population. Students from the Universiti Malaysia Kelantan, City Campus, were chosen as respondents. The total number of respondents is 364 students who were chosen to answer the questions to help researchers collect data regarding the research topic being researched. The reason why researchers chose students in Universiti Malaysia Kelantan, City Campus as respondents is that they are also individuals who are closely related to the consumption of fast food throughout being a student.

Data Analysis

The key information used in the research effort is described in this section. Additionally, this section makes an effort to discuss the research hypotheses and address the objectives of the study. This chapter includes tables, pies, and charts that display the data evaluation, statistical analysis findings, and all of the research study's conclusions. The reliability test, Pearson Correlation, and descriptive statistics are the main analyses used in this research study.

The data from the questionnaire was structured, edited, categorized, and coded by the researcher using computer tools such as the Statistical Package for the Social Sciences (SPSS). This tool aids researchers in quickly calculating information and inspires quantitative investigations that are faster and less demanding. Using a variety of statistical techniques, this study assesses descriptive analysis, reliability analysis, and Pearson's correlation coefficient. Researchers can make use of data sources to evaluate the logical conclusions reached by this computer programme.

To examine the variables and explain the respondents' biographical information, descriptive analysis was performed. The importance of the link between the variables in the study was determined using reliability statistics, while Pearson's Correlation Coefficient was used to evaluate the independent variable and analyze the data (Bewick et al., 2003).

FINDINGS

Results of Frequency Analysis.

Table 1 shows the result of frequency analysis of respondents.

Table 1: Frequency Analysis

No	Socio-Demographic Characteristics	Frequency (n)	Percentage (%)
1	Gender	364	100
	Male	74	20.3
	Female	290	79.7
2	Age	364	100
	18 years	3	8
	20 years	7	1.9
	21 years	19	5.2
	22 years	86	23.6
	23 years	218	59.9

	24 years	21	5.8
	25 years	4	1.1
	26 years	2	0.5
	33 years	2	0.5
	37 years	1	0.3
	39 years	1	0.3
3	Race	364	100
	Malay	324	89
	Chinese	15	4.1
	Indian	19	5.2
	Iban	2	0.5
	Bajau	1	0.3
	Sabah	3	0.8
4	Religion	364	100
	Islam	330	90.7
	Christian	5	1.4
	Buddha	10	2.7
	Hindu	19	5.2
5	Education Level	364	100
	Sijil Pelajaran Malaysia	6	1.6
	Diploma	21	5.8
	Ijazah Sarjana Muda	337	92.6
6	Year of Study	364	100
	Year 1	20	5.5
	Year 2	48	13.2
	Year 3	276	75.8
	Year 4	20	5.5
7	Faculty	364	100
	FHPK	264	72.5

FKP	71	19.5
FPV	29	8

Table above shows the result of frequency analysis of respondents. The research focuses on students in Universiti Malaysia Kelantan, City Campus and most of the respondents were female which is 290 respondents (79.7%) while the male are 74 respondents (20.3%).

On the other hand, majority of the respondents were from age 23 years which is 218 respondents (59.9%), followed by age 22 years which is 86 respondents (23.6%), 24 years as many as 21 respondents (5.2%) then, 21 years which is 19 respondents (5.2%), 20 years as many as seven respondents (1.9%), 25 years which is four respondents (1.1%), 18 years as many as three respondents (8%), 26 and 33 years both two respondents (0.5%) and lastly 37 and 39 years both one respondent (0.3%).

Furthermore, most of the respondents are Malay which is 324 respondents (89%) followed by Indian as many as 19 respondents (5.2%) and Chinese 15 respondents (4.1%). Bumiputera Sabah race consists three respondents (0.8%), Iban have two respondents (0.5%) and one respondent from Bajau race (0.3%). For religion, most of the respondents are Islam which are 330 respondents (90.7%) then, Hindu as many as 19 respondents (5.2%) followed by Buddha which is 10 respondents (2.7%) and lastly Christian consists five respondents (1.4%).

Last but not least, majority of the respondent have education level in Ijazah Sarjana Muda 337 respondents (92.6%), 21 respondents have Diploma (5.8%) and six respondents have education level in Sijil Pelajaran Malaysia (1.6%). For year of study, majority of the respondents are from Year 3 students which are 264 respondents (72.5%) followed by Year 2 as many as 48 respondents (13.2%), then respondents from Year 1 and Year 4 both consists 20 respondents (5.5%). Finally, respondents from FHPK faculty have the most respondents which are 264 respondents (72.5%) followed by FKP which is 71 respondents (19.5%) and FPV consist 29 respondents (8%).

Result of Descriptive Analysis

Table 2 shows the result of descriptive analysis of variable.

Table 2: Descriptive Analysis

Variable	Items	Mean Score	Standard Deviation
Fast-food Consumption	Fast food tastes good.	4.22	0.792
	I get good value for money when I buy a fast food 'packaged meal deal'	3.72	0.867
	I feel satisfied after eating fast food.	3.87	0.977
	I am able to treat/reward myself with fast food.	3.74	0.913
	Eating fast food frequently saves my time.	3.54	1.045
	Eating fast food frequently is good for my health	2.02	1.056
	Eating fast food frequently encourages an inactive lifestyle.	4.41	0.862

	Eating fast food frequently is very convenient for me.	3.41	1.018
Time Management	I am too busy to eat healthy food.	2.78	1.150
	I am too rushed in the morning to eat a healthy breakfast.	3.18	1.178
	I don't have time to think about eating healthy.	2.66	1.137
	Eating healthy meals just takes too much time.	2.62	1.085
	It is hard to find time to sit down and eat a meal.	2.76	1.228
	I tend to 'eat and run'.	2.13	1.143
	Regular meals are important to me.	3.82	0.842
	I eat meals at about the same time every day.	2.90	0.995
Financial Factors	I feel fast food is cheaper than regular meals.	3.39	1.051
	The last fast-food meal I had was worth the price.	3.57	0.886
	My purchasing habit ever been influenced by promotions of fast-food chains on social media.	3.72	0.932
	I always use discount coupons to buy fast food.	3.38	1.109
	I think it is convenient to buy a meal in fast food restaurant.	3.54	0.936
	I prefer fast food over any other meal.	2.92	1.090
	I often consume fast food on a weekly basis.	2.64	1.210
	On average, I think more money is spent on regular meals than fast food per week.	3.51	1.087
Knowledge about Fast Food Impacts	I think fast food is not good for health.	4.46	0.814
	I think fast food can provide all vital nutrients	2.31	1.060
	I think fast food has a lot of salt.	4.12	0.756
	I think fast food has a lot of fat.	4.07	0.759
	I think that consuming fast food will make me fat.	4.10	0.893
	For me, eating fast food frequently is likely to result in weight gain.	4.29	0.900
	I believe that consuming fast food too often can lead to obesity.	4.35	0.844
	I think fast food has a lot of calories.	4.39	0.793
Physical Factors	Consuming fast food causes physical activity to be impaired.	3.92	0.872
	I do exercise three times a week.	3.27	0.976
	Physical activity can reduce chronic diseases.	4.27	0.669
	I work out and exercise to keep myself healthy	4.26	0.839
	Eating fast food can reduce my ability to do physical activity.	3.66	0.909
	I realize that physical activity is important in everyday life.	4.48	0.694
	Eating fast food can harm your health.	4.26	0.715
	Physical activity can control us from consuming fast food.	3.93	0.817

Result of Reliability Test

Table 3 shows the result of reliability analysis based on dependent variable and independent variable.

Table 3: Reliability Test

Variable	Number of Items	Cronbach's Alpha
Fast-food Consumption	8	0.827
Time Management	8	0.762
Financial Factors	8	0.903
Knowledge about Fast Food Impacts	8	0.758
Physical Activities	8	0.609

Results of Pearson Correlation Analysis

Table 4 shows the result of Pearson Correlation Analysis based on the hypothesis

Table 4: Pearson Correlation Analysis

Predictors	Pearson Correlation	P-Value
Time Management	.662**	.000
Financial Factors	.694**	.000
Knowledge about Fast Food Impacts	.151**	.004
Physical Activities	.089	.089

Table 4 shows the result of Pearson Correlation Analysis in order to see the relationship of each predictor with fast-food consumption. According to the results, the null hypothesis is rejected and the alternative hypothesis is accepted for time management, financial factors and knowledge about fast food impacts while for physical activities, the null hypothesis is accepted and the alternative hypothesis is rejected. The Pearson Correlation indicates strong relationship between the fast-food consumption with time management and financial factors. Meanwhile, The Pearson Correlation indicates very weak relationship between the fast-food consumption with knowledge about fast food impacts and physical activities.

Table 5: Multiple Linear Regression Analysis

R	R Square	ANOVA	
		F	P-Value
0.765	0.585	126.299	0.000

In multiple linear regression analysis, the interpretation based on R-square and result of ANOVA. All predictors variable explained 58.5% of the total variation in fast-food consumption. Based on result of ANOVA, the study indicates that the model is significant since F value (126.299) is associated with a p-value of $0.000 < 0.05$ and its obtain that the model fit the data well.

Table 6: Hypothesis Testing

Hypothesis	Coefficients	P-Value	Result (Supported/ Not Supported)
H₁: There is a significant influence of time management on fast-food consumption among students at Universiti Malaysia Kelantan, City Campus.	0.315	0.000	H ₁ is supported
H₂: There is a significant influence of financial factors on fast-food consumption among students at Universiti Malaysia Kelantan, City Campus.	0.403	0.000	H ₂ is supported
H₃: There is a significant influence of knowledge about fast-food impacts on fast-food consumption among students at Universiti Malaysia Kelantan, City Campus.	0.080	0.101	H ₃ is not supported
H₄: There is a significant influence of physical activities on fast-food consumption among students at Universiti Malaysia Kelantan, City Campus.	0.074	0.161	H ₄ is not supported

Based on multiple regression analysis by using enter method, the study obtained that the significant influencing factors on fast-food consumption are time management (p-value < 0.05) and financial factors (p-value < 0.05). While, there is no significant influence of knowledge about fast-food and physical activities on eating habits among students since p-value > 0.05.

DISCUSSION AND RECOMMENDATION

In hypothesis testing, probability values, also known as p-values, are used to indicate whether an alternative hypothesis is accepted or rejected. If the p value is equal to or less than the significance level or alpha value (α), the alternative hypothesis is accepted and the test is significant. Because each hypothesis has been investigated at 95%, the null hypothesis will be rejected if the p-value is equal to or less than 0.05. In other words, there is a significant relationship between variable and non-variable variables. If the p value is greater than 0.05, the alternative hypothesis is rejected. The test was not significant because there was no discernible difference between the transformed and untransformed variables.

The purpose of the discussion is to clarify the relationship between fast food consumption and time management, financial factors, food knowledge, and physical activity among students at Universiti Malaysia Kelantan, City Campus. The data show that there is a significant relationship between the independent variables of time management, financial factors, food knowledge, physical activity, and the dependent variable of fast-food consumption. The previous study also found a significant relationship between fast food consumption and time management, financial factors, food knowledge, and physical activity.

According to the Pearson correlation value, the financial factor has a stronger correlation than time management, food knowledge, and physical activity, while physical activity has the weakest correlation, as shown by a correlation of (0.903>0.762>0.758>0.609).

The researcher will suggest some recommendations that will help for future research. This is to ensure future research gets better results and quality research. First and foremost is to expand the target demographic in future studies to include wellness students in year two and four. This would help provide the best results. This is due to the fact that the students are already educated on nutrition, knowledge about fast-food impacts, and the effect of physical activities on fast-food consumption. Future studies may benefit from it in order to get more effective results.

Furthermore, the researchers respond to the questionnaires using a range of survey approaches. For instance, the researchers can employ telephone surveys and in-person personal interviews to get the fastest response from the respondents. If the respondents have any difficulties comprehending the study, they will find it easy to ask questions and get prompt responses via personal interviews and telephone surveys. If various surveying techniques are applied, the results will also be more accurate and valuable.

Last but not least, multilingual questionnaires that cover languages like Mandarin and Tamil should also be used in future studies. This is due to the fact that the questionnaire's primary languages were simply English and Malay. The questionnaire's multilingual capacity may make it simpler to understand and less stressful to respond for respondents with different ethnic and linguistic origins. As a result, the outcomes will be more reliable and effective. The use of different languages is therefore highly beneficial for providing accurate answers to the inquiry.

By following these recommendations, future research on fast-food consumption among students can provide a more comprehensive understanding of the factors that influence this behaviour. This information can then be used to develop more effective interventions to help students make healthier food choices.

CONCLUSION

The research is about factors that affect fast-food consumption among students in Universiti Malaysia Kelantan, City Campus. Time management, financial factors, knowledge about fast food impacts and physical activities are independent variables. These variables influence the dependent variable which is fast-food consumption. There was a significant relationship between the three independent variables and the dependent variable.

This research was limited due to lack of interest in the questionnaire, lack of understanding and also having problems gaining access to FKP and FPV students at Universiti Malaysia Kelantan, City Campus. The proposed study, which includes expanding the target population, using more survey methods and using multiple languages, will be useful in future research.

ABSTRACT

Nowadays a person's eating habits are influenced by a number of specific factors. It can happen either in positive or negative and problems occur if eating habits are not taken care of properly and bring harm to an individual. The study aims to investigate the factors that influence the eating habits among third year of Wellness students at Universiti Malaysia Kelantan (UMK). A total of 123 respondents from third year Wellness students were surveyed based on a quantitative research design using questionnaire. The study performs the Pearson correlation analysis to see the relationships among variables and modeled the Multiple Linear Regression (MLR) to test the hypothesis in order to find the factors that influence the eating habits. The study found that physical factor ($r = 0.472$), psychological factor ($r = 0.567$) and food consumption trend ($r = 0.624$) have moderate positive significant relationship with eating habits since all the p-value is less than 0.05. However, results of MLR obtain that only two variables were significant influences on eating habits which are psychological (p -value < 0.05) and food consumption trend (p -value < 0.05). While, there is no significant influence of physical factors on eating habits among third year Wellness students at UMK (p -value > 0.05). Factor that most influence eating habits is food consumption trend ($B = 0.338$). The implication of the study is to make the community aware of the importance of maintaining healthy eating habits and to adopt healthy eating habits regardless of the circumstances. Healthy eating habits can prevent chronic diseases.

Keywords: Eating Habits, Physical Factors, Psychological Factors, Food Consumption Trends.

INTRODUCTION

Eating habits have become a concern, especially among the community, especially for university students. As a university student, there is no denying that each student has their own eating habits. However, it is very important for them to adopt proper eating habits as prescribed in the nutritional guidelines. According to the Malaysian Dietary Guidelines 2020, it is important to adopt a healthy diet to ensure the body consumes sufficient protein, fat, and carbohydrates as well as all essential vitamins and minerals. The combination of all food groups in the Malaysian Pyramid 2020 can ensure that students get the necessary nutrients based on the creation of the food pyramid. Eating habits that not only affect the physical, mental and emotional but are also decisive for the future. Healthy eating habits are the selection of balanced food and aim to maintain health. A healthy or balanced diet has sufficient nutrient content such as carbohydrates, proteins, fats, vitamins, and salt. Lack of those nutrition will lead to malnutrition. Therefore, it is important for today's society to wisely choose healthy food because there are various benefits obtained when practicing it.

However, there are also irregular eating habits. According to Dr. Christy C. Tangney, a clinical nutritionist at Rush University Medical Center, studies have shown that even individuals who do not eat breakfast and consume only a few calories that

day are more likely to have a higher body mass index or BMI. Students' eating habits are also caused by their psychology (Ganasegeran et al. Nutrition Journal, 2012). Among the respondents, almost 48.5% of students eat because they feel lonely, 62.1% feel out of control when talking about food, 53.8% eat so much that it hurts stomach, 53% of students will eat because they feel uncomfortable or anxious, 59.1% will eat when they are bored and 80.3% will eat because they feel happy. Previous studies have shown that stress behavior can affect an individual's eating habits (Torres S & Nowson C, 2007; Adam T, & Epel E, 2007). Usually, people who are in a stressed society group will be more inclined to eat more as a way for them to overcome the stress (Gower B, Hand CE & Crooks ZK, 2008).

Eating habits are defined as "habitual behavior related to an individual's eating habits, choice of food eaten, preparation of food, and amount eaten". In addition, eating habits is an important aspect of life because it can affect long-term health outcomes due to unhealthy eating habits such as eating foods that lack nutrients, skipping meals and lack of nutrition. Everyone has different eating habits and it depends on themselves whether they have healthy or unhealthy eating habits. There are many factors that cause people's eating habits. The consumption of unhealthy food does not only occur among children, but it also occurs among teenagers and the elderly. The use of unhealthy food has a great impact on health, especially for people who smoke. Among the effects of eating unhealthy food are obesity, diabetes, and kidney disease. If the body is not healthy, all the activities to be done cannot be done well, for example, movement will be slow. Therefore, this study shows the factors influencing eating habits among third year Wellness students at Universiti Malaysia Kelantan. There were three objectives of this research:

1. To investigate the influence of physical factors on eating habits among third year Wellness students at Universiti Malaysia Kelantan
2. To investigate the influence of psychological factors on eating habits among third year Wellness students at Universiti Malaysia Kelantan
3. To examine the influence of food consumption trends factors on eating habits among third year Wellness students at Universiti Malaysia Kelantan

Significance of the Study

University Students

The study will help university students know and understand about healthy and balanced food selection. In addition, it will be a reference for students to know more about the factors that cause eating habits, and it will be a new experience or knowledge in daily life. The results of this study hope to identify the factors that influence eating habits among third year Wellness students at Universiti Malaysia Kelantan. In addition, eating snacks late at night and eating unhealthy food is also one of the factors that influence eating habits among Wellness students. By consuming unhealthy food, it will affect all student activities because it has a profound effect on a person's body such as losing focus while studying, quickly falling asleep and so on. Thus, this study can help students to prevent chronic diseases caused by students eating habits.

LITERATURE REVIEW

Physical Factors

Physical factors can affect an individual's eating habits. This is because everyone has their own eating habits. According to (Kabir A, Miah S & Islam A, 2018) there is a relationship between an individual's physical factors and their eating habits. This physical factor includes cooking skills for an individual, taste of food, food taboo, state of mind, past food habits, knowledge about food and so on. The results of the study

show that all the physical factors have a relationship with the eating habits of an individual.

However, the eating habits taken by an individual depend on themselves whether they want to choose healthy food or unhealthy food. Taste, texture, appearance, familiarity, smell, whether the food goes with other foods and how the food is prepared as important in influencing their food choice decisions (Amanda Fitzgerald, Caroline Heary, Elizabeth Nixon & Colette Kelly, 2010). Not just that, although they have knowledge about healthy eating, young people's eating preferences, especially in terms of taste, texture, and appearance, seem to prevail over this knowledge when making food decisions.

Psychological Factors

According to the study Psychological Factors are Important Correlates of Dietary Pattern in Overweight Adults which explains that adults are likely to feel depressed when they feel the demands of the environment as a burden on themselves. (Chonen, Kessler RC, Gorlon LU, 1995). This stress can cause bad things like depression and unhealthy eating habits. This can also lead to chronic diseases. (Bale TL.2006 and McEwen Bs 2005). Negative emotions are also one of the causes of changes in eating habits. Feelings of anger, fear, and sadness lead to disordered eating patterns. (Machth M, Simons G, 2000). Desire to eat foods high in fat and high in carbohydrates. This is more common in women than men. (Benton D, 2002). This shows that psychologically depressed people will have unhealthy eating habits. Stress or depression has the potential to drive a person to eat anything to get rid of the stress and depression faced. In contrast to stable emotions, where a person does not face any problems or stress in their life. They will emphasize a healthy lifestyle and balanced eating habits according to nutritional needs.

Food Consumption Trends Factors

Food consumption trend factors can also influence a person's eating habits in making food choices. This is because everyone has their own habits when choosing food. According to evaluation (Zaborkis et al. BMC Public Health 2012) there is a relationship between the factors of food consumption trends of individuals and their eating habits. The percentage of daily crude consumption of fruits, vegetables and others was calculated for each survey year. Differences in food consumption rates between years of study were significant for all foods apart from university students' daily fruit consumption, some specific trends also revealed. Compared with 2010 to 2002, the percentage of girls consuming vegetables daily increased from 24.2% to 31.0%, but the percentage of boys eating vegetables decreased from 29.3% to 23.1%. in 2006, for both sexes, there was an increase in regular consumption of sweets and chocolates, cookies and cakes, and soft drinks. However, in 2006 and 2010, the consumption of crisps and fast food also decreased significantly. This shows that the food intake trend factor has a relationship with eating habits in previous studies. This relationship is believed to depend on a person's food choices, whether healthy or unhealthy.

Eating Habits

The definition of "eating habits" is how a person eats. This can be considered in terms of the type of food eaten, how much and when. It is said that our eating habits affect our health. According to the Live Strong Foundation, healthy eating is consuming amounts of foods that provide the ideal balance of nutrition and energy to support children's growth and adult metabolism. Examples of healthy foods are those fortified with vitamins and minerals with less fat, cholesterol, sugar, and sodium. On the other hand, junk food or sometimes called junk food is defined as any food that is not

conducive to maintaining health. Basically, achieving healthy eating habits is as simple as controlling your food intake. More importantly, eating habits are formed very early. Therefore, taking care is essential to lead a healthy life. According to Juliet A. Boghossian, eating behavior expert and founder of food science, "you are how you eat." Here, he mentions that fast eaters tend to be ambitious, people who use their brains more than their hearts. While a slow eater tends to do whatever they want without worrying about others. Eating habits are also different in men and women. Therefore, differ in their eating habits. Finally, eating habits tend to reflect a person's attitudes and behaviors.

Research Hypothesis

The literature review highlighted the independent variables which is physical, psychology, food consumption trend factors that influence the eating habits. Based on the literature, the hypotheses of the study are as follow:

- H₁** There is a significant influence of physical factors on eating habits among third year Wellness students at Universiti Malaysia Kelantan.
- H₂** There is a significant influence of psychological factors on eating habits among third year Wellness students at Universiti Malaysia Kelantan.
- H₃** There is a significant influence of food consumption trend factors on eating habits among third year Wellness students at Universiti Malaysia Kelantan.

Research Framework

Figure 1 below shows the research framework used for this study.

Figure 1: Research Framework

METHODOLOGY

Research Design

The study uses quantitative research design which involves collecting and analysing numerical data. Moreover, the quantitative research design is ideal for identifying trends and averages, making predictions, testing relationships and generalizing results for the populations. In addition, research design is one of the frameworks of research methods and techniques chosen by researchers to conduct research. Therefore, a quantitative research approach is suitable to study the factors that influence

eating habits among third year Wellness students at Universiti Malaysia Kelantan.

Data Collection

The method used in collecting the quantitative data generates statistics using large-scale survey research, using methods such as internet surveys. All information obtained through the study is from primary sources which is the researcher collects data and information directly from the main source using self-administered questionnaire. Information on all Wellness students is obtained from Faculty of Hospitality, Tourism and Wellness (FHPK) office. With the data obtained, the researcher distributed the question to all respondents through a Google form provided online through their email. The questionnaire was created to find out in more detail about physical factors, physiological factors, and food consumption trends factors that influence the eating habits among third year Wellness students at Universiti Malaysia Kelantan. Internet surveys such as questionnaires became a popular method of obtaining information from the public, especially their opinions on certain issues of public interest. The internet survey also doesn't take long, and respondents are free to answer at any time.

Sampling

A 123 respondents was taken from the total population which is 176 of third year Wellness students at UMK based on the Krejcie and Morgan 1970 table. The list of sampling frame was provided by the faculty. Then, the probability sampling technique which is simple random sampling using a random number generator was conducted to get the respondents. The email owners from a list of 123 numbers generated by a random number generator were respondents for the study. Furthermore, the method that has been used does not incur any costs for this research and it is not necessary to conduct the study face-to-face with the respondents.

Data Analysis

Data analysis is the process of collecting, modeling, and analysing data to extract information to support decision-making. The researcher used the statistical software Statistical Package for the Social Sciences (SPSS) version 28 to analyze the data for the study. There are five types of data analysis used which are Frequency analysis, Descriptive analysis, Reliability analysis, Correlation analysis and Multiple Linear Regression analysis. The frequency analysis is used to describe respondent demographic information while Descriptive analysis is used to find out the respondent's level of agreement about the research conducted. The Reliability analysis was carried out to evaluate the survey, and the process to determine whether it provides consistent results and can be considered reliable. For the Correlation analysis, the researcher used the Pearson correlation test to measure the strength of the correlation and relationship between the independent variable (IV) and the dependent variable (DV) and carry out the Multiple Linear Regression analysis to test the hypothesis hence to determine the factors that influencing eating habits among students.

FINDINGS

Results of Frequency Analysis

Table 1 shows the results of the descriptive analysis for all respondents who are third-year Wellness students at Universiti Malaysia Kelantan. The majority of respondents who answered this questionnaire were female with a frequency of 111 respondents (90.2%), while only 12 male respondents (8.9%) answered this questionnaire. However, all respondents are of various ages. Most of them are 23 years old which is a total of 100 respondents (81.3%), followed by respondents who are 22 years old which is a total of 17 people (13.8%), then 5 respondents who are 24 years old (4.1%) and also a respondent who is 26 years old year that recorded 0.8%. The majority of respondents are Malays, which is 115 out of 123 respondents (93.5%) followed by 6 respondents (4.9%) who are Indians, then one respondent who is Bumiputra Sabah and also Iban who recorded a percentage of 0.8% for both races. As for religion, all the Malays adhere to the Islamic religion, which is a total of 116 respondents (94.3%), the majority of Indians are also Hindu, which is 6 people (4.9) and one respondent adheres to the Christian religion, recording a percentage of 0.8%.

As for marital status, the majority of the 123 respondents are still single. It recorded a frequency of 119 respondents (96.7%) compared to respondents who are married, which is a total of 4 respondents who recorded a percentage of 3.3%. For the subject specialization of third-year Wellness students, the majority of the respondents were from the spa track, which is 81 respondents (65.9%) while the remaining 42 respondents (34.1%) were students from the gym track. There are many answer choices for the respondents who are third year Wellness students. There are 14 respondents who live in college, who recorded a percentage value of 11.4%. The majority of respondents live in rented houses which are 89 respondents (72.4%), while the total number of respondents who live with their families is 18 respondents (14.6%), then one respondent lives in a rented room and also one respondent lives alone. Both of them recorded a percentage value of 0.8%.

Table 1: Frequency Analysis

No	Socio-Demographic Characteristics	Frequency (n)	Percentage (%)
1.	Gender	123	100
	Male	12	8.9
	Female	111	90.2
2.	Age	123	100
	22 years	17	13.8
	23 years	100	81.3
	24 years	5	4.1
	26 years	1	0.8
3.	Race	123	100
	Malay	115	93.5
	Indian	6	4.9
	Bumiputra Sabah	1	0.8
	Iban	1	0.8
4.	Religion	123	100
	Islam	116	94.3
	Christian	1	0.8
	Hindu	6	4.9

5.	Marital status	123	100
	Single	119	96.7
	Married	4	3.3
6.	3rd-year Wellness Subject Specialization	123	100
	Gym	42	34.1
	Spa	81	65.9
7.	Place	123	100
	College	14	11.4
	Rent House	89	72.4
	With Family	18	14.6
	Alone	1	0.8
	Bilik Sewa	1	0.8

Results of Descriptive Analysis

The results in Table 4.2 show the descriptive analysis for dependent variable and independent variables. By referring to the table, it can be identified that eating habits 14 (I know that a good eating habits can prevent myself from getting many types of diseases in the future) is the highest mean value ($M = 4.24$, $SD = 0.937$), while eating habits 12 (I always choose foods that are high in sugar) obtained the lowest mean value ($M = 2.67$, $SD = 1.160$). For physical factors, the physical factors 5 (Have a busy schedule can cause your meal times to be interrupted) obtained the highest mean value ($M = 4.31$, $SD = 0.863$), while physical factors 2 (Cooking skills cause the irregular eating habits of an individual) obtained the lowest mean value ($M = 3.36$, $SD = 1.186$). For psychological factors, the highest mean is psychological factors 9 (My appetite will increase when I eat with my family) with the value ($M = 4.15$, $SD = 0.958$) while for the lowest mean, there are two psychological factors that obtained the same mean which are psychological factors 11 (I tend to eat unhealthy foods when I'm sad) in mean value ($M = 3.45$, $SD = 1.186$) and psychological factors 2 (I like to eat when i feel lonely), with mean value ($M = 3.45$, $SD = 1.223$). For food consumption trends factors, the highest mean is food consumption trends factors 4 (Consuming foods that are high in calories will cause a person to get various types of diseases in a long period of time) with value ($M = 4.11$, $SD = 1.002$), while food consumption trends factors 6 (I like fizzy and sugary drinks even though I know they are not good for health) obtained the lowest mean value ($M = 2.97$, $SD = 1.351$).

Table 2: Descriptive Analysis

Variable	Questions	Mean Score	Std. Deviation
Eating Habits	I eat regularly every day.	3.14	1.169
	I never skip my meals.	3.00	1.215
	I always take my breakfast.	3.03	1.219
	I practice a nutritious diet.	3.46	0.994
	I limit the intake of snacks.	3.53	1.003
	I usually have fruit as a snack.	3.65	1.090
	I prefer ready meals over cooking at home.	3.25	1.135
	I like to eat late at night.	3.31	1.220
	I only eat fried food twice a week.	2.76	1.167
	I choose vegetables in the food I eat.	3.69	1.124
	I drink at least 1 liter mineral of water every day.	3.92	1.076
	I always choose foods that are high in sugar.	2.67	1.160
	I like to eat fast food.	3.41	1.166

	I know that a good eating habits can prevent myself from getting many types of diseases in the future.	4.28	0.937
	I don't take my eating habits seriously because my body mass index (BMI) is in the normal range.	3.02	1.231
	If my weight is at the level of 'obesity', then I will practice a nutritious diet.	4.06	1.069
Physical Factors	Physical factors can influence an individual's eating habits.	3.99	0.954
	Cooking skills cause the irregular eating habits of an individual.	3.36	1.186
	Delicious food can cause the unhealthy eating habits.	3.76	1.079
	Lack of knowledge about nutritious will affect the eating habits.	4.19	0.920
	Have a busy schedule can cause your meal times to be interrupted.	4.31	0.863
	Eating habits between different gender are not same.	3.83	1.069
Psychological Factors	The food i eat depends on my emotions.	3.93	0.968
	I like to eat when i feel lonely.	3.45	1.223
	I like to eat while doing something like doing an assignment.	3.75	1.245
	My food intake will increase when I feel happy.	3.93	1.005
	I will eat uncontrollably if I am under stress.	3.54	1.230
	The food I eat has a healthy diet.	3.47	0.929
	I always prioritize the nutrients of the food I take.	3.61	0.983
	I prioritize taste over nutrition.	3.78	0.958
	My appetite will increase when I eat with my family.	4.15	0.958
	I will eat a lot when I feel very hungry.	4.07	1.009
	I tend to eat unhealthy foods when I'm sad.	3.45	1.186
Food Consumption Trends Factors	Are current food trends affecting your eating habits?	3.81	1.051
	I prefer to try foods that go viral regardless of the number of calories per serving.	3.55	1.182
	Do you think that this unhealthy food consumption trend does not affect your health?	3.01	1.352
	Consuming foods that are high in calories will cause a person to get various types of diseases in a long period of time.	4.11	1.002
	I have become accustomed to practicing unhealthy eating habits.	3.03	1.123
	I like fizzy and sugary drinks even though I know they are not good for health.	2.97	1.351

Results of Reliability Analysis

Table 3 shows the result of the reliability coefficient alpha based on the dependent variable and each independent variable. The Cronbach's Alpha value of all variables is 0.914. The dependent variable which is eating habits with 16 questions has Cronbach's Alpha value of 0.827 which is good and acceptable. For the first independent variable, physical factors with 6 questions show Cronbach's Alpha value of 0.717 which is acceptable. The second independent variable, psychological factors which contains 11 questions shows Cronbach's Alpha value of 0.856 which is good. The third independent variable, food consumption factors with 6 questions in the questionnaire provided has Cronbach's Alpha value of 0.722 which is acceptable.

Table 3: Reliability Analysis

Variable	N	Number of items	Cronbach's Alpha
All Variable	123	39	0.914

Eating Habits	123	16	0.827
Physical Factors	123	6	0.717
Psychological Factors	123	11	0.856
Food Consumption Factors	123	6	0.722

Results of Pearson Correlation Analysis

Table 4 shows the result of Pearson correlation analysis in order to see the relationship of each predictors with eating habits. According to the results, there are a moderate positive significant relationship between all predictors and eating habits. Therefore, the study performs Multiple Linear Regression (MLR) to test the hypothesis testing.

Table 4: Pearson Correlation Analysis

Predictors	Pearson Correlation	P-Value
Physical factors	0.472	0.000
Psychological factors	0.567	0.000
Food consumption trend factors	0.642	0.000

Results of Multiple Linear Regression Analysis (MLR)

Table 5 shows the result of the multiple linear regression analysis. In multiple linear regression analysis, the interpretation is based on R-square and the result of ANOVA. All predictor variables explained 44.7% of the total variation in eating habits. While, the result of ANOVA, indicates that the model is significant since F value (32.105) is associated with a p-value of $0.000 < 0.05$ and it obtain that the model fits the data well.

Table 5: Model Summary and ANOVA of MLR

R	R Square	ANOVA	
		F	P-Value
0.669	0.447	32.105	0.000

Results of Hypothesis Testing

Table 6 shows the hypothesis testing based on multiple linear regression analysis by using enter method. The study indicates that the significant influencing factors on eating habits are psychological ($p\text{-value} < 0.05$) and food consumption trend ($p\text{-value} < 0.05$). While, there is no significant influence of physical factors on eating habits among third year Wellness students at Universiti Malaysia Kelantan ($p\text{-value} > 0.05$). Moreover, factors that most influence eating habits is food consumption trend ($B = 0.338$).

Table 6: Hypothesis Testing

Hypothesis	Regression Coefficients (B)	P-Value	Result (Supported/ Not Supported)
H1 . There is a significant influence of physical factors on eating habits among third year wellness students at Universiti Malaysia Kelantan.	0.062	0.468	H1 is not supported
H2 . There is a significant influence of psychological factors on eating habits among third year wellness students at Universiti Malaysia Kelantan.	0.239	0.006	H2 is supported
H3 - There is a significant influence of food consumption trend factors on eating habits among third year wellness students at Universiti Malaysia Kelantan.	0.338	0.000	H3 is supported

DISCUSSION AND RECOMMENDATION

The discussion was conducted to address the research questions and research hypotheses stated in this study as in the first chapter of this study. In general, the study was conducted to extensively examine the factors that influence eating habits among third-year Wellness students at Universiti Malaysia Kelantan. Based on findings, each student has their own eating habits, as well as male and female. From the Pearson correlation results, it can be identified that the correlation between physical factors and eating habits obtains a moderate correlation value and not significant influence on eating habits. From the questionnaire, it clearly shows that not many students practice a nutritious diet in their eating habits. Students stated that they like to eat late at night and that they will take their eating habits seriously if their weight is not in the normal range. However, they still choose vegetables in the food they eat. However, less than half of the respondents actually eat regularly every day. Among them, many skip meals and don't always eat breakfast every morning.

Not only that, students also eat fried food at least twice a week. Students who live in rented houses, prefer to buy ready-made food instead of cooking at home. One of the best options to practice healthy eating habits is to practice nutritious food in your daily diet. This is because nutritious food has many advantages contained in it. In addition, psychological factors such as emotions also affect students' eating habits. They like to eat when their emotions are at a happy level. Their appetite will also increase when eating with their family. With that, it is clear that emotions affect the eating habits of an individual. From the study, some of the students who live in rented houses only choose to cook food from home instead of food that has already been prepared outside. However, it depends on how much time they have to prepare the food. This is because, it saves their time. However, choosing healthy foods should be prioritized by balancing the intake of food based on a pyramid food chart.

Research findings are also important for the continuation of future research. The same study that can be carried out should be extended to first year and second year Wellness students or made to tourism and hospitality students. The purpose is to study the factors that influence eating habits among students by expanding the target population set by the researcher to get the best results. This is because students have learned and have knowledge about eating habits and the factors that influence them. Researchers can also use different types of survey methods to get information from respondents such as using personal interviews. Among the advantages obtained from the personal interview method, the researcher will receive a response from the

respondent quickly. Not only that, researchers can also use observation methods to choose, see the behavior and characteristics of eating habits for individuals.

CONCLUSION

In conclusion, the study was conducted to find out the factors that influence eating habits among third year Wellness students at Universiti Malaysia Kelantan. Although all three factors which are physical factors, psychological factors and food consumption trends factors have a moderate positive significant relationship with eating habits but among these three factors, there are only two factors were significant influence on eating habits which is psychological and food consumption trend while physical factors was not significant influence on eating habits. Hence, the most influence eating habits is food consumption trend.

ABSTRACT

6. Mental health is important for every stage of life including childhood, teenagers, adults, and others. There are many effects that can lead to mental health issues among university students. Mental health among students is increasingly concerned and very important for students because it is related to emotional, psychological also social well-being. The study is focusing on the factors that cause mental health among 3rd year FHPK student at University Malaysia Kelantan, City Campus which is to identify the effect of time management on mental health among 3rd year students at University Malaysia Kelantan, City Campus, to determine the effect of environment on mental health among 3rd year students at University Malaysia Kelantan, City Campus and to examine the effect of lifestyle factor on mental health among 3rd year students at University Malaysia Kelantan, City Campus. The study was conducted using a quantitative research approach which is through online questionnaire to collect the data. There were 250 respondents participated in the study which had been conducted through social media such as WhatsApp group and it focused on the third years FHPK students in Universiti Malaysia Kelantan, City Campus.
-

Keywords: Mental Health, Time Management, Lifestyle, Environment

INTRODUCTION

The chapter gives an outline of introduction about the research of mental health among 3rd year students at University Malaysia Kelantan, City Campus. This section collaborates on the background of the study and the problem statement of study. This research question and research objective for this research are also stated in this chapter to give an initial overview of the purpose of this study. This chapter also discusses the scope and the significance of the study along with the definition of term for each information contained in this study. There were three objective of this research which are:

1. To identify the effect of time management on mental health among 3rd year students at University Malaysia Kelantan, City Campus.
2. To determine the effect of environment on mental health among 3rd year students at University Malaysia Kelantan, City Campus.
3. To examine the effect of lifestyle factor on mental health among 3rd year students at University Malaysia Kelantan, City Campus.

SIGNIFICANCE OF THE STUDY

Ministry of Health (MOH), Malaysia.

Based on Ministry of Health (MOH Malaysia point of view, this research can gain an information about mental health among university students and show the importance of it. According to MOH, statistic has been revealing that the worst state on mental health among Malaysian students, from one to ten individuals in 2011 to one in five in 2016. From this study, it can trigger the sensitivity of the ministry to come out the best services mental health centre that will help to decreasing the number of mental health disease among the university students. As a result, not only student will get the benefits but also the ministry. By doing that, it will help to minimize the mental health and stress level so they can perform very well in the academic and co-curriculum. Moreover, the number of mental health disease among university students will reduce by time under the government's control. This finding could help in changing the perception of mental health among university students.

University students.

The one that related on this research is university student and the study will help them to understand the factor of mental health among university students. University students

can refer to this research to know more about factor that cause the mental health and also will gain them some knowledge so that they can practice in their daily life in order to have a better life as a students. This study offers information on mental health and ways that universities, particularly students at University Malaysia Kelantan, might address these problems. Because of the importance of the study, it is anticipated that participants will comprehend how factors such as environment, lifestyle, and time management have an impact on their mental health. Armed with this knowledge, participants will be better equipped to manage this issue and succeed as university students.

LITERATURE REVIEW

MENTAL HEALTH

Basically, the World Health Organization (WHO), has defined mental health as:

"...a state or aspect of physical, mental, and spiritual as well as social well-being. These three aspects need to be fulfilled by everyone to achieve an optimal level of health. When a person is in good mental health, he or she may function efficiently at work and at home and can make a positive contribution to society. (World Health Organization, 2018). But the most famous definition of mental health and used by WHO as: "... a state of complete physical, mental, and social well-being and not mere absence or infirmity." (WHO, 2012).

This shows that mental health is not only a problem of stress but emphasizes how an individual overcomes the problem of mental stress. Therefore, aspects of adolescent mental health development are important to pay attention to and discuss. They need elements of positive development, especially aspects of cognitive development and social skills for the well-being of their lives (Hezzrin & Norsuhaily, 2020; Pauzi, 2019).

TIME MANAGEMENT FACTORS

According to Claessens et al, (2007) this definition of time management has been summarized as a behavior that aims to achieve effective use of time while performing specific purposeful activities. In this way, the definition of time does not focus on time itself emphasizing goal-directed behavior, to be achieved within a time frame or

through efficient use of time. He also noted that time management skills can have an impact on anxiety and distress.

Meanwhile W. Rossler (2012) discovered that those who have trouble managing their time are more likely to battle with stress, sleep disorders, anxiety, depression, and other mental health issues. Philip G. Levendusky (2021) found that time management is not only important to get things done on time for your work. Mental health care and timely mental health care training should be developed and implemented as part of professional development activities.

ENVIRONMENT FACTORS

The psychosocial environment, which is characterised as having standards, expectations, and beliefs, is what is referred to as the school climate and it determines how safe people feel physically, emotionally, and socially. (2009) Cohen et al. Another element that influences kids' mental health issues is their environment. The purpose of this study was to determine the role that environmental factors have in the mental health issues that third-year students at Universiti Malaysia Kelantan experience. There have been requests for more diverse research designs (Thapa et al., 2013), more rigorous and complicated research designs (Wang & Degol, 2016), as well as deeper research into how various aspects of the institutional environment can influence student, individual, or group learning outcomes. (Wang & Degol, 2016) group.

Family Environment

According to McIntyre JC et al. (2018), topics pertaining to student experiences in childhood and before to attending university were investigated. Murray E, et al. (2019) also investigated the impact of ACE (Adverse Childhood Experiences), which Feletti VJ (2009) measured using the same scale. This study was conducted to find out different mental health outcomes including positive and negative effects, prevention methods, despair, anxiety, and suicide risk, as well as existing mental health issues, use of mental health services, and psychological adjustment. University students' bad mental health is significantly and favourably related to ACE, according to research that has been done in this area.

Research Hypothesis

According to the literature study mentioned above, time management, lifestyle factors, and environment are the problems that affect the mental health of third-year students at University Malaysia Kelantan. All the aforementioned factors are known as

independent variables, whereas university students' mental health is a dependent variable. The study's hypothesis basically asks whether the independent variables and dependent variable have any discernible effects on one another.

H1: There is a relationship of time management on mental health among 3rd year FHPK student in University Malaysia Kelantan, City Campus.

H2: There is a relationship of environment on mental health among 3rd year FHPK student in University Malaysia Kelantan, City Campus.

Research Framework

METHODOLOGY

Research Design

Research design is a technique and framework that will be chosen by the researcher to find out specific design of the study. A research design is a collection of procedures and methods used to gather and analyse data on the variables listed in the research topic. (Andrew B, 2018). This framework of research design will help the research to find out the method for this research design to successfully accomplish this study. The design of this research was done comprehensively, involving studies being conducted. This is due to the research method conducted covers all the data taken in this study. Research design is a technique and framework that will be conducted by the researcher to execute the answer to research question of the study. The researcher uses quantitative method to approach of this study. A quantitative research approach has been used for the study of factor mental health among 3rd year students at University Malaysia Kelantan, City Campus.

Data Collection

The process of gathering, measuring, and analysing accurate insights for research purposes using established, accepted procedures is referred to as data collection, according to Emily McLaughlin (2018; supported by the evidence acquired, a researcher can evaluate their hypothesis). The first and most important step in most research projects, regardless of the subject, is data collection. The primary data gathering is divided into two parts. Data main refers to the type of information that was gathered for the study through interviews, questionnaires, experiments, and other means. The information is primarily used in the study to support their chosen topic and objective, which is supported by data.

Researchers collect primary data directly from primary sources such as survey like used a questionnaire through the Google form. The questionnaire is applied to collect the information regarding that lead to the factors that affecting mental health among third year FHPK students in Universiti Malaysia Kelantan, City Campus. The questionnaire was distributed using an online platform to all third years FHPK students at Universiti Malaysia Kelantan, City Campus. The questionnaire was distributed through online and social media like WhatsApp and collected data among the third years wellness student. The students answered the questionnaire according to the condition and related to their current situation as well.

Sampling

In this research, the researchers use a probability sampling technique which is simple random sampling. Respondents consist of third years FHPK student at Universiti Malaysia Kelantan, City Campus. The number of respondents is around 250 students. Researchers use the random numbers generator, and it is using physical measures of temperature, phase noise, clock signals, and other non-deterministic inputs, random number generators are hardware or software programmers that produce random numbers as an output. Respondents from the questionnaire were university students from third years wellness students. University students from third years FHPK students were selected for this survey because most students from third years FHPK students were probably experienced in mental health. Respondents were selected to answer this questionnaire and all data were collected based on their answers.

Data Analysis

The data was evaluated by the researcher using SPSS 28 (Statistical Package for the Social Sciences). In this study, four different forms of data analysis—frequency analysis, descriptive analysis, reliability analysis, and correlation analysis—were used. While descriptive analysis was used to describe the level of agreement of the variable, frequency analysis was employed to assess the demographic profile of respondents. To make sure the survey data was accurate and served its goal, reliability analysis was used. A valuable method for assessing any correlation and the strength of a linear relationship between an independent variable (IV) and a dependent variable (DV) is the correlation analysis, often known as the Pearson Correlation Test.

FINDINGS

Results of Frequency Analysis

Table 1: Socio-demographic Characteristics

No	Socio-demographic characteristic	Frequency (n)	Percentage (%)
1	Gender	250	100
	Male	67	26.8
	Female	183	73.2

2	Race	250	100
	Malay	231	92.4
	Chinese	7	2.8
	India	7	2.8
	Others	5	2.0
3	Age	250	100
	19-21 years	20	8.0
	22-24 years	211	84.4
	25-27 years	19	7.6
4	Programme	250	100
	SAH	79	31.6
	SAP	77	30.8
	SAS	94	37.6
5	City	250	100
	Pengkalan Chepa, Kota	250	250
	Bharu		

Data of descriptive analysis obtained from Part A in questionnaire where on demographic variables includes of gender, race, age, study program involved, as well as city. This questionnaire study focuses on 3rd year FHPK students of Universiti Malaysia Kelantan.

Table 4.2 shows the results of descriptive analysis of respondents. The researcher focused on 3rd year FHPK students of Universiti Malaysia Kelantan to answer this questionnaire. Based on the evaluation in the table, the female gender gets the highest frequency compared to the male which is a total of 183 respondents with a percentage (73.2%). While there were 67 male respondents with a percentage (26.8%). Most of the Malay respondents who answered this questionnaire were 231 people (92.4%). Chinese and Indian only got 7 respondents (2.8%) and others got 5 respondents (2.0%).

Following the respondent's age, the highest age frequency of respondents is from 22-24 years old with 211 respondents (84.4%). While the age frequency for the 19-21-year-old stage got 20 respondents (8.0%) and the 25-27-year-old stage got 19 respondents (7.6%). The program offered in this survey has only 3 programs namely Sah, Sap and Sas. In these three programs Sas got the most respondents which is 94 respondents (37.6%). The Sah program had a total of 79 respondents (31.6) and the Sap program

had a total of 77 respondents (30.8%). All of the respondents involved are from Pengkalan Chepa, Kota Bharu because it only involves university students in Kelantan.

Result of Descriptive Analysis

Table 2 shows the result of descriptive analysis of variable.

Table 4: Descriptive Analysis

Variable	Items	Mean Score	Standard Deviation
Time	Lack of rest on weekend.	3.7250	1.02699
Management Factor	Often feel stressed because of not being able to complete academic tasks or other responsibilities on time.	3.7560	1.04154
	Often feel anxious or worried when thinking about schedules and tasks that must be completed.	3.9360	0.95475
	Finding it difficult to sleep because of many tasks or responsibilities that must be completed.	3.7640	1.00015
	Often feel out of control or feel exhausted by academic tasks or other responsibilities.	3.6840	0.98592
Lifestyle Factors	I often neglect a healthy lifestyle and do not practice exercise activity.	3.2280	1.11579
	I lacked awareness about the importance of a balance lifestyle to mental health.	3.0440	1.20993
	I do not take care well about my sleep schedule.	3.6960	1.15278
	I was not practiced healthy eating habits on a regular basics.	3.4280	1.13577
	I was often exposed to unhealthy environments such as noisy and toxic environments.	3.2640	1.23629
	I do not get support from family or friends.	2.6000	1.23210

Environment	I feel isolated from friends.	2.7800	1.23682
Factors	I have difficulty or lack of sleep.	3.5040	1.22638
	I feel lack of enthusiasm.	3.3760	1.15236
	I like to think negative things.	3.2480	1.23312

Table 2 presents the mean and standard deviation of the first independent variable which is the time management factor. Based on the table, the lowest mean score is in time management factor 5 which is (m=3.6840, SD=0.98592) followed by time management factor 1 (m=3.7520, SD=1.02699) and time management factor 2 which has a mean (m=3.7560, SD=1.04154). With the evaluation based on the table, the second highest mean score is in time management factor 4 with (m=3.7640, SD=1.00015) while the highest score is time management factor 3 (m=3.9360, SD=0.95475). It has been shown about the mean and standard deviation of the second independent variable which is the lifestyle factor. In the table, lifestyle factor 3 has the highest mean score among the others which is (m=3.6960, SD=1.15278). Followed by lifestyle factor 4 in the highest mean (m=3.4280, SD=1.13577). While lifestyle factor 5 got a mean score of (m=3.2640, SD=1.23629) and lifestyle factor 1 got a mean score of (m=3.2280, SD=1.11579). Lifestyle factor 2 got the lowest mean score among the others (m=3.0440, SD=1.20993). Table 4.7 presents the mean and standard deviation of the third independent variable, which is the environmental factor. Based on the evaluation in the table, environmental factor 3 mean (m=3.5040, SD=1.22638) has got the meanest score compared to others. Environmental factor 4 became the second highest mean which is (m=3.3760, SD=1.15236) followed by environmental factor 5 which is (m=3.2480, SD=1.23312). While for environment factor 2 got the second lowest mean score as much as (m=2.7800, SD=1.23682). The lowest mean score is environment factor 1 which is as much as (m=2.6000, SD=1.23210).

Result of Reliability Analysis

Table 3 shows the result of reliability analysis based on dependent variable and independent variable.

Table 5: Reliability Analysis

Variable	Number of Items	Cronbach's Alpha
Time Management Factors	5	0.885
Lifestyle Factors	5	0.796

Environment Factors	5	0.847
Physical Activity Factors	8	0.873

The reliability coefficient alpha based on the dependent variable and each independent variable is displayed in Table 4.6. All variables have a Cronbach's Alpha value of 0.851. The five-question dependent variable on mental health has a good and acceptable Cronbach's Alpha score of 0.843. The result of 0.885 for Cronbach's Alpha for the first independent variable, time management factors with 5 questions, is good, trustworthy, and acceptable. The Cronbach's Alpha score for the second independent variable, lifestyle factors, which consists of 5 questions, is 0.796, which is good, reliable, and acceptable. The third independent variable, environment factors, has a good Cronbach's Alpha value of 0.847 and 5 items in the given questionnaire. Results from all factors are highly correlated.

DISCUSSION AND RECOMMENDATION

Based on this research, there are a few factors affecting mental health among third year FHPK students at University Malaysia Kelantan have been determined. This study was conducted to ensure that students can take care of their mental health well and to know how many students are involved or not in mental health, so that this problem can be prevented before it is too late. First and foremost, the recommendation is to enlarge the target demographic or respondents which include all FHPK students at University Malaysia Kelantan, City Campus in future study. The next recommendation for future research is that the researchers should use a variety of survey techniques to get the respondents through the questionnaire. The researchers can use telephonic surveys or another survey technique which is in-person personal interviews. Finally, the researchers can expand the rental house area among all years of FHPK students around the University Malaysia Kelantan, City Campus for the respondents is the recommendation to improve the future studies.

CONCLUSION

This study examines the variables influencing the mental health of University Malaysia Kelantan's City Campus third year FHPK students. The three independent variables (IV) and the dependent variable (DV) in this study were related to one another. Overall, the study's limitations stem from the third year FHPK students at University Malaysia Kelantan's City Campus's lack of interest in the questionnaire, their lack of

comprehension, and their difficulties in gaining access to them. Expanding the target group, utilising more survey techniques, and using several languages are suggested as important in future research.

ABSTRACT

A wellness programme is to maintain and improve a person's health through a balanced diet, regular exercise, stress reduction, and disease prevention. There are various challenges that contribute to the lack of implementation of Campus Wellness Initiatives among students and staffs, including a lack of understanding about personal health, the problem of obesity, which limits daily mobility and causes fast food intake. As a result, participation in these wellness initiatives is reduced. Therefore, the study aimed to explore the effectiveness that motivate, to assess the extent of support provided by campus leadership support, to determine the level of awareness, to assess the level of interest and to investigate the level of satisfaction of facilities among students and staff in campus wellness initiatives. The study was conducted using a quantitative research approach which is through online questionnaire survey in Google Form to collect the data. There were the 362 respondent consists of students and staff from the UMK City Campus. Based on the research findings, the research objectives of motivation, leadership support, participant awareness and participant interest were supported except the facilities, -.230 is not significant. All the hypotheses have been accepted at a significant level of 0.01, meanwhile the facilities showed that is not significant at $p > 0.05$. A few implications related to the research study are the researcher is difficult to get superiors to become respondents, during covid 19, respondents lacked involvement in health initiatives and were unable to know the effectiveness of the program and the difficulty in finding journals related to the research topic being studied. The implications related to the study have been proposed by the researcher.

Keywords: Campus Wellness Initiatives, Effectiveness, UMK City Campus

INTRODUCTION

The concepts "wellness" and "well-being" can be found in a variety of literary genres, including general social commentary, economics, social science, and food marketing. These phrases are frequently employed in contexts that cover both more general and esoteric aspects of life pleasure, such as happiness, as well as mental, physical, and emotional health. Wellness has a direct impact on one's ability to work and labour productivity, the nation's economy, the moral atmosphere in society, young people's education, and how one is perceived and how well one is living. The improvement of the students' quality of life is mostly due to the promotion of health. Indicators of the general personal culture include people's involvement in their own well-being and care, prevention of wellness illnesses, personality tendencies, such as personal health consciousness in many facets of life (Nesterchuk et al., 2020).

Surveys measuring physical, emotional, social, intellectual, and vocational wellbeing were given to participants. Significant institutional variations were reported for measures of physical and social health (Baldwin et al., 2017). Six broad categories of health-related behaviours make up holistic wellness: physical wellness, including eating plan, workout, sleep, smoking, alcohol use, and personal care; emotional wellness, including self-identity and self-esteem; spiritual wellness, including peace and connection with the universe; social wellness, including a sense of community and social support; occupational wellness, including job satisfaction; and intellectual wellness (e.g., creative stimulating mental activities).

As an increasing number of students seek physical and mental health services, college student wellness has become an increasingly important topic in higher education (Staples et al., 2022). Many people have suggested that wellness should be thought of holistically, encompassing not only bodily but also spiritual and mental aspects (Staples et al., 2022). In response to these requests for holistic wellness, studies in higher education have looked into components of moral well-being, such as meaning, direction and purpose in life (Lothes & Nanney, 2019). Then again, to the growth of wellness techniques with a spiritual foundation, such mindfulness and meditation (Lister et al., 2021).

The objectives of this study are as follows :

1. To explore the effectiveness that motivate students and staff to participate in campus wellness initiatives.
2. To assess the extent of support provided by campus leadership support towards wellness initiatives.
3. To determine the level of awareness of students and staff regarding the available campus wellness initiatives.
4. To assess the level of interest among students and staff in participating in wellness initiatives.
5. To investigate the level of satisfaction among participants with the existing wellness facilities in the campus.

Significance of the study

Students

The study's findings are significant because if many wellness initiatives are conducted on campus, students will be able to learn a few ways to overcome health problems in themselves and be able to incorporate strategies for maintaining a healthy lifestyle into their everyday routine. Therefore, it benefits pupils to increase their knowledge. Students that participate in wellness initiatives can teach it to other students. In addition, wellness initiatives can provide many benefits to the student's lifestyle.

Body of Knowledge

Examining empirical research on the subject can help a student acquire a fresh approach to resolving a problem that has been brought up in prior research projects. For example, the method used to gather the data, the sample size, and each data analysis can be modified to focus on a different issue and provide a distinctive study (Rafael, 2018). These opportunities to engage with health programs are great to avoid excessive waste of resources and this can improve the quality of health.

This study intends to provide more precise details regarding the difficulties experienced by campus wellness initiatives and to inform upcoming researchers about the availability of data on campus wellness initiatives among students or staff. This aids in deepening the investigation into the subject pertaining to the difficulties and success of campus wellness initiatives.

University

This study will benefit university as useful knowledge that everyone should learn. When the wellness initiatives are reactivated among students or staff, this institution will eventually understand what crucial techniques and programmes are required for a daily healthy living. It can also identify what factors or ways to improve wellness initiatives. So that, it can implement the program more effectively to the students and staff. It is also to prevent the waste of resources from happening. For example, responding to a challenge by participating in a national sports day.

Community

Wellness initiatives also benefit the community. If the wellness programmed and activities is successful, we can replicate to the community. How important wellness initiatives are to the community because one of the goals is to produce a good health and wellbeing society. By creating socially inclusive wellness initiatives, communities can support people in living fulfilling lives and have a good impact on their general health. A healthy community benefit everyone in it. And community health is one way to achieve a healthy community. That is why it is important for students at University of Malaysia Kelantan as students are usually very familiar with the community and they can practice it to the community.

Health Management

This phrase describes the overall management and direction of both governmental and private healthcare organizations. In essentially, the goal of healthcare management is to make sure that everything in the healthcare sector runs properly (Wager et al., 2021). Wellness programs have to do with Health management. That is why wellness initiatives are important and can benefit Health Management. It is also to prevent the waste of resources from happening.

LITERATURE REVIEW

Motivation

Motivation is crucial for identifying variables that might affect why people decide to finish the course. For example, perceived internal and personal incentives for completing a task or action, such as greater knowledge or a sense of success or self-worth, can be classified as intrinsic or extrinsic sources of motivation. A person's want to conduct or act in a way that will satisfy specific conditions or demands, which typically includes wishes, desires, or objectives, is referred to as motivation (Yilmaz et al., 2017).

According to certain research, when we feel powerless to exert control, for instance, we tend to give up easily (Gacek et al., 2017). Others have demonstrated that when we are pressured, we lose access to our inner resources for motivation (Ryan & Deci, 2019). Mental health problem among student can be reduce by gain motivation in wellness initiatives university (Al-Kumaim et al., 2021) . Programs for wellness actively involve students in activities that reduce anxiety, stress, and other mental health issues that may have an impact on how well they learn. In order for students to have successful futures, educators must provide them with the knowledge, abilities, and general health and well-being. Increasing wellness initiatives can benefit both the educator and the student.

Leadership Support

There are numerous definitions and interpretations of leadership. The leadership development models that originated in the framework of work organisations had limited application to students in learning environments as a result of emphasising employee-employer relations in a corporate environment (Shek & Lin, 2016). One of the earliest theories of leadership was the "Great Man Theory," which claimed that leaders were born, not made (Lumpkin & Achen, 2019).

Participant Awareness

People need knowledge about the actions and intentions of their co-workers when they collaborate in a shared setting, whether it be virtual or not. Successful cooperation requires this knowledge, especially when using groupware solutions (Collazos et al., 2018). One of the most well-known definitions of awareness is a comprehension of other people's activities, which provides context for a person's own activity. This knowledge of others is the outcome of the interaction of the participants and their environment (Collazos et al., 2018).

The prevalence of depression and anxiety disorders was found to be undergraduate students received 15.6%, while graduate students received 13.0%., indicating that there are a variety of mental health issues on college campuses for which students need support (Lipson & Eisenberg, 2017). 14.9% of

college students reported having received a diagnosis of depression at some point in the past, of whom 32% had experienced depression in the previous year, 24.5% were undergoing psychotherapy at the time of the research, and 35.6% were taking an antidepressant (Oswalt et al., 2018).

There is a severe lack of participant awareness of mental health issues, particularly among students. This presents a significant challenge because students tend to think this issue is common because they are unaware that they can participate in health programmes and activities at the same time. Lack of understanding of the extent to which particular situations could precipitate signs of mental illness. Given the various triggers for mental illness that college students experience (Dieringer et al., 2017).

Participant Interest

The majority of health initiatives only reach people who are already driven to take care of their health, according to ongoing studies of participation rates in wellness programmes and activities. Less motivated people will avoid topics like clear awareness of mental health issues and the significance of wellness programmes and activities. The people who are least knowledgeable about the subject are those who need this incentive the most. The fact that student health efforts are overly complicated, time-consuming, or challenging is another factor in the low participation rates in wellness initiatives.

The evidence for success is less positive if the objective of health programming is to lower health care costs, reduce absenteeism, or improve chronic health issues (Heidi Zwart, 2018). As we all know, university students are less interested in wellness initiatives if they are not given the proper emphasis, and if they are not given more attention, they are exposed to the hazards of this mental health to students.

Facilities

The type of campus recreation facilities is sometimes one of the deciding considerations for college enrollment for college students (Andre et al., 2017). Additionally, obtaining a degree after successfully completing a college career is one of the top focuses for institutions across the country (Makubuya et al., 2020). Student outcomes related to campus recreation, according to the Council for the Advancement of Standards in Higher Education (CAS), can be used to gauge the effectiveness of campus health and wellness programmes (Wells, 2015).

Recreational sports departments should use the dimensions associated with these domains as benchmarks for their programming and providing services. Learning outcomes for students are distinctive client qualities that might give the facility information about the likelihood of client intention for referral and repeat business. To maximise the effects of leisure activities on the student body on service delivery, collegiate recreation departments collaborate with campus stakeholders to ensure that they are promoting the educational objectives for their institutions (Makubuya et al., 2020).

Institutions that offer services for students that connect to recreation frequently think about how to improve students' lives and experiences. Climbing walls, elevated walking or jogging tracks, and other sophisticated recreation facilities are now commonplace, and a variety of other attractions rather than the outdated locker rooms and court gymnasiums (Kampf et al., 2018).

Research Hypothesis

The literature review highlighted that the independent variables like motivation, leadership support, participant awareness, participant interest and facilities that effectiveness of campus wellness initiatives among student and staff in UMK City Campus. Therefore, the study planned to examine the level of effectiveness among these variables. Based on the literature discussed, the hypotheses of this study were summarized in the following manner:

H1: There is a relationship between the motivation among student and staff, and the effectiveness of the wellness initiatives.

H2: There is relationship between leadership support and the effectiveness of wellness initiatives effectiveness.

H3: There is a relationship between participant awareness and the effectiveness of wellness initiatives.

H4: There is a relationship between participant interest and the effectiveness of wellness initiatives.

H5: There is a relationship between facilities and the effectiveness of wellness initiatives.

Research Framework

The Figure 1 below shows the research framework use for this study.

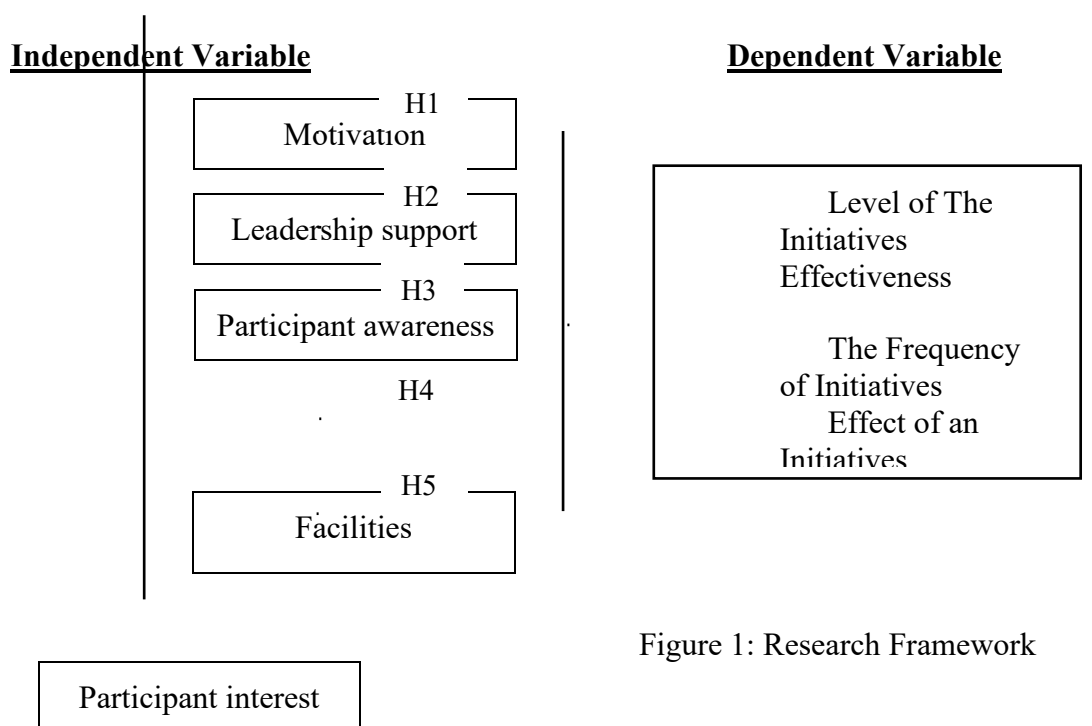

Figure 1: Research Framework

METHODOLOGY

Research Design

This research design is a framework that has been created to find overall answers to the overall answer to the research questions conducted the approach of this study is to use quantitative methods. A quantitative research approach has been used for the study of the level of effectiveness of campus wellness initiatives among students and staff in UMK City Campus. The most effective approach for the study can be viewed as a research design, which is an interpretative methodology. The questionnaires utilised in this study's

examination structure are a quantitative approach, and all of the information collected from respondents will be used as the study's primary data.

Data Collection

Researcher collect primary data directly from primary sources such as survey like used questionnaire through the Google form. The questionnaires were given to students and staff of UMK City Campus for provide insight into the challenges of the campus wellness initiatives and its relationship with the effectiveness of the program. The questionnaire was distributed through online and social media like WhatsApp and collected data among students and staff in UMK City Campus. The students answered the questionnaire according to the condition and related to their current situation as well.

Sampling

The researcher will use the non-probability technique. By taking into account the population's and the survey's time constraints, the researchers adopted the convenience sampling technique, which is in non-probability sampling. Convenience sampling is also easy to do because researchers can get sampling information in a short time and this sampling method can also save research costs. The students and staff of UMK City Campus are to receive the questionnaires. Convenience sampling will be used in this research project because Universiti Malaysia Kelantan's City Campus student and staff populations are relatively huge. This is due to the fact that students from the Faculty of Hospitality, Tourism and Wellness (FHPK), the Faculty of Entrepreneurship & Business (FKP) and Faculty of Veterinary Medicine (FPV) attend University Malaysia Kelantan (UMK) City Campus. The researcher will utilize this sampling technique on 362 respondents, as it will be hard to include the entire population of 6522 students and staff at UMK City Campus given the low participation rate. Respondents were selected to answer this questionnaire and all data were collected based on their answer.

Data Analysis

The researcher using Statistical Package for the Social Sciences (SPSS) version 26 to analysed the data obtained. Measurements based on SPSS data include mean, variance, standard deviation, and the frequency. The researcher chose a straightforward descriptive analysis, reliability analysis and correlation analysis to evaluate the data. Frequency analysis was used to analysed demographic profile of respondents while descriptive analysis was used to describe the level of effectiveness of the variable. The three main categories of descriptive statistics are frequency distribution, measures of variability, and measures of central tendency. Reliability analysis was used to ensure the data from questionnaire was reliable and satisfied the purpose. The inference statistic using Pearson Correlation when two continuous variables are compared, the coefficient measures the strength and direction of the linear relationship between an independent variable (IV) and a dependent variable (DV), divided by the components of the standard deviation.

FINDINGS

Result of Frequency Analysis

Table 1 shows the result of frequency analysis of respondents.

Table 1: Frequency Analysis

Characteristics	Frequency	Percentage (%)
Gender		
Male	108	29.8
Female	254	70.2
Age		

18 – 21 years	29	8.0
22 – 25 years	301	83.1
26 – 29 years	25	6.9
30 years and above	7	1.9
Marital Status		
Single	333	92.0
Married	29	8.0
Ethnicity		
Malay	307	84.8
Chinese	29	8.0
Indian	23	6.4
Others	3	0.8
Employment		
Staff	31	8.6
Student	331	91.4
Faculty		
FHPK	276	76.2
FKP	53	14.6
FPV	33	9.1
Semester		
1	2	0.6
2	18	5.0
3	14	4.1
4	50	13.8
5	29	8.0
6	232	64.1
7	11	3.0
8	6	1.7
The frequency of respondents attending wellness programs or activities at Universiti Malaysia Kelantan City Campus.		
Everyday	27	7.5
Not sure	81	22.4
Several times a month	152	42.0
Several times a week	102	28.2

Table 1 shows the result of frequency analysis of respondents. The research focuses on students and staffs in UMK City Campus. There are 108 respondents (29.8%) of male respondents compared to the female respondent which is 254 respondents (70.2). The reason why the female respondent is more than male respondent is because the female respondent is easy to approach, and they are willing to spend their time answering the questionnaire. The majority of respondent were from age of 22 – 25 years old which is 301 respondents (83.1). The second highest is 18 – 21 years old with 29 respondents (8.0%), while the respondent from aged 26 – 29 years old is 25 respondents (6.9%). Lastly, the age group from 30 years and above is 7 respondents (1.9%). The reason why the age group of 22 to 25 years has the highest percentage is that they are among the first to third-year students of the UMK City Campus. Meanwhile, the age of 30 years and above is the lowest because it is likely from among the staff of the UMK City Campus. Next, there are huge differences between single and married couples, with single scores the highest 333 respondents (92.0%) and respondents who are married 29 respondents (8.0%). Most of the respondents are from Malay which is 307 respondents (84.8%), followed by Chinese which is 29 respondents (8.0%), Indian is 23 respondents (6.4%) and others is 3 respondents (0.8%). The data shows that there are more

ethnic Malays who answered this questionnaire because the majority of students at UMK City Campus are ethnic Malays.

Respondents from students is the highest percentage which is 331 respondents (91.4%). Then followed by staff which is 31 respondents (8.6%). There are more students who answer the questionnaire than staff because students have more time than staff. Furthermore, respondents from FHPK students showed the highest which is 276 respondents (76.2%). Then followed by FKP which is 53 respondents (14.6%) and last but not least are FPV students which is 33 respondents (9.1%). Next, respondents from semester 6 students showed the highest which is 232 respondents (64.1%). Then followed by the second highest semester 4 which is 50 respondents (13.8%) and then semester 5 the third highest which is 29 respondents (8.0%). Next, the fourth highest in semester 2 which is 18 respondents (5.0%). The fifth highest is semester 7 which is 11 respondents (3.0%) followed by semester 8 which is only 6 respondents (1.7%) and finally semester 1 which only gets 2 respondents (6%). Finally, majority the frequency of respondents attending wellness programs or activities at Universiti Malaysia Kelantan City Campus for several times a month shows the highest which is 152 respondents (42.0%). Next, 102 respondents (28.2) for the frequency of several times a week. Then, the frequency of respondents attending wellness programs or activities at the UMK City Campus that is uncertain or not sure is as much as 81 respondents (22.4%) and finally, every day that attends wellness programs or activities at the UMK City Campus is as much as 27 respondents (7.5%).

Result of the Descriptive Analysis

Table 2 shows the result of descriptive analysis of variables.

Table 2: Descriptive Analysis of Variables

Variables	Items	Mean	Standard Deviation
Motivation	I am not taking part in the wellness initiative programs because it can't improve my health.	1.79	962
	I am not taking part in the wellness initiative programs because it can't increase my productivity.	1.83	917
	I am not taking part in the wellness initiative programs because it can't improve my engagement with my friends.	2.36	989
	I am motivated to join wellness program.	4.02	1.040
	I am not taking part in the wellness initiative programs because it can't reduce my stress levels.	2.10	1.087
	I am not taking part in the wellness initiative programs because it can't improve teamwork.	2.75	1.282
Leadership support	The faculty management and student representative council are not always taking part in the planning of wellness programs.	2.39	1.198

	The faculty management and student representative council are not always taking part in organizing wellness programs.	2.36	1.265
	The faculty management and student representative council does not make wellness programs an important agenda in faculty or students' programs.	2.78	1.384
	The faculty management and student representative council does not encourage the staffs and students to take part in wellness programs.	2.10	1.081
	The faculty management and student representative council do not have a clear objective for faculty or students' wellness programs.	2.34	1.223
	The faculty management and student representative council does not always promote the importance of wellness programs.	2.60	1.320
Participant Awareness	I didn't know that participating in campus wellness initiatives programmes can improve my health.	2.24	1.146
	I am not aware that by participate in campus wellness initiative programs can increase my productivity.	2.35	1.216
	I didn't know that participating in campus wellness initiative programs can improve my engagement with my friends.	2.52	1.114
	I am not aware that participating in wellness initiative programs can improve my engagement with my friends.	2.41	1.270
	I am not aware that participating in wellness initiative programs can reduce my stress levels.	2.44	1.297
	I am not aware that participating in wellness initiative programs can improve teamwork.	2.64	1.169
Participant Interest	I am not interested in participating in wellness initiative programs if it is organized during the weekend.	1.88	1.059

	I am not interested in participating in wellness initiative programs if it is organized after the lecture/ working hours.	2.42	1.313
	I am not interested in participating in wellness initiative programs if it is conducted by external expertise.	1.99	1.034
	I am not interested in participating in wellness initiative programs if it is conducted by the faculty management/ student representative.	2.21	1.190
	I am not interested in participating in wellness initiative programs if it is conducted in a simple form.	2.15	1.124
	I am not interested in participating in wellness initiative programs if it is conducted in a fun way.	2.01	1.094
Facilities	The facilities for the wellness initiative programs provided by the university are not satisfactory.	3.29	1.222
	The facilities for the wellness initiative programs provided by the university are low.	3.50	1.187
	The facilities have not become the main factors to initiate wellness initiative programs at the university/ faculty level.	3.54	1.133
	Inadequate facilities can lower the number of participants joining the wellness initiatives programmes at the faculty/ university level.	3.44	1.125
	Staff/ students should have not been informed about the facilities provided at the university/ faculty level to attract more participants to join the campus wellness initiative programs.	2.82	1.419
	There is a need to improve the wellness facility in the campus area.	4.22	1.020
Level of The Initiatives Effectiveness	Each wellness initiative programs I participated in has not defined the desired outcomes.	2.27	1.190

Each wellness initiative programs I participated in do not mention clear goal of a healthy and well-being lifestyle.	2.28	1.262
All of the wellness initiatives programmes are complicated to participate.	2.09	1.150
There are more than 5 wellness initiatives programmes conducted every semester.	2.81	1.336
Staff and students are not well informed about the wellness initiatives programmes conducted in the university/ faculty.	2.62	1.380
I am not satisfied with the wellness initiatives programs conduct in the university/ faculty level.	2.51	1.264
The wellness initiatives programmes schedule is not flexible.	2.46	1.207
The wellness initiatives programmes that I join has not benefited me.	2.12	1.199

Table 2 shows the result of descriptive analysis of variables. For the first of independent variable is motivation which is the item is “I am motivated to join wellness program” has the greatest mean score (M=4.02, S.D=1.040). The next variable is leadership support which is the item that has the greatest mean score is “The faculty management and student representative council does not make wellness programs an important agenda in faculty or students’ programs”, (M=2.78, S.D=1.384). The item for participant awareness that has the greatest mean (M=2.64, S.D=1.169) is “I am not aware that participating in wellness initiative programs can improve teamwork”. Besides, the fourth independent variables is participant interest and the items is “I am not interested in participating in wellness initiative programs if it is organized after the lecture/ working hours” which is (M=2.42, S.D=1.313). Lastly, for independent variables is facilities which is the greatest mean score (M=3.54, S.D=1.133) that the item is “The facilities have not become the main factors to initiate wellness initiative programs at the university/ faculty level”. Meanwhile, for dependent variable is level of the initiatives effectiveness which is the item is “There are more than 5 wellness initiatives programmes conducted every semester” has a greatest mean score (M=2.81, S.D=1.336).

Results of Reliability Analysis

Table 3 shows the result of reliability analysis based on independent variables and dependent variable.

Table 3: Reliability Analysis

Variables	Number of Items	Cronbach’s Alpha
Motivation	6	.733
Leadership Support	6	.900

Participant Awareness	6	.885
Participant Interest	7	.897
Facilities	6	.798
Level of The Initiatives Effectiveness	8	.923

Table 3 shows the result of the reliability analysis based on each independent variables and dependent variable. The first independent variables are motivation with 6 questions shows Cronbach's Alpha value of .733 which is acceptable. The second independent variable, leadership support which contains 6 questions shows the Cronbach's Alpha value .900 which the level is excellent so that the question is strength and high positive. The third is participant awareness also within 6 question and the Cronbach's Alpha is .885 with good of internal consistency level. Next, participant interest which is have 7 questions and the Cronbach's Alpha is .897 with the good result. The last for independent variable is facilities that have 6 questions and the result is .798 with the acceptable result. Meanwhile, in measuring dependent variable, the researcher provides 8 questions and the result of Cronbach's Alpha is .923 with the excellent result.

Result of Pearson Correlation Analysis

Table 4 shows the result of Pearson Correlation analysis based on the hypothesis.

Table 4: Pearson Correlation Analysis

Hypothesis	P-Value	Result
H1: A moderately positive correlation between the motivation among student and the effectiveness of the wellness initiatives.	0.01	Supported
H2: A moderately positive correlation between the leadership support and the effectiveness of wellness initiatives effectiveness.	0.01	Supported
H3: A moderately positive correlation between participant awareness and the effectiveness of wellness initiatives.	0.01	Supported
H4: A strong positive correlation between the participant interest and the effectiveness of wellness initiatives.	0.01	Supported
H5: A weak negative correlation between the facilities and the effectiveness of wellness initiatives.	0.05	Not Supported

Table 4 shows the result of Pearson Correlation analysis based on the hypothesis. According to the results, the significant p-value of H1 is 0.01 which is the p-value is under 0.05. Thus, the study can reject the null hypothesis. The Pearson Correlation result is 0.458 stipulates the strength of the relationship between motivation and the effectiveness of wellness initiatives is moderate and the result is supported. Next, the significant p-value of H2 is 0.01 which is the study can reject the null hypothesis. The Pearson Correlation

result is 0.692 stipulates the strength of the relationship between leadership and the effectiveness of wellness initiatives is moderate correlation and the result is supported. Then, the third hypothesis which is H3, the significant value is 0.01 that the p-value is under 0.05. The study can reject the null hypothesis. The result shows moderate correlation with a correlation coefficient value of 0.666 that has a supported result between participant awareness and the effectiveness of wellness initiatives. The last result that the p-value is under 0.05 is H4 which is the study can reject the null hypothesis. That is strong correlation between participant interest and the effectiveness of wellness initiatives. Lastly, H5 shows that negligible correlation with a correlation coefficient value of -.023. The p value of the facilities with the level of effectiveness of wellness initiatives is 0.662 which is the result is not supported at p-value, that is more than 0.05. Thus, the study is not statistically significant and the null hypothesis is not rejected.

DISCUSSION AND RECOMMENDATIONS

Discussion is aimed at solving questions and addressing hypothesis as mentioned in first chapter of this study. To improve the study and gather more useful data, some recommendations are made. In general, the researcher can conduct in-person interviews or use an online platform to assure the effectiveness of this study. This entails distributing a Google form for responders to complete in exchange for an in-person interview. This is done to make it simpler for researchers to quickly and easily gather information that is more focused. It might expedite research even more.

The researcher needs to decide which respondents to interview in more detail at first. They must be directly related to the subject of the study because if the respondent is familiar with it, it may facilitate the search for relevant material and be faster. If the respondents have a clear understanding of the research topic, it may help to collect respondent data more accurately and fast. Finding the appropriate target respondents for the study is practical on the part of the researcher because problems may arise when the target respondents do not understand the given research topic clearly and it can make it complicated for the researcher to complete the future studies.

Next, to ensure that the findings of the study are fair and focused, the next researcher needs to focus on the target group of respondents which includes UMK City Campus staff and students. The expected results should be compatible with the title of the study, which is to identify the challenges and the level of effectiveness of campus well-being initiatives among students and staff at UMK City Campus. Based on the data results, it can be used as knowledge provided to students and staff at UMK City Campus to find out about work and study experiences while in such a situation.

Finally, when planning future investigations, researchers may consider other variables through perspective. The variables in this study that only have moderate relationship with the dependent variable which is motivation, participant awareness, participant interest, leadership support, and convenience.

CONCLUSION

In conclusion, the study has been accomplished to identify the challenge and the level of effectiveness of campus wellness initiatives among students and staffs in UMK City Campus. This study is focused on the relationship between five independent variables known as motivation, leadership support, participant interest, participant awareness and facilities and one dependent variable which is level of initiatives of effectiveness. A total of respondents for this study among students and staffs in UMK City Campus to examine their effectiveness in wellness initiatives. In short, according to the results, all independent variables are moderately positive and correlated with the dependent variable except facilities variables. In summary, the objective of the study has been achieved which is to identify the level of effectiveness of campus wellness initiatives among students and staff in UMK City Campus.

ABSTRACT

Introduction: The wellness market in Malaysia expanded by 10% in 2014, and the government wants to expand the spa business to draw tourists who have the cash and desire to spend on opulent experiences. A spa is a highly prudent investment for hotel owners. It is the ideal enhancement to the services that may be offered to hotel guests, but it could also make spa services available to residents to make extra money. The research aims to identify the spa post-service experience of reliability, assurance, empathy, and responsiveness toward the emotions of spa customers. **Method:** Cross-sectional study design was applied in the present study. The data were collected from 218 Spa Customers respondents in Kota Bharu, Kelantan. The data collection was conducted through a structured questionnaire using Google Forms. A pilot study was conducted with 30 spa customers before distributing questionnaires in the full-scale cross-sectional study. The data were analysed with Statistical Package for Social Sciences (SPSS) data analysis software. Descriptive analysis and Pearson correlation coefficient were used to analyse the data. **Result:** The Pearson correlation values for the reliability, assurance, empathy, and responsiveness towards the emotions of Spa Customers ranged from 0.80 to 0.91. **Conclusion:** Effective post-Service Spa Experience Activities can attract customers' interest to seek treatment at the Spa.

Keywords: *Assessing the Post-Service Experience of Spa on Emotional, Spa Customer, Reliability, Assurance, Empathy*

INTRODUCTION

The spa industry has evolved away from including water and has become more associated with the wellness sector by advocating that holistic well-being is crucial in the spa environment. Beyond material prosperity, holistic well-being encompasses many other factors. The pursuit of material money and belongings does not bring long-term fulfilment and contentment. Instead, it makes people feel unhappier,

depressed, anxious, angry, lonely, and alienated (Kasser, 2002; Eckersly, 2005). Thus, holistic well-being is the inner happiness, peace, and balance between body, mind, and soul.

The research shows that Pilzner (2002) has the wellness revolution successfully encapsulated this new commercial phenomenon. He emphasizes how the wellness industry differs from the traditional healthcare sector and sees wellness as an industry rather than a philosophy. Additionally, he views the wellness industry as proactive, with healthy individuals choosing to become clients in order to feel better, slow down the impacts of aging, and prevent becoming sick people's customers.

Consumption emotion is a person's emotional response to a good or service (Richins, 1997). Two dimensions that present a person's experience of emotions are positive and negative (Diener, 1999). The consumption emotion scale is considered superior to other emotional measurement scales. Cognition is one of the precursors of consumer emotion. Most of the time, service quality evaluation has been seen as a cognitive activity. The five characteristics of tangible, dependability, responsiveness, certainty, and empathy are used to determine whether a product or service is superior worldwide by consumers.

Hence, this study focuses on the post-service emotional element: lifestyle, stress, and mobile phone use among spa visitors in Kota Bharu, Kelantan. People would gain a new understanding as a result of the investigation and analysis that went into this research method.

This study consists of four objectives:

1. To determine the relationship between reliability and emotional impact on spa customers in Kota Bharu, Kelantan.
2. To determine the relationship between assurance and emotional impact on spa customers in Kota Bharu, Kelantan.
3. To determine the relationship between empathy and emotional impact on spa customers in Kota Bharu, Kelantan.
4. To determine the relationship between responsiveness and emotional impact on spa customers in Kota Bharu, Kelantan.

SIGNIFICANCE OF THE STUDY

Academic Contribution

This consider looked at how customers survey the potential esteem of their spa involvement and get it the variables that impact participation and enduring devotion. The objective of this think about was

to examine how two particular characteristics of seen value—the work score and prosperity score—affect future conduct among spa clients. Based on the system of 'Quality – Seen Esteem – Fulfilment – Behavioural Intention', a field think about was conducted to test the intervening part of useful esteem and wellbeing esteem within the case of spa clients in Kelantan. This result gives more data to clarify the basic instruments that increment spa customers' behavioural purposeful to return and prescribe.

Managerial Implication

The expanding use of advertising within the encounter economy makes the significance of this study clear. According to McNeil and Ragins (2005), the rapidly growing spa benefit industry is what is fuelling this intrigue. To understand the usage sentiment, perceived value, and behavioural eagerness of spa patrons, however, has received only cursory attention. Once the connection between benefit quality, utilization feeling, seen esteem, and behavioural deliberate is understood, spa administrators can use the knowledge to plan appropriate services to draw in customers; marketers can plan the engagement to strengthen utilization feeling and make seen esteem. The competitiveness of spa providers is increased by a strong utilization experience plan, which results in greater benefits.

LITERATURE REVIEW

EMPATHY

Empathy gives careful and individual attention to the client. It includes the following characteristics: accessibility, a sense of security and an effect of understanding the needs of the client. In contrast, empathy is described as the caring and personal care that a company provides to its customers. The essence of empathy is to let customers know that they are unique and special and that their needs are understood through tailored or personalized service. Customers want to feel understood and important by the companies that provide them with services. The purpose of this study is to find out how many tourists believe that the quality of spa services meets their expectations. A customer-centric strategy that starts with empathy being emotionally intelligent. In the healthcare industry, the idea of emotional value is widely accepted and used. Many welfare providers agree that success and effectiveness involve an emotional strategy (Narendra, 2017).

RESPONSIVENESS

In the spa market and industry, responsiveness refers to Spa's staff or management's ability to provide prompt service. A previous survey of resort and hotel Spa customers in Kota Bharu, Kelantan

showed that responsiveness was the most important determinant factor in explaining positive emotions (Lo, Wu, & Tsai, 2015). They may not fully understand the protocol and methodology of spa treatments, especially for infrequent visitors, and they heavily depend on the therapists to educate and inform them (Lo et al., 2013). Furthermore, spa service should be well-designed to anticipate the right moment to provide the right service to the customers. Customers should not feel ignored or kept waiting for too long. The service should be so subtle that whenever a customer needs something, someone is there to help them (Lo et al., 2013).

ASSURANCE

Assurance was also shown to be statistically significant with respect to customer satisfaction, a result similar to previous studies by Omar et al. (2021) believes that security is one of the salient aspects of service quality characteristics that he believes lead to customer satisfaction. Staff knowledge and courtesy are essential to instill confidence in spa customers. Customers expect companies to be industry leaders in the services they provide. It gives customers a sense of security that "this spa is reliable". It also leads to positive word of mouth and customer testimonials. That probably justified the find. Quality of service attributes influence spa-goer satisfaction. Interestingly, from a Malaysian perspective, the results indicate that trustworthiness, safety, and empathy attributes are the factors that most influence satisfaction with spa facilities. Most respondents want reassurance from spa providers that they can use all spa facilities and feel safe, especially when it comes to privacy. In addition, spa-goers want to be served according to their preferences. Finally, spa providers need to know about the well-being of their customers and the spa industry. An article by Mohammad et al. (2021) endorses the statement that the spa industry needs to reinvent itself to remain relevant.

RELIABILITY

Reliability refers to the likelihood of a product or system performing its intended function satisfactorily for a predetermined period of time, or of operating in a predetermined environment without malfunctioning. It also refers to the organization's readiness to address any issues that arise, as well as its ability to provide prompt service. Reliability Spa Service has been a certified pool/spa operator (CPO) for 13 years, and we are proud to offer friendly, experienced hot tub advice, as well as expert service and repair. We repair virtually all makes and models of hot tubs available in southern Ontario, from pump and electronic repair to full spa re-maintenance and conditioning. It is important to note that small improvements do not necessarily indicate the effectiveness of a therapy, as they may be the result of

experimental error, rather than treatment itself. This is evidenced by Chea (2022), which found that reliability was statistically significant in terms of customer satisfaction.

Research Hypothesis

This study has four hypotheses, that are related to identifying the relationship between reliability, assurance, empathy, and assurance toward spa customers' emotions.

H1: There is a significant relationship between reliability and emotional impact on spa customers in Kota Bharu, Kelantan.

H2: There is a significant relationship between assurance and emotional impact on spa customers in Kota Bharu, Kelantan.

H3: There is a significant relationship between empathy and emotional impact on spa customers in Kota Bharu, Kelantan.

H4: There is a significant relationship between responsiveness and emotional impact on spa customers in Kota Bharu, Kelantan.

Research Framework

There are four independent variables (IV) which are the reliability, assurance, empathy, and responsiveness among spa customers in Kota Bharu, Kelantan. The emotion of spa customers is a dependent variable (DV). This research intends to study the effect of service quality on spa customers' emotions in Kota Bharu, Kelantan. The conceptual framework of research is as follows:

Figure 1: Conceptual Framework

METHODOLOGY

Research Design

The most suitable research approach adopted in this study is a quantitative method using survey research. Data will be collected from a sample of spa customers in Kota Bharu, Kelantan. This study focuses on spas in Kota Bharu to facilitate the researcher's data collection.

Data Collection

Quantitative data collection using questionnaires via Google Forms and questionnaires distributed to spa guests who visit spa in Kota Bharu, Kelantan to get the answer to the questionnaire check. There, 218 responses were collected from repliers who answered all the check questions.

Sampling Method

The sample size for all spa customers in Kota Bharu, Kelantan, was selected with a total population of 500 respondents. A total of 218 respondents were selected as respondents in this study. The researcher used simple random sampling as the sampling design for this study. Simple random sampling is a type of probability sampling in which respondents have a chance to be selected as s sample. It only takes a short time to get the data, it is relatively expensive, and respondents are easily available at the right place and time.

Data Analysis

Data is collected and analysed through survey forms. After data collection, all collected data were analysed using the IBM Statistical Package for Social Science (SPSS) version 26. Analytical methods for research are divided into several methods such as data analysis, descriptive statistics, reliability tests, and Pearson correlation. Researchers focus on the independent variables that influence the difficulty of Kota Bharu's spa customer program through questionnaire responses.

FINDINGS

Demographic Profile of Respondents

Table 1 below shows the frequency analysis of this research.

Table 1: Respondents' Socio-Demographic Profile (N=218)

Demographic profile characteristic	Frequency	Percentage (%)
	1821	

Sex	Male	35	16.1
	Female	183	83.9
Race	Malay	196	89.9
	Chinese	13	6.0
	Indian	9	4.1
Religion	Muslim	199	91.3
	Christian	9	4.1
	Buddha	8	3.7
	Others	2	0.9
Age range	20 – 24 years	116	53.2
	25 – 29 years	37	17
	30 – 34 years	24	11
	35 – 39 years	14	6.4
	40 - 44 years	11	5.0
	45 – 49 years	8	3.7
	50 and above	8	3.7

Table 1 shows the descriptive statistics of the respondent's demographic profile. The table indicates that the total number of respondents in this survey is 218. The total number of male respondents was 35 (16.1%), while 183 (83.9%) were female respondents. This shows that more female respondents answered the survey than male respondents.

There are three main different races in this survey. The highest number of respondents was Malays, consisting of 196 respondents with a value of 89.9 percent. The lowest are from Indian, with 9 respondents with a value of 4.1 percent. The Malay respondents answer the questionnaire mainly because a majority of people in Kelantan are Malays. Furthermore, there are four main different religions in this survey. The highest number of religions which has responded to this questionnaire was the Muslim religion, with a frequency of 199 respondents with a value of 91.3 %, whereas the lowest was respondents from the other religion, with a frequency of 2 respondents and 0.7%. Most of the respondents come from young adults (22 years old) compared to other age groups.

Section B in the questionnaire shows different variables of customer emotions toward the spa, such as satisfaction with the spa visited, spa treatment or services used, and emotion after visiting the spa.

Descriptive Analysis

Table 2 below shows the descriptive analysis for the independent variable, reliability, assurance, empathy, responsiveness, and dependent variable spa customers' emotions.

Table 2: Descriptive Analysis

Variable	Items	Mean Score	Standard Deviation
Reliability	When the therapist confirms the appointment at a certain time, they will perform the treatment as prescribed.	4.26	0.819
	The therapist is dependable.	4.15	0.878
	The therapist can explain the charges for services clearly.	4.15	0.851
	The spa keeps customer records confidentially.	4.15	0.954
	When a customer has a problem, the therapist shows sincerity to solve the problem.	4.20	0.849
Assurance	The spa is always clean.	4.28	0.870
	The products used are of good quality (natural ingredients or trustworthy brands).	4.28	0.837
	The environment of the spa is safe.	4.27	0.844
	The spa provides proper changing facilities.	4.33	0.886
	Spa management shall take all reasonable measures to ensure the security of customers and their possessions during their time at the spa.	4.41	0.823
Empathy	The therapist knows what the customers' needs are.	4.27	0.861
	Treatment at the spa has its own charm.	4.27	0.898

	The spa operates at a convenient time for customers to receive treatment.	4.32	0.851
	The spa offers a variety of treatments to suit the customer's needs.	4.37	0.823
	The service received from the therapist was very satisfactory.	4.30	0.836
Responsiveness	The therapist deliver prompt service to customers.	4.27	0.903
	The therapist is always willing to help customers.	4.33	0.831
	The therapist explained the types of service provided clearly.	4.34	0.862
	The therapist is never too busy to respond to customer requests.	4.08	0.999
	The therapist is professional in providing the service.	4.31	0.892
Spa Customers	I felt calm after the treatment.	4.40	0.793
Emotional	I felt secure at the spa.	4.32	0.812
	I felt comfortable with their treatment.	4.39	0.767
	I felt excited at the spa.	4.33	0.837
	I felt satisfied with their treatment.	4.39	0.831

The first item in the independent variable of reliability is “When the therapist confirms the appointment at a certain time, they will perform the treatment as prescribed,” which has a mean of 4.26 (SD=0.819). “The therapist is dependable” is the second item. It has the same mean as items “The therapist can explain the charges for services clearly and “The spa keeps customer records confidentially,” which are 4.15.

Furthermore, the first item in the independent variable of Assurance is, “The spa is always clean” has a mean of 4.28 (SD=0.870). The second item is “The products used are of good quality (natural

ingredients or trustworthy brands) has a mean also 4.28 (SD=0.837). “The environment of the spa is safe” has the lowest mean of 4.27 (SD=0.844). The fourth item, “The spa provides proper changing facilities” has a mean of 4.33 (SD=0.886). “Spa management shall take all reasonable measures to ensure the security of customers and their possessions during their time at the spa” is the fifth item with the highest mean, 4.41 (SD=0.823).

Besides that, the first item in the independent variable of empathy is “The therapist knows what the customer needs are”. It has the lowest mean of 4.27 (SD=0.861). The second item, “Treatment at the spa has its own charm” has the same mean of 4.27 (SD=0.898). The third item, "The spa operates at a convenient time for customers to receive treatment, " has a mean of 4.32 (SD=0.851). The item “The spa offers a variety of treatments to suit the customer’s needs” is the highest mean of 4.37 (SD=0.823). The fifth item, "The service received from the therapist was very satisfactory, " has a mean of 4.30 (SD=0.836).

In addition, the first item in the independent variable of responsiveness, “The therapist delivers prompt service to customers” has a mean of 4.27 (SD=0.903). “The therapist is always willing to help customers” is the second item of responsiveness, with a mean of 4.33 (SD=0.831). The third item, "The therapist explain the types of service provided clearly” has the highest mean of 4.34 (SD=0.862). The fourth item, "The therapist are never too busy to respond to customer requests” has the lowest mean, which is 4.08 (SD=0.999). The fifth item is “The therapist is professional in providing the service”. It has a mean of 4.31 (SD=0.892).

Other than that, the first item in the dependent variable of spa customer emotion is “I felt calm after treatment”. This item has a mean of 4.40 (SD=0.793), which is at the strong agree level. The second item is “I felt secure at the spa”. It has the lowest mean of 4.32 (SD=812), which is at the strong agree level. The third item is “I felt comfortable with their treatment” with a mean of 4.39 (SD=7.67). “I felt excited at the spa” is the fourth item of Spa customer emotion. It has a mean of 4.33 (SD=0.837). The fifth item, “I felt satisfied with their treatment” has a mean of 4.39 (SD=0.831).

Reliability Analysis

Result of Reliability Analysis

Table 3 below shows the reliability analysis of this research.

Table 3: Reliability Analysis

Variable	Number of Items	Cronbach Alpha
Reliability	5	0.933
Assurance	5	0.950

Empathy	5	0.956
Responsiveness	5	0.949
Spa Customers Emotional	5	0.970

Table 3 above demonstrates the reliability of 5 variables. Cronbach's Alpha turned into used to observe the reliability of the 25 gadgets and used to degree the 5 constructs. In addition, the effects in Table 4.6 display that the reliability of every assemble stages from 0.933 to 0.949. All the variables have been above the cost of 0.7. As an end result of the pilot test, the general end result turned into acceptable. According to the effects, spa client emotion has the best coefficient of 0.970, even as reliability has the bottom coefficient of 0.933.

Result of Pearson Correlation Analysis

Table 4: Pearson Correlation Analysis Result

Hypothesis	P-Value	Result
H1: There is a significant relationship between reliability and emotional impact on spa customers in Kota Bharu, Kelantan.	0.001	H1 is accepted
H2: There is a significant relationship between assurance and emotional impact on spa customers in Kota Bharu, Kelantan.	0.001	H2 is accepted
H3: There is a significant relationship between empathy and emotional impact on spa customers in Kota Bharu, Kelantan.	0.001	H3 is accepted
H4: There is a significant relationship between responsiveness and emotional impact on spa customers in Kota Bharu, Kelantan.	0.001	H4 is accepted

Table 4 shows the result of Pearson correlation analysis based on the hypothesis. According to results, the significant p-value of H1 is 0.001 which is below 0.05. Thus, the study can reject the null hypothesis. There is significant relationship between reliability and post-service spa customers' emotions. And it made hypothesis is accepted. Next, the significant p-value of H2 is 0.001 which is below 0.05 and the p-value is under 0.05. There is a significant relationship between assurance and post-service spa

customers' emotions, and the hypothesis is accepted. In addition, the significant p-value of H3 is 0.001 which is below 0.05 and the p-value is under 0.05. There is significant relationship between empathy and post-service spa customers' emotions, and the hypothesis is accepted. Lastly, the significant p-value of H4 is 0.001 which is below 0.05 and the p-value is under 0.05. There is significant relationship between responsiveness and post-service spa customers' emotions, and it was hypothesis accepted.

DISCUSSION AND RECOMMENDATION

Discussion on Hypothesis 1

Reliability is the capacity to offer the promised carrier reliably and accurately. In an extensive sense, reliability manner that the organisation promises on its guarantees concerning the availability of services or products offered, trouble fixing and charges given to spa customers. Most of the respondents agreed with the consequences of this observe via way of means of displaying a correlation coefficient of 0.789 because of this that a completely nice dating even as the p-price is 0.000 that is much less than the excessive widespread stage that is 0.01. This observe can show the reliability of spa patron emotional. Therefore, in an effort to offer pride to therapist customers, it's far essential to boom using fitness merchandise for spa customers.

Discussion on Hypothesis 2

The second hypothesis is assurance, the therapist's knowledge, politeness, and ability to create confidence in spa customers. The results of the study show that the correlation coefficient is 0.793, indicating a very positive relationship, so the agreement between the respondents is high, with a p-value of 0.000, which is below the significance level of 0.01. Security is therefore very important to give spa customers trust and confidence.

Discussion on Hypothesis 3

The third hypothesis is empathy. This is indicating a being concerned attitude, and the non-public interest given to spa customers. The essence of the empathy measurement is to expose the client via the carrier supplied that the client is special, and their wishes may be understood. As an end result of the

study, the respondents agreed via way of means of displaying a correlation coefficient of 0.803 at the same time as the p-cost is 0.000 that's much less than the 0.01 sizeable level. This indicates that empathy is carefully associated with client relations, is the capability to experience or revel in what some other individual is feeling or experiencing via way of means of imagining what it might be want to be in that individual's position. Therefore, empathy is carefully associated with emotional client spa.

Discussion on Hypothesis 4

A fourth hypothesis is responsiveness. This is the awareness and desire to support clients who come to the spa for beauty treatments. Most respondents supported the results of this study, with a correlation coefficient of 0.777 and a p-value of 0.000, below the significance value of 0.01. This emphasizes diligence and accuracy in dealing with customer requests, inquiries and complaints. Therefore, in order to increase client satisfaction, therapists should provide clear explanations and due consideration to clients who request spa treatments.

Discussion on Hypothesis 5

This discussion aims to assess the post-service experience on emotional effects on spa users in Kota Bharu, Kelantan. The results of the study show that there is a significant relationship between the independent variables namely reliability, assurance, empathy, responsiveness while the dependent variable is the emotional impact on spa users in Kota Bharu, Kelantan. Independent variables and dependent variables are very influential during the study. Then, to show stronger evidence during the study, the researcher found that person correlation showed positive.

This study builds a new avenue by highlighting the recommendations of proposals for potential research advances. Firstly, it is recommended that future researchers to change existing data collection methods to qualitative methods. Qualitative research generates data in a different way that quantitative research seems not to. Interviews, observations, and document analysis are examples of qualitative data. The key supporters in validating the fieldwork conducted in the qualitative study are field notes and researcher

diaries. Future researchers are recommended to use qualitative methods such as telephone surveys and face-to-face interviews in their study.

In addition, future researchers may be able to collect data by expanding the survey scope to all regions rather than focusing only on Kota Bharu, Kelantan. Because future research will be able to collect more comprehensive data in all areas to gather and efficiently confirm facts. The collected data will also allow us to more accurately determine how spa customers feel after their treatments.

Then future researchers will be able to update, improve and recreate the journal. In this study, researchers used standard journals to compare data from Western countries. As a result, cultural differences between Western and Eastern students may reflect different perspectives and make different recommendations, resulting in a based situation.

CONCLUSION

In conclusion, the study's objectives are to analyse the role of reliability to the emotional impact of spa customers, analyse the role of assurance in influencing the emotions of spa customers, measure the role of empathy aspect spa customers, and measure responsiveness towards spa emotion in Kota Bharu, Kelantan. The hypothesis of this study was developed using Pearson Correlation Coefficient and descriptive analysis. The study's findings were provided in the previous chapter. The findings, limitations, and suggestions of this study will be discussed in this chapter. From the results obtained, it is found that there is a significant relationship between the four independent variables, which are reliability, assurance, empathy, and responsiveness, assessing the post-service experience of the spa on emotions among spa customers in Kota Bharu, Kelantan.

ABSTRACT

A wellness initiative can be defined as an activity that aims to improve and promote health and fitness that is usually offered in universities or working place. The wellness initiative activities carried out in the university can provide mental and physical relief to students. **Issue:** At the University Malaysia Kelantan (UMK) City Campus, there was a lack of facilities and equipment, students did not have a proper track to do exercise like running or jogging. Student may experience physical and mental issue of as result of their lack of motivation to engage in structured and regular sporting activities. **Method:** Cross-sectional study design was applied in the present study. The data were collected among 361 students of the University Malaysia Kelantan (UMK) City Campus. Descriptive analysis and Pearson correlation coefficient were used to analyse the data using SPSS version 26.0. **Result:** The Pearson correlation values for the facilities, leadership support, student awareness, and participant involvement towards the effectiveness level of the wellness initiatives ranged from 0.70 to 0.91. The data also revealed that the factors were significantly correlated with the effectiveness of wellness initiative activities in the university. **Conclusion:** Effective wellness initiative activities could reduce the prevalence of unhealthy lifestyles among students. The involvement of university students in wellness initiative activities may also improve their mental health, well-being, and academic achievements.

Keywords: Facilities, Leadership support, Student awareness, Participant involvement, The effectiveness level of the wellness initiatives

INTRODUCTION

The level of the wellness is the degree to which a person realizes and chooses to engage in healthy behaviours daily. Well-being occurs when a person is free from any disease. It is a dynamic growth. A healthy body does not mean that a person has reached a level of well-being, but it needs to include both physical and mental aspects, i.e., internal and external health. Health is “a state of complete physical, mental, and social well-being and not merely the absence of disease or infirmity” (World Health Organization, 2020).

Well-being affects student performance in learning. Previous research showed that student well-being has a significant impact on student performance. Student achievement results affect high cognitive well-being. (Govorova, Benitez & Muniz, 2020). Among the importance of well-being among students is being energized. Energize is not only obtained through nutrition but also sleep. Sleep is also psychological well-being. Students must attend classes, complete assignments, study, maintain a social life, and there are even students who work part-time to cover living expenses. As a single integrated setting that includes academic, professional, and social activities, as well as health care and other support services, universities and colleges have the potential to improve the mental health and well-being of young

adults significantly. While universities continue to grow, there is growing worried that the resources provided to help students and staff are not progressing at the same rate. More concern should be highlighted for those with mental health issues and poor levels of well-being. This study aims to examine the factors that influence mental health and well-being among student the University of Malaysia Kelantan.

In addition, a healthy mind is essential to a healthy community. One of the most pressing issues in health care in the twenty-first century is the lack of effective mental illness promotion, prevention, and treatment programmes. According to the World Health Organization (WHO), a healthy mind is a “state of well-being in which every individual realizes their own potential, can cope with the normal stresses of life, can work productively and fruitfully, and is able to contribute their community”. (Velten, Bieda et al. 2018). Student lifestyle also affect mental health; students don’t get enough nutrition from food, which is caused by insufficient financial resources. Students have no other option but to choose unhealthy foods such as instant noodles. Not only that, but irregular sleep also affects student health and well-being and makes students unable to focus on class. Students also need to face the screen for a long period of time to join the class, complete assignments, and take assessments.

The study consists of four objectives:

1. To identify the relationship between leadership support and the effectiveness level of wellness initiative activities at the University Malaysia Kelantan.
2. To identify the relationship between student awareness and the effectiveness level of wellness initiative activities at the University Malaysia Kelantan.
3. To identify the relationship between participant involvement and the effectiveness level of wellness initiative activities at the University Malaysia Kelantan.
4. To identify the relationship between facilities and the effectiveness level of wellness initiative activities at the University Malaysia Kelantan.

Significance of the Study

Body of Knowledge

This study can help increase knowledge on the importance of wellness initiatives as researchers want to embed the mind of prioritizing wellness among students. It is also a medium to inform the importance of this study to the university management so that they can take appropriate action to provide and improve the facilities.

Practicality

Practicality can help to improve the capacity of wellness initiatives on campus. This study can prove that the wellness initiative is not only about physical exercise, but it is also about the mentality to practicing a healthy lifestyle. For example, the students are able to manage their stress as they know what they have to do. like take a nap or mingle with their friends. Thus, wellness is such a broad concept. It also convinces the student representative council to raise the issue about the insufficient facilities and lack of awareness among students and the top management. University Malaysia Kelantan has a lot of students, so it is worth providing sufficient recreation facilities.

Community

This study focuses on higher education settings, but at the same time, it can replicate the study in a broader setting which means it is not limited to campus but to the community. Facilities play a significant role in improving motivation towards a healthy lifestyle. For example, housewives may want to join and support

the wellness program, but there is no incentive for them to do so. Most of them cannot participate in wellness initiative activities because they do not want to leave their children alone at home. Thus, this study will replicate on how these factors will contribute to wellness initiatives in terms of residential park aspects.

Policy Maker

This study is to let the top management know the importance of wellness initiatives and convince them to take possible action to improve the wellness initiatives in the university.

LITERATURE REVIEW

Wellness encourages a person to achieve balance in life to ensure that the body remains healthy. Wellness has seven dimensions (physical, mental, financial, spiritual, environmental, vocational, and social). These seven dimensions are interrelated with each other. Without one of these dimensions, it may affect the other dimensions. This section will include a critical analysis of the sources. In the research literature, this study shows the understanding of the success factors of the effectiveness of well-being initiatives among students at the University Malaysia Kelantan. Previous studies showed that the success factors, such as facilities, leadership support, student awareness, and participant involvement. Success factors or important success factors are crucial actions needed to guarantee the achievement of an organisation. Previous studies showed that the success factors, such as facilities, leadership support, student awareness, and participant involvement, contributed to the effectiveness level of the wellness initiatives activities. The awareness of the well-being facilities offered by the university is an internal aspect that contributes to the success of the campus well-being initiative among the students of the University Malaysia Kelantan (UMK) City Campus. Students worked together to achieve this effectiveness by utilising the available resources. The effectiveness of campus well-being among the students of City Campus is greatly influenced by external success factors, which are elements that originate from outside the individual. According to Brown's definition from 2007, external influences vary depending on the person, but in general, they are exclusively based on situations outside of the student's control and influence.

Facilities

The purpose of a spa at University Malaysia Kelantan is to give a space where the students can go to relax their body and their mind. By incorporating unique themes (e.g., gym, spa, netball, and futsal court) into spa facilities, it has attracted students to make use of the suggested wellness initiative (Sarah, E. Colby, 2010). The spa treatment offers the physical, emotional, and spiritual mending necessary for conserving a healthy way of life and extending life. Spa treatments can also increase the body's immunological response, decrease bodily inflammation, and ameliorate circulation. Also, going to a spa to relax and be cockered can ameliorate their self-esteem and internal clarity. Spa treatments, like massages, are non-medical procedures that help the body's wellness. According to scientific exploration, a frequent hand massage may soothe pain, improve hand strength, and lessen pressure and anxiety. Treatments for illnesses including neuropathy, carpal tunnel syndrome, and arthritis can all profit from hand massage.

Leadership Support

To ensure that every activity can be arranged successfully, the support of leadership plays an important role. Administrative leaders in academia have permanent or fixed-term roles managing academic organisations or parts of them. Leaders in this category include the vice president, deans, and the Student Representative Council (SRC). Individuals in these positions are in charge of university leadership. These individuals serve multiple tasks simultaneously, such as departmental figureheads, staff, and student leaders. (Braun et al., 2016). Not only does financial support for the well-being programme matter, but it is also necessary to provide adequate facilities at the City Campus with enough financial support. Supporting students to manage stress and adversity could benefit their current and future health and well-

being student-learning. Universities that want to foster student resilience must look at the big picture rather than the details. (Holdsworth et al., 2018)

Student Awareness

The term “awareness” is used interchangeably with the term “consciousness” and which shows a person's level of awareness of something. (John et al., 2000). The American Psychological Association defines awareness as the present-moment, judgment-free awareness of one's events. In other words, consciousness is a state and not a trait. Although often, particular techniques or activities are used to gain this awareness. Being conscious of one's own wellness is crucial, especially for students who are already aware of how depression, stress, and other conditions are frequently linked to it. In a 2013 survey by the National College Health Assessment, participants were asked to list the elements that influence their academic performance over the course of one semester. Student awareness can be improved with welfare exhibitions. Wellness programs may help students become aware of imbalances (Cohen, 2003, p. 204). This welfare exhibition can help students learn more about the significance of well-being while also raising their awareness of the topic.

Participant Involvement

Participant involvement essential in ensuring that every university activity receives support from students at University Malaysia Kelantan (UMK). According to (Imms et al., (2017)), participation may include components of engagement, motivation, persistence, social connection, and affect level. Attendance is a necessary but not sufficient criterion for participation and involvement. If one participates in an activity on a regular basis, the likelihood of being involved in that activity increases. However, individuals may attend to various components of the same action, possibly because they are motivated by distinct goals; as a result, they may be participating in separate portions of the same activity. Planned activity is crucial since it can help students cope and manage stress while only addressing one aspect of student mental health; it is equally essential to create protective elements in the university's social and academic environment. In a university setting, this approach recognises the impact of the teaching and learning environment on students' mental health and wellness (Baik et al., 2019).

Research Hypothesis

Four hypotheses have been tested in this study:

H1: There is a significant relationship between leadership support and the effectiveness level of wellness initiative activities at the University Malaysia Kelantan.

H2: There is a significant relationship between student awareness and the effectiveness level of wellness initiative activities at the University Malaysia Kelantan.

H3: There is a significant relationship between participant involvement and the effectiveness level of wellness initiative activities at the University Malaysia Kelantan.

H4: There is a significant relationship between facilities and the effectiveness level of wellness initiative activities at the University Malaysia Kelantan.

Research Framework

Facilities, leadership support, student awareness, and participant involvement are the four independent variables (IV) listed in the conceptual framework, which is based on the researcher's research. The dependent variable is the efficacy level (DV). The goal of this study is to understand what makes campus wellness programmes successful in university. The following are some of the conceptual frameworks used in this study:

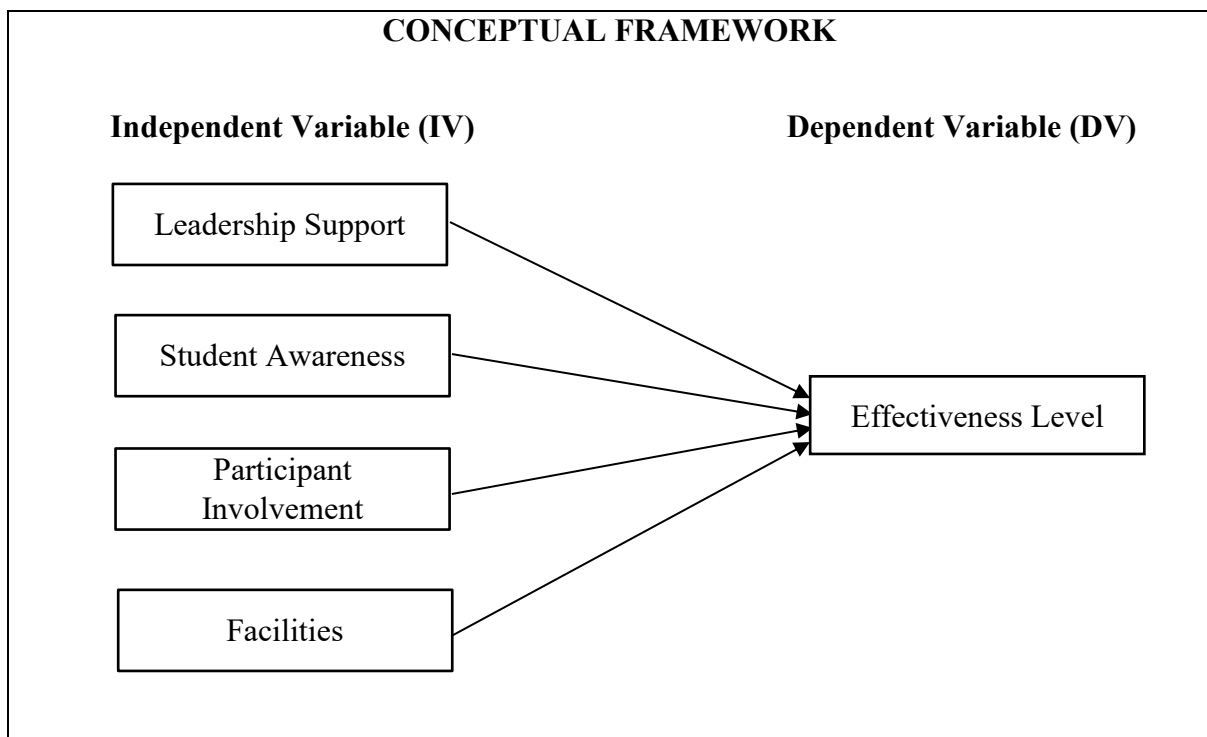

Figure 1: Research Framework

METHODOLOGY

Research Design

This study used a cross-sectional study. The method used by the researcher to collect data is by giving out questionnaires that are distributed to 361 respondents. The respondent was chosen by convenience sampling. Our target population for this study is from the University Malaysia Kelantan (UMK).

The questionnaire for this data collection process contains six sections which are section 1 related to the demographic (5 questions); section 2 about leadership support (6 questions); section 3 related to student awareness (5 questions); section 4 related to the participant involvement (7 questions); section 5 related to the facilities, (5 questions) and; section 6, about level of effectiveness, (7 questions). The Likert scale is the instrument that provides the most accurate measurement of respondents' most agreeable opinions. The Likert scales used in this study are: - 1 = Strongly Disagree, 2 = Disagree, 3 = Neutral, 4 = Agree, and 5 = Strongly Agree. The quantitative research approach, using a cross-sectional study design, was used to measure the relationship between the dependent variables, which are the level of effectiveness, and the independent variable, which are facilities, leadership support, student awareness, and participant involvement.

Data Collection

A questionnaire has been distributed via Google Forms via WhatsApp. The students will have an explanation for a little information to avoid misunderstanding the questionnaire. They were given space and their own self-judgment of the success factors on the questionnaire. There are 361 respondents among 6814 students. The data were collected and analysed through a self-administrator questionnaire. The respondents must answer all the questions given.

Sampling

Convenience sampling is a strategy used by this study to obtain research data from available groups of respondents. This method is used when there is a situation where the population is very large. It is also known as grab sampling or availability sampling. The data obtained from the respondents can help in solving specific issues. Students at University Malaysia Kelantan (UMK) were selected as target respondents. Convenience sampling will be used in this study because the total student population at University Malaysia Kelantan is large. The researcher utilised this sampling technique on 361 respondents because it was impossible to include all 6814 students in the study. Pilot studies frequently employ convenience sampling to gather information on success criteria for effectiveness in higher education settings. The poll was carried out independently. The approach was straightforward and suitable for the budget and schedule constraints.

Data Analysis

An instrument used in analysing the data was statistical tool or Statistical Package Social Science (SPSS) version 26.0. Descriptive analysis was used to assess the data. One variable is considered at a time in a frequency distribution, which is a mathematical distribution. The frequencies were gathered, and a comparison using the supplied data was made. The information gathered revealed the influences of the success factor of the effectiveness of wellness initiatives among students at University Malaysia Kelantan. The study consists of descriptive analysis, reliability analysis, and Pearson Correlation.

FINDINGS

Demographic Profile of Respondents

Table 1 below shows the frequency analysis of this research.

Table 1: Result of Frequency Analysis

Characteristics	Frequency	Percentage (%)
Age		
18-20	60	16.6
21-23	281	77.8
24-26	6	1.7
27 and above	14	3.9
Gander		
Male	62	17.2
Female	299	82.8
Race		
Malay	261	72.3
Chinese	40	11.1
Indian	40	11.1
Other	20	5.5
Marital Status		
Married	13	3.6
Single	348	96.4
Current Year of Study		
Year 1	11	3.0
Year 2	61	16.9
Year 3	268	74.2
Year 4	3	0.8
Other	18	5.0

Table 1 illustrates the result of the frequency analysis of socio-demographic characteristics. The distribution based on age shows that 60 respondents (16.6%) were between 18-20 years old, 281 respondents (77.8%) were between 21-23 years old, 6 respondents (1.7%) were from 24-26 years old, and 14 respondents are among 27 years old and above. The majority the respondents were between the age of 21-23 years old. This is because most degree students range in age from 21 to 23 years old.

The total number of respondents for males was 62 respondents (17.2%), while the number of females was 299 respondents (82.8%). This study used the convenience sampling method, meaning that anyone who wants to answer the questions can survey. In this study, more female was interested answering the questionnaire. For the analysis of the respondents by race, 261 (72.2%) respondents were Malays, Chinese and Indian respondents both have the same total of respondents, which is 40 respondents (11.1%), and another 20 respondents (5.5%) were from other races. The highest number of respondents by race is Malay because the student community at University Malaysia Kelantan is mostly Malay.

Referring to marital status, 348 respondents were single (96.4%), and 13 of the respondents were married, which is 3.6%. The majority of the respondents were single because they were still studying for degrees. The analysis of current-year study respondents showed that there were 11 respondents (3.0%) in student year 1, 61 respondents (16.9%) in student year 2, 268 respondents (74.2%) in student year 3, 3 respondents (0.8%) in student year 4, and 18 students (5.0%) in other current year of study. The result showed that more third-year students answered the survey.

Descriptive Analysis

Table 2 below shows the result of the descriptive analysis of this research.

Table 2: Result of Descriptive Analysis

Variables	Items	Mean	Standard
		Score (M)	Deviation (SD)
Leadership support	The faculty management and student representative council always participate in planning wellness initiative activities.	4.60	.716
	The faculty management and student representative council always take part in organizing wellness initiative activities.	4.62	.693
	The faculty management and student representative council make wellness initiative activities an important agenda in faculty or students' activities.	4.62	.705
	The faculty management and student representative council always encourage students to participate in wellness initiative activities.	4.61	.727

	The faculty management and student representative council have a clear objective for faculty or students' wellness initiative activities.	4.61	.698
	The faculty management and student representative council always promote the benefit of wellness initiative activities.	4.61	.714
Student awareness	As a student, I will always participate in planning the wellness initiative activities.	4.66	.583
	As a student, I will always participate in the wellness initiative activities organized by the university.	4.68	.575
	I am aware that participating in wellness initiative activities can improve my engagement with friends.	4.70	.498
	I am aware that participating in wellness initiative activities can reduce my stress levels.	4.68	.569
	I am aware that participating in wellness initiative activities can improve teamwork.	4.72	.485
Participant involvement	I will engage in wellness initiative activities if they are organized on weekends.	4.57	.742
	I will engage in wellness initiative activities if they are organized after lectures.	4.63	.645
	I will get involved in wellness initiative activities if they are run by external experts.	4.67	.556
	I will involve myself in the wellness initiative activities if managed by faculty management/student representatives.	4.67	.571
	I will engage in the wellness initiative activities if it is conducted online.	4.60	.692
	I will get involved in a wellness initiative activity if it is run in a fun way.	4.78	.445
	I will engage in wellness initiative activities if they are given incentives such as certificates, club memberships, and training hours.	4.77	.473

Facilities	The facilities for the wellness initiative activities provided by the university are good.	4.74	.470
	The wellness facilities become the main factors in organizing wellness initiative activities at the university/faculty level.	4.75	.515
	Good facilities can attract more participants to join the wellness initiatives activities at the faculty/university level.	4.78	.438
	Students should always be informed about the facilities provided at the university/faculty level to attract more participants to join the campus wellness initiative activities.	4.78	.450
	Wellness facilities were well maintained.	4.73	.550
Level of Effectiveness	Each wellness initiatives activities I participated in has fulfilled the desired outcomes.	4.68	.598
	Each wellness initiatives activities I participated in has a clear goal of healthy lifestyles.	4.71	.523
	All of the wellness initiatives activities are easy to participate in.	4.71	.554
	Students are informed about the wellness initiative activities carried out by the university/faculty.	4.72	.524
	I am highly satisfied with the wellness initiatives activities conducted at the university/faculty level.	4.71	.535
	The wellness initiatives activities schedule is flexible.	4.73	.537
	The wellness initiatives activities that I join have benefited me.	4.77	.451

Table 2 shows the results of means scores and standard deviation analysis on the independent variables, which are leadership support, student awareness, participant involvement, and facilities. The highest mean value for leadership support was for items 2 and 3. Item 2 receives a mean value of 4.62 (SD = .693): “The faculty management and student representative council always take part in organising wellness initiative activities”. Meanwhile, item 3 “The faculty management and student representative council make wellness initiative activities an important agenda in faculty, or students’ activities” receive a mean score of 4.62 (SD = .705).

Item 5 of student awareness has the highest mean value, which is 4.72 (SD = .485). The respondents strongly agree with the question, “I am aware that participating in wellness initiative activities can improve teamwork”. Item 6 for participant involvement has the highest mean value, which was 4.78 (SD = .445). Most respondents strongly agree with the question, “I will get involved in a wellness initiative activity if it is run in a fun way”.

Items 3 and 4 of the facilities have received the same mean value. In Item 3, which was 4.78 (SD = .438), the respondent strongly agreed with the question, “Good facilities can attract more participants to join the wellness initiatives activities at the faculty/university level”. In Item 4, whose mean value was 4.78 (SD = .450), respondents strongly agreed with the question, “Students should always be informed about the facilities provided at the university/faculty level to attract more participants to join the campus wellness initiative activities”. The lowest mean value was item 5, which was 4.73 (SD = .550). The respondent majority strongly agrees with the question, “Wellness facilities were well maintained”.

The highest mean value for the dependent variable; level of effectiveness item 7, was 4.77 (SD = .451). The respondent strongly agrees with the question, “The wellness initiatives activities that I join have benefited me”. Item 1 scored the lowest mean value, which was 4.68 (SD = .598), where the respondents strongly agreed with the question, “Each wellness initiatives activities I participated in has fulfilled the desired outcomes”.

Reliability Analysis

Table 3 below shows the reliability analysis of this research.

Table 3: Result of Reliability Analysis

Variables	Number of Items	Cronbach's Alpha
Leadership Support	6	0.943
Student Awareness	5	0.851
Participant Involvement	7	0.857
Facilities	5	0.906
Level of Effectiveness	7	0.934

The result of the reliability analysis for Table 3 in this variable is that the number of items is as follows: leadership support (6), student awareness (5), participant involvement (7), facilities (5), and level of effectiveness (7). The reliability analysis was conducted in this analysis to determine Cronbach's Alpha values for all variables. The value of leadership support is Cronbach alpha 0.943; the value of student awareness is Cronbach alpha 0.851; the value of participant involvement is Cronbach alpha 0.857; the value of facilities is Cronbach alpha 0.906; and the level of effectiveness is 0.934. As a result of the pilot test, the overall result was acceptable and reliable for this study. According to the results, leadership support has the highest coefficient of 0.943, while student awareness has the lowest coefficient of 0.851.

Pearson Correlation Analysis

Table 4 shows the result of the correlation analysis of this research.

Table 4: Result of Pearson Correlation Analysis

Hypothesis	R-value	P-value	Finding of Data Analysis
H1: There is a positive relationship between leadership support and the effectiveness level of wellness initiative activities in the university.	0.864	0.001	H1: Accepted
H2: There is a positive relationship between student awareness and the effectiveness level of wellness initiative activities in the university.	0.796	0.001	H2: Accepted
H3: There is a positive relationship between the participants involved and the effectiveness level of wellness initiative activities in the university.	0.797	0.001	H3: Accepted
H4: There is a positive relationship between facilities and the effectiveness level of wellness initiative activities in the university.	0.912	0.001	H4: Accepted

Hypothesis 1 (H1) proposed that leadership support is a positive relationship with the level of effectiveness. The finding reported in this study revealed that the reliability recorded value of Pearson Correlation, which is $r = 0.864$, $p = 0.000$. Thus, the result accepts hypothesis 1 (H1), whereby leadership support is positively significant with the level of effectiveness.

Hypothesis 2 (H2) proposed that student awareness was a positive relationship level of effectiveness. The finding reported in this study revealed that the reliability recorded value of Pearson Correlation, which is $r = 0.796$, $p = 0.000$. Thus, the result accepts hypothesis 1 (H1), whereby student awareness is positively significant with the level of effectiveness.

Hypothesis 3 (H3) proposed that the participant involved was a positive relationship with the level of effectiveness. The finding reported in this study revealed that the reliability recorded value of Pearson Correlation, which is $r = 0.797$, $p = 0.000$. Thus, the result accepts hypothesis 3 (H3), whereby the participant involved is positively significant with the level of effectiveness.

Hypothesis 4 (H4) proposed that facilities were positive relationship with the level of effectiveness. The finding reported in this study revealed that the reliability recorded value of Pearson Correlation, which is $r = 0.912$, $p = 0.000$. Thus, the result accepts hypothesis 4 (H4), whereby facilities were positively significant with the level of effectiveness.

DISCUSSION AND RECOMMENDATION

For our first independent variable, leadership support, the study proved that there is a positive relationship between leadership support toward effectiveness level. According to (Holdsworth et al., (2018), ensuring that every activity can be arranged successfully, the support of leadership plays an important role. Supporting students to manage stress and adversity benefits their current and future health and well-being. The development of resilience, in particular, contributes to students' mental health and well-being and is supported by formal and informal practices both within and outside the classroom.

The second is student awareness. This study proved a positive relationship between student awareness toward effectiveness levels. According to (Daphne M. Davis et al., 2012) particular techniques or activities are used to gain this awareness. Being conscious of one's own wellness is crucial, especially for students who are already aware of how depression, stress, and other conditions are frequently linked to it. The university's failure to deal with the problem of lack of student awareness can affect the university's performance in the eyes of the world.

Next is the participants involvement. This study proved a positive relationship between participants involved toward effectiveness level. According to (Imms et al., 2017), participant involvement plays an important role in ensuring that every university activity receives support from students. Participation may include components of engagement, motivation, persistence, social connection, and affect level. Furthermore, this planned activity is crucial since it can help students cope and manage stress while only addressing one aspect of student mental health; it is equally important to create protective elements in the university's social and academic environment (Baik et al., 2019).

Our last independent variable is facilities. This study proved a positive relationship between facilities toward effectiveness levels. According to Glasgow, et al., (2021), welfare facilities are provided to ensure the well-being of students. The higher authorities of the university pay attention to the initiatives of facilities available to guarantee the well-being of students so that they are aware of the importance of taking care of health. The facilities provided are reserved for all users to ensure user activities run smoothly. With the availability of facilities, it will be able to benefit users if it is used well and prudently.

Recommendations for future research

One area of further research could be to examine the impact of different types of wellness initiatives on student well-being. For example, a study could compare the effectiveness of mindfulness meditation programs versus exercise classes in reducing stress levels and improving mental health. This type of research could help universities determine which types of initiatives would be most effective for their student population. Another area that could be explored is the impact of peer-to-peer support on the success of campus wellness initiatives. Many universities have implemented programs where students can serve as peer mentors or wellness ambassadors to help their peers navigate available resources study could examine the impact of these programs on student engagement with wellness initiatives and their overall well-being.

Additionally, it would be helpful to investigate the role of technology in the success of campus wellness initiatives. Many universities have developed wellness apps or online resources for students to access information and resources related to their well-being. Research could examine the effectiveness of these resources in promoting healthy behaviours and improving student well-being. Furthermore, it is important to consider the role of diversity and inclusion in the success of campus wellness initiatives. A study could examine the effectiveness of wellness initiatives in promoting well-being for students from different backgrounds and identities. This could include exploring the impact of culturally responsive programming or examining the accessibility of wellness resources for students with disabilities.

CONCLUSION

In conclusion, this study has been accomplished to discover the success factors and measure the level of effectiveness of the well-being initiative among the students of the University Malaysia Kelantan (UMK). Four independent variables, leadership support, student awareness, participant involvement, and facilities, have been chosen to examine their relationships with the dependent variable, effectiveness level. A total of 361 respondents from the University Malaysia Kelantan (UMK) were selected to examine the success factor and measure the level of effectiveness of the well-being initiative among the students. Overall, based on Pearson's correlation analysis, leadership support scored a value of *0.864, followed by student awareness with *0.796, participant involvement with *0.797, and facilities with *0.912.

ABSTRACT

The study is about the Traditional and Complementary Medicine (TCM) services that can help the public to understand about TCM therapies which are safe and effective. This study propose three independent variables namely Certified Therapist, Experienced Therapist, and Skillful Therapist towards Customer Satisfaction in Traditional and Complementary Medicine (TCM) Services. This study was conducted in TCM facilities Malaysia. The total sample size in this study was 385 respondents who participated through WhatsApp, Telegram, and others. The results shows that all the three hypotheses were supported. The researchers have also proposed a few recommendations related to the study.

Keywords: Traditional and Complementary Medicine (TCM) services, Customer Satisfaction, Certified Therapist, Experienced Therapist, and Skillful Therapist.

INTRODUCTION

According to National Policy of Traditional & Complementary Medicine, Ministry of Health Malaysia (2007), TCM means a form of health-related practices designed to prevent, treat and manage illnesses or preserve mental and physical well-being of individuals, with alternatives and complementary therapies. It does not include medical or dental practices performed by registered medical or dental practitioners. Traditional and complementary medicine (TCM) is widely used particularly among patients with chronic diseases in primary care. Traditional medicine is important in providing healthcare to mankind and becoming more popular in the community, Traditional and Complementary Medicine Division. TCM is also an important component in our healthcare system which helps to improve the level of health and quality of life of Malaysians in relation to modern medicine. Next, the traditional and complementary medicine (TCM) Council was established in line with the enforcement of the TCM Act 2016 (Act 775) to regulate TCM practices and practitioners in Malaysia and to provide for matters connected with it.

There were three objectives of this research:

1. To investigate the relationship between Certified Therapist and Customer Satisfaction in Traditional and Complementary Medicine (TCM).
2. To investigate the relationship between Experienced Therapist and Customer Satisfaction in Traditional and Complementary Medicine (TCM).
3. To investigate the relationship between Skillful Therapist and Customer Satisfaction in Traditional and Complementary Medicine (TCM).

Significance Of The Study

The outcomes of this study will help Traditional and Complementary Medicine (TCM) practitioners and employees in Malaysia. Investigating TCM customer satisfaction can be beneficial to the sector's administration as a whole. This study will assist them in identifying the most critical elements influencing customer satisfaction with TCM treatment. The research findings can potentially be utilized by the Malaysian government to improve oversight of the country's Traditional and Complementary Medicine (TCM) sector. As a result, Malaysia may have the world's most competent TCM practitioners. This study might also aid future research on the contentment of conventional and alternative medical practices.

LITERATURE REVIEW

Certified Therapist

"A clear and formal method of adding visible, salient, and trustworthy extrinsic information about a product or service" is what certification is defined as (Starr & Brodie, 2016). According to Hodgkins (1953), "certification is an official statement in writing by an official in the public or private service that confirms a candidate's compliance with established requirements." If a legislative act should mandate certification, this means that only certified personnel will be allowed to hold the position. Having this certification will ensure that the candidate who holds the certificate has met the prescribed conditions and has the necessary qualifications. For Traditional and Complementary Medicine (TCM) services, these services are the focus subject of this study's quality certification in the health sector, although it has been shown that other certifications serve multiple functions in other business contexts. Therefore, individuals who are involved with this TCM service must have a certified certification in the field of health or medicine.

Experienced Therapist

The sum total of a worker's experiences with their employer is known as their therapist experienced (Pete, 2019). Specialists in the therapist experience have the power to alter workers' perceptions of therapist jobs and the company as a whole can be re-positioned into a more trustworthy culture if the personnel take the time to listen and respond appropriately. Employers save time and effort by not having to train new hires when employers bring in veterans in the field (Nelson, 2015). A trustworthy specialist can quickly become productive in their new position. Due to the gaps in knowledge the therapist fill in the leadership and communication skills that therapist contribute, the therapist are an invaluable member of the team. The organization could reap significant benefits from the decision to hire and train new personnels with no experience in the sector.

Skillful Therapist

According to Knapp (1963), skillful can be defined as "the learned ability to bring about per-determined results with maximum certainty; often with the minimum outlay of time or energy or both." In a general perspective, skill refers to any ability acquired by training or practice, allowing individuals to perform well in multifarious types of tasks. Based on the Britannica Dictionary (2022), skillful is about having the training, knowledge and experience that is needed to do something well which means it is having a lot of skill. According to the Traditional and Complementary Medicine Council, Ministry of Health Malaysia (2021), practitioners of TCM should always act professionally and honestly while doing their obligations to protect their good reputation. So, TCM therapist should be competent and constantly strive to enhance their knowledge and skills. Skills of TCM therapist can be divided into two categories which are domain-general and domain-specific skills (IGI Global).

Customer Satisfaction

Customer satisfaction is a person's emotion of joy or dissatisfaction after comparing the performance (results) of a product to the expected performance results (Kotler, 2019). If the performance falls short of expectations, the customer is unhappy; if the performance meets expectations, the customer is content; and if the performance exceeds expectations, the customer is highly satisfied or joyful (Kotler, 2019). Customer satisfaction is a mindset that is determined by the encounter. An evaluation of the features or benefits of a product or service, or the product itself, that brings a level of consumer enjoyment in relation to meeting consumer needs is called satisfaction. This satisfaction is derived from three factors: Certified Therapist, Experienced Therapist, and Skillful Therapist.

Research Hypothesis

The hypotheses in the study are to find out whether there are any correlations or relations between dependent variables and independent variables:

H1: There is a positive relationship between Certified Therapist and customer satisfaction.

H2: There is a positive relationship between Experienced Therapist and customer satisfaction.

H3: There is a positive relationship between Skillful Therapist and customer satisfaction.

Research Framework

Figure 1 below shows the research framework of this study.

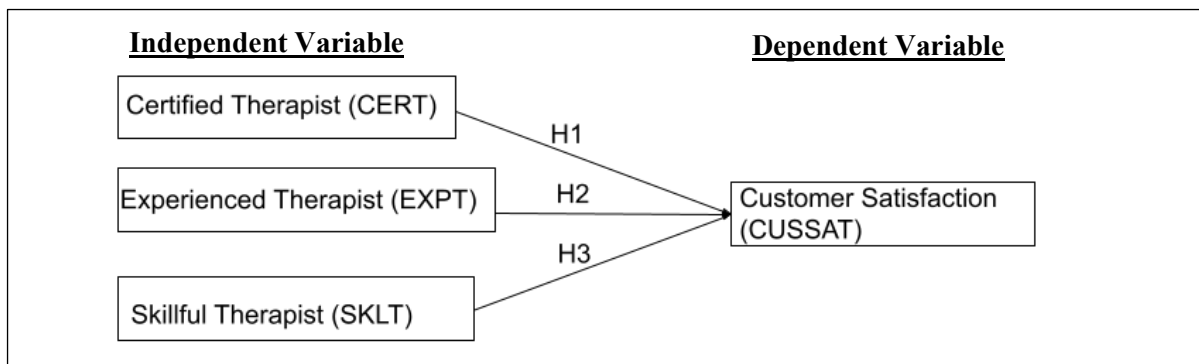

Figure 1: Research Framework

METHODOLOGY

Research Design

The framework of the study methods and procedures a researcher selects is known as the research design. The structure enables researchers to focus on research techniques that are appropriate for the field and set up their studies for success. The decision to be made regarding the research method is crucial to the study design process since it impacts how pertinent data may be gathered for a report. Several important factors must be considered when designing a study. According to Henry Manheim (1980), study design not only predicts and specifies the innumerable decisions associated with conducting data collection, processing, and analysis, but it also provides a logical justification for these choices.

There are two types of research design namely qualitative and quantitative. Qualitative research is gathering and evaluating non-numerical data, such as text, video, or audio, in order to better comprehend concepts, opinions, or experiences. Quantitative research produces factual, reliable outcome data that is

usually generalizable to some bigger populations, whereas qualitative research creates rich, detailed, and valid process data based on the viewpoints and interpretations of the participants rather than the investigators. Quantitative research is the systematic examination of phenomena through the collection of measurable data and the application of statistical, mathematical, or computational methodologies.

This study adopted a quantitative research design through the distribution of online surveys. Using a qualitative research design for this study because the researcher wants to receive a response as quickly as possible and from a specific group. This qualitative makes it easier for the researcher to carry out this study easily and accurately. For this study, an online survey is used so that it is easy to distribute and receive responses from customers who have received TCM therapy in a short time.

Data Collection

Primary or secondary data sources may be used in data collection. Primary data is a type of information that is gathered by researchers directly from primary sources using methods including tests, questionnaires, and interviews. The best type of data for study is considered to be primary data, which is typically gathered from the original source.

Data that has previously been gathered from primary sources and made easily accessible for academics to use for their own research is known as secondary data. It is a category of information that has previously been gathered. The information may have been gathered by one researcher for a specific study and then made available for use by another researcher.

Data for this study is directly collected from customers who have received TCM therapy using primary data sources. These data are gathered using questionnaires that have been created with a number of TCM-related questions. A questionnaire is used to collect information on the relationship between a certified therapist, an experienced therapist, and a skillful therapist to the satisfaction of the customer. The questionnaire was distributed online, and data was collected from TCM service customers. This poll was performed online because it is simple to reach customers throughout Malaysia and since AI technology has advanced significantly in recent years. As a consequence, we know what they said.

Sampling

Sampling is the process of choosing a portion of the population from which an assessment or inference about the complete population is made. By studying the sample and coming to understand its qualities or characteristics, the researcher can then generalize those properties or characteristics to the population's individual members (Ramayah, 2012). In general, the sampling method can be divided into two types, which are probability sampling and non-probability sampling.

Probability sampling means that every item in the population has an equal chance of being included in the sample. Creating a sampling frame first, then selecting samples from it using a computer program that generates random numbers is one method of conducting random sampling (Zikmund, 2002). Probability sampling techniques has five types of sampling, which are simple random sampling, stratified sampling, systematic sampling, cluster sampling, and multistage sampling.

Non-probability sampling technique is totally based on judgment (Sharma, 2017). There are four types of non-probability sampling techniques, which are convenience sampling, judgment sampling, quota sampling, and snowball sampling.

In this study, the researcher will use a non-probability sampling technique. Instead of that technique, convenience sampling will be used by the researcher because the researcher is aware that this sample is easier to get the respondents. Questionnaire forms will be distributed to respondents in Malaysia to ask

respondents to answer the questionnaire. The researcher will ask whether the respondents know or not about Traditional and Complementary Medicine (TCM) and their satisfaction with TCM.

Data Analysis

According to Johnson (2022), data analysis can be defined as a process of cleaning, transforming, and modelling data to make a decision in business within the useful information. In order to make decisions based on data analysis, it is necessary to extract meaningful information from the data.

There are several types of data analysis that are available to use which consist of Diagnostic Analysis, Predictive Analysis, Prescriptive Analysis and Statistical Analysis, Kelley (2022). Descriptive analysis is either complete or selections of summarized numerical data, while Inferential analysis works with samples derived from complete data.

SPSS (Statistical Package for the Social Sciences) is a software program used by researchers to collect and analyze the data. The SPSS can help the researcher to extract the information from the file to do descriptive, inferential and other variant statistical procedures, William (2022). This study will use descriptive statistics, bivariate statistics and linear regression. This study will use SPSS version 16.0 using Pearson Correlation.

FINDINGS

Demographic Analysis

A total of 385 respondents participated in this study. Table 1 below shows the demographic analysis of this research.

Table 1: Demographic Analysis

GENDER	Frequency	Percent	Valid Percent	Cumulative Percent
Male	163	42.3	42.3	42.3
Female	222	57.7	57.7	100.0
Total	385	100.0	100.0	
MARITAL STATUS				
Single	205	53.2	53.2	53.2
Married	180	46.8	46.8	100.0
Total	385	100.0	100.0	
AGE				
18-27	188	48.8	48.8	48.8
28-37	66	17.1	17.1	66.0
38-47	75	19.5	19.5	85.5
48-57 Above	56	14.5	14.5	100.0
Total	385	100.0	100.0	

The gender distribution of a total of 385 respondents. Table 4.1.1, shows that male respondents were 42.3 percent (n=163) less than female respondents' which is 57.7 percent (n=222). The reason is female respondents are more than male respondents is because female prefer to go to receive TCM services to relax than males.

The marital status distribution of a total of 385 respondents. It clearly shows that Single respondents were 53.2 percent (n=205) more than Married respondent 46.8 percent (n=180). The reason Single respondents were more than married respondents is because had more time to go for TCM services but married respondent did not have time because they had to do housework.

Among these four age groups, the highest number of respondents were from 18 to 27 years, with 48.8 percent (n = 188). The second highest respondent age was from 38 to 47 years, 19.5 percent (n = 75) and followed by 17.1 percent (n = 66) respondents from the age 28 and 37 years. While the lowest number of respondents were from 48 to 57 years above with 14.5 percent (n = 56). The reason the age of respondents from 18 to 27 years has the highest number is that they want to calms their mind because of stress lifestyle. Meanwhile, Respondent 48 to 57 years above have the lowest number of respondents because they are preferring their own home remedies and they don't have much time for it.

Descriptive Analysis

Table 2 below shows the descriptive analysis of this research

Table 2: Descriptive Analysis

Variable	Item	Mean score	Standard Deviation
Certified Therapist	Improve customer outcomes.	4.33	0.709
	The certified therapist provides better care.	4.36	0.727
	The certified therapist are improve customer care.	4.31	0.708
	The certified therapist are important to customers.	4.38	0.719
	The certified therapist benefits society.	4.34	0.741
Experienced Therapist	The experienced therapist create a satisfying and enjoyable environment.	4.36	0.758
	The experienced therapist are more likely to enable positive customer experience.	4.36	0.747
	The more experience the therapist the more the skill will be the develop.	4.34	0.734
	The performance and the productivity are influence by the therapist experience.	4.42	0.728
	The experienced therapist easily recognize the customer's problem.	4.32	0.790
Skillful Therapist	The therapist is skillful and have the professional attitude.	4.30	0.762
	The therapist is giving a clear explains during the treatment.	4.36	0.752
	The duration of treatment is appropriate for each treatment.	4.36	0.713
	The patience have an opportunity to express their opinion regarding the treatment section.	4.38	0.731

Customer Satisfaction	I'm satisfied with the therapy.	4.38	0.712
	I am delighted with the friendliness of the therapist.	4.40	0.711
	I am happy with cleanliness in the environment.	4.40	0.686
	Overall state the satisfaction of the service.	4.38	0.741

The frequency, mean and standard deviation for the items used to measure Certified Therapist. The higher questions measured for C4 (The certified therapist are important to customers.) Mean is 4.38. The questions, which were C3 (The certified therapist are improve customer care.) The mean is 4.31. The mean values C1, C2 and C5 are 4.36, 4.34 and 4.33.

The frequency, mean and standard deviation for the items used to measure the stage Experienced Therapist. There were five questions measured with one question having the highest mean E4 (The performance and the productivity are influence by the therapist experience.) 4.42 mean for the lower mean is E5 (The experienced therapist easily recognize the customer's problem.) with a 4.32 mean, continue with E1, E2 and E3 with 4.36 and 4.34 mean.

The frequency, mean and standard deviation for the items used to measure Skillful Therapist. There were one questions measured with the lowers means of 4.30 for question S1 (The therapist is skillful and have the professional attitude.). The higher measure is question S4 (The patience have an opportunity to express their opinion regarding the treatment section.) with 4.38 mean. Questions S2 and S3 with 4.36 mean.

The frequency, mean and standard deviation for the items used to measure the Customer Satisfaction. There were four questions measured with the two highest mean of 4.40 which is C1 and C4 (I'm satisfied with the therapy and Overall state the satisfaction of the service.) Meanwhile, the same means 4.38 for questions C2, and C3.

Reliability Analysis

Table 3 below shows the results of the reliability analysis

Table 3: Reliability Analysis

Variable	Number of items	Cronbach Alpha
Certified therapist	5	0.930
Experienced therapist	5	0.903
Skillful therapist	4	0.891
Customer satisfaction	4	0.923

Table 3 presents the Cronbach's Alpha values of the questionnaire in between the range of very good level 0.930 to excellent level 0.891. A total number of three independence variables and one dependent variable has been tested using Cronbach's Alpha. The first independent variable, which is Certified Therapist found to be very good and reliable in the strength of Correlation (5 questions: $\alpha = 0.930$). Then, the Experienced Therapist (5 question: $\alpha = 0.903$) for Skillful Therapist was also found to be excellent in the strength of Correlation (4 question: $\alpha = 0.891$). Lastly, Customer Satisfaction in TCM service is (4 question: $\alpha =$

0.923). The overall variables have remained with 18 questions as the current Cronbach's Alpha result is already above the good level. Therefore, the data were considered suitable for further analysis.

Table 4: Pearson Correlation Analysis

Table 4 below shows the Pearson Correlation Analysis

Table 4: Pearson Correlation Analysis

Hypothesis	P.Value	Result (supported/ not supported)
There is a positive relationship between Certified Therapist and customer satisfaction.	0.823	H1 is supported
There is a positive relationship between Experienced Therapist and customer satisfaction.	0.850	H2 is supported
There is a positive relationship between Skillful Therapist and customer satisfaction.	0.856	H3 is supported

Based on the table 4, Pearson's Correlation Analysis was used to test the relationship between hypotheses on a significant relationship such as Certified Therapist, Experienced Therapist and Skillful Therapist in TCM service quality with Customer Satisfaction. Based on the result, all hypotheses were accepted at a 0.01 significant level.

DISCUSSION AND RECOMMENDATION

The purpose of the present study was to Customer Satisfaction with Traditional and Complementary Medicine (TCM) Service. Customer satisfaction has been measured in a variety of social sectors such as economy banks (Culiberg & Rojsek, 2010), the hotel industry Alexandris, Dimitriadis & Markata, 2002), restaurant business (Wall & Berry, 2007), health hospitals (Murti, Deshpande & Srivastava, 2013) and many more. This study focuses on three dimensions of variables which are Certified Therapist, Experienced Therapist, and Skillful Therapist. Certified Therapist refers to a professional who must be a licence psychologist with a doctorate from an approved university and have completed a license exam. Post-doctoral training under supervision is also essential, as are extra specialty-specific practise and tests. Providers must also be licensed by the state. In comparison, experienced therapist refers to a licensed psychologist, psychotherapist, counselor, or other qualified therapists with expertise in treating customers with mental health issues. Lastly is skillful, which refers to any skill that may be developed via practise or instruction that enables people to excel at a variety of activities. The last result of this study shows the relationship between hypotheses on a significant relationship such as Certified Therapist, Experienced Therapist, and Skillful Therapist in TCM services with customer satisfaction. All hypotheses were accepted at a 0.01 significance level. Several recommendations can be made to increase customer satisfaction, including willingness to help the customers, provide food and beverages to customers, and emphatic treatment of customers. The first recommendation is the willingness to help customers. It refers to the attitude of an employees who is willing to help a customer without being asked. This can be realized in each employee through training or company policy. So, the management of those TCM must create an environment of willingness to help the customers.

CONCLUSION

In conclusion, the study discovers Customer Satisfaction with Traditional and Complementary Medicine (TCM) Services. Three independent variables, Certified Therapists, Experienced Therapists, and Skillful Therapists have been chosen to examine the relationship with the dependent variable, Customer Satisfaction with Traditional and Complementary Medicine (TCM) Services. The data was taken from 385 respondents in the Google form. The respondents are from various age groups starting from 18 years old to 57 years old and above. Overall, based on Pearson's correlation analysis, the Certified Therapist scored a value of 0.930, followed by Experienced Therapists with 0.903, and Skillful Therapists with 0.891.

ABSTRACT

A healthy lifestyle is one of the ways a person needs to live in order to achieve their optimal health including physical, mental, and social well-being. Researchers have shifted their focus to awareness of the importance of adopting a healthy lifestyle practice among communities. This is due to health issues that have arisen recently among communities that have become a public concern. The objective of this study is to investigate the relationship between peer influence, heredity disease and mental well-being in adopting a Healthy Lifestyle practice among communities in Malaysia. 384 respondents participated in this study which was conducted through Whatsapp, Facebook, and Instagram. This study focused on generation Z, a disease suffered and all Malaysians. The result showed that peer influence, heredity disease and mental well-being influence communities to adopt a healthy lifestyle.

Keywords: *A Healthy Lifestyle, Peer Influence, Heredity Disease, Mental Well-being*

INTRODUCTION

The World Health Organization (WHO), defines Health as a state of complete physical, mental, and social well-being, not simply just the absence of disease. While, the actual definition of Healthy Living is the steps, actions and strategies one puts in place to achieve optimum health. Healthy living is about taking responsibility for decisions and making smart health choices for today and for the future.

Healthy lifestyle practices are activities that are always done to maintain the health of the body. Dato' Seri Najib Tun Razak, who is the 6th Prime Minister of Malaysia once said that Malaysians should practice a healthy lifestyle to gain good from it. History proves that people in the past lived for a longer period than the people of today because they practiced a healthy lifestyle. Today's society suffers from many health problems because they do not practice a healthy lifestyle. The proof is that Malaysia has the highest number of diabetes sufferers in Asia, also among the most in the world after Saudi Arabia. According to the 2019 national health and morbidity survey (Nhms), the percentage of diabetic patients in Malaysia has risen from 13.4% in 2015 to 18.3% in 2019.

The level of health among Malaysians people is at a worrying level. Factors such as peer influence, heredity disease and mental well-being can affect healthy lifestyles, especially among students and other community members. The conditions such as heart disease, cancer, diabetes, joint disease, and mental illness are responsible for a vast number of deaths and disabilities. But, Many health problems can be prevented or at least their occurrence postponed by having a healthy lifestyle (Prsaanna, 2018). This is because a healthy lifestyle is one of which helps to keep and improve people's help and wellbeing (Prsaanna, 2018). A healthy lifestyle consists of eating a healthy diet, doing regular physical activity, avoiding toxic habits such as smoking (Grisolia, J.M, 2018). Thus, this study proposed three research objectives to explain the phenomenon.

1. To examine the relationship between peer influences and healthy lifestyle.
2. To examine the relationship between heredity disease and healthy lifestyle.
3. To examine the relationship between mental well-being and healthy lifestyle.

SIGNIFICANCE OF THE STUDY

This study was significant for future researchers, disease sufferers, all Malaysians, and generation Z to improve well-being and prevent themselves from suffering from serious diseases. Furthermore, policymakers, health agencies, program planners, and community leaders can also use the data obtained from this study as a reference to plan and implement effective policies and programs for the Malaysian community to promote a healthy lifestyle.

LITERATURE REVIEW

Peer Influence

Peer influence meaning is when someone chooses to do something individuals like or not, because some individual wants to feel accepted and appreciated by a friend then individuals are willing to do it (Nadiah, 2021). Peer influence is the best way to describe how teenagers' behavior is shaped around their friends (Nadiah, 2021). Peer influence can be a positive and negative thing. For example, Peer influence can make a person interested in taking care of individual health with interesting activities such as group cycling on weekends, participating in exercise classes and more together (Aminuddin, 2014). Positive influence from friends can encourage them to be better and expose themselves to positive things. In addition, it can also be a negative thing when someone is led to try things that they are not usually interested in due to the influence of peers, such as smoking or social behavior (Nadiah, 2021).

Peer Influence is very important to create awareness of adopting a healthy lifestyle when an individual feels pressure from their peers. There will be a tendency for them to choose the same path as making a decision to follow in the footsteps of their friend, which is likely to be an action outside of the individual's character such as playing sports for awareness (Ann, 2021). It can also increase a person's productivity to practice a healthy lifestyle and can increase self-confidence (Aminuddin, 2014). On the other hand, peers are in a good position to promote the health of individuals if their own health is desired (Joseph L, 2021). It also allows a person to live a healthy life because of them who always guide that person to continue living a healthy lifestyle and shaping the direction of a person (Nadiah, 2021).

Heredity Disease

Heredity disease is known as the process by which genes and characteristics are transmitted from parents to their children. Some of the genes from the mother combine with the father's genes to come up with a special combination of genes just for that child. Heredity disease can be categorized into three main groups which are single genes, chromosomal and also multifactorial diseases. Changes in the DNA sequence of single genes or known as mutations cause many diseases. Chromosomal occurs in every cell of the human body which has a full set of chromosomes but a child will inherit one set of chromosomes from each of its parents. Meanwhile, genetic disorders are the conditions that an infant is born with that can cause or be part of a set of conditions that can cause diseases (Professor B, 2021). In addition, multifactorial diseases are caused by a complex combination of genetic factors such as diabetes and heart disease (Dan Blazer, 2017).

Heredity disease plays a significant role in health, fitness and also wellness. Scientists have also discovered that people respond differently to exercise depending on their heredity disease condition. It is because people are starting to realize that making healthy lifestyle choices can help to counteract heredity diseases. As an example, adopting a healthy lifestyle can give people many benefits such as reducing their risk of diseases. Furthermore, heredity disease influences people to adopt a healthy lifestyle when one of biological parents died prematurely because of heredity disease such as cancer. So that, people can slow the process within the natural limits set by heredity disease by adopting healthy lifestyle habits such as following dietary patterns and engaging in physical activity (Béliveau, R., 2017). Heredity diseases are an important factor that lead people to practice a healthy lifestyle.

Mental Well-being

The World Health Organization (1946) defines good mental well-being as “a state of well-being in which the individual realizes the abilities, can cope with the normal stresses of life, can work productively, and is able to make a contribution to community. Someone who does not have a stable mental health condition is more susceptible to diseases, makes rash decisions, and is easily influenced to engage in negative and self-destructive activities such as illegal racing, smoking drugs, and vandalism. Several examples that can be pointed out are the commonly encountered mental conditions such as depression, mental illness, and stress.

Western Australian Department of Health. (n.d) stated that ‘things that can lead to positive mental health include spending quality time with family members and close acquaintances, working in a job or finding an activity that is meaningful, finding fun activities, practicing relaxation techniques such as meditation, yoga or tai-chi and others’. This physical activity can improve mental health by helping the brain cope with stress and depression. Based, research shows that individuals who exercise regularly are twenty-five percent less likely to develop depression or mental disorders in the next five years (Isa, A. M. 2022).

Healthy Lifestyle

In 1946, the World Health Organization defined a Healthy Lifestyle as the way a person lives in order to achieve optimal health with a state of complete physical, mental, and social well-being, which is not merely just the absence of disease only'. A healthy lifestyle is a life practice that positively impacts a person, family, and society. By adopting a healthy lifestyle as a way of life, individuals can improve their health, general mood, and extend their lifespan. Thus, people need to make healthy lifestyle changes starting with a step-by-step plan and then building a Healthy Lifestyle as habits.

In addition, there are some tips and ideas that people can use to achieve their wellness goals to make their life healthier. Among them is avoiding harmful activities, doing healthy things they enjoy, and taking care of their general well-being. If people keep in mind to remember these tips, people will be able to unlock a healthy and happy lifestyle. Also, people are advised to watch some videos that are being shared on the internet about healthy lifestyle tips as a reference to be able to follow the tips properly. Moreover, it is better to seek guidance from the experts such as therapists, coaches, or wellness entrepreneurs themselves to get more effective results.

Research Hypothesis

This study investigates the relationship among these discussed variables. Based on the literature discussed, the hypotheses of this study were summarized in the following manner:

H₁: There is a positive relationship between Peer Influence and adopting a Healthy Lifestyle.

H₂: There is a positive relationship between heredity disease and adopting a Healthy Lifestyle.

H₃: There is a positive relationship between mental well-being and adopting a Healthy Lifestyle.

Research Framework

Figure 1 below shows the research framework used for this study.

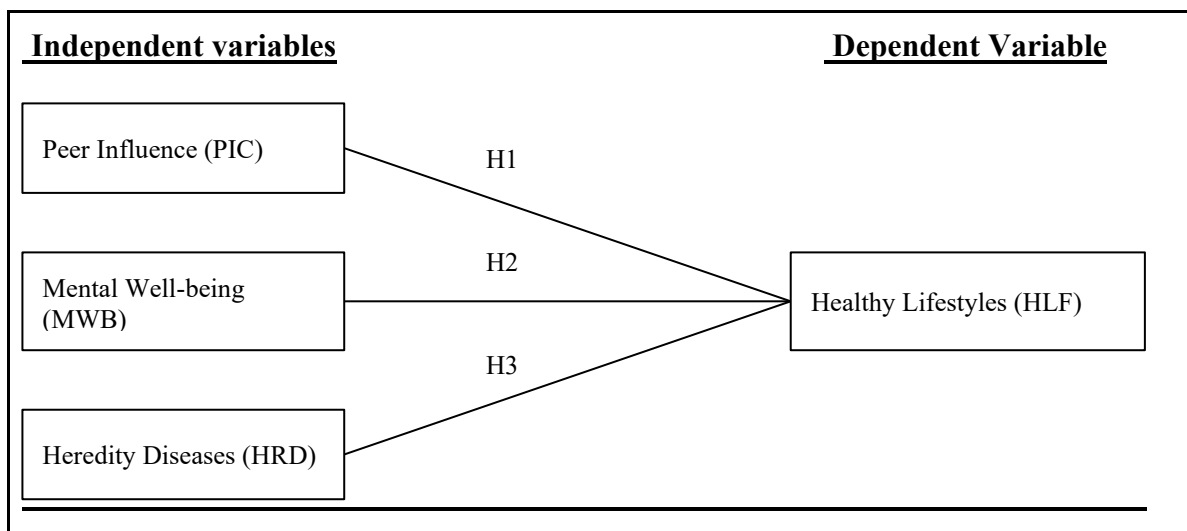

Figure 1: Research Framework

METHODOLOGY

Research Design

The researchers applied a quantitative research approach. The community in Malaysia was chosen as the representative group of people that gives opinions about Adopting a Healthy Lifestyle. The researcher chose community living in Malaysia because they are suitable respondents for a study about adopting a healthy lifestyle.

The questionnaire gathered all general information about adopting a healthy lifestyle. The five sections designed for the questionnaires in this research are section A, B, C, D and E. Section A, contains the respondent's demographic information. Section B till D was about the independent variables which are Peer Influences, Heredity Disease and Mental Well-being. Section E focuses on the dependent variable, which is Healthy Lifestyle.

Data Collection

Data collection that the researcher used in this research is primary data. Data collection for this research was through an online questionnaire. The complete questionnaire was distributed via social media such as WhatsApp, Facebook and Instagram. The questionnaire was distributed in April 2023. Respondents who were suitable for the research criteria were randomly selected to answer the online questionnaires. It consists of the general public, contact with the family, and friends. This questionnaire was used to collect information regarding the awareness of the Importance of Healthy Lifestyle Practices among communities in Malaysia.

Sampling

The sampling method that has been chosen is non-probability techniques by the researchers because the procedures used to select units for inclusion in a sample are much easier, and quicker. Convenience sampling is the easiest method because participants are selected based on availability and willingness to participate. In this study, certain characteristics that exist in the population or respondents are noticed by the researchers which cause purposive sampling to be used. Therefore, the data analysis techniques, such as frequency, descriptive, reliability, and correlation, are presented in the next section.

Data Analysis

Data analysis is known as an evaluating method of assessing records with applying statistical, logical, and analytical. The tool that is used in this study to analyse the data collected is known as the statistical package for Social Science (SPSS). SPSS is a software that can explain the relationship between independent and dependent variables in terms of descriptive analysis and correlation. The software processes large datasets efficiently and helps researchers to perform complex statistical analysis. Therefore, the data analysis techniques, such as frequency, descriptive, reliability, and correlation, are presented in the section.

FINDINGS

Result of Demographic Analysis

Table 1 below shows the Demographic Analysis of this study

Table 1: Demographic Analysis

Characteristics	Frequency	Percentage
Gender		
Male	138	35.9
Female	246	64.1
Age		
18 – 25 years old	308	80.2
26 – 34 years old	47	12.2
35 – 42 years old	18	4.7
43 years old and above	11	2.9
Marital Status		
Single	330	85.9
Married	54	14.1

Table 1 above shows an analysis in Frequency and Percentage for each Socio-Demographic Characteristic based on data of descriptive analysis obtained from Part A in the questionnaire where demographic variables include gender, age, and marital status. This table 1 depicts the results of the socio-demographic characteristics of the 384 total respondents. Also, the respondents are people who adopt healthy lifestyle practices among communities in Malaysia.

First of all, it is the gender distribution where most respondents were female with 64.1 % (n = 246) while the rest were male with 35.9% (n = 138). Besides that, in terms of age distribution, the highest number of respondents were from 18 until 25 years old, with 80.2% (n = 308). The second highest number of respondents are from 26 until 34 years old, with 12.2% (n = 47). Next, followed up by another age group which is from 35 until 42 years old, with 4.7% (n = 14). Meanwhile, the last age group with the lowest number of respondents are from 43 years old and above, with 2.9% (n = 11). Moreover, the majority for Marital status of the respondents were Single, which consists of 85.9% (n = 330) of them. Which also means the Marital Status of remaining respondents who were married is equivalent with 14.1% (n = 14z).

Result of Descriptive Analysis

Table 2 below shows the Descriptive Analysis of this study

Table 2: Descriptive Analysis

Variable	Items	Mean Score	Standard Deviation
Peer Influence	The influence of peers can affect my healthy lifestyle.	4.20	0.939
	The influence of peers can be an important factor in adopting a healthy lifestyle.	4.17	0.944
	The influence of peers is important in adopting a healthy lifestyle in my life.	4.17	0.887
	There are a few activities that related to peers' influence can affect my health.	4.18	0.896
Heredity Disease	A genetic is a disease.	3.88	1.124
	A genetic is a piece of DNA.	4.27	0.879
	I can see genetics with the naked eye.	3.42	1.419
	Some diseases are caused by genetics, environment and lifestyle.	4.27	0.789
	A genetic test can determine whether someone has a higher chance to develop a particular disease.	4.27	0,850
	All of the serious diseases is heredity diseases.	3.88	1.077
	A healthy parent will have a child with heredity diseases.	3.85	1.130
Mental Well-Being	I am optimistic about the future.	3.99	1.042

	I feel useful.	4.07	2.342
	I feel relaxed.	4.18	0.892
	I am interested in other people.	4.10	0.994
	I can handle the problem well.	4.14	0.875
	I can think clearly.	4.21	0.907
	I can make my own decisions.	4.29	0.871
Healthy Lifestyle	I smoke regularly.	2.57	1.712
	I sleep between 7 to 8 hours daily.	3.81	1.249
	I eat breakfast, lunch, and dinner daily.	3.98	1.134
	I eat five portions of fruit and vegetables daily.	3.71	1.270

Table 2 illustrates the mean and standard deviation for the independent variable which is peer influence, disease, mental well-being and also the dependent variable which is adopting a healthy lifestyle. Firstly, Table 2 shows the mean and standard deviation for the items used to measure the variables of peer influences. Four questions were measured, with the highest mean being 4.20 for item PI1 with the statement “The influence of peers can affect my healthy lifestyle”. The items of PI4 are second highest with the statement “There are a few activities that related to peers' influence can affect my health“. Instead, with the lowest mean 4.17, items PI2 and PI3 both share the last place. PI2 statements are “ The influence of peers can be an important factor in adopting a healthy lifestyle. Meanwhile, PI3 statements are “The influence of peers is important in adopting a healthy lifestyle in my life”.

Next, Table 2 also shows the mean and standard deviation for the items used to measure the Heredity Disease. Seven questions were measured with the highest mean being 4.27 for item HD2, HD4 and HD5 with respectively on the statement “A genetic is a piece of DNA”, “Some diseases are caused by genetics, environment and lifestyle”, and “A genetic test can determine whether someone has a higher chance to develop a particular disease. It is followed by item HD1 and HD6 with both 3.88 means. Then, HD7 with 3.85 means, and lastly item HD3 with just 3.42 means only to be the lowest by statement “I can see genetics with the naked eye”.

Moreover, Table 2 shows the mean and standard deviation for the items used to measure Mental Well-being. There were also seven questions being measured with the highest mean being items MVB7 with 4.28 means by statement “I can make my own decisions”. Otherwise, the lowest mean, with 3.99 was for

MVB1 with the statement that “I am optimistic about the future”. The mean values for the other five items are respectively 4.21, 4.18, 4.14, 4.10 and 4.07 for item MVB6, MVB3, MVB5, MVB4, and MVB2 .

Lastly, Table 2 shows the mean and standard deviation for the items used to measure Healthy Lifestyle. Four questions were measured with the highest mean being 3.98 for the item HL3 on the statement “I eat breakfast, lunch, and dinner daily”. Otherwise, the lowest mean with 62.57 was for HL1 with the statement “I smoke regularly”. Meanwhile, the other mean for item HL2 and HL4 were 3.81 and 3.71 respectively.

Result of Reliability Analysis

Table 3 below shows the Reliability Analysis of this study

Table 3: Reliability Analysis

Variable	Number of Items	Cronbach’s Alpha
Peer Influence	4	0.820
Heredity Disease	7	0.661
Mental Well-Being	7	0.686
Healthy Lifestyle	4	0.754

Table 3 shows the reliability analysis through Variables, Number of items and Cronbach’s Alpha. Based on the result of this table 3, Cronbach’s alpha coefficient indicates the values of the questionnaire were above the excellent reliability level of 0.60, with values in the range from 0.661 to 0.820. Peer Influence has been shown to have excellent reliability with four items which had Cronbach Alpha value of 0.820. Heredity Disease similarly showed very good reliability with 7 items and the Cronbach’s Alpha value of 0.661. After that, Mental Well-Being also showed very good reliability with 7 items equivalent to 0.686 Cronbach’s Alpha value. Lastly, the dependent variable, which is a Healthy Lifestyle, was shown to be very good of reliability with 4 items, and the Cronbach’s Alpha value was 0.754. To summarise, all of the variables included in the study have very good reliability and are acceptable. Thus, the data were considered suitable for further analysis.

Result of Pearson Correlation Analysis

Table 4 below shows the Pearson Correlation Analysis of this Study.

Table 4: Pearson Correlation Analysis

Hypothesis	P-Value	Result (Supported/ Not Supported)
H ₁ : There is a positive relationship between Peer Influence and adopting a Healthy Lifestyle.	0.165	H ₁ is supported.
H ₂ : There is a positive relationship between heredity disease and adopting a Healthy Lifestyle.	0.339	H ₂ is supported.

H ₃ : There is a positive relationship between mental well-being and adopting a Healthy Lifestyle.	0.553	H ₃ is supported.
---	-------	------------------------------

Table 4 shows that Peer Influence and Healthy Lifestyle were significantly correlated at $r = 0.165, p > 0.01$. Similarly, the result shows a statistically significant correlation between Heredity Disease and Healthy Lifestyle with $r = 0.339, p > 0.01$. The third correlation is between Mental Well-being and Healthy Lifestyle, the result also shows a statistically significant correlation between them with $r = 0.553, p > 0.01$. According to the results, all the hypotheses were supported at a 0.01 significance level.

DISCUSSION & RECOMMENDATIONS

In general, this study has discussed extensively about adopting a Healthy Lifestyle Practice, it's a choice among communities in Malaysia. Therefore, the study has figured out the relationship between three variables: peer influence, heredity disease and mental well-being with adopting a healthy lifestyle. Correspondingly, the previous research showed a significant relationship between peer influence, heredity disease and mental well-being with adopting a healthy lifestyle. However, based on the previous study, there are several factors that affect communities in Malaysia to adopt a healthy lifestyle. Hence, there are some recommendations to the researchers for improving the research for future studies.

The first recommendation is that the researchers can use a variety of survey techniques to respond to the questionnaires. One of the survey techniques that the researchers can use to carry out the study is by using a qualitative method which is in person personal interviews. Besides that, the second recommendation is that the researchers need to expand more methodological work in his study as a research reference. This research can be qualitatively by observing and looking at the people who perform such activities. Lastly, this study was significant for future researchers for better insight and knowledge. Future researchers should conduct the research topic focusing on adopting a Healthy Lifestyle Practice, it's a choice among communities in Malaysia.

CONCLUSION

The primary purpose of this research is to examine the relationship between peer influence, heredity disease, and mental well-being with adopting a healthy lifestyle. The Malaysian community was selected as the respondents of this study. The data from the survey was analysed using the SPSS and Demographic analysis, Descriptive analysis, Reliability analysis and Pearson Correlation analysis. According to the results, all independent variables: peer influence, heredity disease, and mental wellbeing had a positive relationship with the dependent variables' healthy lifestyle. All the hypotheses were supported at a 0.01 significance level. Thus, all the hypotheses such as H₁, H₂, and H₃ stated are accepted.

ABSTRACT

Physical activity refers to a person's movements, which include leisure activities, travel from one point to another, and work. Participation in physical and fitness activities has grown in popularity among Malaysians. This problem statement is mostly concerned with health issues. People who suffer from health issues such as obesity tend to engage in less physical and fitness activity. This research about community involvement towards physical and fitness activities. The research was conducted among communities that are basically doing physical and fitness activities. Therefore, this study aimed to examine the relationship between reduce stress, lose weight, sleep and involvement factors with physical and fitness activities. When it comes to finding information, community in Malaysia from 18 to 26 years old and above appear for identifying involvement factors in physical and fitness activities among communities in Malaysia. 200 respondents were participated in this study which was conducted through social media like Google Form, WhatsApp, Facebook, and Instagram. The result showed that reduce stress, lose weight, and sleep influence the involvement in physical and fitness activities.

Keywords: *Involvement in physical and fitness activities, Community in Malaysia, Social media, Involvement*

INTRODUCTION

"Physical activity" includes any skeletal muscle-driven body movements that require energy. All of a person's movements, including doing leisure activities, travel, and work are considered physical activity. Physical activity can prevent and treat noncommunicable diseases like heart disease, stroke, diabetes, and some cancers. It prevents hypertension, maintains a healthy weight, and improves mental health, quality of life, and well-being. Walking, cycling, and leisure activities keep people active.

The action of participating in something or communicating with someone is characterised as involvement. According to Collins Dictionary (2022), participation is the excitement that people feel when they have a deep passion for something. According to the Cambridge Dictionary (2022), involvement involves participating in something, either actively or passively. In this study, engagement is defined as actively or passively participating in anything. The purpose of this study was to find out what variables motivate people to participate in physical and fitness activities. The following were the study's research objectives:

1. To determine the relationship between reducing stress and involvement factors with physical and fitness activities.
2. To examine the relationship between lose weight and involvement factors with physical and fitness activities.
3. To determine the relationship between sleep and involvement factors with physical and fitness activities.

SIGNIFICANCE OF THE STUDY

Researchers

This study can help the researcher understand why stress, weight loss, and sleep can measure physical and fitness activity. Next, this study will reveal a crucial feature of involvement that many researchers missed. This research paper topic might benefit future researchers.

Generation Z

Gen Z is often referred to as the iGeneration or the centenary generation. People born between 1997 and 2012 comprise Generation Z, the generation that comes after the millennials. Many members of this generation's oldest cohort, who grew up during the era of ubiquitous internet access, will have completed their formal schooling and be ready to enter the workforce by 2020 (Meola, 2022). Generation Z will be exposed to greater physical and fitness activities as a result of this study.

LITERATURE REVIEW

Reduce Stress

The stress symptom occurs when a person believes that the need exceeds his ability or resources. According to Berretz et al. (2020), stress is a long-term physical and psychological tension that might impair a person's ability to deal with a situation. Marksberry (2017) has given a new meaning to stress by demonstrating in his work that stress may induce sickness and that an overdose can result in death. According to Kubala (2022), physical activity and fitness can lower stress by claiming that jogging for 10 minutes is equivalent to 45 minutes of physical exercise. A quick walk or any other modest physical activity can bring relief for several hours, despite the fact that it is only a brief effect. This demonstrates that physically active people had lower levels of stress and sadness than inactive people.

Physical activity and fitness, according to Madell (2012), can boost blood flow and improve an individual's body's ability to use oxygen. Both alterations have an immediate influence on the brain.

Regular exercise not only reduces stress but also promotes overall health in other ways. Stress levels may be reduced gently as a result of general health improvements. When a person improves their physical wellbeing and cardiac health, they will feel less stressed.

Lose Weight

Body weight includes water, protein, minerals, and fat, according to In Body India (2020). Healthy and energetic people must maintain a balanced body composition. Weight loss reduces water, lean body mass, muscle mass, and fat mass. Warrier and Incze (2021) say a balanced, low-calorie diet and exercise are the safest and most effective ways to lose weight. This diet and 150 minutes of moderate-intensity physical activity each week can have several health benefits. The most important thing is to return to your weight loss strategy, which, like your diet, should be healthy and body-friendly.

Petridou et al. (2019) found that self-reported and objective measures of physical activity positively correlate with long-term weight reduction maintenance. Weight-maintainers burned 2621 kcal per week. This is more than 60 minutes of moderate-intensity exercise per day, like brisk walking, or 35 minutes of strenuous exercise, like jogging. Weight loss maintenance differed significantly between workout groups. They expended 2500 kcal per week (corresponding to 75 minutes of daily walking) while the standard behavioural therapy group expended 1000 kcal (equal to 30 minutes of daily walking) during 12 months (8.5 kg vs. 6.1 kg) and 18 months (6.7 kg vs. 4.1 kg). The researchers confirm prior findings that considerable physical activity increases lead to long-term weight decrease.

Sleep

Hawkins (2014) defines sleep as a natural state of rest in which one is unconscious and muscles relax. Nightly sleep needs vary. Taking a bath, listening to music, or doing yoga before bed may help people sleep better. Daytime activity helps people fall asleep at night. Green (2022).

“What’s the difference” (2021) states that sweating after exercise can help people sleep better. Wang & Boros (2021) found that moderate exercise improves sleep quality for all ages. Gupta & Hussain (2020) found that people who exercise sleep better. However, longer bedtimes, delayed initiation of sleep, lower nighttime sleep duration, and greater daytime napping during lockdown have all linked to a decline in physical activity and fitness.

Involvement

The action of participating in something or interacting with someone, according to Oxford Learners Dictionaries (2022), is a definition of involvement. According to Collins Dictionary (2022), involvement is the excitement that people feel when they have a deep passion for something. According to the Cambridge Dictionary (2022), involvement involves participating in something, either actively or passively. In this study, engagement is defined as actively or passively participating in anything.

Physical activity, according to Sekulic et al., (2020), can benefit people in a variety of ways, including those directly related to the prevention of obesity, type 11 diabetes, colon cancer, and cardiovascular problems. As a result, even while some types of physical activity have been shown to be beneficial for persons with serious health problems, achieving the recommended levels of physical activity remains a major public health issue. According to Tosho Bakinde (2022), a healthy lifestyle should include frequent physical activity because it maintains the body fit. Physical activity has several rewards. Physical activity, for example, enhances both physical and mental well-being. Physical fitness lowers the risk of getting generative diseases such as diabetes, hypertension, cancer, and heart disease. It also makes ordinary tasks such as lifting goods easier.

Research Hypothesis

This study investigates the relationship among these discussed variables. Based on the literature discussed, the hypotheses of this study were summarized in the following manner:

H₁ : There is a positive relationship between reducing stress and involvement with physical and fitness activities.

H₂ : There is a positive relationship between lose weight and involvement with physical and fitness activities.

H₃ : The quality of people's sleep correlates positively with their level of activity.

Research Framework

The Figure 1 below shows the research framework used for this study.

Figure 1 : Research Framework

METHODOLOGY

Research Design

McCombes (2021) describes a research design as "an organised strategy for gathering, analysing, and interpreting data to address a research issue." A well-designed study can ensure that the research's methods achieve its goals and that the data is properly analysed. Quantitative or qualitative investigations are possible. This study will use quantitative methods. Quantitative research is fast, scientific, and approachable, thus researchers decide on it. Quantitative research is convenient and fast, hence many researchers choose it (Williams, 2021).

Data Collection

This study used "primary data." This study's data was gathered using an online questionnaire. The entire poll was distributed via social media platforms such as Google Forms, WhatsApp, Facebook, and Instagram. The questionnaire was distributed in April 2023. Randomly selected respondents completed the online questions. Malaysians who like fitness are the biggest source of respondents. Thus, Section B had filter questions. Qualified participants can fill out the questionnaire.

Sampling

This study used convenience and non-probability sampling. Questionnaires will be preserved to respondents in Kota Bharu, Kelantan, in order for them to respond. The researcher will inquire whether the respondent is aware of the elements associated with physical exercise and fitness. This is a method of learning about the advantages of this involvement for personal wellness.

Data Analysis

This study analyses data using SPSS. SPSS can describe and correlate independent and dependent variables. The programme enables academics to execute advanced statistical analysis on massive datasets. Next, frequency, descriptive, reliability, and correlation data analysis methods will be discussed.

FINDINGS

Result of Frequency Analysis

Table 1 below shows the Frequency Analysis of this study

Table 1 : Frequency Analysis

Characteristics	Frequency	Percentage
Gender		
Male	132	66.0%
Female	67	33.5%
Age		
18-19 years old	8	4.0%
20-21 years old	10	5.0%
22-23 years old	144	72.0%
24-25 years old	20	10.0%
26 years old and above	18	9.0%

Table 1 above shows the gender distribution where most respondents were male 66.0% (n=132) while the rest were female with 33.5% (n = 67). Besides that, the highest number of respondents were from 22 to 23 years old, with 72.0% (n = 144). The second highest number of respondents are from 24 to 25 years old, with 10.0% (n = 20). At the same time, the third highest number of respondents are from 26 years old and above, with 9.0% (n = 18). Next, the age group of 20 to 21 years old recorded 5.0% (n = 10) while the lowest number of respondents were from 18 to 19 years old, with 4.0% (n = 8).

Result of Descriptive Analysis

Table 2 below shows the descriptive analysis

Table 2 : Descriptive Analysis

Variable	Items	Mean Score	Standard Deviation
Reduce Stress	1. Exercise can reduce stress.	4.22	898
	2. I feel relaxed physically and mentally by exercising.	4.08	915
	3. I can think positively if I do the exercise.	4.04	940
	4. My feelings and emotions will be control by the exercise	3.98	1.012
Weight Loss	1. I use specific goals and methods for weight loss.	3.88	1.006
	2.. I use weight-loss aids as apps, equipment, or diet foods to help me lose weight.	3.72	1.090
	3. I have many ways to boost my motivation to lose weight.	3.79	0.966
	4. I try to lose weight by myself or more people	3.84	0.995

	5. I go to a weight-loss group or program or have recently talked to a professional about losing weight..	3.27	1.263
Sleep	1. Exercise can benefit people's sleep.	4.10	977
	2. Exercise can increase an individual's sleep duration and the amount of slow wave sleep (SWS).	3.88	1.002
	3. I can get a better sleep when do a simple relaxation exercises or meditation before bed.	3.96	942
	4. Physical activity is impacted by the irregular sleep pattern.	3.93	946
	5. Physical exercise can help people who have sleep problems or insomnia.	3.90	995
Involvement	1. I speak one hour for walking activities in a day.	3.64	1.135
	2. I do physical activities like skipping, jogging, and yoga at home.	3.53	1.190
	3. I engage in physical activity while listening to music at home.	3.96	

Table 2 displays the frequency, mean score, and standard deviation for weight loss measurement items. The highest mean was 3.88 for item WL1: "I use specific goals and methods for weight loss". 200 responses slightly strongly disagree, disagree, not sure, agree, and strongly agree on WL1. Items LW5 on "I go to a weight-loss group or programme or have recently talked to a professional about losing weight" had the lowest mean, 3.27. WL2, WL3, and WL4's other three items averaged 3.72, 3.79, and 3.84.

Table 2 illustrates the frequency, mean, and standard deviation of sleep items. Five items were measured, with item S1's statement "Exercise can give a benefit people's sleep" having the highest mean of 4.10. The lowest mean score is shown in Table 2. Four questions were measured with item RS1 on "Exercise can reduce stress" having the highest mean of 4.22. 200 responses slightly strongly disagree, disagree, not sure, agree, and strongly agree on RS1. Item RS4, "My feelings and emotions will be controlled by the exercise," had the lowest mean, 3.98. The item S2 on "Exercise can increase an individual's sleep duration and amount of slow wave sleep (SWS)" had a mean score of 3.88. S3, S4, and S5's other three items averaged 3.96, 3.93, and 3.90.

Lastly, item frequency, mean, and standard deviation measured involvement. Three questions had the highest mean, 3.96 for item I3 on "I engage in physical activity while listening to music at home". Item I2, "I do physical activities like skipping, jogging, and yoga at home," has the lowest mean score of 3.53. Other I1 items averaged 3.64.

Result of Reliability Analysis

Table 3 below shows the results of the reliability analysis.

Table 3 : Reliability Analysis

Variable	Number of items	Cronbach's Alpha
Reduce Stress	4	0.922
Weight Loss	5	0.889
Sleep	5	0.923
Involvement	3	0.773

Table 3 shows that Cronbach's Alpha values of the questionnaire were above the excellent reliability level of 0.70, with values in the range from 0.888 to 0.922. Reduce stress has been shown to have an excellent reliability with four items ($\alpha = 0.922$). Weight loss similarly showed very good reliability with five items and Cronbach's Alpha value is $\alpha = 0.889$. Next, sleep also shows a good reliability with five items and Cronbach's Alpha value is $\alpha = 0.923$. For dependent variables, which is involvement, shows good reliability with three items and Cronbach's Alpha value is $\alpha = 0.773$. To summarize, all of the variables included in the study have very good reliability and are acceptable. Thus, the data were considered suitable for further analysis.

Result of Pearson Correlation Analysis

Table 4 below shows the Pearson Correlation Analysis.

Table 4 : Pearson's Correlation Analysis

Hypothesis	P-Value	Result (Supported/ Not Supported)
H1 : There is a positive relationship between reducing stress with physical and fitness activities community In Malaysia.	0.597	H ₁ is supported
H2 : There is a positive relationship between lose weight with physical and fitness activities community in Malaysia	0.528	H ₂ is supported
H3 : There is a positive relationship between sleep with physical and fitness activities community in Malaysia	0.532	H ₃ is supported

Table 4 shows that reduce stress and involvement were significantly correlated at $r = 0.597$, $p < 0.01$. Similarly, the results show a statistically significant correlation between weight loss and involvement with $r = 0.528$, $p < 0.01$. The third correlation is between sleep and involvement with $r = 0.532$, $p < 0.01$. According to the results, all hypotheses were supported at 0.01 significance level.

DISCUSSION AND RECOMMENDATION

In general, this study has extensively researched factors of the involvement in physical and fitness activities among communities in Malaysia. The study has figured out the relationship between three variables : reduce stress, lose weight, sleep with involvement in physical and fitness activities.

For the benefit of future researchers, they may be able to recommend additional variables related to this broader scope of physical activity and fitness to pursue new findings in their studies. Next, the scope of the research was limited to include only 200 samples that could be evaluated in terms of the main target. It has been determined that the current sample size of this size is sufficient for the purposes of this study.

However, to get 200 respondents, the researcher needs to take a long time because there are some people in Malaysia who think that answering online questionnaires will be a waste of their time. In conclusion, the interview method, or the creation of several open questions for respondents should be used in the future instead of asking respondents to answer online questionnaires. With this, the researcher will have a better chance of getting a high response rate if using the method. This method will also save the researcher's time to satisfy the respondents.

CONCLUSION

The main objective of this research is to examine the relationship between reduce stress, lose weight and sleep in involvement in physical and fitness activities. Community in Malaysia was selected as respondents of this study. The data from the survey was analysed using SPSS and descriptive analysis, reliability analysis and Pearson Correlation analysis were performed. According to the results, all independent variables, reduce stress, lose weight and sleep, significantly and positively influence the involvement in physical and fitness activities. Thus, all the hypothesis such as H1, H2 and H3 are supported.

Preferences of Fast-Food Selection Among Third-Year Students of Bachelor Entrepreneurship (Wellness) with Honour at UMK City Campus.

Jeyageetha a/p Rajandran, Siti Nurul Aisyah binti Marzuki, Amir Hakim bin Abd Rahman, Nur Yasmin Balqis binti @ Rosliza, Suchi binti Hassan

Faculty of Hospitality, Tourism and Wellness, Universiti Malaysia Kelantan

Corresponding email:suchi.h@umk.edu.my

ABSTRACT

Fast food is a type of food produced in large quantities for commercial resale, with a strong emphasis on quick service. It is commonly found in restaurants or stores, offering frozen, preheated, or precooked ingredients packaged for take-out or take-away purposes. Understanding the factors influencing fast food selection, such as delicious, preparation, and price, is crucial. This research specifically focuses on third-year students pursuing a Bachelor's degree in Entrepreneurship (Wellness) with honours at UMK City Campus. The study aims to collect data from a total of 161 respondents, with an expected target of 113 participants. The research methodology employed ensures a structured approach to ensure reliable and valid results. A study must have a clear purpose, maintain objectivity, and employ appropriate methods to yield the desired outcomes or answers.

Keywords: Fast Food Selection, Delicious, Preparation, Price

INTRODUCTION

Fast food, found in various establishments such as sit-down restaurants, counter service, take-out, drive-thru, and deliveries, is known for its quick preparation and service. It is popular due to its tastiness, accessibility, and convenience in the Health Guides (2022). However, it is important to note that fast food frequently relies on refined grains rather than whole grains and is often high in sodium for the purposes of flavor enhancement and preservation. Its nutritional value is generally lower compared to other foods, and it is frequently available at a low cost. Fast food is commonly associated with high levels of calories, fat, sodium, and sugar, while being deficient in essential vitamins, minerals, and nutrients. Common examples include burgers, pizza, French fries, fried chicken, and tacos.

According to Yong & Hee (2020), China's growth after joining the WTO in the early 2000s has been remarkable. The middle class has seen a significant increase in their consumption levels. Western-style fast food restaurants are rapidly expanding and gaining popularity among the younger population. This rise in competition poses a threat to Western fast food companies operating in China. Chinese consumers are becoming more discerning in their dining choices, considering factors like what, how, and where they eat. Consequently, both domestic and foreign businesses are facing inevitable competition. This trend extends beyond China to other countries like Malaysia, where fast food has become increasingly popular. Therefore, the goal of this study is to examine the preference of fast food selection among third-year students of Bachelor Entrepreneurship (Wellness) with honour at UMK City Campus. There were three objectives for this study:

1. To investigate the relationship with the delicious with the preference of fast food selection among third-year students of Bachelor Entrepreneurship (Wellness) with honour at UMK City Campus
2. To investigate the relationship between preparation with the preference of fast food selection among third-year students of Bachelor Entrepreneurship (Wellness) with honour at UMK City Campus
3. To investigate the relationship between price with the preference of fast food selection among third-year students of Bachelor Entrepreneurship (Wellness) with honour at UMK City Campus

SIGNIFICANCE OF THE STUDY

The findings of this study are expected to provide knowledge and awareness about fast food. More importantly, this study will help students limit fast food consumption, give knowledge about fast food consumption to their bodies and make them more careful about food to be healthier. Addiction scholars and academic researchers will benefit from this research because it will provide them with fascinating insights that will be the basis for future research. Furthermore, this study will be a starting point for future studies on the same topic and issue related to the preference of fast food selection among third-year students of Bachelor Entrepreneurship (Wellness) with honour at UMK City Campus.

LITERATURE REVIEW

Delicious

The deliciousness of food plays a crucial role as a determining factor for customers. Numerous research studies have emphasized the importance of food quality and its positive impact on purchase intention. When considering the effect of well-known food quality on customer retention, a significant body of literature emphasizes the joy experienced by customers when they receive exceptional service. According to Ma and Yang (2018), customers are likely to be satisfied when they purchase high-quality products. Therefore, there is a strong correlation between food quality and customer satisfaction, which in turn significantly influences consumer behaviour and loyalty.

Moreover, the quality of the cuisine has been recognized as a pivotal element in shaping the overall dining experience, as emphasized by Sulek and Hensley (2014). When it comes to food quality, purchasing intention significantly impacts the selection of restaurants. Susskind and Chan (2000) conducted a study revealing that the quality of the meal is the primary factor that drives individuals to visit fast food establishments. Fast food restaurants consider food quality as a fundamental factor in retaining customers. Sulek and Hensley (2014) concurred, stating that meal quality outweighs other restaurant-related factors, such as the environment and service quality, in influencing purchase intention. Consequently, fast food becomes the preferred choice for daily routine lunches among UMK students due to its excellent food quality.

Preparation

Atkins and Bowler (2001) state that "fast food" often refers to fully prepared food to be eaten and then served rapidly, either on- or off-site. This means that to ensure that food is prepared safely and adequately for delivery, enterprises must comply with established standards for food preparation facilities, food prep tools, food transport vehicles, and people responsible for handling and preparing food. While any meal that requires little preparation is considered fast food, the term is frequently used to refer to food that is served to consumers in a packaged form for eating in or taking away from a restaurant or store and contains components that have already been heated or cooked.

In other words, lifestyle—which is defined as the collection of recurring patterns of behaviour that each person voluntarily and consciously adopts throughout their daily lives—reflects one's values, way of thinking, personal style, and ultimate goals (Vyncke, 2002). As a result, lifestyle has a significant impact on how people behave as consumers. Due to time restrictions, many students have shifted their eating habits to accommodate their hectic schedules, they switch from healthy, home-cooked meals to fast food. This is due to the fact that for many young adults, their college years represent a crucial time of change. Most students are currently living independently for the first time after leaving their parents' houses. These changing living arrangements may have an impact on lifestyle elements like dietary preferences, diet quality, and exercise routines (Brevard & Ricketts). As a group, college students are particularly susceptible to the intake of "convenience" food.

Price

As stated by Jacoby and Olson (1977), price represents the subjective perception of the objective cost of a product for consumers. In the fast food industry, price plays a pivotal role in shaping purchase intentions. When making food choices, consumers are influenced by the price associated with a particular brand. Brands often establish their own pricing standards, setting them apart from competitors. Moreover, price exerts a significant influence on purchase intentions, as changes in pricing can greatly impact customers, as emphasized by Liew (2015). Furthermore, when customers find a price point that aligns with their affordability and satisfies them, it enhances their willingness to make regular purchases of products from that brand in the future. This rationale applies to third-year students pursuing a Bachelor's degree in Entrepreneurship (Wellness) with honours at UMK City Campus, as brand pricing influences their inclination towards selecting fast food options.

According to Yang and Mao (2014), the influence of a lower price on consumers' purchasing decisions is emphasized. Customers who are price-sensitive, as described by Wakefield and Inman (2003), actively strive to find the most affordable price available. If a student is on a budget, they may prefer lower-priced items such as burgers, fries, and soft drinks instead of more expensive items like steak or seafood. Moreover, if a fast food restaurant offers a lower price than its competitors, students may be more likely to purchase the item, as they feel like they are getting a better deal. Additionally, offering discounts and promotion can be a great way to entice students to purchase fast food items. These incentives can make UMK third-year students of Bachelor Entrepreneurship (Wellness) with honour feel like they are getting a good value, while also giving them an extra reason to try out a new product.

Research Hypothesis

Based on a review of the literature three hypotheses have been developed. The hypotheses are:

H1: There is a positive relationship between the delicious and preference of fast food selection among third-year students of Bachelor Entrepreneurship (Wellness) with honour at UMK City Campus.

H2: There is a positive relationship between the preparation and preference of fast food selection among third-year students of Bachelor Entrepreneurship (Wellness) with honour at UMK City Campus.

H3: There is a positive relationship between the price and preference of fast food selection among third-year students of Bachelor Entrepreneurship (Wellness) with honour at UMK City Campus.

Research Framework

INDEPENDENT VARIABLE

DEPENDENT VARIABLE

Figure 2.1: Conceptual Framework

Based on the literature review, a conceptual framework was developed to investigate the fast food selection preferences of third-year students pursuing a Bachelor's degree in Entrepreneurship (Wellness) with honours at UMK City Campus. Figure 2.1 presents the proposed conceptual framework, which includes three independent variables: delicious, preparations, and price. The dependent variable is the preference for fast food selection among the aforementioned student group. From this, it can be inferred that the independent variables are expected to exert an influence on the dependent variable in this study.

METHODOLOGY Research Design

The researchers of this study using quantitative data methods to collect the data. Using quantitative data, the information can be collected quickly and easy to summarize the findings. Besides, the quantitative can also involve more respondent in one research study, than the qualitative data method.

Data Collection

A questionnaire is a specific tool or instrument for collective data. This questionnaire will be assigned to third-year students of Bachelor Entrepreneurship (Wellness) with honour at the City Campus of UMK. The purpose of this research endeavour will be explained first before respondents answer the questions. This questionnaire will be distributed through online plat platforms like WhatsApp, which are more aware and exposed to this kind of platform.

Sampling

Researchers used non-probability sampling techniques for this research. This is because non-probability sampling is best when a researcher wants to gain a greater understanding of a specific group of people or when it is challenging to establish a clear definition of the population of interest. Additionally, this sampling method is also proper when there is limited time and resources. Non-probability sampling can provide more in-depth and targeted information that may not otherwise be obtained through a probability sampling method.

Data Analysis

The analysis involves a series of steps, including data examination, cleaning, transformation, and modelling. These processes assist in breaking down large volumes of data into meaningful and manageable fragments. To facilitate this, researchers often utilize SPSS (Statistical Package for the Social Sciences), which is a comprehensive software package that integrates various programs. SPSS is commonly employed for data analysis in the social sciences, including market research, surveys, and data mining. It enables researchers to analyse, transform, and identify patterns within different data variables, ultimately yielding valuable insights.

FINDING

Demographic Analysis

Table 1: Respondent Profile

Characteristics	Frequency	Percentage (%)
Gender		
Male	80	70.8
Female	33	29.2
Age		
19-21 years old	0	0
22-24 years old	113	100
25 years old above	0	0
Marital Status		
Single	110	97.3
Married	3	2.7
Race		
Malay	98	86.7
Chinese	3	2.7
Indian	10	8.8
Others	2	1.8
Year of Study		
Year 1	2	1.8
Year 2	0	0
Year 3	109	96.5
Year 4	2	1.8

Among the respondents, 80 individuals (70.8%) identified as female, while 33 individuals (29.2%) identified as male. In terms of age, the study included 113 respondents, all falling within the range of 22 to 24 years old, making up the highest percentage of respondents (100%). Among the respondents, 110 were single, accounting for the majority (97.3%), while 3 respondents were married (2.7%). In terms of racial distribution, Malay respondents constituted the largest group, with 98 individuals (86.7%). The second largest racial group was Indian, comprising 10 individuals (8.8%). Chinese respondents accounted for 3 individuals (2.7%), while other racial groups contributed 2 individuals (1.8%). Among the respondents, the highest representation was from students in their third year of study, totalling 109 individuals (96.5%). Both first and fourth-year students were represented by 2 individuals each (1.8%). Notably, there were no respondents from the second year of study.

Result of Descriptive Analysis

Table 2: Descriptive Analysis

Variables	Items	Mean Score (M)	Standard Deviation (SD)
Delicious	The deliciousness increase the emotion of cheerfulness	3.61	.881
	The deliciousness increase the emotion of cheerfulness	3.63	.878
	The taste of fast food meets the taste of the middle class	3.42	.832
	The satisfaction of the deliciousness of fast food is guaranteed	3.47	.887
	The delicious taste of fast food can be shared with loved ones	3.65	.963
Preparation	Fast food is well prepared and neat	3.36	.955
	Fast food uses special plastic to easily carry food	3.50	.908
	Fast food provides a good variety of set menu options	3.52	.897
	Quick and time-saving food preparation	3.73	.887
	Fast food preparation is taken seriously by fast food restaurants	3.55	.886
Price	Promotions in fast food attract customers to buy	3.70	.875
	Fast food price is lower than other restaurants	3.34	.933
	Fast food option is seen as a good value for money	3.43	.877
	Fast food prices reflect the service quality of fast food restaurants	3.50	.846
	The price I pay for fast food guarantees my satisfaction	3.49	.857
Fast Food Selection	Fast food is easy to prepare	3.71	.831
	Fast food provides the latest menu	3.65	.864
	Fast food has the same quality and nutrients as other foods	3.16	.960
	Popularity of fast food getting increase due to easy and quick service	3.71	.903
	Eating too much fast food causes the risk of disease	3.60	.936

The result in Table 2 shows a descriptive analysis of independent variable which is delicious that shows the item " The delicious taste of fast food can be shared with loved ones" has the highest mean score (M=3.65, SD=.963) while the item " The taste of fast food meets the taste of the middle class" has the lowest mean score (M=3.42, SD=.832). The second independent variable which is preparation shows the item " Quick and time-saving food preparation " has the highest mean score (M=3.73, SD=.887) while the item " Fast food is well prepared and neat" shows the lowest mean score (M= 3.36, SD=.955). Next, the third independent variable which is price show the item " Promotions in fast food attract customers to buy " has the highest mean score (M=3.70, SD=.875), while the item "Fast food price is lower than other restaurants"(M=3.34, SD=.933). Lastly, for the dependent variable which is fast food

selection shows the item "Popularity of fast food getting increase due to easy and quick service" has the highest mean score (M=3.71, SD=.903). However, the item "Fast food has the same quality and nutrients as other foods" has the lowest mean score (M=3.16, SD=.960).

Reliability Analysis

Table 3: Reliability Analysis

Variables	Cronbach's Alpha	No. of Items
Delicious	.773	5
Preparation	.729	5
Price	.717	5
Fast Food	.639	5

Table 3 showed the results of the reliability analysis based on the independent variable and dependent variable which include delicious (.773), preparation (.729), price (.717), and fast food (.639). According to Cronbach's Alpha coefficient scale, all these variables show acceptable coefficient.

Pearson Correlation Analysis

Table 4: Pearson Correlation Analysis

Hypothesis	P-Value	Result
H1-There is a positive relationship between the delicious Preference of fast food selection among third-year students of Bachelor Entrepreneurship (Wellness) with Honour at City Campus.	.000	H1 Accepted
H2-There is a positive relationship between the preparation preference of fast food selection among third-year students of Bachelor Entrepreneurship (Wellness) with Honour at City Campus.	.000	H2 Accepted
H3-There is a positive relationship between the price preference of fast food selection among third-year students of Bachelor Entrepreneurship (Wellness) with Honour at City Campus.	.000	H3 Accepted

Table 4 presents the results of the Pearson correlation analysis conducted to test the hypotheses. The p-value for the association between the nature of deliciousness in fast food and the dependent variable is .000, which is lower than the significance level of .001. Consequently, the hypothesis is deemed valid and accepted. Similarly, the p-value for the relationship between the nature of preparation in fast food and the dependent variable is .000, indicating statistical significance below the level of .001. Hence, the hypothesis is accepted.

Furthermore, the p-value for the connection between the quality of price and fast food is .000, demonstrating significance below .001. As a result, the hypothesis is accepted

DISCUSSION AND RECOMMENDATION

The aim of this study is to investigate the relationship between 3 independent variables (delicious, preparation, price) preferences of fast-food selection among third-year students of bachelor entrepreneurship (wellness) with honour at the City Campus of UMK. The main findings of the study revealed that delicious, preparation, price exhibits a significant relationship with the fast-food selection in this research.

To improve future research in this study, several recommendations have been made. Firstly, combining qualitative and quantitative methodologies is suggested to enhance the investigation's effectiveness and precision. Secondly, when conducting online survey questionnaires, an official approach with a letter of approval should be utilized to ensure respondents' confidence and trust and prompt completion. It is also advised to narrow the scope of target respondents to eliminate imbalances and align the study with its title. Lastly, defining respondent characteristics can contribute to obtaining reliable results. These recommendations aim to improve the quality of future investigations and enhance the overall study.

CONCLUSION

In conclusion, fast food offers a wide range of delicious options that are convenient and easy to prepare. The preparation of fast food is designed to be efficient and standardized. When it comes to pricing, fast food is generally considered to be affordable and budget friendly. Overall, fast food offers convenience and taste, but moderation and mindful eating are key to enjoying it without compromising well-being.

ABSTRACT

Being overweight has serious adverse effects on health, linked to hypertension, coronary heart disease, stroke, type 2 diabetes, and some cancers of the breast, colon, prostate, endometrium, and gallbladder. Being overweight accounts for 5% of all deaths worldwide. Being overweight can also lead to serious physical behaviour, social, psychological, and economic consequences. The main objective of this research is to examine the relationship between unhealthy lifestyle factors among students at University of Malaysia Kelantan. There are three research objectives. To examine the relationship between hereditary disease and unhealthy lifestyles. Next is to examine the relationship between psychology and unhealthy lifestyles and the last one to examine the relationship between peer influence and unhealthy lifestyles. The conceptual framework contains three independent variables: hereditary disease, psychology, and peer influence. Moreover, one dependent variable is an unhealthy lifestyle. According to the findings of the literature analysis, the researcher has created the frame shown below related to the characteristics of unhealthy lifestyles among UMK students.

Keywords: Hereditary disease, Psychological, Peer influence, Unhealthy lifestyle

INTRODUCTION

The A healthy body is essential for a prosperous existence, and the Malaysian educational system aims to create individuals who are intellectually, physically, psychologically, emotionally, and spiritually balanced. The Malaysian Ministry of Education has developed a unique physical education and health education curriculum to educate students on physical fitness, sportsmanship, sports and recreation skills, personal and family health, healthy living, and environmental cleanliness and safety. The curriculum focuses on macronutrients, micronutrients, and nutrition, as well as illnesses related to eating patterns, such as obesity, coronary heart disease, hypertension, diabetes mellitus, and peptic ulcer.

The government has spent significant money on paying rising medical bills, and advertisements have focused on health issues. A healthy community can be aided by maintaining good nutrition and engaging in physical exercise for at least 30 minutes three times a week. Engaging in physical activity and eating a balanced diet are the primary goals of a healthy lifestyle.

People are increasingly realizing the importance of health and prioritizing it as something to be proud of. Food plays a crucial role in human life, providing daily energy and nutrients for the body's metabolic processes. A balanced diet is essential for optimal health and growth, and poor eating habits, such as high cholesterol, fat, oil, salt, and sugar, can lead to various health issues and diseases.

Research Objective

1. To examine the relationship between hereditary disease and unhealthy lifestyles.
2. To examine the relationship between psychological and unhealthy lifestyles.
3. To examine the relationship between peer influence and unhealthy lifestyles

Research Questions

1. What is the relationship between hereditary disease and unhealthy lifestyle?
2. What is the relationship between psychological and unhealthy lifestyle?
3. What is the relationship between peer influence and unhealthy lifestyle?

SIGNIFICANCE OF THE STUDY

This study will be helpful to future researchers covering similar events and topic areas. As a result, future researchers can obtain additional knowledge and data for their future studies. Wellness students, they will increase the health industry's understanding of unhealthy lifestyle factors that can be used to improve health. By doing so, all Wellness students will better understand the unhealthy lifestyle factors associated with being overweight. This research will affect several factors from an unhealthy lifestyle. This research will be helpful to anyone interested in examining the concept of health in nutrition.

LITERATURE REVIEW

Hereditary Disease

Hereditary illness is the process of encoding traits in genes and passing them down from parents to offspring. It is a unique gene combination created by combining some of the mother's genes with the father's DNA. Family history is a crucial factor in differential diagnosis, as it reveals a person's future risk of developing conditions like heart disease, diabetes, or cancer. Each chromosome contains many genes, with only 29% of the human genome being composed of genes. Hereditary factors can cause or impact several diseases, with the three main categories being single-gene, chromosomal, and multifactorial. Modern genetic testing can identify hereditary conditions through chromosomal, biochemical, or DNA-based technology. It is essential to retrieve multiple family members' DNA for testing to be helpful for a disorder.

Research Hypothesis

Psychological

Physiological, psychological, social, and genetic factors influence food intake, food preference, and meal time. Cognitive factors, such as self-regulation, motivation, and self-efficacy, can also impact eating behaviour. Stress can lead to increased appetites, and students with mental illnesses may struggle with managing eating habits, exercise, and maintaining a balanced body weight. The mind plays a crucial role in determining the need for exercise and the importance of eating well. People may become "restrained eaters," making decisions based on factors like cost, brand, and accessibility. Self-regulation, or the ability to control and self-regulate one's actions, is another area of study for psychologists. When self-regulation fails, people may forget about their diet, leading to "perverse logic." Both inner and extrinsic motivation are necessary to lose weight.

Peer Influence

Peer influence is the decision to engage in activities or behaviours based on acceptance and value from friends. It can be beneficial, such as motivating individuals to work harder, serve as positive role models, and expose them to positive influences. However, it can also be harmful, such as encouraging unhealthy behaviours or social behaviours. Peer influence is crucial in promoting a healthy lifestyle and offering moral and emotional support. People with a positive outlook on health can demonstrate the value of maintaining a healthy lifestyle. However, if peers desire to harm health, they can do so, as seen with disregarding hygienic rituals. A healthy lifestyle is closely tied to peer influence, as it significantly impacts a person's health and determines their course.

Unhealthy Lifestyle

Lifestyle is a way of living influenced by geography, economics, politics, culture, and religious texts. It affects 60% of variables impacting individual health and quality of life. Millions of people live unhealthy lives, leading to diseases, disability, and death. Lifestyle factors include malnutrition, improper diet, smoking, alcohol, drug misuse, stress, and new IT technologies. Lifestyle has a significant impact on human physical and mental health, with consanguinity and drug abuse being major risks. Reforming unhealthy lifestyles is crucial for minimizing genetic diseases and improving overall health.

Research Hypotheses

H1: There is a significant relationship between hereditary disease and unhealthy lifestyle among Wellness students at UMK City Campus.

H2: There is a significant relationship between psychological with unhealthy lifestyles among Wellness students at UMK City Campus.

H3: There is a significant relationship between peer influence and unhealthy lifestyle among Wellness students at UMK City Campus.

Research Framework

Framework showing the researcher how the study concept and variables can be achieved together. The independent variable and the dependent variable are two variables in the framework. The conceptual framework contains three independent variables: hereditary disease, psychology, and peer influence. Moreover, one dependent variable is an unhealthy lifestyle. According to the findings of the literature analysis, the researcher has created the frame shown below related to the characteristics of unhealthy lifestyles among UMK students. Fransen et al. (2016) stated that many studies have linked unhealthy diets to several aspects, such as socio-demographic and lifestyle factors. According to Deasy et al., (2014). Students in higher education should be aware of this behaviour because it may indicate psychological discomfort, cause by self-inflicted actions.

METHODOLOGY

Research Design

This study's methodology employs quantitative methodologies. Students of Wellness at University Malaysia Kelantan were studied for their unhealthy lifestyles using a quantitative research methodology. Quantity is prioritised in the quantitative approach. This is due to researchers using numerical or statistical data. The quantitative method is organised, has a distinct scan and different emphasises outcomes. A qualitative approach is used to obtain data, derive meaning from the study, and gain knowledge. Data collection procedures include, for instance, identifying individuals, making records, sampling, recording data, addressing problems in the field, and storing data (Cresswell, 1998).

Data Collection

The researcher collects data from primary sources using various research methods of data collecting that can be used to continue the study. At the UMK City Campus, data was collected based on information concerning unhealthy lifestyles among Wellness students who were overweight. For students to better understand health, data is collected through a survey.

The tool used to collect the data required for the questionnaire is a google form that is distributed to selected respondents online through a google form link who voluntarily answer the questionnaire used to obtain data about unhealthy lifestyle factors among Wellness students against overweight at UMK City Campus. This questionnaire can identify the relationship between hereditary diseases, psychological, and peer influence.

Researchers in this study will collect primary data during the distribution of questionnaires to respondents, and the data collection results will be obtained. Secondary data was also used in this inquiry, referred by the researcher in the journal publication of previous research studies and used for this study.

Sampling

In this study, simple random sampling, a type of probability sampling method, will be used. It is a type of sampling to obtain information about a population such as a person, institution, place, or phenomenon. The researcher chose this sampling strategy because the results obtained from the sample are the same as those obtained from measuring the entire population (Shadish et al., 2002). Simple random sampling gives each unit in the population an equal probability of being selected. This sampling is the easiest and easiest to select the respondents of the study, and the cost is not expensive. In other words, this sampling strategy is not determined by the sampling procedure because anyone can be used as a study sample. By using this sampling method, researchers can get data results immediately.

Data Analysis

The process of collecting, modelling, and analysing data to obtain insights that can be used to make decisions is known as data analysis. It is also a technique used by researchers to dissect and interpret data in order to gain insights, make recommendations, and aid decision-making. The researcher's information was processed and used in the study. All of the information was gathered from various sources. The Statistical Package for Social Science (SPSS) will be used to analyse the data collected by the researcher in this study. As a result, researchers from various fields use IBM SPSS Version 25 software for quantitative analysis of complex data. This statistical tool can process statistical data and provide answers for this study.

FINDINGS

Demographic Analysis

4.4.1 Gender of Respondents

Gender

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Male	62	25.6	25.6	25.6
	Female	180	74.4	74.4	100.0
	Total	242	100.0	100.0	

Table 4.8: Number of Respondents by Gender

4.4.2 Age of Respondents

Age

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	18-21 years old	24	9.9	9.9	9.9

DISCUSSION AND RECOMMENDATION

In other words, there are many causes and reasons that contribute to unhealthy lifestyles among Wellness students at UMK City Campus. However, based on the research we have done, we only use hypotheses which are hereditary diseases, psychology and peer influence. Based on random and non-random discussions, all of these hypotheses are closely related and have a profound effect on the unhealthy lifestyle of wellness students at UMK city campus. However, due to the fact that these wellness students are in UMK city campus rather than on campus, the influence of peers should be more of a cause for unhealthy lifestyles for these students. But this matter needs to be taken seriously, because they are wellness students who are indeed healthy students and they should show a healthy lifestyle as wellness students. Therefore, unhealthy lifestyles need to be curbed to ensure that all campus students regardless of students from all faculties lead a healthy lifestyle.

CONCLUSION

In conclusion, overall, the findings of the study we found from the research we conducted, namely unhealthy lifestyle factors among wellness students at UMK city campus, we found that all the hypotheses we used have a close relationship with our topic. All of our respondents also agreed with the variables we released in this research as a result of the findings we got from the survey conducted. It can be seen clearly in our table 4, which is in the findings which provide a summary of the entire question from questionnaire.

ABSTRACT

Motivation is dropping due to Malaysian Movement Control Order (MCO) due to COVID-19. This situation also affects students' motivation because they have to change their way of learning from face-to-face to online learning. Therefore, this study looks at students' motivation after returning to the Universiti Malaysia Kelantan City Campus. This study tries to achieve three research objectives and three research questions. For that purpose, 327 students from the hospitality, tourism, and wellness departments at the Universiti Malaysia Kelantan took part in this survey. The research was done descriptively, utilizing an online questionnaire to collect respondents' replies. The study's results reveal that student motivation after returning to university is modest, although respondents feel that they effectively overcame problems, collaboration, and appreciation throughout the learning session. According to the results, the campus is highly significant as a center and site of learning to promote student motivation. Furthermore, intrinsic motivators for students, such as challenge, collaboration, and student recognition, may be discovered among students at Universiti Malaysia Kelantan. In conclusion, we have learned through this coursework that student motivation aspects are very significant and beneficial to students after they return to university.

Keywords: Intrinsic motivation, challenge, collaboration, student recognition

INTRODUCTION

Motivation is the fuel that propels individuals to achieve their goals and objectives. Humans would remain inert without this fuel, resulting in a regular and unproductive existence. People may be motivated by the factors that come from inside and those that come from outside. The source of an individual's intrinsic drive is found inside themselves, whereas extrinsic motivation comes from the environment around them. The concepts of money, rewards, deadlines, and punishment are all examples of extrinsic motivation. In contrast, the images of pleasure, purpose, pride, interest, knowledge, and self-worth are all examples of intrinsic motivation (Gayane Tovmasyan, 2020). The word motivation originates, which translates to move. Accordingly, the term motivation is being used to refer to a strong desire that manifests itself in a person and has the potential to influence the behavior that will be created. This desire will motivate action to work toward achieving the objective that has been set. Therefore, this study proposes three research objectives to explain the statement:

1. To investigate the relationship between challenge and motivation after returning to the University Malaysia Kelantan City Campus.
2. To investigate the relationship between cooperation and motivation after returning to the University Malaysia Kelantan City Campus.
3. To investigate the relationship between recognition and motivation after returning to the University Malaysia Kelantan City Campus.

SIGNIFICANCE OF THE STUDY

The study is intended to help other researchers learn more about the causes of the problem of influence and mental health for student motivation. When we return to campus from this survey, we will know what action is needed to solve the problem and what development is needed to ensure success for each student. Furthermore, this survey will assist not only the university but also the government in taking action to stabilize and improve learning quality. Finally, this research will develop various methods to ensure that students always receive high-quality learning content while remaining free of external pressure. This will result in effective, relaxed, beneficial, and successful learning for the next generation.

LITERATURE REVIEW

CHALLENGE

First, there are many factors that affect student motivation after returning to campus, including the challenge factor (Fitriana Harintama's (2020)). The challenge factor is one of the factors that affect student motivation after returning to campus (Fitriana Harintama's (2020)). It is also considered as a factor component internal factors that affect a student's ability to study on campus. This is also reinforced by the choice model that will be influenced by the individual that is the student and the socioeconomic environment as stated in the same publication.

Motivational challenges are included in the model as a study contained in it. The challenge factor is based on the individual's experience with certain situations, which can lead to different types of learning, and the social learning environment is based on the student's attitude during the lesson. In general, motivational challenge factors such as emotions, mood, and attitude towards learning have a great impact on students' ability after returning to campus. A condition in which one's ability is tested by being presented with something that, to complete correctly, requires great mental and physical effort on their part. Students who are challenging to work with engage in behaviors such as talking too much, not being able to sit still, being apathetic or distracted, disruptive or disrespectful.

COOPERATION

According David Hortigüela Alcalá1, Alejandra Hernando Garijo, ngel Pérez-Pueyo, and Javier Fernández-Ro (2019) define cooperative learning as "a major step beyond just learning side by side other to learn with, by, and for each other." This might imply that collective learning is preferable to individual learning. We may deduce from this that to cooperate, students actively establish small, varied groups based on criteria such as gender, color, ability, and socioeconomic level. Many academics agree on five fundamental components of cooperative learning. The first is the connection for the better, interdependence. It refers to how members of an organization rely on one another to achieve its goal. This is illustrated by the fact that this pattern may teach someone to accept and get along with others. Then there's the ensuing promotional engagement. It symbolizes the third individual responsibility job, face-to-face contact with current group members. It suggests that each group member is in charge of a specific work. Everyone is responsible for taking responsibility for this. The fourth is interpersonal and small-group skills. They include recognizing other people's efforts, offering and accepting feedback, and actively listening. It is fantastic that some individuals appreciate providing constructive criticism and comments since it makes it easier to discover and solve issues. And group processing is the fifth and final stage in groups.

The term "cooperative learning" refers to a kind of education in which students are divided into smaller groups and tasked with completing a single project collaboratively. Students can work together on various assignments, from straightforward mathematical exercises to substantial projects such as devising environmental solutions at the national level; hence, the parameters are typically left up to interpretation. There will be moments when the entire class will be held accountable for the work, and there will also be occasions when each student will be held individually responsible for their contribution.

RECOGNITION

According to Agota Kun and Peter Gadanecz (2019), learning is intrinsically motivated since incentives are crucial, but many students also put great value on the credentials they will obtain after graduation. Further analysis revealed that teachers emphasized the importance of feedback from students, parents, coworkers, and leaders, emphasizing the need to get good feedback from individuals close to them or superiors to enhance their confidence and enthusiasm for better things. The following subcategory focuses on moral praise and esteem for the educator's efforts. When discussing the preceding category, students, employees, parents, and leaders receive a broad degree of acknowledgment. This is because success via their efforts improves their worth. Moral appreciation and value recognition have an unmistakable influence on commitment and performance.

STUDENT MOTIVATION AFTER RETURNING TO CAMPUS

Students may be encouraged to study through motivation, a key psychological concept in education (Faridah et al., 2020). It is essential to have some cognitive motivation (the desire to take conscious action) when engaging in online learning. When a student completes a task, it is not out of fear, to stand out, or for a reward; rather, it is to learn and grow, broaden one's perspectives, and advance in one's personal development (Samsudeen and Mohamed, 2019). In an online learning environment, the ability to maintain student motivation relies on the student. It may be difficult for students who lack study motivation to focus on what is being taught (Jammu, Kim, and Lee, 2008). Studies in both the medical and non-medical fields have shown that students are typically happy with the suggested e-learning approaches. Students express much higher levels of satisfaction with e-learning compared to more conventional educational modalities; this is also true of their assessments of the relative ease of access, navigation, engagement, and interface usage (De Leeuw et al., 2019).

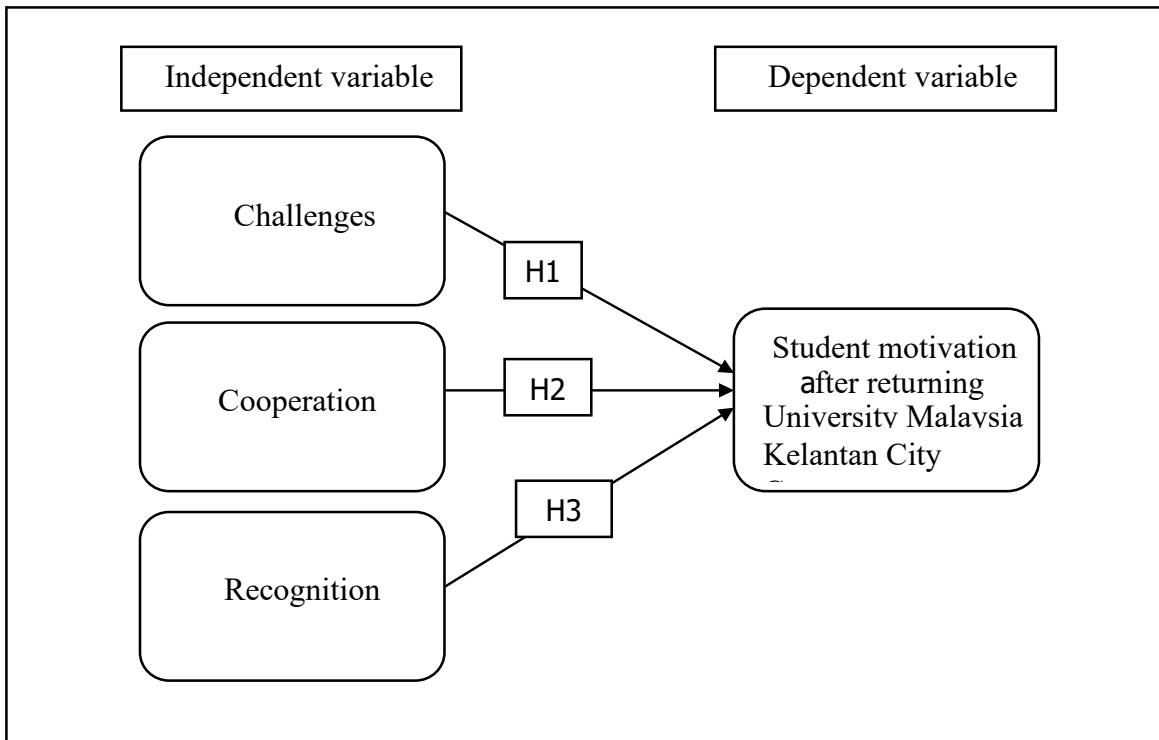

RESEARCH HYPOTHESIS

The research hypothesis is based on study factors such as challenge, cooperation, and recognition in education among university students. Based on the study hypothesis, the following were developed and were to be tested:

- H1:** There is a relationship between challenges and motivation after returning to the University Malaysia Kelantan City Campus.
- H2:** There is a relationship between cooperation and motivation after returning to the University Malaysia Kelantan City Campus.
- H3:** There is a relationship between recognition and motivation after returning to the University Malaysia Kelantan City Campus.

RESEARCH FRAMEWORK

Based on the previous literature review, the researchers have proposed a framework to study the students' motivation after returning to the University Malaysia Kelantan City Campus. Hence, as seen below, the structure.

METHODOLOGY

This chapter discusses analytical approaches. The method of analysis employed to finish the case study is described in this chapter. The study methodology, target population, sample size, sampling procedure, data collection, research instrument, data analysis, and chapter description for this report have all been completed. Because research is a form of intellectual activity, it must be used in a business setting (Kothari,2004). Finally, the methodology of this investigation has been described. This part illustrates the whole process of carrying out this study session. When doing industrial research, analysis is a form of analytical practice that must be employed (Kothari,2004). The study procedure, data gathering method, sample strategy, and work produced are all part of the analysis approach.

RESEARCH DESIGN

Quantitative methods are theoretically validated, numerically measured, and statistically analyzed, focusing on objectivity and reproducibility. Smith and colleagues (1979). To draw conclusions or test hypotheses, quantitative analysis design relies on numerical evidence. Inequality for both will influence the decision of characters who wish to be completed. Tests, questionnaires, probability sampling, and document reviews are quantitative data sources. A quantitative research approach was applied in this investigation. To test the relationship between collected data, quantitative observation based on statistical data is used. Quantitative research designs are used when statistical conclusions for a set of actionable insights are significant. The main distinction between the four types is the amount of design control the researcher has over the variable in the experiment (Fatima, 2019). This study will employ quantitative methods. This is because the quantitative research strategy assumes continuous and distinct numerical data.

Quantitative is also referred to as numerical form. The primary purpose of this study is to investigate the relationship between students' issues, collaboration, recognition, and motivation upon their return to the University Malaysia Kelantan City Campus. Second, more significant sample size analyses are feasible. Because the research included students from the Faculty of Hospitality, Tourism, and Wellness, the findings apply to the broader public. Third, each responder may be given a regular and formal questionnaire.

DATA COLLECTION

This strategy may be used with either primary or secondary data. Preliminary data, also known as raw data, is information that is gathered straight from the source, whereas secondary data is information that has previously been collected, organized, and analyzed by another researcher, according to Jovancic and Nemanja (2019). Gathering information for the study from dependable sources, such as students, the organization, the public, or other research groups, is a component of primary data analysis studies. Secondary data research is the process of gathering information from published sources that is pertinent to the present research topic. The important information learned from the survey. 335 students from the Department of Hospitality, tourism, and Wellness at the University of Malaysia Kelantan responded to the survey. The information from their replies was collected by the researchers over the course of about two weeks. In Section A, the respondent is required to provide demographic data, including their gender, age, ethnicity, year of study, and program. The independent variable problems are in Parts B, C, and D, while the dependent variable problems are in Part E. While Sections B, C, D, and E utilize the Likert Scale, Section A's questionnaire architecture employs a nominal and interval scale.

SAMPLING

The researchers employed non-probability sampling and the researcher uses convenience sampling approaches for the investigation. Questionnaire forms will be distributed to respondents from the hospitality, tourism, and wellness department at the University of Malaysia Kelantan to ask the respondents about their motivation after returning to university.

DATA ANALYSIS

Data analysis is the methodical process of collecting, gathering, and analyzing data to explain and prove anything. Additionally, data analysis seeks to extract pertinent information from data so that conclusions may be drawn based on that knowledge. Research methods use both primary and secondary data. The Statistical Package for the Social Sciences (SPSS) was used to analyze information that was obtained from the original researcher as preliminary data for this investigation. A collection of interconnected software tools is called SPSS. Quantitative research, according to Ahmad et al. (2019), is a study that uses theoretical physics approaches to produce numerical data and facts via the gathering of questionnaire data.

FINDINGS

Result of Frequency Analysis

Table 1 shows the result of frequency analysis of respondents.

Table 6: Frequency Analysis

Characteristics	Frequency	Percentage (%)
Age		
19-21 years	64	19.6
22-24 years	236	72.2
25-26 years	26	8.0
Gender		
Male	118	36.1
Female	209	63.9
Education Level		
Degree	327	100
Ethnicity		
Malay	242	74
Chinese	36	11
Indian	25	7.6
Others	24	7.3
Year of study		
Year 1	28	8.6
Year 2	67	20.5
Year 3	200	61.2
Year 4	32	9.8
Program		
SAP	84	25.7
SAH	104	31.8
SAS	139	42.5

Table 1 displays the findings of the respondents' frequency analysis. The study focuses on FHPK students at Universiti Malaysia Kelantan's City Campus. Most respondents, 236 in total (72.2%), were between the ages of 22 and 24, while 64 respondents (19.6%) were between the ages of 19 and 21. Next, there are 209 respondents who are female (63.9% of the total), compared to 118 respondents who are male (36.1%). 327 individuals, or 100%, of the sample, hold a degree in education. Additionally, the bulk of respondents—242 respondents, or 74% of the total—are Malay, followed by Indians with 25 respondents (7.6%), Chinese with 36 respondents (11%), and others with 24 respondents (7.3%). Additionally, year 3 had the highest percentage of responses (200 respondents, or 61.2%), followed by year 2 (67 respondents, or 20.5%), year 4 (32 respondents, or 9.8%), and year 1 (28 respondents, or 8.6%). Finally, program SAH receives the most responses, accounting for 104 respondents (31.8%), followed by program SAS with 139 respondents (42.5%) and program SAP with 84 respondents (25.7%).

Result of Descriptive Analysis

Table 2 shows the result of descriptive analysis of variable.

Table 7: Descriptive Analysis

Variable		Means	Standard
Items		score	deviation
challenges	I often wish I was doing something else in class	3.28	1.392
	During class, I often miss important things because I'm thinking about other things	2.60	1.254
	It is important for me to learn what is taught in class.	3.91	1.281
	When the work is difficult, I either give up or learn only the easy part	2.59	1.217
	I always try to understand what the lecturer is saying, even if it doesn't make sense.	3.15	1.284
	I want to succeed in my studies because it is important to show my ability to my family, friends, employer or other people.	4.41	0.948
	I often feel so lazy or bored in class that I have trouble completing my assignment.	2.63	1.318
	I use my class time well	4.10	0.850
	I ask the lecturer for help when I need it.	4.13	0.978
	I often attend class.	4.37	0.978
Cooperation	I like working together in a group to complete a task	4.03	1.019
	I like to ask other friends for opinions	4.13	0.949
	I can easily focus on studying in groups	3.79	1.119
	I like to ask friends about lessons that are not understood	4.17	0.912
	I can discuss it with friends about the lesson	4.13	0.939
	I like to share ideas with friends	4.07	0.927
	I like to be the leader working in groups.	3.44	1.249
	I communicate easily when working in groups.	3.94	0.938
	I like to chat rather than discuss work	3.25	1.296
	I like to keep quiet when studying in groups.	2.51	1.294
Recognition	Students will get a certificate when they attend a program.	4.23	0.965
	Students will get a certificate when they volunteer in a program	4.13	0.992
	I like being appointed as a student leader	3.31	1.261
	I study solely to get the dean's certificate	3.46	1.335
	Students will get marks for full attendance	4.04	1.069
	I like to be a role model by dressing well in class.	3.69	1.092
	Students will be fined if they break the rules	4.21	0.905
	Students will get a leave letter when sick.	4.22	0.962
	I am more enthusiastic when the lecturer praises my work	4.34	0.898
	The university will reward students when they get excellent results.	4.39	0.930
Student motivation	I concentrate on my assignment	4.04	1.021
	I feel proud of my university	4.12	0.951
	I am a responsible student	3.77	1.117
	I am responsible for achieving my goals	4.16	0.911
	I am good at staying focused on my goals	4.14	0.940
	I respect other points of view, even if I do not agree	4.08	0.931
	I work well in groups or teams	3.43	1.248
	It is easy for me to convey my thoughts and ideas	3.95	0.939
	I finish whenever I start something	3.26	1.297
	I always can come up with new ideas	2.50	1.292

The outcome of the descriptive analysis of the variable is shown in Table 2. The item of student motivation (I am accountable for attaining my objectives) had the highest mean score for the dependent variable, student motivation (M=4.16, SD=0.911). The student motivation question, which asks, "I always have new ideas," gets the lowest mean score (M=2.50.66, SD=1.292). The challenge factors item, "I want to succeed in my studies because it's important to prove my ability to my family, friends, employer, or other people," has the highest mean score (M=4.41, SD=0.948), whereas the challenge factors item, "When the work is difficult, I either give up or learn only the easy part," has the lowest mean score (M=2.59, SD=1.217). Aside from that, the cooperation factors item (I like to ask friends about lessons that are not understood.) has the highest mean score (M=4.17, SD=0.912) and the cooperation factors item (I like to keep quiet when studying in groups.) has the lowest mean score (M=2.51, SD=1.294) for the second independent variable. The item of recognition factors (The university will reward students when they get excellent results) has the highest mean score (M=4.39, SD=0.930) and the item of recognition factors (I like being appointed as a student leader) has the lowest mean score (M=3.31, SD=1.261) for the third independent variable, recognition factors.

Result of Reliability Analysis

Table 3 shows the result of reliability analysis based on dependent variable and independent variable.

Table 8: Reliability Analysis

Variable	Number of Items	Cronbach's Alpha
challenges	10	0.703
Cooperation	10	0.837
Recognition	10	0.871
Student motivation	10	0.836

Table 3 shows the result of the reliability analysis based on the dependent variable and each independent variable. The dependent variable which is student motivation with 10 questions has Cronbach's Alpha value of 0.836 which is good and acceptable. For the first independent variable, challenges factors with 10 questions shows Cronbach's Alpha value of 0.703 which is good, reliable and acceptable. The second independent variable, cooperation factors which contains 10 questions shows the Cronbach's Alpha value of 0.837 which is reliable and very good. The third independent variable, recognition factors with 10 questions in the questionnaire provided has Cronbach's Alpha value of 0.871 which has very good internal consistency.

Result of Pearson Correlation Analysis

Table 4 shows the result of Pearson correlation analysis based on the hypothesis.

Table 9: Pearson Correlation Analysis

Hypothesis	P-Value	Result (Supported/ Not Supported)
------------	---------	-----------------------------------

H₁ - There is a significant relationship between the challenges and student motivation after returning to the University Malaysia Kelantan City Campus..	0.424	H1 is supported
H₂ - There is a significant relationship between cooperation and student motivation after returning to the University Malaysia Kelantan City Campus.	0.999	H2 is supported
H₃ - There is a significant relationship between recognition and student motivation after returning to the University Malaysia Kelantan City Campus.	0.760	H3 is supported

Table 4 shows the result of Pearson correlation analysis based on the hypothesis. According to the results, the significant p-value of H₁ is 0.001 which is below 0.05 and the p-value is under 0.05. Thus, the study can reject the null hypothesis. Pearson Correlation value of 0.424 stipulates the strength of the relationship between challenges factors and student motivation is moderate and the result is supported. Next, the significant p-value of H₂ is 0.001 which is below 0.05 and the p-value is under 0.05. Thus, the study can reject the null hypothesis. Pearson correlation value of 0.999 stipulates the strength of the relationship between cooperation factors and student motivation is strong and the result is supported. Lastly, the significant p-value of H₃ is 0.001 which is below 0.05 and the p-value is under 0.05. Thus, the study can reject the null hypothesis. Pearson Correlation value of 0.760 stipulates the strength of relationship between recognition factors and student motivation is moderate and the results also is supported.

DISCUSSION AND RECOMMENDATION

The discussion aims to solve the question and address the hypothesis as stated in the first chapter of this study. In general, this study has extensively studied the motivational factors of students after returning to campus among students at Universiti Malaysia Kelantan City Campus. Based on the findings of the study, each individual has different attitudes and thoughts about student motivation. The results of the motivational challenge factor showed a weak correlation using Pearson's correlation. It shows students who lack knowledge about challenges will affect their studies. Students stated that they prefer to feel relaxed when studying and when they are stressed especially if they have a lot of assignments to complete. This is because they can calm themselves down.

Students also usually learn without taking knowledge of the motivation. This unhealthy attitude will affect student performance. One of the best options to overcome student motivation is to create an interesting atmosphere when studying in class. This is because students will know what they will learn and be enthusiastic when learning. In addition, different family backgrounds and lack of guidance when studying cause the challenge factor of student motivation to weaken. Students have different perceptions about student motivation choices. From this study, some students from high-income families tend to have learning motivation and most students from low-income families tend to have less learning motivation. Future research still needs to improve on this study. As a result, to improve the quality of the output from future investigations, several suggestions have been created. The first suggestion is that utilizing quantitative approaches would improve and increase the effectiveness of this investigation. This is because it may assist researchers in doing future studies with outcomes that are more precise and higher in caliber.

The next step is for academics to disseminate survey questions in a more official manner if they are provided online. In addition, a letter of approval from the institution or superiors is required to conduct the research, along with questionnaires. This is done to ensure that the respondents have faith in the survey and don't hesitate to reply to the questionnaires that were issued since the survey was included with the letter of confirmation.

In addition, researchers may narrow the reach of the target respondents or more focused respondents for the next studies. This is done because the researchers feel it is acceptable given the study's title and to prevent imbalances among the respondents when the survey's findings are released. Returning to the initial suggestion, defining the characteristics of the respondents may help researchers get reliable findings. These suggestions are created for use in future research and may assist researchers in further enhancing the study that will be conducted.

CONCLUSION

In conclusion, this study was conducted to find out student motivation after returning among students at Universiti Malaysia Kelantan City Campus. Three independent variables namely challenge factor, cooperation factor and appreciation factor were selected to study their relationship with the dependent variable which is student motivation after returning to campus. A total of 327 respondents aged 19 years and above were selected from 1st to 4th year FHPK students at Universiti Malaysia Kelantan to study their knowledge of student motivation after returning to campus. Overall, based on Pearson's correlation analysis, the cooperation factor has the strongest correlation compared to the challenge factor and the recognition factor followed by the challenge factor and the recognition factor, represented by the correlation ($0.999 > 0.760 > 0.424$).

Corresponding email: fatimah.g@umk.edu.my

ABSTRACT

Depression is one of the most common mental health problems among university students. However, the prevalence of depression among 3u1i university and its factors were remaining unknown. Therefore, a cross-sectional study was carried out among 73 respondents to investigate the relationship between family value and coping skills to the depression level among 3u1i university students. A set of questionnaires including the Depression, Anxiety and Stress Scale (DASS21), Asian Family Characteristic Scale (AFCS) and Brief-COPE were used to measure depression, family values and coping skills, respectively. Data were analysed using descriptive analysis, reliability test and logistic regression. Based on Logistic Regression analysis, family values were found to be a significant protective factor of depression in 3u1i students, whereas, avoidant-based and emotion-based coping skills were significant risk factors of depression in 3u1i students. Future study should develop the depression intervention program among this target group.

Keywords: Family values, Depression, 3u1i Students, Coping skills

INTRODUCTION

Depression is a persistently depressed mood that interferes with daily functioning. According to research, stressful life experiences such as poverty, the loss of a loved one, physical disease, or abuse may raise the probability of depression. The typical causes of it are a mix of biological, psychological, and environmental factors. University students face not only challenges related to independent living, but also academic challenges. Next, family values are the fundamental beliefs and principles that direct and govern how members of a household behave and engage with the rest of the community. It is the guiding principle upon which a family is built, and it is frequently passed down from generation to generation. Family values include all conceptions of what constitutes and governs a family, and they are frequently passed down from one generation to the next. University students participating in the 3u1i industrial mode study program are also at risk for depression. A program of study with an industrial focus is the 3u1i

Apprentice Program. Students will spend three (3) years in college concentrating on theory and one (1) year in the workplace gaining practical experience. The prevalence of depression changes every year among university students at the global level, developed countries, developing countries and Malaysia. Then followed by 3 factors related to depression among university students which is biological, psychological and social.

SIGNIFICANCE OF THE STUDY

Body of knowledge – added more reading material and can be used by users who want to do more research to understanding upon that element of a correlation with depression about 3UII students.

Future study – Students will take into coping skills to measures that can be practiced by themselves against the problem of depression among these students.

3u1i university students – Contribution to future studies for university students for self-prevention because there are a lot of studies about the problem of depression among students but no one related to 3UII students.

University counsellor – Contribution for university counsellor to convey all information for university students through a motivational programme, a seminar, talks and more to help students from any possibility of depression with prevention from initial stages.

LITERATURE REVIEW

Family Value

The term “family value” in this study refers to the family value scales obtained using the 30 item Asian Family Characteristic Scale (AFCS). (Ramli Musa et al., 2015) Asian families are known for doing activities and exercising together, grinning because everything is peaceful in the family, helping one another. However, my parents don’t understand me (Ramli Musa et.,al 2015)

Coping Skill

Coping may be described as the mobilisation of mind and conduct to handle an internal and external stressful circumstance. It is the term used to distinguish between conscious and

voluntary mobilisation of activities and defensive mechanisms, which are subconscious or unconscious adaptive reactions that both seek to reduce or endure stress. The most often used coping scales are COPE. Coping is divided into three categories: problem-based coping, emotion-based coping, and avoidant coping.

The Depression

Depression is a prevalent mental illness. It is estimated that 5% of people globally are afflicted. A continuous sensation of discontent and a loss of interest or pleasure in once-satisfying or enjoyable activities are its defining traits. It may also interfere with appetite and sleep. Common symptoms include exhaustion and a loss of concentration. The world's most common disability, the depression, is responsible for a sizeable share of the global illness burden. The effects of depression can be chronic or recurrent, and they can significantly affect a person's capacity to function and lead a happy life.

Research Hypothesis

H1: There is significant association between family values and depression among 3u1i university students.

H2: There is significant association between coping skill and depression among 3u1i university students.

Research Hypothesis

METHODOLOGY

Research Design

This study makes use of a questionnaire in to three sections, including part ‘A’ on demographics, part B on family values & coping skill, and part C on depression among 3u1i students. The question in part A contains 4 questions regarding gender and courses taken, whilepart B contains 30 questions for family values and 16 questions for coping skill. There are 21 questions in Part C, a cross sectional study was used, which is a sort of observational researchthat examines data on variables that were gathered at one particular point in time across a sample population or subgroup.

Data Collection

A questionnaire was given to the respondent using Google Form via WhatsApp or email because it’s simpler to the respondents. The rapid proliferation of social media, the researcher used Google Form and received responses from 3U1i university students.

Sampling

Given that the researcher was aware of the sample size, a probability sampling method was used in the investigation. Three students from various departments make up the sample size. From that list, the researcher may select 73 of the 90 3U1I university students for the study. Convenient sampling, a non-probability sampling strategy, is one that is frequently employed in clinical and qualitative research. Convenient sampling is popular because it is less

expensive, time-consuming, and simplistic than other sample procedures. Convenience sampling is helpful when used to develop a prospective hypothesis or study objective.

Data Analysis

The method to evaluate and understand the information collected from the respondents is through data analysis.

Statistical Package for the Social Sciences (SPSS)

The SPSS (Statistical Package for the Social Sciences) software bundle is offered as a single package. The main purpose of this programme is to analyse research data from the social sciences. This information can be used for market research, surveys, and data mining. Using the statistical information they have collected, researchers may quickly assess the market demand for a product and modify their plan as necessary.

Frequency Analysis

Another name for frequency analysis is descriptive statistics. Frequency in statistics refers to how frequently an event takes place. An important area of statistics called frequency analysis studies measures of central tendency, dispersion, percentiles, and other occurrences.

Descriptive Statistic

As a result, descriptive statistics for each dependent and independent variable in this study were generated. Users can select pie charts or graphs to display or clarify processed data (SPSS). It uses metrics such as mean, median, and others to make the data simpler for users to comprehend.

Reliability Analysis (Cronbach's Alpha)

Internal consistency, or how closely connected a set of things are to one another, is measured by Cronbach's alpha. It is recognised as a scale reliability indicator. The metric mightnot be one-dimensional even if alpha has a "high" value.

INFERENCEAL ANALYSIS (LOGISTIC REGRESSION)

The data obtained is evaluated using logistic regression. A straightforward research used to assess the impact of a direct link between the independent variable (IV) and the dependent variable (DV). Logistic regression is used to examine if the two variables (IV) and (DV) have a connection. If there is a relationship, the researcher must understand how closely the independent variable (IV) and the dependent variable (DV) are associated. The logistic regression coefficient assesses the strength of a two-variable linear connection. It has a value between 0.5 and 0.5, with 0.5 indicating that it is not significant.

FINDINGS

The conclusions from the previous chapter, "Result and Discussion," which are based on the study's goals, issues, and hypotheses, will be a condensed version of those findings in this study.

The relationship encompasses family values and depression among 3uli university students.

Research question 1 of this study asked about relationship encompasses family values and depression among 3uli university students?

This is also to answer the first objectives and hypothesis.

RESEARCH OBJECTIVES (RO)	RESEARCH QUESTION (RQ)
To investigate the correlations between family value and depression encompasses 3uli college students.	Relationship encompasses family values and depression among 3uli university students.
H1: There is significant association between family value and depression among 3uli university students.	

Table 1: Research Objective 1 and Research Question 1,

The results of hypothesis 1 in the previous chapter were reviewed to answer research question 1. In addition, H1 states that there is a significant association between family value and depression among 3u1i university students, it shows a negative relationship which is highly related to depression among 3u1i university students. The p value for family value is 0.000 which is less than the highly significant level of 0.03. Apart from that, there is a relationship between family values and depression among 3u1i university students. Therefore, H1 is accepted.

The relationship between coping skill and depression among 3u1i university students.

Research question 2 of this study ask an about significant relationship between copingskill and depression among 3u1i university students.

This is also to answer the first objectives and hypothesis.

RESEARCH OBJECTIVE (RO)	RESEARCH QUESTION (RQ)
To investigate the correlations between coping skill and depression encompasses 3u1i college students.	Significant relationship between coping skill and depression among 3u1i university students.
H2: There is significant association between coping strategies and depression among 3u1i university students.	

Table 2: Research Objective 2 and Research Question 2,

The results of hypothesis H2 in the previous chapter have been reviewed to answer research question 2. In addition, H2 states that there is a significant association between coping strategies and depression among 3u1i university students. From the findings, it shows that emotion based coping and avoidant based coping are positive related to depression among 3u1i university students compared to problem based coping showing that it is not related to depression among 3u1i university students. The p value for emotion based coping and avoidant based coping is 0.000 which is very significant 0.03 and 0.01. Meanwhile, the problem based coping shows not significant among depression 3U1i, students, similar to the previous study (Ramli Musa et., al 2007). Therefore H2 is accepted.

DISCUSSION AND RECOMMENDATION

Descriptive Analysis

This research shows the results of our study for the percentage of gender is 84.4% for women and 15.6% for men. This is due to the fact that the majority of FHPK faculty is women, with fewer men available to complete the questionnaire. The second reason is that the majority of 3U11 students are many female students, especially those who work in the spa field and we also know that nowadays there are more female students than male students who are in the university. While the percentage of age is 20-21(2.2%), 22-23 (11.1%) and 24-25 (86.7%) among students 3u1i. Based on previous studies, it shows equality in terms of gender (Nuran et al.,2008). Age also demonstrates similarities because many students have finished their education and have entered the workforce by the time they are 24 to 25 years old. The second reason is that STPM graduates who are between the ages of 24 and 25.

In this research, we have carried out our results for the percentage of ethnicity. The majority of 3u1i university students were Malay 73.3% because the students at University Malaysia Kelantan have many Malay students and the distribution of the population in Malaysia also has Malays. In our study, majority our respondent was malay. However, the previous study shows the majority of respondent was indian among university students 45% (Keong et., al 2018). The reason of involvement ethnicity Malays in the 3U1i university student program was more than that of Indians, and Chinese who choose to study at the university instead of being in industry for a long time. In addition, the majority of FHPK students are Malay compared to other races.

In this research, we have carried out our results for the percentage of course. The majority of students 3u1i university students were SAS 35.6%. Compared to previous studies showing the prevalence of course, tourism and hospitality which is 50.5% and 25.7% among tourism and hospitality management internship students (Armah et., al 2021). The reason why not the same with previous study because 3u1i program not the same with internship and it's different study mode. The majority of students in this study from the SAS course they give response because they work less. Compared with students SAP and SAH has a lot of work. Another reason SAS students decided to take the time to answer the questionnaire was that the title of the final-year project was relevant and done by SAS students themselves.

The prevalence of depression in this study was 64.4% among 3u1i students compared to the previous study with 53.9% among bachelor students (Wong et al., 2023). This could be because the population in prior studies was bachelor's students at the university, but the target population in the study was industrial placement students. According to (Naidu et al., 2019) student in industry maybe poor social support from their friends to express feelings because of pressure in the industry and limited time for personal pursuits compare to bachelor students that only stays in the university. According to (M Zehr & Korte, 2020) different workloads also can affect depression rates, for example, students in industry got more job to do in a short period compared to students in the university.

Inferential Analysis

Based on the logistic regression, findings show that there is significant association between depression and family values. It is comparable to the previous study conducted by (Musa R et al., 2019). One probable explanation is that both studies used the same scale to measure Asian Family Characteristics (AFCS) and the Depression, Anxiety, and Stress Scale (DASS21). This could be because one of the domains we measured in the AFCS was family harmony, which can boost people's emotions, whether they are children, teenagers, or students. Other than that, we also measure domains of family conflict where low family conflict can cause less problems in the family. So, this has proven that family values are protective factors which mean the higher family values the lower depression rate.

Based on the results, there was significance association between depression and emotion-based coping among 3U1i university students. This result was similar to the previous study conducted by Cummings et., al 2001. The possible reason is that both of these studies use the same scale to measure the level of depression, which through the DASS-21. In addition, emotion based-coping with 3U1i university students reported that students got support from friends and they also used many strategies to deal with emotions such as seeking professional help and talking to someone to find out something. So, this has proven that emotion-based coping is a risk factor which means that there is a parallel direction because the lower the emotion causes the lower level of depression. There will be parallel directions for the independent variable and the dependent variable.

Based on the result, there is a significant between depression and avoidant based coping which is 0.01. This finding is also consistent with the previous study of Nazila Sayyed. This is probably because of people who exposed to stressor an event also who had depression and anxiety are more likely use more avoidance coping style actively. This issue is related to avoidance coping strategy, which is difficult in the setting and position that could be mentioned for people with depression because of frustration feelings that can lead to their difficulties and also a negative attitude towards the future that leads them to believe that they have limited access. Although the potential role avoidance coping in causing stress has not done yet been investigated, relying in avoidance is especially likely to cause a wide variety of stresses.

The results show that the p-value is not significant between depression and problem-based coping with 0.62 among 3u1i university students. It is comparable to previous studies conducted by (Rathakrishnan et al., 2022). In this case, the same results for p-values were above

0.05. The reason is because the university does not provide exposure from the beginning to reduce depression among students which causes the problem of depression among university students to increase. The study shows that it is not significant because where the findings indicated problem-based coping with being negatively correlated with depression among 3U1I students of FHPK faculty.

The recommendation is to change the data collection method from quantitative to qualitative. This is to make the future researcher not only use the questionnaire but they also can use the face-to face interview to make the data collection more easy. Secondly, enlarge the target population. The researcher can enlarge it from 3u1i students to all the internship students at University Malaysia Kelantan. This will make it easier to collect data and increased the number of sample data. The researcher can perform a simple random sampling which this method has advantages to represent study population. The third recommendation is, for future study, the researcher will consider using other independent variable to investigate the relationship between coping mechanisms and familial relationships in relation to the problem of depression among 3u1i university students.

CONCLUSION

The main purpose of this research is to examine the association between family values and coping skills towards depression among 3U1I students of FHPK faculty in University Malaysia Kelantan. Overall, the relationship between family values, avoidant-based coping and emotion-

based coping was positive and significant but problem-based coping shows not significant. It is the term used to distinguish between conscious and voluntary activity mobilisation and defence mechanisms, which are subconscious or unconscious adaptive reactions that both seek to reduce or tolerate stress.

ABSTRACT

This is a cross-sectional study to determine the relationship of traditional postnatal care services utilization (massage, hot stone, and body wrap) and postnatal depression (PND). A total of 97 postpartum mothers who utilize traditional postnatal care service in Kelantan was involved in this study. Postnatal mothers completed a set of questionnaires on sociodemographic characteristics, postnatal care service utilization, and the Edinburgh Postnatal Depression Scale (EPDS). The prevalence of PND was 37.1 %. This study has not found a significant association between traditional postnatal care service utilization (massage, hot stone, body wrap) and PND among postpartum mothers.

Keywords: Postnatal Care Service, Postnatal Depression, Kelantan

INTRODUCTION

This chapter begins with explanation about the background of the study, problem statement, research questions, research objectives, significance of the study, definition of the terms and lastly closed with the summary of this research. For this chapter, researchers study stress factors that cause postnatal depression in women.

SIGNIFICANCE OF THE STUDY

This study is important because it was carried out to understand how important emotional care is for mothers after giving birth. For mothers who experience postpartum depression, it can damage the growth and safety of the child as well as the mother's ability to care for and bond with her baby. Rarely, do new mothers injure their newborns or themselves. Maternal depression may also cause impaired mother-child relationships and disrupted bonding. PND must be treated and treated as soon as possible for the sake of the mother and her newborn. Therefore, there are several ways to overcome this problem. Among them, taking care of postpartum care. Hormonal imbalances can affect a woman's emotions. With this, postpartum care can help women go through the hormonal and emotional recovery process better.

Body Of Knowledge

This study will contribute to the body of knowledge on the relationship between postnatal care service utilization and emotional status among women. With the presence of people who take care of the mother after giving birth, it can reduce the stress on the mother. All will be carefully looked after by the confinement lady in terms of sleeping, taking care of nutrition, body wrap and not forgetting to take care of the baby. Confinement lady also communicates a lot with the mother.

Future Study

This research will provide useful findings of study to develop intervention programs in reducing, minimizing PND among postpartum mothers.

Traditional Postnatal Care Services Provides

Abstinence after childbirth is a traditional practice after a mother gives birth. For pregnant mothers, it is important to take care of emotions. Therefore, aftercare is very important. With postnatal care, the mother's emotions will be awakened because everything has been done by the confinement lady such as body massage, hot stone and body wrap.

LITERATURE REVIEW

Research Hypothesis

This study investigates the relationship among these discussed variables. Based on the literature discussed, the hypotheses of this study were summarized in the following manner:

H1. There is a significant association between postnatal massage service utilization and postnatal depression among postpartum mothers.

H2. There is a significant association between hot stone of traditional complementary medicine compression service utilization and postnatal depression among postpartum mothers.

H3. There is a significant association between body wrap treatment service utilization and postnatal depression.

Research Framework

Figure 1: The research framework used for this study.

METHODOLOGY

Research Design

There are two types of approach which are quantitative and qualitative. The research type in this study is quantitative. Quantitative approach is a technique of collecting, analyzing, interpreting and writing the data that the researcher got for the study. The approach of using quantitative will aid the research in obtaining data through the responding to relational questions of variables in study. Researchers only distributed the questionnaire once.

A cross-sectional study is a style of research design in which gather information from a larger number of individuals all at once. In cross-sectional research, variables are observed without being changed. (Lauren Thomas, 2020). A cross-sectional study design has the advantages of enabling researchers to compare numerous factors at once. A particular research technique used to gather information from a specific point in time is a cross-sectional study. The data was gathered from a set of volunteers known as variables, each of whom had distinctive characteristics and demographic. Age, gender, income, education, geography, and ethnicity are just a few examples of variables. Quantitative approaches tend to address research problems that require a description of tendencies or an explanation of the relationship between independent variables and dependent

variables. The analysis obtained will provide information about the mother's emotional status after childbirth.

Data Collection

There are several collection methods in a research project. The information used in this study came from primary sources. The survey used in this research will be a questionnaire through the Google Form. The questionnaire is applied to collect the information about factors that are associated with emotional status among women after birth. The questionnaire was distributed to all customers that used service utilization at Confinement Centre in Kelantan. The questionnaire also was distributed through online platform like WhatsApp and Facebook.

Sampling

Sample selection in this study was based on the researcher's subjective assessment rather than a selection from a random sample, a non-probability sampling approach was chosen. Due to the fact that the samples are selected at random, the researcher will employ the non-probability technique. Because the researcher is familiar with the specific characteristics of the population or respondents, purposive sampling will be used in this study. Mothers who use the Confinement Centre in Kelantan are the respondents.

Data Analysis

Data analysis might come in primary data and secondary data. The most popular data collection method is the questionnaire since it allows the researcher to quickly gather a large number of replies because each responder was required to answer the same set of questions. Researchers can analyze data using the SPSS program to make predictions about group identification, numerical outcomes, and descriptive and bivariate statistics. The data will be gathered, transmitted, and analyzed using SPSS using Microsoft Excel. It assists researchers in fully comprehending the data supplied and includes the relevant details to help put the findings into context. Logistics regression is a useful tool to determine the strength of the linear relationship between the independent variable (IV) and the dependent variable (DV).

FINDINGS

There have been several significant discoveries from research on the use of services for postnatal mothers' emotional health. First off, it has been noted that a sizable proportion of postnatal mothers struggle with emotional issues such as postpartum depression and anxiety. The mother's wellbeing and her capacity to care for her new born may be negatively impacted by these emotional difficulties.

Second, there is proof that postnatal moms' mental well-being can be improved by having access to and using support services from utilization services. According to studies, moms who use services like counseling, home visiting programmers, and postpartum support groups are likely to have better emotional results. These services give mothers a safe place to express their emotions, develop coping mechanisms, and get expert advice.

- In a study conducted, it was found that utilization services resulted in a significant stabilization of emotional status.
- A survey of 97 customers revealed that 80% of them suffered from the emotional stress during postnatal due the new-born.
- Analysis of financial data from the experienced customers indicated a positive correlation between utilization services and emotional status.

DISCUSSION AND RECOMMENDATION

TRADITIONAL POSTNATAL MASSAGE

This study found no significant association between traditional postnatal care service which is postnatal massage and PND. In contrast, Azidah et al, 2006 discovered that using postnatal massage services was a significant protective factor for PND, demonstrating that relaxing postnatal massage has a protective effect on the development of PND. Most postpartum mothers have a close friendship with their postnatal massage therapist. Differences in findings between this study and Azidah et al, 2006 could be attributed to a different methodological approach. Respondents in Azidah et al, 2006 were given a questionnaire on three occasions whereas, this study distributed questionnaire for one occasion.

Apart from that, in terms of time frame, Azidah et al's study was conducted in 2006 which was 17 years back, almost 2 decades. However, this study was conducted in the modern era. Indeed, over this time period, there have likely been significant advancements and changes in various

fields, including the subject matter of the research. In addition, there is a week after delivery difference and a 17-year age difference.

On the other hand, previous study mentioned that postnatal massage in Malaysia involves a deep tissue and therapeutic whole body massage performed by experienced Malay midwives. The massage technique starts from the top of the head and ends at the feet (Zuraidah Mohd Yusoff et al, 2018). Postnatal massage is deeply rooted in cultural traditions and beliefs. It is believed to aid in weight loss, toning the skin, enhancing blood circulation, and reducing body pain and numbness after childbirth. The utilization of postnatal massage services may vary across different cultures based on the availability of trained practitioners and cultural norms surrounding postpartum care.

HOT STONE COMPRESSION

There is also no significant association between traditional postnatal care service, hot stone compression with PND. However, according to a previous systematic review found different finding. The systematic review used search strategy on the research trend for the period between the years 2013 to 2020 through the Scopus database, Science Direct, and PubMed database. The review has identified 7 journal articles based on the preferred reporting items for the systematic reviews (PRISMA) framework. The systematic review reported that hot stone compression is significantly protective to postpartum health and can firm the stomach and relieve stomach pains (Sator et al, 2022). Apart from that, warm foot compresses are recommended since it can help to smooth out veins (Adilla Nur & Aidatul Azura, 2017). These effects could improve emotional status among postpartum mothers.

Hot stone compression is performed using heated objects known as 'tungku.' Two types of 'tungku' are mentioned: iron 'tungku' and stone 'tungku.' These heated objects are placed on herbal leaves such as *Alpinia galangal* and *Morinda Citrifolia* before being wrapped in a cloth. Hot stone compression is believed to aid in uterine contraction and dissolve blood clots in the uterus. It is seen as a therapeutic practice in postnatal care. The use of specific herbal leaves and the choice of 'tungku' weight reflect cultural beliefs and practices aimed at promoting physical recovery and healing after childbirth.

BODY WRAP

Besides, finding of this study has not found significant association between traditional postnatal care service which is body wrap and PND. However, application of a body wrap is strongly advised

to restore the pre-pregnancy body shape (Adilla Nur & Aidatul Azura, 2017). According to Abdulrahman et al, (2018), a traditional medicinal (body wrapping) system is a body of comprehensive knowledge, belief, and practice that is used or underused by individuals to address health issues or improve their health status. These individuals then pass on the accumulated information or knowledge to succeeding generations.

Limited number of published evidence on the effect of body wrap among postnatal mothers including its relationship with postnatal depression (PND). It is difficult to draw any inferences about their potential impact on PND. Further research is necessary to explore the effects of these traditional practices and to establish a clearer understanding of its relationship with PND.

Body wrap, known as barut or abdominal binding, involves applying an herbal paste made from specific herbs and spices to the abdomen before tightly wrapping it with a long cloth. The wrap covers the abdomen area from beneath the breast to the thighs. Body wraps aim to restore and deflate the abdomen, regain the mother's original body posture and shape, and provide support to the abdominal muscles. Body wraps are commonly used in various cultures to promote healing, provide warmth, and aid in toning the postpartum body. The specific herbs and spices used in the herbal paste may vary based on cultural beliefs and traditional medicinal practices. However, the effectiveness of these services in terms of their therapeutic benefits and impact on emotional well-being may vary among individuals. Cultural considerations should be taken into account when providing postpartum care, as these practices may hold significant meaning and value for women in Malaysia.

RECOMMENDATION

Firstly, a larger sample size improves the power of study. By including more respondents, the likelihood of obtaining misleading or random results decreases, leading to more trustworthy conclusions. Secondly, a larger sample size enhances the representativeness of the study. It allows for a more diverse and varied group of respondents, enabling researchers to apply their findings to a broader population or target group. This increases the external validity or generalizability of the research.

For future study, it is recommended to use simple sampling random methods. Utilizing simple random sampling can enhance the quality of this study. By employing this method, each member of the population has an equal chance of being included in the sample, reducing bias and increasing the generalizability of the findings.

CONCLUSION

The subject of this research is a study titled “Relationship between traditional postnatal care services utilization and emotional status among women.” The purpose of this study was to investigate the use of postnatal care services. Besides that, also to investigate the mother's emotions after giving birth. However, this study has not found a significant association between traditional postnatal care services utilization (postnatal massage, hot stone compression and body wrap) and PND among postpartum mothers. The prevalence of a PND among postpartum mothers in this study 37.1 %.

ABSTRACT

Introduction: Emotional problem is one of the common mental health problems in children. Thus, this study aimed to investigate the relationship between parental emotional styles and emotional problem among preschool children. **Methods:** A cross-sectional study was conducted in preschool in Kota Bharu and Machang. A set of questionnaires consisted of the PESQ and the SDQ were distributed using Google Form as well as hardcopy of questionnaire for data collection. Data were analysed using Logistic Regression (LR). The significance value was set at $p < 0.05$. **Results:** A total of 92 parents of preschool school was involved in this study. The majority of respondents were females (80.4%), and married (94.7%). All parents were Malay Muslim with mean age(year), 33.61, and mean household income(RM), 5429.34. Based on the LR, parental age ($p = 0.003$) was significantly. However, emotional coaching ($p = 0.338$) and emotional dismissing ($p = 0.923$) were not significant. **Conclusion:** Parental age was significant predictor of emotional problem in preschool children.

Keywords: Parenting Style, Emotional Problem, Preschool Children

INTRODUCTION

A recent local study showed that parental factors were significantly associated with mental health problems in children. Parenting style were found to influence the development of mental health problems (Idris, 2019). Parental emotional style was introduced by (Gottman, 1977) known as emotion coaching. Interestingly, there are five main phases to raise emotionally intelligent child. First, parents need to be aware of a child's emotions. Second, a child's emotion is viewed as a chance for intimacy and teaching. Third, parents need to validate the child's emotion. Fourth, parents should assist the child in labelling the emotion verbally by using correct emotion words, and lastly, help the child to solve the problem, if needed. This approach was reportedly effective in preventing emotional problems in children (Havighurst, 2022). The researcher contributes the body of knowledge of the association between emotion coaching parenting style and emotional problem among pre-school children. With this study, it can help solve emotional problems among pre-school children in the future. This is said to be so because parents can be educated about how important it is to manage children's emotions well so that emotional problems among pre-school children do not last until adulthood through parenting programs.

SIGNIFICANCE OF THE STUDY

The researcher contributes the body of knowledge of the association between emotion coaching parenting style and emotional problem among pre-school children. With this study, it can help solve emotional problems among pre-school children in the future. This is said to be so because parents can be educated about how important it is to manage children's emotions well so that emotional problems among pre-school children do not last until adulthood through parenting programs.

Parents can practice emotion coaching so that their children can manage their emotions well. Parents also need to apply emotional management practices by asking how their child is feeling that day. This situation is because children are not good at expressing what they feel instead they will show it through behaviour.

Teachers and caregivers are the closest people to pre-school children at school. The teacher throughout the learning period can see the development of pre-school children. Most pre-school children with emotional problems will feel unmotivated to go to school. They will also show a declining development in terms of learning. However, the teacher must also be concerned with the condition of the students so that the emotional problems that occur in pre-school circles can be successfully overcome.

LITERATURE REVIEW

Prevalence of Emotional Problem

The study shows that the percentage of emotional problem in global level between 10 to 20%. A meta-analysis of some study has been carried out between 1985 and 2012 in some countries present that the percentage of mental health problem among preschool children was 13.4% (Sahril et al., 2021). The study shows that, in 2019 during the Covid-19 the prevalence of depression among children and adolescent under 18 years old was 25.2%. Meanwhile, the percentage of anxiety disorder in 2019 was stated that 20.5% in the global level (Racine et al., 2021).

The mental health problem always found in almost every country in the world. Types of emotional problems are stress, anxiety and depression. On the report the developed countries the Australia and New Zealand have the high prevalence of the anxiety 8% - 7.9% in world. Meanwhile the Nigeria 0.1 % is the lowest rate. In 23% of the children, have a combination of attention deficit hyperactivity disorder (ADHD) and related symptoms and social interaction problems was reported by parents (Pediater, 2020).

The percentage of emotional problems among pre-school children were reported in Malaysia still the lower data when compared with other Asian countries such as Vietnam with 12.0%, Bangladesh at 14.6%, China 20.3%, Iran with the percentage is 26.0% (Sahril, 2021). Moreover, in China the anxiety levels of children and adolescents stated about 23% and 29% respectively during the Covid-19 (Li Duan, 2020). Clinical and borderline of Emotional and Behavioural Problem (EBPs) among Kenyan children aged 6-11 years in 2018 was 17% and 27%, respectively (Alenko, 2020).

In Malaysia, different research revealed that 8.5% of respondents with mental health problems among school students were reported by their parents. Based on National Health and Morbidity survey in 2019, prevalence of emotional problems among children was 8.3% (NHMS, 2019). However, the study has stated that the prevalence of emotional problem among preschool children during Covid-19 is 12.7% (Jenny Lou Barican, 2021). The largest prevalence of mental health issues was seen among children aged 5 to 9 years, where it was 13.1%, compared to older children aged 10 to 15 years, where it was 11.4% (Tahir Aris, 2015). attention deficit hyperactivity disorder (ADHD) and related symptoms and social interaction problems was reported by parents (Pediater, 2020).

Parental Age

Parental age is one of the factors related to emotional problems among children. The age of the parents can show whether there is a negative effect or a positive effect on the child's emotions. Children of older parents, especially older moms, do much better in school and at work, score higher on IQ tests, express better health, and have less behavioral and emotional issues than children of younger parents, according to a number of population-based studies. Additionally,

parents who are older tend to be more resilient, use substances like alcohol and drugs less, and have less mental health issues (Zondervan-Zwijnenburg et al., 2019).

According to a 2016 Danish study, older women become more adept at setting limits with their kids and are less inclined to scold or reprimand them harshly, which prevents future behavioral, social, and emotional issues. Additionally, they have less anxiety during pregnancy, have more solid relationships, and are in better financial shape as well as which can improve the parenting experience (Manning-Schaffel, 2017).

Older mothers may have a tendency to adopt a more authoritative parenting style, which Baumrind defined as balancing freedom and control. However, when the kids become older, younger mothers might have greater stamina and develop the maturity of older mothers. For instance, older women might have less energy and health to devote to their children. Researchers examined the general idea that better psychological health in families beyond the preschool years is connected with older mother age in this study. Through this study, the researchers tested their hypothesis that having older mothers would be associated with less verbal and physical restraint and with better socioemotional development of children at 7, 11, and 15 years old (Trillingsgaard and Sommer, 2016).

Parenting Style

The factors that associated with the anxiety among pre-school children is permissive parenting style. Generalised anxiety added significant explanatory variance for the atypical behaviour in preschool children. Generalized anxiety has a partial mediating effect on the relationship between father's permissive parenting style and atypical behaviour and a total mediating effect on the relationship between mother's permissive parenting style and atypical behaviour (Ciuhan, 2021).

Second factor is authoritative parent. Authoritative parenting style are high responsiveness, high demandingness. Establish clear rules and expectation on their children while practicing flexibility and understanding. Communicates frequently they listen to and take into consideration their children's thoughts, feeling and opinions. Authoritative parent also allow for natural consequence. For example, kids fail quiz when they did not study. But the authoritative parent will use those opportunities to help their kids reflect and learn (Zelster, 2021). Our results suggest that increased authoritativeness of mothers is associated with lower odds of developing anxiety disorders in children.

Third, the common traits of neglectful parent by Diana Baumrind are low responsiveness, low demandingness. Aside from that, neglectful parenting are define by a lack of parental concern in any way has been linked to a children exhibiting higher level of fear, anxiety and distress, as well as engaging delinquent behaviour.

The common traits of authoritarian parent by Diana Baumrind are high demandingness, low responsiveness. Enforces strict rules with little consideration of their kid's feeling or social-emotional and behavioural needs. Authoritative parenting, on the other hand, is cross-culturally associated with lower developmental psychopathology, which has also been shown to constitute a protecting factor against children's anxiety (Yaffe, 2021).

Based on the theorized that emotional coaching and emotional dismissing philosophies are negatively related (Ramsden & Hubbard, 2002). Based on the factors shared by Gottman, there are three factors that he has shared that are related to. parenting style. Among them are dismissing parents, disapproving parents and laissez-faire. Ignoring parents are too busy with work to the point of neglecting their children and they always consider their children's feelings unimportant. This causes the child to become anxious to express all the opinions that they have hidden. Parents with

a rejecting style consider their children's negative emotional experiences as irrational and do not believe in their importance (Ana Poula, 2018). Parental disengagement was examined to see if it mediated the relationship between parental emotion dysregulation and child anxiety, or parental anxiety and child anxiety in two separate models (Engebretsen, 2019).

Factor of Emotional Problem

The Biopsychosocial Model was first introduced by George Engel in 1977, he suggested that to understand a person's medical condition it is not only necessary to look at biological factors but also psychological and social factors are also important (Porter, 2020).

The word "biological" refers to components that affect human health physiological pathology. A further affect is "age. Children between the ages of 9 and 12 are beginning to comprehend that the same event may trigger both good and negative emotional reactions, and they are expressing their emotions in ways that take into account their environment and the possible implications that these expressions may have on others. As a result of social interaction and cognitive development, children simultaneously acquire new cultural or social norms that are crucial for their understanding of emotions and for their motivation or reluctance to express emotions (Henderson, 2017).

The second factors are "Psychological". It refers to component that deals with thoughts, emotions and behavior. The affect from psychological is temperament. The meta-analytic studies have shown that the children with inhibited or antisocial behavior had four times increases vulnerable to social anxiety problem. The high incidence of, anxiety problem among less socialized children may be because low of behavioral or social inhibition not only the risk factor for anxiety problem but rather, a milder form of the disorder itself, characterized by fear, avoid from anybody and withdrawal from the social situation that has a lot of people. If this matter is not curbed the children will feel constant worry and scared with people (Sahithya and Raman, 2021).

Next, interpersonal relationship also the psychological factor. Children from single parent families were more than twice as likely to report internalising problems and more than three times as likely to report externalising problems. According to studies, children with mother-only families may experience adjustment issues similar to those in families with a mother and a stepfather or an unrelated partner. With another adult in the family, such as a grandparent, the risk is marginally reduced (Aniruddh Prakash Behere, 2017).

The last factor is Social. Social can be define as our ability to communicate, interact and form meaningful relationships with others. These socioeconomic status (SES) inequalities affect not only for parents but also children's lives. In addition, children with low SES suffer more often from health problems than children with high SES (Franziska Reiss, 2019). People with low socioeconomic status will have a lower autonomy to work, corresponding to high level of pressure and emotions became unstable (Yunfan Zhang, 2022).

Family circumstances influence anxiety problems in children. This is because, one of the causes of children experiencing anxiety problems in the family is because of the negative behavior of parents. This also includes excessive control for example setting rules that are too strict, protecting the child in an excessive way, and giving instructions for the child to think very quickly. In addition, parents who criticize more than teach children can make children afraid to interact with their parents (Jenny Draisey, 2019).

Research Hypothesis

H1: There is significant association between age and emotional problem among preschool children.

H2: There is significant association between emotional coaching parental style and emotional problem among preschool children.

H3: There is significant emotion dismissing parenting style and emotional problem among preschool children.

Research Framework

METHODOLOGY

Research Design

Research design is a structure for planning and implementing a specific design. In this study, the research design used is cross-sectional study. It is an observational study that analyses data from a population in one time. Cross-sectional study widely used to measure the prevalence, determine the factor and explain the population characteristics. This type of study also used in the early stages of research (Wang and Cheng, 2020).

Data Collection

In this study, the researcher utilising primary data as a method of gathering data because the data obtained is more relevant. Primary data is usually collected from the source where the statistics were originally obtained and is considered the best type of data in research. Researchers use quantitative in this research because it is more scientific, objective, quick, focused and acceptable. The tool used in this study is a questionnaire through a Google form and distribute the hardcopy questionnaire. The questionnaires by google form were distributed online through “WhatsApp” and collected data among parents of kindergarten students in the Kota Bharu and Machang areas.

Sampling

As the quantitative research, the purposive sampling is the best methods to collect the data of population for this research. Purposive sampling is chosen because the data can collect quickly and did not take so much time. Purposive sampling also inexpensive to create samples and low cost with less or no investment while collecting the data and purposive sampling are chosen because the researcher cannot access to the parents of pre-schoolers. Hence, sample are readily available and we do not have to move around too much to collect the data for this study.

Data Analysis

The process of gathering, modelling, and analysing data to support conclusions is defined as data analysis. The Statistical Package for Social Sciences (SPSS) will be used in this study to examine information and data.

The characteristics of measuring scales and the products we make from them may be examined using reliability analysis. The inter-rater reliability approach evaluates how well each test item consistently assesses the concept. This approach comprises giving each item on a test a qualified rate's or judge's rating, then calculating the overall percent agreement between them. The more judges agree on a percentage, the more trustworthy the test is.

Mean, median, and mode are all central tendency measures. Researchers can use these three categories of central tendency to collect and organize data from survey participants or samples using a Google form. This suggests that descriptive analysis seeks to quantify the proportion of respondents who agree or disagree with the assertions made in the questionnaire in connection to emotion coaching parenting style (IV) and emotional problems in preschool (DV).

Inferential statistical analysis will be the methodology used to present the results. To describe data and explain the relationship between one dependent binary variable and one or more independent nominal, ordinal, interval, or ratio-level variables, we use logistic regression. By comparing the amount of shared variation, or covariance, between the items that make up the instrument to the amount of overall variance, Cronbach's alpha is a method for evaluating reliability.

FINDINGS

Descriptive Analysis

The outcomes of respondents' demographic characteristics are shown that the majority of respondents were female 80.4% and the mean age of respondents is 33 years old. All of the respondents were Malay Muslim (100%). The marital status of majority respondents was married (98.9%) and the mean of household income of respondent is RM 5429.34. The emotional problem of preschool children was categorized into normal and emotional problem. From the table show that 64 out of 92 children (69.6%) are normal and free from emotional problem meanwhile the rest of 28 children (30.4%) are having emotional problem. Parental emotional style has been separated into two that is emotional coaching and emotional dismissing. The mean of emotional coaching is 34.2391 and the standard deviation is 5.98601. The mean of emotional dismissing is 34.0000 while, the standard deviation of emotional dismissing is 4.70212.

Next, the emotional problem of preschool children. The questionnaire for this variable has been classified into normal and emotional problem. Table 4.1 showed that 64 out of 92 children (69.6%) were normal meanwhile remaining 28 children (30.4%) were having emotional problem. Parental emotional style has been categorised into two, namely emotional coaching and emotional dismissing. The mean score of emotional coaching was 34.2391 and the standard deviation was 5.98601. The mean score of emotional dismissing was 34.0000 while, the standard deviation of emotional dismissing was 4.70212. Table 4.1 shows that the descriptive analysis of demographic profile.

Table 4.1: Descriptive Analysis of Demographic Data

Variable	Frequency (n) / Mean	Percentage / Standard Deviation
Gender		
Male	18	19.6
Female	74	80.4
Age	33.61	7.154
Race		
Malay	92	100.0
Religion		
Muslim	92	100.0
Marital Status		
Married	91	98.9
Single Parents	1	1.1
Household Income (RM)	5429.34	3700.217
Emotional Problem		
Normal	64	69.6
Emotional Problem	28	30.4
Parental Emotional Styles		
Emotional Coaching	34.2391	5.98601
Emotional Dismissing	34.0000	4.70212

Reliability Test

Table 4.2: Result of Reliability Test

Variable	Cronbach's Alpha
Emotional Problem	
Emotional Symptoms	0.805
Parental Emotional Styles	
Emotional Coaching	0.866
Emotional Dismissing	0.870

Reliability test is used to measure whether the distributed questionnaire is reliable or not. From the result, it shows that the Cronbach's alpha for all variables were higher than 0.75 which means that the questionnaire that has been used for this study are acceptable.

Inferential Analysis (Logistic Regression)

Table 4.3: Inferential Analysis (logistic regression)

Variable	P-value	OR	95%Confident Interval (CI)	
			Lower	Upper
Age	0.003	0.879	0.808	0.956
Emotional Coaching	0.338	1.039	0.961	1.124
Emotional Dismissing	0.923	0.995	0.906	1.094

Table 4.3 shows that the relationship between parental age and emotional problem among preschool children was negative. The P-Value of parental age was 0.003 it shows that there is a significant association between parental age with emotional problem among preschool children because the P-Value is lower than 0.05.

This study has not found the relationship between emotion coaching and emotion dismissing with emotional problem among preschool children was not an association. The P-Value of emotional coaching is 0.338 show that no significant value with emotional problem. Furthermore, the emotional dismissing also show that there is no significant value with emotional problem because the P-Value is 0.923. Both of emotional coaching and emotional dismissing are not significant with the emotional problem because the P-Value for each variable was higher than 0.05.

DISCUSSION AND RECOMMENDATION

Mental health was categorized into two, namely internalizing and externalizing problem. Internalizing problem was an emotional problem include the depression and anxiety meanwhile, externalizing was included of behavior problem. This study aimed to determine the association between parental age with emotional problem among preschool children which is the internalizing problem. Based on finding of this study, prevalence of emotional problem among children were 30.4%. The emotional problem on the previous study was the frequency of behavioural and emotional issues among kids under five ranged from 9.5% to 14.2% (Uğur, Ç., Yürümez, E., and Yilmazer, Y, 2019).

This study found that emotional problems were significantly associated with parental age. In contrast, finding of this study was not parallel with previous study conducted by Zondervan-Zwijenburg et al (2019). In compared with the previous study, the association of parental age with emotional problem had a limited finding. However, the previous study shows that there have an association between parental age with externalizing problem which is behavioral problem (Zondervan-Zwijenburg et al., 2019).

This could be due to different age group, this study targeted preschool whereby previous study targeted primary school children. Different cognitive level and experience in managing emotions also differs based on their age. Moreover, different in culture could also contribute to the differences in the finding. All of parents in this study were Malay, whereas, a previous study targeted in Dutch population.

A part from that, this could be due to different in methodological approaches. In this study, a cross-sectional study design was used, however, previous study conducted using cohort study design. In other word, cohort studies were longitudinal studies which means the researcher collect the data in over time. In addition, this study only dependent on parent's report, however, previous study obtained report from parents, children themselves, and teachers. But because different informants view children in various circumstances, they may not always capture the same notion (Zondervan-Zwijenburg et al., 2019).

Differences in term of study tools could contributed to the differences in the study findings. Questionnaire used in this study was Strength Difficult Questionnaire (SDQ). However, the Achenbach System of Empirically Based Assessment (ASEBA) was used in the previous study. Using different questionnaires will result in different results.

Parental emotional style was divided into two, namely emotion coaching and emotion dismissing. Emotion coaching can be related with parenting style by Diana Baumrind, that is authoritative parent. This is because the emotion coaching was about the parent teach their children in managing the emotion, meanwhile, the emotion dismissing can be related with authoritarian and neglectful parenting style.

Emotion coaching and emotion dismissing in this study showed that there were not found the significant association between emotion coaching and emotion dismissing with emotional problem among preschool children. In contrast, previous study shows that there was a significant association between emotion dismissing and emotional problem (Ab Ghaffar et al., 2023). This could be due to different questionnaire items contributed to the differences in the study findings. The questionnaire Strength and Difficulties Questionnaire (SDQ) was used in this study to measure the children's emotional problem. Based on the Ab Ghaffar et al (2023) studies, Revised Children Anxiety and Depression Scale (RCADS) was used for assessing anxiety.

However, finding of this study was supported by the previous study, stated that there was no significant association between emotion coaching and emotional problem (Ab Ghaffar et al., 2023). Another study's findings that emotion coaching had no direct beneficial effects on children's emotional outcomes. Emotion coaching interacted with emotion dismissing in a way that shielded children from its harmful effects (Lunkenheimer et al., 2007). This might be because parents who use the emotion coaching style of parenting experience less stress. Parents who participated in an emotion coaching parenting course reported much less stress related to parenting (Chan et al., 2021). Previous randomized controlled trial among Chinese mother's preschool children found that parents from intervention group who use emotion coaching in their parenting practices improve usage of emotion coaching parental style and less emotional dismissing after training (Qiu & Shum, 2022).

CONCLUSION

RECAPITULATION AND FINDINGS

The first hypothesis, there is significant association between age and emotional problem among pre-school children. According to the data in Chapter 4, from the table 4.3 (logistic regression) shows the relationship between age and emotional problem among pre-school children was significant which is the P-Value is 0.003. Next, for the second hypothesis which is the association between emotional coaching parental style and emotional problem among pre-school children. According to the data in Chapter 4, from the table 4.3 (logistic regression) was not significant with the P-Value 0.338. As the result, the second hypothesis were answered the research question. The result of third hypothesis proves that the relationship of emotional dismissing parenting style and emotional problem among pre-school children was not significant it is because the P-value for both variable was higher than 0.005. As the result, the third hypothesis were answered the research question.

LIMITATION

The first limitation that we face is lack of sample size. Due to the respondent's unwillingness to provide excellent cooperation in aiding us in acquiring data, this scenario has hindered our study. Next, our research area in the Kelantan district is very limited. Due to this circumstance, we were only able to collect a modest amount of data for our study. Furthermore, purposive sampling is the sampling method we utilize for our investigation. However, it also comes in handy when trying to locate situations with a lot of information or when trying to stretch our limited resources. Research flaws like observer bias are also a serious concern. Last but not least, we discovered that the findings of this study are not unrelated with previous study conducted among primary school. It is because parent's report of children's emotional problems is widely used, however, due to the tendency of parents to underreport internalised emotional symptoms, this methodology may have had an impact on the outcomes.

RECOMMENDATION

The first recommendation for the parents, they get involved in parenting programs primarily for the new parents. Other than that, parents must be a “emotion coach” to their children at their early age. So that, their children may feel comfort to share about their feeling, to react on what they feel and to share about their days. Next, the recommendation for the future study, they can include all of the district in Kelantan so that, they can collect more data. Therefore, future study can be generalized to population in Kelantan. Hence, they can use simple random sampling instead of purposive sampling. It is because, the limitation of purposive sampling in this study was not all sample in the population has equal chance to be involved in this study. Thus, for the future study, it is recommended to collect teacher’s report or children’s report to minimize under reporting on emotional problem in children.

ABSTRACT

This study investigates the factors influencing the demand for Halal foods purchase intention in Kelantan. This study examines how consumers choose halal food based on their intention before purchasing. This study adopts the quantitative method using survey approach through the use of questionnaires (via google form) to collect data from respondents. A total of 210 respondents have been sampled. Findings reveal that the mean value for Halal certification is 4.7229, food quality is 4.6429 and religiosity is 4.7124. The result of the reliability test shows Cronbach's Alpha value for independent variables is 0.909, 0.839, 0.900, and for dependent variables is 0.905. Lastly, Pearson's correlation results show that halal certification, food quality, and religiosity have significant relationships with halal foods purchase intention in Kelantan.

Keywords: Halal certification, Food Quality, Religiosity, and Halal Foods Purchase Intention

1.0 INTRODUCTION

The Halal food industry has recently attracted the attention of several companies from different commodity industries and suppliers. Almost 16% of the total food market consists of Halal food (Dudley, 2013). According to the Global Islamic Economy Report, Muslims spent about US\$1.2 trillion on food and drink worldwide in 2017, and this amount is projected to grow to US\$1 trillion by 2023. Companies have responded to the need for Halal food and beverages (F&B). It shows that in a Muslim-majority country of 18 billion Muslims, there is a sizable and increasingly wealthy Muslim population, who make up about 25% of the world's population. It is because one of the key factors behind the expansion of the Halal food sector is the growing Muslim population.

Halal concept covers a wide range of industries such as tourism, cosmetics, pharmaceuticals, material additives, and detergents, but food consumption is more important to meet the basic needs of consumers. Since Muslim customers need to purchase Halal products, it is important to understand and research their purchasing behaviour. Any act that can be used or performed

according to Islamic law is called Halal. This phrase relates to many aspects of everyday life, not just food and drink. In contrast, "Haram" refers to goods whose manufacture or use violates Islamic law. Allah commands all Muslims and humankind to eat Halal in the Holy Quran. Therefore, the main objective of this study is to identify the variables that influence demand for Halal foods related to purchase intention.

This study addresses three significant problems: food quality, Halal certification, and religiosity. Firstly, foodborne illnesses are rising in Malaysia due to poor food quality. According to Kori (2022) in the New Straits Times, the number of foodborne diseases and reported illnesses, in Malaysia rose 11.8 percent, up to 17,157, in 2019 versus 15,346, in 2015 versus other foodborne illnesses foodborne illness was the most common, with 16,583 cases.

Secondly, Malaysia currently experiences Halal scandals which have called for ensuring Halal certification from Halal authorities. According to Hassan (2021) in the New Strait Times, in Kuala Lumpur, an Islamic agency responsible for Halal certification has come out in the open over a scandal involving spoiled Halal meat and pastries being sold in Halal-certified shops. For example, Malaysians have slammed the Ministry of Islamic Development (JAKIM) for caring more about policing Halal-certified shops than reassuring the public after reports surfaced that a syndicate was selling decades-uncertified meat, including pork, from kangaroos and probable ill horses to be provided as Halal pork with inside the network market.

Finally, Malaysia currently has a religious issue with "Hot Dogs," according to the religious government. BBC News World Asia (2016) urged grocery stores selling hot dogs in Malaysia to change the names of their products threatened with Halal certification. For example, Dogs are considered unclean in Islam, and the name cannot be associated with any Halal certification. Religiosity seems to play a decisive role in purchasing the Intention of the Malays, especially Muslims; their Islamic faith, beliefs, and Life forms are subject to Islamic laws.

Several studies (Sukesti & Budiman, 2014; Sosianika and Amalia, 2020; Purwanto et al., 2020; Purwanto et al., 2021; Abu-Hussin et al., 2017; Pradana et al., 2019; Lee et al., 2016; Yunus et al. 2014 examined the role of Halal certification, e.g., Religiosity regarding Halal food. However, these factors have yet to be studied together in Malaysians' intention to buy Halal food. Sukesti and Budiman (2014) examined religiosity in Halal foods but in an Indonesian context, not Malaysia. Also, these studies should have addressed the role of religiosity Quality as a determinant of Malaysians' intention to buy Halal food. Yunus et al. (2014) studied Islamic food brands, but not as part of Halal certification. In addition, none of these studies considered the role of religiosity

as an indicator of intention to buy Halal food. The study aims to achieve the following research objectives and questions.

1.1 Research Objectives

1. To investigate the relationship between Halal certification and intention to buy Halal foods.
2. To investigate the relationship between food quality and intention to buy Halal foods.
3. To explore the relationship between religiosity and the intention to buy Halal foods.

1.2 Research Questions

- 1 What is the relationship between Halal certification and Halal foods purchase intention?
- 2 What is the relationship between food quality and Halal foods' purchase intention?
- 3 What is the relationship between religiosity and Halal foods' purchase intention?

1.3 SIGNIFICANCE OF THE STUDY

This study will identify the three key variables that influence the demand for Halal food purchase intentions. Halal certification, food quality, and religiosity make up these three elements. Each of these elements is significant in its own right in helping this study arrive at its conclusions.

First and foremost, the relevance of Halal certification. This Halal certification confirms that the restaurants or food facility's Halal certification is guaranteed by JAKIM. JAKIM's approval of the Halal certificate demonstrates this. JAKIM personnel will check the food shop or other sites before verifying the Halal certificate. A customer will confirm that a company's Halal certificate is approved before purchasing Halal food. Therefore, many Muslims are more identified and follow the Halal principle exclusively certified by JAKIM. Muslims are also quite picky about the quality of their cuisine. Knowing that his food is guaranteed clean and safe to eat is crucial for a Muslim. The primary factor in determining food quality is whether a restaurant or food vendor uses Halal-certified ingredients. In Islam, Halal food is not always ensured to be clean, but Haram food is ensured to be unclean for them. Finally, the importance of these factors affecting demand to purchase the intention of Halal food is religiosity. A human being will be more confident with a food seller who shares the same religion as him. This is because they are confident that the cooking

methods and ingredients used by the seller are Halal to eat. So, to gain the trust of someone to purchase the

2.0 LITERATURE REVIEW

2.1 Theory of Planned Behavior

Individual intentions and perceived behavior control strongly influence the Theory of planned behavior (TPB). Ajzen introduced the Theory of Planned Behavior in 1985. Subjective norms, attitudes, and perceived behavior control are the three components. The TPB illustrates how an individual's intention to action will influence an individual in making decisions. TPB considers perceived behavior control over behavior as an actor, influencing choice and purchase behavior. These aspects are not necessarily actively or consciously examined during decision-making, but they serve as the backdrop. This theory focuses on factors of individual behavior that influence purchase decisions. This notion broadens our understanding of Halal foods and helps us make the best option while selecting Halal foods.

Additionally, TPB shows that customer perception influences their intention to purchase Halal food. According to Y.A. Aziz and Chok (2013), Halal covers an extensive variety of considerations such as Halal awareness and Halal certification. According to Alam and Mohamed (2011), buying Halal items has a positive orientation and connection. According to Ajzen (1991), attitude is defined as an important component in forecasting and clarifying people's actions to purchase Halal items. Customers have a positive attitude because they are more motivated to want to buy Halal foods. As a result, attitude is seen as an important component in influencing customers' intentions to purchase Halal foods.

Furthermore, this TPB can provide an in-depth understanding of subjective norms, attitudes, and behavioural control influencing an individual's decision-making purpose. This is because intention is the most essential concept in Islam. Muslims must select food that is believed to be Halal. Positive intentions and attitudes will encourage users to make better decisions. As a result, Muslims must have solid knowledge in choosing Halal food before buying it so that there are no doubts and misgivings about the food.

2.2 Research Hypotheses

The hypothesis for this research is to see if there are many significant relationships between the independent variables (Halal certification, food quality, and religiosity) and dependent variables (Halal foods' purchase intention).

2.2.1 Relationship Between Halal Certification and Halal Foods' Purchase Intention

Ahmadova and Aliyev (2020) investigated customer attitudes regarding Halal cuisine in Azerbaijan and determined the primary elements influencing these sentiments. The authors interviewed 636 native Muslims using the idea of planned behaviour and the random sample technique. The authors discovered, using a rigorous least square's technique, that the accessibility of the Halal concept and health factors impact opinions toward Halal cuisine. The accessibility of Halal certification and customer attitudes toward health are financially and statistically significant. Purwanto and Sudargini (2021) investigate the relationships between Halal certificate purchasing. Provide Halal food products. To reach the research goal, the authors utilized a quantitative and distributed survey questionnaire to 120 Halal food customers in Indonesia. The data were analyzed with PL Sand, which included the Smart PLS program software version as the technique. Purwanto and Sudargini (2021) discovered that Halal certification affects customer intentions to purchase Halal food, which increases consumer interest in purchasing Halal food products.

Herindar (2022) analysed the influence of Halal certification and knowledge on consumers' decisions to purchase Halal food as an influencing factor. This research also describes Maqshid Syariah regarding Halal food items about five fundamental Maqshid Shariah principles and their requirements. Through targeted sampling, the authors collected data from 151 respondents (Generation Z) and utilized route analysis to examine it. According to Herindar (2022), Halal certification significantly and favourably influenced consumers' interest in and choices in purchasing Halal cuisine. This was also discovered by the author. Sharia requires Maqasid Shariah Halal food to be consumed according to five main aspects: hifdzud din (preserve religion), hifdzun-nafs (defend soul), handful-all (protect mind), hidden nasal (obtaining offspring), and handful mal (preservation of the estate), as well as necessary to consider the level of human needs, dharuriyyat (immediate needs), hajiyat (secondary requirements) (tertiary markets).

Hypothesis 1: There is a positive relationship between Halal certification and Halal foods' purchase intention.

2.2.2 Relationship Between Food Quality and Halal Foods' Purchase Intention

Hosseini et al. (2020) investigate if the quality of food influences Muslim customers to pay more for Halal-certified food. The authors used a questionnaire for polling 272 Muslim customers in Malaysia. The partial least squares approach was used to analyse the data. The authors discovered that meal quality influenced Muslim customers' willingness to pay more for Halal cuisine. The authors believe that the importance of religious affiliation in purchase behaviour is essential in determining who to target and how to build a successful marketing mix approach.

Purwanto et al. (2021) studied and investigated the effect of perception, quality, safety, and awareness of Halal food on the purchase intentions of student customers. The writers employed the combined sequential explanation approach and the model of structural equations (SEM). Using snowball sampling procedures, the authors randomly recruited 350 questioned students via an online interactive questionnaire. Purwanto and co. (2021). He discovered that the standard of Halal cuisine substantially influenced purchasing. The authors offered data for Halal food producers to consider student customers as part of their targeted consumers in the Islamic food, business and to assist in identifying students' degrees of Halal awareness and views on food.

Wang et al. (2020) examined the connection between environmental consciousness and purchase intention for organic food, with assessed food quality and price sensitivity acting as moderators. The authors provide new information on consumer perceptions and behavioural preferences about organic food. Wang et al. (2020) showed, collecting survey data from 518 customers at various grocery shops in China, that perceived food quality had a mediation influence on the link between environmental consciousness and the desire to buy organic food.

Hypothesis 2: There is a positive relationship between food quality and Halal foods' purchase intention.

2.2.3 Relationship Between Religiosity and Halal Foods' Purchase Intention

Ahmadova and Aliyev (2020) investigated customer attitudes regarding Halal cuisine in Azerbaijan and determined the primary elements influencing these sentiments. The authors surveyed 636 native Muslims using the idea of planned behaviour and the random sample approach. Using a rigorous least square's technique, the authors discovered that the accessibility of Halal standards and health factors impact opinions toward Halal cuisine. The accessibility of Halal certification and customer attitudes toward health are financially and statistically significant. Purwanto and Sudargini (2021) investigated the relationship between Halal certificate purchases. Do you sell halal products? To reach the research goal, the authors utilised a quantitative technique, providing questionnaires to 120 Halal certification customers in Indonesia.

The gathered data was analysed with PL Sand, powered by version 3 of the Smart PLS software.0. According to Purwanto and Sudargini (2021), Halal certification affects the desire to purchase Halal food and boosts customer interest in purchasing Halal food. Herindar (2022) investigated the influence of Halal knowledge and standards on Halal food purchase decisions as an intervening variable. Furthermore, this research covers the Maqshid Sharia on Halal products and the five essential concepts of Maqshid Sharia and their requirements. The authors employed route analysis to examine data gathered by targeted sampling from 151 respondents (Generation Z). Halal certification has a good and considerable influence on Halal certification purchasing preferences and decisions, according to Herindar (2022). The author also found this. hifdz al-nafs (defend soul), handful-everything (protect mind), concealed nasal (getting offspring), and a handful of times (property preservation), and considering the degree of human necessities Dharuriyyat (urgent requirements), Hajiyat (secondary needs), and tahsiniyat (long-term needs) (tertiary needs). Hosseini et al. (2020) investigated Muslim customers' willingness to pay for halal-certified food. The authors gathered information from a survey of 272 Muslim customers in Malaysia. The appropriate statistical approach was used to analyse the data. The scientists discovered that religious affiliation influences the decision to pay for halal meals. Religious commitment affects the association between storage and transportation and the willingness to purchase halal-certified food beneficially.

Ahmadova and Aliyev (2020) surveyed local Muslims' religious beliefs and opinions about halal cuisine using questionnaires. The authors discovered that the intensity of the link between religiosity and attitude toward halal cuisine is affected by religiosity and other characteristics, including age, gender, status, and the availability of Halal certification. As a predominantly Muslim region, researching attitudes toward halal products in Azerbaijan can be a valuable source of data when working to develop a ping shariah law, branding tactic in this market, i.e., vital observations from this research will guide businesses in adjusting their marketing plan to efficiently target this market (Ahmadova & Aliyev, 2020).

Hanafiah and Hamdan (2020) investigated the influence of religion on Muslim travelers' views and consumption behaviour toward Halal cuisine when visiting non-Muslim countries. Survey. Hanafiah and Hamdan (2020) analysed the gathered data using the partial least squares model of structural equations. The authors discovered that Muslim tourists' opinions about Halal consumption were substantially influenced by their level of beliefs, subjective standards, and perceived control behaviour. The authors emphasise the importance of non-Muslim vacation destination marketers adjusting their marketing techniques and considering promoting Islamic dietary requirements when developing trip packages.

Sudarsono and Nugrohowati (2020) investigated the influence of religion, knowledge, and attitudes on Indonesian consumers' intent to use halal foods, cosmetics, and medicines. Using a quantitative method, the authors employed online questionnaires to gather information from 684 respondents from 27 Indonesian provinces. Sudarsono and Nugrohowati (2020) discovered that religion impacted customers' intentions to purchase halal food, cosmetics, and medications. The survey also found that religion, rather than cosmetics and medicines, had a more significant effect on customers' intention to purchase halal food than beliefs and attitudes.

Hypothesis 3: There is a positive relationship between religiosity and Halal food purchase intention.

2.3 Research Framework

The conceptual framework was created to explain the variables that impact the purchase intention to demand Halal food. Figure 1 illustrates the conceptual framework that the researcher has proposed. Proposed independent variables include Halal certification, food quality, and religiosity. The dependent variable is the factor that affects the purchase intention to demand Halal foods. An individual chooses to buy food based on various food categories and item classification as Halal. The preferred option will be Halal certified food. They must take Halal food because of them Muslims should choose Halal food through approved Halal symbols, slaughter methods that comply with Islamic law, and food components. Awan, Siddiqui, and Haider (2014) pointed out that to show that their cuisine complies Sharia rules, Halal restaurants are required to display a Halal certificate mark.

Figure 1: Conceptual framework of the study

3.0 METHODOLOGY

3.1 Research Design

The plan that describes the study methodology and data-gathering strategies include research design. A research design is a study project plan that explains how researchers will test hypotheses or achieve their study objectives (McDaniel & Gates, 1990). It serves as the foundation for our study. In this investigation, quantitative methodologies will be applied. Consequently, the sample will be analyzed by selecting a location sample that includes all Muslim clients. Muslim customers will select a representative to provide input on variables impacting the purchase intention of Halal cuisine. In the descriptive research, the questionnaire will be utilized as a reference source. The questionnaire will be designed to capture all of the necessary data for the research.

3.2 Data Collection

There are two types of basic data collection methods which are primary data and secondary data. Primary data is records gathered thru surveys, Interviews, or experiments, at the same time as secondary records are data associated with reference works which include newspapers, books, and the Internet. The Secondary Data is collected based on existing information.

In this study, we selected the primary data because we obtained data through a survey by sending a questionnaire to all Muslim clients and students at the University of Malaysia Kelantan (UMK) on factors influencing the demand Halal foods Purchase intention. The questionnaire was created using Google Forms. This questionnaire was used to gather information related to the factors influencing the demand Halal foods purchase intention.

3.3 Research Instrument

The research instrument includes surveys, questionnaires, telephone, and interviews. This study employs a questionnaire as the research instrument. An objective technique for collecting data about people's knowledge, beliefs, attitudes, and behavior is through the use of questionnaires (Boynton & Greenhalgh, 2004). The questionnaire of the study has three sections. The first section introduces the cover letter. The second section introduces the demographic information, and the third section presents the variable items. Variable items in the halal certification were sourced from Ahmadova and Aliyev (2020). Variable items on food quality were sourced from Iranmanesh et al. (2019). Variable items on religiosity were sourced from Ahmadova and Aliyev (2020) while variable items on halal food purchase intention were sourced from Pradana et al. (2020). The questionnaire items are shown in Table 1.

Table 1
Variables and measurement items

Items to measure Halal certification	SD	D	UN	A	SA
1. I always pay attention to the availability of Halal certificates. 2. The availability of a Halal certificate is important for me. 3. I always try to buy Halal-certified products. 4. The availability of a Halal certificate is an indicator of the product being Halal. 5. I choose Halal products based on the Halal logo on the product.					
Items to measure food quality	SD	D	UN	A	SA
1. I take foods that contain high-quality ingredients. 2. I take foods that contain no Haram ingredients. 3. I take foods that contain ingredients that are free from any forbidden or dirty components.					
Items to measure religiosity	SD	D	UN	A	SA
1. I believe in the fundamental principles of Islam. 2. I pray Namaz five times a day. 3. I fast during Ramadan. 4. I adhere to religious rules. 5. I always try to increase my religious knowledge.					
Items to measure Halal foods purchase intention	SD	D	UN	A	SA
1. I prefer to buy a “Halal” certified product even when the brand is not very popular. 2. I would recommend my family and friends buy Halal food. 3. I am interested in buying Halal food. 4. I will keep buying Halal food according to my needs.					

3.4 Sampling

3.4.1 Sampling Technique

Sampling can be performed using two methods: probabilistic and non-probabilistic sampling (Saunders, Lewis, & Thornhill, 2012). This is because non-probability sampling is not based on the probability that a population member is selected in the sample, and therefore no statistical inferences can be made about the sample. On the other hand, probabilistic sampling was performed based on the assumption that each population member has a finite probability of being included in the sample. A targeted sampling method is used to collect respondents from Muslim customers in Halal restaurants in Kelantan. Given that the total number of Muslim customers in Halal restaurants in Kelantan (Amanda restaurant, The H restaurant, Nasi Kukus Luqman restaurant, D'mee restaurant, and Syikin nasi ayam) is unknown. The study will use a non-probability sampling technique. The researchers will visit the Halal restaurants and sample some Muslim customers who would be voluntarily participating in the study.

3.4.2 Sample Size

A sample is a smaller and more manageable element than a larger group. A sample is a subset that represents the size of the entire population. Sample members are known as subjects, whereas the number of subjects in the sample is known as sample size. Usually, a sample size can be determined by the population because when the number of the population increases, the simple size will also increase. The sample size can be determined by 10 times the number of predictors or independent variables (Hair et al., 2019).

In this study, researchers intend to choose 211 respondents in total from Muslim customers on purchase intention of halal foods in Malaysia as the sample size. This sample size is greater than 30 respondents and less than 500 respondents. The best sample size for quantitative investigations, according to Sekaran and Bougie (2016), is between 30 and 500 participants.

The sample size chosen by the researcher is very appropriate and sufficient because the Muslim customers in Malaysia is large, necessitating a smaller sample size for this study. Thus, a sample size of 250 can determine the accuracy and effectiveness of the sample size, increasing confidence that it will comprehensively address the existing gap.

3.5 Data Analysis

Data analysis is an evaluation approach wherein information sets are evaluated using statistical, logical, and analytical methods. Statistical Package Social Science (SPSS) is the tool or software used to analyze the data. SPSS software is helpful for the researcher to determine an excellent

statistical technique. Statistical data such as cumulative and valid percentages are explained by the SPSS data. The researchers will use SPSS version 26.0 to create data entry and analysis tables. Researchers can collect data for variable items as well as perform descriptive and correlation evaluations.

3.5.1 Descriptive Analysis

Descriptive analyses help with this. Distribute data and allow associations between variables to be identified to organize further statistical analysis. Descriptive statistics are used to analyze data from Percentage and frequency and with central trend measures such as Mean, mode, and median.

3.5.2 Correlation Test

This research can also be defined as correlation Research. According to Gay et al. (2011), correlation research describes an existing condition if it deviates significantly from it. Conditions typically described in surveys or observational studies. Data is collected to decide whether there is a quantitative relationship between measurable variables. The correlation study provides a numerical estimate of the connection between two variables. Correlation Analysis is required to discover the connection among the variables. Correlation analysis is a statistical approach that aims to determine the Degree of correlation among variables. Hence this study performs a correlation analysis to decide the correlation between Halal certification, meal quality, religiosity, and buying intention to request Halal food.

4.0 FINDINGS

This study discusses the results of the data analysis that was done on the data obtained from the survey. The study collected 210 respondents out of 250 distributed, giving a response rate of 84%. The data were analyzed to examine and identify the factors influencing the demand for halal foods purchase intention. Besides that, the researchers were able to test the hypothesis and answer the research objective of this study.

4.1 Demographic Profile

Based on table 2, shows the data analysis from 210 respondents. The demographic profile includes gender, age group, marital status, race religion, and educational background.

The result shows that most of the respondents are female with 121 respondents. Followed by the age group, most respondents are from 18 to 25 years old with 146 respondents. This show that the

young generation is the most respondents that purchase Halal foods. Next, the most of respondents that purchase Halal foods are single with 160 respondents out of 210 respondents. Most of the respondents are Malay with 176 respondents, meaning that most of the respondents are Muslim with 187 respondents. For the education background, most of them are Bachelor's Degree holders with 100 respondents out of 210 respondents. From the data, we can conclude that most of the respondents are Muslim and as we know, as Muslims, they must choose Halal foods according to Islamic law. Therefore, Muslim have solid knowledge about Halal foods and make wise decisions before buying them so that there is no doubt about foods.

Table 2
Demographic Profile

Profile		Frequency	Percentage
Gender	Female	121	57.6
	Male	89	42.4
Age Group	18 – 25	146	69.5
	26 – 35	39	18.6
	36 – 45	13	6.2
	46 – 55	7	3.3
	55 and above	5	2.4
Marital status	Married	50	23.8
	Single	160	76.2
Race	Chinese	1	0.5
	Indian	5	2.4
	Malay	176	83.8
	Others	28	13.3
Religion	Islam	187	89.0
	Hindu	4	1.9
	Others	19	9.0
Education Background	Secondary School	65	31.0
	Diploma	41	19.5
	Bachelor Degree	100	47.6
	Postgraduate Degree	4	1.9

4.2 Descriptive Statistics

Based on table 3 shows the total mean score and standard deviation of the variables for the independent variables which are halal certification, food quality, and religiosity, while the dependent variable represents

the purchase intention to demand Halal foods. For the independent variables, the total mean score and the highest standard deviation are Halal certification (mean= 4.7229, SD= 0.57537) followed by religiosity (mean= 4.7124, SD= 0.59305) and food quality has the lowest score (mean= 4.6429, SD = 0.66744). For the dependent variable, purchase intention to demand Halal foods has a score (mean= 4.7044, SD= 0.58926). In conclusion, Halal certification most influences the purchase intention to demand Halal foods in Kelantan, Malaysia.

Table 3

Total Mean Score and Standard Deviation of Variables

Variable	N	Minimum	Maximum	Mean	Standard Deviation
Halal Certification	210	1.00	5.00	4.7229	0.57537
Food Quality	210	1.00	5.00	4.6429	0.66744
Religiosity	210	1.00	5.00	4.7124	0.59305
Halal Foods Purchase Intention	210	1.00	5.00	4.7044	0.58926

4.3 Reliability Test

The overall Cronbach's Alpha Coefficient for the study's survey variables. Based on table 4 shows the total of three independent variables and the first variable is halal certification, this variable has a total of 5 items with Cronbach's value is 0.909. The second variable is food quality with 3 items used to test reliability. The value is 0.842. The third independent variable is 0.903 for religiosity with 5 items under it. The dependent variable which is purchase intention is 0.909 with 4 items under it and it is considered as good terms of internal consistency. For this study, the items for independent variables and dependent variables are reliable.

Table 4

Reliability Test (Cronbach's Alpha)

Variables	Cronbach's Alpha	Number of items
-----------	------------------	-----------------

Halal Certification	0.909	5
Food Quality	0.842	3
Religiosity	0.903	5
Purchase Intention	0.909	4

4.4 Pearson Correlation Result

Based on table 5 shows the correlation analysis for three hypotheses (Halal certification, food quality, and religiosity). Hypothesis 1 shows the relationship between halal certification and halal foods purchase intention, The correlation coefficient of 0.807 suggested a strong positive relationship between halal certification and halal foods purchase intention. The p-value of purchase intention is 0.000 which is less than the highly significant level of 0.001. Therefore, there is a significant relationship between halal certification and purchase intention.

Hypothesis 2 shows the relationship between foods quality and halal foods purchase intention. The correlation coefficient of 0.782 suggested a strong positive relationship between food quality and halal foods purchase intention. The p-value of halal food purchase intention is 0.000 which is less than the highly significant level of 0.001. Therefore, there is a significant relationship between food quality and halal foods purchase intention.

Hypothesis 3 shows the relationships between religion and halal foods purchase intention. The correlation coefficient of 0.730 suggested a strong positive relationship between religiosity and halal foods purchase intention. The p-value of halal food purchase intention is 0.000 which is less than the highly significant level of 0.001. Therefore, there is a significant relationship between religiosity and halal foods purchase intention.

Table 5
Pearson Correlation

Variables	Halal Certification	Purchase Intention
Halal Certification	1	0.807 (p-value= 0.000)
Purchase Intention	0.807*** (p-value = 0.000)	1
Variables	Food Quality	Purchase Intention

Food Quality	1	0.782 (p-value= 0.000)
Purchase Intention	0.782*** (p-value= 0.000)	1
Variables	Religiosity	Purchase Intention
Religiosity	1	0.782 (p-value= 0.000)
Purchase Intention	0.730*** (p-value= 0.000)	1

5.0 DISCUSSION AND RECOMMENDATION

5.1 Hypothesis 1

The result for hypothesis 1 shows that halal certification significantly and has a positive influence on halal foods purchase intention. This result is due to the following reason.

(i) Availability of halal certification

Availability of halal certification

Halal-certified foods not only benefit Muslims but also everyone because of their Wholesomeness (Thoyyiban).

(ii) Display of halal certification

Halal certification at restaurants ensures that foods are served according to Islamic dietary laws. Halal means permitted or lawful or fit for consumption

(iii) Halal logo

The halal logo is the most common graphic mark used for Halal Malaysia which is a symbol to indicate the product or business is certified Halal by JAKIM. This is also an indication that the product or business is Shariah compliance.

5.2 Hypothesis 2

The results for hypothesis 2 show that food quality significantly and has positive influence on halal foods purchase intention. This result is due to the following reason.

(i) Providing the nutrition of food

A healthy diet is essential for good health and nutrition

(ii) Providing high-quality ingredients

Quality ingredients can have a true impact on the taste of food that is served at a restaurant.

5.3 Hypothesis 3

The results for hypothesis 3 show that religiosity significantly and has a positive influence on halal foods purchase intention. This result is due to the following reason.

(i) Principles of Islam

The concept of halal cuisine encompasses the food's religious conformity and its cleanliness, sanitary quality, and acceptability in terms of human values.

(ii) Religious Knowledge

Consuming Halal is an order of Allah and an essential part of the Islamic faith.

5.4 RECOMMENDATION

This study's findings can be used as an ongoing framework to enhance more optimal findings on halal food in Malaysia, especially for those who are directly involved in buying behavior of halal food.

First, the recommendation that can be done to increase halal food purchase intention is to put the halal logo on the main signboard of the shop, so that the people will trust and see that the store has halal food and items. A store can also put the name of the store with Islamic and halal elements. This is because a person's first impression lies in his first glance at the name of the store (signboard). This will influence a person in halal food purchase intention.

Next, the influence of packaging and labeling is very important to investigate the influence of packaging design, labeling practices, and product information on consumer perception and intention to purchase halal food. This is to assess the impact of clear and accurate labeling on building consumer, trust and confidence in halal food products.

6.0 CONCLUSION

In conclusion, this study examines the factors influencing the demand for Halal foods purchase intention in Kelantan. A total of 210 respondents were sampled and found that the mean value for Halal certification is 4.7229, food quality is 4.6429 and religiosity is 4.7124. Cronbach's Alpha value for independent variables is 0.882 and Pearson's correlation results show that halal certification, food quality, and religiosity have significant relationships with halal foods purchase intention.

ABSTRACT

The study aims to examine the determinants of purchase intention of online shopping platforms. This study extends the Theory of Planned Behaviour (TPB) by introducing product warranty, product information and trusted seller in the development of a theoretical model to study customers' purchase intentions within the context of online shopping platforms. The researcher employed a non-probability sampling technique (i.e., purposive) in this study. Data was collected from 255 users of online shopping platforms in Kelantan through questionnaires and analyzed using descriptive statistics, reliability test, and correlation matrix via Statistical Package for the Social Sciences (SPSS). The findings show that product warranty, product information and trusted seller are significant determinants of customers' purchase intention of online shopping platforms. The findings are beneficial to buyers, sellers, and delivery agents.

Keywords: Product warranty, Product information, Trusted seller, Online purchase intention

INTRODUCTION

Consumers have developed a habit of shopping online over the past few years. It is fair to say that every group of people, both inside and outside the country, are following this trend more and more closely. Some people believe that shopping online is simpler and more cost-effective because customers can take advantage of more sales and discounts. E-commerce, also referred to as online shopping, allows customers to make immediate purchases from vendors using a shop website or a mobile application. As a result of the Internet's popularity and accessibility, e-commerce can encompass a variety of businesses (Ismail & Masud, 2020). Customers for items received with a credit or debit card when making an online purchase. Numerous online retailers exist, including Lazada, Alibaba, Taobao, Zalora, Amazon, and Shopee. Since the Movement Control Order (MCO) went into effect in March 2020, online buying and selling activity has increased by 28.9% in April 2020 (Lok et al., 2022). Thailand has shown the fastest growth in digital infrastructure across ASEAN countries over the past five years, with Singapore coming in second with 2.31% growth above Malaysia (Ismail & Masud, 2020). Businesses may consider enhancing the fundamental relationship between customers through social media, forums, or directly through the site or "Reviews & comment" section in order to improve social interaction on e-commerce sites

(Khoa & Nguyen, 2022). In terms of network readiness, Malaysia outperformed its neighbours. These initiatives, which support e-commerce growth and help Malaysia achieve its goal of dominating Southeast Asian e-commerce, involve all levels of stakeholders.

To achieve the objective of actual behaviour purchase, online purchase intention is used as an indicator. Consumer behaviour when it comes to purchases is actually dichotomous; either the consumer must buy the product, or they must choose not to. Additionally, consumer purchasing behaviour describes consumer behaviours associated with the acquisition and consumption of goods and services, such as the identification of a need, the search for information, the evaluation of alternatives, the choice to make a purchase, and the actions taken afterward. In order to evaluate products and make a final judgement on which brand would best serve users, product attributes, specs and information from photos, videos, reviews and blogs are needed. An integrated process is used to handle information about customers. Due to the popularity of online shopping and the ease of access to information, this is made possible (Sethna et al., 2017).

The Malaysian e-commerce ecosystem is still developing and needs to make progress in several areas (Ismail & Masud, 2020). Another issue the e-commerce sector must address is how to increase the effectiveness of product warranties. Remanufactured product warranties may be able to increase consumers' willingness to pay (Tang et al., 2020). The impact of product warranties, particularly extended warranties, on e-commerce is significant. Sometimes, a warranty is ultimately rejected. Miscommunication between service centres and brands can result in delays and warranty denial. Due to security and privacy concerns, many online shoppers still prefer to visit physical stores and lack of trust in online sellers. The greater the consumer's faith in the seller, as evidenced by the seller's skill, generosity, and integrity, the more likely they are to make a purchase (Lisnawati et al., 2022). Even though e-commerce is growing in popularity, Malaysia has not yet built a functional e-commerce infrastructure, lagging far behind other countries in this regard. Another challenge includes lack of information about the product. Under the condition of information asymmetry, although consumers cannot obtain objective and detailed product information, consumers form quality perceptions of products and brands with the help of heuristic clues and judge, evaluate and choose based on this (Jurij et al., 2022). A seller's website with comprehensive product information can be a powerful resource for serving customers and enhancing the seller's online presence for citizen search.

Due to its ease of use and ability to offer customers a full range of services, e-commerce presents a variety of business growth opportunities (Koe & Sakir, 2020). The Internet and technological

advancements have significantly altered how people live. They could learn about the world at their fingertips without ever leaving their house. Online shopping may have seemed impractical and unreliable a few years ago, but it is now a common practice. But as savvy buyers, people are urged to exercise caution when making purchases online because some dubious parties, like scammers, may use the situation to their advantage. To avoid being easily duped, users should wisely select a reputable shopping platform before making any online purchases. Accordingly, this study's objective is to investigate three variables which are product warranty, trusted seller, and product information that determine online purchases intention and an online shopping platform.

This study focuses on the factors that influence consumers' intentions to make purchases over the internet through online marketplaces. Particularly since the epidemic, online shopping sites typically rank among the most lucrative industries. Covid-19. Looking at the issues that were discovered, one that can arise is "What is the issue with product warranty in Malaysia?" First off, Malaysia has a poor product warranty. By 2021, owners of newer Volvo automobiles in Malaysia would benefit from a larger covering duration of five years, with little to no mileage restriction (Yap, 2021). He asserts that, like other companies, Volvo has progressively extended its guarantee periods. Previously, innovative Volvos took place with a comparative manufacturer's warranty that had been covered by insurance by a different insurance partner and was valid for an additional two years. The most prevalent written agreements are product warranties, but not much is recognized about influences on their composition or their relationship with dependability and endurance of products. Providing high-quality product warranty to customers is costly for manufacturers in industrial practice. Heavy costs will be incurred by building service facilities, recruiting, and training engineers, or investing in maintenance technologies (Huang et al., 2021).

Another second issue to raise is "What is the issue with product information in Malaysia?", which constitutes the study's second problem statement. One intriguing finding from AsiaPac (2022) is that, compared to other resources, 54.7% of internet users in Malaysia use online platforms to research companies and products. Markets depend heavily on information transfers. Both individuals and businesses base their decisions on information they have learned about their possible transaction partners when determining with whom to interact, which people to employ, or what things to buy. Businesses are vulnerable to disorganization and could cease to function when information is lacking or tend to be erroneous (Etzion & Pe'er, 2013).

Moreover, the issue of trusted sellers in Malaysia is the study's third problem statement. Lazada, Lelong, and 11Street are the most well-known and reputable online shopping websites in Malaysia (Ab et al., 2018). It doesn't imply that they are immune to seller fraud. The quantity of contacts and reviews among the seller's customers is seen as the simplest technique to determine the legitimacy of the seller. Lazada yet again earns the greatest rating as consumer accessibility to the products or services is accompanied by the vendor ratings of 29.5. Building and maintaining connections among purchasers and sellers depends on large part upon trust (Mallalieu & Nakamoto, 2008). Key factors that contribute trust earning behaviours are necessary for sales achievement. Dealing with an undetermined sense of trust is a category that this issue falls under (Brainov & Sandholm, 1999). Buyers acquire ongoing purchasing intents due to their faith in both suppliers and brands, and buyers build brands out of sellers' faith (Zhao et al., 2019). However, online shopping buyers find it difficult to put their trust within the seller because they are open to fraud. This causes individuals to re-evaluate the decision, that could discourage consumers from using e-commerce websites. The study aims to achieve the following research objectives and questions.

Research Objectives

1. To investigate the relationship between product warranty and purchase intention of online shopping platforms
2. To examine the relationship between product information and purchase intention of online shopping platforms
3. To assess the relationship between a trusted seller and purchase intention of online shopping platforms.

Research Questions

1. What is the relationship between product warranty and purchase intention of online shopping platforms?
2. To what extent does product information affect the purchase intention of online shopping platforms?
3. What is the relationship between the trusted seller and purchase intention of online shopping platforms?

SIGNIFICANCE OF THE STUDY

The study has some practical significance to buyers who purchase on online shopping platforms, including sellers and delivery agents.

First, this study gives some benefits to buyers. First of all, buyer behavior data is used to estimate and predict buyer acts. Organization must ensure that they receive accurate buyer details in order to make good marketing determinations such as item development and marketing. Second, buyer behaviour differs from person to person. Customers may say one thing but do another. They can often shift their opinion due to an outside influence. As a result, it is critical for businesses to devise effective promotional strategies in order to achieve strong demand.

From a seller point of views, this study is beneficial for people who wants to make a living and selling their product on online shopping platform such as Shopee, Lazada and Tiktok shop. For example, to increase their sales, they need to give details and more information able to their product and the most try as most as possible to give like upper sales services. Giving discount to a trusted seller in terms of the empathy the seller is here, the upper sales service if any problem, the seller can be able to perhaps or replace the product to empathy wise. The most to ensure that the warranty are still in condition are not waste out.

Moreover, this study spreads awareness in the community about how important the trusted seller and the delivery agents are in online shopping platforms. It is because without delivery agents in this platform, it will not thrive until now. In addition, the delivery agents will also be more sensitive to the problems and hardships faced by workers in the online shopping platform to ensure that this platform continues to progress and be recognized and to always ensure that the customer receives a good delivery from them. Not only that, but the delivery agents will also strive to advance this platform by always seeking delivery because this platform is able to become a major contributor to the national economy with the birth of great agents. Other than that, online shopping platforms and indirectly also contribute to national come through foreign currency exchange rates.

LITERATURE REVIEW

The Theory of Planned Behavior (TPB)

The Theory of Planned Behavior (TPB) is a psychology concept that connects thought and action. The theory has three main elements which are subjective norm, attitude, and perceived behavioural control that work together to encourage someone to change their behavioural intentions. According to the Theory of Planned Behavior as stated in the article "Determinants of Customer Repurchase Intention in Online Shopping" (Chiu et al., 2009), trust beliefs produce pleasant perceptions on the

e - retailer which would increase a user's decision to buy products and services from the seller. In addition, The Moderating Role of Trust and Commitment Between Consumer Purchase Intention and Online Shopping Behavior in The Context of Pakistan (Rehman et al., 2019) stated that Theory of Planned Behaviour presents a proper description related to behavioural framework as especially in comparison to Theory of Reasoned Action, according to which a person is meant to perform specific actions only if the person own an actual control on their behaviour. However, according to Moshrefjavadi et al. (2012)'s An Analysis of Factors Affecting on Online Shopping Behaviour of Consumers, information behaviour and purchase behaviour have both been impacted by confidence and perceptions of vulnerability, user's personality, cultural pressure, personalised online capabilities, and digital considerations, such as performance expectancy, relative advantage of use, and quality of website. Demography, network literacy, apparent medium value, and purchasing habits all have an impact on consumers' online purchasing behaviour. In the article "Building Consumer Trust Online," Theory of Planned Behavior claims that consumers who have low trust are less likely to participate in online purchasing due to their wary of seller exploitation and less inclined to purchase with a vendor who failed to inspire confidence (Hoffman et al., 1999). As mentioned by the article "Trust and TAM in Online Shopping: An Integrated Model," Theory of Planned Behavior states that buyers first have faith on their online merchants, thus believe that practicing e-commerce is beneficial (Gefen et al., 2003). Lastly, in the article titled "Prospective Prediction of Health-Related" Behaviour with The Theory of Planned Behavior: A Meta-Analysis," a meta-analysis on Theory of Planned Behavior (TPB) was performed that demonstrates the connection among intention and behaviour, which typically indeed very considerable can dramatically transform.

Research Hypotheses

Relationship between product information and online purchase intention

Hermanda (2019) states that consumer attitudes and behaviours could be influenced by the dissemination of current product information. Online retail stores may also take the role of the party recommending and describing the products through social media posts, which may have an impact on consumers' attitudes, behaviours, and opinions about a product. Consumers who looked for product information frequently considered social media to be a reliable source of information. Given that information shared through social media was more potent at influencing consumer behaviour and purchase intention, the marketing strategy that places a premium on product information would produce a favourable relationship with the brand image.

Aziza and Astuti (2019) mentioned that the ability of advertising to inform audiences about products is known as informativeness. The ability of an audience to tailor the content to suit his or

her own interests and requirements was also discovered to be a predicate for the advertising value of internet advertising. When customers learnt about new items, product advantages, and product information, they saw information as a positive part of advertising. Customers gain brand awareness through efficient marketing communication channels which offer details on product credibility and quality assurance that help customers evaluate and select products with less risk. According to Aziza and Astuti, a customer's intent to purchase anything is influenced by their level of brand awareness. The study also discovered a connection between brand awareness and purchase intention as well as between advertising value and brand awareness.

H1: There is a positive relationship between product information and online purchase intention.

Relationship between product warranty and online purchase intention

Indiani and Fahik (2020) examined the effects of warranty in the purchase decision. It mentioned that a sort of security awareness, the existence of a product warranty and its return handling provides the psychological benefit for overcoming buyer's regret. Additionally, consumers may associate warranties with higher service quality from a firm, and perceptions of a company's quality might affect purchasing decisions. The spectrum of consumer wants that undermine confidence varies across different channels of commerce. Data encryption and the availability of a return policy were identified as the two most crucial security features by both groups, according to the cross-cultural study's findings. This finding suggests that e-businesses must first offer a product warranty and present a clear statement informing customers that the website is equipped with encryption technology to safeguard any information they provide.

Singhal (2019) stated that performance warranties often include component substitution and the failure of the product for a long time which could be possibly a year. Cash-back assurances usually have a shorter lifespan but permit returns with no justification. Although offering a guarantee does not need upfront costs, an online retailer will experience unfavourable effects if the goods turn out to be of subpar quality. A substantial warranty policy essentially shows the e-tailer's good faith and suggests that they have adopted a long-term perspective on the connection. Furthermore, offering a substantial warranty coverage can be seen as a sign that the e-tailer is genuinely committed to building a solid reputation, which should reinforce notions of competitive equity. Customers will view an e-tailer's competitiveness value to be stronger the more they believe it has strong leadership credentials, say because it has a solid warranty policy.

H2: There is a positive relationship between product warranty and online purchase intention.

Relationship between trusted seller and online purchase intention

Mahliza (2020) the elements of believe in terms of online purchasing intention were investigated, as well as the impact of believe on online purchase outcome. Therefore, Mahliza (2020) used a technique called as purposive sampling. The classification of online questionnaires resulted in a total sampling of 120 survey participants in Jakarta. Partial Least Squares (PLS) was utilized to examine the study's data. The author discovered that marketing strategy and safety are trust significant predictors with a positively significant influence on trust. According to the findings, perceived risk is an antecedent of trust and has significant negative impact on trust. Buyer trust has important positive impact on their online purchase decisions based on the findings.

Yunusa, Saputra, and Muhammad (2022) investigated customer relationship management (CRM) mediation effect in the relationship between digital marketing and internet trust on ecommerce purchases' online purchase intentions in Banda Aceh, Aceh province, Indonesia. The authors chose the sample based on a general principle. Purposive sampling was used to collect information from 150 participants. The authors discovered a positive relationship between CRM and digital marketing and online trust on online purchase intentions.

As all we know, nowadays online shopping platforms are very important at all times, because of the many advantages and benefits, an increasing number of people now prefer online shopping to shopping experience. In recent years, the customer's decision-making process had also shifted dramatically. Consumers carry out extensive research on the internet before speaking with a sales representative. Consumers are indeed starting to make more immediate purchases online and through their smartphones, have not ever entered conventional concrete stores. Promoting business has become much simpler and quicker due to the internet. It has resulted in changes in the way individuals conduct business, with a quickly expanding global trend toward internet purchases or ecommerce.

H3: There is a positive relationship between trusted seller and online purchase intention.

Research Framework

The study proposes a research framework to examine the determinants of purchase intention of online shopping platforms by referring to the literature review. Figure 1 illustrates the purpose of this study. The framework consists of three independent variables of the study which are product warranty, product information and trusted seller. Meanwhile the dependent variable is online purchase intention.

Figure 2.1: Conceptual framework of purchase intention of online shopping platforms.

METHODOLOGY

Research Design

Research design is the strategy used to carry out a study's objectives or test its hypotheses. This research design provides the framework for the methods and approaches a researcher has chosen. Framework makes it possible for researchers to concentrate on applying research methods that are pertinent to their field and to successfully conduct their studies. Many of the traits of the qualitative analysis process used in grounded theory are also present in design research (Maher et al., 2018).

Exploratory research, descriptive research, and explanatory research are three fundamental types of research objectives. Exploratory research seeks new insights while also figuring out what is going on. In order to assess phenomena and formulate the questions, a new viewpoint is being used. The classification of research known as "descriptive method of research" aims to collect information on a phenomenon's current state (Rahi, 2017). Depending on the research questions, inclusion criteria may be relatively strict or very broad, allowing for rumination of various research designs and types of evidence (Sovacool et al., 2018).

This study uses the quantitative research design. Through the use of broad survey research techniques like questionnaires, quantitative research creates statistics. The benefits of a quantitative research design can be tested and verified; however, rigorous experimental design, as well as the ability to replicate results across different populations, in order to conduct quantitative research. The information gathered is therefore more trustworthy and less subject to doubt. Additionally, it is the simple analysis that will show which statistical tests should be used when collecting

quantitative data. Consequently, data analysis and results presentation are simple, objective, and less prone to error.

Data Collection

The function of collection and analysing data is referred to as data collection about the variables being studied in a way that is systematic and accurate enough to respond to the research questions, test hypotheses, and evaluate results. This study uses a method called "primary data collection," which means that information is gathered from real sources like questionnaires with closed-ended questions. This survey is a self-administered data collection, meaning that respondents are responsible for completing the questionnaire on their own time without the assistance of the researchers.

This study focuses on the people who stay in Kelantan. After the respondents agree to fill out and answer the accompanying questionnaire, they will be told what the purpose of this study is so they can understand what they are being asked to do. There is no obligation to fill out the research questionnaire. The questionnaire will be collected once again after the respondents have finished filling it out.

Data was collected using an online survey strategy, specifically, Google Forms. The questionnaire will collect basic demographic information as well as data on the study's independent and dependent variables. Respondents' perceptions, levels of satisfaction and others can all be measured along a linear scale based on the questions presented to them. When the respondents successfully complete and submit the form, their responses and data reviews will be received via Gmail notification. After that, data collection and analysis will begin immediately.

Research Instrument

In research from Bastos et al (2014), a research instrument can reliably achieve the same outcomes when used again with the same group of individuals, it is reliable. This idea is frequently used at various stages of the research process, such as when a data collection supervisor conducts a quality control check, when reapplying some questions to the same survey respondents, or even when developing a new instrument in the testing process where the accuracy and consistency of the responses are evaluated. Besides that, a research instrument is a method or set that researchers use to gather information. The work is simple and easy, and the research's findings are clearer, more specific, comprehensive, and systematic (Suharsimi, 2010).

In this research, the researchers use questionnaires to determine the intention to purchase on online shopping platforms. Ary et al., (2018) defines a questionnaire as a tool in which respondents select items to state their responses or submit relevant responses to survey questions. The researchers conducting this research use a questionnaire when collecting data since it ensures that the responses are properly collected. The researchers divide it into two parts which are Part A and Part B. Part A provides information about the respondent’s demographic profile. The respondent will have to answer six items of their profile background such as gender, age group, ethnicity, employment status, marital status, and income group. Meanwhile, Part B contains the independent and dependent variables of the research. The respondent needs to answer four sections of variable items which are Section A for product warranty, Section B for product information variables items, Section C provides trusted seller items, and Section D for items of online purchase intention.

Besides that, the respondent will state their responses through a Likert Scale, which allows for multiple choices for each item given. The Likert Scale has a one to five scale that measures the respondent’s true evaluation. It has five-point items such as Strongly Disagree (1), Disagree (2), Neither/Nor Agree (3), Agree (4), and Strongly Agree (5). The respondent will rate their opinions about the items that are given in every section of Part B. This method will make sure the researchers can easily measure the objective of the study. The items of product warranty were sourced from Blu et al. (2015). The items of product information were sourced from Park and Kim (2003). The items of trusted seller were sourced from Javed and Wu (2020). The items of online shopping platforms were sourced from Kim et al. (2012).

Table 1
Measurement of variables

Product Warranty	1	2	3	4	5
1. The online shop provides me with convenient options for returning items.					
2. The online shop handles product returns well.					
3. The online shop offers a meaningful guarantee.					
Product Information	1	2	3	4	5
1. The site provides up-to-date product information.					
2. The site provides product information easy to understand.					
3. The site provides sufficient product information.					
4. The service is relevant.					
Trusted Seller	1	2	3	4	5
1. Based on my experience with online sellers, I know that they care about their customers.					
2. Based on my experience with online sellers, I know that it is not opportunistic.					
3. Based on my experience with online sellers, I know that they keep their promises to their customers.					
Online Purchase Intention	1	2	3	4	5

1. I intend to continue to purchase goods online from a site that I use regularly.				
2. If I were to buy something, I would consider buying it from online shops.				
3. I intend to recommend the Internet shopping site to other people that I use regularly.				
4. Except for any unanticipated reasons, I intend to continue using internet shopping sites that I use regularly.				
5. I intend to use an internet shopping site that I regularly use as a priority online store for future purchases.				

Sampling

Sampling Technique

Sampling is a type of statistical analysis in which a set number of observations are taken from a larger group or population. Sampling from the population is often easier and cheaper than trying to reach every single person in the population (Turner, 2020). In general, there are two types of sampling techniques which are probability sampling or random sampling, and non-probability sampling or non-random sampling.

The researcher employed a non-probability sampling technique in this study. Under the non-probability sampling method, the researcher uses convenience and purposive techniques. Non-probability sampling, according to Etikan (2016), is a technique for collecting samples that does not ensure that each participant or unit in the population has an equal chance of being included. Convenience sampling, also known as "haphazard sampling" or "accidental sampling," is a type of nonprobability or non-random sampling where members of the target population are chosen based on practical factors, such as being accessible, nearby, available at a specific time, or agreeable to participate in the study. While purposeful sampling is a method in which certain places, people, or events are chosen on purpose to get important information that can't be gotten any other way (Maxwell, 1996). It also collects data on the population in Kelantan. The study uses this sampling to find out what personal characteristics are present in the respondent population. Before the respondents fill out the questionnaire, the researcher will give them a clear explanation of why the study is being done. This will help the respondents understand the purpose of the study and make sure that they meet the targets. A questionnaire was used by the researcher to gather information. The respondents have comprised of people who are staying in Kelantan.

Sample Size

A sample is a smaller, manageable segment of a larger grouping that is utilised in research. It is a demographic segment containing characteristics out of a larger population. Samples are used in statistical analysis when population's size are too large for those eligible participants or information to be included. A sample should be representative of the general population in its entirety and must

not remain impartial to any characteristic. Despite the desired for a sample to accurately represent the population from which it was selected, there is no guarantee where any sample will do so. A disproportionately high number of atypical observations might be expected by chance. The number of individuals or assessments involved in a research study is referred to as the sample size. Generally, n is used to indicate this figure. The accuracy of estimations as well as the research's capability to come up with conclusions are two statistical qualities that are influenced by sample size.

To properly carry out the research and obtain reliable, statistically significant outcomes, the sample size must be determined. There seem to be a few techniques for calculating sample size according to various writers of publications. The sample size is ten times the quantity of independent variables or determinants, as according to Hair et al. (2019). (IVs). As per Sekaran and Bougie (2016), the ideal sample size for quantitative investigations must be somewhere among 30 and 500. Also, Krejcie and Morgan (1970) developed a table utilising a sample size formula for limited populations to make figuring out the sample size for a known population easier. When using the Krejcie and Morgan Table, it is essential to understand how many populations there are.

The approach Sekaran and Bougie (2016) recommended is the one this research used to determine the sample size. The sample size for this research would be 200. The sample size has been selected as it falls within sample sizes of 30 and 500 which was recommended by Sekaran and Bougie (2016).

Data Analysis

Data collection, cleansing, and structuring are frequent steps performed by the researcher while using data processing methodologies. To be prepared for any purpose, they must undergo various processes, which often require the use of tools for data analysis. Thorne (2000) asserts that the data analysis method allows in breaking up a significant amount of information into little, comprehensible parts. Additionally, the objective of data evaluation is to gain a deeper comprehension of the information prior of making conclusions.

The correlation analysis was carried out in this investigation. According to Schober et al. (2018), correlation measures how closely two variables are related. When two variables fluctuate in magnitude, they are associated with one another, either in a similar way (positive correlation) or the reverse way (negative correlation). The most typical definition of a linear correlation between two continuous variables when the term "correlation" is employed is the Pearson product-moment correlation. The Pearson correlation reveals the strength of the linear link between two variables.

Its possible values range from -1 to 1, with -1 signifying a negatively skewed total linear correlation, 0 signifying no correlation, and +1 signifying a favourably skewed total linear correlation. Testing statistical hypotheses is another application for inferential statistics. We can precisely decide if there is a significant relationship between two factors. The Pearson correlation coefficient, abbreviated as r , has a range of values from +1 to -1. The two variables are unconnected if the value is zero. A value which is larger than 0 denotes a positive connection, which means that when one variable's value rises, the other variable's value rises as well. A value which is smaller than 0 denotes a negative association, meaning that the other variable's value decreases as the first variable's value increases.

4. FINDINGS

4.1 Demographic Profile

Firstly, the percentage shows that 143 respondents (56.1 percent) are female meanwhile 112 respondents (43.9 percent) for male out of a total of 255 respondents. For the age group, 118 (46.3 percent) respondents were aged 18 to 24 years and respondents aged 25 to 34 years recorded a total of 73 (28.6 percent) respondents while 37 (14.5 percent) respondents showed the number of respondents aged 35 to 44 years. In addition, respondents aged 45 or more recorded the number of 27 (10.6 percent) respondents. There are 4 ethnic groups involved which is Chinese, Iban, Indian and Malay. The table shows that the highest percentage of the ethnic group is the Malay ethnicity with a percentage of 67.1 percent or 171 respondents while the second highest percentage is recorded by the Chinese which is 17.6 percent or 45 respondents. In addition, respondents from Indian ethnicity are 38 or 14.9 percent of respondents and 0.4 percent or 1 respondent is from Iban ethnicity. The employment status contains of 3 categories such as employed, student and unemployed status. The data for employed status shows 40.4 percent for 103 respondents while 134 or 52.5 percent are respondents among students. Apart from that, respondents from the unemployed status are as many as 18 or 7.1 percent of respondents that involved in answering the survey give. The table shows that 83 or 32.5 percent of respondents are married and respondents from single status were 172 or 67.5 percent of respondents. Finally, the income group of less than RM

1500 was the highest percentage which is 53.7 percent or 137 respondents that answers the survey for this research. Next, the data shows income group from RM 1500 to RM 3000 consist of the total of 40 or 15.7 percent of respondents, 62 or 24.3 percent are collected for respondents with the income of RM 3000 to RM 6000 meanwhile the respondents from the income RM 6000 to RM 9000 are 15 or 5.9 percent. Lastly, the respondents from income group of more than RM 10000 are the lowest percentage with 1 or 0.4 percent of respondents.

Table 2

Demographic factors.

Factors	Items	Frequency	Percentage
Gender	Male	143	56.1%
	Female	112	43.9%
Age Group	18 - 24	118	
	25 - 34	73	
	35 – 44	37	
	45 and above	27	

4.2 Descriptive Statistics

This study involved 255 respondents and it analyzed the mean and standard deviations for the dependent variable, which is online purchase intention and independent variables, which are product warranty, product information, and trusted seller. Concerning the mean and standard deviations, product information has the highest score (mean = 4.2147, SD = 0.65713) followed by trusted seller score (mean = 4.1673, SD = 0.68726), and product warranty has the lowest score (mean = 3.9974, SD = 0.78425). The score for online purchase intention is (mean = 4.1631, SD = 0.69399). It could be concluded that product information was the most influential factor on determining the purchase intention of online shopping platforms among people in Kelantan.

Table 3

Demographic factors of respondents

DEMOGRAPHIC FACTORS	FREQUENCY	PERCENTAGE
GENDER		
Male	143	56.1
Female	112	43.9
AGE GROUP		
18 - 24	118	46.3
25 - 34	73	28.6
35 - 44	37	14.5
45 Or More	27	10.6
ETHNICITY		
Chinese	45	17.6
Iban	1	0.4
Indian	38	14.9
Malay	171	67.1
EMPLOYMNT STATUS		
Employed	103	40.4
Student	134	52.5
Unemployed	18	7.1
Employed	103	40.4
MARITAL STATUS		
Married	83	32.5
Single	172	67.5
INCOME GROUP		
Less Than RM 1500	137	53.7
More Than RM 10000	1	.4
RM 1500 - RM 3000	40	15.7
RM 3000 - RM 6000	62	24.3
RM 6000 - RM 9000	15	5.9

Table 4

Total mean score and standard deviation of variables

Variables	N	Minimum	Maximum	Mean	Std. Deviation
Product Warranty	255	1.00	5.00	3.9974	.78425
Product Information	255	1.00	5.00	4.2147	.65713
Trusted Seller	255	1.00	5.00	4.1673	.68726
Online Purchase Intention	255	1.00	5.00	4.1631	.69399

4.3 Reliability Analysis

Table 5 shows the reliability dependent variable of online purchase intention is the highest value which is 0.868. For the independent variable of product warranty with 3 questions is 0.798 the

value of Cronbach's Alpha. The second independent variable is product information, and the value is 0.802 with 4 questions. The third of the independent variables is trusted seller and the value is 0.755 with 3 questions.

Table 5

Reliability analysis for dependent variable and independent variables

Variable	N	Number of items	Cronbach's Alpha
Product Warranty	255	3	0.798
Product Information	255	4	0.802
Trusted Seller	255	3	0.755
Online Purchase Intention	255	5	0.868

4.4 CORRELATION ANALYSIS

Hypothesis 1: Product Warranty and Online Purchase Intention

H1: There is a relationship between product warranty and online purchase intention.

The Pearson correlation coefficient, significant value, and number of responses (255) are shown in the table 6. The p-value was 0.001, which was less than the 0.01 level of significance. The correlation value of 0.706 indicated a positive correlation between product warranty and online purchase intention. Hence, H1 is accepted and supported.

Hypothesis 2: Product Information and Online Purchase Intention

H2: There is a relationship between product information and online purchase intention.

The Pearson correlation coefficient, significant value, and number of responses (255) are shown in the table below. The p-value was 0.001 which was less than the 0.01 level of significance. The correlation value of 0.766 indicated a positive correlation between product information and online purchase intention. Thus, H2 is accepted and supported.

Hypothesis 3: Trusted Seller and Online Purchase Intention

H3: There is a relationship between trusted seller and online purchase intention.

The Pearson correlation coefficient, significant value, and number of (255) responses were presented in the below table. The p-value was 0.001, which was below the significance level of

0.01. The correlation coefficient of 0.805 demonstrated a positive relationship between trusted seller and online purchase intention. Thus, H3 is accepted and supported.

Table 6
Pearson correlation analysis

		PRODUCT WARRANTY	PRODUCT INFORMATION	TRUSTED SELLER	ONLINE PURCHASE INTENTION
1. PRODUCT WARRANTY	Pearson Correlation Sig. (2- Tailed) N	1 255			
2. PRODUCT INFORMATION	Pearson Correlation Sig. (2- Tailed) N	.685** .000 255	1 255		
3. TRUSTED SELLER	Pearson Correlation Sig. (2- Tailed) N	.676** .000 255	.796** .000 255	1 255	
4. ONLINE PURCHASE INTENTION	Pearson Correlation Sig. (2- Tailed) N	.706** .000 255	.766** .000 255	.805** .000 255	1 255

** . Correlation is significant at the 0.01 level (2-tailed).

5. DISCUSSION AND RECOMMENDATIONS

Discussion on Hypothesis 1

The study finds that product warranty has a significant positive correlation with online purchase intention. This is due to the following factors (i) offers a meaningful guarantee, (ii) provides with convenient options for returns, and (iii) handles the product returns well. To achieve the objective of actual behavior purchase, online purchase intention is used as an indicator. The customer's actual decision-making process is a binary choice, either they must buy the product, or they must choose not to. Besides, the product warranty establishes deadlines for customers to make claims for issues with the items they bought and receive solutions like a return, exchange, or maintenance. Following

these reasons, online purchase intention is very important in ensuring that the product warranty for each item purchased is applicable.

Discussion on Hypothesis 2

The study finds that product information has a significant positive correlation with online purchase intention. This is due to the following factors (i) provide up-to-date product information, (ii) provides the product information easy to understand and (iii) provides sufficient product information. In the intention purchasing online, it is crucial to have reliable information that the customer can rely on before making a purchase because they have a legal right to know it. Other than that, customers are constantly seeking additional product details to address any purchase concerns. Customers are more satisfied with a seller who can answer their questions clearly. Following these reasons, to ensure that the customer receives a high-quality product, it is obvious that online purchase intention is closely related to product information before making the decision to buy it.

Discussion on Hypothesis 3

The study finds that trusted seller has a significant positive correlation with online purchase intention. This is due to the following factors (i) good customer care, (ii) legal seller, and (iii) keep their promises to their customers. A trusted seller significantly influences a customer's decision to make an online purchase. If the seller is unreliable, this situation makes customers hesitant to engage in online purchase intention and causes them to worry. Besides, customers can identify an official seller on Shopee by the Shopee Mall icon on their profile and product pages. These sellers have been verified by Shopee to sell products which are 100% authentic. Following these reasons, it shows that trusted seller plays a big role on online shopping platform for customer who buy their product trust them before they purchase.

This section discusses some forms of recommendations that can serve as guidelines for future researchers. Firstly, for the future research it is necessary to expand and increase the target respondents in a larger and more diverse manner. This aims to obtain more systematic data and relevant results as well as encouraging effect on the topic of this study. At the same time, it is proposed to collect data face to face where the researcher can distribute questionnaires to respondents to obtain information quickly and easily and give some souvenir in response to the feedback given. Other than that, future researcher is also encouraged to use this study as a reference and can reinforce any objectives presented on this same topic and add other personal factors that determine the purchase intention of online shopping platforms in terms of age, occupation, and

income. This can further expand the study of a person's personal factors that can affect consumer purchases.

6. CONCLUSION

This study aim is to study the determinants of purchase intention of online shopping platforms. A total of 255 consumers of online shopping platforms from Kelantan, Malaysia have been the target respondents and need to answer the questionnaire distributed. Through the research methods used, all research questions and research objectives have been answered and achieved well. Overall, the relationship between independent variable and dependent variable is positive and all these supported hypotheses prove that factors such as product warranty, product information and trusted seller influence the purchase intention of consumers through online shopping platforms.

ABSTRACT

This study aims to examine the factors Influencing the Intention to Use Fitness Apps among Generation Z. The study employs the non-probability selection approach of purposive sampling to survey a total of 130 respondents who use different types of Fitness Apps. The data collected was analysed using frequency, descriptive statistics, Cronbach's alpha, and Pearson correlation analysis with the aid of IBM SPSS Statistics version 25 software. The findings of this study reveal that perceived usefulness, perceived ease of use, health consciousness, and dietary culture have significant associations with intention to use fitness apps among generation Z. In conclusion, the findings of this study can be used as a guide for Fitness Apps companies and academics looking to understand further the influence of intention to use fitness apps among Generation Z.

Keywords: Fitness apps, perceived usefulness, perceived ease of use, health consciousness, dietary culture

1.0 INTRODUCTION

Physical activity describes an effective way to improve physical and mental health, lower the risk of chronic diseases, and manage weight. However, according to the World Health Organization (WHO), four out of five teenagers and one out of every four adults do not get enough exercise.

In Malaysia, despite a slight increase in awareness of the benefits of physical activity, many people suffer from chronic diseases and are in poor health. The younger generation, particularly those between the ages of ten (10) and twenty-five (25), is experiencing an increase in the prevalence of high blood pressure and other cardiovascular diseases. Generation Z is the name given to this generation. In light of this, the Malaysian government places a high priority on the general public's health. Several official documents were made available by the State Council between July and September 2019. These documents reaffirmed that physical activity may play an important role in preventing disease and enhancing the health and well-being of people. To give individuals easy ways to physical exercise, you also need to promote the creation of "Internet & Sports" and e-commerce platforms, which could lead to the development of physical and fitness applications.

Fitness applications have grown in popularity in Malaysia because of "Internet & sports". Fitness Apps primarily direct users to engage in physical exercise and enhance their level of health via electronic devices. There has illustrated the effectiveness of using fitness applications to improve physical fitness (Oyibo & Vassileva, 2020). The increasing level of cardiovascular diseases, high blood pressure and other poor health conditions among generation Z requires further studies into the contextual issues affecting the intention to use fitness Apps.

Fitness apps are increasingly being used as a tool by people who wish to work out and lose weight or among people who intend to monitor and manage their health status. This study looks at the elements that determine users' intentions to use exercise programmes and how their health states affect those intentions. The way people work and interact with one another has fundamentally altered due to the recent developments in mobile technology, such as smartphones. Consequently, the fast development of smartphone programs (apps) has provided customers with a variety of services, which were made possible by mobile devices. The significance has been underlined in terms of managing one's own health, and ongoing management is made feasible via mobile smartphone apps. Particularly, these studies frequently failed to account for user preferences for fitness applications, such as health status.

Although it is crucial for fitness app designers and researchers to comprehend users' intentions and individual variances including contextual problems, past studies have not sufficiently covered these topics. Research on users' intentions for fitness applications may also have a big impact on public health policies in the near future. Because users' perceptions of mobile fitness applications can have a big impact on the public healthcare sector, this study investigates the factors that influence users' intentions to use a fitness app in generation Z.

This study addresses four major research problems. Firstly, there is a bad nutrition culture in Malaysia. According the Star Online (2020), there is a significant change in the eating patterns and lifestyle of the people in Malaysia. This has resulted in a large part of the population suffering from non-communicable diseases (NCDs) related to excessive nutrition, as obesity, high blood pressure, heart problems, and cancers. These changes have caused the community to often suffer from NCDs. The authorities are unable to stop the rise of diseases linked to these bad eating habits due to the deteriorating eating style of Malaysians. According to data from the National Health Morbidity Survey (NHMS) in 2019 announced by the Ministry of Health, being overweight and obese is more common than just past the 50% threshold (Stopa et al., 2020). This means that every other adult Malaysian is either obese or overweight. The prevalence of diabetes among adults is 18.3% while high blood cholesterol affects 38.1% of adults. Following the nutrition problem, this

study is motivated to examine whether dietary culture would influence the intentions of people using fitness apps.

Secondly, health care awareness is still low in Malaysia. According to Bernama (2021) in the New Straits Times, there is a highly concerning condition because Malaysia has long been regarded as an unhealthy country due to the high prevalence of heart disease and obesity. This is because people's understanding of health-related issues is still minimal. Furthermore, Malaysia has become one of the countries with the highest rates of obesity and cardiovascular illness. However, to realize the Healthy Malaysia National Agenda (HMNA, 2021-2030), Malaysians must alter themselves and their behavior in order to promote awareness and voluntarily develop a healthy nation and people. This is because the feature of behavior modification is highly significant in raising awareness about the importance of doing a self-health check-up, which is the essence of HMNA. Based on the problem, this study is motivated to explore whether health consciousness would influence the intentions of people using fitness apps.

Thirdly, about one-third of Malaysians do not exercise. According to The Star Newspaper (2014), a Star Online poll on exercise or not, out of 1,742 respondents, 1,243 (71%) said they exercise while 499 (29%) said they don't. A total of 198 respondents (41%) out of 481 people stated that they were too lazy to exercise while 162 people stated that they did not have time because they were too busy with daily affairs. In addition, a total of 36 respondents stated that they could not afford a gym membership while 25 respondents stated that they did not like to exercise. According to Lee (2014) citing the Oxfam International Report of 2001, Malaysia is the sixth-fattest nation in the Asia-Pacific region and the fattest in Southeast Asia. This is because Malaysia has been ranked 44th out of a list of 125 countries. Malaysians are said to often adopt unhealthy eating practices and neglect exercise. There are various reasons given for avoiding exercise. Following the problem, this research is motivated to examine whether perceived usefulness of fitness applications was able to influence the intentions of people using fitness apps in facilitating exercise.

Lastly, a healthy lifestyle is a challenge for most Malaysians. According to Stanford University survey on exercise, Malaysians are the third laziest people in the world to exercise (Yeong, 2022). This has indirectly resulted in a high level of obesity among the Malaysian population. In addition to a lack of access to increased daily physical activity, many people and their families face challenges when it comes to eating healthier. This is because most parents want to provide their children with healthy food, but it is easier and cheaper for them to give their children processed fast foods that was only cause them to become obese just by eating it but are too lazy to exercise

to burn the fat. Following the lifestyle problem, this research was motivated to assess whether perceived ease of use helping to workout would influences the intentions of people using fitness apps.

In this research, the conceptual framework includes four independent variables (IVs) which are Perceived Usefulness (PU), Perceived Ease of Use (PEOU), Health Consciousness (HC), and Dietary Culture (DC). By reviewing past studies which are Zhang and Xu (2020), García-Fernández et al. (2020), Beldad and Hegner (2018), Yang and Koenigstorfer (2021), and the last one is Chiu and Cho (2020), all five research papers from the past studies had mentioned Perceived Usefulness (PU) and Perceived Ease of Use (PEOU) only. The rest of the independent variables that these previous studies examined are level of Satisfaction, Entertainment from using fitness apps, Social Influence, and Perceived Enjoyment.

Hence, from all the independent variables from previous studies, none of them had mentioned about Health Consciousness (HC) and Dietary Culture (DC). This is the main reason why we conduct our current research of study to include other independent variables which are Health Consciousness and Dietary Culture that form parts of the contextual problems of this study. For this current research, we determined to study about the two additional independent variables which have not been mentioned by the previous studies and wanted to continue to further study about Perceived Usefulness and Perceived Ease of Use for generation Z. The study aims to achieve the following research objectives and questions.

1.1 Research Objectives

1. To examine the relationship between Perceived Usefulness and Intention to use Fitness Apps
2. To investigate the relationship between Perceived Ease of Use and Intention to use Fitness Apps
3. To explore the relationship between Health Consciousness and Intention to use Fitness Apps
4. To assess the relationship between Dietary Culture and Intention to use Fitness Apps

1.2 Research Questions

To achieve the research objectives, the following research questions were developed to establish the factors influencing the intention to use fitness apps.

1. What is a relationship between Perceived Usefulness and Intention to Use Fitness Apps?
2. What is a relationship between Perceived Ease of Use and Intention to Use Fitness Apps?
3. What is a relationship between Health Consciousness and Intention to Use Fitness Apps?
4. What is a relationship between Dietary Culture and Intention to Use Fitness Apps?

1.3 SIGNIFICANCE OF THE STUDY

The significance of this research is to inspect factors influencing the intention to use fitness apps among generation Z. This study examines the perceived usefulness, perceived ease of use, health consciousness, and dietary culture as determinants of fitness apps' usage. The outcomes of the study could help us further understand and comprehend more factors influencing intention to use fitness apps among generation Z.

Users are confident and believe that the perceived usefulness of fitness apps can help them live healthier lifestyles. Fitness apps can provide a push in the right direction when it comes to health by referring to multiple verified sources. This motivates and influences a person on changing their lifestyle and daily habits until they reach their desired level of fitness. Additionally, users receive new ideas for exercise regimes. Fitness apps have diversified new fitness regimes to intrigue users who do not have time to go to the gymnasium to practice them in order to get the best health results. For instance, the body fitness and jefit applications now include new resistance training recommendations that focus on specific body muscles. Also, fitness apps are regarded as useful because they can keep track of health performance data. Most fitness apps keep detailed records of a person's health over time, such as weight, calories burned, height and calories gained. As a result, users can assess exercise performance accordingly.

On the other hand, fitness apps have features that are simple to use even if the user is connecting with the app for the first time. Smartphone and smartwatch application developers try to create simple user interfaces to understand and make it easy for people to get started. Using a fitness application is a very simple and quick process that involves simply entering health-related questions such as gender, age, weight and questions about various individual health goals. In addition, it's simple to track fitness and health accomplishments with fitness apps at any time. The majority of features found in fitness applications provide exercise guidance, easy-to-follow exercise regime steps, heart rate training, and tracking.

Moreover, the use of fitness apps can boost motivation to exercise, encouraging Malaysians to use this technology because it can help track daily activities. As a result, the use of fitness apps has the potential to disseminate health knowledge, allowing the community to monitor their own health levels. According to the Malaysian Ministry of Health (KKM) in year 2020, a study on Malaysians' health consciousness found that only 6.6 percent more aware compared to the percentage of awareness of the people of the United States which is 12 percent (Harian, 2020). The study considered knowledge of healthy eating habits such as calorie intake, serving size, and fat intake. However, following the spread of COVID-19, Malaysians have begun to be more conscious of their health status since more people expressed interest in improving their health during the Movement Control Order (MCO) period, such as exercising more frequently and eating nutritious food. Besides, society is always busy, and hectic daily schedules make it difficult to find time to care for your health. Thus, the reminder and notification feature of this fitness software assist in sending messages like "Keep it up!" and "You're doing fantastic!". The purpose is to indirectly remind the user of their health goals, ensuring that they are always motivated to exercise. In the smartphone and smartwatch application, badges can be shared with peers and family on social media profiles, contributing to inspiring and motivating others to take care of their health and physical fitness.

In addition, fitness apps can help users control their eating habits and make wise food choices. A healthy food selection is essential during an exercise regimen to help maintain body weight and fitness. Malaysia is a country rich in food resources and various types of food premises such as restaurants and food stalls run by various ethnic groups. The food establishments are always busy and full of customers, indicating that people enjoy eating outside if the prices displayed are reasonable. Additionally, great food is frequently promoted on television as the state's favourite dish, giving Malaysians an urge to explore local cuisine. The wide range of cuisine that is readily accessible has influenced Malaysians' way of life, culture, and customs. Coconut steam rice and flatbread are some of the example well-known and adored dishes in Malaysia. However, consuming these foods consistently throughout the day may be harmful to one's health. This demonstrates how unhealthy eating contributes a rise in the quantity of calories consumed every day, resulting in obesity and overweight. According to the Ministry of Health (KKM) in year 2022, Malaysia has the highest obesity rate in Southeast Asia, at 15.6 percent (Shamsuri, 2022). Thus, fitness apps like Calories Counter and Diet Tracker can help to save a food culture that contributes to a variety of chronic disease risks. This fitness apps can aid in recommending the best form of exercise and help direct or regulate dietary choices. Besides, keeping track of calories consumed

after meals and calories burnt during activity. It also was recommended which food groups to eat based on the proper calorie intake.

2.0 LITERATURE REVIEW

2.1 Technology Acceptance Model

The theoretical model of this study is based on the original Technology Acceptance Model (TAM) by Davis (1989).

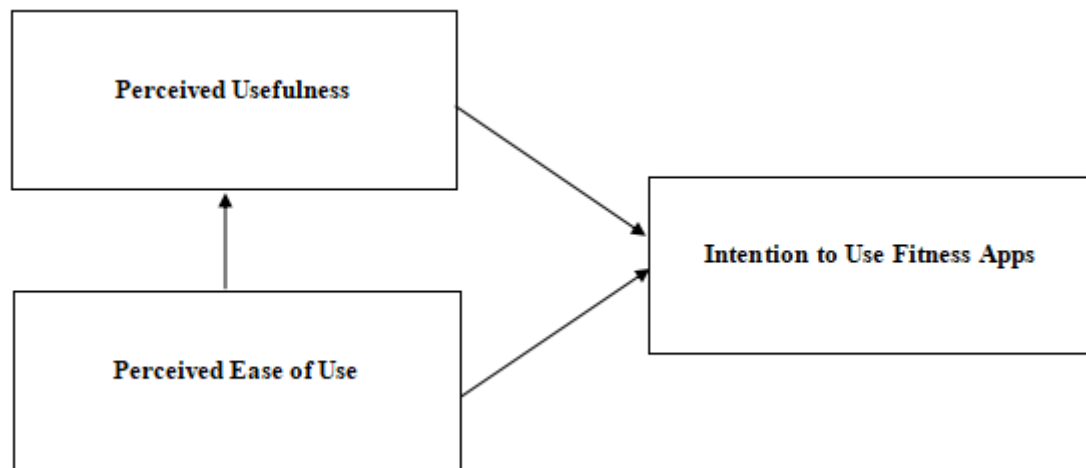

Figure 1: Perceived Usefulness and Perceived Ease of Use are related to Intention to Use Fitness Apps (Beldad and Hegner (2018); Davis, 1989; Chiu and Cho, 2020)

Chiu and (2020) stated TAM theory (Davis, 1989) initially TAM aims to explain computer use behavior which is often widely used to study the technology-related use behavior of individuals across the population and various innovative technologies. TAM is a system-unique model made up of two main comprehensions components, namely perceived usefulness (PU) and ease of use (PEOU). It determines people's attitude both intended practical use of modern technology. PEOU characterized as "the degree to which a person believes that using a particular system will be free of effort" (Davis, 1989, p. 320). Meanwhile, PU is "the degree to which a person believes that using a particular system will improve his work performance" (Davis, 1989, p. 320). In other words, PEOU emphasizes the role of technology in reducing user effort, while PU focusing on the extent to which technology can improve user performance. Thus, TAM argues that PEOU influences PU because the technology is easier to employ, more helpful, and both PEOU and PU perceptions play an important role while influencing people's choices to use technology. TAM is often used by some scholars to study individual consumption and behavior in the context of fitness

applications and health. Therefore, several studies have found TAM to be a very good theoretical framework for describing the intentions of individuals using health and fitness applications.

Beldad and Hegner (2018) stated that research on the use of technology has relied heavily recognising the significance of Davis's TAM effects of two related technologies rules, namely the perception of ease of use and perceived usefulness, on people's willingness to adopt certain technologies. This is because, according to (Davis 1989, p. 320) acceptance of ease of use is 'the degree to which a person believes that using certain systems was free of effort. Then he also defines perceived usefulness as 'a person's degree of belief that using a certain system will improve his work performance. Hence, the diversity of goals targeted by mobile health apps achieve and various features embedded in applications to meet their various objectives, one might expect that an individual's decision to use a particular health application was give the benefits offered by the application and the level of complexity or simplicity in using it. Both support the usefulness of TAM in determining people's propensity to use or keep using a specific application. In research on the use of mobile health applications, it uses TAM as a theoretical basis is in its initial phase and several studies have demonstrated the model's applicability in the context of mobile health applications by emphasizing the effects of both per- feel the usefulness and feel the ease of use on real people their use of health apps and their intention to continue using health apps.

Based on past study by García-Fernández et al. (2020) about using Technology Acceptance Model (TAM) on their study. Based on TAM theory, Davis created this theory in an effort to explain how users and adopters of new information technologies behave. The TAM on this research paper relates two factors which is perceived ease of use (PEOU) and perceived usefulness (PU) with the resulting intent of behaviour and the subsequent real behaviour of the individual. PEOU is the level of thought and consideration necessary for someone to learn how to use technology. Meanwhile, the degree to which people believe a particular system was aid in the completion of a specific task is referred to as PU. The importance of using the TAM model is the positive relationship between its variables and how its impact on attitudes towards technology and intention to use. Due to its excellent resilience and application, the TAM model has historically one of the most used models, with a focus on the technology's practical applications and understanding consumer intent to use fitness apps. Hence, in the sports industry a few studies have examined these factors and discovered there is a connection between PEOU and PU (Ahn et al, 2014; Angosto et al, 2020). In this way, research using TAM has shown that PEOU and PU are influenced by different factors such as

social norms, sociodemographic and health awareness. Therefore, this study includes health consciousness and dietary culture to the TAM theory to examine Fitness Apps' Usage intention.

2.2 Research Hypotheses

2.2.1 Relationship Between Perceived Usefulness and Intention to Use Fitness Apps

Many studies show the link between Perceived Usefulness and Intention to Use Fitness Apps. Zhang and Xu (2020) examined the study's objective related to the mental mechanism that decides whether college students were continue to use fitness applications. The study sampled 379 Chinese college students who completed a questionnaire to determine their user experience. The authors used data analysis techniques such as structural equation modelling (SEM), which was assisted by AMOS 21.0 software. The study discovered that the continuous intention of college students to use fitness apps has significantly and positively impacted on confirmed usefulness. During the interview, the college students stated that, while they did not receive pleasure from the fitness app, they were still motivated to use it because they had a clear goal to achieve fitness and health.

Chiu and Cho (2020) examined the study's objectives related to individuals' choices to utilize health and fitness apps by employing some theory or model, namely the extended technology readiness and acceptance model (TRAM, that merge three other model technology such as readiness (TR), technology acceptance model (TAM), and perceived enjoyment (PEN). Their study investigated the variation in intention to use health and fitness apps linking users and non-users. Chiu and Cho (2020) employed a sample of 206 students selected from four major universities in South Korea, and directly facing interviews were transported accompanying four trained survey administrators to strengthen the study. In their study, the researcher used data analysis techniques like partial least squares structural equation modeling (PLS-SEM) with SmartPLS 3.0 in their study. Chiu and Cho (2020) found that TR absolutely effects perceived usefulness (PU), perceived ease of use (PEOU), and perceived enjoyment (PEN). Furthermore, multigroup analysis demonstrates that app users have a greater association between PU and behavioral intention.

Cho et al. (2020) examined the study's objectives related to the health and decision-making process of users using fitness applications by combining the theory of the Technology Acceptance Model (TAM) and the Investment Model (IM). This study engages a sample of 346 reactions composed of fitness and appropriateness app consumers in China. The authors used descriptive statistics to perform a preliminary test to determine the data assumptions' normality. The authors used structural equation modelling analysis (SEM) to test the proposed hypothesis. Thus, the study

employs standardized factor loadings and t-values of path coefficients to decide the path's strength and significance level of the latent variable. To summarize, the study found that perceived ease of use positively impacts perceived usefulness, which in turn affect influences users to persist in using the apps.

Yu et al. (2021) explored the antecedents of university students' fitness application usage behaviors combined with the theory of planned behavior and the technology model acceptance. The study contained 634 students from six universities in Zhanjiang City the one achieved an online survey to decide the appropriateness of app habit behavior. Using SPSS 18.0 and SmartPLS 3.0 to analyse the data collected, the authors found that perceived usefulness has a significant and positive effect that influences students' attitudes toward fitness apps and increased usage intentions.

Dong et al. (2022) examined the intrinsic and extrinsic factors that explain the intention of Chinese citizens to use fitness applications following the expansion of Technology Acceptance Model. The study sampled 224 Chinese citizens and used data analysis techniques such as Cronbach's alpha coefficient to determine the reliability of the questionnaire and the Kaiser-Meyer-Olkin (KMO) test to determine whether the variables fit the analysis factors through examining their correlation and bias correlation. The authors use the structural equation model with AMOS 24 software and analyzed the path coefficient for the structural equation using the maximum likelihood estimation method to obtain the standardized path coefficient. Dong et al. (2022) discovered that perceived usefulness has a significant and positive effect on people's willingness to use fitness applications. Hence, we hypothesize that:

H1: There is a positive relationship between Perceived Usefulness and Intention to Use Fitness Apps

2.2.2 Relationship Between Perceived Ease of Use and Intention to Use Fitness Apps

Many studies show the connection between Perceived Ease of Use and Intention to use Fitness Apps. García-Fernández et al. (2020) examined study's objective related to analyze the association between e-lifestyle of Boutique Fitness centers and influence different relationships with perceived ease of use and intention to use fitness apps. The study the sampled 591 Boutique Fitness customers (378 female, 213 male). The selection criteria for participation in the survey is that the participants had to download a fitness app. The authors used data analysis technique involves confirmatory factor analysis (CFA) and structural equation model (SEM). The study contributed to understanding how e-lifestyle are associated to technology in relation to fitness apps, and which may make it easier to predict fitness consumption behaviors.

Beldad and Hegner (2018) examined study's objective related to analyzing the relationship between German users' willingness to continue to use fitness apps and influence relationship of perceived ease of use and perceived usefulness. The data collected through self-administered online surveys and here are 476 responses. Beldad and Hegner(2018) used data analysis involves confirmatory factor analysis (CFA) and structural equation modeling (SEM) technique. The authors found that the intention of respondents to keep up using a fitness app is originally believed to be influenced by including perceived usefulness and perceived ease of use. Hence, results showed user perception of the fitness app is related to the perceived ease of use.

Gómez-Ruiz et al. (2022) examined study's objective related to analyze the aspects that can influence consumers intents to use fitness apps based on how appealing the fitness apps are. The authors used the technology acceptance model (TAM), structural equation modelling (SEM) exploratory factor analysis (EFA) and confirmatory factor analysis (CFA). An online questionnaire was distributed to 200 sports consumers of a fitness centre (117 women and 83 men) to determine user's viewpoint of the attractiveness, perceived usefulness, perceived ease of use, enjoyment, trust, and intention to use of the fitness center's fitness app. The study found that the variables studied have a positive influence on the intention to use fitness apps, with attractiveness and usefulness, as well as perceived ease of use and intention to use are having the strongest associated. These results highlight how crucial these factors are when using fitness applications in fitness facilities.

H2: There is a positive relationship between Perceived Ease of Use and Intention to Use Fitness Apps

2.2.3 Relationship Between Health Consciousness and Intention to Use Fitness Apps

Many studies show the relationship between Health Consciousness and Intention to use Fitness Apps. Damberg (2021) examined study's objective related to the role of fitness app users in the United Kingdom in determining future use intention of Health Consciousness. The study sampled 500 respondents was solicited using an online panel through Harris Interactive. The authors used data analysis techniques such as partial least squares structural equation modeling (PLS-SEM) to test and analyze the relationship in the model. The study found the role that health consciousness plays as a motivator of future consumption intentions. Therefore, the desire to use a product in the future is primarily impacted not only by routines and a sense of amusement, but also by health consciousness and application performance. This suggests that users of fitness health

consciousness applications are another key factor to consider when forecasting future use intentions for fitness apps.

Chen and Lin (2018) examined the objectives of the study is to enhance the model's capacity to forecast a person's attitude and intention to download and utilise nutrition and fitness applications by expanding the technology readiness and acceptance model (TRAM) to consider the person's health consciousness (HC). The study sampled 994 people who completed the online self-report questionnaire. The authors used data analysis techniques such as structural equation modelling (SEM) to statistically test hypothesized models and determine the model's consistency with the sample data. The study found that HC has a favourable impact on how simple and practical diet and exercise applications are judged to be. The suggested HC-TRAM offers a greater predictive potential than the TRAM, according to two distinct test findings.

Yan et al. (2021) examined the mobile applications for healthy living with affecting variables Plans to keep using health apps. Previous studies have looked into the variables that affect a health app's adoption. However, very few researches for mobile health apps have considered Continuance Intention (CI). The study sampled 397 users of a health app in China to validate the model. The authors used data analysis technique such as Partial Least Squares (PLS). The study found that factors such as perceived usefulness, perceived ease significant determinants of CI and satisfaction are frequency of usage, flow experience, and behavioural modification techniques acts as a mediator between these factors and their effects. The influence of health consciousness on the relationship between perceived usefulness and satisfaction is moderated in a positive way, whereas the effect of health consciousness on the relationship between perceived ease of use and contentment is moderated in a negative way. Hence, we hypothesis that:

H3: There is a positive relationship between Health Consciousness and Intention to Use Fitness Apps

2.2.4 Relationship Between Dietary Culture and Intention to Use Fitness Apps

Koo at el. (2016) examined that this study aimed to assess consumption patterns of dietary culture and intention to use fitness apps among generation Z. Regardless of socioeconomic situation, follow the remaining six food groups recommended by the Malaysian Dietary Guidelines. It is important to try to promote balanced, healthy eating, especially for foods that don't meet the recommended intake levels. Generation Z's ideal growth rates are encouraged by appropriate nutrition, which is essential for good health and was directly affect their adult health. According to the Food and Agriculture Organization (FAO) and the World Health Organization, each nation

should create fundamental food-based dietary guidelines based on their public health issues and suitable for people of different cultures, lifestyles, and ages (WHO). The Malaysian SEANUTS, a cross-sectional survey of Malaysian children that is nationally representative, provided the data for this study. Using stratified multistage selection, Generation Z members of all ethnicities (Malay, Chinese, Indian, bumiputra Sabah, bumiputra Sarawak, and other bumiputra) were randomly selected from six Malaysian regions. The structure and operations of SEANUTS Malaysia have been fully described elsewhere. To the best of our knowledge, this study is the first to undertake a dietary culture-based analysis on a sample of Malaysian Generation Z from various socioeconomic backgrounds that is nationally representative. By detailing the consumption patterns of the seven food categories in accordance with the Malaysian Dietary Guidelines, which covered Generation Z from all six regions of Malaysia, this research considerably contributes to the literature. The results of the current study show that the mean intake of all food categories did not match MDG requirements, with the exception of meat and poultry. The differences in eating habits between young people from urban and rural areas in Malaysia can be explained by the nutritional transition from a traditional to a modern or Western lifestyle. The results of this study suggest that with current technology, fitness apps can inspire generation Z to maintain a healthy lifestyle and improve the efficacy of dietary culture.

Many studies show the relationship between dietary culture and intention to use fitness apps. Suzuki and Tachihara (2014) examined the study's objective related to aims at the preservation of the region's historic nutritional culture, although with a modern perspective, by identifying key designing-a-living components and outlining future goals. Since they are the driving force behind change and the important players in completing this crucial mission for the benefit of future generations, Generation Z is one of the major target groups. Family and community bonds have been severely disrupted as a result of globalisation, media social loss of traditional culinary culture, and has led to a disdain for natural resources. The study of constructing a lifestyle in Ngiwal State, Republic of Palau, tries to highlight the significant problems associated with this continuous societal transition and to provide answers that will help communities and people manage them. From May 2010 to April 2011, a study team from Chiba University made three trips to the research location to conduct in-depth interviews and gather information on the local traditional food culture and public opinion. The team draws the following conclusions after analysing the data. The locals are aware of the value of traditional food culture; however, this is not reflected in reality or in their behaviour. Implementing the "designing-a-living" idea should incorporate key design components including communication, cooperation, social media, and others in order to transmit the social ideals embodied in this food culture to future generations. In order for people in deeper regions to

keep a healthy lifestyle with apps for their food culture, they need be made aware of the advantages and benefits of utilising fitness applications. Hence, we hypothesize that:

H4: There is a positive relationship between Dietary Culture and Intention to Use Fitness Apps

2.3 Research Framework

Based on the research hypotheses, this study proposes an advanced TAM theory by evaluating the Factors Influencing Intention to Use Fitness Apps Among Generation Z. Thus, the research framework as shown below.

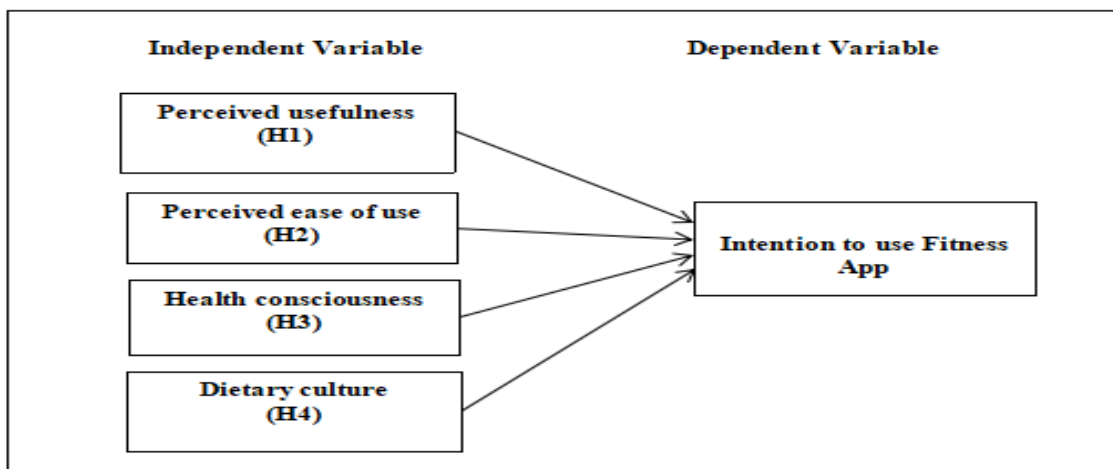

Figure 1: Conceptual framework of the study

Figure 1 shows that the research framework and it contains two variable which is the dependent variable (DV) and the independent variable (IV). The intention to use a fitness app is the dependent variable, and the four independent variables are perceived usefulness, perceived ease of use, health consciousness, and dietary culture. This framework explains the relationship between the independent variables, which are perceived usefulness, perceived ease of use, health consciousness, and dietary culture, and whether it shows a positive or negative effect on the dependent variable, which is intention to use fitness apps.

The findings from previous research established that perceived usefulness and perceived ease of use are related to a user's intention to use technology, with both having a positive effect on fitness applications. This is due to the numerous advantages of using fitness apps, such as saving time, having simple features to use, being user-friendly, and so on. Following that, health consciousness and dietary culture are important factors in the user's intention to use fitness applications, with giving an approach to boost motivation to exercise, control eating habits, and make wise food

choices being an important element that results in the user's decision to use fitness applications among generations Z.

3.0 METHODOLOGY

3.1 Research Design

According to Saunders, et al. (2012), a research design is a strategy for answering the study's questions. It entails proper research data management as well as the collection of various components, strategies, and methods for data collection and analysis. Meanwhile, according to McCombes (2019) research design is also known as a research strategy is a strategy to answer a series of inquiries. It is a framework that incorporates techniques for gathering data, analysing it, and interpreting it. To put it another way, the research design describes the method through which the main problem of the study was investigated.

This study uses quantitative research approach. According to Creswell (2002), quantitative research is the process of collecting, analyzing, interpreting, and documenting research findings. The quantitative research process has the advantage of being tested and checked. Quantitative research necessitates careful ability to repeat the test and the outcomes, as well as an experimental design. This improves the accuracy of the data gathered and lessens the likelihood of disagreement. Furthermore, the analysis is straightforward. When gathering quantitative data, the type of results was influencing the statistical test to be used. As a result, quantitative research makes it simpler and less sensitive to subjectivity and error to interpret data and report results.

In this study, the correlative study design was used. A correlational study is a form of research design that explores the link between two or more variables (Leech et al., 2022).

3.2 Data Collection

A research instrument is one of the measurement tools that can assist the researcher in collecting data and all of the information required to complete the research (Sathiyaseelan, 2015). In this study, data was gathered by the researchers using a questionnaire. Thus, the technique for gathering data is the questionnaire for researchers that requires respondents to answer questions or items based on their experience, attitude, or opinion.

In this study, the questionnaire has four sections. Section 1 displays a cover letter which introduces the topic and states the purpose of the study. Section 2 describes the demographic information

which include the age group, the gender, income group, race, and marital status. Section 3 presents the variable items of the IVs and DV. The variables items are sourced from different studies comprising five sections which are Section A, Section B, Section C, Section D, and Section E. Section A focuses on the dependent variable (DV) which is Intention to Use Fitness Apps. The items on Intention to Use Fitness Apps was sourced from Acikgoz et al. (2022) and García-Fernández et al. (2020). Section B, C, D and E consists of independent variable (IV) which are health consciousness, dietary culture, perceived ease of use and perceived usefulness. Variable items in the health consciousness were sourced from Acikgoz et al., (2022), Iqbal et al., (2021) and Park et al. (2017). Variable items on dietary culture were sourced from Sanusi (2020). Variable items on perceived ease of use and perceived usefulness were sourced from Acikgoz et al., (2022), Zhang and Xu (2020), and García-Fernández et al., (2020). The questionnaire items as shown below.

Table 1
Variable Items

A. Intention to use Fitness Apps	1	2	3	4	5
1. I know how to judge the quality of a fitness apps.					
2. I do not feel very knowledgeable about fitness apps.					
3. I intend to use fitness apps within the next three months.					
4. I intend to use fitness apps for my training.					
5. I intend to use fitness apps as often as possible.					
6. I will use fitness apps on a regular basis in the future.					
7. I will frequently use fitness apps in the future.					
8. Assuming I have access to fitness Apps, I intend to use them.					
9. Given that I have access to fitness Apps, I predict that I would use them.					
B. Perceived Usefulness	1	2	3	4	5
1. I use fitness apps to improve the quality of my exercising.					
2. Fitness apps save me time.					
3. I use fitness apps to improve my training/ workout performance.					
4. Fitness apps are useful for doing exercise.					
5. I use fitness apps to enhance my effectiveness in doing exercise.					
6. I use fitness apps to increase my productivity in doing exercise.					

C. Perceived Ease of Use	1	2	3	4	5
1. Overall, I find fitness apps easy to use.					
2. It is easy for me to remember how to perform tasks using fitness apps.					
3. Learning to use fitness apps is easy.					
4. Interaction with fitness apps is clear and understandable.					
5. It is easy to interact with fitness apps.					
D. Health Consciousness	1	2	3	4	5
1. I am self-conscious about my health.					
2. I take responsibility for the state of my health.					
3. I reflect on my health a lot.					
4. I am alerted to changes in my health.					
5. I am aware of the state of my health as I go through the day.					
6. Good health requires active participation on my part.					
7. I am worried about my health when I get sick.					
8. Living life without disease and illness is very important to me.					
9. My health depends on how well I take care of myself					
10. Living life in the best possible health is very important to me.					
11. I do worry about harmful chemicals in my food.					
12. I am concerned about the quality of my drinking water.					
13. I usually read the ingredients on my food labels.					
14. I read more health-related articles than I did 3 years ago.					
15. I am interested in information about my health.					
E. Dietary Culture	1	2	3	4	5
1. I eat a variety of foods within my recommended intake.					
2. I maintain body weight in a healthy range.					
3. I am physically active every day.					
4. I eat an adequate amount of rice, others cereal products (preferably whole grain) and tubers.					
5. I eat plenty of fruits and vegetables every day.					
6. I consume a moderate number of fish, meat, poultry, egg, legumes, and nuts.					

7. I consume adequate amounts of milk and milk products.
8. I limit intake of foods high in fats
9. I minimise fats and oils during food preparation.
10. I choose and prepare foods with less salt and sauces.
11. I consume foods and beverages with low sugar.
12. I drink plenty of water daily.
13. I practice exclusive breastfeeding from birth until six months and continue to breastfeed until the child is two years of age.
14. I consume safe and clean foods and beverages.
15. I make effective use of nutrition information on food labels

3.3 Sampling

3.3.1 Sampling Technique

Sampling is a method of choosing an adequate number of components from a population for researchers to examine a sample and comprehend their features to generalize those properties or characteristics to the elements of the population. There are two different kinds of sampling techniques which are probability and non-probability sampling techniques. The probability sampling technique is one, where every member of the population is likely to be chosen as a sample, whereas a non-probability sampling technique does not give every member of the population the same opportunity to participate in a study. For this study, the respondents who will be chosen is generation Z.

Purposive sampling is the method of sampling that is employed in the study, which is under the group of non-probability sampling techniques. This method relies on the researcher's judgment and criteria when selecting members from the population to take part in the survey. For instance, people who meet the qualifications for the required characteristics can assist the researchers in answering the research question.

Aside from that, the use of the purposive sampling technique in this study has the advantage of being the most cost-effective and saving time. Purposive sampling is the most appropriate sampling method available to contribute to this study if there are fewer than a few primary data sources and is suitable for studies that require some selection criteria i.e., only respondents who qualify under the age group of generation Z can participate in this study. Also, only respondents from generation Z who use Fitness Apps took part in this research.

3.3.2 Sample Size

A sample is a smaller and manageable element than a larger group. A sample is a subset that represents the size of the entire population. Sample members are known as subjects, whereas the number of subjects in the sample is known as sample size. Usually, a sample size can be determined by the population because when the number of the population increases, the simple size was also increase. The sample size can be determined by 10 times the number of predictors or independent variables (Hair et al., 2019).

In this study, researchers intend to choose 170 respondents in total from generation Z users of fitness applications in Malaysia to serve as the study sample. This is due to the fact that the sample size cannot be less than 30 respondents or greater than 500 respondents. The best sample size for quantitative investigations, according to Sekaran and Bougie (2016), is between 30 and 500 participants.

The sample size selected in this study is very appropriate and sufficient because the generation Z population in Malaysia is large, necessitating a smaller sample size for this study. Because generation Z is exposed to the increasing use of technology, researchers can easily access the accessibility of participants. As a result, a sample size of 170 can determine the accuracy and effectiveness of the sample size, increasing confidence that it was comprehensively address the existing gap

3.4 Data Analysis

A data analysis technique is a method used by researchers to convert data into a narrative and then analyze it to make closure. The data analysis method assists in breaking down a large amount of data into smaller fragments. Data analysis is mainly used to obtain any relevant information from data and then apply that knowledge to decide. This study was perform the correlation analysis to analyze the association between the independent variables and dependent variable and establishes the strengths of the association between each IV and DV. The data analysis of this study was analyzed using descriptive statistics and Pearson's correlation.

Descriptive statistics are specific methods used to measure, characterize, and outline research info in a reasonable, important, and effective way. Descriptive statistics assist in detailing and comprehending the traits of a specific data set by providing brief analyses of the sample and data

measures. Descriptive statistic includes frequency, central tendency, dispersion and distribution measures. This study uses descriptive statistics because it simplifies the data's interpretation while simultaneously providing the researchers with the knowledge to conduct further analysis.

Correlation analysis refers to a method that describe the linear association between two different variables. With correlation analysis, researcher could see the patterns and define how linear it is. There are types of correlation analysis which are Pearson correlation and Spearman correlation. Thus, there are two relationships of correlation analysis which are positive correlation and negative correlation. Positive correlation is an association between two variables which means the increase of one variable can causes an increase for another variable. Meanwhile, negative correlation means the increase of one variable cause a decrease in another variable. The perfect correlation positive is in between two values at all if the result is the between -1. Perfect positive correlation between two values indicates 1. When, the result is shown 0, this means that there is no relation between the IVs and DV. Overall, a perfect correlation generates a straight line on a graph. The correlation is perfect positive if two variables point in a direction that is a constant positive or negative direction. Whereas the correlation is perfect negative if both variables change in the opposite direction which is one increases while the other lowers or vice versa.

4.0 FINDINGS

4.1 Demographic Profile

Table 2 shows the frequency of demographic profile. According to the table below, this study consists of 130 respondents and the frequency of using Fitness Apps according to the demographic profile. The demographic profiles include gender, age group, race, marital status and income group. For gender, it can be seen that the highest frequency of using Fitness Apps is female with 84.6% compared to male which is 15.4%. Based on age group, the highest frequency was from age 23 to 25 years old with a percentage 63.9 and the highest frequency for race was malays which is 88.5%. Then the highest frequency for marital status was single compared than married. Lastly, the frequency for income group which is the highest was for income less than RM1000.

Table 2
Frequency

Profile	Frequency	Percentage
---------	-----------	------------

Gender	Male	20	15.4
	Female	110	84.6
Age Group	10-18 years old	3	2.3
	19-22 years old	44	33.8
	23-25 years old	83	63.9
Race	Malay	115	88.5
	Indian	2	1.5
	Other	13	10.0
Marital Status	Single	121	93.1
	Married	9	6.9
Income Group	< RM 1000	96	73.8
	RM 1001 - RM 1500	34	26.2

4.2 Descriptive Statistics

Table 3 shows the total respondent, mean score, and standard deviation of independent and dependent variables. According to the table above, this study comprised 130 respondents who used Fitness Apps to examine the mean and standard deviation for the five variables. For the independent variable, health consciousness was the highest mean, which is a mean of 4.286 with a standard deviation of 0.59155, second highest followed by perceived usefulness score (mean=4.2000, SD=0.76119), followed by the third score is perceived ease of use which was (mean=4.1846, SD=0.74568), and dietary culture has the lowest score (mean=3.9338, SD=0.66296). Meanwhile, the mean for the dependent variable which is the intention to use Fitness Apps was (mean= 3.8402, SD= 0.59651). To conclude, the independent variable of health consciousness was the most influential on the intention to use Fitness Apps among Generation Z.

Table 3

Descriptive statistics of the main variables

No	Variables	N	Mean	Standard Deviation
1	Health Consciousness	130	4.2862	.59155
2	Dietary Culture	130	3.9338	.66296
3	Perceived Usefulness	130	4.2000	.76119
4	Perceived Ease of Use	130	4.1846	.74568
5	Intention to Use Fitness Apps	130	3.8402	.59651

4.3 Reliability Test

Table 4 shows the reliability statistics for independent variables and dependent variable of the analysis using Cronbach's alpha. The study includes four independent variables: health consciousness, dietary culture, perceived usefulness, and perceived ease of use, and one dependent variable: intention to use fitness apps. The independent variables have excellent internal consistency, indicating high trustworthiness. The dependent variable, intention to use fitness apps, has a Cronbach's alpha value of 0.829, indicating good reliability and respondents' understanding of the questions. Overall, the study's results are reliable and acceptable.

Table 4

Reliability Statistics for Independent variables and dependent variable

Variables	Number of items	Cronbach's Alpha
Health Consciousness	15	0.936
Dietary Culture	15	0.925
Perceived Usefulness	6	0.943
Perceives Ease of Use	5	0.937
Intention to Use Fitness Apps	9	0.829

4.4 Pearson Correlation Result

The table 5 shows the Pearson correlation coefficient, the significant value, and the total number of responses (130) for all independent variable. For perceived usefulness, the p-value is 0.01 which is the correlation level of significant. The correlation value of 0.565 indicated a high positive correlation between perceived usefulness and intention to use fitness apps, which is significant at 1% level. Therefore, H1 is accepted and supported.

Then, for perceived ease of use, the p-value is 0.01 which is the correlation level of significant. The correlation value of 0.462 indicated a positive correlation between perceived ease of use and intention to use fitness apps.

After that, for health consciousness, the p-value is 0.01 which is the correlation level of significant. The correlation value of 0.466 indicated a positive correlation between health consciousness and intention to use fitness apps.

Lastly, for dietary culture. The p-value is 0.01 which is the correlation level of significant. The correlation value of 0.399 indicated a positive correlation between perceived usefulness and intention to use fitness apps.

Table 5

Pearson Correlation

		Intention to Use Fitness Apps	Intention to Use Fitness Apps
Perceived Usefulness	Pearson Correlation	.565**	1
	Sig. (2-tailed)	.000	
	N	130	130
Perceived Ease of Use	Pearson Correlation	.462**	1
	Sig. (2-tailed)	.000	
	N	130	130

Health Consciousness	Pearson Correlation	.466**	1
	Sig. (2-tailed)	.000	
	N	130	130
Dietary Culture	Pearson Correlation	.399**	1
	Sig. (2-tailed)	.000	
	N	130	130

Asterisk ** indicates that it is significant at 1% while asterisk * indicates that it is significant at 5%.

5. DISCUSSION AND SUGGESTION FOR FUTURE STUDIES

The outcomes of the research findings of this study have provided insight into discussion for the positive relationship between independent variables (IVs) which are Perceived Usefulness (PU), Perceived Ease of Use (PEOU), Health Consciousness (HC), Dietary Culture (DC) and the dependent variable (DV) which is Intention to use Fitness Apps. Therefore, the suggestion for future studies was also provided.

5.1 Hypothesis 1

Hypothesis 1 shows that there is a significant positive association between Perceived Usefulness and Intention to Use Fitness Apps. This finding is due to the following reasons:

i) Quality of exercise

Fitness apps are able to make the exercise of the users become more quality. This is because fitness apps offer variety of workouts and explain well the proper way to do physical activity in accordance with the wishes of the users. As a result, users could get benefits from the use of fitness apps to improve their quality of exercise which also contribute in the quality of life. Thus, perceived usefulness of fitness apps could influence Gen Z people's intention to use them.

ii) Time saving

Individuals who use fitness apps are the ones who save more time than the people who do not used to it. This is because Fitness Apps have been input time feature which helps users to set the schedule of their exercise and assign on how many sets/repetitions each of the

exercises they need to do. As a result, fitness can help user to have a regular workout routine.

iii) Training/workout performance

Fitness apps are designed to help users to get the proper and right exercise as this fitness app has multiple fitness features such as providing a variety of exercise, monitor and track the fitness activity and even advanced personal trainers. As a result, this definitely helps users to a better training or workout performance which also can enhance productivity.

5.2 Hypothesis 2

Hypothesis 2 shows that there is a significant positive association between Perceived Ease of Use and Intention to Use Fitness Apps. This finding is due to the following reasons:

i) Easy to use

Most fitness apps are easy to use because all the illustrations, design and features are in well placed. In addition, all the layout arrangements in the app are straightforward and simple, helping users to easily find what they need without confusion. As a result, users from a variety of ages could easily download the fitness and all the procedures from sign in until getting in the app are effortless easy because the apps had provided easy instructions. Hence, perceived ease of use of fitness apps could influence Gen Z people's intention to use them.

ii) Easy to remember how to perform tasks

Majority of the fitness apps are often paired with wearable devices such as smartwatches or fitness bands. These wearable devices have provided real time data on metrics such as steps taken, calories burn and reminder to do daily exercise. As a result, this sync connection between the fitness apps and wearable devices allows users to easily track their fitness activity and remind them to perform their workout routine.

iii) Clear and understandable

All the guidelines or instructions that have been provided in fitness apps are clear and written with easy-to-understands instructions. The majority of fitness apps offer comprehensive instructions and guidance on how to carry out exercises, monitor progress

and use the different features. To illustrate proper methods, fitness apps frequently included pictures, videos and step by step explanations.

5.3 Hypothesis 3

Hypothesis 3 shows that there is a significant positive association between Health Consciousness and Intention to Use Fitness Apps. This finding is due to the following reasons:

i) Individuals are responsible for the state of their health

All people have the ability to make choices that affect their state of health. Individuals have options whether to do physical activity, taking care of themselves, and eat a balanced diet. Therefore, for those who are conscious of taking responsibility for their health, fitness apps are one of the initiatives individuals could take to make a better healthy lifestyle such as helping the users to manage and track their exercise activity, schedule exercise and control the intake of food they consume via the apps. As a result, individuals' general health and wellbeing are significantly impacted by their own decisions.

ii) Living life without disease and illness are important

Living a life free of disease and illness is important because it allows people to experience to have best possible physical health and gives people freedom to carry out their daily activities without limitations. Therefore, Fitness apps are a desirable choice for those who place a high priority on their health due to their ability to create personalised fitness plans, goals setting, track progress and many more. As a result, by keeping and maintaining health conditions individuals can save more money on the healthcare costs and reduce the risk of developing chronic illness.

iii) Individuals health are depending on how well they take care themselves

Individuals are in charge of managing their own health including taking initiative to be productive to stay fit and prevent chronic illness. In connection with that, fitness apps can help by providing accessibility by allowing users to access physical activity routines and health information anytime, even anywhere. By proactively managing their own health, individuals could have lower chances to be diagnosed with chronic illness and also enhance their general healthiness.

5.4 Hypothesis 4

Hypothesis 4 shows that there is a significant positive association between Dietary Culture and Intention to Use Fitness Apps. This finding is due to the following reasons:

i) Eat variety of foods within recommended intake

Eating a variety of food within the recommended amounts is important to keep a healthy and balanced diet. Different foods contain different nutrients such as proteins, carbohydrates, vitamins and minerals. By eating a variety of foods an individual can get all the nutrients that the body needs to function at its best. Fitness apps frequently concentrate on helping users to achieving their fitness goals such as losing weight, increasing muscle and decreasing body fat. Users can achieve their goals by consuming the necessary nutrients within recommended intake by the fitness apps.

ii) Physically active everyday

Being physically active every day is important for individual general well-being and health and fitness apps can be very helpful in motivating and monitoring users' physical activities. Fitness apps come out with a way to tracking people's daily physical activity and setting goals. Fitness apps frequently provide features such as progress tracking, notifications and reminders to help users to stay liable and motivated. Overall, utilising fitness apps allows users to track their workout levels, set goals and help to stick to a regular exercise physical routine.

iii) Maintain body weight

Being overweight can make people easily feel exhausted and have less energy. By maintaining a body weight, the body are able to function properly which can boost energy levels and overall vitality. Fitness apps can be helpful tools in maintaining the body by providing guidance, monitoring progress and encouraging motivation. Therefore, fitness apps can help users to maintain their ideal weight and healthy weight.

5.5 Suggestion for Future Studies

The findings of this study have been able to provide significant information and valuable insights to influence the intention to use fitness apps among generation Z. However, there is lots of potential to develop future studies that can be made based on these findings. Because respondents in this study were all members of generation Z using fitness apps and their ages ranged from 10 to 25, it would be beneficial in expanding the scope of this research to include the respondents from different age groups and demographics. Future studies can be extended to other generations such as generation X, generation Y, and generation W.

To expand on this study, future studies should focus on other types of fitness apps. It can focus on Health Monitoring Technology. This is because such technology is able to monitor a person's health factors. For example, fitness trackers that work in tracking people's daily activities. It is able to monitor heart rate, blood oxygen and so on. In addition, it also serves as a medication reminder which is very important in health management. It helps in remembering to take medicine on time. For example, the Mango Health app which is an application in helping to set medicine reminders at the right time. Besides, health monitoring technology also serves as a continuous surveillance monitor for fall detection capable of tracking patients and alerting healthcare professionals to incidents such as falls.

Furthermore, Emergency Monitoring Technology can also be focused on in future studies. This type of technology is a medical alert system that provides emergency monitoring inside and outside the home. It helps ensure personal safety to stay safe. This technology works to provide an immediate emergency signal in calling emergency medical personnel. For example, an emergency wristband which serves to protect a person during an emergency by providing accurate health information. The bracelet can help someone who is incapacitated or unable to explain all the medical details during an emergency. It's a silicone wristband with a button that connects to a home or mobile medical alert system. The middle button is called the help button. The bracelet uses sensors known as accelerometers, which can detect movement, to know when someone has fallen. It then notifies the monitoring centre for medical alerts that the individual needs help.

Lastly, future studies can also focus on other types of fitness applications such as Security Monitoring Technology. This technology works to track security related activities. With cyber security alerts, it allows individuals to act quickly and protect themselves from harm. It includes warning and alarm technology which is a security alarm that can detect an intrusion, such as unauthorised entry into a building or home. Security alarms protect against theft or property

damage. For example, a smart alarm that works as an intruder detection system in monitoring and security is easier. This system can monitor a person's home remotely and provide instant alerts if something happens.

6. CONCLUSION

This study was aimed to discover the factors influencing the intention to use Fitness Apps among Generation Z. The study employs the non-probability selection approach of purposive sampling to survey a total of 130 respondents who use different types of Fitness Apps. The data collected was analysed using frequency, descriptive statistics, Cronbach's alpha, and Pearson correlation analysis with the aid of IBM SPSS Statistics version 25 software. The findings of this study reveal that perceived usefulness, perceived ease of use, health consciousness, and dietary culture have significant associations with intention to use fitness apps among generation Z. In conclusion, the findings of this study can be used as a guide for Fitness Apps companies and academics looking to understand further the influence of intention to use fitness apps among Generation Z.

As with other studies, this study has a few limitations. The primary limitations in this study is that researchers solely focus on Generation Z. Therefore, the data collected to obtain information and opinions from respondents via the 5-point likert scaling questionnaire becomes limited and weak. It is probably because the degree of response in relation to the intention to use fitness applications is relatively low, and the health condition of generation Z is not very high compared to other generations, such as baby boomers, generation X or millennials who face serious health risks. However, there are limitations to other generations that do not meet the specific characteristics required by the researchers to fill out the questionnaire. Furthermore, not all respondents between the ages of 10 and 25 are capable to utilize the fitness applications to track their health status. As a result, they employ physical exercise programs that do not require purchase or merely charge an entrance fee of RM 20.00, similar to a gymnasium service.

The next limitation of the study is the data collection method. In this study, the researchers used an online survey consisting of more than 5 question items for each independent variable and dependent variable. So, it is possible that the respondents did not read the questions completely and simply put the scale at random because it took a long time to answer the questionnaire. Thus, leading to possible sampling bias. Furthermore, when using quantitative research methods, it involves a structured questionnaire with closed-ended questions. As a result, when answering the questionnaire, the options for responses are limited due to the selection of answers based on the 5-point likert scaling. Future studies can perform both quantitative and qualitative methods to give

room for additional factors that could influence intention to use fitness apps among generation Z other than the factors examined in this study.

ABSTRACT

Through the participation of the University Malaysia Kelantan (UMK), Pengkalan Chepa, and Institute Pendidikan Guru (IPG), this study seeks to examine the comparative value of fast food among university students. When conducting this investigation, the researchers used quantitative techniques. To make communication between the researcher and the respondents easier while conducting this study, the questionnaire was made available to the respondents online. The purpose of this study is to determine whether factors such as social standing, the environment, and student lifestyles have an impact on college students' involvement in fast food eating.

Keywords: fast food consumption among university students, social status, the environment, student lifestyles

INTRODUCTION

Saha (2018) defines fast food as a type of unhealthy food that has been chosen by most students. Fast food also refers to a higher intake of energy-dense food and can also expand the risk, especially for the health of the human body, such as weight gain. In addition, research by H. H. Al-Otaibi (2015) claims that, compared to when they were children or teenagers, college students are more likely to skip meals or eat out with friends. There is evidence that, throughout college years, consumption of nutritious foods, including fruits, vegetables, and milk, drops while consumption of fast-food soft beverages rises.

On the other hand, eating patterns change while technology is developing quickly. Although nutrition is important for all societal groups, university students give it a varied level of importance.

People start making decisions regarding their food habits and dining out more as they become more autonomous during this time and are influenced by their social circles (H. Darminci 2012).

There are three objectives in this research:

1. To examine the significant relationship between social status and fastfood consumption.
2. To determine the significant relationship between environmental factors and fast-food consumption.
3. To identify the relationship between student lifestyle and fast-food consumption among university students.

SIGNIFICANCE OF THE STUDY

The main fact about fast food

The main objectives of this study are to find out the main factors of fast-food favourites faced by university students, especially at University Malaysia Kelantan and Institute Pendidikan Guru.

HELP THE GOVERNMENT

This study also helps the government improve the management of wellness. By doing this, the health of students will be guaranteed, especially in the future.

FUTURE RESEARCHERS

This study will also help future researchers conduct more studies on the cause authority fastfood consumption between university students.

LITERATURE REVIEW

Social status

Fast foods are created quickly and are less expensive than other forms of food, according to the participants, who also found them to be generally accessible. In addition, the variety of tastes, aromas, and colors of fast foods was highlighted as factors driving the consumption of fast foods.

Some participants claimed that they ate fast food despite not wanting to because they felt that they had to keep up with their friends. They said things like, "When I am with my friends, if they invite me to go out to eat fast food, I won't deny the offer" (male, 21 years old)

According to a few participants, eating fast food makes teenagers feel modern and like they belong to a higher social class. (Bauer KW, Larson NI, Nelson MC).

The environment

According to research, college is a crucial time for students to change their eating habits. University students are also more likely to have a bad diet intake. Students who first enroll in college frequently experience the strains of shifting academic burdens, attempting to adapt to their new environment, building networks, and taking on unexpected obligations. University students today have more flexibility and control over their lives than ever before, which can lead to poor nutritional decisions like a regular fast-food diet. It is possible that fast food culture among students will cause a demographic shift away from traditional foods and home-cooked meals

The reasons college students eat at fast food outlets have not been the subject of much research. Different sociodemographic characteristics, including age, sex, education, employment position, and household size, appear to have an impact on people's reasons for eating fast food. Food preferences can be influenced by a variety of factors, including advertising and media, a lack of parental supervision, taste preferences, self-control,

Student lifestyles

College students in South Asia are increasingly engaging in unhealthy eating habits. Younger age, higher socioeconomic class, higher BMI (being overweight or obese), study groupings including Humanities students, lack of nutrition understanding, and internet addiction all played a part as favorable predictors of frequent fast-food consumption. Additionally, due to the flavor, brand reputation, accessibility, location, affordability, atmosphere, sanitation standards, variety, promotional offers, and quick service, college students consumed significantly more fast food (Md Abdullah et al,2021).

In addition, some of the people who are knowledgeable about nutrition, and who are skilled in food preparation also consume fast food in their diet due to lack of time and energy, academic stress, eating cravings, and more lax social norms, among other factors. (Malane et al,2014).

Research Hypothesis

The researchers state the relationship between factors of fast-food consumption among university students. The relationship is divided into three components, which are social, the environment, and student lifestyle.

H1: there is a significant relationship between social factors and fast-food consumption among university students.

H2: there is a significant relationship between environmental factors and fast-food consumption among university students.

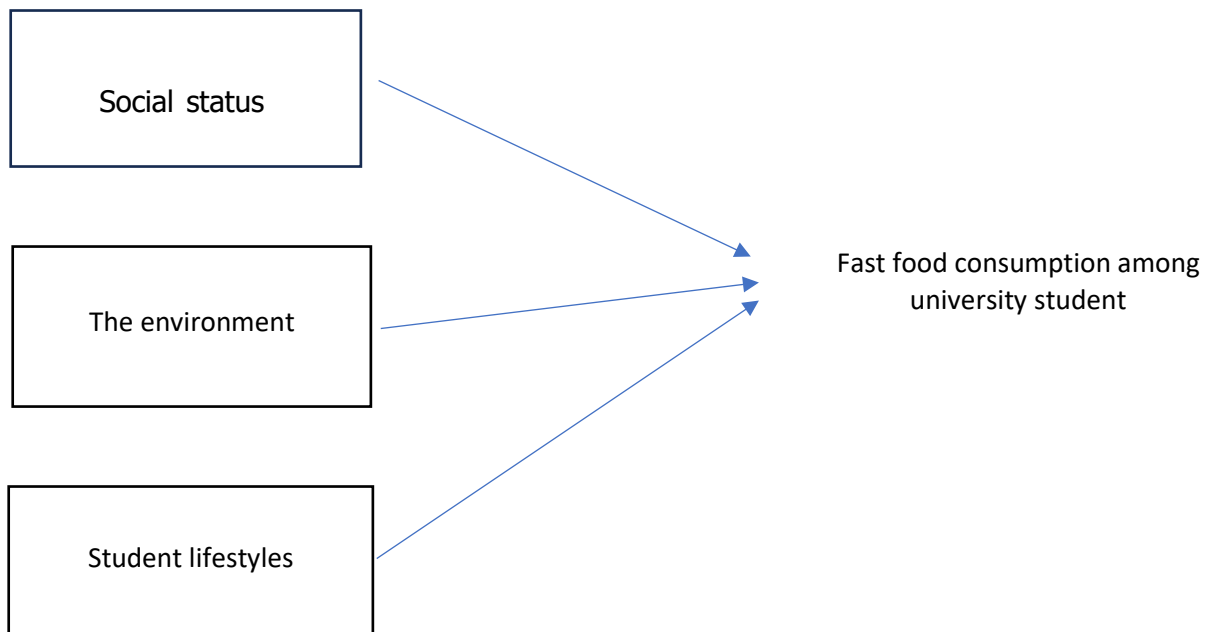

H3: There is a significant relationship between student lifestyle and fast - food consumption among university students.

Research Framework

INDEPENDENT VARIABLES

DEPENDENT

VARIABLES

METHODOLOGY

Research Design

The method utilized to accomplish research goals or test hypotheses is known as a research design. In order to answer the research question, it is important to make sure that any proof obtained from the data can be used. The three fundamental research designs that can be used to illustrate how the researchers accomplish the research goals are exploratory, informal, and formal. Researchers can find out how the dependent variables in this method are university students and the independent factors, which are socioeconomic status, the environment, and student lifestyles. The researcher used the quotatives research technique to complete this study using the data that our group had gathered. In order to fill out the questionnaire, the researchers collected data from students at the University Malaysia Kelantan and the Pendidikan Guru.

Data Collection

The questionnaire is the main method for data collection in this study. The researchers had chosen Google Forms because it can make it easier to distribute the questionnaire. This questionnaire was distributed specifically to students from the University Malaysia Kelantan and institute Pendidikan guru to find out their experiences with fast-food consumption.

Sampling

Sampling is an academic method of collecting information to learn more about a specific population by examining the result of a sample of people rather than focusing on some individual

Data Analysis

Data analysis is a technique used to examine records using logic, reasoning, and statistics. The data analysis is the statistical package for the social sciences. By using statistical software, researchers can select the most effective statistical technique to use. Statistics like the cumulative percentage and valid percentage will be explained by using SPSS data. The researchers also will use SPSS-created tables for data entry and analysis. Researchers can collect data for industry research in addition to performing descriptive, reliability, and correlation analyses.

FINDINGS

DESCRIPTIVE ANALYSIS

A simple descriptive coefficient is used in a descriptive analysis to summarize a particular set of data, which could be a sample of the complete population or a representative of that group. Just look at a student's grade point average to see an example of descriptive statistics in action (GPA).

Measures of variability include a standard deviation, variance, minimum and maximum variability, and skewness, whereas measures of central tendency include mean, median, and mode. Through the application of descriptive statistics, large amounts of data can be made simpler. Each descriptive statistic condenses a lot of data into a condensed space. 1

Mean level	Level of agreement
4.50 – 5.00	Strongly agree
3.50 – 4.50	Agree
2.50 – 3.50	Neutral
1.50 – 2.50	Disagree
1.00 – 1.50	Strongly disagree

Gender

The gender distribution of a total of 223 respondents is shown in Table 4.1 below. The information was gathered through a questionnaire.

GENDER	FREQUENCY (n)	PERCENTAGE (%)
male	96	43
female	127	57
total	223	100

The table displays the gender distribution of all 223 respondents based on Figure 4.1 above. According to the table, there were 57 percent (n = 127) more female respondents than male respondents (n = 96), who made up 43 percent (n = 96). Because she is friendlier and simpler to approach than the male respondent, the female respondent is more well-liked, and they are prepared to put in the time to complete the questionnaire.

Age

The below shows the age distribution of a total of 223 respondents collected with the questionnaire.

AGE	FREQUENCY (n)	PERCENTAGE (%)
19 to 21 years old	30	26.3
22 to 25 years old	123	54.9
26 and above	12	5.4
TOTAL	223	100

The highest rate of fast-food intake among university students at UMK and IPG among these three age groups is 26.3 percent (n=30) among those who are 19 to 21 years old. The age group between 22 and 25 has the second-highest percentage (54.9%) (n=123). Ages 26 and older account for the lowest percentage (n=12), which is 5.4%.

Because they are still in their teenage years, people aged 22 to 25 had the largest percentage. They typically prefer consuming fast food at this point to support their existence and reduce the cost of living in IPTA. Ages 26 and over, however, are the lowest since people at these ages typically loathe fast food because most of them are married.

Marital Status

Table 4.3 displays the distribution of marital status for a total of 223 respondents who were surveyed by information.

Table 4.3 Marital Status of Respondent

MARITAL STATUS	FREQUENCY (n)	PERCENTAGE (%)
Married	16	7.6
single	207	92.4
total	223	100

The percentage of respondents who were married is shown in the table. Significant disparities exist between single respondents and married respondents, with single respondents scoring 92.4 percent (n = 207) and married respondents scoring 7.6 percent (n = 16), respectively. Because they had more time to answer the questionnaire than respondents who reported being married, who were too busy with their families and other responsibilities, single respondents received the highest percentage and number of responses.

Races

Table 4.4 shows the race distribution of the total of 223 respondents collected from data collection through the questionnaire.

Table 4.4 Races of respondent

RACES	FREQUENCY (n)	PERCENTAGE (%)
Malay	105	47.3
Chinese	27	12.1
Indian	29	12.9
Iban	3	1.3
TOTAL	223	100

Among these 4 groups of races, the high of percentage fast-food consumption among university students at UMK and IPG is Malay with 47.3 percent (n=105). The second highest is Indian with 12.9 percent (n=29). The third highest is Chinese with 12.1 percent (n=27). The lowest percentage is 1.3 percent (n=3) from Iban.

Education Level

Table 4.5 shows the education level distribution of a total of 223 respondents collected through the questionnaire.

Table 4.5 Education Level of Respondent

Education Level	FREQUENCY (n)	PERCENTAGE (%)
Stpm/Stam	123	57.9
Diploma	45	20.1
Foundation	13	5.8
Matriculation	42	18.7
TOTAL	223	100

Among these 4 groups of education level, the high of percentage fast-food consumption among university students at UMK and IPG is STPM/STAM with 57.9 percent (n=123). The second highest is Diploma with 20.1 percent (n=45). The third highest is Matriculation with 18.7 percent (n=42). The lowest percentage is 5.8 percent (n=13) from Foundation.

Institution

Table 4.6 shows the Institution distribution of a total of 223 respondents collected from data collection through the questionnaire.

Table 4.6 Institution of Respondent

INSTITUTION	FREQUENCY (n)	PERCENTAGE (%)
UNIVERSITY MALAYSIA KELANTAN (UMK)	165	73.7
INSTITUT PENDIDIKAN GURU (IPG) KOTA BHARU	58	25.9
TOTAL	223	100

Among these 4 groups of races, the highest percentage of fast-food consumption among university students is at UMK, with 73.7 percent (n = 165). The lowest percentage is 25.9 percent (n = 58) from IPG.

Years of Study

Table 4.7 shows the Years of Study distribution of a total of 223 respondents collected from data collection through the questionnaire.

Table 4.7 Years of Study of Respondent

YEARS OF STUDY	FREQUENCY (n)	PERCENTAGE (%)
1 st Year	42	18.8
2 nd Year	30	13.4
3 rd Year	117	52.3
4 th Year	34	15.2
TOTAL	223	100

Among these 4 groups of Years of Study, the high of percentage fast-food consumption among university students at UMK and IPG is 3rd Year with 52.3 percent (n=117). The second highest is 1st Year with 18.8 percent (n=42). The third highest is 4th Year with 15.2 percent (n=34). The lowest percentage is 13.4 percent (n=30) from 2nd Year.

4.2.8 Household/ Family Income Classification

Table 4.8 shows the household and family income classification distribution of a total of 223 respondents collected from data collection through the questionnaire.

Table 4.8: Household and Family Income Classification of Respondents

HOUSEHOLD/FAMILY INCOME CLASSIFICATION	FREQUENCY (n)	PERCENTAGE (%)
B40	143	63.9
M40	61	27.3
T20	19	8.5
Total	223	100

Among these 4 groups of Years of Study, the high of percentage of fast-food consumption among university students at UMK and IPG is B40 with 63.9 percent (n = 143). The second highest is M40 with 27.3 percent (n = 61). The lowest percentage is 8.5 percent (n = 19) from T20.

DISCUSSION AND RECOMMENDATION

The topic of fast-food consuming behavior amongst University of Malaysia Kelantan students and IPG students was examined in this study. Fast food consumption among college students is on the rise these days as it gains popularity among Malaysian students as well as those attending UMK and IPG. Chains of fast-food restaurants have grown quickly as a result of societal demand. This survey included 223 respondents in total. The results of this study's descriptive analysis, which was used to ascertain the respondents' eating habits, revealed that 77.5% of UMK students and 22.5% of IPG students consumed the fastest food. A little price factor of around 72% has an impact on fast food consumption patterns as well. It appears that 93% of the respondents enjoy eating fast food a lot. Only 5% of respondents bothered to read the nutrition labels before buying fast food. The findings also show that 99% of respondents, or the majority, frequently eat fast food 1–5 times each week. Over the past few decades, university students have consumed more fast food. Because they consume too many high calorie, fatty meals and have an imbalance between their energy intake and consumption, university students are now more likely to acquire cardiovascular disease and diabetes. The purpose of this study is to compare fast food consumption among students at Institute Pendidikan Guru (IPG) Kota Bharu and UMK Campus Kota. 223 respondents, including 165 UMK and 58 IPG students, received the questionnaire.

To gather data, it is advised to hand out the questionnaire physically or in person. This is because it is easier to convince respondents to take the time to fill out the questionnaire. Furthermore, respondents are prohibited from providing false information about gender, age, or race throughout the entire survey. Online and mobile survey incentives may encourage response fabrication. Since people could provide false demographic data to complete the questionnaire fast. Next, the questions must be reduced or written in a way that is simpler to understand. This is due to the researcher's examination that a small proportion of respondents do not comprehend the questions and opt not to respond.

The chi-square analysis of various demographic variables revealed a relationship between age and fast-food intake and pocket money. It demonstrates how variations in pocket money may impact the consumption of fast food. It also demonstrated that age also plays a key influence in college students' intake of fast food, demonstrating that those with greater disposable income are prone to consume more fast food. Contrary to popular belief, it has been discovered that college

students consume fast food regardless of gender or level of education. According to the literature, there are four independent variables that affect the dependent variable; nevertheless, the findings of the regression analysis showed that only the flavor and advertising of fast food had an impact on consumer behavior. Although much of the research argued that convenience and eating habits influence the consumption of fast food, this study finds that these characteristics are not as relevant as flavor and advertising.

CONCLUSION

The good and negative consequences of fast-food eateries are amplified by their very existence. The beneficial effects it has can help to increase student possibilities, which will aid in the expansion of the national economy. One of the unfavorable consequences, meantime, is linked to a health problem that might cause weight difficulties in students, which can have an impact on academic performance. A healthy diet can aid in boosting the immune system now and in the future. In summary, society should inform those who enjoy fast food that they have a responsibility to limit their consumption. The demand for fast food goods is rising daily as a result of shifting lifestyles. This pattern is becoming more prevalent, especially among student fraternities. Considering such a perspective, the main objectives of this study was to resolve college students' dietary preferences for fast food items. Food preference is the study's dependent variable, and there are five independent factors. 223 respondents participated in the study that was done among UMK and IPG students. To evaluate the hypothesis, regression analysis, and chi-square testing were performed.

By understanding the effects of bad eating the current state of knowledge regarding the effects of unhealthy diet on adolescents was covered by fifteen studies (45.45%); impacts covered included those that result in obesity, hypertension, high cholesterol, intestinal cancer, cardiovascular disease, dental caries, etc.

ABSTRACT

This study aims to find out the factors that influence the involvement of Universiti Malaysia Kelantan (UMK) Kampus Kota students in physical activity. There are several factors that influence student involvement in physical activity. The objective of this study is to determine whether psychological factors, environmental factors and intrinsic factors may influence student's involvement in physical activity. Physical activity provides many benefits to an individual's body. The researcher used quantitative methods when conducting this study. The questionnaire was distributed to the respondents online to facilitate the researcher and also the respondents when conducting this study. The selected respondents are students of Universiti Malaysia Kelantan Kampus Kota. The results of this study found that students' involvement in physical activities can improve their mental and physical health.

Keywords: Physical activity, physiological factors, environmental factors, intrinsic factors

INTRODUCTION

Any physically taxing or competitive game, competition, or activity that is performed in accordance with rules for fun or as a job is considered a sport. The Council of Europe's definition of sport is inclusive and broad aside from that. According to the study, men are far less likely than women to achieve the ideal body type. In order to boost their sexual attraction, college students are provided with descriptions of their body types and beauty. Physical activity can help you have a slim or slender body shape and can also help you overcome social discomfort (Abdullah et al., 2021). The World Health Organisation (WHO) defines physical activity as any physiological movement involving energy expenditure from skeletal muscles. Any movement counts as physical activity, whether it's done for exercise, to go to and from work, or for other reasons. Physical activity is good for your health, whether it is moderate or vigorous. Common forms of exercise include playing, participating in sports, cycling, and wheeling. Anyone can engage in any of these activities, regardless of their degree of competence. The management and prevention of non-communicable diseases like diabetes, heart disease, stroke, and numerous cancers have both been demonstrated to be aided by regular exercise.

Another key tactic for guaranteeing participation is engaging in physical activity. Students' involvement in physical activity can promote health while also raising satisfaction

levels for everyone. Even though regular exercise has many health benefits, individuals in developing countries generally do not fully embrace a healthy culture. Exercise encourages a healthy lifestyle and builds self-esteem. In order to maintain excellent health and ward off health issues, both male and female students participate in physical activity. This shows that regular exercise is the best way to reduce your risk of contracting a non-communicable disease (Abdullah et al., 2021). The purpose of this study is to determine whether or not the elements have an effect on university students. Exercise is often recommended for university students because it offers so many advantages.

There are three objectives in this research:

1. To determine whether psychological factor may influence students' involvement in physical activity among Universiti Malaysia Kelantan (UMK) Kampus Kota students.
2. To determine whether environment factor may influence students' involvement in physical activity among Universiti Malaysia Kelantan (UMK) Kampus Kota students.
3. To determine whether intrinsic factor may influence students' involvement in physical activity among Universiti Malaysia Kelantan (UMK) Kampus Kota students.

SIGNIFICANCE OF THE STUDY

Physiological

Physiological research focuses on both behaviour and cognition (Brazier, 2018). The principles that support the mind, the brain, and behaviour are of great interest to scientists who study physiology. It includes immaterial items that are not visible to the naked eye, such as concepts, emotions, memories, dreams, experiences, and other things.

Environmental

The meaning of the word "natural" as it is used in ordinary speech and dictionaries is the foundation for the definitions of these two ideas: natural environment and environmental change. The three terms environmental, land, and land degradation all refer to a change or disturbance to the land, the soil, or the environment that is judged harmful or undesirable (Johnson, 1997).

Intrinsic

The value of life is increased by social interaction but reduced by isolation. Loneliness and a lack of purpose in life are incompatible. Their relationship to individually assembled measures of whole-brain functional connectivity revealed significant and recurrent patterns. Greater loneliness is associated with denser and fewer connections between the frontoparietal and default modules, attentional, and perceptual networks. Stronger inter-network connections are associated with poorer life meaning, while increased modular brain connectivity is associated with reduced levels of loneliness (Mwilambwe-Tshilobo, 2019).

LITERATURE REVIEW

Physical Activity

Any skeletal muscle-based movement of the body requiring the consumption of energy is referred to as physical exercise. All motions, whether they are made for fun, to get to and from other places, or as part of one's job, are considered to be a part of this physical activity. Moderate and strenuous physical activity both benefit the body's health.

Any movement of the body involving the skeletal muscles and requiring energy is considered physical exercise. Any movement is considered to be physical exercise, regardless of whether it is done for recreation, to get to and from places, or as part of a person's job. Non-communicable diseases like diabetes, heart disease, stroke, and a variety of cancers can all be treated and prevented with exercise, according to research. Additionally, it decreases blood pressure, improves quality of life, and promotes mental wellness (World, 2022). It also aids in maintaining a healthy body weight.

Physiological Factor

Stress is an emotional and physical response to life's growing demands. Stress contributes to a multitude of physical and mental illnesses and makes some students feel anxious, helpless, angry, and guilty (Normaizatul Akma Saidi, 2019). The research revealed that participating in physical education classes helped students control the stress brought on by their coursework. (Al-Wadei, 2013). Exercise is intended to boost mood and lessen stress, which may help people realise how depression, stress, and health outcomes are connected. (2012) Hamer, M., Endrighi, R., and Poole.

A prevalent type of psychological anguish has a major impact on both daily social and physical functions. Even worse, it leads to impairments that are on par with those brought on by diabetes, hypertension, or arthritis. Independently, both joyful and unpleasant moods have an impact on longevity and physical health. Growing amounts of data support the positive biochemical and physiological effects of joy, happiness, pleasure, optimism, and sense of humour. Therefore, achieving happiness, overcoming long-term stress, and minimising negativity are key components of better health.

Environmental Factor

Environmentally related health problems are complex and can result from a variety of factors, including an individual's genetic propensity to get a disease or other condition as reported by scientists (Biddle, 2018). Environmental health issues may be caused by biological, physical, or even financial factors. Environmental health problems can be influenced by the way our bodies function, the air we breathe, the water we drink, the food we consume, as well as the homes, buildings, and areas where we live and work.

Environmental considerations Our health is impacted by a number of environmental factors. This covers issues including increased computer use, air pollution, lead, pesticides, and food containing carcinogens. 2022) (Carolyn M. Hutter. Understanding environmental influences is necessary to comprehend genetics. Genes can change due to environmental

factors, which can lead to disease. The risk and onset of disease may be influenced by gene-environment interactions, or a complicated interplay between genes and environment.

Intrinsic Factors

Your familiarity with the activity, your experience with it, your preferences for the activity, and more are internal factors that influence physical activity. Inner influence, which depends on your own thinking as well as the experience and knowledge you have, comes from within as opposed to being informed by others. Since it will have an impact on them, whether for the better or worse, each individual needs to pay special attention to this internal component. Because a person's desires might influence their decision-making, it is said that this is the case. Furthermore, everyone is entitled to their own beliefs, including those on physically demanding activities. Even if they are aware that physical activity, such as running, walking, and other comparable activities, offers many advantages, some people find it to be tiresome and despise it for that reason. While lower degrees of loneliness are related with more modular brain connectivity, stronger inter-network connections are associated with inferior life meaning (Mwilambwe-Tshilobo, 2019).

The relationship between physiological factor, environmental factor, and intrinsic factor that influence involvement physical activities among Universiti Malaysia Kelantan (UMK) Kampus Kota students.

As a way to reduce stress, exercise is commonly advised. Exercise appears to increase good feelings while decreasing stress and other negative emotions. Prior studies, however, have demonstrated that when faced with stress and unpleasant emotions, people increase health-promoting habits like physical exercise and healthy food while lowering such behaviours when faced with positive feelings. Exercise is linked to better mood, less stress, and negative consequences on the hours that follow in a typical day. 22 January 2019 (Dana Schultchen).

According to scientists, environmental health issues are complicated and can be caused by a wide range of variables, including a person's genetic susceptibility to get a disease or another condition. Environmental health issues are complex and can be brought on by a number of things, such as a person's genetic propensity for certain diseases or other ailments, according to specialists.

It is widely acknowledged that maintaining a healthy lifestyle is necessary for the development of young people, therefore physical activity is essential. The multiple physical, psychological, aesthetic, and social benefits of regular engagement in sports or physical activity are now backed by a lot of evidence. It has been demonstrated that regular exercise enhances wellbeing overall, prevents sarcopenia and fragility, lowers the risk of contracting a number of chronic diseases, as well as depression and dementia. Because adults and the elderly are more likely to experience physical and psychological issues due to sedentary habits throughout childhood and adolescence, youth sports participation is highly regarded in society (Sáez, I. et al., 2021).

Hypothesis

The independent variables for this study were those that affected physiological factor, environmental factor, and intrinsic factor in accordance with the conceptual framework. Three independent variables have been presented, and they are as follows. The dependent variables are the participation in physical activities.

H1: There is a positive relationship between physiological factor that influence the involvement physical activities among Universiti Malaysia Kelantan (UMK) Kampus Kota students.

H2: There is a positive relationship between environmental factor that influence the involvement physical activities among Universiti Malaysia Kelantan (UMK) Kampus Kota students.

H3: There is a positive relationship between intrinsic factor that influence the involvement physical activities among Universiti Malaysia Kelantan (UMK) Kampus Kota students.

Conceptual Framework

The model below shows the variables that affect students at UMK Kampus Kota's involvement in physical activity. The topic of conceptual framework has been explained and addressed by numerous academics. It was advised to use a portion of a literature review as a research approach to look at the relationships between the physiological, environmental, and intrinsic components. These are the three independent variables that have been presented.

Independent variables

Dependent variables

Figure 1: Conceptual Framework of the relationship between factors that influence in physiological factor, environmental factor and intrinsic factor.

METHODOLOGY

Research Design

The method utilised to accomplish research goals or test hypotheses is known as a research design. In order to answer the research question, it is important to make sure that any proof obtained from the data can be used. The three fundamental research designs that can be used to illustrate how the researcher meets the research objectives are exploratory, descriptive, and causal. Physical activity is the dependent variable in this method, and researchers can learn about the relationship between independent variables such as physiological parameters, environmental factors, and intrinsic factors. The researcher used quantitative research techniques to carry out this investigation. Students at UMK Kampus Kota who responded to a questionnaire provided the researcher with information.

Data Collection

Data collecting is a method for gathering information from the outside world to answer research questions, test hypotheses, and evaluate the outcomes. There are two different approaches to gathering data. Both primary and secondary data are gathered. The 364 respondents will receive the questionnaire online using Google Forms, which was employed as the main data collection tool for this study. The study will be carried out online by the researchers utilising a Google Form. The questionnaires will be distributed to UMK Kampus Kota students via social media channels like Twitter, Facebook, Telegram, and WhatsApp. An online survey with four-point Likert scale evaluations for each issue will be used to collect the data. Information and data are obtained for this project through both primary

Sampling

By looking at the findings of a sample of people rather than concentrating on a small group of individuals, sampling is a method used in academia to gather data and learn more about a certain population (Turner, 2020). This study used both probability sampling and non-probability sampling, the two main sampling techniques. By using random samples, probability sampling enables judgements about the overall demography. 2020 (Stratton). Non-probability sampling commonly has an impact on qualitative research as well as the construction of research papers (Taherdoost, 2016).

In this investigation, a non-probability strategy, such as a straightforward sampling procedure, was used to select the sample design. For this study, simple random sampling will be used. There are the most samples available. A table of random numbers is then used to select the units. This method will enable the researcher to choose a random respondent and get particular data from each participant. Through the use of facility sampling, a non-probability or non-random sampling technique, people of a target demographic who meet the conditions, such as easy accessibility, geographic location, capacity at a specific time, or want to participate, will be included in the study (Etikan et al., 2016.).

Data Analysis

Using logic, reasoning, and statistics to investigate records is a process known as data analysis. The Statistical Package for the Social Sciences is a tool for data analysis. Researchers can choose the best statistical methods to employ using SPSS software. We will use SPSS data to discuss statistics like the cumulative percentage and valid percentage. For data entry and analysis, the researcher will make use of tables prepared using SPSS. In addition to conducting descriptive, reliability, and correlation studies, researchers might gather data for industry research.

FINDINGS

Result of Frequency Analysis

Table 1: Demographic Profile of Sample

Characteristics		Frequency (N)	Percentage (%)
Gender	Male	225	61.8
	Female	139	38.2
Age	18-21 years old	56	15.4
	22-25 years old	255	70.1
	26-29 years old	43	11.8
	30 years old and above	10	2.7
Race	Bumiputra Sabah	2	5
	Bumiputra Sarawak	1	3
	Chinese	72	19.8
	Christian	1	3
	Indian	71	19.5
Faculty	Malay	217	59.6
	FHPK	154	42.3
	FKP	133	35.5
	FPV	49	13.5
Year of Study	FSDK	28	7.7
	Year 1	45	12.4
	Year 2	80	22.0
	Year 3	166	45.6
	Final Year (Year 4&5)	73	20.1

The frequency analysis of the respondents' responses is shown in the table above. Students from Universiti Malaysia Kelantan (UMK) Kampus Kota are the subject of the study. Male respondents made up 225 of the total respondents, or 61.8%, while female respondents made up 139 of the total respondents, or 38.2%.

In addition, the majority of respondents (255, or 70.1%) were between the ages of 22 and 25. Next, 56 respondents, or 15.4%, were between the ages of 18 and 21. With 43 respondents, the average age group is 26 to 29 years old (11.8%). While the lowest percentage of respondents—10—belonged to the 30-year-old and older age group (2.7%).

Additionally, the respondents were separated into six groups according on their race: Chinese, Christian, Indian, Malay, Bumiputra Sabah, and Bumiputra Sarawak. According to the poll, 59.6%, or 217 respondents, of the respondents who participated in this questionnaire were Malay. Chinese responses made up 19.8%, or 72 people, which was the second-highest percentage. Indian respondents made up 19.5% of all respondents, or 71 people, ranking third. Bumiputra Sabah has the second-lowest response rate at 0.5%, or 2 responders. The remaining respondents, who are Bumiputra Sabah and Christians and make up 0.3% of the total, were all in the same percentage.

The faculty from this questionnaire was separated into 4 groups, namely FHPK, FKP, FPV, and FSDK. Therefore, FHPK, which has 154 respondents and a 42.3% response rate, made up the majority of the respondents who took part in this survey. The FKP survey, which had 133 respondents, had the second-highest rate at 36.5%. With 49 respondents, or 13.5% of the total, FPV has the third-highest percentage of students' faculty. FSDK, which had 28 responders and a 7.7% response rate, has the fewest respondents among faculty.

The third-year students have the highest percentage, with 45.6% equivalent to 166 respondents, according to the chart above, while first-year students have the lowest percentage, with 12.4% equal to 45 respondents. Between them, students in their second year (years 2 and 3) at 22.0% had 80 responses, while those in their final year (years 4 and 5) at 20.1% had 73 replies.

Result of Descriptive Analysis

Table 2 shows the result of descriptive analysis of variable.

Table 2: Descriptive Analysis

Variable	Items	Mean Score	Standard Deviation
Physiological Factor	The pressure can make my performance better.	2.99	1.368
	I have trouble relaxing and hard to sit still before the exercise or tournament start.	3.44	1.147
	I become annoyed and irritable during the tournament or exercise.	3.41	1.211
	I have negative thought patterns during tournaments, exercise, or training.	3.30	1.126
	I feel down or depressed after watching opponent the tournament and training.	3.41	1.215
	After the tournament, training, or exercise, I had trouble sleeping at night.	3.05	1.164
Environmental Factor	The hot temperature affects me during tournaments, training, or exercise.	3.90	0.933
	The sudden change of temperature will cause me sick during tournaments, exercise, or training.	3.80	0.972
	The cold temperature affects me during tournaments, training, or exercise.	3.62	0.971
	The change in temperature affects my focus	3.74	0.898

	and concentrate on exercise or tournament.		
	The high Altitude affects me during my tournament, exercise, or training.	3.69	0.910
	High altitude makes me fatigue or lose energy easily.	3.66	0.900
Intrinsic Factor	There is no fitness Centre that I could get into.	3.21	1.156
	I have no exercise equipment at home that I use.	3.48	1.110
	My family or friends do not encourage me to exercise.	3.11	1.215
	My parents give academic success priority over exercise.	3.40	1.185
	I have no leisure time for exercise because of my busy lesson schedule.	3.46	1.091
	I have no leisure time for exercise because of my social and family responsibilities.	3.27	1.160
Physical Activity	I've been thinking about exercise is difficult and too tiring.	3.39	1.176
	I have no energy as much as to be able to do exercise.	3.38	1.137
	I've been thinking about other recreational activities with my friends are more entertaining than exercise.	3.48	1.112
	I have not been thinking about exercise has positive effects on my health.	3.06	1.236
	I've been worried about my looks when I exercise.	3.40	1.095
	I have not been thinking about my ability to exercise.	3.41	1.111

Research investigating the mean and standard deviation for the physiological element, the independent variable. The maximum mean value was 3.44, and the majority of respondents concurred that the statement, "I find it difficult to unwind and sit still before an exercise or tournament starts," is the physiological factor that has the greatest impact on students at University Malaysia Kelantan (UMK) Campus Kota.

The mean and standard deviation are included in the study of the independent variable, environmental component. The maximum mean value was 3.90, and the majority of respondents concurred that the statement "The hot temperature affects me during tournaments, training, or exercise" was the most significant one regarding mental health and how environmental factors affect students at University Malaysia Kelantan (UMK) Kampus Kota.

The mean and standard deviation are included in the analysis of the independent variable, intrinsic factor. The maximum mean value was 3.48, and the majority of respondents concurred that the statement "I have no exercise equipment at home that I use" was the intrinsic factor with the greatest influence on students at University Malaysia Kelantan (UMK) Kampus Kota.

The mean and standard deviation are also included in the study of the physical element, the dependent variable. The maximum mean value was 3.48, and the majority of respondents concurred that it was "I've been thinking about other recreational activities with my friends are more entertaining than exercise." that had the greatest influence on students at University Malaysia Kelantan (UMK) Kampus Kota's participation in physical activity.

Result of Reliability Test

Table 3 shows the result of reliability analysis based on dependent and independent variable.

Variable	Number of items	Reliability Cronbach's Alpha	Internal consistency
Physiological factor	6	0.899	Very good
Environmental factor	6	0.876	Very good
Intrinsic factor	6	0.894	Very good
Physical activity	6	0.921	Excellent

Table 3: Reliability Test

The tables above show the Cronbach's Alpha Coefficient values for the study's dependent variable (physical activity) and independent variables (physiological factor, environmental factor, and intrinsic factor). The tables show that the dependent variable and all independent factors were all over 0.7. As a result, the questionnaire has been approved and is legitimate. Six questions were utilised in this study to assess the Physiological Factor variable that affects University Malaysia Kelantan (UMK) Kampus Kota students' participation in physical activity. The table reveals that the Physiological Factor's Cronbach's alpha coefficient is 0.899, indicating a very strong level of connection. As a result, the coefficient found for the Physiological Factor Variable questions is accurate.

Next, six questions were utilised to assess the environmental factor variable that affects students at University Malaysia Kelantan (UMK) Campus Kota's participation in physical activity. The table reveals that the environmental factor's Cronbach's alpha coefficient is 0.876, indicating a very strong degree of connection. As a result, the coefficient found for the Environmental Factor variable's questions is accurate.

Last but not least, six questions were utilised to assess the intrinsic factor variable that affects students at University Malaysia Kelantan (UMK) Campus Kota's participation in physical activity. The table demonstrates that the intrinsic factor's Cronbach's alpha coefficient is 0.894, indicating a very strong degree of association. As a result, the coefficient found for the variables relating to the intrinsic factor is reliable.

The physical activity variable was lastly measured using six questions. The chart reveals that Physical Activity has an outstanding strength of association with a Cronbach's alpha coefficient of 0.921. The coefficient found for the questions related to the physical activity variable is therefore accurate.

Pearson Correlation

Finding the linear relationship between the two variables required careful consideration of Pearson's correlation analysis. The purpose of this study was to look into potential

connections between the dependent variable (physical factor) and the independent variables (physiological factor, environmental factor, and intrinsic factor). The Pearson Correlation Analysis may be seen in the table below.

Table 4: Pearson Correlation Analysis

Hypothesis	Correlation coefficient (r)	P value	Strength of association	Result (Supported/Not Supported)
There is a significant relationship between physiological factor and physical activities among Universiti Malaysia Kelantan (UMK) Kampus Kota students.	0.765	0.001	Strong	H ₁ is supported.
There is a significant relationship between environmental factor and physical activities among Universiti Malaysia Kelantan (UMK) Kampus Kota students.	0.418	0.001	Moderate	H ₂ is supported.
There is a significant relationship between intrinsic factor and physical activities among Universiti Malaysia Kelantan (UMK) Kampus Kota students.	0.795	0.001	Strong	H ₃ is supported

Results of the Pearson Correlation study are shown in the table above. There is an association between physiological variables and physical activity for the H1. The correlation coefficient of 0.765 obtained from the results shows that the link is very favourable. The physiological factor associated with physical activity has a p value of 0.001, which is below the highly significant level of 0.01. H1 has therefore been approved.

The relationship between environmental conditions and physical exercise is also good for the H2. With a correlation coefficient of 0.418, the findings show a somewhat good association. The physiological factor associated with physical activity has a p value of 0.001, which is below the highly significant level of 0.01. H2 has consequently been approved.

The last finding for the H3 is that environmental factors and physical activity are positively correlated. According to the findings, the link is very strong, with a correlation coefficient of 0.793. The physiological factor associated with physical activity has a p value of 0.001, which is below the highly significant level of 0.01. H3 has consequently been approved.

DISCUSSION AND RECOMMENDATION

The discussion aims to answer the queries and address the hypothesis presented in the study's first chapter. In general, this study has thoroughly examined the variables that affect students at Universiti Malaysia Kelantan (UMK) Kampus Kota's involvement in physical exercise. The results led H1 to the conclusion that physiological parameters and physical exercise have a favourable association. This study demonstrates that physical activity and physiological factors have a beneficial relationship. The findings indicated that taking part in physical education sessions helped pupils better manage the stress caused by their assignments. Exercise is meant to elevate mood and ease stress, which may help people comprehend how stress, depression, and health consequences are related (Hamer, M., Endrighi, R., and Poole, L., 2012).

The results led H2 to the conclusion that environmental influences and physical activity are positively correlated. This study establishes a link between environmental factors and physical activity that is favourable. Environmental factors have an impact on a person's ability to engage in physical activity. Our health is impacted by a number of environmental factors. Carcinogens in food, increased computer use, pesticides, lead, and air pollution are a few of these (Carolyn M. Hutter, 2022). It follows that environmental influences have an impact on pupils' participation in physical activity.

Furthermore, based on the results, H3 came to the conclusion that environmental influences and physical activity are positively correlated. This study demonstrates a beneficial relationship between intrinsic variables and physical activity. Even if they are aware that regular exercise, like jogging or walking, has many benefits, some people dislike it because they find it to be exhausting. While lower degrees of loneliness are related with more modular brain connectivity, stronger inter-network connections are associated with inferior life meaning (Mwilambwe-Tshilobo, 2019). Thus, it can be said that intrinsic factors have an impact on students' participation in physical activity.

Every research project must have some kind of barrier or restriction, and this study is no different. The researchers found it challenging to complete this investigation due to its restrictions. This study has three limitations: a lack of cooperation, a time crunch, and the challenge of finding an excellent and pertinent literature review. In order to better comprehend research challenges, the main objective of the research study is to analyse and present the results of the data analysis from the previous chapter. Physical activity and the independent variables of physiological, environmental, and intrinsic factors are correlated, according to the research.

The questionnaire for subsequent studies should be made simpler and clearer to grasp, as the first recommendation. This is due to the fact that respondents always react to surveys without reading or comprehending the sentences. Because of the respondents' positive responses, the outcomes may also be more useful. The second recommendation is to upgrade tools and facilities to benefit pupils. This is so because the physiological, environmental, and internal elements that determine physical activity the subject of this study are already well-known.

CONCLUSION

In conclusion, research has been done to identify the variables that affect students at Universiti Malaysia Kelantan (UMK) Kampus Kota's involvement in physical activity. The dependent variable, which is the level of physical activity among students at UMK Kampus Kota, has three independent variables: a physiological factor, an environmental factor, and an intrinsic factor. The Pearson Correlation Coefficient was used to assess these independent and dependent variables. This demonstrates that the independent and dependent variables are related. The advice relates to the strategy the researcher used to complete the questionnaire. Respondents are required to fill out the questionnaire's information in order for the researcher to receive positive survey findings. This study demonstrates how psychological, environmental, and intrinsic factors affect students at Universiti Malaysia Kelantan (UMK) Kampus Kota's participation in physical activity.
